The spur north from Huntingburg to Jasper has been mentioned. The Monon has a branch line 18 miles long running from Orleans, on its main line between Chicago and Louisville, southwesterly to French Lick Springs, a watering place of some prominence and distant from Jasper only 19 miles by air line. A connecting line between these two points would therefore supply the necessary link in the desired direct route. But the intervening country is quite rugged, making the construction difficult and costly. The traffic possibilities, however, appeared to justify the expenditure and work was begun on such a line by the Southern in the fall of 1905.

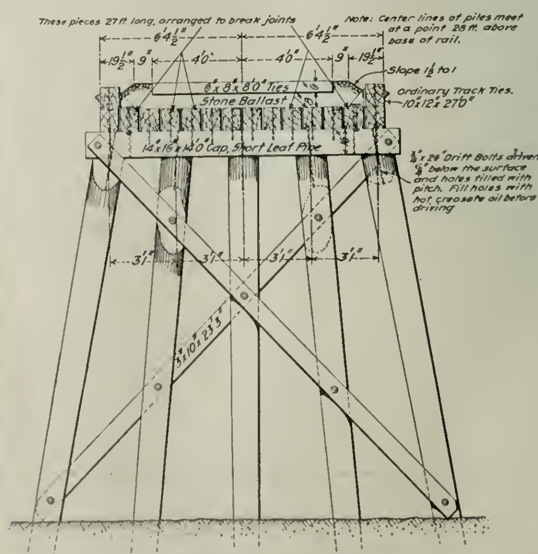
The length of the new line is 24.8 miles. As indicated by the accompanying map, from Jasper it takes the general direction of the Patoka river, which it crosses four times, to Dillon creek, which it follows closely to French Lick. The maximum gradient is 0.8 per cent., compensated, and the maximum curve 6 deg.; there is only one of these, however, also one of 5 deg., and a few of 4½ and 4 degs. The curves are mostly 3 deg. and under. As the profile shows, the highest point on the line is at mile-post 20, which is 157.5 ft. higher than Jasper. There is a tunnel at this point 2,200 ft. long, and the maximum gradient of 0.8 per cent. occurs only at the approaches to this tunnel. The controlling gradient elsewhere is only 0.4 per cent., and this will be the rating gradient of the line, the intention being to double the trains over the heavier summit grades and through the tunnel. For this purpose, passing tracks are provided at suitable points on each side of the tunnel.

The line was to have been ready for traffic by April 1 last, but unusually heavy and continued rains caused repeated slides in the larger cuts and fills that delayed the work six months at least. The most prominent example of the difficulties which have attended the work, due to the extremely wet weather, is at "big cut," 8.5 miles from Jasper. The original estimate was for 50,000 yds. of material, rated 80 per cent. rock. The rock, however, proved to be stratified throughout with soapstone, and the ground being surcharged with water, slide after slide has occurred until the total amount of material which will finally be removed will be at least four times the original estimate. This cut proved to be the critical point in the work, as tracklaying had, of course, to be done from the Jasper end of the line, and although most of the grading had been finished, the condition of the big cut prevented getting materials through to lay track beyond. A photograph of this cut is reproduced herewith. However, it fails to give an adequate idea of the character and extent of the real conditions.

Method of Timber Framing Heading in Burton Tunnel.

The tunnel is, of course, the most important single feature of the line. It is called Burton tunnel and, as already mentioned, is 2,200 ft. long. The four miles of line from French Lick to the tunnel were built prior to beginning work on same to enable machinery, supplies, etc., to be carried to it. The material pierced by

Big Cut, Where the Most Serious Sliding Occurred.



Ballasted Deck Trestle.

Jasper-French Lick Line of the Southern; Looking East from Station 40.

the tunnel is shale, principally. The method used in driving the tunnel was that of taking out side and top drifts around a central core, which was afterward removed with a shovel. Sections of the tunnel are reproduced in the drawings. It is a single-track bore, the size of the opening through the natural material being 20 ft. wide by 26 ft. 3 in. high, and the clearance dimensions being 16 ft.

Combination Roadway and Waterway Arch.

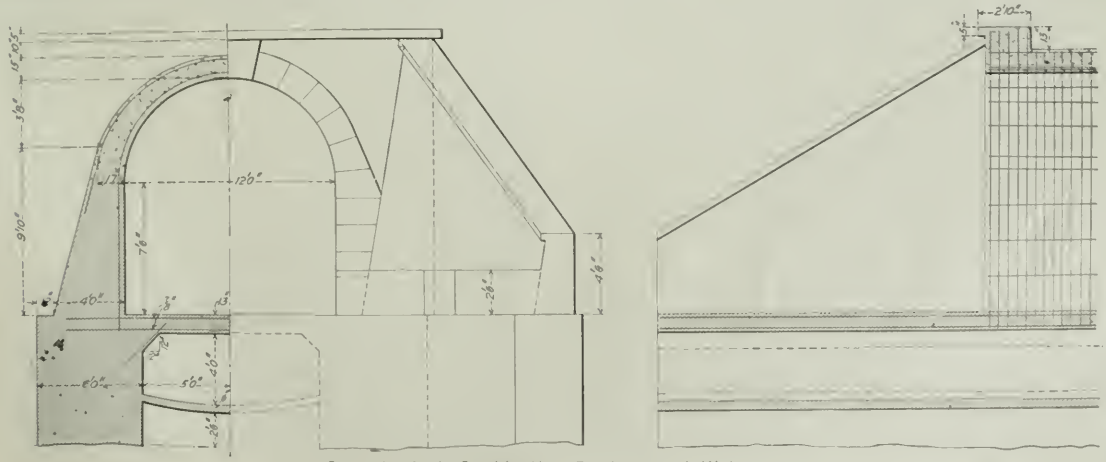
and 21 ft. 6 in. respectively. The excavation of the material was closely followed by timber lining, as shown by the illustration. Inside the timber lining a reinforced concrete lining is now being placed, which includes a concrete bottom of unusual section. This bottom has parapets, 12 in. high, 6 in. wide at the top and 10 in. at the bottom, on each side of the rock ballast, and all drainage is cared for by the gutters between these parapets and the side walls. Weep holes of 3-in. vitrified tiling are provided every 20 ft. on each side. The side walls and arch of the concrete lining are reinforced with ¾-in. Johnson corrugated bars placed as shown, the vertical bars extending horizontally into the bottom concrete 2 ft. 6 in. The quantity of material per lineal foot of lining is 4.132 cu. yds.

The approach to the south end of the tunnel is on a 4½ deg. curve. Also at this point there is a small creek which comes down

Rear View of Abutment; Potaka River Crossing.

the hillside from the west and crosses the right-of-way. Some thought was given to the best method to take care of this creek, and fluming it over the track was considered. But the objections to the presence of the overhead structure, and the cost of maintaining same, caused the idea to be given up in favor of conducting the water beneath the track and into a ditch along the east side of the tunnel approach cut. There are seven creek or river crossings on the line, four of which is Dubois, about 8¾ miles from Jasper. The profile shows of these are 135-ft. riveted through truss spans, and one 150-ft. The three creek crossings are 60-ft. through girder spans. The substructures for these crossings are reinforced concrete on pile foundations, and the superstructures are standard Southern designs for Cooper's E-50 loading. There are also a number of 20-ft. and 12-ft. reinforced concrete arches. These latter include a design of combined roadway and waterway, the drawings of which are included in the illustrations. In the particular design shown, a waterway 10 ft. wide and 4 ft. high at the center of the invert is provided immediately below the roadway, the 13-in. reinforced floor of the latter forming the roof to the waterway. The roadway entrances to the arch are protected on the waterway side by parapets 30 in. high and 26 in. thick. All of the concrete used on the work is a 1:3:5 mixture, and the reinforcing is Johnson corrugated bars. All trestles on the line have ballasted decks, the design being shown herewith.

At French Lick a yard of 350 cars capacity, with the necessary



Concrete Arch Combination Roadway and Waterway.

terminal facilities, is being built, for joint use with the Monon. Also a new joint passenger station will be built. During the season there is a considerable passenger traffic to French Lick, hitherto reached only by way of the Monon branch already referred to and therefore most inconvenient of access from the west and southwest. This new line of the Southern makes this resort directly accessible from those regions.

There is at present only one town on the line between termini, which is Dubois, about 8¾ miles from Jasper. The profile shows two other stations: Union Valley at mile post 15, and Weaver, between mile posts 17 and 18. There are only small settlements at these points as yet. The line is to be rock-ballasted and when thoroughly settled will be laid with 80 or 85-lb. rails. The first rails are 60-lb. relaying. Treated ties are being used throughout, the timbers being red and black oak, beech, elm and gum, preserved with zinc chloride. All bridge timbers are creosoted.

The seven-mile line from Huntingburg to Jasper is being revised and rebuilt to correspond with the new line. The grade is being raised above the high-water level of December, 1906, the highest recorded since 1840. The grades are being reduced to 0.5 per cent. controlling, and the alinement changed at one point to reduce a 5 deg. curve to 3½ deg. A 135-ft. crossing of the Patoka river, built 25 years ago and therefore suited only for very light loads, is being replaced by one of the riveted through-truss E-50 designs used on the new line. Also a new frame station of neat design has been built at Jasper.

The average cost of the new line was about $40,000 a mile. The contract for the entire work from Jasper to French Lick was let to McArthur Brothers, Chicago, the working being done under the supervision of Edward Gray, Engineer Maintenance of Way of the St. Louis-Louisville lines. The concrete work was done by Bates & Rogers and G. H. Scribner, both of Chicago, one-half to each, except the tunnel lining, which is being done by the Cullen-Friestedt Company, Chicago. All of the concrete and bridge work was designed in Mr. Gray's office, and the steel work for the bridges was furnished by the Louisville Bridge & Iron Company.

The Strenuous Life of the Freight Agent.

The recent doubling of the rate to be paid for interchange freight cars, increasing the need of moving all foreign cars with the least possible delay, has led Mr E. E. Betts, Car Service Agent of the Chicago & North-Western, to re-issue the per diem rules; and in connection with switching service and reclaims he says:

Switching service is the movement of a car to be loaded or unloaded, or the movement of a car between railroads, at a charge for the service rendered within designated switching limits, the road performing the service not participating in the freight rate.

It will be observed, therefore, that this campany pays 50 cents to the car owners for each day a per diem car is on our rails, whether in switching or road service. It is incumbent on this office to keep an absolutely correct record of all cars on our line in order that we may pay car owners what is due them, and *no more*. To do this we must have correct and legible interchange reports from agents at junction points. If one figure of a car number, or the initial, is wrong, it means sending out a correction to the agent to get it right, and this makes much additional work on our part and on the part of the agent. Bear in mind, please, that we have 40,000 individual car records daily, and if only 1 per cent. are wrongly reported it means 400 correction sheets and 400 replies. It takes much longer to correct than to report right in the first place. Then, again, we are likely to pay out money unnecessarily when cars are incorrectly reported, and it doesn't require many 50 cents to amount to considerable money, so let me urge on agents to see that their interchange reports are correct.

Where per diem cars are switched for connections, we pay the per diem to car owner and are entitled to reclaim from the line for whom switching is done an agreed number of days—in Chicago five, but usually in country three to four days. As day of receipt is not counted, it really gives us some additional time, depending on the hour of the day the car is received. If we handle the car in less than agreed time, we are ahead; if we take more than the agreed number of days, we lose, therefore promptness in placing, releasing and returning cars is profitable. To get the best results requires continual watchfulness. Agents should keep a pad constantly before them of all cars received for switching, showing date, and fill in the date of return. Keep this on the regular reclaim form, then you will know all the time how many cars you have in your possession. Bear in mind this fact: We are entitled to a reclaim on every per diem car we switch (system excepted), no matter what disposition is made of it after unloaded. If you are getting cars from connections faster than they can be placed account disability of consignee, your remedy is collection of demurrage. We cannot hold the bag for switching revenue must be net revenue. The reclaim must equalize the per diem at least, to effect this result.

A car day ends at midnight. There is a difference of 50 cents to our company between a delivery of a car effected at 11.59 p.m. and 12.01 a.m. All cars made empty each day, or cars loaded for connecting lines, must be switched out in preference and delivered before midnight, and where no night switch engine is worked, you must see that the day engine does this work at the latest hour possible, so as to get all available cars. If no engines are employed, have the way-freight engine to do it. If cars are set on transfer track after 6 p.m. and no receipt can be obtained, arrange with connecting line agent for a bill box, and cars are delivered when set on this track and billing deposited in designated place. Do not take empties unless order has been placed with you by the industry, and when you do take them, see that they are placed at once, and collect demurrage after expiration of free time. If you do not place the cars promptly, either loaded or empty, you are holding the bag instead of the other fellow. All we want is what is right, but cars are made to transport freight, not to stand idle, either to be loaded or unloaded, and the more promptly we handle the shipper's loads and unloads, the more cars there will be for those wanting them. If shippers could be made to realize this and act accordingly, it would increase the car supply in this country 15 per cent.

General Manager Smith to Be Tried for Manslaughter.

Justice Giegerich, of the Supreme Court of New York, has decided that Alfred H. Smith, general manager of the New York Central & Hudson River, must stand trial on his indictment for manslaughter in connection with the derailment of an electric train near Williamsbridge on February 16. Mr. Smith, through his attorneys, DeLancey Nicoll and John D. Lindsay, entered a demurrer, which was disallowed by Justice Giegerich, who says in his opinion:

On the day named the defendant was vice-president and general manager of the corporation, and as such officer he had charge and control over the maintenance of tracks, roadbeds, the curves and the operation of all trains over the line, and of the engineers running the engines.

And it was then and there the duty of the said Alfred H. Smith, as such officer and general manager, thus in charge of and control over the operation of the said trains and the employment and instruction of the said locomotive engineers, to ascertain and know at what speed it was safe for the said trains to pass along the said line of railroad and around the said curve, and to use and exercise and cause to be used and exercised all proper, reasonable and effective measures and all means within his power to prevent said train from passing along the line of railroad and around the curve at a speed faster than was safe for the train to pass, and to place the train under the government and control of a locomotive engineer properly trained and experienced and competent to run the train with safety along the line of railroad and around the said curve; but defendant, knowing the facts and his duty, as aforesaid, wholly omitted to ascertain at what speed it was safe for the train to pass around the curve, and placed the train under the control of a locomotive engineer not properly trained and not experienced and not competent to run the train with safety around said curve. It is further alleged that by reason of the culpable negligence of the defendant the train was run at a dangerous speed, and left the rails and was wrecked, thereby causing the death of one Clara L. Hudson, a passenger.

I am asked to take judicial notice of the obligations imposed upon the defendnt as general manager of the great railroad system of which he was in charge, and of the fact that by reason of their magnitude, the defendant could not have been charged with the personal performance of the duties the indictment alleges were imposed upon him. It is said that the court should not entertain the idea that it is ever one's personal duty to do that which is impossible for him to do personally. It is enough on this point to say that no such case is presented. It was not only possible for the defendant personally to cause proper measures to be taken for ascertaining what was a safe rate of speed around the curve in question and for providing proper regulations against running trains in excess of such speed, and for procuring trained and competent engineers, but it is manifest that in any properly conducted system of railroad administration such personal duty must have rested upon some one. Duties of supervision and management are just as much personal as are the manual duties of the least skilled employee of the road. If this particular duty, which the indictment avers was the defendant's, in fact belonged to some other officer of co-ordinate rank, or had been entrusted by the defendant to some carefully chosen and competent subordinate, so as to relieve him from further personal responsibility, these are facts that can be shown at the trial; but for the present purposes the allegations of the indictment must be taken as veritles, and those allegations are that it was a part of the defendant's employment to perform the acts of supervision and management specified, which he in part failed to perform and in other respects improperly performed. That the death described in the indictment was a direct and immediate consequence of such acts and omissions is also sufficiently alleged

Washing Out and Filling Boilers with Hot Water.

The essential feature of an economical system for heating water to be used in washing and filling boilers, embodies the principle of utilizing the heat contained in the water discharged for raising the temperature of the water to be used for washing and filling. Utilization of exhaust steam from various sources provides a means of maintaining the temperature of the water when locomotive boilers are not being blown off. A system operated according to this principle requires a battery of heaters located at some convenient point in or near the roundhouse, where the heat contained in the water and steam blown off may be utilized in heating the water used for washing and filling. The heaters are connected by suitable permanent mains and adjustable connections with the locomotive boiler blow-off cocks in order that all water and steam blown off will be delivered to the heater. The heat so utilized is supplemented by delivering waste steam from the exhaust of stationary engines and air compressors. The economical feature of this system is that heat which would otherwise be wasted is utilized to good advantage and the water for washing and filling is heated at an extremely low cost. Where it is necessary to obtain live steam from a boiler to operate the heaters, the economical feature of the system is destroyed.

To wash a maximum number of boilers two pipe lines are necessary between the heaters and the blow-off connections at the boiler. One pipe is for blowing to the cistern and the other is for delivering hot water to the boiler during the process of cooling after the steam has been blown off. Such an arrangement establishes a pressure in the boiler and discharges the water more rapidly than it would escape by gravity alone, because of the frictional resistance of the pipes. It is considered undesirable to blow water and steam from the boiler at the same time and allow scale and mud to stand on the hot metal without being covered by water. For this reason water should not be let out of the boiler until the temperature of the metal is the same as the temperature of the water that will be used for washing.

Heating systems may be so arranged that the heat of the steam released when the boiler is blown off may be used to heat the water for both filling and washing, or the boiler may be washed out with the water originally drawn from the boiler and the filling water alone heated by the steam blown off. Where the shop power house is equipped with condensing engines, the hot water from the condensers may be led to a pool or cistern and delivered to the roundhouse for washing boilers. Another method of providing hot water for washing is to deliver all water blown out of the boilers to a receptacle where it is allowed to settle, the same water being used many times. Arrangements are necessarily made to dispose of the scale and sludge that settle in the bottom of the receptacle.

A suggested method is to pipe the roundhouse with water and steam connectors at each pit and provide a portable injector to be carried from one engine to another.

When cold water is used for washing and filling boilers about seven or eight hours are usually consumed to blow off, wash out, fill up and raise steam to 100 lbs. pressure. To perform the work in less time is apt to cause detrimental results to the boiler. Where hot water is used for washing out and filling, a boiler can be blown off from 150 lbs. pressure in 20 minutes. It may be washed almost immediately with hot water and by filling with water at a temperature of 212 deg. F., a pressure of 100 lbs. may be raised in 30 minutes from the time the fire is started. The actual time consumed at the point from which these figures are quoted is usually about three hours for blowing off, washing out, filling up and raising steam. Boilers have been washed out at this point in less than two hours and there are other instances on record of equally short time. It is believed, however, that two hours will hardly represent general or regular practice.

While opinions vary as to the time actually saved by washing and filling boilers with hot water, it is generally considered that an engine will be ready for service in at least one-half of the time usually required when washing and filling with cold water.

The actual cash saving to be obtained by utilizing the heat in the water blown off depends upon a number of variable factors and can hardly be determined with any degree of accuracy; inasmuch as the same figures would not apply to all cases. Several authorities consider that a saving of 50 per cent. is effected; another advises 33 per cent.; a representative of one road says, side-sheets 75 per cent., flues and stay-bolts 50 per cent.; another believes that an average of $1 per boiler is saved.

The actual economy obtained depends, among other things, upon the size of the boiler, the amount of heat in the steam blown off, the initial temperature of the water to be used for washing, the size of grate, as well as the heating value and the price of the fuel used. The results of some experiments showed that locomotives with a grate surface of 54 sq. ft. could be fired up with about 1,200 lbs. of coal when the boiler was filled with hot water, and a good fire was left on the grate. To fire the same engine when the boiler was filled with cold water required from 2,200 to 2,400 lbs. of coal.

With a locomotive having 72 sq. ft. of grate area [illegible] coal were required to fire up when the boiler was filled with hot water, the greater amount of coal used as compared to the case of 54 sq. ft., being due to the difference in size of grates. When the boilers were filled with cold water there was very little difference in the amount of coal used on the two grates.

At a certain locomotive terminal where 95 boilers are washed per month the cost of labor and fuel for each boiler washed is as follows:

Seven hours' labor, one man, at 18 cents per hour	$1.26
1,500 lbs. coal for building fire, at $2 per ton	1.50
200 lbs. coal for pumping about 6,000 gals. water to cool boiler	.20
Total	$2.96

With a system of hot water washing investigated by those in charge of this terminal three hours per boiler washed was considered a conservative estimate. The corresponding cost per boiler washed with the hot water system would be:

Three hours' labor, one man, at 18 cts. per hour	$0.54
1000 lbs. coal for building fire, at $2 per ton	.90
Total	$1.44

According to these figures, the saving in labor and fuel for each boiler washing would be $1.52. Washing 95 boilers per month would represent a saving of $144.40 per month, or $1,732.80 per year. Estimating the cost of installing the necessary equipment for a hot water system to be $9,000, the figures quoted would represent an interest of 19 per cent. on the original investment.

A further economy represented by the hot water system is in the shorter terminal detention. The earning capacity of a locomotive is realized when it is on the road and not when it is in the roundhouse undergoing repairs.

The figures quoted show that an engine may be ready for service in four hours' less time when washed with hot water than when cold water is depended upon. Assuming the average engine mileage to be 10 m.p.h., the time saved would represent 40 engine miles, and at, say, 960 tons per train, the four hours' additional service of each engine would represent 38,400 ton miles. The 95 engines washed per month would then enable the road to obtain 3,648,000 more ton miles per month from engines cared for at the terminal under consideration. In busy seasons this additional ton mileage would represent considerable economy.

The number of boilers which should be washed per day to justify installing a hot water washing system would depend on the peculiar local governing conditions and the interest that would be represented by the investment. On the other hand the elaborateness of the plant might well vary with the amount of work to be done. For instance, if but very little boiler washing is done at a roundhouse, the use of a portable injector would seem practical, for it is more than likely that there is a boiler in the roundhouse for operating the washout pump, even if there are but five or six stalls in the house.

The results obtained by the hot water system of washing and filling boilers indicate that not only is much time saved in turning engines at terminals, but repairs to boiler in engine house and back shop are reduced by this method of caring for boilers. In bad water districts, the use of treated water in connection with the hot water system of washing and filling, results very successfully in lengthening the life of tubes and fire-boxes.

A representative from a Western road advises that before the installation of a hot water system in 1903, tubes were removed from freight engines every 10,000 miles and from passenger engines after 15,000 miles' service. Since this system has been in operation the mileage of the tubes has been doubled. A representative of a road that has had a hot water system in operation 15 months advises that engine failures due to leaking tubes and side-sheets have decreased 50 per cent. and that repairs for boiler work have decreased 22 per cent. Another representative says that before three hot water plants were put in operation on a division, the heavy power in freight service made 30,000 miles between flue settings. The same power is now making 50,000 to 60,000 miles, using the same feed water as formerly.—*From a committee report to the convention of the Traveling Engineers' Association.*

According to a press despatch from St. Petersburg the director of the Transcaucasian Railway, Colonel Neigebauer, has issued an order containing the announcement that in six months of the current year 30 officers of the Transcaucasian line have perished by violent death. Ten among them were of the highest rank. It has become customary to ascribe these appalling murders to revolutionary organizations, but it is believed that a majority have been caused by a desire to see situations vacant. Therefore the Director has ordered that all vacancies which have resulted from officials having suffered violent death shall be filled by persons transferred from the railroads in European Russia, and none by promotion of local candidates.

Reduced Passenger Rates in Georgia.

The order of the Georgia Railroad Commission reducing passenger rates, in effect Sept. 2, must be obeyed by every road in the state, or the officers of the road disregarding it will be indicted and prosecuted by Gov. Hoke Smith. This, according to the newspapers, is the Governor's threat. He has notified all judges and prosecuting officers in the state to watch for violations of the law and to prosecute. Up to this week the roads have been unable to get a Federal injunction. The Atlantic Coast Line, the Central of Georgia and the Atlanta & West Point went before United States Judge Shelby at Huntsville, Ala., and asked for an injunction, but the Judge refused to grant it. The Judge, however, ordered the Georgia commission to appear on Sept. 16 in Atlanta before some United States Circuit Judge to show cause why an injunction should not be granted. In refusing the restraining order Judge Shelby commented sharply on the action of the railroads in waiting until two days, one of them on Sunday, before an order was to take effect to ask an injunction, although the order reducing rates was made three months ago.

Judge Shelby holds that there is no presumption to begin with, that the commission has not acted in good faith, and that the order reducing rates is confiscatory. "I cannot hold," says Judge Shelby, "that the affidavit to the bill filed by the railroads outweighs the prima facie presumption that the action of the Georgia Railroad Commission is valid."

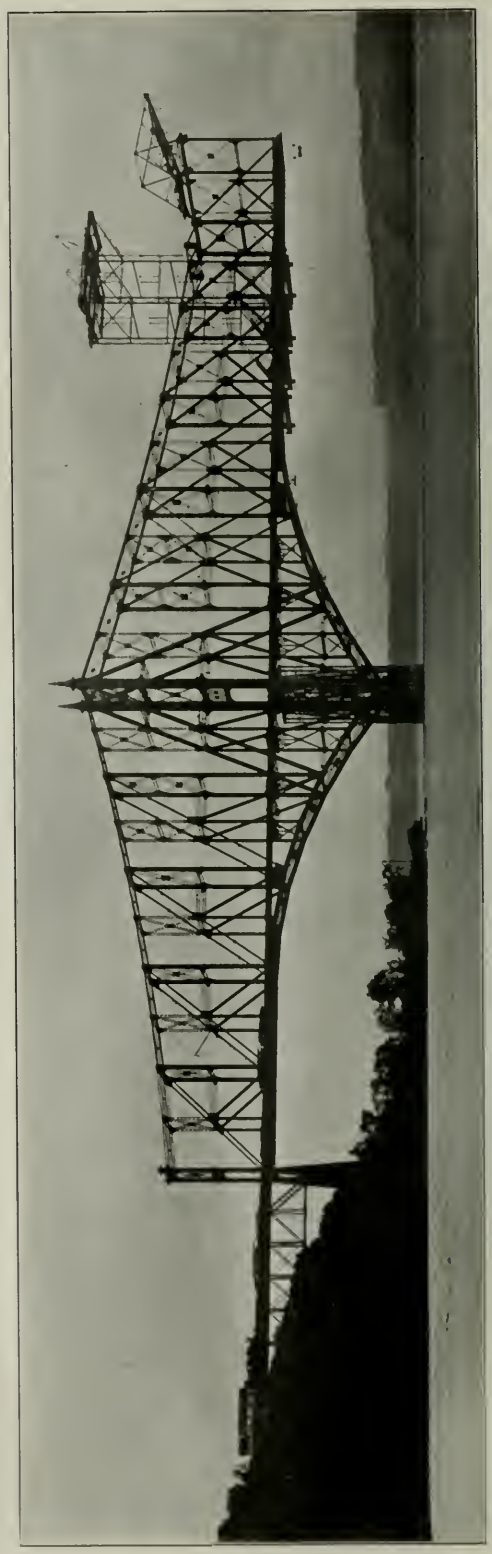
Collapse of the Quebec Bridge.

The south half of the Quebec bridge, which was being erected over the St. Lawrence river, collapsed on the afternoon of August 29, about half-past five. Of the 92 men who were working on the bridge at the time, 84 were killed or drowned and only eight were rescued, all of whom were injured. The entire structure fell and nothing was left standing except the approach span, which was carried on separate supports on the shore side of the anchorage. The south cantilever span had been erected and permanent riveting was nearly completed. Three panels of the suspended span over the middle of the river were in place and partially riveted up, and the erection of the fourth panel was in progress when the bridge fell.

While the exact cause of the failure has not been determined as we go to press, E. A. Hoare, Chief Engineer of the Quebec Bridge & Railway Co., the owners of the bridge, is reported to have said that the failure apparently took place near the main post, and that the collapse was vertical. The accompanying photographs of the wreckage, which are reproduced through the courtesy of *La Presse*, of Montreal, seem to substantiate the theory of vertical failure. The wreckage of the main posts is scattered on both sides of the pier and the other parts are almost directly underneath their former position in the structure. The anchorage supports are bent down toward the main pier, but the anchor eye-bars are intact in the foundations, indicating that the failure was not due to overloading and consequent overturning of the cantilever span. Nearly 15,000 tons of steel fell, and the principal members, which were the largest ever fabricated, are twisted, bent and broken so as to be hardly recognizable. The masonry of the main and anchorage piers seems to be but little damaged.

At the time the bridge fell there was a wind blowing about 28 miles an hour and a train of cars loaded with steel was being pushed out to the traveler at the end of the span. The engineer of the locomotive was carried down with the wreckage, but was rescued alive from the water by a boat which had just passed under the bridge. There were two travelers being used for the erection, which were both near the outer end of the span. The main traveler was about at the end of the cantilever span and the second traveler, running on the top chord of the truss span, was out over the third panel. While the weight of the two travelers and of the material piled near the end of the bridge was considerable, it was not more than the weight of the two remaining panels of the center span yet to be erected, and of the floor system of the entire half span which had not been put in place. It is not probable, therefore, the failure was due to excessive dead loads which had not been allowed for in figuring the erection stresses. If the failure was due to defective design, the error must be attributed to wrong assumptions or calculations of stress and not to insufficient loading.

While the failure came suddenly and without warning to the men on the bridge, who had no opportunity to escape, it is unfortunately true that the engineers in charge of the work had a warning that everything was not right, but the danger was not appreciated until it was too late. Early in the week one of the workmen on the bridge discovered and reported to the resident engineer, A. H. Birks, that one of the lower chord members in the third panel out from the main post was slightly buckled. N. R. McLure, inspector on the bridge for Theodore Cooper, who is consulting



The Quebec Bridge as it Appeared on August 15, Two Weeks Before the Collapse.

General View of the Fallen Bridge from the South Bank of the River.

engineer for the Quebec Bridge & Railway Co., was notified, and on Wednesday he left the bridge site and came to New York, arriving Thursday morning with his report, a copy of which had been forwarded to the office of the Phoenix Bridge Co., Philadelphia, the contractor for the steel work. Mr. Cooper received the report Thursday morning and immediately telegraphed the Phoenix Bridge Co. as follows: "Add no more load to bridge until full investigation is made. See report of McLure." This telegram was delayed and was not forwarded from New York until 12.15 p. m. It was received by the Phoenix Bridge Co. early in the afternoon and was put on the desk of Mr. Deans, Chief Engineer, who was not at his office. Mr. Deans returned about 5 p. m., and before he could telegraph ordering the men off the bridge it collapsed.

The Canadian Government has appointed Henry Holgate, Montreal; J. G. Kerry, Montreal, and Professor Galbraith, of Toronto University, to investigate the collapse and to determine, if possible, the cause. The loss is estimated at between $1,000,000 and $1,500,000, and two or three years' delay in completing the bridge. Work on the north half had only progressed to the point of erecting the false work to support the shore arm of the north cantilever span. Much of the material for the north half of the bridge is on the ground, and work will probably be resumed next year. The river channel was not seriously obstructed by the wreckage and is open for navigation.

View of the Wreckage from the River, Showing Approach Span Left Standing.

Near View of Wreckage Inside of Main Pier.

The Quebec Bridge & Railway Co. was chartered as the Quebec Bridge Co. in 1887 to build a highway and railroad bridge over the St. Lawrence river about seven miles above Quebec, to connect the railroads on the north and south shores of the river. It was granted a subsidy of $1,000,000 by the Dominion Government, $250,000 by the Province of Quebec, and $300,000 by the City of Quebec. The bridge was intended to be used by the Grand Trunk and the Intercolonial for an entrance into Quebec. Competitive plans were asked for in 1897, and in 1898 the Dominion Railway Committee approved the plan for a cantilever bridge with a channel span of 1,800 ft., the longest in the world. Bids were opened in 1899, and the contract for the piers and abutments was let to M. P. Davis in 1900. The corner stone was laid on October 2 of that year. The Phoenix Bridge Co., Philadelphia, Pa., was awarded the contract for the steel superstructure. The substructure was completed in November, 1902, and during the seasons of 1902 and 1903 the 210 ft. deck truss approach spans at each end of the bridge were erected by the Phoenix Bridge Co. The Quebec Bridge Co. was reorganized under the present name in 1903, and under an arrangement with the Dominion Government, which required the use of the bridge for a connecting link in the proposed Grand Trunk Pacific, the government guaranteed the bonds of the new company to the amount of $6,678,200. Work on the erection of the south half of the main structure was not begun until July, 1905. At the end of the working season, December 1, six panels of the anchor arm of the cantilever had been erected on falsework. During the season of 1906 the entire cantilever was erected and the falsework removed under the anchor arm. Erection had progressed to the fourth panel of the suspended truss during the present season.

The total length of the bridge between abutments is 3,220 ft., and it consists of two deck truss approach spans 210 ft. long, two

anchor arms each 500 ft. long, two cantilever arms each 562½ ft. long, and one suspended truss span 675 ft. long, the longest simple truss span built. The distance from center to center of main piers is 1,800 ft. The trusses are pin-connected and are spaced 67 ft. apart center to center. They vary in depth from 97 ft. at the portals to 315 ft. over the main piers. The main posts rise 400 ft. above the river and there is 150 ft. clear headway under the central span at high tide. The bridge was to have carried two railroad and two street car tracks, two roadways and two footwalks, all on the same level. The total weight of steel required was 38,500 tons. The main piers are concrete faced with granite, and each contains 35,000 cu. yds. of masonry. They are 30 ft. by 130 ft. at the top.

All of the detail plans for the superstructure were made by the Phoenix Bridge Co. and approved by E. A. Hoare, Chief Engineer of the Quebec Bridge & Railway Co., and by Theodore Cooper, Consulting Engineer for the Dominion Government and the Quebec Bridge and Railway Co.

The officers of the Phoenix Bridge Co. are: David Reeves, President; John S. Deans, Chief Engineer; P. L. Szlapka, Designing Engineer; A. H. Milliken, Superintendent of Erection, and A. H. Birks, Resident Engineer.

The officers of the Quebec Bridge & Railway Co. are: S. N. Parent, President; Ulric Barthe, Secretary; E. A. Hoare, Chief Engineer, and Theodore Cooper, Consulting Engineer.

Compound Ten-Wheel Locomotives for the Buenos Ayres Western Railway.

The Baldwin Locomotive Works has recently built five compound 10-wheel locomotives for the Buenos Ayres Western Railway. They were built throughout to drawings furnished by the railroad and have many special features.

As shown in the photograph, these engines are outside connected with slightly inclined cylinders. They are cross compounds, with the high-pressure cylinder on the left side and the low-pressure on the right side. The intercepting valve is placed on the left side above the high-pressure cylinder. It is of the piston valve type, as patented by Von Borries, and is worked in connection with the reversing gear. The receiver pipe between the high and low-pressure cylinders is copper, and is located in the smokebox. The slide valves are of bronze, and are balanced; they travel horizontally over vertical seats, the steam chests being placed between the engine frames. With this arrangement, a simple form of Stephenson link motion is readily employed. The eccentrics are placed on the second driving axle, while the links are suspended by double hangers immediately back of the first driving axle. The link blocks are connected to the valve stems by short transmission bars which pass over the leading driving axle. A suitable cross-tie, bolted to the frames, supports the valve-rod guides. Thus all parts of the motion are practically in the same plane, and the tendency for the gear to twist and spring is reduced to a minimum. The reversing mechanism is of the screw type.

The guides are of steel of the two-bar type, while the crossheads are of cast steel, with cast iron shoes lined with anti-friction metal. The piston rods are extended through the front cylinder heads; the pistons are of cast steel, with cast iron packing rings. All the driving wheels have cast steel centers, with tires held in place by shrinkage, retaining rings and set screws. The leading driving wheels have blank tires.

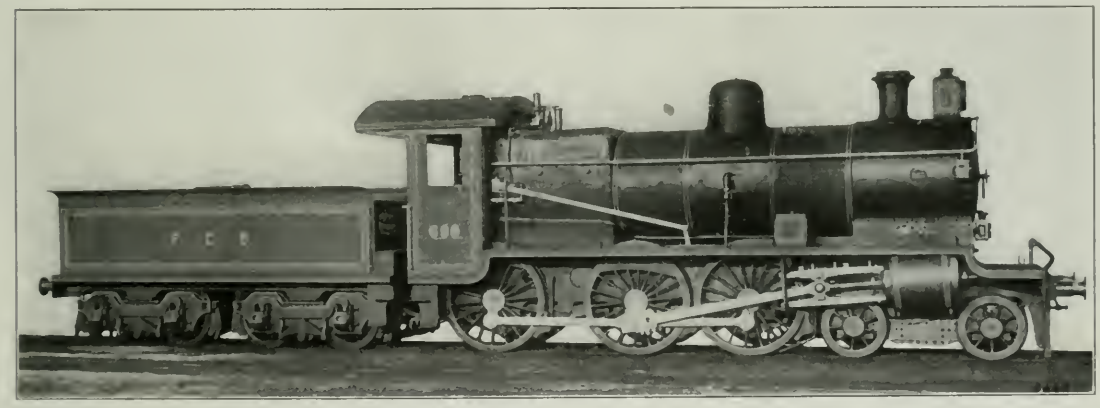
The frames are of the plate form, 1⅛ in. thick, and planed on both sides. The "horn blocks," or pedestals, are of cast steel, with wedge adjustments. All the driving springs are [illegible] and the driving wheel loads are equalized. The leading truck is of the swing-link type, designed to swing 1¾ in. on each side of the center line. The truck wheels are steel tired, with cast steel centers.

The boiler is steel, with the exception of the [illegible] back and crown of the firebox, which are copper. The firebox tube sheet is steel. The Belpaire system of staying is used, and the staybolts are bronze, with the exception of those in the throat and crown, which are Yorkshire iron. The throat sheet completely encircles the barrel to which it is united by a double row of rivets. An oval fire door opening is used, and it is formed with a wrought iron ring machined on both sides, to which the inside and outside sheets are riveted. The boiler barrel is built up of three rings. The circumferential seams are double riveted, while the longitudinal seams are butt jointed, with double covering strips and six rows of rivets. As is usual in British locomotive practice, the smokebox is separate from the boiler shell, to which it is united by a ring riveted to the barrel. The sides of the smokebox are fitted and bolted at the bottom, to the engine frames.

Among the boiler fittings may be mentioned two safety valves of the "Ramsbottom" type, which are mounted over the firebox; also two water gages which are placed in the cab. No gagecocks are applied. The grate, which slopes toward the front, is made up of plain bars of wrought iron. The boiler is fed by two injectors, one on each side, and also by one pump, which is driven from the left hand crosshead.

The engine is provided with steam brake equipment on the driving wheels, in addition to the vacuum brake for the tender and train. The sandboxes are placed on the runningboards, and steam sanding equipment is applied. The couplings are of the screw type, with draw hooks and spring buffers.

The tender is carried on two four-wheeled trucks of the swing link type, having steel-tired wheels with cast steel spoke centers. The frame is built of steel plates and angles. The tank has a water bottom and is of 4,200 gallons capacity. These locomotives will be used in both freight and passenger service.



Compound Passenger and Freight Locomotive for the Buenos Ayres Western Railway.

The following are some of the principal dimensions of the engines:

Gage	5 ft. 6 in.
Cylinders, diameter, h. p.	19 "
Cylinders, diameter, l. p.	27½ "
Piston stroke	26 "
Boiler material	Steel
" diameter	62 in.
" thickness of sheets	11/16 in.
Fuel	Coal
Steam pressure	200 lbs.
Firebox, material	Copper
" length	89 5/16 in.
" width	44⅝ "
" depth, front	74⅝ "
" depth, back	66⅝ "
" thickness all sheets	½ in.
" material of tube sheet	Steel
" water space	5 in.
Tubes, material	Iron
" number	211
" diameter	1⅞ "
" length	12 ft. 3⅛ "
Heating surface, firebox	132 sq. ft.
" " tubes	1,446 "
" " total	1,627 "
Grate area	29 "
Wheels, diameter, driving	68 in.
" " truck	28 "
" " tender	41 "
Journals, driving	7¾ x 9 "
" trucks	6 x 10 "
" tender	7½ x 9 "
Wheel base, driving	13 ft. 7 "
" " total engines	25 3 "
" " engine and tender	48 6 "
Weight on drivers	104,600 lbs.
" on truck	42,300 "

Weight, total engine	146,900 lbs.
" engine and tender	242,000 "
Tank capacity, water	4,200 gals.
Tank capacity, coal	220 cu. ft.
Tractive power	18,370 lbs.
Ratio of high to low pressure cylinder	1 to 2.09

$$\frac{\text{Weight on drivers}}{\text{Tractive power}} = 5.69$$

$$\frac{\text{Total weight}}{\text{Tractive power}} = 8.0$$

$$\frac{\text{Tractive power x diameter drivers}}{\text{Heating surface}} = 767.77$$

$$\frac{\text{Heating surface}}{\text{Grate area}} = 65.08$$

$$\frac{\text{Firebox heating surface}}{\text{Total heating surface}} = 8.11 \text{ per ct.}$$

$$\frac{\text{Total weight}}{\text{Heating surface}} = 90.29$$

Volume h. p. cylinder x 2 = 8.53 cu. ft.

$$\frac{\text{Heating surface}}{2 \text{ x Vol. h. p. cylinder}} = 190.73$$

$$\frac{\text{Grate area}}{2 \text{ x Vol. h. p. cylinder}} = 2.93$$

Tube heating surface equated to firebox heating surface (Vaughan formula)	418.71 sq. ft.
Total equated firebox heating surface	540.71 "
Ratio equated heating surface to total heating surface	1 to 3.00

Enginemen and Superheaters.

The engineman has his little part to play to accomplish the successful operation of the superheater and obtain from it the highest possible efficiency. While the engine is working, conditions permitting, the circulating tubes should be kept full of steam at boiler pressure, and to do this the engine should be worked with a full throttle and the cut-off regulated accordingly. While the effect of the superheater's work is to dry the steam on its way to the steam chests, it is just as essential and desirable that a reasonably low water level be carried in the boiler with the superheater as it is in the case of an engine using saturated steam. The engineer must see to it that the superheater damper is working properly at all times. The damper might stick in the closed position, in which case the superheater is useless and the total heating surface of the engine materially reduced, or the damper might stick in the open position, in which case there will be a deterioration of the superheater tubes, resulting in their finally breaking and causing an engine failure. Engines have been known to run for a month or more without a damper, and this, as well as other evidences, leads to the opinion that burning cinders in the smoke-tubes are partly responsible for the overheating and blistering of the return bends and the firebox ends of the circulating tubes; but be this as it may, it is essential that the engineer watch the damper and report it when it fails to work.—*From a committee report to the Traveling Engineers' Association.*

New Railroad Law in Georgia.

The Georgia Legislature, now in session, has passed the Candler-Overstreet bill, enlarging the State Railroad Commission from three to five members, and making radical amendments to the general railroad law of the state. The names of the members of the Commission as reorganized are given in another column. The Governor makes appointments to fill out the board, but with the next election the members will be elected as heretofore, and the term of each will be six years. The Commission will henceforth have supervision over telegraphs, telephones, street railroads, heat, light and power companies, docks, wharves and cotton compress corporations. The qualification for commissioner is to be 30 years of age, a qualified elector, and to be free from any interest in the businesses which the board is to control; "and a candidate is eligible without reference to his experience in law or in railroad business." We summarize the other principal features of the law.

Section 4. The Commission may employ two or more rate experts at a cost of not over $4,000 yearly in the aggregate.

Section 5. The power to determine what are just and reasonable rates and charges is vested exclusively in the said Commission.

Section 6 describes the powers of the Commission. It may investigate of its own motion, and may require common carriers and other public service corporations to establish and maintain reasonable service and facilities. It may require publication of time tables in local newspapers, may prescribe uniform accounting, the same to be, as far as practicable, in conformity with the regulations of the Interstate Commerce Commission.

Section 7. The Board is authorized to ascertain the cost of construction and the present value of corporation properties in Georgia; to require the construction of side tracks, and compel service on private sidings; to compel the operation of sufficient passenger service; to order the making and operation of physical connections between railroads at junctions; to prescribe penalties regarding the prompt movement of freight and rules for the transfer of cars through yards; to order the erection of stations and to regulate schedules of trains at junction points.

Section 8. Each corporation must furnish to the Commission a list of its stocks and bonds, and no corporation shall issue obligations for more than one year without the approval of the Commission, and then only so far as necessary for actual and reasonable expenditures. The decision of the Commission is to be final as to the validity of securities issued. Notes issued for one year or less shall not be refunded by long time obligations without the consent of the Commission.

Section 9. Penalties. A corporation violating this law shall be liable for all loss, damage or injury caused thereby; and if the violation of law is found by a jury to be wilful, the offender must pay a reasonable counsel's fee.

Section 10 prescribes the procedure for the enforcement of penalties.

Section 11 repeals sections 3 and 4 of the law of August 23, 1905, which gave the Commission power to regulate the transportation of freight, the present law taking the place of that.

Section 12 prescribes a penalty of $5,000 for violation of this act. Prosecutions for the recovery of penalties are to be brought in the name of the state of Georgia by direction of the Governor, and suits are to be given precedence in the Court over other business. The court shall not be adjourned until the suit is legally continued or is disposed of.

Section 13 makes it a misdemeanor to violate or aid or abet in violating this law, and any officer or agent found guilty shall be punished according to Section 1039 of the Penal Code of 1905; and besides this he shall be subject to indictment in any county where a subordinate employee by his approval violates either the law or the directions of the Commission.

Section 14 fixes the domicile of the Commission at the capitol in Atlanta, Fulton County, and no court outside of that county shall have jurisdiction in any suit brought against the Commission.

Section 15. The contingent expenses of the Commission shall not exceed $3,000 a year. The salary of the Chairman of the Commission is $4,000. (Salaries of other members not mentioned in this law.) The salary of the Secretary is $2,000. The printing fund is $2,000 a year. A stenographer may be employed at not over $1,200 a year.

Section 16. The Governor is authorized to appoint an attorney to the Commission for a term of four years at $2,500 a year. The attorney may be removed by the Governor at any time.

The Railroads of Mexico.*

BY FRDIS G. ROBINSON, C.E.,
Formerly of the Engineering Department of the Mexican Central.

IV.

LOCATION AND CONSTRUCTION.

A large part of the railroads of Mexico have been planned and organized by railroad men from the United States, and American standards of location and construction have been generally followed. The work has usually been in charge of engineers who gained their experience on the railroads of the United States, especially on those roads located through similar topographical conditions. Field parties for location work, as usually made up, include the engineer in charge, transitman, levelman and topographer, these four commonly being Americans, while the other members of the party are usually Mexicans, the labor being performed by the common peon. While a party thus constituted could not be expected to do an amount of work equal to that done by a well trained American party, yet there will often be developed from such workmen a chainman or rodman who will not suffer from a comparison with one of any other nationality. The daily wage paid these workers varies from 50 centavos to one peso, while one of exceptional ability would get better pay by the month. The company, while it provides tents for peon laborers, makes no provision for feeding them, and in this regard they must look after themselves.

The peon is originally a laborer on the haciendas of the country, and is held there by force if he happens to be in debt to the proprietors—a condition that is often easy to bring about. But when once freed from this debt under which he is held, he becomes a rover without home ties and feels as much at home in camps as elsewhere, so long as he has his family with him, a source of supply of strong drink within convenient distance, and no restraint upon his inclination to sing at all hours as much as it pleases him. The engineer or contractor who attempts to curb this inclination toward

*The first article was published in the *Railroad Gazette* of July 12, 1907; the second, in the issue of Aug. 9; the third in the issue of Aug. 30.

Mountain Construction, Showing Riprap Work.

wine, women and song" will find his camp unpopular and laborers difficult to obtain. The women members of the Mexicans' camp are not altogether an undesirable population, since they look after the board of the peons and do the washing and cleaning for the American members of the party

Engineers in charge of parties receive from 250 to 350 pesos, and the instrument men from 150 to 250 pesos a month. These receive their expenses while out and are well cared for by the railroad in the matter of cooks, supplies and camp equipment.

An engineer contemplating entering railroad work in Mexico should if possible prepare himself as well as may be, along two lines. First, he should learn as much Spanish as possible. It is evident that an engineer can render much more valuable service for his company if he can use the language of the country in instructing and directing his workmen, in conducting the necessary business connected with the survey, in making reports and carrying on the correspondence as needed. In this connection it is pleasing to note the tendency in our schools to include Spanish in the engineering courses, frequently at the expense of time formerly devoted to the study of other languages. Second, he should become familiar with the metric system of weights and measures. Years ago the Mexican Government adopted the metric system and required its use in industries and trades, and now the French standards have come into pretty general use. In the stores the measuring stick shows the meter on one side and the *vara* on the other. The carpenter's rule likewise gives inches and centimeters. The tape lines manufactured for use in that country similarly have both the English and French measures. In some of the districts the people still think in *phencgas, almudes, varas*, even if they are

Mountain Construction, Showing Riprap Work.

obliged to buy in hectolitres, kilogrammetros—even as some Americans sometimes still think in bushels, pounds and ton—and using the new standards. On the whole the change has made slow progress in eliminating the old units from the minds of the people, even in that country where the problem is a simple one compared to that which would follow a similar movement in other countries.

In the engineering operations connected with railroad building, the metric system is readily adapted and has some points of superiority. The length of chain now generally used on location and construction is one 20 meters long, divided into 100 links of 20 centimeters each. The curve formulas and tables found in the various handbooks or field books, based upon the use of a chain of 100 units, are readily used in laying out metric curves, for since 20 is one-fifth of 100, the curve data containing the radius as a factor will be found by dividing by five the corresponding tabular values based upon the chord of 100 units. There are certain tables published for use with the chord of 20 units, but as they are usually somewhat condensed it is probably shorter to make the simple division noted above than to use the shorter table and perform the necessary interpolations. For curve deflections, since the "degree of curve" is the angle subtended by one chord of 20 units, the deflection for one meter is one-fortieth part of the degree of curve and so equals in minutes 1.5 times the degree of curve. The advantages of the metric system are most apparent perhaps in construction work. On ordinary work cross sections are taken at each station, or 20 meters apart, and volumes are obtained by averaging end areas. Therefore the cubic contents of one station is found by adding the two end areas and multiplying by 10.

Standard Station Construction; Mexican Central.

The Mexican Government requires the railroad companies operating within its territory to submit for its approval plans and studies for the preliminary location or reconnaisance plans and profiles of the final location, as well as plans and estimates of the permanent structures. The maps prepared in this way for the government are required to show contour lines for a distance of one kilometer each side from the line of the survey, the contours being spaced for differences of level of two or five meters, according to the nature of the topography. Much valuable data are thus accumulated in the government files since the various railroad surveys have pretty well covered the country. Many lines are surveyed only to be abandoned, while others are surveyed to secure information to be used at a later time when some quick move may be needed in the great game played by the railroad managers.

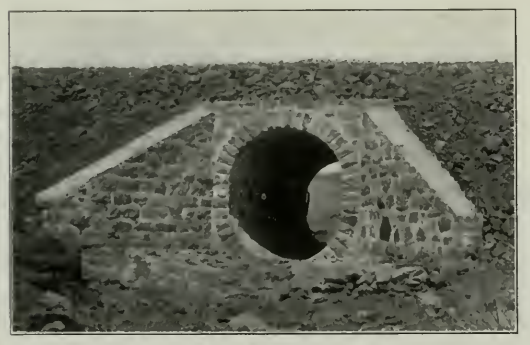
In location and construction the standards are as high as those used in this country. Thus, the Mexican Central, in its instructions

to engineers, while stating that the maximum grade is to be established as the preliminary survey may indicate, specifies that the maximum curve shall be of 6 deg. (20 meter chord, radius 627 ft.), and this degree was not exceeded in the location of that company's difficult Pacific line now under construction. It is provided that curves are to be compensated at the rate of .05 meter per degree of curve for curves of 0.7 degree and more, and at the rate of .06 meter for curves of less radius. Values of distance, rise and fall, unbroken tangents, etc., are given in conformity with the standards of other well located lines, while much stress is given to reducing the curvature to the smallest possible amount. Main line changes of location are based upon the cost of train operation as found from an examination of the records of the company and the amounts to be saved by the proposed change capitalized at 5 per cent. in the usual way.

When the final location is accepted and the work ordered the transit and level work of the location party are checked by the engineer in charge of construction, and drainage areas are determined (if this has not already been done by the location party) for proportioning the bridges and arriving at the openings required. Fortunate is the engineer who finishes this work before the arrival of the contractors, since he will be kept sufficiently busy thereafter.

The work is let by contract in the usual way, and the contractor sublets the least desirable parts of the work to others, often furnishing them such parts of their equipment as they do not require, or are pleased to be rid of. Many of these sub-contracts are let to small Mexican firms or individuals whose equipment is very meagre. In fact, many miles of embankment have been put in by Mexicans working only with shovel and basket, the earth being shoveled into a basket and carried to the embankment on the head or shoulders of the workmen.

Good scraper work on banks up to two meters is done with the small Mexican mules and native drivers, one such team being able to move from 45 to 50 cubic meters on a bank up to one meter high, and 25 to 35 cubic meters on banks up to two meters. These teams do not work to advantage on higher banks and in such cases the earth must be carried in carts or wheel scrapers from the cuts which are usually adjacent to the banks. In solid rock work of ordinary extent the drilling is done by hand by Mexican drillers. It is usually not difficult to secure skilled drillers, due to the training many men have had in the mines of the country. This work is paid for on the basis of amount of work done, and is often in charge of some disappointed though still hopeful American mine prospector. On larger works machine drills, conveyors, etc., are used as may be justified by the size of the contract.



Standard Arch Culvert, Rubble Masonry.

Classifications of material are inclined to be liberal but the work is required to be well done. The following prices may be taken as indicating those generally prevailing on heavy work:

	Pesos, per cu. meter.	Dollars, per cu. yd
Solid rock excavation in tunnel	7.50	2.87
Lava rock excavation	1.40	0.53
Solid rock excavation	1.30	0.50
Loose rock excavation	0.625	0.24
Earth hauled	0.25	0.13
Earth embankment	0.15	0.06
First-class masonry	15.00	5.75
Rubble masonry	8.00	3.00
Cement concrete masonry	9.00	3.50
Tunnel concrete in place	11.50	4.40
Tunnel concrete in blocks	19.00	7.25
Haul on rock, per kilo and mile	1.00	0.80
Clearing right of way 80 meter and yd.	0.01	0.005
Other items at cost plus 15 per cent.		

In this list of prices a number of classes of work may be paid for on the basis of force account plus a certain per cent. for contractors' profit. This method of payment is followed for such work as could not readily be covered by the usual classifications, or which if such classification were attempted would lead to disagreement. In these cases the engineer is kept informed as to wages paid for labor and keeps a check force account. The matter of clearing of right-of-way is a case of this kind. In many parts of the country the land is completely covered with low brush, and in this case the price listed above may stand. Where the line crosses heavy or scattered timber land the payment may be by force account. Other works, as wet excavation, dry retaining walls, etc., may be paid for in this way.

In bidding for the work the contractor must consider the low wages to be paid for labor (from 50 centavos to one peso per day), the scarcity of water, provisions and feed, and other items. Probably the greatest difficulty of the contractor arises from employing the cheap peon labor. The peons are a class unknown in this country. Poorly paid, poorly fed for generations, they lack the personal ambition which produces the best results in any work. They are continually moving from place to place, so that the engineer or contractor is always breaking in new men, whose breaking in is no small matter. Of late years there has been a good demand for labor, so that the supply in many parts of the country is hardly adequate for the needs. This has naturally led to an increase in wages. This increase in wages has only increased the scarcity, since a Mexican laborer whose wages have been increased will be satisfied to work fewer days. Since all he wants is to exist, he considers it bad financial management to accumulate a surplus. He has no fears of the "rainy day." In some regards the peon is not dissimilar to the imported labor now much employed in this country, but he is not held in restraint by any contract of employment firm, as often happens in this country, and is entirely independent in his comings and goings.

Peon Members of Location Party.

The following figures indicate the nature of the roads as built in Mexico, taking the Mexican Central as the type:

Gage of track	4 ft. 8½ in.	.....
Width of roadbed: earth excavation	23 ft.	7 meters.
Loose rock excavation	20 "	6 "
Solid rock excavation	20 "	6 "
Earth embankment	20 "	6 "
Length of free haul	820 "	250 "
Shrinkage from quantities measured in bank for:		
Scraper work	5 per cent.	.....
Wagon work	10 "	.....
Basket work	15 "	.....
Subgrade in rock cuts	1 ft.	0.30
Berms for banks:		
Less than 5 meters high	6.5	2.0
Higher than 5 meters	10.0	3.0
Distance between reverse curves	200.0	60.0

The following figures are gathered from records of track laying material yards, and from tie camps, and may be of interest in making comparisons of labor costs, etc. The costs given are in centavos, equal to one-half cent, American money:

Standard rail on new work	76 lbs.
Standard frogs, number	9
Cost of curving rail (60 lbs.)	$0.07
" " straightening rail	0.06
" " sawing rail	1.10
" " drilling rail per hole	0.07
" " unloading rail per car	0.22
" " loading rail, per car	0.79
" " loading car containing 800 angle bars, 100 kegs spikes, 15 kegs bolts	2.30
" " unloading ties and throwing clear of track, per tie	0.00½
" " loading ties from pile	0.00½
Labor cost of hewn pine ties in the woods, each	0.07
Labor cost of cull ties, each	0.04
(These prices paid workmen working on piece basis.)	
Paid for haul of ties, 2 to 6 kilometers, per tie	0.13 to 0.20
Size of standard tie	6 in. x 8 in. x 8 ft.
Number of ties cut by native axemen per day	10 to 15
Tie renewals per year	6 per cent.

(To be continued.)

GENERAL NEWS SECTION

NOTES.

Australian coal, imported by the Southern Pacific for locomotives, is being carried as far east as Sparks, Nev.

On the Chihuahua division of the Mexican Central train service has been interrupted by a strike of firemen.

The Seaboard Air Line has put in effect in the state of Georgia the passenger rate of 2½ cents a mile, ordered by the State Railroad Commission.

The General Superintendent of the New York, Ontario & Western has issued an order limiting the speed of all passenger trains to 50 miles an hour and, on descending grades and on certain curves, to 40 miles an hour.

The Kansas state railroad commissioners have notified the Pullman Company that empty "dead head" sleeping cars attached to crowded trains are an offense to them. They want such cars open for the use of passengers "at the usual Pullman rates."

At Bridgeport, Pa., 30 enginemen, conductors, firemen and brakemen of the Philadelphia & Reading have been suspended for violation of the company's rule relative to the use of intoxicating drinks. According to the newspaper reports, these suspensions are indefinite.

On the Baltimore & Ohio a number of "inspectors of Freight service" have been appointed, seven of them on the whole system. These men, formerly local agents and freight conductors, are to endeavor to secure the more careful loading and handling of freight with a view to reducing the bills for damages.

Texas, from being the most radical railroad regulator in the country, has lately become by comparison a very "slow" state; but the Railroad Commission has now aroused itself, and it is announced that within a month the Board will issue an order reducing passenger fares throughout the state 2½ cents a mile.

The Pennsylvania Railroad has established at Bedford, Pa., a school of telegraphy, with a view to increasing and improving the supply of operators to fill the several thousand positions of this kind on the company's lines east of Pittsburg. Bedford is 50 miles southwest from Huntingdon, which is on the middle division of the main turn.

The Long Island Railroad has made a slight increase in the pay of station agents and other station employees at a considerble number of stations, about 250 men being affected. The agents had presented to the superintendent a tentative schedule, but each individual case was dealt with on its merits, and there was no uniformity in the increases granted.

The Pittsburgh Car Service Association reports an average detention for the first seven months of this year as only 1.61 days, against 2.09 days in 1906. In this period the association reported 1,713,006 cars, of which 93 per cent. were released within free time. Of the average detention .47 was consumed by railroads and 1.14 by consignees. For the month of July 267,271 cars were reported, compared with 321,147 for July, 1906.

Hon. E. E. Clark, Interstate Commerce Commissioner, has been chosen as arbitrator of the dispute between the Colorado railroads and the Brotherhood of Railway Trainmen concerning the wages of yardmen, which recently caused a short strike on the Denver & Rio Grande. The railroad granted an increase of pay of 1 cent an hour, and the question for arbitration is whether the company shall grant an additional cent or any part thereof.

Chicago reports say that prominent shippers are beginning to complain loudly of the inability of the railroads to furnish them with freight cars of moderate size. In the constant movement toward a complete stock of large freight cars of uniform size the railroads have destroyed the old and smaller cars so rapidly that shippers of those kinds of freight which consignees want in 10-ton or 15-ton lots are being seriously inconvenienced.

Alpheus S. Frank, a young lawyer of New York City, has been sent to Sing Sing Prison for three years for subornation of perjury. Frank was the promoter of a fraudulent suit against the New York City Railway by a woman who claimed to have been injured while alighting from a street car, but who was found to be suing under a false name, and to have conspired with her husband, the conductor, to defraud the company, no injury having been obtained.

The State Corporation Commission of Virginia has ordered the adoption on October 1 of the revised passenger fares recently ordered by the Commission, on all of the roads of the state to which the reduction applies, except the Southern and the six other roads which secured injunctions in the United States Circuit Court. Under this order the rate will be 2 cents a [illegible] Richmond, Fredericksburg & Potomac, the Washington Southern, the New York, Philadelphia & Norfolk, the Virginia Southwestern and the Seaboard Air Line.

The Public Service Corporation, operating [illegible] In Jersey City, Newark and adjacent places in New Jersey, announced that, in consequence of the large number of accidents to passengers, especially those riding on the running boards, the use of open cars will be discontinued. The company has ordered 200 convertible cars—closed cars, which can be arranged for hot weather use so as to be as comfortable as open cars. The new cars are to have fenders hung much lower than those now used by the company, with a view to making it impossible for a person to be rolled under.

"The National Industrial Traffic League," which is the name of the organization of representatives of large shippers recently formed, proposes to meet in Washington, October 10, and its officers will call upon the members of the Interstate Commerce Commission. The League favors the addition to the Interstate Commerce Commission of a railroad man and a member familiar with commercial affairs. It also recommends the amendment of the anti-trust law so as to permit railroads to make traffic agreements with each other. The 48 persons who attended the first meeting of the league are said to represent 16,450 firms and corporations.

The new Railroad Commission of Georgia is as prompt in getting to work as the Public Service Commission in New York, and has already issued a number of orders to the railroads. One of these requires a complete and detailed statement of all free transportation issued during the month of September. Another, which applies also to street railroads, and telephone, telegraph, electric light and electric light companies and cotton compresses, requires by November 1 a full statement of the property of every such corporation; and a third notifies the railroads that they will be held to a high standard in the maintenance of accommodations for passengers on trains and at stations.

The Chicago, Peoria & St. Louis, a line lying wholly within the state of Illinois and dependent solely on local traffic for the support of its passenger trains, is said to have been running its three daily passenger trains between Peoria and Springfield since July 1 at less than cost, the passenger traffic being, under the reduced rate ordered by the legislature, insufficient to cover the expense of running the trains. An officer of the road has expressed the intention of taking off some or all of the passenger trains and carrying the passengers on freights. Just to keep the General Manager from dwelling too long on this matter, the firemen of the road have presented a request for an increase in pay of 12 to 15 per cent.

New York State Accident Reports.

Rules to govern the reporting of accidents by railroad and street railway companies have been promulgated by the New York State Public Service Commission, Second district. Immediate notice by telegraph must be sent to the Commission of all accidents resulting in loss of life to passengers or employees; accidents occurring at grade crossings, resulting in death or serious injury to any person; derailments of passenger trains or locomotives or cars in passenger trains; collisions involving freight or passenger trains whether resulting in loss of life or not; explosions of locomotive boilers and accidents to locomotive boilers resulting in death or serious injury to any person.

The Commission requires prompt report by mail of every accident, whether covered in a preliminary notice by telegraph or not, upon a form prescribed by the Commission, to be sent immediately after the circumstances attending the accident shall have been ascertained. This form calls for details similar to those required in the reports made to the Federal government.

Block Signals on the Rock Island.

The Chicago, Rock Island & Pacific is now equipped with automatic block signals from Chicago to Utica, Ill., 95 miles, and signals are under construction on a length of 10 miles additional. The company has now decided to extend these signals as far as Iowa City on the Iowa division and to Muscatine on the Missouri river line. Automatic signals are also to be put up on the line from Topeka, Kan., to Herington. When this work is finished the Rock Island will have automatic signals on 270 miles of double track and 80 miles of single track. On those parts of the road not equipped with automatic signals, the stations are being equipped with [illegible] for the more convenient working of the telegraph block system.

This system is already in use on 500 miles of Rock Island lines and is being rapidly extended.

The Buell Automatic Stop and Cab Signal.

At Cameron Run, Va., on the Southern Railway, August 30, a test was made of the Buell automatic signal. This apparatus, by means of track-circuit control, protects a train in a given block section by automatically stopping any following train. Apparatus is provided on the locomotives for setting the air-brakes and also for giving both a visual and an audible signal in the cab. The test is reported as having been successful. It was witnessed by members of the Block Signal and Train Control Board of the Interstate Commerce Commission.

Thermit Welding.

At the recent meeting of the Master Blacksmiths' Association an individual paper and a report were presented on the subject of thermit welding and the method was strongly commended in both. It was stated that the first thermit weld on the Southern Pacific was made on the frame of an engine in April, 1905. The cylinders had a diameter of 22 in. and a piston stroke of 30 in., and the weight was 184,000 lbs. The frame was broken at the root of the pedestal where the main driving axle is located. The frame is in service to-day and shows no sign of defect.

To prepare the surfaces of the broken section, the ends of the frame should be corrugated by drilling holes through the frame and the ends kept practically clean. A jack-screw was placed between the jaws of the frame referred to for the purpose of opening the fracture $^1/_{16}$ in. After the weld had been completed the frame was too short, consequently it should have been spread one-eighth of an inch. In every case the broken section should be enforced with a band of thermit extending about 3 in. each side of the fracture and being about ¾ in. thick.

The method of making the mould for the molten thermit is explained in the pamphlet of the Goldschmidt Thermit Co., New York. The shape of the mould must be changed to meet conditions. Three or four different shapes will meet all the conditions required for repairing frames. The mould is usually made in halves and bolted together on the frame. Care should be taken that the mould is a perfect fit around the portion to be welded. To produce the contour desired in the inside of the mould is to make a pattern of wood similar to the shape the reinforced portion of the frame is desired after being completed. The mould being bolted to the frame, the ends of the frame should be brought to a red heat by passing a pipe gasolene burner through the pouring hole. The crucible of thermit is now placed over the pouring hole and ignited. In a few seconds the work is completed.

As soon as the molten thermit begins to congeal release the jack-screw slowly so that the spring of the frame will compress the heated thermit and equalize the shrinkage that must take place by the metal cooling. Many frames have been repaired by this method with a small percentage of failure.

It also appears from the report that on one road thermit is used in the construction of new engines. The statement is that a class of engine is now being built that has the forward pedestal and front end combined. This part is made of steel and is welded to a wrought iron frame with thermit, doing away with the front end splice and thus making a continuous frame.

In addition to frame welding the method is also in use for welding connecting rods, of which there are seven in service. It is stated also that after the reinforcing collar was machined off and the rod finished to standard size, it was impossible to see by the use of a glass where the weld was made.

These rods are in service and one of the engines has since passed through the shop, and after careful inspection the rod was found in perfect condition. The method of doing this class of work is as follows: The broken part is drilled 2 in. from the broken line. The mould is made over the break, using a piece of material which is soft steel taking the place of the broken piece. To hold the new piece in line a clamp is used and as soon as the thermit has entered the mould we use this clamp to draw the new piece together from ½ to ⅝ in., when the thermit is in liquid form, thus making a perfect weld, doing away with all tendencies due to air cavities. After the welds are machined they are taken to the smith shop and heated to a red heat and looked over carefully. This is a simple method and often puts an engine back in service in a very short time.

All of the above welds have been made by heating the work through the riser opening to a red heat. Since this method has been used there have been no failures.

In spite of this endorsement of the process by both contributions to the subject the author of the individual paper, Mr. Uren, closes with the remark that he does not wish it to be understood that this method is as good as the blacksmith method, forge, steam-hammer and anvil. However, in emergency cases when an engine comes in with a broken frame, by the thermit method the frame can be repaired and go into service the next day, and oftentimes will serve the purpose until the engine comes in for general repairs. I should advise that when engines come in for general repairs the frames be closely examined, and if defects are found bring the frame to the blacksmith shop and have it put in perfect order.

New Jersey Demurrage Law.

The Legislature of New Jersey at its last session amended the railroad law of 1903 so as to forbid the collection of demurrage on freight cars until after three full days. The law has a proviso that if a car, on account of switching or otherwise, is off from the team track more than one working hour in a day, that day cannot be counted against the consignee. The law gives the railroad a lien on freight for demurrage charges assessed according to the law, but provides that if the consignee gives a bond of $50 (or double the demurrage charge) he may take his freight, notwithstanding the lien.

A Quiet Place.

Glenfield tunnel, on the Leicester & Swannington, a part of the Midland Railway system of England, is described as the oldest tunnel in the world. It is about a mile long. Only four passenger trains pass through the tunnel each week day, and from Saturday night until Monday morning it is closed by a padlocked door at either end.

Steel Rail Exports.

The exports of steel rails for the first seven months of 1907 show very little increase over the similar period of 1906, as far as value is concerned. This year exports have amounted to $5,387,947, as compared with $5,345,509 in 1906. The quantity shipped abroad has been about 20,000 tons less in this year, 180,720 tons being sent abroad in the seven months as against 203,352 in 1906. The aggregate value was brought up by the increased price which American manufacturers got for their products. During this year foreign consumers have paid an average price of $29.81 per ton for steel rails, as against $26.28 last year.

The exports appear in detail as follows:

Exported to	1907.	1906.
Europe	$1,178	$11,211
British North America	282,806	1,344,473
Central America and Br. Honduras	446,094	475,757
Mexico	728,088	426,879
West Indies and Bermuda	148,192	616,586
South America	1,640,233	1,890,360
Japan	195,534	237,425
Other Asia and Oceania	1,619,506	332,593
British Africa	7,741	9,849
Other Africa	17,885	376
Total	$5,387,347	$5,345,509

There is practically no market at all for American steel rails in Europe; but 52 tons have been sent there in seven months. The railroad development of British North America is much retarded at present, there being a decline of over $1,000,000 in its demand in the time under consideration. South America likewise showed a falling off.

The Far Eastern markets, outside of Japan, have been much more profitable. The territories grouped under "other Asia and Oceania," purchased $1,286,913 more than in the first seven months of 1906.

The Ashokan Dam.

The Board of Water Supply recently received bids for the building of the Ashokan dam, which is part of the new reservoir work under way in the Catskill mountains to supply water to New York city. The lowest bid came from the John Pierce Company and was $10,315,350, over $2,000,000 less than the engineer's estimates. This bid was not accepted. It is understood that the John Pierce Company told the Board that because of the company's inexperience in reservoir work it had underestimated the cost, although it stood ready to carry out the contract at the price offered. The contract was awarded to the MacArthur Brothers Company and Winston & Company, who jointly bid $12,669,775.

New Oriental Steamship Line.

The American & Manchurian Line has been organized in connection with the United States Steel Products Export Company, which handles the export trade of the United States Steel Corporation. The vessels will ply between New York and Dalny, Japan, China and Straits Settlements ports. The line will first be used to carry steel work to be used on the South Manchurian Railroad.

The first ship, the "Kabinga," left New York last Saturday, carrying 12,000 tons of steel, including 1,500 tons of bridge mate-

rial, 2,500 tons of rails, 110 cars, 18 locomotives and a large quantity of machinery. This consignment is the first shipment of a total of 167,000 tons of rails, 8,000 tons of bridge material, 259 locomotives and 3,000 cars that are to be used on the Manchurian road, and are to be shipped as soon as possible, the Carnegie mills having received instructions to rush the work as fast as they can. The "Kabinga" carries what is said to be the largest cargo of steel work that has ever been sent to the far East.

New York Rules for Boiler Inspection.

The New York State Public Service Commission, Second district, has formulated rules for the inspection of locomotive boilers. Detailed instructions are given as to the time and method of inspection of all parts, including steam gages, safety valves and staybolts. Each boiler must be washed out at least once a month and a thorough inspection made once every three months; and it must be tested by hydrostatic pressure not less than once a year. All inspections must be made by competent boilermakers and sworn reports filed with the commission within 10 days after each inspection.

Wells-Fargo Earnings.

Wells, Fargo & Co. earned during the fiscal year ended July 31, 1907, nearly 54 per cent. on its capital stock. The company pays 10 per cent. dividends. The earnings were as follows:

	1907.		Changes.
Gross earnings	$22,934,425	Inc.	$4,251,390
Expenses	19,566,103	"	3,428,313
Net earnings	$3,368,022	Inc.	$823,077
Other income	945,882	"	425,865
Available for dividends	$4,313,904	Inc.	$1,248,942

MANUFACTURING AND BUSINESS.

The Pennsylvania has ordered from Henry Pels & Co., New York, a large T-bar and angle shear for installation at the Juniata shops, Altoona, Pa.

The T. B. Arnold Supply Co., St. Louis, Mo., and Theodore Thomas & Co., Chicago, have been made agents of the Maryland Railway Supply Co., makers of the "spike-strut" rail fastener, Baltimore, Md.

A. Bruce has been appointed American representative of the Great Central Railway of England, succeeding F. Patman, who has left for England to take a higher office in the company. The New York office has been moved from 1 Broadway to 355 Broadway.

Barney Barkley, Superintendent of Construction in charge of the work which the Grigsby Construction Company, De Ridder, La., has been doing on the extension of the Jasper & Eastern, a Gulf, Colorado & Santa Fe line, has resigned to take a similar position with the Ball-Gardner Construction Company, Dallas, Tex.

The name of the Detroit Graphite Manufacturing Co., Detroit, Mich., has been changed to the Detroit Graphite Co. F. W. Davis, Jr., has been elected Vice-President, and T. R. Wyles, Second Vice-President. Extensive additions and improvements were recently made to the building and machinery departments, largely increasing the facilities.

At the annual meeting of the stockholders of the Locomotive Appliance Co., Chicago, held August 15, the following directors were elected for the ensuing year: Frank W. Furry, J. B. Allfree, Willis C. Squire, J. J. McCarthy, E. H. Allfree and Ira C. Hubbell, all of Chicago; Clarence H. Howard, C. A. Thompson and Ira B. Kegler, of St. Louis, Mo.; F. B. Olney, Ludington, Mich., and H. S. Gray, Benton Harbor, Mich.

Iron and Steel.

The North Georgia Marble Company, Ellijay, Ga., is in the market for second-hand light portable track or rails.

Bids were asked September 5 for about 5,000 tons of structural steel, castings, rails, etc., for the remaining material necessary to complete the Blackwells Island bridge approaches in the Borough of Queens, New York city.

The McClintic-Marshall Construction Co. has contracts for 13,000 tons of structural steel for new piers in New York; also an order for 1,700 tons for a viaduct for the Chicago, Milwaukee & St. Paul, and several smaller orders.

The rail mills of the Pittsburg district have received notice from the Baltimore & Ohio that it will need about 75,000 tons of rails for 1908 delivery, and that the specifications will be handed in later. The railroad is said to be holding back its orders awaiting the result of conferences between the [illegible] Railway Association and the Steel Corporation.

The National Transcontinental (Canada) has ordered about 36,000 tons of rails for the Grand Trunk Pacific, the orders being divided between the Dominion Iron & Steel Co. of Sydney, N. S., and the Algoma Steel Works, Sault Ste. Marie. The contract price of the Algoma company's rails, f. o. b. Fort William, was about $34 a ton, and that of the Dominion Steel Co., for delivery at Quebec, about 50 cents a ton less.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad associations and engineering societies, etc., see advertising page 21.)

Central Railway Club.

At the meeting of this club to be held at Buffalo, N. Y., Sept. 13, a paper on "Some of the Requirements of Modern Air-Brakes," by J. P. Kelly, of the Westinghouse Air-Brake Company, will be presented.

Railway Signal Association.

At the September meeting of this association, which is to be held at the Great Northern Hotel, Chicago, next Tuesday, beginning at 10 a.m., the subject for discussion will be the Committee Report on Standard Specifications for Electric Interlocking. The committee desires the views of members preparatory to making a final report at the annual meeting, which is to be held at Milwaukee October 8, 9 and 10.

Iron and Steel Institute.

At the autumn meeting of this Institute to be held in Vienna, Austria, September 23 and 24, the papers to be submitted will probably include the following: Steel and Meteoric Iron, by Professor F. Berwerth; Quantity of Blast Furnace Gas for a Given Make of Pig Iron, by Professor Josef von Ehrenwerth; Application of the Laws of Physical Chemistry to the Metallurgy of Iron, by Baron H. von Jüptner; Case Hardening of Mild Steel, by C. O. Bannister and J. W. Lambert; New Blue-Black Paint as a Protective Covering for Iron, by F. J. R. Carulla; Hardening of Steel, by L. Demozay; Structure of Hardened Steel, by Percy Longmuir; Case Hardening, by G. Shaw Scott, M. Sc.; Ageing of Mild Steel, by C. E. Stromeyer; Economical Distribution of Electric Power from Blast Furnaces, by B. H. Thwaite.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Alabama & Vicksburg.—See New Orleans & North-eastern.

Beaumont & Great Northern.—G. W. Pennell, Vice-President, has been elected also Treasurer, succeeding, as Treasurer, J. H. Pearcy, who remains Secretary.

Chicago, Cincinnati & Louisville.—The office of G. A. S. Graves, Assistant Treasurer and Purchasing Agent, has been moved from Cincinnati, Ohio, to Chicago, where the other general offices now are.

Chicago, Indianapolis & Louisville.—N. Staat, tariff and rate clerk in the freight department, has been appointed Assistant General Freight Agent.

Georgia State Railroad Commission.—S. G. McLendon has been elected Chairman. Under the law passed by the last legislature, the number of members of the Commission has been increased from three to five. The new members are Judge George W. Hillyer, of Atlanta, and Fuller E. Calloway, of La Grange.

Grand Trunk Pacific.—G. W. Caye, chief clerk to the General Manager, has been appointed Assistant to the Vice-President and General Manager, with office at Winnipeg, Man.

Mobile, Jackson & Kansas City.—The office of Assistant to the President, held by W. F. Owen, has been abolished. Mr. Owen remains General Manager. H. C. Snyder has been elected Assistant Secretary and Assistant Treasurer at New York, succeeding R. H. Sherwood, resigned.

New Orleans & North-eastern.—E. Ford, General Manager of this road and of the Alabama & Vicksburg and of the Vicksburg, Shreveport & Pacific, has been appointed Assistant to the President of the three roads. D. D. Curran, President, is now also General Manager.

Oklahoma Central.—D. I. Green has been appointed Auditor, with office at Purcell, Ind. T., succeeding W. P. Wissmann, resigned. G. W. Parker has been appointed Assistant Auditor, with office at Purcell.

Southern.—C. P. Cooper, General Superintendent of the St. Louis-Louisville lines, has been appointed Manager of these lines and his former position has been abolished.

Vicksburg, Shreveport & Pacific.—See New Orleans & North-eastern.

Operating Officers.

Alabama & Vicksburg.—See New Orleans & North-eastern.

Ann Arbor.—The headquarters of W. F. Bradley, Superintendent, have been moved from Owosso, Mich., to Toledo, Ohio.

Colorado & Southern.—See Denver & Rio Grande.

Denver & Rio Grande.—A. F. Brewer, Superintendent of Car Service of the Colorado & Southern, has been appointed Superintendent of Transportation of the Denver & Rio Grande, with office at Denver, Colo., succeeding W. A. Whitney, resigned.

Galveston, Harrisburg & San Antonio.—George S. Waid, Assistant Superintendent at El Paso, Tex., has been appointed Acting Superintendent at that place, succeeding to the duties of S. C. Marks, who has been given indefinite leave of absence because of ill health.

Louisville & Nashville.—James Allyn Morrison, who was recently appointed Assistant Superintendent at Birmingham, Ala., was born in 1868 at Sonora, Ky. After a public school education, he began railroad work, in 1886, as a telegraph operator on the Louisville & Nashville. After serving in different despatchers' offices as operator and, later, extra despatcher, he was made chief despatcher at Birmingham in 1892. He was transferred to the same position on the Montgomery division in 1897 and was appointed Trainmaster of the Decatur division in 1902, where he remained until his recent promotion.

Mobile, Jackson & Kansas City.—The office of General Superintendent, held by H. S. Jones, has been abolished. Mr. Jones remains Chief Engineer. See this company under Executive, Financial and Legal Officers.

New Orleans & North-eastern.—E. A. Kelly, Car Accountant of this road and of the Alabama & Vicksburg, and of the Vicksburg, Shreveport & Pacific, has been appointed to the new office of Superintendent of Transportation, and his former office has been abolished.

New York Central & Hudson River.—S. J. Kearns, chief despatcher of the Western division, has been appointed Assistant Superintendent of that division, with office at Syracuse, N. Y.

Oregon Railroad & Navigation.—The headquarters of the Assistant Superintendent of the Washington division have been moved from Starbuck, Wash., to Spokane. R. O. Cowling has been appointed Trainmaster at Starbuck.

Trinity & Brazos Valley.—Patrick Owens has been appointed Trainmaster at Teague, Tex.

Vicksburg, Shreveport & Pacific.—See New Orleans & North-eastern.

Traffic Officers.

Chicago, Cincinnati & Louisville.—T. C. Beyland, Assistant General Freight Agent, has resigned to go into other business.

Chicago Great Western.—C. D. Thompson, General Agent at Duluth, Minn., has resigned to go into other business.

Colorado Midland.—N. L. Drew, City Passenger Agent at Denver, Colo., has been appointed General Agent at Colorado Springs, Colo., succeeding C. S. Browne, transferred.

Denver & Rio Grande.—W. H. Paul has been appointed General Agent at Goldfield, Nev.

Georgia, Florida & Alabama.—B. C. Prince has been appointed Acting Traffic Manager, with office at Bainbridge, Ga., succeeding to the duties of J. H. McWilliams, resigned.

Missouri Pacific.—R. T. G. Matthews, traveling passenger agent at Louisville, Ky., has been appointed General Agent of the passenger department at Cincinnati, Ohio.

Seaboard Air Line.—J. G. Cantrell, Assistant General Freight Agent at Birmingham, has been appointed to the new office of General Western Freight Agent, with office at St. Louis, Mo. E. T. Steele succeeds Mr. Cantrell.

Engineering and Rolling Stock Officers.

Chicago, Burlington & Quincy.—W. F. Ackerman, superintendent of shops at Havelock, Neb., has been appointed Assistant Superintendent of Motive Power of the Lines West of the Missouri river, with office at Lincoln, Neb., succeeding J. Dietrich, transferred.

Mexican Central.—J. M. Fulton, Master Mechanic at Aguascalientes, has resigned to become general foreman of the El Paso & Southwestern shops at Tucumcari, N. Mex.

Texas Central.—A. S. Grant has been appointed Master Mechanic, with office at Walnut Springs, Tex., succeeding N. L. Smitham, resigned.

Wabash.—E. F. Needham, Master Mechanic at Springfield, Ill., has been appointed Superintendent of the Locomotive and Car Department, with office at Springfield, Ill., succeeding J. B. Barnes, retired. Mr. Needham began railroad work in 1880 as an apprentice in the Fort Wayne shops of the Wabash. He was made foreman of these shops in 1894 and was transferred to the same position at Springfield, Ill., in 1899. In December, 1901, he was appointed Assistant Master Mechanic at Decatur, Ill., and a few months later was transferred to the same position at Ashley, Ind. In the fall of 1902 he was made Master Mechanic at Fort Wayne, and in the spring of 1906 was appointed Master Mechanic of the Decatur and Springfield divisions, where he remained until his present promotion.

LOCOMOTIVE BUILDING.

The South Dakota Central is in the market for four second-hand locomotives.

The Isthmian Canal Commission, as reported in the *Railroad Gazette* of August 23, opened bids on August 30 on 12 four-wheel saddle tank 3-ft. gage locomotives. The lowest bid, according to press despatches, was that of the Davenport Locomotive Works, whose price was $36,996, or $37,956, ready for operation at Colon.

The Tonopah & Goldfield, as reported in the *Railroad Gazette* of August 23, has ordered eight simple freight locomotives from the Baldwin Locomotive Works.

General Dimensions.

Type	Simple freight
Weight, total	183,800 lbs.
Weight on drivers	165,000 "
Diameter of drivers	55 in.
Cylinders	22 in. x 28 "
Boiler, working steam pressure	180 lbs.
" number of tubes	344
" diameter of tubes	2 in.
" length of tubes	14 ft. 6 "
Firebox, length	121 "
" width	41⅝ "
" material	Homogeneous steel
" grate area	34.97 sq. ft.
Heating surface, total	2,792.9 "
Tank capacity	7,000 gals.
Coal capacity	13 tons

Special Equipment.

Air brakes	Westinghouse
Boiler lagging	Magnesia
Brake-shoes	Streeter
Couplers	Tower
Injector	Hancock
Piston rod packings	United States
Valve rod packings	United States
Safety Valve	Crosby
Sanding devices	Leach
Sight-feed lubricators	Nathan bull's-eye
Steam gages	Ashcroft
Tires—driving wheels	Midvale
Tires—truck wheels	Midvale

CAR BUILDING.

The Grand Trunk is in the market for 25 first-class passenger cars.

The Chicago Refrigerator Car Company, Chicago, is in the market for 100 refrigerator cars.

The Twin City Rapid Transit, Minneapolis, Minn., will build about 100 additional electric cars at its own shops.

The Denver & Rio Grande has ordered 1,000 steel ore cars of 100,000 lbs. capacity from the Pressed Steel Car Co.

The South Dakota Central is in the market for about 50 box cars and five hopper bottom gondola cars, all second-hand.

The Mississippi Central is in the market for two passenger coaches, two combination, baggage, mail and express cars and one compartment car.

The Union Pacific is building a number of 31-ft. steel trailer cars at its Omaha shops, similar in shape to the gasolene motor cars, except that they are four-wheel cars fitted up for baggage, mail and express.

The Union Pacific, as reported in the *Railroad Gazette* of August 9, is building 22 gasolene steel motor cars at its Omaha shops. These cars will weigh 60,000 lbs. and measure 56 ft. 11½ in. long, 9 ft. 8¼ in. wide and 12 ft. 1 7/16 in. high, over all. The special equipment includes:

Bolsters	Commonwealth Steel Co.
Brake beams	Waycott and Damascus
Brake shoes	Congdon type
Couplers	Climax
Curtain fixtures	Hartshorn tin rollers
Curtain material	Pantasote
Dust guards	Union Pacific standard
Paint	Sherwin-Williams
Seats	Union Pacific
Springs	Union Pacific
Trucks	Union Pacific built-up

The Harriman Lines are asking prices on 5,000 steel underframe box cars of 100,000 lbs. capacity, 250 steel underframe box cars

of 80,000 lbs. capacity, 500 steel underframe gondola cars of 100,000 lbs. capacity, and 250 steel underframe flat cars of 80,000 lbs. capacity.

The Virginia & Southwestern, as reported in the *Railroad Gazette* of August 23, has ordered 500 drop bottom gondola cars of 80,000 lbs capacity from the Western Steel Car & Foundry Company. These cars will weigh 35,000 lbs. and will measure 34 ft. 4¼ in. long and 9 ft. 5 in. wide, inside measurements, and 36 ft. 3 in. long and 8 ft. 3¾ in. high, over all. Bodies and underframes will be of wood. The special equipment includes:

Holsters	Scullin Gallagher
Brake beams	Simplex
Brake shoes	American Brake Shoe & Foundry Co.
Brakes	Westinghouse
Brasses	Ajax Plastic Bronze
Couplers	Major
Draft rigging	100 Miner; 100 Farlow
Journal boxes	Symington
Paint	Frazer Paint Co.
Springs	Railway Steel-Spring Co.

The Buffalo & Susquehanna, as reported in the *Railroad Gazette* of August 23, has ordered 200 steel underframe box cars of 80,000 lbs. capacity, 200 center dump hopper cars of 100,000 lbs. capacity, 500 gondola cars of 100,000 lbs. capacity and 100 general service cars of 100,000 lbs. capacity from the Pressed Steel Car Company, the box cars and the general service cars to be built by the Western Steel Car & Foundry Company. All are for October delivery, except that the general service cars are to be delivered after the completion of the hopper cars. The box cars will be 39 ft. 4⅜ in. long and 8 ft. 6 in. wide, inside measurements, and 40 ft. long and 9 ft. 1⅝ in. wide, over all. Bodies will be of wood and the underframes of steel. The center dump hopper cars will be 30 ft. ¼ in. long and 9 ft. 6 in. wide, inside measurements, and 31 ft. 6 in. long and 10 ft. 1½ in. wide, over all. Underframes will be of steel. The gondola cars will be 41 ft. 9 in. long and 9 ft. 4⅞ in. wide, inside measurements, and 43 ft. 3 in. long, 9 ft. 11⅞ in. wide and 7 ft. 5⅛ in. high, over all. Bodies and underframes will be of steel. The general service cars will be 41 ft. 9 in. long and 9 ft. 6⅜ in. wide, inside measurements, and 42 ft. 9 in. long, 10 ft. 2 in. wide and 8 ft. 9 in. high, over all. Underframes will be of pressed steel. The special equipment for all cars includes:

Bolsters	Pressed steel for gondola and general service
Brasses	Spiral
Couplers	Climax
Centerplates & side bearings	Hartman for general service cars.
Draft rigging	Miner
Dust guards	Gould
Journal boxes	Gould
Springs	Suitable for arch-bar trucks, for general service cars
Trucks	Arch bar for all except box cars
Truck frames	Arch type for box cars
Wheels	700-lb., for general service cars

RAILROAD STRUCTURES.

ALTOONA, PA.—The wheel foundry shop of the Pennsylvania, which has been in use for the past 30 years, is to be torn down and the site is to be used for a large boiler shop. Contracts for the new shop are to be let this fall.

DECATUR, ILL.—The Wabash, it is said, has recently given an order to put up a new roundhouse and machine shops here.

RUTHERFORD, PA.—The Philadelphia & Reading has given a contract to Augustus Wildman, of Harrisburg, to put up a brick power house on concrete foundations 56 ft. x 56 ft., a fan house 20 ft. x 24 ft. and a viaduct. The new plant will supply electric lighting for the entire yard and power and heat for the new shops. The cost of the new plant, exclusive of machinery, is about $25,000, and about $300,000 will be spent for machinery.

WASHINGTON, D. C.—Bids for furnishing material for a single-track steel railroad bridge over the Chagres river at Gamboa, Canal Zone, were recently opened at the office of the Isthmian Canal Commission. They were: Penn Bridge Company, Beaver Falls, Pa., $59,000; United States Steel Products & Export Co., New York, $62,090; Receivers for Milliken Bros., New York, $73,300; R. G. Hoffman & Co., Baltimore, Md., $77,827; Cowing Engineering Co., Cleveland, Ohio, $82,086, and Interstate Engineering Co., Bedford, Pa., $85,847. The Penn Bridge Company in addition to being the lowest bidder guarantees the earliest delivery.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

BINGHAM CENTRAL.—Incorporated in Utah with $500,000 capital to build a line about 50 miles from Salt Lake City, Utah, south to Bingham and the tributary smelting and mining districts. The officers are: A. C. Ellis, Jr., President; T. W. Sloan, Vice-President; John Welr, Jr., Second Vice-President; W. T. Gunter, Secretary, and W. F. Adams, Treasurer. R. G. Schulder is a Director, and F. A. Heinze is also interested.

CANADIAN PACIFIC.—Arrangements, it is said, are being made for the construction of the line from Kamloops, B. C., southeast via Yellowhead Pass in the Rockies, [illegible] miles. The proposed line will have a [illegible] existing line. The work will cost about $[illegible] much rock work.

The Guelph & Goderich branch from Guelph, Ont., to Goderich, 80 miles, has been opened for passenger traffic.

CHICAGO, BURLINGTON & QUINCY.—Surveys, it is said, are being made by this company for a connecting line from Fulton, Mo., northwest via Clark to Macon, on the Hannibal & St. Joseph line, 160 miles.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—This company, which has work under way straightening its lines, raising the grade and eliminating numerous curves from Indianapolis, Ind., west to Greencastle, 40 miles, expects to have the work finished by November. The work includes two triple arch cement bridges, which have been built over Big and Little White Lick creeks at a cost of $160,000. The line will be practically level. It is double-track and laid with 90-lb. rails.

FAIRMONT & SOUTHERN.—Incorporated in Pennsylvania, with $25,000 capital, to build a line from Bellington, W. Va., on the Baltimore & Ohio, the Coal & Coke and the Western Maryland, north to Pittsburg, Pa., 125 miles. Ralph Overholt, of Pittsburg, and B. F. Overholt, of Scottdale, Pa., are the principal promoters.

GEORGIA & FLORIDA.—This company, which proposes to build a number of connecting links between existing lines to complete a through line from Augusta, Ga., to Madison, Fla., has given a contract to Schofield & Sons, of Philadelphia, for part of the work. (May 17, p. 695.)

GRAND TRUNK.—This company is to start work on the Kingston, Smith's Falls & Ottawa cut-off projected from Rideau, six miles east of Kingston, Ont., north via Smith's Falls to a point a few miles west of Ottawa, on the Canada Atlantic, as soon as the railway department of the government has approved its route map.

GRAND TRUNK PACIFIC.—It is said that this company has bought the Vancouver, Westminster & Yukon's charter to build from Vancouver north to a connection with the Grand Trunk Pacific.

GREAT NORTHERN.—Double tracking of the mountain district is to be begun as soon as the surveys are made, according to a reported statement of Chief Engineer A. H. Hogeland. The work will be on the west slope of the Rockies from Summit northwest to Whitefish, 68 miles. Much of the line will be rebuilt to eliminate curves and to reduce the grade.

This company is reported building under the name of the Crows Nest Southern, from Fernie, B. C., north to Michel, 20 miles, in the Crows Nest coal country.

GREENVILLE & KNOXVILLE.—Contracts, it is said, are to be let about September 15 for extending this line to River Falls, S. C., 27 miles. The line is now in operation from Greenville, S. C., north to Travelers Rest, 10 miles. The northern terminus is to be at Henderson, N. C., 56 miles from Greenville. (May 24, p. 727.)

GUELPH & GODERICH.—See Canadian Pacific.

ILLINOIS TRACTION.—The McKinley Interurban Electric Railway has made arrangements to enter St. Louis as contemplated in its original plans. At Venice the company is to have an independent terminal in connection with its new bridge over the Mississippi river from Venice to the foot of Salisbury street, St. Louis. The company has ground for yards, terminals and stations at Salisbury street in St. Louis, and adjacent to the stock yards at Venice. The land, on both sides of the river, is situated at the approaches of the proposed bridge. The Venice City Council has granted the company right of way over a mile of city streets, also over a mile of private property for the bridge approach. Work is to begin on the bridge piers as soon as possible. (May 10, p. 663.)

JOPLIN & PITTSBURGH (ELECTRIC).—This company, incorporated last spring in Missouri with $5,000,000 capital, is expected soon to take over the properties of the Pittsburgh Railway & Light Company of Pittsburgh, Kan., operating 32 miles of electric roads, and the Joplin & Pittsburgh Street Railway Company, the latter having under construction a line to Joplin, Mo., about 48 miles. The new owners propose to build 26 miles of railroad to connect the Pittsburgh lines with the Joplin lines. (June 28, p. 949.)

JOPLIN & PITTSBURGH STREET RAILWAY.—See Joplin & Pittsburgh.

KINGSTON, SMITH'S FALLS & OTTAWA.—See Grand Trunk.

MEDINA, BATAVIA & ONTARIO (ELECTRIC).—Work has been begun on this proposed electric line. There are to be two divisions, one from Olcott, N. Y., northeast eight miles to Somerset, along the lake shore, through Niagara county, and the other from Olcott southeast to Medina and thence to Batavia 30 miles. The line has been projected for several years.

Mexican Central.—An officer writes that on the Tampico Short Line only about 191 miles remains to be built, 50 miles of which is under contract (from the Panuco river south), and that no bids are being asked for the remainder of the work. The line as located from the City of Mexico to Tampico will be 304 miles long; of this 142 miles, from Tampico to the foot of the plateau, will have a .5 per cent. grade, and on 54 miles the maximum will be 2.5 per cent., with 8 deg. curves. The report that the line is eventually to be extended to the United States border at Matamoras, where a bridge is to be built over the Rio Grande river to Brownsville, Tex., has no official confirmation. (May 3, p. 631.)

Pagosa Springs & Del Norte.—Incorporated in Colorado to build a line from Juanita, in Archuleta county, north to Pagosa Springs, thence northeast via Mineral county to Del Norte, 70 miles. Both of these places are on the Denver & Rio Grande. The incorporators include: Former State Treasurer Whitney Newton, H. N. Hawkins and F. Richardson.

Pittsburg, Binghamton & Eastern.—Announcement is made that the permanent location of this proposed line, under construction from Binghamton, N. Y., to Clearfield, Pa., 225 miles, has been made. From Binghamton the route is west through Owego, Sayre, Pa., thence southwest via Athens, Towanda, Canton, Williamsport, Jersey Shore, Lock Haven and Renovo, following closely the Susquehanna river to Clearfield, where connection is made for Pittsburg with the Buffalo, Rochester & Pittsburg. The grades are very light. (March 15, p. 390.)

Pittsburgh Railway & Light Company.—See Joplin & Pittsburgh.

Southern Pacific.—This company has recently laid track from West Port Arthur in to the city of Port Arthur to the site of its docks and prospective terminal. The company owns 160 acres of land along Taylors bayou, giving over a mile of water front, where a depth of 25 ft. of water is to be had.

On the 85-mile Alexandria branch of Morgan's Louisiana & Texas, 75-lb. rails are being laid to replace the present 60-lb. The work has been finished from Lafayette, Ala., north to Washington, 28 miles.

Sulphur, Colgate & Southeastern.—Surveys are being made by this company, organized to build a line from Sulphur, Ind. T., east through Hickory, Pontotoc and Colgate, thence southeast to Paris, Tex., about 150 miles. The Commercial Club of Hickory guarantees a terminal at that place and residents of Sulphur will pay part of the cost of the survey.

Tidewater Electric.—This company, reported to have secured valuable franchises in Gadsden, Birmingham and Tuscaloosa, Ala., has increased its capital from $100,000 to $150,000. The city of Bessemer ordered work on the line to be commenced September 2, or the franchise was to be forfeited. A time limit to commence work in Birmingham also exists.

Tonopah & Tidewater.—This road was opened for business September 1 to Death Valley Junction, Cal., 121 miles north of Ludlow. Also a branch from Death Valley Junction to Lila C, seven miles. The main line is being extended as rapidly as possible to Gold Center, Beatty and Rhyolite, Nevada.

Vancouver, Westminster & Yukon.—See Grand Trunk Pacific.

Wyoming Roads (Electric).—A franchise has been granted to W. J. Baker, President of the Northern Colorado Power Company, to build an electric line from Cheyenne, Wyo., northwest five miles to Fort Russell. Work to be begun by December.

RAILROAD CORPORATION NEWS.

American Light & Traction Company.—This company is offering to its stockholders for subscription at par $1,500,000 6 per cent. collateral notes payable in two, three or five years and convertible into either common or preferred stock at par.

Boston & Maine.—Results of operation for the year ended June 30, 1907, were as follows:

Gross earnings	$41,125,256	Inc.	$1,911,054
Operating expenses	30,968,397	"	1,615,029
Net earnings	$10,156,859	Inc.	$296,025
Other income	701,359	"	82,274
Gross income	$10,861,218	Inc.	$378,299
Interest, rental and taxes	8,233,237	Dec.	61,177
Net income	$2,627,981	Inc.	$439,776
Sinking fund payments	28,785	Dec.	107,500
Balance available for dividends	$2,599,196	Inc.	$547,276
Dividends of 7 per cent. on common and 6 per cent. on preferred	1,973,332	"	138,686
Additions and betterments charged to income	193,249	"	493,249
Surplus	$432,615	Dec.	$84,659

Central of Georgia.—The following committee has been appointed to protect the interests of the holders of the preference income bonds: C. Altschul, of Lazard Freres; R. Walter Levy, of Maitland, Coppell & Co., and Ernest Groesbeck, of Groesbeck & Co., all of New York; William Scott, of Scott & Stringfellow, Richmond, Va., and J. F. Minis, of Savannah, Ga. The bondholders contend that the company has earned the full 5 per cent. dividends on all three classes of these bonds, although the income account for the year ended June 30, 1907, shows only $33 surplus after paying 5 per cent. on the first incomes and 3.729 per cent. on the second incomes, nothing being paid on the third incomes. It is claimed that the earnings of the Ocean Steamship Co., a subsidiary of the Central of Georgia, should be used to help pay interest on the income bonds; also that about $263,000 should be charged to capital account instead of to income, and that $150,000 is being held to satisfy lumbermen's claims for overcharges in a case pending. This latter sum has been charged against earnings of the past year, although the case has been in the courts for the last three years.

Chicago, Rock Island & Pacific.—A quarterly dividend of 1¾ per cent. on the $74,854,100 capital stock has been declared payable October 1; this makes 5¼ per cent. paid so far this year. The rate in 1906 was 6 per cent., in 1905, 6¼ per cent., and in 1904, 8¼ per cent.

Colorado & Southern.—See Denver & Interurban.

Denver & Interurban.—This company, a subsidiary of the Colorado & Southern, has made a first mortgage to the Guaranty Trust Company, New York, securing an issue of $1,250,000 6 per cent. bonds of 1937. The road is under construction from Denver, Colo., to Louisville Junction, 16 miles, and will include two Colorado & Southern lines from that point to Boulder, each about 28 miles long, which are to be electrified.

Erie.—Results of operation for the year ended June 30, 1907, were as follows:

Miles operated	2,169	Inc.	18
Gross earnings	$53,914,827	"	$3,912,195
Operating expenses and taxes	38,167,039	"	2,294,202
Net earnings	$15,747,788	Inc.	$1,617,991
Other income	475,022	Dec.	62,275
Gross income	$16,222,810	Inc.	$1,555,712
Fixed charges	10,319,152	"	668,697
Net income	$5,903,658	Inc.	$887,015
Additions and improvements	1,642,029	Dec.	284,944
Balance available for dividends	$4,261,629	Inc.	$1,171,959
Dividends:			
4 per cent., 1st preferred	$1,915,696		
4 per cent., 2d preferred.	640,000		
	2,555,696		
Surplus	$1,705,933	Inc.	$1,171,959

Los Angeles Pacific (Electric).—It is understood that a mortgage for $20,000 has been made to the Southern Trust Company, Los Angeles, to secure an issue of that amount of bonds, of which $12,000,000 will be used to retire outstanding bonds and the remainder for improvements. The company owns 107 miles of road from Los Angeles to the Pacific ocean, with branches. The improvements include extensions, new rolling stock and power stations, and rock ballasting and relaying the whole line with 90-lb. ralls.

Michigan Central.—See St. Joseph, South Bend & Southern.

Ohio Electric Railways Company.—The capital stock of this company has been increased from $100,000 to $25,000,000, half of which is preferred. The dividend rate on the preferred stock is to be 2 per cent. in 1908, 3 per cent. in 1909, 4 per cent. in 1910, and 5 per cent. thereafter. The company is to be a merger of the Schoepf properties, including:—the Cincinnati Northern Traction, the Lima & Toledo Traction, the Indiana, Columbus & Eastern Traction, the Columbus, Buckeye Lake & Newark Traction, the Columbus, Newark & Zanesville Electric, the Dayton, Springfield & Urbana Electric, the Urbana, Bellefontaine & Northern, the Columbus, London & Springfield and the Columbus, Grove City and Southwestern. It is said that the new stock has been subscribed to by Cincinnati and New York interests and that the merger will be completed within two months.

St. Joseph, South Bend & Southern.—The regular semi-annual dividends of 2½ per cent. on the $250,000 preferred and 1 per cent. on the $500,000 common stock have been declared, and also an extra dividend of half of 1 per cent. on the common stock. The same extra dividend was declared in 1905, but not in 1906. The road runs from South Bend, Ind., to St. Joseph, Mich., 39 miles, and is operated by the Michigan Central.

Toledo Railway & Terminal.—According to the report of the Special Master, the recent foreclosure sale of this property brought $2,000,000. The principal and interest on the bonds, together with the expenses of the foreclosure proceedings, amounted to $3,865,921.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

Published Every Friday by The Railroad Gazette at 83 Fulton Street, New York
Branch Offices at 878 Old Colony Building, Chicago, and Queen Anne's Chambers, Westminster, London

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. Boardman, *Pres't. and Editor*
E. A. Simmons, *Vice-President*
Ray Morris, *Secretary*
R. S. Chisolm, *Treas.*
I. B. Rines, *Cashier*
L. B. Sherman, *Western Manager*

EDITORS:

Ray Morris, *Man'g Editor*
Braman B. Adams
Charles H. Fry
Rodney Hitt
George L. Fowler
Frank W. Kraeger
Hugh Rankin
Bradford Boardman

CONTENTS

Vol. XLIII., No. 11. Friday, September 13, 1907.

We reprint this week, by permission from the *Quarterly Journal of Economics*, a remarkable paper by Professor Mitchell, of the School of Commerce, Accounts and Finance, of New York University. The author has given a scholarly and thorough history of the Union Pacific and the growth of its financial operations, and has covered his subject far more fully than it has ever been covered before. In this period of rapid corporate expansion the story of the last ten years of Union Pacific development has been partially obscured by the multitude of other interesting events which have forced themselves upon the observer's attention. It is highly important therefore, that the salient facts of this development should be placed upon record, and we congratulate Professor Mitchell upon the manner in which he has performed the task.

The butting collision of electric cars near Charleston, Illinois, August 30, resulting in the death of 14 persons, is charged by a coroner's jury to the negligence of both motormen. As a number of passengers testified that there appeared to have been time for a material reduction of the speed of the passenger car, the motorman of that car may perhaps be justly blamable, for it is said that he, as well as the other motorman, jumped off without so much as turning off the power; but the other car—an express car, not a passenger car—was running on the time of the passenger car, and the real fault lies at the door of the man who was responsible for this irregular use of the track. A motorman may, indeed, be blameworthy for wasting a few seconds in an emergency, when he ought to apply brakes instantly, but as the ability to *save* seconds when one is facing danger is not an art that can be taught by the superintendent or prescribed by a court, it is puerile to talk of punishing by law a man who lacks such ability. The reports indicate that the superintendent or despatcher told the man in charge of the express car to keep out of the way of the passenger car, but failed to add that the passenger car was, on that day, on account of a fair, making round trips every 30 minutes instead of one in 45 minutes, as was customary. These instructions were given over the telephone line and were not written down. This collision will doubtless confirm in their objection to the telephone those railroad officers who hold that it is not a safe means of transmitting train orders; but it seems quite clear that the fault was not with the mode of communication, but with the failure to have orders written out, repeated and approved after repetition. Intrusting an order to one man (the motorman alone), instead of to two, appears also to be a fault of the system practiced on that road. In short, the same bad practices would have been almost or quite as easy with the Morse telegraph. It is not the telephone that has developed the weakness of the despatching system. The only safe system is the block system.*

W. A. Garrett, President of the Seaboard Air Line, acting as arbitrator in the matter of freight car service on the Long Island Railroad has decided that after November 1 the "switching reclaim" by which that short terminal railroad is now partly recompensed for the excessive cost and delay incident to moving freight on its Brooklyn lines shall be abolished; and that in place of it freight rates shall be readjusted so as to give that company $2.35 a car more than it now receives. This amount equals 50 cents a day for 4.7 days, which the records show to be the average time occupied by each loaded car moving in switching service on the Long Island tracks in the Greater New York district. This is an eminently wise decision. It is based on the only rational plan of adjusting the car service rate to the transportation rate. Car service rates must be as nearly uniform as possible in order to keep the clerical machinery of the car-record offices in working order. A sufficient number of exceptions to a uniform rule would cause the whole scheme to break down. And to be uniform the rate must necessarily be arbitrary. To base the car service rate either on the cost of the service or on what the traffic would bear, would result in almost as many rates as there are transactions; that is to say, scores or hundreds of different rates on the same car withiu the same year. The car service rate being arbitrary, the only way to make adjustments where it is burdensome is to increase the price for the work done by the cars. The only practicable and rational relief from the arbitrariness of the interchange car-service rate is for each of the roads participating in a joint service to furnish its fair share of the cars to be used in that service. Such an adjustment is not perfect, but it is the best that has yet been thought of. If a road cannot or does not furnish its share of the cars it is face to face with the problem of increasing its charge to shippers, if necessary, to compensate for the extra cost of doing business with hired cars. Mr. Garrett's decision is dated August 22, and is published in the September issue

*On the application of the two companies Judge Craig, at Mattoon, Ill., Sept. 5, appointed W. P. Avey receiver for the Central Illinois Traction Company and the Mattoon City Railway Company. It was on the Central Illinois line that the collision occurred, but the two companies are controlled by the same men and work together. E. A. Potter, of Mattoon and Chicago, is president of each line, and Judge Peter S. Grosscup, of the United States Circuit Court, is the principal stockholder in the two companies.

of the *Railway Equipment Register*. He was chosen by the Long Island Railroad and the General Managers' Association of New York City. The chairman of this association is Vice-President Besler of the Central of New Jersey, and the secretary is W. F. Allen. Mr. Garrett's decision is short and logical. He first shows that the Long Island Railroad participates in the through rate, and therefore should not be allowed a reclaim on freight cars. Reclaims have been allowed there for five years; but, according to the rule, they are intended only for cars which are switched by roads not participating in the joint freight rate. He then quotes from a statement of Chairman Hale that the reclaim, an arbitrary arrangement, is often unsatisfactory and always unscientific. Mr. Hale believes that "the day will come when all switching reclaims can be wiped out and the transportation rates revised to cover real terminal expenses." The New York, New Haven & Hartford delivers freight at Long Island City and the Long Island Railroad there accepts it and adds its own local rate. Why cannot other roads adopt this plan? But, whether they do or do not, the only way to settle this question and settle it right, is to do whatever is possible to carry out Mr. Hale's prediction; and that is the gist of Mr. Garrett's verdict.

The notice, which was given by the New York, New Haven & Hartford last June that it would withdraw from the Per Diem Rules Agreement October 1, was still in force at last accounts; and all efforts at a compromise on the rate to be charged for interchanged cars having been thus far fruitless, the western connections of the New Haven have given it notice that after the withdrawal becomes effective, freight for its lines will be received, transported and delivered as heretofore, unless declined by the New Haven company; but that on cars thus delivered to the New Haven road "you will be charged such sum per day as is reasonable for the use of each car for the period the same shall remain on your lines; and payment thereof will be insisted on accordingly." The committee appointed on behalf of the American Railway Association to negotiate with the New Haven consisted of Messrs. Atterbury, of the Pennsylvania; Smith, of the New York Central, and Hale of the Baltimore & Ohio. This committee suggested that the questions at issue be arbitrated, but the New Haven declined and made the alternative proposition that it should be allowed two days' reclaim, beginning October 1 and continuing until the road has received 8,500 new cars which it has ordered; after the receipt of these cars the other roads to accept a sufficient number of New Haven cars to equalize the per diem payments, this arrangement to continue for one year. The New Haven has ordered 17,000 cars to be delivered by May 1, next. The committee declined this proposition and proposed instead that the connecting roads agree to begin at once to equalize equipment on a monthly basis, leaving all questions concerning the per diem rate to arbitration. The New Haven road declined this, insisting that, until its new cars could be put in service, it was entitled to some compensation. The committee then suggested to the other roads the form of notice referred to above; and this form has been adopted, we understand, not only by all of the immediate connections of the New Haven but by a number of other roads as well. This notice seems eminently fair. These roads cannot take the responsibility of obstructing the enormous movement of traffic from the West to New England over the New Haven road by requiring the goods to be transferred at New York to New Haven cars, though under the circumstances they would have the technical right to do this. In offering to let cars go through for "a reasonable sum per day" they are giving the New Haven full opportunity to show, if it can, that fifty cents a day is exorbitant. But if the burden should lie on the New Haven (as we suppose it would) to prove any rate named by the car owners unreasonably high, the New Haven would have another aspect of the case to consider; for unless all signs fail cars will be worth at least a dollar a day within the next month or two—and perhaps much more than that

The public service commission of the state of New York has issued an official interpretation of the law relating to the inspection of locomotive boilers that went into effect on July 1. It is well that this should be done, for the wording of the law is such that an overzealous and ill-informed person in authority might easily interpret it in such a way that its execution would be a burden to the railroads, as well as an impossibility. The law says in substance that these boilers shall be thoroughly inspected once every three months. If a thorough inspection were to be understood to be the removal of tubes and an inspection of the inside as well as the outside of the shell, it would probably require at least twice as many engines as are now in use to meet the requirement. As it is, the commission simply requires that the boilers shall be washed out and the staybolts inspected in the time named, and that the thorough inside and outside inspection shall be made at least once in three years. As a matter of fact it will probably appear to most of the mechanical officers of the roads affected, that the regulations for the care and inspection of boilers that have just been issued, have been taken from their own regulations on the subject. There is not a single requirement that can work a hardship in any way and, with the exception of the method of keeping the records, there will be little, if any, change in the present workings. It looks as though these regulations had been compiled from the best of those current on all of the roads. In a few instances men will find that the time of inspection has been shortened. For example, it is required that "safety valves should be tested at least once every month, and no boiler must be used over three months under any circumstances unless the safety valves have been thoroughly tested." It often happens, at present, that safety valves are not inspected and tested between shoppings, but the engineman is required to report those that do not work properly, and this means a constant supervision of the matter. Another regulation is that gage cocks and glasses shall be cleansed whenever the boiler is washed. This is often neglected, and dependence is placed on the fact that they are working and nothing further is done. It is merely an additional precaution and will require but little time to meet. In this interpretation the commission has set the stamp of its approval on the use of the tell-tale hole in staybolts and made it a requirement that cannot be omitted unless the railroad company can show very good evidence that its methods of testing are so thorough as to obviate the necessity for such a precaution. This will probably result in the universal acceptance of the hole, in spite of the fact that some still consider it useless. In the same way the methods of testing staybolts are set forth, and as these are the methods followed in the majority of cases, it will probably lead to uniform practice in this respect also. With the exception of these minor matters, which are already embodied in the practice of some roads, there is nothing in the regulations that need do more than attract a passing notice. It looks very much as though somebody was pushed to it for a law to regulate the railroads, and so one was passed that might have been construed in such a way as to be a hardship, if a wise commission had not taken it in hand and simply set up good current practice, stamped it with the seal of official approval and sent word to the railroads that they were doing well, and that if they continued in the same way there would be no occasion for complaint.

THE NOISE NUISANCE.

With the return of the season of wide-open bedroom windows come renewed complaints of all kinds of noise nuisances, and the newspapers of the past two months have contained the usual editorials and local items on the subject. The railroads come in for at least their regular share of the growling, and in some cases an increased share, this because engines are larger and louder and more numerous and also, apparently, because engine runners are flagrantly careless in the use of whistles and bells. It would seem that in the great expansion of business many superintendents have promoted firemen more rapidly than they have trained them and instances are not wanting where the discipline of the runners of a given division appears to be poorer than it was five or ten years ago.

Complaints of noise reach railroad managers in an irregular stream and usually receive only intermittent attention; so that, like some other reforms which are regarded by everybody as of secondary importance, this reform makes only halting progress. And yet every superintendent is ashamed of his noisy engineers, whenever their slipshod conduct comes under his own personal notice, and if he happens to be out on the road in his private car, or in a sleeper at night, with members of his own family, or their friends, his shame leads to brave resolves to cure the nuisance. Why, therefore, should not there by an improvement? Surely the feelings or wishes of women and invalids residing near a freight yard, and doomed to stay there 24 hours a day, and especially if they be too poor to escape by moving to some other locality, ought to have as much consideration as those of people who are troubled only occasionally. Moreover, anything that is done in this line must be managed as for an all-the-year-round campaign. Sensitive ears suffer in winter as well as in summer. To make enginemen careful

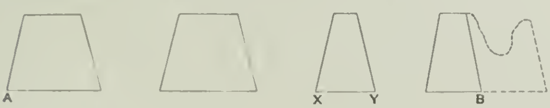
It is necessary to "surprise-check" their management of whistles, bells, air pumps and other noise producers twelve months in the year. A circular issued in the spring is not enough—is, in fact, not worth the cost of printing it, unless it is followed up by personal attention to the matter.

That the noise made by locomotives is as bad now as ever it has been before, seems a pretty safe assumption. Besides the weakness of discipline just mentioned, the increase in the size of engines and of air pumps, and in the number of trains run, helps to swell the total volume of noise. (Air pumps are often allowed to make a great deal of unnecessary noise in train sheds.) The abolition of crossing whistles where grade crossings have been done away with appears to be the only important exception to this statement. But whether the nuisance is larger or smaller it demands abatement to the fullest possible extent.

The noise made by locomotives is often great enough to be a nuisance even after everything possible has been done to lessen it, and this is the real reason why some railroad officers neglect their duty regarding it, but it is not a good reason. Following this line of argument, we should not subdue bells and pop valves around sleeping cars at night. In point of fact the respect shown for the rights of sleeping passengers is the best example we have of rational and restrained use of locomotives and their whistles and bells, and all that a superintendent needs to do, in most cases, is to enforce as good a degree of care at other times and places as he does in this particular.

The problem, therefore, is simple and we have no editorial exhortation to offer. The manager who has many engines, or even a single sleeping car, and who keeps in close touch with his road knows whether or not his passengers and his (the railroad's) neighbors are accorded as considerate treatment as he would like to have accorded to his own family. But we do wish to set forth a few flagrant instances. Some superintendents evidently do not know how great a nuisance some of their enginemen are, or else don't care. In a recent hundred mile trip on a fast train of one of the best trunk lines, the writer rode in a coach next to the engine; and, with the other passengers, was forced to listen to four long ear-piercing shrieks of the whistle at every crossing; and there were somewhere from 20 to 50 crossings. The whistle blasts were not only twice as loud and four times as long as was necessary, but were also of all sorts of lengths. The engine driver was one of those unsensitive, unmusical men who seem to have no delicate idea of time and who therefore make — ——— ——— —— and other combinations for —— —— — — with as cheerful persistency as though they were eliciting applause at every repetition.

Another experience that compelled a poor opinion of the railroad superintendent was that at a summer resort near the main line of an important railroad in Massachusetts. Although a mile from the track, outrageous whistling of the freight locomotives was noticeable day and night, particularly in the early morning and late at night. The needlessly large size of the whistles on the engines and the carelessness of the enginemen, were equally annoying. The excess, both in volume and length of sounds, may be approximately indicated by the accompanying diagrams. In both



diagrams the horizontal measurement represents time and the vertical measurement represents volume of sound. Both diagrams are designed to show two long blasts followed by two short ones, the usual whistle signal for a highway crossing. The smaller one represents the signal as given on an ordinary whistle in about two seconds' time (A B—2 seconds); the larger shows how it was usually made on these engines (A B—9 seconds), by runners who had no thought of the comfort of residents along the line, sick or well, old or young, asleep or awake. Eight or nine seconds was a common length of the crossing signal. Often they would take more time than that. Most of them, like the runner before mentioned, took little care to graduate the length of the blast according to the rule. One runner, apparently wishing to indulge his fancy or to distinguish himself by something that would seem prettily characteristic would put a flourish on at the end [illegible] what is indicated by the dotted line in the larger drawing. [illegible] at night the whistle of a passenger train—[illegible] as the whistles on the freight—was sounded continuously for about 12 or 15 seconds.

The remedy for such slovenly work, as we have [illegible], is obvious. The main question is as to how earnestly the division superintendent desires to apply it. As every energetic superintendent makes an improvement in this matter when complaint is made by his wife's sister, or by some cousin of the president of the road, it would seem to be the part of wisdom for ordinary citizens or boards of aldermen who desire to secure action, to enlist the co-operation of such relatives; or else to try to imitate their method—which is nothing more than direct appeal, persistently repeated as many times as may be necessary. It is quite certain that a city council cannot make much headway by passing ordinances, unless it is prepared to forbid all whistling; for where any at all is to be permitted it is necessary that the enginemen exercise their judgment, and defective judgment can rarely be corrected by ordinance. There is, however, one way in which city authorities can do some good, and that is by publicly recognizing the sufficiency of bells and the non-necessity of whistles, where the circumstances warrant taking such a stand. The laws of some of the states—notably Massachusetts and New York—require as a signal at highway crossings the sounding of either the whistle or the bell, but do not require both. The persistent use of the whistle, everywhere, to-day, after experience has demonstrated in so many situations the sufficiency of the bell alone, is due largely to the feeling among railroad officers that they must do more than the law requires of them. Innumerable law-suits have resulted in awards of damages to persons injured at crossings who failed to heed a reasonably loud warning, and the railroad officer in such cases has naturally determined to clear his own skirts for the future by having all warnings made unreasonably loud. He persists in this until the noise becomes intolerable to himself, unless some state or municipal authority publicly approves of an abatement of his zeal.

The most obvious lack in the remedial measures usually adopted by superintendents is their neglect to clinch their instructions. To actually effect the reasonable limitation of the use of whistles it is necessary not only to issue to enginemen an order—which will be obeyed for a short time by nearly all and thereafter by only a few—but to tell them how to carry it out and then watch and see how well they obey. Proper lengths of blasts can be put in force only by a regular teaching process. On the Fitchburg road a dozen years ago an electric buzzer was used by the instructor and men were taught by example—not by circular—that the highway crossing signal could and should be made in 2½ seconds; and at the same time they were shown that "two-long-and-two-short," meant what it said, and that four blasts of irregular lengths—with occasional two-second intervals between blasts—did not come within a mile of complying with the rule. Unfortunately, that Fitchburg superintendent went "higher up" and his graduates seem to have all died and to have left no successors. That buzzer, with the right kind of a man back of it, is needed to-day in five hundred trainmasters' offices.

Two other simple things might be done. Most locomotive whistles will give an adequate signal for a crossing, or for almost any purpose, if opened only half way. It would be easy to arrange the whistle-pull so that ordinarily it would give only a soft blast, while yet leaving the engineman free, by a more energetic movement, to pull the valve wide open. Or, a single rod or lever could be made to sound a soft and mild whistle and then, by a further stroke, to sound an additional whistle, doubling the volume of sound.

The second point is to give premiums. One of the most satisfactory details of American railroad operation is the payment of prizes in the roadway department, with the emulation and excellence thereby secured; why should not this advantage be secured in other departments? A good record in noiselessness is hard to define, in giving instructions or advice to an engineman; but with a proper incentive he will very readily define it to himself. Premiums are peculiarly adapted to secure excellence in matters which cannot be suitably described in written orders. Where good service depends, not on an improvement of knowledge or skill, but on a more lively motive, a premium is often the best or only means available. As may be noted by observing the movements of engines in any busy train shed after 10 o'clock at night, the maintenance

of a tolerable degree of quiet depends on a number of other things besides the right use of whistles; and a premium covers these other features of the problem as nothing else will. By first giving a premium—or good pay—to others to report careless or noise-loving enginemen, premiums to enginemen for clean records could be made to work an improvement in a very short time. Of course, we are not considering train sheds, or cities, particularly. Many long-suffering country people deserve to have their rights recognized.

NEW PUBLICATIONS.

Allowable Pressures on Deep Foundations. By E. L. Corthell. New York: 1907: John Wiley & Sons. Cloth, 98 pages and tables. Price, $1.25.

This book is a reprint of a paper read before the Institute of Civil Engineers, London, in 1906, which was prepared after the author had made a study of foundation pressures in connection with harbor improvement work at Rozario, Argentine Republic, in 1902-1903. The allowable pressures on the footings of a proposed quay wall resting on the tertiary sand in the bed of the Paraná river were under consideration by the advisory board of engineers of which the writer was chairman, and wide differences of opinion arising, an investigation of recent practice in this detail of design was begun. The data, obtained through circular letters to prominent engineers all over the world and from articles in the technical press, were compiled in the form of brief descriptions of important works and in a long table giving the essential details of practice. This work was done under the direction of Mr. Corthell, by C. R. Wychoff, Jr., of Columbia University. The appendix contains brief descriptions of 54 engineering structures involving deep foundation work. In the table, the data for 178 structures has been collected. The pressures per sq. ft. safely employed in different soils as shown by the tables are as follows: Fine sand, from 2.25 tons to 5.80 tons, average 4.50 tons; coarse sand and gravel, from 2.40 tons to 7.75 tons, average 5.1 tons; sand and clay, from 2.5 tons to 8.5 tons, average 4.9 tons; alluvium and silt, from 1.5 tons to 6.2 tons, average 2.9 tons; hard clay, from 2.0 tons to 8.0 tons, average 5.08 tons; hard pan, from 3.0 tons to 12.0 tons, average 8.7 tons. The average pressures given above are low and safe pressures lie somewhere between the average pressures and the maximum pressure in each case.

The Bond Buyer's Dictionary. Edited by S. A. Nelson; 1907 edition. 174 pages; 5 x 7¼ in.; cloth. Price, $2.00. S. A. Nelson & Co., Inc., 116 Nassau street, New York.

This is a compilation of facts and opinions about bonds of various sorts which Mr. Nelson has been seven years in collecting. It is largely made up of extracts from papers like the *Wall Street Journal* and the *Railroad Gazette*, and from articles by various men who are authorities on financial matters. There is little original work in it except in the editing and combination of these various materials. The book is divided into seven parts, as follows: Government Bonds; Municipal Bonds; Railroad Bonds; Real Estate Mortgage Bonds; Industrial and Public Service Bonds; Underwriting and Distributing Bonds. The most important of these is the section on Railroad Bonds. These are described under a great number of different heads which are generally in no special way related, but each a brief summary of information on one point. The book is well worth reading for any one who does not understand the principles of bond issues and bond investments, and it is a convenient collection and summary of information for all who are interested in bonds.

Self Propelled Vehicles. By James E. Homans. New York: Theo. Audel & Co. Cloth, 644 pages.

The automobile is a complex machine and to the layman difficult to understand in its workings. The multiplicity of details and the difficulty of clearly explaining in language as non-technical as possible the construction and operation of many of them make the writing of a layman's text book no easy task. The author of this book has succeeded well, however. With the aid of more than 500 illustrations and diagrams, the essential details of steam, electric and gasolene automobiles are described in simple language, easily understood. Some of the best known makes of machines are described as a whole, together with the method of operating them. One of the most interesting chapters is on the history of self-propelled vehicles from the time of Cugnot's steam wagon in 1770 down to the practical application of the high-speed gasolene motor about 1885 by Gottlieb Daimler. The book will be found particularly useful to owners of automobiles and prospective purchasers.

On the Art of Cutting Metals, by Frederick W. Taylor, M.E., Sc.D., which was the Presidential address presented at the last annual meeting of The American Society of Mechanical Engineers, has been reprinted and bound in cloth by the society, price $3. This or any other publication of the society may be had by addressing the Secretary, 29 West 39th street, New York. It is not necessary to send orders through members. None of the publications of The American Society of Mechanical Engineers are copyrighted.

A Theory Concerning the Cause of the Quebec Bridge Failure.

Chicago, Sept. 7, 1907.

To the Editor of the Railroad Gazette:

The accounts which have been published of the failure of the Quebec bridge generally refer to the slightly buckled condition of one of the lower chord members of the anchor span in the third panel out from the main post, the impression given being that this condition was the initial cause of the failure. There is no evidence to support this, other than that the member ultimately failed. To be sure this member shows evidence of being crippled by an extraordinary load, and there is no doubt that all of the members in the anchor arm were subjected to the same conditions at the instant of failure, but it so happened that this member had an initial distortion, so that at the instant of failure it absorbed the bulk of the great dynamic energy of the falling cantilever arm. The fact that the structure, as a whole, dropped vertically, points to other causes for failure than the collapse of a single member in one truss.

In all cantilever bridges with curved chords, during the process of erecting the bridge an anomalous condition arises with regard to the web members when the traveler stands out on the end of the cantilever arm. Similar conditions may arise in a finished structure, but in the Quebec bridge, at the time of the failure, this condition was intensified by the presence of two travelers on the end of the cantilever arm, and at the same time a large part of the fixed load in the floor was omitted. In other words, the condition of the loading which produces large pier moments with comparatively small shearing forces, in a cantilever arm with curved chords, develops a very critical condition in the web members near the tower unless these members are qualified to resist either tension or compression.

In the Quebec bridge, beginning at the tower, the first diagonal web member on each side of the tower is a stiff member. The remaining diagonal members to the end of the cantilever arm are purely tension members. What point is the criterion of these members for the condition existing at the time of the failure? To be sure, the designer of this bridge made a stress diagram for the conditions covering the erection of this structure, but were those conditions faithfully carried out? Did he provide for one traveler or two travelers on the bridge at the same time? Did he assume the distribution of the fixed loads correctly? Were the shipping weights of the finished members the same as the calculated weights, within reasonable limits? All these things and many more militate against him, and unless he fully appreciates the gravity of the case he will go astray. Now, what can happen if all this is not provided for? If the stress diagram shows a member near the tower just at the point of turning from tension to compression, or neutral, this member is in a very critical condition when the chords have an extreme curvature. Any departure from the loading assumed, especially at the criterion, works for or against him as the load is increased or diminished at that point. Any slight deviation may mean failure in case the member under consideration is not capable of resisting either tension or compression.

Now, what can happen in case the load on a web member is such that it cannot resist? If the member is an eye-bar and the load is compression, the member will shirk its duty and allow the bottom-chord joint to rise. This will occur simultaneously in both trusses, bringing a bending action on the chord sections, and thereby delaying momentarily the fall until they finally yield and allow the arm to drop. At the same time the tower posts will be pushed in at the bottom and pulled out at the top, dragging the anchor arm with them, so that the top chord eye-bars will be strung out on top of everything else, just as shown in the views published. To be sure, the anchor arm collapsed, but at the same time it was dragged forward, as is clearly shown by the fact that the portal now lies midway between the anchorage and the main pier where the top chord eye-bars begin.

All this argument can be answered by the designer of the bridge, who has all the data at hand, and the writer suggests that he publish a stress diagram giving the stresses in the cantilever arms to correspond as nearly as possible to the conditions existing at the time of the failure of the bridge.

J. W. SCHLAUR,
M. Am. Soc. C. E.

Which Is the Best Electric Railroad System?

New York, Sept. 9, 1907.

To the Editor of the Railroad Gazette:

Electrification is a very actual question for many railroads, and electrical engineers in general are enthusiastic in stating what electricity can do. But they have of late been talking almost too much about the advantages which one particular electric system is supposed to possess as compared with all other systems. And in view of the many widely different statements made in this connection, it is difficult for the average railroad man to form an opinion

concerning the advisability of using electricity as motive power on his road. The following is written as an attempt to assist in understanding the differences, real and imaginary, between the three rival electric railroad systems.

With few exceptions electrical engineers are distinctly given to praising their pet system as being by far the best for every purpose, and all other systems they consider impracticable, or at least uneconomical and otherwise defective. Now, the fact of the matter is, that each system has distinct advantages and disadvantages. It all depends on the viewpoint chosen. Indeed, it is very easy to prepare hypothetical cases in order to show that under certain conditions one particular system is far superior to everything else. But it is a distinct mistake to judge from such a demonstration that the particular system is the best for all railroad purposes. It is, on the contrary, an absolute requirement that each electrification problem be studied on its own merits, and that system should be adopted which best meets the special conditions under consideration. There is no such thing as a universal electric system, but an analysis of the entire electric railroad problem will give some idea as to the greater or lesser fitness of the various systems for certain different classes of service. Let us therefore first look at the foundation of the matter.

It is probably admitted to-day that it is possible to build electric locomotives to handle any traffic now handled by steam locomotives. But where does the use of electricity as motive power begin to be profitable? This seems to be quite distinctly a question of adequate return on first cost of installation.

On steam railroads the motive power equipment is concentrated in the locomotives. On an electric railroad it comprises three distinct parts—the electric power house, the conductors along the line and the locomotives. Take any railroad now operated by steam locomotives and the first cost of an electric equipment suitable for handling the same traffic will be in the great majority of cases in excess of the first cost of the present steam equipment.

Nevertheless, the use of electricity as motive power is justified in all cases where either one or all of the following conditions are fulfilled. First, where governmental action, or the willingness of passengers to pay more for electric traction, make electrification imperative or advisable; second, where the increase in traffic capacity, due to electric locomotives, makes up for the increased fixed charges on the larger investment; third, where the savings effected by electric operation are in excess of the increased fixed charges.

The first condition is exceptional and needs here no special consideration. The second condition is fulfilled on all those roads where the traffic density is nearing the limit of what can economically be handled with steam locomotives. In these cases the greater acceleration and the higher running speeds feasible with electric locomotives will make it possible to handle from 30 to 50 per cent. more traffic without adding new tracks, and the additional investment for electric equipment is generally only a fraction of what new tracks would cost. The third condition is found principally on roads with comparatively heavy grades, or with other features limiting the useful output of the steam locomotives. The greater power of the electric locomotives will make it possible to run trains over grades at the same speeds as on the level, without the use of pushers, and the savings thus effected, together with the savings due to smaller maintenance costs of electric locomotives will frequently much more than counterbalance the new fixed charges due to additional investment.

In many cases, for instance, where grade reductions are contemplated to increase the traffic capacity of any given line, two or more conditions are found together, and in such cases the use of the more powerful electric locomotives will not alone decrease operating expenses materially, but will also save the entire new investment for reducing the grades. The electric equipment will thus pay for itself over and over again.

The general problem of trunk line electrification is therefore quite distinctly the problem of finding the most powerful locomotive. Through increase in tractive power of locomotives it is possible to increase the traffic capacity of the road, or decrease the operating expenses, or both.

Now, let us see how the various electric traction systems meet this condition. There are three distinct systems: First, the well-known continuous current system, introduced into practice by the Grand Master of Electric Traction, Frank J. Sprague, on the historical Richmond road over twenty years ago, and since then successfully used on many thousands of miles of road and more recently for the important electrification work of the New York Central's New York City terminal; second, the single-phase alternating current system, brought out about five years ago by B. G. Lamme, installed during the last few years on a number of interesting interurban railroads and exemplified for the heavier work by the equipment which the New York, New Haven & Hartford has just put in service on a first section of its line between New York City and Stamford, Conn.; third, the three-phase alternating current system, thus far not well enough known in America, but successfully used in Europe for the past fifteen years, among other places for the well-known high-speed tests between Berlin and Zossen and for a recent heavy electrifications, the Simplon Tunnel, the Giovi line near Genoa, and others, the first American installation of this system being the equipment of the Cascade Division of the Great Northern now in course of construction. Each of these three rival systems comprises the three parts of the motive power equipment mentioned above—namely, the electric power house, the conductors along the line and the locomotives. In a comparison of the systems it is feasible to take up one of the parts after the other.

First the power house. With the distances to be covered in trunk line work and the amounts of power involved, it is indispensable that the power house be arranged to produce electricity at high pressures. In the continuous current system it is possible to employ several power houses along the line, each producing continuous currents at pressures up to, say 2,000 volts or somewhat more. But in general this does not prove advantageous, and the usual practice in all three systems is to have a central power house generating three-phase alternating currents at reasonably high pressures, up to, say 50,000 or 60,000 volts, according to the distance to be covered, which high pressure three-phase currents are then transformed for use on the locomotives into low-pressure currents, continuous or single-phase or three-phase, as the case may be. The size of the power house depends, above all, on the amount of energy required at the axles of the locomotives throughout the day; that is, on the weight, number and distribution of trains, on the speed at which they are moved, and on the grades they have to overcome, but furthermore also on the efficiency with which the electric energy is transmitted to the locomotives, and by them transformed into mechanical energy for the purpose of turning the wheels. As regards energy required at the axles, the three systems are pretty nearly on a par, though special conditions, such, for instance, as the use of energy made free on trains descending a grade, may sometimes favor one system over the other. On the question of efficiency of transmission much has been said and written, but not much actual data is thus far at hand. On comparatively short lines, up to, say 20 miles long, the single-phase and the three-phase alternating current systems can feed the locomotives direct from one central power house without the use of sub-stations. In such cases they are almost unquestionably more efficient than the continuous current system, which must of necessity use either sub-stations or else several smaller power houses to cover the same ground. But a very careful investigation into this matter leads me to believe that under ordinary conditions the total efficiency of the three systems is not much different, though the losses occur in each one at different points. Generally speaking the three systems may therefore be assumed to call under similar conditions for power houses of approximately the same size and approximately the same first cost.

Coming to conductors along the line, we find greater differences between the three systems. By conductors we shall understand all that is required to conduct the energy from the power house to the locomotives. To collect, say 2,000 h.p., with 2,000 volts continuous current pressure, means the handling of about 700 amperes. With 5,000 volts single-phase alternating current or 3,000 volts three-phase alternating current it means the handling of about 300 amperes. A pressure of 2,000 volts is pretty close to the upper limit for continuous current operation, while 5,000 volts is not by any means the limit for alternating current operation. The collection of anything above, say 300 amperes from an overhead line at railroad speeds, creates difficulties. It is therefore easy to see that for heavy work the continuous current system will probably be forced to use a third rail, while the single-phase and three-phase alternating current systems can use overhead wires or third rail as may best suit the conditions. For a given current density the pressure of the single-phase system has to be 1.73 times the pressure of the three-phase system. On long roads, or wherever the pressure generated in the power house differs from the pressure used in the locomotives, sub-stations are necessary. The two alternating current systems use stationary transformer sub-stations to change from high pressure to low pressure alternating currents. The continuous current system has to use rotary converter or motor generator sub-stations to convert the high-pressure alternating currents into low-pressure continuous currents. Converter sub-stations are unquestionably more expensive than stationary transformer sub-stations. The costs of first-class third rail and overhead wire installations are taken by the best authorities as being pretty nearly equal, perhaps with a slight advantage in favor of third rail. We find, therefore, that on short roads, where sub-stations are unnecessary, the first cost of the conductors along the line may be taken as being almost the same for the three systems. On longer roads, where sub-stations are required, the cost of the conducting system between power house and locomotive becomes more expensive for the continuous current as compared with the two alternating current systems, and, on account of the higher pressure required, probably also more expensive for the single-phase as compared with the three-phase system.

Coming to the locomotives, we find very material differences between the various systems. Take as examples of each kind, the New York Central continuous current locomotive, the New York,

New Haven & Hartford single-phase alternating current locomotive and the Italian Simplon three-phase alternating current locomotive. Designed and built at pretty nearly the same time and for very similar service, they may well be directly compared with one another. They are similar in that all three weigh about 95 tons and have their axles direct driven by the electric motors without any intermediary gearing. But there the similarity ends. The New York Central locomotive has four continuous current motors of 550 h.p. each, or a total of 2,200 h.p. The New York, New Haven & Hartford locomotive has four single-phase alternating current motors of 250 h.p. each, or a total of 1,000 h.p. The Simplon locomotive has two three-phase alternating current motors of 1,500 h.p. each, or a total of 3,000 h.p. The above ratings of the motors are based on the standard one hour test, accepted by electrical engineers as giving probably the fairest basis of comparison; in other words, the motors are capable of exerting the output mentioned above for one hour continuously without heating any of their parts more than 75 deg. C., which is considered a reasonable temperature for railroad motors. For short periods all of the three locomotives will be able to exert very much larger powers, the maximum output of the continuous current motors being probably about 4,000 h.p., that of the single-phase alternating current motors about 2,000 h.p. and that of the three-phase alternating current motors about 8,000 h.p. The continuous current and the single-phase alternating current motors are of the so-called "Series" type, their speed varying in inverse proportion to the load, being a maximum with light loads and dropping off as the load increases. The three-phase alternating current motors are of the so-called "Synchronous" type, and will run at any desired speed, it being immaterial whether the load increases or decreases. This may be an advantage or a disadvantage according to conditions. Structurally there is this to be said about the three types of motors. For light traffic they are probably equally reliable. For handling very heavy trains, the single-phase alternating current motor is open to objections, because its inherent characteristics make it impossible for the single-phase alternating current motor to exert while standing still a long and steady pull without serious injury to its winding. The single-phase alternating current locomotive is therefore exposed to danger if called upon to hold a heavy train on a grade or to start a train from rest in cold weather, etc. The three-phase alternating current motor is unquestionably the most robust of the three, and the entire absence of any commutators in the three-phase motor will undoubtedly be highly appreciated by all who know what it costs to maintain commutators in railroad service. But, aside from the above-mentioned limitations of the single-phase motors, it may be said that either type of electric locomotive is to-day probably at least as reliable and accident-proof as a steam locomotive. At any rate the companies manufacturing electric locomotives are strong enough to back up any guarantees they may care to give to that effect. The efficiencies of the three types of motors will probably be pretty nearly the same in general service. The continuous current motors will likely show a somewhat better efficiency where trains make frequent stops, as is the case in suburban passenger service. On the other hand, the three-phase alternating current motors will unquestionably be the most efficient for heavy grade work, because they automatically recuperate the energy made free by the trains going down grade. When the weight of locomotives is compared with the output, we find the following: Based on the one hour rating the continuous current locomotive produces 23.2 h.p. for each ton of locomotive weight, the single-phase alternating current locomotive 10.5 h.p. and the three-phase alternating current locomotive 31.5 h.p. The weight efficiency of the three types is therefore very materially different and, inasmuch as the cost is closely proportional to the weight, the same amount of locomotive power will cost most in the single-phase alternating current locomotive, less in the continuous current locomotive, and least in the three-phase alternating current locomotive, more or less in the above proportion of weights per horse power.

Having thus investigated the characteristics of the three parts comprised in any electric system, we are now in a position to judge with greater accuracy what are the chances of the three rival systems for adoption in heavy electric traction work. I repeat, it is dangerous to generalize and each case must of necessity be treated individually and in great detail. Yet it is quite permissible to draw the few general conclusions which follow:

As regards power house there is a slight advantage with the continuous current system for very short lines, and with the single-phase and the three-phase alternating current systems for medium and long lines.

As regards conductors the three systems are fairly equal for the short lines, and there is an advantage with the single-phase and the three-phase alternating current systems for medium and long lines.

As regards locomotives the three systems are equal for light trains and long runs over a fairly level profile. For heavy trains the advantages are with the continuous current and the three-phase alternating curent system. For frequent stops the advantages are with the continuous current system. For grade work the advantages are with the three-phase system.

The comparisons are admittedly crude. But they seem to confirm pretty plainly the general opinion that the particular field of the continuous current system is short distance work, both heavy and light, freight and passenger. The field of the single-phase alternating current system is long distance work of the lighter kind, such as interurban passenger service. The long distance heavy work, or the real trunk line work, is quite plainly the field of the three-phase alternating current system, both from the cost standpoint and because the three-phase system has the most powerful locomotive.

It is, of course, up to the engineer to decide whether any given road may justly be classified in one of these three categories, or whether it belongs to two or more or them at the same time. In the latter event the advantages presented by one system for part of the service may be more than counterbalanced by the advantages presented by some other system for the rest of the service. A careful and detailed investigation, considering all of the points involved, will usually bring out very plainly the system which presents the greatest advantages all around.

In any case it is well to remember that the differences between the three systems are, after all, not fundamental, but rather differences in details, just as an electric power house can be built to generate electricity by the use of a reciprocating engine, a steam turbine or a gas engine, and, aside from the differences in unit costs, the results will be pretty nearly the same in either case. It might be well, therefore, to close these lines with a word of admonition to electrical engineers in general, not to fight too much among themselves on the question of which system is the best, but rather to concentrate their forces on the supplying of general data on the electrification problem as such, so that we may all see the day brought nearer when electricity will be used as motive power on every road where it should be thus employed.

Of Muralt & Co., Engineers, 114 Liberty St., New York.

A Detachable Voucher Draft.

BY FRANK H. CRUMP,
Assistant to the Auditor; San Pedro, Los Angeles & Salt Lake Railroad.

The present voucher draft used in settlement of accounts is objectionable for several reasons. It contains one or more awkward folds. When a large account is stated in detail one or more sheets are added, which makes a cumbersome document to pass through the banks and gives information about quantities and prices which it is sometimes not desirable to make public. The voucher draft, a drawing of which is shown herewith, has been designed in order to overcome these objections. The upper two divisions of this drawing show the statement of account and the detachable draft. The lower part of the drawing shows the bottom of the duplicate sheet which goes to the auditor. The rest of this duplicate sheet, which is concealed by the statement of account and the draft, is similar to the statement of account and is blank in the space covered by the draft. The triplicate sheet is the same as the duplicate sheet.

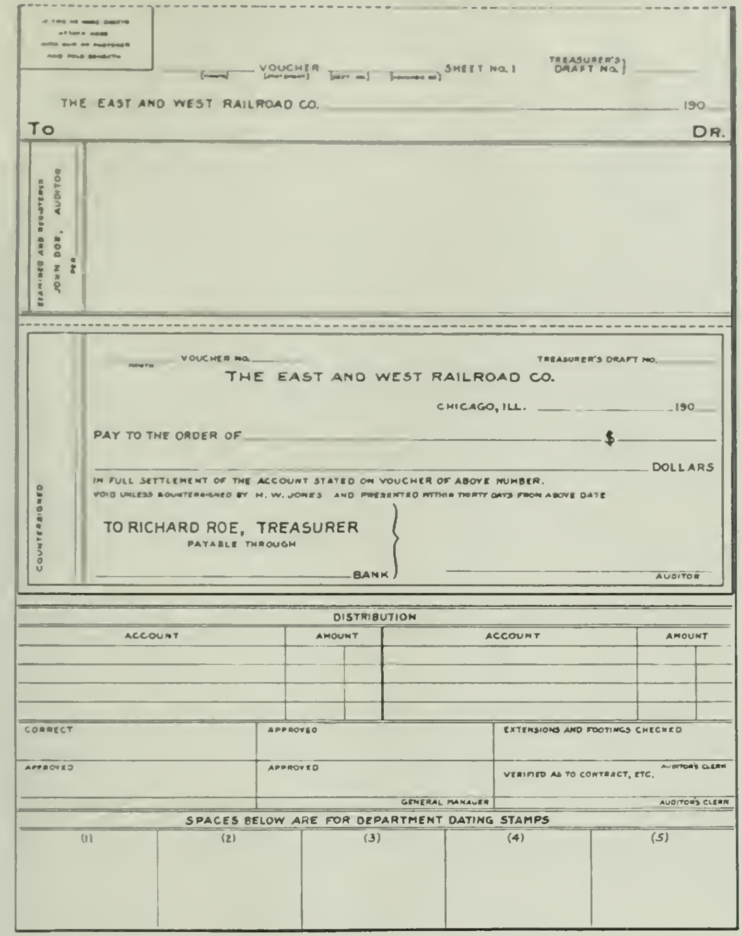
It will be noted that the original is perforated between the draft and the voucher statement, which are to be torn apart by the payor before mailing them both to the payee. On receipt of these documents the payee checks the voucher statement with his records and retains it for future reference. The draft is then deposited for collection. Under this method the banks handle a standard form of draft without any papers attached, and the statement of account, containing one or more sheets, remains with the payee. This idea of making a draft detachable is entirely new.

Many railroad companies have refused to adopt the ordinary form of voucher draft because it is likely to give disinterested persons unnecessary information. As a substitute the ordinary voucher requiring the receipt of the payee is most commonly used. This is sometimes paid by a bank check or where the information shown on the voucher is unimportant, made a sight draft by the use of a rubber stamp, reading as follows:

When properly receipted this voucher
becomes a sight draft, payable through
..... Bank.

In the first case, where payment is made by check, the bank handles the check only, but the payee has to endorse the check and also receipt the voucher. The latter the payee frequently fails to do, until a special request is made by the payor, and in many cases the original voucher is lost and duplicates are prepared and receipted. In some cases the payee cannot be located and the bank check remains as the only receipt in the hands of the payor. When vouchers are made sight drafts by a rubber stamp, it is necessary for the banks to open and examine them very carefully, and for that reason this form of voucher draft is objectionable. The new form of voucher draft can be freely used in payment of all accounts without disclosing information as to price details. Assignments, releases, contracts, deeds, agreements, etc., can be signed in the usual way and reference to them shown on the voucher statement.

As it is impracticable to show full detailed information on every



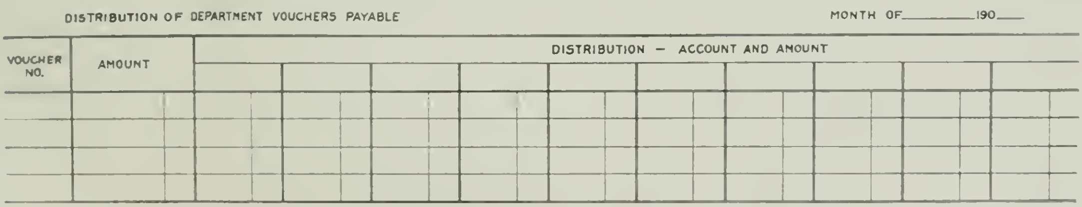
A Detachable Voucher Draft.

Original form and lower part of duplicate form are shown.

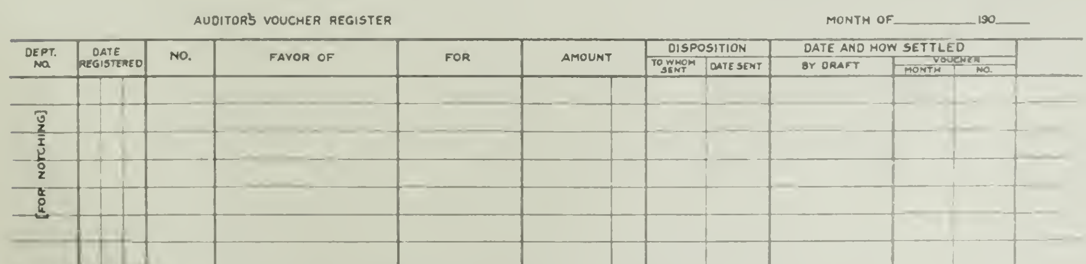
voucher [illegible] the invoice date or n[illegible] identifying the account wh[illegible] pays. The [illegible] voucher statement [illegible] way. The draft refers to the n[illegible] voucher which contain[illegible] account. The draft states explicitly that the money is received "in full settlement of the account stated on voucher of above number," thus connecting the instrument by which payment is made, with the account whose payment it covers. This is the essential feature of the new form.

At first this may seem to be a good deal of a departure from the present practice, but a moment's thought will convince under the present system when there are too many accounts to be listed on a single sheet, two or more voucher sheets are used, the total being carried forward. In such cases the receipt or draft portion on the additional voucher sheets is canceled or cut off. The receipt or draft which is used reads "In full settlement of the account stated above," when, as a matter of fact, the account is only *partially stated above*, the rest of the account being stated on a separate sheet or sheets. In the detachable voucher form the principle of identification by a number has been applied to all accounts. The account is stated on one document and the draft in payment of the account on another document, each referring to the other. The bank endorsements fully protect the payor on all drafts paid through the banks, and proper endorsement is secured on all drafts paid in cash.

In using the detachable voucher draft the department preparing the voucher fills in on a typewriter the voucher number, payee and account on the upper part, and the voucher number, payee and, in figures and in writing, the amount on the lower part. The stenographer, without removing the voucher from the machine, inserts the distribution of the expenditure in the space provided on the duplicate in plain view of all who handle the voucher. The voucher is then press-copied, which sets the ink and prevents alteration of the number, payee and amount on the statement of account and also on the draft. When designed, a triplicate copy may at the same time be made for the department pre-



Auditor's Record of Distribution of Voucher Payments.



Auditor's Register of Vouchers Paid by Detachable Voucher Draft.

paring the voucher, the duplicate being forwarded to the auditor.

The original voucher is folded over the duplicate, to which are attached all supporting papers, making a compact document which may be quickly handled by officials whose signatures of approval appear on the duplicate as the auditor's authority for payment of the account. When vouchers pass through two or more departments, the department dating stamp, which is usually shown on the back of vouchers, is on this form shown on the *face* in department order.

When the voucher reaches the auditor it is verified and registered and the signatures of the clerks who perform these duties shown in space provided. The draft is then signed by the auditor and the original voucher and draft are detached and forwarded to the treasurer.

When the treasurer is ready to pay the account the draft is numbered, dated and the name of the bank on which it is drawn inserted. The draft is then countersigned by the treasurer, cashier, teller or other authorized official. The draft portion should then be detached from the statement of account and *both* mailed to the payee. When the draft is returned through the bank paid, a bank check should be given to cover the drafts presented each day. This method of paying vouchers materially reduces and simplifies the work of the disbursing office.

The forms used for the records kept by the auditor in using detachable voucher drafts are shown herewith. The auditor's register of vouchers payable should be kept by departments, as shown on this form. The sheets should be printed on one side only, bound on the right-hand margin and notched on the left-hand margin for department number.

A separate sheet should be used for each department's vouchers, and all vouchers entered in numerical department number order, which should also be the auditor's number. Each department should keep each month's account separate and begin each month's vouchers with number "1." Each department should be assigned a department number to be used in connection with the voucher number. For example, if the store department has department number 1, all vouchers issued by that department should be numbered 1—1, 1—2, etc.

The auditor's record of the distribution of department vouchers payable is also shown. This is made up by each department which issues vouchers. This method puts each department in close touch with its own expenses and saves the auditor the labor of making a voucher distribution.

The distribution furnished by each department should be verified by the auditor with the distribution shown on each voucher, and balanced with the total vouchers issued by each department, as shown on the register of vouchers payable. As vouchers are paid, the date on which each is paid should be stamped in the column provided and at the close of the month a detailed statement made of vouchers still unpaid, which should agree with the balance "vouchers payable" on the general ledger.

The Traveling Engineers' Association Convention.

The Traveling Engineers' Association held its fifteenth annual convention at the Auditorium Hotel, Chicago, September 3 to 6, inclusive, President W. J. Hurley (N. Y. C.) in the chair. The association was welcomed by E. J. Brundage, Corporation Counsel of Chicago, representing the Mayor. W. A. Gardner, Vice-President of the Chicago & North-Western, delivered an address. The association now has a total membership of 632. The following committee reports and individual papers were presented for discussion:

1. To locate fault of engine not steaming without moving draft appliances.
2. Eliminating the smoke nuisance on soft coal burning engines.
3. Advantage of the hot water system of washing out and filling boilers.
4. Lubrication of cylinders and valves of locomotives using saturated and superheated steam.
5. Waste of energy in railroad operation.
6. Advantages of mechanical stokers as compared with hand firing.
7. What is required of the air-brake to properly control the trains of to-day and what has been done by railroads and manufacturers to meet these requirements?
8. Superheated steam and how to get good results with it in service.

There were morning and afternoon sessions on two of the four days of the meeting, so that plenty of time was allowed for the discussion of each subject. Extracts from two of the more important reports were printed last week and others will be given in a future number.

The officers for the ensuing year are: A. M. Bickel (L. S. & M. S.), President; J. A. Talty (D., L. & W.), First Vice-President; C. F. Richardson (St. L. & S. F.), Second Vice-President; F. C. Thayer (Southern), Third Vice-President; W. O. Thompson (N. Y. C.), Secretary; C. B. Conger (I. C. S.), Treasurer.

The Growth of the Union Pacific and Its Financial Operations.

BY THOMAS WARNER MITCHELL.

Reprinted by permission from the *Quarterly Journal of Economics.*

At midnight of January 31, 1898, the Union Pacific Railroad system emerged from one of the most drastic reorganizations hitherto known in railroad finance. Its growth and activities since that date have also been the most remarkable, perhaps, in corporate history. An account of these will be attempted in the following pages.

Since the organization of the present Union Pacific Railroad Company in July, 1897, there have been three fairly well-defined periods in the system's development. During the first period, which extended from the date of organization to, say, December 31, 1900, the company confined its activities in the way of expansion mainly to bringing back under its control those auxiliary systems and branch lines which had been parts of the old Union Pacific, but which during the receivership period of 1893 to 1897, inclusive, had been torn out and reorganized separately. The second period began early in 1901 with the Union Pacific's attempt to gain control of Northern Pacific, and thereby a one-half interest in the Chicago, Burlington & Quincy. Growing out of this attempt, and belonging to this period, were the formation of the Northern Securities Company, the subsequent decision by the United States Supreme Court that this company was a combination in restraint of trade and illegal, and the redistribution to its stockholders of the Great Northern and Northern Pacific stock which it held. The gradual sale by the Oregon Short Line of its portion of these shares, and its subsequent large purchases of Alton, Atchison, Baltimore & Ohio, Illinois Central, New York Central, North-Western, and Chicago, Milwaukee & St. Paul stocks are the important events of the third period. Running through all three periods are the extensive activities of the Union Pacific in the betterment and equipment of the lines of its system.

I.

ORGANIZATION AND RECONSTRUCTION, 1897-1900.

A brief description of the Union Pacific system as it existed in 1893, just before the receivership, and of its subsequent dismemberment, will assist to an understanding of the events of the first period.

The old Union Pacific Railway Company was organized in 1880 as a consolidation of the still older Union Pacific Railroad Company, whose main line extended from Council Bluffs, Iowa, to Ogden, Utah, a distance of 1,043 miles; of the Kansas Pacific Railway Company, whose main line, lying about 100 miles to the southward, connected Kansas City with Denver, Colo., a distance of 643 miles; of the Denver Pacific Railway & Telegraph Company, whose 104 miles, extending almost north and south, connected the Kansas Pacific at Denver with the Union Pacific at Cheyenne, Wyo.; and of a small branch line. These lines, aggregating 1,821.86 miles, were owned in fee simple by the Union Pacific Railway Company.

Through the ownership of $15,116,703 out of $26,244,853 of the capital stock of the Oregon Short Line & Utah Northern, and through the ownership by this company in turn of $14,508,200 out of $24,000,000 of the capital stock of the Oregon Railway & Navigation Company, the Union Pacific exercised control of the 1,425 miles of the one and 1,059 miles of the other, and gained an outlet to Portland, Ore., and the Pacific ocean. Also through the ownership of $13,251,882 out of the $32,634,482 of the capital stock of the Union Pacific, Denver & Gulf Railway, the Union Pacific exercised actual control of that company's 1,463 miles of railroad, extending the Denver Pacific from Denver southeasterly to Fort Worth, Texas.

In addition to these extensions the Union Pacific owned a majority interest in, and in many cases all of the stock of, about 25 branch lines and systems of various lengths. The largest of these were the Omaha & Republican Valley Railway, 482 miles; the Denver, Leadville & Gunnison Railway, 325 miles; the St. Joseph & Grand Island Railroad, 251 miles; the Central Branch Union Pacific, which with its leased lines aggregated 388 miles; and the Union Pacific, Lincoln & Colorado Railway, 225 miles.

Altogether the Union Pacific Railway Company controlled or owned 7,681.72 miles of railroad. In the case of the branch lines it owned not only most of their capital stocks, but in many cases a large part or even all of their bonded debt. By 1893, however, all these shares and bonds had been pledged as security for one or the other of the Union Pacific's numerous mortgage bond or note issues.

Unable to meet its obligations during the depression which then set in, the company's properties were placed in the hands of receivers in 1893. In the subsequent negotiations between its creditors great difficulty was experienced in arriving at a satisfactory adjustment of the United States government's second lien against the main lines. This difficulty delayed reorganization for several years, and in the meantime the creditors of the branch systems, for their own protection, had proceeded with independent reorganizations of their properties. The great subsidiaries—namely, the Oregon Short Line & Utah Northern, the Oregon Railway & Navigation Company, and the Union Pacific, Denver & Gulf—were each reorganized separately, together taking 4,307 miles of railroad out

of the Union Pacific system. Most of the branch lines were also either reorganized independently or given separate receivers pending reorganization. So that when on January 31, 1898, the new Union Pacific Railroad Company took possession of the properties which had been bought in for it at foreclosure sale, it found itself in possession only of the main lines which its predecessor had owned in fee simple and one or two small branches—in all (June 30, 1898) 1,849.29 miles of railroad.

Thus the Union Pacific had lost 5,832.43 miles of railroad, or by far the larger part of its system. It had also lost its connection with the Pacific ocean. Finally, it was devoid of the branch lines which are the necessary source of traffic of every prosperous railroad system. Thus arose the first great problem which confronted the new management, namely, to bring back into its system on a satisfactory basis all the important branches and feeders which had been cut off during this receivership, and to restore the company's connection with the Pacific. This task was not completed until the latter part of 1900. In fact, one of the former subsidiaries, the St. Joseph & Grand Island, was recaptured only within the last year.

The Union Pacific Railroad Company began its business in February, 1898, with an authorized capital stock of $136,000,000, consisting of $75,000,000 of non-cumulative preferred and $61,000,000 of common stock. It also had an authorized bonded indebtedness of $100,000,000, consisting of 4 per cent. 50-year first mortgage bonds. Its first balance sheet, as of June 30, 1898, was as follows:

Assets.	
Cost of railroads, equipment and appurtenances	$221,264,210
Stocks and bonds owned	2,252,962
Trust funds	199,400
Cash	6,071,810
Other current assets	1,526,295
Materials and supplies	961,485
	$232,276,102
Liabilities.	
Common stock	$61,000,000
Preferred stock	75,000,000
Funded debt	90,011,000
Interest accrued or unpaid	1,800,275
Vouchers and pay rolls	1,585,367
Reserve for improvements and equipment	1,082,774
Surplus available for dividends	1,796,686
	$232,276,102

The 1,849 miles of railroad, nearly all main line, with which the company commenced operations, constitute by far the greater portion of the first item among the assets. The valuation (namely, $221,264,210) has no special significance, merely representing approximately the par value of the new shares and bonds which were issued in exchange for the old and for other reorganization purposes. The cash cost of these lines and equipment to the Reorganization Committee has been estimated at about $81,500,000; namely, $40,255,605 paid to the United States government to extinguish its second lien, $13,645,250 paid for the securities in the sinking fund of this second lien, and $27,637,435 bid at the foreclosure sale under the old first mortgage. But these requirements were met by the issuance of mortgage bonds and preferred stock which were not accepted at par. Most of the old high-interest bonds received (in lieu of cash) 100 per cent. of their par value in new 4 per cent. bonds and a bonus of 50 per cent. in new preferred stock. The bankers received corresponding amounts of bonds and preferred stock for the cash which they were called upon to furnish to take up the government lien and for other purposes. Finally, the old shareholders, or their successors, who responded to a cash assessment of $15 a share, were given about $9,000,000 of new preferred stock for this cash, and the $61,000,000 of new common stock for their old shares. "Cost of railroads and equipment" was charged to the extent of the par value of all these securities except the $9,000,000 of preferred stock issued as a result of the cash assessment, and even this was thus charged in so far as a part of the cash was paid out for reorganization expenses as distinguished from being held as working capital. This situation will show the meaning or rather the lack of meaning, of the cost of properties as stated in a railroad balance sheet.

The Union Pacific's first great step toward regaining its lost mileage was its acquisition early in 1899 of nearly all of the stock of the newly reorganized Oregon Short Line Railroad Company, whose lines connected with its own near Ogden, and extended northwesterly to a junction with those of the Oregon Railroad & Navigation Company. All the securities which had been owned by the old Union Pacific had been pledged by it as security for one or other of its numerous collateral trust bond or note issues. The trustees of these mortgages and indentures had sold portions of this collateral from time to time during the receivership, Kuhn, Loeb & Co., representing the Reorganization Committee, being the principal purchaser. In this way, as early as December, 1897, the committee had obtained possession of $8,460,000 out of the $24,778,600 of capital stock of the reorganized Oregon Short Line Railroad company. This stock was not turned over at once to the new company, but held for its benefit by the syndicate.

In January, 1899, by which time it was seen that the company was going to be strong in earning power (it had already paid one dividend of 1½ per cent. on its preferred stock), the [illegible] ratified a proposal to increase its common stock by $27,4[illegible], and to offer the new shares in exchange for a like amount of Oregon Short Line stock. This offer was accepted by the Short Line shareholders, who paid in cash $3 with each share exchanged. These [illegible] the Union Pacific take over the stock purchased on its behalf by the Reorganization Committee and enough more to bring the total up to $26,505,300 par value. Since that time all but $10,[illegible] of the remaining Short Line stock has been acquired, so that for all practical purposes the Union Pacific and the Oregon Short Line Companies are one.

In October of the same year the Union Pacific shareholders were called upon to authorize another stock increase, namely, $25,000,000 preferred and $7,718,600 common. The purpose of this was as follows. The old Oregon Short Line & Utah Northern had held, subject to a collateral trust mortgage, $13,827,200 of the $24,000,000 of capital stock of the old Oregon Railway & Navigation Company. In the latter's reorganization this old stock was replaced by an equal amount of common stock of the new Oregon Railroad & Navigation Company, the trustees of the Short Line collateral trust bonds receiving their share. The collateral trust bonds were replaced in the new Oregon Short Line Railroad Company by an equal amount of "Income B and Collateral Trust" bonds. The latter had as security the same Navigation Company shares, together with 24,542 additional shares which were obtained in direct exchange for some of the "Income B" bonds. Thus the Union Pacific, which, as before stated, eventually acquired control of the Short Line, came into virtual possession of these Navigation Company shares.

The Oregon Railroad & Navigation Company was governed at this time by a voting trust representing the Northern Pacific, Great Northern and Union Pacific,* which, as holders of that company's preferred stock, elected two-thirds of the board of directors. By this means it was planned that the Navigation Company should be kept independent of any one system and be made to subserve the interests of all three. Why the arrangement failed to be continued is not understood. But in October, 1899, the Union Pacific offered its $25,000,000 of new preferred stock in exchange for the Navigation Company's preferred stock ($11,000,000 par value), and for the outstanding "Income B" bonds of the Oregon Short Line. These offers were accepted. In fact, it was reported that the Northern Pacific had already sold its holdings of the Navigation Company's stock to the Union Pacific. The purchase of the "Income B" bonds of course gave the Union Pacific a firmer grip upon the $16,281,400 of the Oregon Railroad & Navigation Company's common stock which served as their collateral. The $7,718,600 of new Union Pacific common shares were offered in exchange for an equal quantity (namely, the remainder) of the Navigation Company's common stock. Practically all of the latter's shares of both classes was thus acquired. This restored the Union Pacific's outlet to the Pacific northwest. Henceforth, except for certain legal purposes, the Union Pacific and its two great auxiliaries, the Oregon Short Line and the Oregon Railroad & Navigation Company, may be considered and are virtually one.

In the meantime the Union Pacific had not been idle in the work of regaining its former branch systems. As before stated, all of the old Union Pacific Railway Company's holdings in the shares and bonds of its subsidiaries had been hypothecated under one or more of its collateral trust issues. Much of this collateral, both bonds and shares, was bought in at low prices from time to time by the Harriman syndicate. When the properties of these companies were offered at foreclosure sale, the syndicate bought them in, again at low prices, and turned them over to the Union Pacific. In the latter part of 1898 the company acquired in this way the properties of the Omaha & Republican Valley, the Union Pacific, Lincoln & Colorado, the Kearney & Black Hills, and the Junction City & Fort Kearney. It also purchased, in accordance with the terms of an agreement with the reorganization committee of the Union Pacific, Denver & Gulf, the so-called Julesburg branch of that system. That company itself remained independent. In a similar manner the Union Pacific purchased, in January, 1900, the lines of the Carbon Cut-off Railway and the Echo & Park City Railway. In the latter part of the same year the lines of the Solomon Railroad and the Salina & South-western Railway were acquired. This, with the exception of the recent acquisition of the St. Joseph & Grand Island, completed the Union Pacific's task of regaining the branches of the old system which had been lost to it.

These acquisitions, together with trackage rights over 74.94 miles of other railroad, brought the total mileage operated as of June 30, 1900, by the Union Pacific Railroad Company proper up to 3,033.22 miles. All of these acquisitions were owned in fee simple by the company, and were without any lien encumbrances, having been paid for out of the cash funds in the company's treasury.

*The Great Northern and Northern Pacific had purchased a large quantity of the Navigation Company's stock in Europe. It was stated that the Union Pacific was to acquire an interest in this purchase. Whether it did or not the writer has been unable to ascertain. The financial manuals all represent the Union Pacific as being represented in the voting trust, however.

This statement may seem remarkable. The new company was fortunate from the beginning in several ways. In the first place it had a strong earning power. Its surplus income at the end of the first five months was $1,796,685. In 1899, after the payment of dividends on the preferred stock, which were commenced in September, 1898, the surplus for the year was $2,883,367, and in 1900, after paying dividends on both preferred and common stock, it was $834,183. The surplus earnings of the two auxiliary systems, which by this time were integral parts of the Union Pacific, brought this up to $7,536,737. The Reorganization Committee had started the company with a good cash working capital. In November, 1899, the old Union Pacific Railway Company, which had been kept alive pending the realization on some of its assets and the liquidation of its unsecured liabilities, declared a cash dividend upon those claims. The new Union Pacific, as the holder of some of those obligations which it had bought in at nominal prices, received $5,249,090 in this way. The $3 per share received from the holders of 265,053 shares of Oregon Short Line stock at the time of the exchange described above should not be forgotten.

The Union Pacific's expansion had been financed thus far either by the issuance of stock or out of its cash funds obtained from earnings and other income. The mileage in its system had grown from 1,849.29 miles in 1898 to 5,628.42 miles on June 30, 1901. At the same time the system's management had entered upon a policy of extensive improvements to the railroad and equipment. During the fiscal year 1900-01, according to the report, $8,516,971 was expended for betterment of the lines of the three large companies in the system and $3,571,759 for new equipment. Of the former amount, $4,498,094 represented the cost of making changes in the lines, while the remainder was spent in rectifying grades, widening embankments, laying better ballast, enlarging tunnels, building second and side track, and the like. Of the $12,000,000 used in these two ways in one year, $1,500,000 was appropriated from the surplus earnings of the year. Yet, after deducting this and paying 4 per cent., or approximately $8,000,000 in dividends on the two classes of stock, the formal surplus was still $3,678,175; $2,061,012 represented the appropriation of a "Reserve for Improvement," leaving $8,521,718 to be added to the "Cost of Railways and Equipment." In a similar manner, during the preceding year, $8,977,405 had been expended for betterments and equipment, $2,000,000 of which was charged directly against surplus income, but still leaving the latter at the figure, $7,536,737, given above.

During all this time, as intimated, the Union Pacific had been paying dividends on both its preferred and common stock. Payment of dividends on the preferred stock was commenced in September, 1898, six months after the new company had begun operations, with the distribution of $1.50 per share. The financial operations up to June 30, 1898, were as follows:

Gross earnings, Union Pacific main line	$7,670,579
Miscellaneous income	606,442
Total	$8,277,021
Operating expenses and taxes	4,534,418
Available income	$3,742,603
Fixed charges	1,945,918
Surplus exclusive of branches	$1,796,685

To this surplus was to be added $446,659 as the net results of the operations of the branch lines. Of the total free income of $2,243,344, the preferred dividend took $1,025,000, leaving $1,118,344, or more than 50 per cent., for other purposes. The percentage is respectable enough, but the absolute amount left in the surplus account represented a rather small margin, when we consider that it was the undivided profits of a large railroad system whose financial success was not yet assured.

At the directors' meeting at which the second semi-annual dividend on the preferred stock was declared, a resolution was passed which, in substance, was as follows:

> Whereas the company has been in possession of all of its main lines barely a year, and of its branch lines a less time, and is therefore without a basis of experience for determining any fair average of results for unequal years, and it is not deemed advisable to add to the bonded debt, but to continue a liberal application of surplus income to permanent improvements and additions and to such uses as will secure economy of operation and increased earning power, and thereby establish stable and permanent values for its securities and a reasonably safe minimum basis of regular dividends to its stock, be it
>
> Resolved, That we distribute $1.50 per share on the preferred stock.

The preamble contains a great deal of financial wisdom, especially for a company which had yet to work out its salvation. But it is difficult to see any logical connection between it and the conclusion, unless the directors were trying to justify themselves in paying *only* 1½ per cent. instead of 2 per cent.

In October, 1899, the semi-annual dividend on the preferred stock was increased to its maximum (namely, 2 per cent.), and in February, 1900, the company commenced paying 1½ per cent. semi-annually on the common shares. By this time the surplus earnings were so large that before deducting the appropriations therefrom for betterments and equipment they were more than double the requirements to pay the 3 per cent. per annum to the common shareholders. Accordingly, on July 31, 1900, the semi-annual dividend on this stock was increased to 2 per cent. Yet, in spite of this and in spite of deductions for improvements and equipment, the formal surplus for the year ended June 30, 1901, was $3,678,175. It will readily be appreciated that by this time the Union Pacific was in good financial condition, and possessed of a strong credit wherewith to carry on its activities of the second period of its history.

II.

THE SOUTHERN PACIFIC AND THE NORTHERN SECURITIES COMBINATION.

We may now begin an account of the Union Pacific's activities during this second period. In it the company commenced reaching out and acquiring control of railroad mileage which had not been a part of the former Union Pacific system. The two great events were the purchase of a substantially controlling interest in the stock of the Southern Pacific Company and the fight with the Hill-Morgan interests for control of Northern Pacific. It is true that Mr. Harriman and his associates had about completed their now famous Chicago & Alton deal; but, although this promoted friendly relations between the Alton and the Union Pacific, there was no formal connection between the two until a much more recent date.

In January, 1901, Kuhn, Loeb & Co., acting on behalf of the Union Pacific, purchased $75,000,000 par value of the Southern Pacific Company's stock. The total outstanding share capital of this company was $197,832,148. This purchase did not, therefore, give absolute control of that company; it represented a substantial control, however. A year later another $15,000,000 of the stock was acquired. The major portion of the original purchase was obtained by the Harriman Syndicate from Speyer & Co., of New York city. It consisted of the so-called Speyer and Huntington interests. The former was estimated by current financial writers at about $20,000,000 par value. It was accumulated a year earlier from the estates of Charles Croker and Leland Stanford, two of C. P. Huntington's former associates. The original Huntington interest consisted of 600,000 out of the 2,000,000 shares of the Southern Pacific Company. Of these 400,000 shares were left to the widow of C. P. Huntington, and 200,000 to his nephew, H. E. Huntington. Of the total Huntington interest, that portion held by Speyer & Co. at the time of this purchase was variously estimated at from 300,000 to 430,000 shares. These two blocks of stock would not account, therefore, for the entire 750,000 shares included in the purchase.

Opinion was expressed at the time to the effect that a considerable portion of this stock must have been acquired in the open market. Certain it is that Southern Pacific stock was very active just a few days previous to the announcement of the purchase. On January 29, 1901, 187,760 shares changed hands at prices ranging from $45.50 to $47 per share. During the next two days the total sales amounted to 326,000 shares at prices ranging from $46.62½ to $48.25 per share. In two days more shares changed hands than were traded in during a week before this time, and the company's stock had been one of the most active of the entire list during a period of at least two months previous to the consummation of this purchase. This does not mean that Kuhn, Loeb & Co. bought all of these extra shares. But to obtain at a fair price what was finally taken probably required a great deal of stock market manipulation on the part of their generals, involving the sale and repurchase of a large additional number of shares.*

An important question is, How was this purchase financed? Within a few days after the purchases had been consummated (they were announced on February 1, 1901), the Union Pacific advertised a new bond issue of $100,000,000. These bonds bore 4 per cent. interest, matured at the end of 10 years, and were convertible, dollar for dollar, into common stock of the company at any time before May 1, 1906. To provide for this conversion, the authorized common stock was also increased $100,000,000, but, of course, the new stock was not issued except as the new bonds were presented for conversion. The security of these bonds consisted of a first lien upon about 859 miles of the branch lines which had been acquired as described above, and the following railroad stocks and bonds:

Southern Pacific Co. capital stock	$75,000,000
Oregon Short Line, capital stock	27,334,700
Oregon R. R. & Navigation Co. common stock	7,633,500
Oregon R.R. & Navigation Co. preferred stock	9,876,200
Union Pacific Coal Co., 1st mortgage bonds	4,706,000
Leavenworth, Kansas & Western Ry., capital stock	1,000,000

The Short Line and Navigation Companies' stocks had been acquired by the Union Pacific in exchange for its own shares, as described above, and were, therefore, "free assets." All this collateral was pledged at a valuation of $87,080,400, the Southern Pacific stock having been placed at 50 per cent. of par, a little more than its market value at the time. The railroad lines were valued at $20,485,400. Altogether, security of an estimated value of $107,565,800 was pledged under this $100,000,000 bond issue. The pro-

*The financial paragraphs of that time state that the large transactions in this stock indicated a "liberal application of Wall Street laundry methods," i. e., "wash," or bogus sales. Whether this manipulation was connected with Kuhn, Loeb & Co.'s purchase of the stock or was independent cannot, of course, be known. It can only be inferred.

[illegible] of the bond sales were to be used for lawful corporate purposes."

It is noteworthy that little more than 73½ per cent of the value of the above security consisted of the Southern Pacific stock purchased. There are two partial explanations of this. In the first place that stock was not paying dividends so that the bonds would have no income behind them in case the Union Pacific should tire of the interest burden. Further, it did not represent absolute control of the Southern Pacific Company so that the bondholders could not force dividend payments even if they seized the collateral. Additional security would be needed, therefore, to render the bonds marketable on favorable terms. In the second place only $40,000,000 of these bonds were to be used to finance the Southern Pacific purchase, the other $60,000,000 being reserved for other "lawful corporate purposes." The entire bond issue was eventually subscribed by the shareholders, the subscription being underwritten by Kuhn, Loeb & Co.

The importance of this deal will readily be appreciated. It gave the Union Pacific substantial control over 9,500 miles of railroad, stretching from New Orleans to San Francisco, from San Francisco to Ogden, Utah, and gridironing the states of Texas and California. On 7,545 miles of this total the gross earnings in 1900 were $64,400,000. On only one railroad system (namely, that of the Pennsylvania Railroad Company) did the gross earnings then exceed this figure. The feeling current in financial circles of that day was that the control would result in less friction between the Union Pacific and Southern Pacific systems. The Union Pacific management, however, were careful to give out that their purpose was to insure "harmonious relations" in the interchange of traffic between their system and the Central Pacific, which, joining with the former near Ogden, connected it with San Francisco, but whose stock was owned by the Southern Pacific Company. The Union Pacific and Central Pacific had been conceived and built as one continuous line from the Missouri river to the Golden Gate, and should logically have been owned by one company. Under the separate companies, however, their relationships had at times been anything but harmonious. The Southern Pacific purchase did away with this friction. It also conferred another important benefit upon the Union Pacific; namely, steamship connection with the Orient through the Pacific Mail Steamship Company, control of which had recently been acquired by the Southern Pacific Company.

Of Southern Pacific finances we have little to do in this story. We may, therefore, seize this opportunity for disposing of them. The Union Pacific inaugurated, or, rather, continued, a very extensive betterment policy for its southern auxiliary, causing it to use all of its surplus income for a number of years thereafter for improvements and the purchase of equipment. In an analysis of that system's accounts made by White & Kemble in 1902 it was estimated that in addition to past expenditures another $40,000,000 would be needed to completely modernize the property. During the four years from 1902 to 1905, inclusive, the Southern Pacific Company expended from its earnings, in improving and better equipping its properties, the enormous sum of $33,409,611, an average of $8,352,403 a year. For the fiscal year ended June 30, 1906, after providing for dividends on its stock, the company's stated surplus was $11,118,838. Of this it acknowledges the expenditure of $6,381,775 for betterment and equipment purposes. There was a further $2,354,218 appropriated for betterments, which was charged directly to the operating expenses of the year, bringing the total appropriation and expenditure for betterments and equipment up to $8,735,993.

During these six years not only has the Southern Pacific Company appropriated its stated surplus income for these betterment purposes, but it has apparently improved its existing equipment at the expense of its operating account. This is indicated by the following facts. The average stated cost per mile run of maintaining locomotives during this period has been 9.17 cents; that of the Union Pacific was 9.82 cents. But the similar expenditures on a number of other systems somewhat similarly situated range between 6 and 7 cents per mile run. This may be interpreted in part as meaning that both the Union Pacific and Southern Pacific are pursuing the very liberal practice of sending old locomotives to the scrap heap, replacing them with more modern and expensive locomotives, and charging the entire cost of the latter to operating expenses. Again, the average stated cost per mile run of maintaining passenger cars on the Southern Pacific line has been 1.028 cents, which is well above the average of 9.1 mills on other systems. Finally, the cost of maintaining freight cars has averaged 6.99 mills per mile run as compared with a maximum of 6 mills on about 12 other systems. We may infer, then, that the Southern Pacific Company has been improving the character of its equipment, charging the difference in cost between the old and the new directly to "operating expenses" instead of to "cost of railroads and equipment." What an opportunity some financier of the future will have for capitalizing these expenditures, issuing bonds to represent them, and from the proceeds of the sale thereof declaring a 30 per cent. dividend!

Not only has the Southern Pacific Company bettered its system by the use of funds obtained in this way, but it has been [illegible] capital expenditures from funds obtained [illegible]. During the years 1903 and 1904 it borrowed from the treasury of the Union Pacific system a total sum of $2[illegible]. But [illegible] in the latter part of 1904 it was decided by the Harriman management to capitalize some of these expenditures and to obtain [illegible] from the outside with which to continue these betterment [illegible]. Accordingly the stockholders voted to create an issue of 7 per cent non-cumulative preferred stock amounting to $10[illegible], of which $40,000,000 was offered to the old shareholders for pro rata subscription at par. A part of the proceeds was used to reimburse the Union Pacific treasury. The Oregon Short Line took $18,000,000 of the new stock.

Under the policy inaugurated by the Harriman management the Southern Pacific system's net earnings increased from $2[illegible] to $37,500,000. Owing to the liberal maintenance policy, however, the operating ratio (i.e., the ratio of operating expenses to gross earnings) has not decreased, but, on the contrary, has increased somewhat. The operating ratio is taken as an indication of the economy of management, but the high ratio of the past should be followed by a lower ratio in the future if the betterment expenditures realize their purpose. The following table will show to best advantage the growth of the system's traffic and earnings

Southern Pacific System

	1901.	1902.	1903	1904.	1905.	1906.
Density of passenger traffic	108,047	124,110	124,986	140,686	141,661	152,[illegible]
Density of freight traffic	561,838	566,089	569,187	591,450	600,71[illegible]	678,513
Gross earnings per mile	$8,503	$9,012	$9,371	$9,631	$9,784	$10,78[illegible]
Operating expenses, per mile	5,324	5,824	6,305	6,459	6,406	6,827
Operating ratio, per cent	62.6	64.6	67.3	67.1	65.5	[illegible]
Net earnings per mile	$3,179	$3,188	$3,066	$3,172	$3,378	$3,956
Fixed charges per mile	2,390	2,322	2,264	2,441	2,269	2,208

By "density of passenger traffic" is meant, in technical language, the average number of passengers carried one mile per mile of road operated. Thus the figure for 1901 indicates that for each mile of road operated the company did the work equivalent to carrying 108,047 passengers one mile. A similar definition applies to the term "density of freight traffic." The enormous growth of the Southern Pacific traffic is indicated by the increase in these averages year by year. The gross earnings and operating expenses per mile have also increased, the one correspondingly, the other more than correspondingly. The management's liberal maintenance policy is indicated in the high operating ratios of 1902, 1903 and 1904. Since the last date this ratio has rapidly fallen off, possibly showing that the liberal maintenance and betterment policies have begun to have their desired effect of increasing the economy of operation. The result has been a rapid growth in the average net earnings per mile since 1903. The declaration in October, 1906, of dividends on the Southern Pacific Company's common stock will be discussed in its proper connection in the story of Union Pacific finances which will now be resumed.

The other great event of the year 1901 was the contest between the Harriman Syndicate, representing Union Pacific interests on the one side and the Hill-Morgan interests on the other, over the control of the Northern Pacific Railway. It is evident that the Great Northern and Northern Pacific wished to secure a permanent connection of the terminus of their lines at St. Paul with Chicago. Early in 1901 there arose persistent rumors that these two companies were negotiating for a lease of the line of the Chicago, Milwaukee & St. Paul. These rumors were officially denied. Yet one individual, said to be high in Great Northern councils, gave out that they were founded in fact, and that the only point to be settled was the amount of the dividend to be guaranteed on St. Paul stock. Nevertheless, the deal was never consummated. At the same time Dame Rumor had it that the Union Pacific was trying to obtain control of the Chicago, Burlington & Quincy. This, if acquired, would give the Union Pacific direct access to Chicago. It would also drain a large volume of westbound traffic through the Union Pacific outlet.

There seems to have been a substantial foundation in truth for these rumors. As explained afterwards by President James J. Hill, of the Great Northern, the success of the Union Pacific in this attempt would have shut the Great Northern and Northern Pacific out of most of the territories of Nebraska, Kansas, Missouri, South Dakota, Iowa, Illinois and Wisconsin. To prevent this, the two companies entered into negotiations with the directors of the Burlington, making proposals for the purchase of their entire property. These were successful, practically the entire $109,321,000 of the stock of the Chicago, Burlington & Quincy Railroad Company being purchased by the two companies at $200 per hundred-dollar share. The Union Pacific asked to be admitted as a participant in this purchase, but the Morgan-Hill interests refused to accede to the request, because to do so would have defeated the purpose of their move.

Mr Harriman decided to fight. Under the terms of the purchase, the Northern Pacific was to have a half interest in the control of the Burlington. If the Union Pacific could gain control of Northern Pacific, all would yet be well with its own interests. Accordingly, his bankers purchased over $60,000,000 of Northern Pacific stock in Europe and the United States. Mr Hill and his friends

found that they held about $26,000,000 of the common stock of that company. Mr. Morgan succeeded in obtaining in London and New York about $16,000,000 more. The bidding of the rival factions, together with that of the speculators who found themselves "short" of the stock, forced the price up to $1,000 a share, and precipitated the stock market panic of May 9, 1901. The result was that, after the contending parties had taken account of their holdings, the Morgan-Hill interests owned $42,000,000 out of the $80,000,000 of Northern Pacific common stock and probably $34,000,000 of the preferred stock, while the Harriman Syndicate held $37,000,000 of the one and $41,000,000 of the other.

The Union Pacific people claimed absolute control of the Northern Pacific Railway Company and through it a one-half interest in the control of the Burlington. In his stock purchases, however, Mr. Harriman overlooked one vital fact. According to the charter of the Northern Pacific Railway Company its common stockholders had the right to call in all the preferred stock for redemption in cash at par. This move was decided upon by Mr. Hill and his friends. To finance this redemption, the Northern Pacific offered its common shareholders for pro rata subscription at par $75,000,000 of 4 per cent. debentures, which were convertible, dollar for dollar, into common stock. The Harriman Syndicate received its share of these debentures, about $34,700,000, and of course would convert them into common stock. This would necessitate a similar conversion of their debentures by the Morgan-Hill faction if they were to retain their control. In the end, however, the Union Pacific party would hold only about $61,700,000 out of the new $155,000,000 of stock of the Northern Pacific.

Control of Northern Pacific was lost to Mr. Harriman and his associates, but he would still hold enough stock to make him dangerous. Consequently, a compromise was effected. This involved in the first place the formation of the Northern Securities Company to acquire as much as possible of the share capital of the Great Northern and Northern Pacific, Mr. Harriman agreeing to exchange his holdings in the latter for stock of the new company; secondly, the formation of a new Chicago, Burlington & Quincy *Railway* Company to take a 99-year lease of the existing Chicago, Burlington & Quincy *Railroad* Company's lines. The Union Pacific interests were to share with the two northern companies in the management of this new corporation, thereby being assured good treatment. At the same time the new company guaranteed the payment of 7 per cent. dividends on the old Burlington's stock, most of which had been pledged as security for the Great Northern and Northern Pacific C., B. & Q. collateral joint 4 per cent. bonds. One object of the formation of the Northern Securities Company was probably to enable the Morgan-Hill faction to resell a part of their stock without losing control of the Northern Pacific; for after the exchange the Union Pacific would hold only $82,491,000 out of over $394,000,000 of Northern Securities stock, or about 23 per cent. This would leave a wide margin for sale by the other faction.

We have finally to inquire how the Union Pacific financed these extensive stock purchases and subscriptions. The prices paid for Northern Pacific preferred and common shares are not known, but Mr. Mahl, controller of the Union Pacific system, testified at the recent investigation that the Northern Securities stock cost $79,459,691.36. Presumably, this was the sum paid for the original 781,980 shares of Northern Pacific stock which were exchanged. This is assumed to be true. Sixty millions of this were provided out of the proceeds of the sale of the convertible bond issue mentioned above in connection with the Southern Pacific purchase. The remaining funds were evidently borrowed from the banks, as is evidenced by the fact that the Union Pacific system's net floating debt on June 30, 1901, was $30,249,459 larger than it was a year before, and that for several years thereafter the company had outstanding large amounts ($28,750,000 in 1902) of "Loans and Bills Payable."

Later the Union Pacific received $41,085,000 in cash for that amount of Northern Pacific preferred shares which it held. Out of this it paid about $34,700,000 for its subscription to that company's convertible debentures, leaving about $6,300,000 of cash in the treasury. But, of course, this was not available for the financial purposes with which we are dealing. This is important, however, in that it left the net cost of the $82,491,000 of Northern Securities stock which the company eventually received at about $73,160,000, freeing the remaining $6,300,000 of the original investment for other corporate purposes.

The title to the Northern Pacific shares, and later to the Northern Securities shares received in exchange, was vested in the Oregon Short Line Railroad Company. That company issued to the Union Pacific Railroad Company in payment therefor its purchase money certificates of indebtedness amounting to $61,000,000. This transaction was merely between these two companies, and had nothing to do with the work of financing the purchase of the stock. It was probably a method of technically avoiding the laws against the combination of parallel railroad lines.

During the year 1901-02 the Union Pacific advanced $4,393,887 to future subsidiaries to aid them in constructing their lines. In June and July, 1902, it purchased an additional $15,000,000 par value of the Southern Pacific Company's stock, bringing its total holdings up to $90,000,000. These shares cost about $7,500,000. During 1903 and 1904, as we have seen, it advanced an aggregate of $20,460,927 to that company to aid it in carrying out its betterment policy. The Union Pacific also advanced to the Pacific Mail Steamship Company during the two years the sum of $5,055,311. This was to aid that company in the construction of two large steamers for the trade with the Orient.

These activities in 1903 were financed partly out of cash funds already in the treasury, partly out of current earnings, but mainly by the issuance of $36,000,000 of Oregon Short Line 4 per cent. and participating (collateral trust) bonds. That company pledged all of the $82,491,000 par value of Northern Securities stock, which it received under the terms of the compromise with the Morgan-Hill interests, as security for an equal amount of these "Participating Fours." The latter it was caused to give to the Union Pacific Railroad Company at 10 per cent. discount to take up the $61,000,000 of purchase money certificates mentioned above and for other debts which it owed to the parent organization. Thirty-one millions of these bonds were at once offered to the Union Pacific shareholders for pro rata subscription at 90 and interest, and another five millions were sold later. The proceeds were used partly for the purposes mentioned above and partly to pay off $14,500,000 of the loans contracted at the time of the Northern Pacific purchase. Thus was this purchase eventually financed in part by means of the Oregon Short Line "Participating Fours." The remainder of these bonds was never sold to the public.

In 1904 the Union Pacific embarked upon a new enterprise. This was the purchase of a one-half interest in the San Pedro, Los Angeles & Salt Lake Railway Company. This company was originated by Senator Clark, of Montana, to build a line of railroad from San Pedro on the California coast, near Los Angeles, through that city northeasterly through southern Nevada and western central Utah to Salt Lake City. Its construction and acquisition would give the Union Pacific a direct line to the fruit-growing section of southern California. In 1904 the Oregon Short Line purchased from Senator Clark a one-half interest in this line, paying therefor and for its share of advances to it for construction purposes up to June 30, 1904, the sum of $14,960,000. During the next year additional payments of $5,440,000 were made. At the same time the Oregon Short Line sold to its newly acquired subsidiary about 340 miles of its own line which stood on its books at a valuation of $7,043,994. The acquisition by the San Pedro of these lines, which extend from Salt Lake City southerly to Calientes, Nevada, relieved it from the necessity of building so much railroad. A portion of the funds required for these and the other advances of the year was obtained by the sale of $10,000,000 of Union Pacific collateral trust notes.

On March 14, 1904, the United States Supreme Court handed down a decision, affirming that of the lower court, to the effect that the Northern Securities Company was a combination in restraint of trade and illegal. It enjoined that company from collecting dividends on the Great Northern and Northern Pacific stock, and entailed the redistribution of this stock to its shareholders. This resulted in other financial measures on the part of the Union Pacific and Oregon Short Line. But another matter must be discussed before that tale is related.

It will be recalled that in 1901 the Union Pacific shareholders subscribed to a huge bond issue aggregating one hundred millions of dollars. The purpose of this issue, as before stated, was to finance the Southern Pacific purchase and to finance in part the acquisition of Northern Pacific stock. These bonds bore 4 per cent. interest, and were convertible at any time before May 1, 1906, into common stock at par. This common stock was paying at that time only 4 per cent. dividends, so that for the time being the conversion clause was not very attractive. Only $12,743,000 of the bonds were converted up to June 30, 1904. But during this time the Union Pacific's net earnings increased very rapidly, so that, despite large appropriations therefrom every year for betterments and equipment and despite the increases in dividends, large sums were left to be carried to the formal surplus account. It became evident that Union Pacific common stock was a good investment and was going to improve, especially since it possessed the entire equity in the net income after 4 per cent. had been distributed to the preferred shareholders. During the fiscal year ended June 30, 1905, there was converted a total of $56,071,000 of these bonds, and after the increase of the common stock dividend to a 5 per cent. basis in October, 1905, and to a 6 per cent. basis in April, 1906, another $32,687,000 of these bonds was exchanged. In August, 1906, only $500,000 of the original hundred millions were outstanding, and these were called for redemption.

According to the terms of the trust agreement securing these bonds, as they were converted, a proportionate amount of their underlying collateral could be released. In this way during the years 1901 to 1904, inclusive, the Union Pacific came into free possession of a considerable amount of Oregon Railroad & Navigation Company and other stock which had originally been pledged under

this mortgage. These shares could be used, if desirable, as collateral for other loans.

Again, as stated above, in 1904 the Southern Pacific Company was caused to create an issue of $100,000,000 of 7 per cent non-cumulative preferred stock, 40 millions of which was offered to its old shareholders at par. The Oregon Short Line, as the holder of $90,000,000 of its old stock, took $18,000,000 of these new preferred shares. Out of the proceeds of this stock sale, also, the Union Pacific system's treasuries were repaid the $20,460,960 which had previously been loaned to the Southern Pacific Company. As a net result, the Union Pacific system, after paying its subscription, gained $2,460,960 in cash and $18,000,000 par value in securities.

Considerable importance must be attached to the above-described activities. The possession of this Southern Pacific preferred stock as a free asset, and the freeing of the Navigation Company's common and preferred stock, gave the Union Pacific system securities which it could use as collateral for further loans, or could substitute for and thereby release securities which might be more valuable for certain purposes. The significance of this will be seen presently.

Let us return now to the main thread of our story. The method decided upon by the Northern Securities Company of distributing to its shareholders the Northern Pacific and Great Northern stock in its treasury was to give $30.17 par value of Great Northern and $39.27 of Northern Pacific* stock and $1 in Northern Securities "Stubs" for each hundred-dollar share of its own stock surrendered. If carried out, this would give the Oregon Short Line in exchange for its $24,910 shares of Northern Securities stock the following amounts of securities: Great Northern shares, $24,887,534.70; Northern Pacific shares, $32,391,215.70; Northern Securities stubs, $824,910.† These securities would come in time into the hands of the trustees of the Oregon Short Line "Participating Fours."

And thereby hangs a tale. Pending this distribution the Northern Securities Company could not collect the dividends declared upon the Great Northern and Northern Pacific stock. That being true, it could not pay dividends on its own shares. Since this was true, again, there was no income accruing to the Oregon Short Line upon the collateral, consisting, it will be remembered, of Northern Securities stock, underlying its "Participating Fours." Hence that company had to pay the 4 per cent. interest drawn by those bonds with funds derived from other sources. Those uncollectible dividends, however, were accumulating in the Northern Pacific and Great Northern treasuries and, after the completion of the above stock distribution, its share of them would be received by the Oregon Short Line. Now an important privilege accruing to the holders of the "Participating Fours" was that of sharing each year in the income received upon their collateral to the extent that this income exceeded during that year the 4 per cent. interest drawn by their bonds. There was grave danger that, when these back dividends were finally received, the holders of the bonds would insist upon being given the entire amount, notwithstanding the fact that in reality a part of them was to be set over against the interest already paid on those bonds during the legal deadlock. To avoid this, it was decided to call in these "Participating Fours" for redemption at 102½, as was permitted under the terms of the trust indenture securing those bonds.

To retire these bonds and for "other corporate purposes," the Oregon Short Line created an issue of "Four Per Cent. Refunding Twenty-five Year Gold Bonds" amounting to $100,000,000. A portion of this new issue, amounting to $42,250,000, was sold at 96 and interest, or given to the holders of the "Participating Fours" for the principal and accrued interest of their bonds at a corresponding rate. The remaining $57,750,000 was retained in the treasury of the Union Pacific Railroad Company.

According to the advertisement, the security of this new issue was to have consisted of whatever the company received in exchange for its Northern Securities holdings and of any other shares or bonds at not exceeding 80 per cent. of their appraised value. For months all holders of these bonds imagined that their security consisted of Northern Pacific and Great Northern stock and Northern Securities stubs, as described in a foregoing paragraph. When the mortgage finally appeared,‡ the investors were much surprised to find that the actual collateral consisted of the following:

Northern Securities stubs	$5,000,000
Southern Pacific Company preferred stock	18,000,000
Southern Pacific Company common stock	90,000,000
Oregon R. R. & Navigation Co. preferred stock	10,000,000
Oregon R. R. & Navigation Co. common stock	20,000,000

*A return of 1 per cent. of the Northern Securities stock surrendered because of other of the company's assets not realized upon.

†Mr. Harriman asked that he be returned the original 781,080 shares of Northern Pacific stock which he had turned over to the Northern Securities Company on the ground that, the combination being illegal, the receipt by that company of those shares was illegal, a good title to them could not pass, and, therefore, that the title to them remained in the Oregon Short Line Railroad Co. This would have given the Oregon Short Line the control of the Northern Pacific Railway Company. But his position was not sustained by the courts.

‡The Union Pacific has a peculiar faculty for issuing and selling bonds and not exhibiting the mortgage instrument until weeks or even months afterward.

No Northern Pacific or Great Northern stock was included.

The significance of the Union Pacific's bond conversions described above will now be seen. By the time the Oregon Short Line's new refunding mortgage was given out, which was not in 1905, enough of the former company's bonds had been converted into stock to release not only the underlying shares of the Navigation Company but those of the Southern Pacific Company as well. These securities were substituted under the new mortgage thereby freeing the Northern Pacific and Great Northern stock for other purposes of the system. What was done with these securities we shall now see.

III.

INVESTMENTS IN OTHER RAILROADS.

We reach now the third and most recent stage in the history of the system or in the expansion of its interests—the investments made within the last year or two in sundry other railroads not closely connected with the system itself. These investments are closely connected with the financial operations arising out of the Northern Securities combination.

It might be maintained that the funds with which the Union Pacific Railroad Company and its auxiliary have carried on their vast operations of the past few months were those obtained by means of the bond issue of 1901, but which the subsequent conversion of those bonds freed for the general uses of the company. The fact that they were embodied for a time in Great Northern and Northern Pacific stock was merely an incident, an incident, however, which had important results.

The Oregon Short Line made the following disposition of its original Northern Securities stock.† Of the $82,491,871 of these shares originally acquired, $10,000,000 was sold for $16,880,019 cash, $72,491,871 was exchanged for $21,652,089 par value of Great Northern stock, $28,182,882 of Northern Pacific stock, and $724,919 of Northern Securities stubs. These shares might have been held as an investment. The 7 per cent. dividend paid by each of the two railroad companies would yield about $3,488,448 annually. The market prices of these two stocks became very high, however. The average market price of Northern Pacific stock during 1905 was about $199 a share; for January and February, 1906, during which time over one million shares changed hands, it was about $216 a share; for the first six months of 1906 it was about $205. The average price of the Great Northern stock during 1905 was about $290 a share; during the first half of 1906 it was about $306, and the quotations were as high as $348 per share at one time. At these prices the Union Pacific holdings in these two stocks together were yielding in dividends less 3 per cent. of their market value. There were other good railroad stocks which could be obtained at prices which would yield a much larger income. Manifestly, it would be merely a plain business proposition, if there were no other reason, to sell the Great Northern and Northern Pacific shares and reinvest the proceeds in other securities. This was done.

Other motives no doubt entered. The Great Northern and Northern Pacific lines paralleled those of the Union Pacific system, and to retain their shares might entail other legal complications. Then there were the old dreams of a continuous transcontinental railroad line from the Atlantic coast to the Pacific.

According to Mr. Mahl's testimony, of the original $28,182,882 of Northern Pacific stock acquired in the exchange, $24,030,082 par value was sold for $50,166,357.95, an average of $208.76 per share; $4,152,800 had been unsold at the date of the investigation (February, 1907). Of Great Northern stock, $21,652,089 par value was obtained in the exchange for Northern Securities stock, and $3,744,400 was acquired subsequently through a subscription to new stock at par. Of this, $16,360,089 par value was sold for $49,801,576.47, an average of $304.41 per share; $9,036,400 remained unsold at the date of the investigation. The Union Pacific also received on account of its holdings in Great Northern stock 90,364 shares of that company's ore certificates, which were quoted at from $70 to $85 per share.

From these sales, it will be seen, the Union Pacific realized in cash about $116,848,000. At the same time it retained securities which, at the same prices, were of the aggregate value in round numbers of about $43,000,000. According to Mr. Mahl's statement, the original Northern Securities stock cost $79,459,691.36. Presumably, this was the cost of the 781,080 shares of Northern Pacific preferred and common stock which were purchased in the first instance. As shown above, in the subsequent redemption of the preferred shares about $6,300,000 of this investment came back to the Oregon Short Line in cash. This would reduce the final cost of Northern Securities stock to about $73,159,700. Add to this the $3,744,400 of cash subsequently paid on the subscription for that amount of new Great Northern stock, and the total investment in these securities was about $76,904,100. To represent this the Union Pacific holds in securities or has realized in cash, as shown at the

†William Mahl, controller of the Union Pacific System, at the Interstate Commerce Commission's recent investigation.

beginning of the paragraph, about $159,848,000. This represents a profit in hand and on paper of about $82,943,900, or 113 per cent.

Some wonderment has been expressed concerning the source of the funds with which the Union Pacific made its vast stock purchases of the past few months. It has been stated that this company is the most potent factor in the investment market. The above account will show the source of at least the major portion of these funds. But what has been done with them?

It was reported that in September, 1904, Kuhn, Loeb & Co. had purchased several hundred thousand shares (variously estimated at from 300,000 to 480,000) of the capital stock of the Atchison, Topeka & Santa Fé Railway Company for the purpose of obtaining for the "Union Pacific interests" a minority holding sufficient to maintain "harmonious relations" between the two systems. Later President Ripley, of the Atchison, stated that Messrs. John D. Rockefeller and James Stillman had acquired $25,000,000 of his company's stock. These shares must have been held privately, however, since the Union Pacific's report as of June 30, 1905, which contains a detailed table of all securities owned by the company, shows that no Atchison stock was included in its holdings.

During that fiscal year, however, the Union Pacific acquired $10,343,100 out of the $19,544,000 of preferred stock of the Chicago & Alton Railway Company. In December, 1903, Kuhn, Loeb & Co. issued a circular asking for the deposit, with certain designated trustees, of the Chicago & Alton preferred stock for the purpose of selling it for cash or for the notes of any one or more dividend-paying railroad companies. If notes were taken, they were to bear not less than 5 per cent. interest per annum, mature in not more than five years, and be secured by this preferred stock itself. Large deposits under this agreement were reported. On October 1, 1904, Kuhn, Loeb & Co. announced the sale of this stock at $84 per share. The purchaser was not mentioned, but presumably it was the Union Pacific, since E. H. Harriman and two of his associates in Alton finances constituted the administrative committee under the agreement. In that case the Chicago & Alton shares cost the Union Pacific about $8,688,204. During the same year the Rock Island had also acquired $18,790,000 of Alton stock, and the two companies entered into an agreement for joint alternating control of this property.*

The Union Pacific's table of stocks and bonds owned (contained in its report as of June 30, 1906) does not show extensive investments up to that time in the share capital of independent railroad corporations. The company is shown to own still $15,436,400 par value of Great Northern stock and $13,352,800 of Northern Pacific. The Alton shares represented the only additional purchases up to that time. Yet there had been extensive sales of the former two stocks, enough to decrease the book value of the company's "Stocks and Bonds Owned" to the extent of $62,493,520. This is an enormous sum to lie idle, but it was not all idle. To represent the proceeds, the company had increased its cash on hand $13,913,318, bringing the total up to $21,258,883, its advances to other companies for construction purposes by $16,841,646, and held "Demand Loans" to the extent of $34,710,000, besides other smaller items. The last item is remarkable. As we have seen, during two former years the Union Pacific had lent the Southern Pacific Company over $20,000,000; but these were not carried as demand loans. The reader will wonder who the borrowers of this enormous amount of funds were. Were they other companies, officers of the Union Pacific, or were these funds put out on call loans in Wall street? He will be left wondering, for the company's report throws no light upon the subject.

After June 30, 1906, the Union Pacific made up for the time it had lost in the work of reinvesting its funds. According to the testimony of Mr. Mahl, the company purchased, between that date and the Interstate Commerce Commission's investigation, a mass of securities of an aggregate cost of $131,970,018.46. Summarized these consist of the following:

Acquired by the Union Pacific Railroad Company.

	Par value.	Cost.	Cost, per share.
Illinois Central R.R. Co.	$18,623,100	$32,618,883.53	$175.15
Railroad Securities Co.:			
Common stock	3,115,400	6,905,156.42	202.18
Preferred stock	1,898,400	1,917,988.42	101.03
St. Joseph & Grand Island:			
First preferred	932,000		
Second preferred	1,250,000	2,022,540.00	39.79
Common	2,900,000		
Fresno City Railway	495,650	106,110.98	21.47
Pacific Fruit Express*	1,200,000	1,200,000.00	100.00
Total	$30,712,550	$44,770,979.35	$145.77

*1% per cent. subscription to $12,000,000.

*The purchase of the greater portion of the capital stock of the old Chicago & Alton Railroad Company, made in 1899 by Mr. Harriman and three of his associates, that company's subsequent sale of a thirty two million dollar bond issue at $650 per 1,000-dollar bond out of the proceeds of which a 30 per cent. dividend was distributed to its stockholders, the recapitalization of this system through the organization of the Chicago & Alton Railway Company, the subsequent loans made to the latter company by Mr. Harriman in order to enable it to pay its preferred dividends, and the more recent consolidation of these two corporations into one—all this would make an interesting story. But to tell it would unduly extend this narrative; and, since the transactions were the private activities of Mr. Harriman and his associates rather than of the Union Pacific, a description of them has been omitted.

Acquired by the Oregon Short Line Railroad Company.

	Par value.	Cost.	Cost, per share.
Atch., Topeka & S. Fe preferred stock.	$10,000,000	$10,395,000.00	$103.95
Baltimore & Ohio: Common	32,334,200	38,801,040.00	120.00
Preferred stock	7,206,400	6,665,920.00	92.50
C., M. & St. Paul Ry. common	3,690,000	6,274,500.24	170.04
Chicago & Northwestern common	2,572,000	5,303,673.94	204.21
New York Central	14,285,745	19,634,324.93	137.44
Northern Pacific Ry.†	124,580	124,580.00	100.00
Total	$70,212,925	$87,199,039.11	$124.19
Total, both companies	100,925,475	131,970,018.46	130.76

†5 per cent. subscription to $2,491,600.

In computing the average cost, a par value of $100 a share is assumed in every case. Of the total, $45,466,960 was the cost of Baltimore & Ohio stock. Of this, it was stated by Mr. Harriman in the investigation, $36,393,432 was unpaid as yet, leaving $94,576,586 to represent the reinvestment of the proceeds of the sales of Great Northern and Northern Pacific stock. To this is to be added, possibly, the $8,688,204 paid for the Chicago & Alton shares in 1904. We have accounted in this way for $103,264,790 out of the $116,848,000 estimated above as constituting those proceeds. The Union Pacific's advances to other companies will account for the remainder.

At present rates of dividend, the annual income on all of these shares aggregates $4,693,703, which is nearly 4.55 per cent. on their cost. This is to be compared with the barely 3 per cent. which the Great Northern and Northern Pacific stocks yielded on their market value at the time of their sale. This annual income itself exceeds the total income received in dividends on those two stocks by $1,205,255. There is yet to be counted the income on the unsold Great Northern and Northern Pacific stock which would bring this excess up to $2,128,500. As before stated, the Union Pacific's sales and reinvestments were a good stroke of business.

Concerning the purchase of the Illinois Central's stock Mr. Harriman stated on the stand that control of this system was not one of the Union Pacific's motives, since control had not been acquired. This illustrates Mr. Harriman's acuteness in taking advantage of a technicality. Technically, the Union Pacific does not have control of the Illinois Central, since it owns only $18,623,100 out of the total amount issued of that company's stock—namely, $95,042,600; control of the Railroad Securities Company gives it voting power over possibly another ten millions owned by that company. But these holdings certainly give the Union Pacific a strong influence in the direction of the Illinois Central's affairs, and constitute a large nucleus about which to build up actual control of that company.

Further, Mr. Harriman's own words, as recorded in the minutes of the Union Pacific's board of directors, show that he did contemplate control of the Illinois Central when he advised the purchase of its stock. Summarized, Mr. Harriman's argument for the purchase was as follows: (1) The Union Pacific served a large grain-producing country, but had no line to the Gulf or to Chicago and the southeast; (2) the value of a system having low grades and extending from the territory north of the Missouri river to the Gulf will be enhanced by the Panama Canal; the importance of such a connection to the Union Pacific is very great; (3) the strategic value of the Illinois Central is little understood and appreciated, and its stock is bound to become much more valuable.

In the last argument Mr. Harriman might be interpreted as advising the purchase of the Illinois Central's stock for investment or speculative purposes. But there is certainly running through the entire argument the idea that the control of the Illinois Central would greatly benefit the Union Pacific on account of the latter's grain traffic. One proposition in which far-seeing railroad managers are coming to believe thoroughly is that eventually the foreign-bound grain from the Mississippi basin, and especially from the states west of that river, will move by way of the Gulf instead of the Atlantic ports. Because of this idea certain systems, notably the Rock Island and the Missouri Pacific, have been throwing lines into the Gulf ports. When this time comes, the Illinois Central will probably be the most strategically located railroad system for handling this grain traffic. The importance of that system to the Union Pacific in such an event can easily be seen. In the meantime its possession would give the latter an important connection with Chicago.

It was these ideas just as much as that of finding a good investment for the Union Pacific's funds which impelled Mr. Harriman to advise his company to pay $175 a share for Illinois Central stock and to buy Railroad Securities stock on the same basis. The fact that a large portion of both of these stocks was purchased from Mr. Harriman himself, and that he had acquired them at a much lower cost in years long previous, might be made the basis of criticism by his enemies. Fair consideration, however, will deprive it of any significance.

The above described stock purchases, we have intimated, might be considered to be the reinvestment of funds liberated, or rather borrowing capacity created, by the conversion into common stock of the Union Pacific's bond issue of 1901. The conversion of those bonds also made another financial measure possible. It reduced the fixed charges to the extent of $4,000,000 a year, through the conversion of an interest into a dividend claim. This, together

with the rapidly increasing earning power of the system placed the Union Pacific in a position where it could finance a part of its further capital requirements by means of the sale of preferred stock instead of bonds. The truth of this statement will be evident if one considers that although the interest charge which disappeared in the bond conversion was replaced by a much larger claim upon earnings for the payment of dividends, yet these dividends were upon common stock. Any new preferred stock which might be sold would present a claim for dividends which would be superior to that of the common stock. Such preferred stock ought to sell well, because after the conversion of those bonds a much larger portion of the net earnings would be left for dividend purposes.

It was this consideration which actuated the Union Pacific in its authorization, in April, 1905, of an increase to the extent of $100,000,000 in its preferred stock. The issuance of such stock at this time, had the capital requirements of the company necessitated the creation of some new security, would have been in accordance with a conservative and wise financial policy, for it would have economized the credit of the company. It would have left unimpaired the company's ability to issue bonds at a later date, should its need for capital funds again become pressing. However, although authorized for some unnamed "lawful corporate purposes," none of this preferred stock has been issued.

During all this time the Union Pacific had not been idle in its traffic department and in its work of building up its system internally. The growth of traffic earnings, income from investments and other sources, net income available for dividend payments, dividends, surplus income, and the appropriations therefrom for betterments and equipment are represented in the following table:

Union Pacific Operations.
(000 omitted.)

	1900.	1901.	1902.	1903.	1904.	1905.	1906.
Gross earnings	$39,148	$44,538	$47,500	$51,075	$55,279	$59,325	$67,282
Net earnings	18,952	20,201	23,311	23,735	26,253	28,954	32,020
Income from investmts. etc.	2,744	3,221	4,581	4,648	5,520	6,497	10,330
Gross income	21,695	23,122	27,891	28,383	31,772	35,451	42,350
Fixed charges	9,108	9,525	13,388	13,107	13,922	12,665	10,586
Net income	12,588	13,598	14,503	15,277	17,850	22,786	31,765
Dividends	7,744	8,420	8,197	8,333	8,333	10,087	19,532
Betterms & equipmts.	2,000	1,500	2,000	2,000	3,500	4,479	4,200
Other adjustments*	- 2,403	.....	- 220	- 5,173	+ 110	+ 385	- 125
Net surplus	5,247	3,678	4,526	—229†	6,127	8,605	8,158

*Net increase to income, +; net decrease, —
†Net deficit

The enormous increase between 1900 and 1906 of $28,134,000 in gross earnings is seen at a glance. This is nearly 42 per cent. Not less striking, the net earnings have increased $13,068,000, or 69 per cent. This shows economy in the operating department. This economy has not been secured by under-maintaining the property or equipment, however, for the Union Pacific, like the Southern Pacific, makes maintenance expenditures which are well above the average of those on other systems.

Probably the most remarkable line in the table is that representing the income from investments, loans, etc., showing an increase in this income from $2,744,000 to $10,330,000. The amount for 1906 was more than sufficient to pay half of the dividends of that year, and exceeded the entire amount of the dividends distributed in 1905. The increase in this income has been most marked within the last year included in the table, and is due in part to the commencement of dividends on Southern Pacific common stock, in part probably to the interest on the $34,710,000 of "Demand Loans" spoken of above. Owing to these increases in income and to a reduction in fixed charges in recent years, due to the conversion of the 4 per cent. bonds of 1905, the net income available for the payment of dividends has increased at an even greater rate, namely, $19,177,000, or 152 per cent.

The dividend payments have grown rapidly since 1904. This is due to two causes; namely, an increase in the rate to common stockholders and the aforesaid conversion of bonds into that stock. In September, 1905, the common stock was placed on a 5 per cent. basis. In April, 1906, it was advanced to 6 per cent. Finally, for October, 1906, it was placed at 10 per cent., the semi-annual dividend of 5 per cent. being payable 3 per cent. from earnings and 2 per cent. from the income from investments.

The manner in which this last dividend was announced has brought upon Mr. Harriman and his associates probably more deserved criticism than any other act. The boards of directors of the Southern Pacific Company and of the Union Pacific Railroad Company met in the same room at practically the same time. The former transacted its business first. The enormous growth in that company's net earnings, its directors thought, justified them in commencing the payment of dividends to the common stockholders, and accordingly that stock was placed on a 5 per cent. basis. The Union Pacific board then transacted its business, declaring the customary 2 per cent. semi-annual dividend on its preferred stock and the common stock dividend, as described above. So far all is well. But a report concerning these actions was not given out until two days afterwards. When this report should finally be given forth, both the Union Pacific and Southern Pacific stocks would rise many points, as they did rise afterwards, on the market. Here was an excellent opportunity for those with [illegible] of profits by buying these stocks at the existing prices and selling them on the advance. Whether this was actually done, no one knows but those who had this knowledge ramely, the directors of the two companies. Mr. Harriman explained the fact that two of the Union Pacific's directors were not present at the first meeting and he thought it advisable to inform them of the action before making a public announcement. This may be so, and those who were in possession of the confidential knowledge may not have used their knowledge to gain a single dollar for themselves. Yet it does not seem that the importance of giving the other two directors advance information was great enough to warrant the giving of such an *opportunity* for amassing illegotten gains.

But, after paying dividends amounting to 10 or 20 millions of dollars, the company has had vast sums left for betterments and other purposes. For instance, in 1905, $4,479,000 was spent upon or appropriated for betterments and equipment, and charged against the surplus account, yet $8,605,000 remained of the year's earnings to increase the formal surplus. In 1906, after paying $19,532,000 in dividends and after charging another $4,200,000 against the surplus account for similar purposes, it again had $8,158,000 to carry to its surplus account. This surplus, too, it must be remembered, is not kept in the form of idle cash, but is also expended upon betterments, in the purchase of additional new equipment, or by way of advances to other companies (notably the San Pedro, Los Angeles and Salt Lake) to aid them in the construction of their properties. Its use differs from the previously mentioned appropriations only in that the cost of these things is added to the "cost of railroads and equipment" account or carried as "advances for construction," *i.e.*, is treated as a capital expenditure instead of being technically classed as an expense, and deducted from "surplus income."

The financial strength, and, yes, we may even say the financial conservatism, of the Union Pacific Railroad Company are brought out in the above description. A brief restatement of certain facts will throw the policy of the Union Pacific management more strongly into relief. Mr. Harriman has enforced for this company the highest standard of maintenance for roadway and equipment of any railroad system west of the Mississippi river. The expenditure for maintenance of freight equipment until 1904 was, perhaps, somewhat below the standard set by other systems, being about 4½ mills per mile run (for freight cars) as compared with 5 to 6 mills on other lines; but the Union Pacific's expenditure on this branch of the equipment rose to 6.13 mills in 1905 and 6.87 mills in 1906—figures which are as much above the standard as the earlier amounts were below it. The expenditure for the maintenance of the passenger equipment during the last five years has averaged 1.25 cents per mile run of those cars, or more than 25 per cent. more than is expended by other western companies. To maintain the locomotive equipment, the company has allowed an average of about 9.82 cents per mile run, or 50 per cent. more than comparative statistics would indicate as necessary to keep this branch of the equipment in good operating condition. The alkaline character of the water used in the boilers over a considerable portion of the system will account for a part of the excessive allowance for locomotive maintenance, but not for all of it. These expenditures mean that, as the company's equipment wears out, it is replaced with more capacious and better equipment, the entire cost of which is charged as an expense; they mean, also, that the old equipment is sent to the scrap heap earlier in its life than is similar equipment on other systems.

In a similar manner the Union Pacific has allowed an average, during the last five years, of $1,256 per mile per annum to maintain its roadway, while other western companies have been expending only $800 and $900 per mile on their lines. These expenditures result in giving the Union Pacific an excellent roadbed and track over which to roll its traffic and an adequate equipment with which to handle it economically.*

All of these liberal maintenance allowances the Union Pacific charges as a part of the expense of operation. They are taken into account before net earnings are ascertained. Yet, in spite of their great magnitude, the company has the large net earnings indicated in the table exhibited above—earnings which are large enough to pay fixed charges of nearly $10,600,000 and the huge dividends of over $19,500,000 distributed in 1906, and still leave a surplus reserve of nearly $2,000,000 for other purposes. But to these earnings the company adds a vast sum—it was more than $10,300,000 in 1906, and will approximate $14,000,000 in 1907—received as income from investments in the stocks of other railroad systems. In fact, the Union Pacific could completely abandon the operation of its railroad lines and still receive, as tribute from the Alton, the Atchison, the Baltimore & Ohio, the North-Western, the St Paul, the Illinois Central, and the other great railroad systems whose stocks it owns, enough income to pay its fixed charges and the customary 4 per cent. dividends on its preferred stock.

*For a striking comparison between the [illegible] management policies of the Union Pacific and its great rival, the Great Northern, see the *Wall Street Journal* for June 26 1907.

Live Rail Accidents in England.

It is clear that the North Eastern does not desire to conceal its satisfaction with electric traction working. It has found it just the help that was required in meeting the electric trolley car competition which sucked away its traffic in the district about Newcastle in its pre-electric days. At the last half-yearly meeting it was shown that though the cost of electrical working had shown a slight increase caused by the running of a larger number of trains and car miles, the receipts have made a more than corresponding increase, with the result that the takings for these sections have now got back to practically what they were when the tramways began running. The length of route of running lines is 29.5 miles electrical operated on a 600-volt, direct-current system, with multiple unit control.

It will be remembered that three to three and a half years ago, when the converted lines were opened, there was some disquiet occasioned by the number of accidents that occurred through trespassers and some employees coming into contact with the third rail. The same experience was also recorded in the case of the Lancashire & Yorkshire Liverpool-Southport section. As time has worn on it has been shown that these disasters were largely due to unacquaintance with the conditions attending live rail traction. The railroad authorities took special precautions for preventing trespassers from finding their way on to the track and for the guarding of the third rail at exposed places. Additional bridges were erected in the neighborhood of certain of the crossings, and these various measures together with a better knowledge of the danger on the part of the public and railroad employees, have led to a very gratifying falling off in the fatalities.

English electrical experts are quiet again just now, but the danger of the live rail between tracks was one of their strong arguments in favor of the single-phase alternating current system. The statistics that have been officially compiled of the live rail fatalities during 1906 will not help them in that argument, whatever may be the relative merits of the two systems on other grounds. The only shock fatality—apart from those of trespassers—was to a railroad employee. The only other deaths were those of three trespassers. Of these four, one occurred on the Lancashire & Yorkshire, one on the Metropolitan District and two on the North Eastern. There were 21 persons injured, and of these 10 were railroad employees and eight were trespassers.

These four deaths and 21 injury cases in 1906 on eight electric systems may be compared with eight deaths and 20 injuries in 1904, when only three of the railroads were electrified, and it is at once clear that the better guarding of the rail, the publishing of placard warnings, better fencing, and a closer knowledge of potential danger on the part of employees and the public, have been in a great measure effectual.

Experience in England in all departments of electrical application is showing how necessary it is that the worker in the vicinity of live apparatus or conductors should be fully warned concerning the possible dangers attending his employment. An examination of recent returns shows that carelessness, recklessness and foolhardiness are responsible for far too many fatalities. It has been the custom in power stations of all kinds, and latterly on electric railroads, to circulate illustrated wall sheets and pocket pamphlets describing the most effective methods of handling a man under shock, and this is an instructive warning. The Government Department (Home Office) dealing with such matters is about to order the use of such wall sheets in all factories where electricity is used at above 130 volts continuous and 65 volts alternating.

The Connecticut Avenue Concrete Bridge at Washington, D. C.

The concrete arch bridge carrying Connecticut avenue over Rock creek gorge in the outskirts of Washington, D. C., is now nearly completed. It consists of five main arches, full centered and of 150-ft. span, and one small flanking arch of 82-ft. span at each end. With the abutments it has a total length of 1,341 ft., and the roadway is 125 ft. above the level of Rock creek. It carries a 35-ft. roadway and two 8-ft. sidewalks and is 52 ft. wide over the faces of the arch rings. The roadway is carried over the haunches of the main arches by seven spandrel arches of 14-ft. span supported on piers 3 ft. thick, the middle arch being blanked by a face wall carried up from the piers. The main arch piers are 20 ft. thick and rest on rock foundations; the abutment piers next to the flanking arches are 31 ft. thick. The arch rings are monolithic concrete without reinforcement and are 5 ft. thick at the crown. All the quoins, ring stones, mouldings, etc., are molded concrete faced with mortar and bush hammered to give the same finish as the granite balustrades and coping. In all, nearly 60,000 yds. of concrete have been used in the superstructure and 50,000 yds. of earth filling.

The Connecticut Avenue Bridge; View from the South End.

The Connecticut Avenue Bridge over Rock Creek, Washington, D. C.

The District Construction Co., of Washington, D. C., was the contractor for the superstructure. The bridge cost nearly $1,000,000, and was designed and built under the direction of W. J. Douglas, Engineer of Bridges for the District of Columbia.

Locomotive Boiler Inspections in New York State.

The Legislature of New York last spring amended the requirements for locomotive boiler inspection to read substantially as follows:

Inspection of Locomotive Boilers.—It shall be the duty of every railroad corporation operated by steam power, within this state, and of the directors, managers, or superintendent of such railroad, to cause thorough inspections to be made of the boilers and their appurtenances of all the steam locomotives which shall be used on said railroads. Inspections shall be made, at least every three months under the direction of said corporation by persons able to perform the services required of inspectors of boilers, and who from their knowledge of the construction and use of boilers and the appurtenances therewith connected, are able to form a reliable opinion of the strength, form, workmanship and suitableness of boilers, to be employed without hazard of life, from imperfections in material, workmanship or arrangement of any part. All boilers shall comply with the following requirements: The boilers must be made of good and suitable materials, the openings for the passage of water and steam respectively, and all pipes and tubes exposed to heat shall be of proper dimensions; the safety valves, fusible plugs, low water glass indicator, gage cocks and steam gages, shall be of such construction, condition and arrangement that they may be safely employed without peril to life; and each inspector shall satisfy himself by thorough examination that said requirements have been fully complied with. No boiler, nor any connection therewith shall be approved which is unsafe in its form, or dangerous from defects, workmanship or other cause. The inspector if he approve of the boiler and appurtenances throughout, shall make a certificate which shall contain the number of each boiler inspected, the date of its inspection, the condition of the boiler inspected, and such details as may be prescribed by the railroad commissioners. Every certificate shall be verified by oath and shall be filed in the office of the railroad commissioners, within ten days after each inspection, and also a copy thereof with the chief operating officer or employee of such railroad having charge of the operation of such locomotive boiler; a copy shall also be placed in a conspicuous place in the cab connected with the locomotive boiler inspected, and there kept framed under glass. The railroad commissioners shall have power to formulate rules and regulations for the inspection and testing of boilers. If it shall be ascertained by such inspection and test or otherwise, that any locomotive boiler is unsafe for use, the same shall not again be used until it shall be repaired, and made safe. Every corporation, director, manager or superintendent operating such railroad and violating any of the provisions of this section shall be liable to a penalty of $100 for each offense, and the further penalty of $100 for each day they shall neglect to comply with said provision, and the making or filing of a false certificate shall be a misdemeanor, and every inspector who wilfully certifies falsely touching any steam boiler, or appurtenance, or any matter contained in any certificate, signed and sworn to by him, shall be guilty of a misdemeanor. Any person, upon application to the secretary of the board of railroad commissioners, and on the payment of a reasonable fee shall be furnished with a copy of any such certificate.

Care of Steam Locomotives; Steam and Water Cocks; Penalty.—It shall be the duty of every corporation operating a steam railroad within this state, and of its directors, managers or superintendents, to cause the boiler of every locomotive used on such railroad to be washed out as often as once every 30 days, and to equip each boiler with, and maintain thereon at all times, a water glass, showing the height of water in the boiler, having two valves or shut off cocks, one at each end of such glass, which valves or shut-off cocks shall be so constructed that they can be easily opened and closed by hand; also to cause such valves or shut-off cocks and all gage cocks or try cocks attached to the boiler to be removed and cleaned whenever the boiler is washed out, also to keep all steam valves, cocks and joints, studs, bolts and seams in such repair that they will not at any time emit steam in front of the engineer, so as to obscure his vision. No locomotive shall hereafter be driven in this state unless the same is equipped and cared for in conformity with the provisions of this section; but nothing here contained shall be construed to excuse the observance of any other requirement imposed by this chapter upon railroad corporations, their directors, officers, managers and superintendents. Every corporation, person, or persons operating a steam railroad and violating any of the provisions of this section, shall be liable to a penalty of $100 for each offense, and the further penalty of $10 for each day that such violation shall continue. The board of railroad commissioners shall enforce the provisions of this act.

The law went into effect September 1, and on August 20 the Public Service Commission, Second district, which assumed all of the duties of the State Railroad Commission mentioned in the Act, issued complete instructions and regulations for inspecting, testing and washing locomotive boilers together with forms for making reports. The regulations are as follows:

GENERAL CONSTRUCTION AND SAFE WORKING PRESSURE.

The chief mechanical officer of each railroad company will be held responsible for the general design, construction and inspection of the locomotive boilers under his control. The safe working pressure for each locomotive boiler shall be fixed by the chief mechanical officer of the company or by a competent mechanical engineer under his supervision. The safe working pressure must be determined in accordance with calculations of the various parts after full consideration has been given to the general design, workmanship and condition of the boiler.

INSPECTION OF INTERIOR OF BOILER.

(a) *Time of Inspection.*—The interior of every boiler shall be thoroughly inspected before the boiler is put into service, and also whenever a sufficient number of flues are removed to allow examination.

(b) *Flues to be Removed.*—All flues shall be removed at least once every three years and a thorough examination made of the entire interior of the boiler. After the flues are taken out, the inside of the boiler must have the scale removed and be thoroughly cleaned.

(c) *Method of Inspection.*—The entire interior of the boiler must then be examined for cracks, pitting and grooving. The edges of plates, all laps, seams and points where cracks and defects are likely to develop, or which an exterior examination may have indicated, must be given an especially minute examination. It must be seen that braces and stays are taut, that pins are properly secured in place, and that each is in condition to support its proportion of the stress.

(d) *Repairs.*—Any boiler developing cracks in the shell shall be taken out of service at once and thoroughly repaired before it is reported to be in satisfactory condition.

(e) *Lap Joint Seams.*—Every boiler having lap joint longitudinal seams without reinforcing plates shall be examined with special care to detect grooving or cracks at the edges of the seams.

INSPECTION OF EXTERIOR OF BOILER.

The jacket and lagging shall be removed at least once every three years, and also whenever the inspector considers it desirable or necessary in order to thoroughly inspect the boiler.

TESTING BOILERS.

(a) *Time of Testing.*—Every boiler before being put into service, and at least once every 12 months thereafter, shall be subjected to hydrostatic pressure 25 per cent. above the working steam pressure.

(b) *Removal of Dome Cap.*—Preceding the hydrostatic test the dome cap and throttle pipe must be removed and the interior surface and connections of the boiler examined as thoroughly as the conditions permit.

(c) *Foreman to Witness Tests.*—When boilers are being tested by hydrostatic pressure the foreman of the shop having under his charge the repairs of boilers, or an authorized competent boilermaker, shall personally attend and assist the inspector in his examination.

(d) *Repairs and Steam Test.*—When all necessary repairs have been completed, the boiler shall be fired up and the steam pressure raised to not less than the allowed working pressure.

STAY BOLT TESTING.

(a) *Time of Testing Rigid Bolts.*—All stay bolts should be tested at least once every month, and no boiler must be used over three months under any circumstances unless thorough stay bolt inspection has been made. Stay bolts shall also be tested immediately after every hydrostatic test.

(b) *Method of Testing Rigid Bolts.*—The inspector must tap each bolt from the firebox side and judge from the sound or the vibration of the sheet which of them are broken. If stay bolt tests are made when the boiler is filled with water there must be not less than 50 lbs. pressure on the boiler. This will produce sufficient strain upon the stay bolts to cause the separation of the parts of the broken ones. Should the boiler not be under pressure the test may be made after draining all the water from the boiler, in which case the vibration of the sheet will indicate any unsoundness. The latter test is preferable.

(c) *Method of Testing Flexible Stay Bolts.*—All flexible stay bolts having caps over the outer ends shall have the caps removed at least once every year, and also whenever the inspector considers the removal desirable in order to thoroughly inspect the stay bolts. The firebox sheets should be examined carefully at least once a month to detect any bulging or indications of broken stay bolts.

(d) *Broken Stay Bolts.*—No boiler must be allowed to remain in service when there are two adjacent stay bolts broken in any part of the firebox or combustion chamber, nor when three or more are broken in a circle 4 ft. in diameter.

(e) *Tell Tale Holes.*—All stay bolts shorter than 8 in. applied after September 1, 1907, except flexible bolts, shall have tell tale holes $^{3}/_{16}$ in. diameter by 1¼ in. deep or more in the outer end. These holes must be kept open at all times, and must not in any case be plugged. All stay bolts shorter than 8 in., except flexible bolts, shall be drilled when the locomotive is in the shop for heavy repairs or at other suitable opportunity, and this work must be completed prior to January 1, 1909.*

STEAM GAGES.

(a) *Location of Gage.*—Every boiler shall have at least one steam gage which will correctly indicate the working pressure. Care must be taken to locate the gage so that it will be kept reasonably cool, particularly in case of gages located on the back head of boilers.

(b) *Siphon.*—Every gage shall have a siphon of ample capacity to prevent steam entering the gage. The pipe connection shall enter the boiler shell direct, and shall be maintained steam tight between siphon and gage.

(c) *Time of Testing.*—Steam gages should be tested at least once every month, and no boiler must be used over three months under any circumstances unless a thorough test has been made of the steam gage.

*Applications from companies desiring to omit the use of tell tale holes will be considered when it can be shown to the satisfaction of the commission that unusual care is used in stay bolt testing, both as to the frequency of tests and the selection of inspectors.

SAFETY VALVES.

(a) *Number and Capacity.*—Every boiler shall be equipped with at least two safety valves, the capacity of which shall be sufficient to prevent, under any conditions of service, an accumulation of pressure of more than 5 per cent. above the allowed steam pressure.

(b) *Setting of Valves.*—Safety valves shall be set by the gage employed upon the boiler, to pop at pressures not exceeding 5 lbs. above the allowed steam pressure, the gage in all cases to be tested before the safety valves are set or any change made in the setting. When setting safety valves the water level in the boiler must not be above the highest gage cock.

(c) *Time of Testing.*—Safety valves should be tested under steam at least once in every month, and no boiler must be used over three months under any circumstances unless the safety valves have been thoroughly tested.

WATER GLASS AND GAGE COCKS.

(a) *Number and Location.*—Every boiler shall be equipped with at least one water glass and three gage cocks. The lowest gage cock and the lowest reading of the water glass shall not be less than 3 in. above the highest part of the crown sheet.

(b) *Water Glass Valves.*—All water glasses shall be supplied with two valves or shut-off cocks, one at the upper and one at the lower connection to the boiler, and also a drain cock, so constructed and located that they can be easily opened and closed by hand.

(c) *Time of Cleaning.*—All gage cocks and water glass cocks shall be removed and cleaned of scale and sediment whenever the boiler is washed.

PLUGS IN FIRE TUBES.

(a) *Plugs Prohibited.*—No boiler shall remain in service which has one or more fire tubes plugged at both ends of the tube unless the plugs are securely tied together by means of a rod not less than ⅝ in. diameter.

WASHING BOILERS.

(a) *Time of Washing.*—All boilers shall be thoroughly washed not less frequently than once in 30 days.

(b) *Plugs to be Removed.*—When boilers are washed all washout, arch and water bar plugs must be removed.

(c) *Water Tubes.*—Special attention must be given the arch and water bar tubes to see that they are free from scale and sediment.

(d) *Office Record.*—An accurate record of all locomotive boiler washouts shall be kept in the office of the railroad company. The following information must be entered on the day that the boiler is washed:

(1) Number of locomotive;
(2) Date of washout;
(3) Statement that boiler was washed;
(4) Signature of the boiler washer or the boiler inspector;
(5) Statement that gage cocks and water glass cocks were removed and cleaned;
(6) Signature of the boiler inspector or the employee who removed and cleaned the cocks.

STEAM LEAKS.

(a) *Leaks Under Lagging.*—If a serious leak develops under the lagging an examination must be made and the leak located. If the leak is found to be due to a crack in the shell or to any other defect which may reduce safety, the boiler must be taken out of service at once and thoroughly repaired before it is reported to be in satisfactory condition.

(b) *Leaks in Front of Engineer.*—All steam valves, cocks and joints, studs, bolts and seams shall be kept in such repair that they will not at any time emit steam in front of the engineer, so as to obscure his vision.

FILING OF REPORTS.

(a) *Specification Card.*—A specification card containing the results of the calculations made in determining the working pressure and other necessary data shall be filed in the office of the Public Service Commission, Second district, for each locomotive boiler. A copy shall also be filed in the office of the chief mechanical officer having charge of the locomotive. Every specification card shall be verified by the oath of the engineer making the calculations, and shall be approved by the chief mechanical officer. These specification cards shall be filed as promptly as thorough examination and accurate calculation will permit. Where accurate drawings of boilers are available, the data for specification card may be taken from the drawings, and such specification cards must be completed and forwarded prior to March 1, 1908. Where accurate drawings are not available, the required data must be obtained at the first opportunity when general repairs are made, or when flues are removed. Specification cards must be forwarded within one month after examination has been made, and all examinations must be completed and specification cards filed prior to January 1, 1909, flues being removed if necessary, to enable the examination to be made before this date.

(b) *Certificate of Inspection.* Not less than once in three months and within 10 days after each inspection, a certificate of inspection shall be filed with the Public Service Commission, Second district, for each locomotive boiler used by a railroad company, and a copy shall be filed in the office of the chief officer having charge of the locomotive. A copy shall also be placed under glass in a conspicuous place in the cab of the locomotive before the boiler inspected is put into service. Each certificate shall give the number and the condition of the boiler inspected, the date of the inspection and other required details, and each certificate shall be verified by the oath of the inspector.

(c) *Reporting Washouts.*—The inspector shall examine the record of boiler washouts on file in the company's office not less frequently that once every three months, and if he is satisfied of its accuracy he shall enter the dates of every washout made during the preceding three months on the certificate of inspection. In case the record is not satisfactory the inspector shall make notation thereof on the certificate.

COPIES OF REGULATIONS.

The chief mechanical officer of each railroad company shall keep each inspector of locomotive boilers under his supervision supplied with a copy of these regulations. Copies can be obtained upon application to the Secretary of the Public Service Commission, Second district, Albany, N. Y.

Track Work Involved in the New York Central's Reversal of the Direction of Traffic.

In the *Railroad Gazette* for August 30, page 227, was given some account of the signal work made necessary by the change from left-hand running to right-hand running, on August 25, of trains on the Harlem Division within the Electric Zone. In addition to this, the track work involved was considerable and interesting, because only a part of the construction could be entirely completed beforehand, and all connecting up and putting in service was concluded in about twelve hours.

The entrances to the tail-end yards were previously revised so as to make a trailing switch entrance from the new direction of traffic. This caused a substantial rebuilding of the yards with the installation of new switches, the building of roadways, and in two cases the previous moving of the freight houses to locations where they could be used both before and after the change. It involved also much work in taking care of the industries affected and the making of new leases and negotiations for private sidings. The crossovers in main tracks were reversed, and in some cases the locations were revised. The new crossovers were installed beforehand and spiked ready for service where it was possible to do this. Wherever the old crossovers prevented this anticipation of a change as much work as possible was done beforehand. The rails were cut and material was at hand for a quick completion of the work. The inner guard rails were pointed for the new direction of traffic. Bridge ticklers were erected to warn trainmen on top of cars that they were approaching an overhead obstruction. There were forty-two bridges for which tell-tales were required.

In the main tracks rigid crossing frogs were replaced by movable point frogs and the electric circuit was designed to prevent the switches being thrown under a train. This did away with the unprotected portion of the rigid crossing formerly in use and substituted a continuous rail for traffic which should outlast the old arrangement and make an easier riding track.

At the Harlem river draw bridge the lift rails have mitered ends fitting those which they meet on the draw. These mitered ends must have their chisel edges pointed away from the direction of traffic, and, due to the reversal, this whole construction needed to be taken out and changed so as to make the points trailing. This meant removing 1,150 ft. of rail in the four tracks, substituting new insulators and insulated tie-rods and clips. As the track is on a steel structure, this was precise work. The new track had to be drilled for the negative return current from operation, and this single item, drilling and bonding cost $475 during the 15 hours in which the change was made.

The point of departure of the New Haven track from the Harlem track was shifted to a place one-quarter mile south from the old junction. From the Grand Central Station to this point the double-equipped New Haven electric motors are fed with direct current from the under contact third rail. Here they change to the overhead contact with alternating current. This point, therefore, becomes a new third rail terminal. The new construction involved a change of colors in about 1,200 lights in switch lamps and repainting the switch targets to conform to the new color indications. The change in color indications involved an additional complication both in construction and in practice in drilling the men. Green instead of white now means proceed and yellow means caution. The changes necessitated the quick use of many barrels of paint and many thousand carefully chosen words used in lectures to the men. There was also a change in nomenclature in which the men had to be drilled. The numbers by which the main tracks were known were reversed in order, the westerly main track became No. 1 and the other tracks numbered consecutively eastward, so that the easterly track became No. 4. At the same date a new time table went into effect, so that nearly every one on the line was kept busy in learning new things.

At Mott Haven Junction the electro-pneumatic controlled manual signals were kept in operation, but were rebuilt and modernized during the period of change. During this period the trackmen threw the switches by hand, flagged trains and set up routes through this busy junction under the direction of the towermen. The trackmen were also used as watchmen and inspectors of the condition of tracks at every spot where changes were made.

The adaptation of northbound tracks to southbound running involved a revision of the superelevation of track on many curves. The grades and reversal of approaches and departures at stations made material changes in possible speed and in operating limitations to speed. New calculations were made and the heights of the outer rail were readjusted.

The pneumatic interlocking plants have been heretofore arranged for a switch throw of 4 in. The new interlocking plants are arranged for a throw of 5 in. The track work involved in this change was considerable. All switch rods in these plants were insulated and were redrilled for the wider throw. This was work of precision and accuracy, and to secure it all available draftsmen and instrumentmen were detailed to measure and inspect the progress of the work.

The changing of the position of signs and the making of new signs on the track and at stations was also a considerable undertaking. Almost everything of this character had to be moved to new places. Slow order signs, resume speed signs, yard limit signs, all and many others were changed. Notices to the public in the stations were changed so as to guide all except absent-minded persons to the proper departure place of trains, and new notices, conspicuously placed, were put up to assist in this. This included the signs adjacent to the tracks in the waiting-rooms and on the stations. There was a change in the lighting of the signs in Park avenue tunnel and also a making, painting and placing of signs on the new towers, designating those towers as described in the train orders. Involved, too, in this same department of the work was the moving of the benches on the platforms. These are required principally near those tracks used by outgoing passengers, and a change in the direction of traffic meant a change in the bench location at all places where the platforms are separated into two groups.

At 125th street station it was necessary to extend the platform south, so that the baggage cars could stop near the baggage elevator and still allow landing platform room for passengers.

At Claremont Park the new southerly entrance to the freight yard went through the passenger platform. An overhead bridge has been designed from the overhead station to the platform to allow for this, but has not yet been received. To allow for the change it was necessary to shift the canopy back, make temporary stairs and platform for passengers to walk across this entering track.

At the Harlem river drawbridge the new location of the tower and the new signal interlocking made necessary new rules for communication between the bridge foreman and the towerman controlling the opening of the draw.

The changes in third rail were such as were needed to allow for track changes, and an adaptation of third rail to the new direction of operation. The two-bolt angle plates connecting the third rails were bolted tightly on the receiving end of the third rail, but loosely on its leaving end. The idea of this was to allow more room for expansion, as the bolts are covered by the sheathing and cannot be readily loosened and tightened in changing temperature. The location of the third rail appeared all right, except when forced upward by the shoe of a passing train, at which time a slight lip or jog was caused between the ends of the adjacent rails. To tighten these bolts meant taking off the sheathing at all joints throughout the Electric Division. All end inclines were carefully gaged in the new direction of traffic and test trains were run against traffic to see if any further trouble developed.

To make the change there were employed: General Railway Signal Company men who were responsible for the completion of their contract to erect the new signals; inspectors from the signal engineer who were responsible for the proper inspection and correct working of the new installation; maintainers from the engineer of signals who were responsible for the maintenance and care of the new system.

To co-ordinate the different departments involved in the change, it was decided to have one boss, a director representing the four departments. Mr. H. S. Balliet, Engineer of Signals, was so appointed. All instructions affecting the work were issued through him, so that there would be no chance of confusion or lack of understanding. During the work progress reports were telephoned or telegraphed to Mr. Balliet from each point, and any one wishing to get information about his own work or somebody else's work could find out the condition from Mr. Balliet. To assist in this communication, lists of all public telephones adjacent and available for use, were given to each foreman.

The territory was divided into sections, each one being under the jurisdiction of a signal inspector, who was responsible for the proper carrying out of changes affecting the operating of the signal. As the operation of the signal guided the operation of trains that meant the whole change. With him was a signal company representative, a signal maintainer and a trackman, each with the necessary forces to complete such work as was assigned to him. The time for unspiking the new switches and spiking up the old switches was arranged for in advance, each territory having a program for each portion of the work issued as a bulletin over the signatures of the four officials in general charge of the work. However, the actual placing in service of these tracks was only done on orders from the director in order to guard against any trouble.

The determining point in the change seemed to be the Harlem river drawbridge. At 7 p.m., August 24, tracks Nos. 2 and 3 were put out of operation, the current on the third rail killed and the work of taking out the old lift rails and installing, bonding and connecting up the new was begun. This was completed together with the signal work about 4 o'clock in the morning, at which time tracks Nos. 2 and 3 went into service for right-hand operation, tracks Nos. 1 and 4 put out of service, and the work of equipping these latter tracks for right-hand running began. This was completed about noon Sunday.

At daylight Sunday morning the work of changing notices to the public and signs affecting movement of trains was begun, and was completed by the time the out-of-town movement for the day began.

Philippine Railroad Building with Filipino Builders.

When the concession for building, equipping and operating the new system of railroads in the Philippine Islands, Panay, Negros and Cebu, was let by the Government in January, 1906, to a syndicate, including Wm. Salomon & Co., Cornelius Vanderbilt, International Banking Corporation, J. G. White & Company and others, under the name of the Philippine Railway Company, the first problem which had to be met was the selection of the chief construction and operating officials. The second problem was that of

Map of the Philippine Railways in Visayan Islands.

labor, and the third, in part still in process of solution, was the development of standards of construction and equipment best adapted to the conditions. These three primary considerations have been stated in what is estimated to be the order of their importance.

After a careful investigation of the records of several well known railroad construction engineers, whose services were available, the contracting company chose as Chief Engineer for construction Edward J. Beard, Principal Assistant Engineer of the Chicago, Rock Island & Pacific Ry. In organizing the operating staff of the Philippine Railway Company, William B. Poland, formerly on the Baltimore & Ohio Southwestern, was made Vice-President and chief operating officer.

Not until these officers had gone to the Islands and completed close personal studies of the labor conditions in the archipelago generally, and in the Visayan group in particular, was it felt safe to map out the labor policy, the second important problem. This

involved primarily the question whether Filipinos should be employed or whether the Government should be asked to let down the bars temporarily and admit Chinese coolies for the work, under deportation bond. There was a strong feeling current among business men experienced in the affairs of the islands that because of the many previous expensive trials of native labor on road making and like work that the Filipinos were not up to this greater job and that Chinese labor would have to be depended on to complete the project. Because of this general trend of opinion it might have been possible to get governmental permission to import Chinamen but no attempt in that direction was ever made. The counsel of Mr. Beard, coupled with the previous successful experience of the contractors, J. G. White & Co., in using natives on the Manila Street Railway and power plant and upon various harbor works, caused the decision to be made in favor of Filipino labor, at the beginning of operations in the summer of 1906. Doubts as to the wisdom of this decision were quite freely expressed by many of those interested in the enterprise, but the decision proved right.

Before describing how the details of policy were formulated and how the whole programme has worked out in practice, it is well to outline the successive steps in the organization of the Philippine Railway Co. up to the point of breaking ground. This is the largest railroad project and probably the largest engineering development of any kind ever advanced by Americans over seas without any cooperation or help from foreigners, in addition to being far larger than any single industrial development of any kind previously carried out in the Philippines. Under its franchise, there is conceded to the Philippine Railway Company by the Philippine Commission through special act of Congress, the privilege of building and operating perpetually between 300 and 400 miles of road, almost equally divided between the Visayan islands of Panay, Negros and Cebu, and the 4 per cent. interest on the 30-year gold bonds of the company is guaranteed by the Government. The route and terminals

Terminal Yards at Cebu and Construction Tracks.

tentatively planned by the Government are shown on the accompanying map. Only after the most exhaustive study of the resources and topography of these islands, through the United States Government records and through reconnaissance surveys by special representatives,* did the associated bankers decide to bid for the work and organize a syndicate to carry it out. These studies indicated potential wealth in the Visayas awaiting for development only the completion of adequate and economical transportation, and these resources quite overshadowed difficulties of construction. Another source of information that should be mentioned was the statistical records of the Spanish priests in the Philippines, about the most valuable documentary heritage of the United States from Spain.

Throughout these Visayan islands the soil is very fertile. The population varies from 130 per square mile on Negros to more than 300 on Cebu, which is the most thickly populated island of the whole Philippine archipelago. The great staple product is sugar, although in the lowlands considerable rice is cultivated. In the year 1905 Negros, which is the best sugar producer, exported not more than 80,000 tons of sugar, but in the face of a transportation cost of from $20 to $30 per ton in the dry season and an entire lack of transportation in the wet season because of impassable roads. This sugar goes largely to China, the Chinese merchants buying it up in the native markets. This island contains in the uplands also vast untouched forests of the

Construction Foremen's Quarters at Lopus Lopus.

best native hard and soft woods. Other products of the higher country throughout the Visayan group are coffee, cocoa, hemp, copra and other valuable vegetable fibers. Easily as these products are grown, they are produced only in small quantities mostly for local consumption, there being no means of getting them out of the country in bulk. As far as at present discovered, the most valuable mineral resource is coal, a fine grade of high carbon lignite, plentiful on Cebu, which the locomotives on the construction of the railroads are burning, they having been designed for the purpose. These facts of population and resources account for the readiness of the syndicate to offer to build these roads, after determining how the routes lay across tracts of rolling plains and low-lying hills, presenting no great problems of construction other than were likely to be induced by the uncertainty of the labor factor.

The first active step after the selection of the Chief Engineer was the organization of the pioneer corps of locating engineers. This was done in New York by Mr. Beard through his personal knowledge of railroad men and with the aid of the employment records of J. G. White & Company. Successful experience in railroad locating in the tropics was the first consideration in selecting men, and three of the five chiefs of party chosen were so qualified, two of them, H. F. Howe and C. H. Farnham, having been with the Canton-Hankow Railroad in China, where they were respectively Principal Assistant Engineer and Division Engineer, and the third, J. M. Robinson, coming from the Guayaquil-Quito Railroad in Ecuador, where he was Division Engineer. The other chiefs of party chosen were R. F. Ricker, from the Virginia & Carolina Coast, and F. D. Nash from the C., B. & Q., both well known to the Chief Engineer. The engineering corps was recruited up to a complement of 50 men, and they all reported at Kansas City and made the trip to the coast in special cars over the Northern Pacific. On April 26, 1906, they sailed from Seattle on the "Minnesota." This was the first big step toward the fulfillment of the plan of the United States Government to relieve the greatest economic need of the Philippine Islands.

The five locating parties, two for Panay and one each for Negros and Cebu, were made up on the voyage out, and the Cebu party was first in the field, beginning work on June 14, undaunted by the prospect of the tropical rainy season before them. After arriving

A Long Tangent near Cebu.

Grading a Fill from Borrow Pits.

mer months the rapid rate of construction established in the spring was somewhat by unfavorable weather. Forty miles of the advanced construction is on Cebu, half north of Cebu, the chief town, to Danao, the northern terminus of the Cebu lines, and half south of Cebu to Sangat. The other 20-mile section is on Panay Island from Iloilo, the metropolis of the southern Philippines, and the southern terminus of the Panay Railroad to Pototan in the interior north.

Construction has been pushed on Cebu in advance of the other islands because the dense population makes the demand for transportation most acute there. A construction force of about 4,000 natives was organized and the stability and efficiency of this force was so rapidly established that within three months a monthly average rate of 90,000 cu. yds. of earth and about 35,000 cu. yds. of rock was moved, at a cost of only 12½c. per cubic yard. Nothing but hand tools and wheelbarrows and baskets are used, as abundant labor and the heavy shipping expense which would have to be reckoned both ways, render the use of heavy railroad construction equipment impracticable in the Philippines in the present state of development.

The great majority of the natives engaged were quite unaccustomed to the use of the white man's pick and shovel and wheelbarrow and rock drills, coming as they did from plantations where their own primitive tools were still largely in vogue. It is a native trait to use the hands and feet for working earth and some patience was required to overcome the tendency to drop the new tools and resort to nature's implements whenever the foreman's back was turned. There was also a disposition to try to carry the wheelbarrows after loading on the back. These little idiosyncracies were gradually eliminated, so that in a very few weeks the men were able to use their implements effectively, throwing up embankments four feet high all through a nine hour-shift without serious fatigue.

The experiences encountered on Panay Island, where about 2,000 natives have been at work were practically a repetition of those on Cebu, though the island is not so densely populated and some fears were at first entertained as to whether the labor supply would be adequate. Negros is also less densely populated than Cebu, but there now appears good reason to suppose that a sufficient force can be mustered without difficulty among the natives there, though it was at one time thought that labor might have to be imported to some extent from the other islands. Altogether the use of Filipino labor is proving an unqualified success, and the experience thus far is summed up in the opinion of the Chief Engineer, recently stated, that his men were doing work not only better than could ever be achieved by white laborers in the tropics but comparing favorably with the average rate of workmen on railroad work in temperate climates.

Naturally the secret of this achievement lies largely in the administration which has attempted to develop the best qualities in the native character as well as to attract and hold the better element among the laboring populace. First there is the question of wages. Common labor is paid 50 centavos, or about

in their respective territories the other parties lost no time in getting to work and it became a race among the five to see which could make the best showing. Little will ever be known of the fortitude displayed by these little bands of surveyors working in an utterly strange country, toiling through miles of tropical undergrowth and not infrequently cut off entirely from their base of supplies. At times bad trails made packing with animals quite impossible and cargadores or native carriers were the only reliance of the field parties for supplies and transportation. Men accustomed to endure this kind of hardship are generally the last to talk about it, but occasional despatches briefly informing the New York office of the progress of the work, by their very terseness told the tale. So and so pulled out for a bit of a rest; supplies sent in ahead and cached to prevent running short again; and once in a long while the bare statement of a resignation, doubtless of some weaker brother unable to endure the strain. The actual test was bound to develop here and there weaknesses that even the searching examination at appointment failed to detect.

As a whole the locating engineers were admirably well qualified for the work, and all the parties succeeded in demonstrating markedly better routes than were supposed to exist. For example, on Panay between Passi and Dao, a distance of about 20 miles, it was supposed from reconnaissance that a 2 per cent. line would be necessary. After a comparatively long silence when the Chief Engineer had begun to wonder just what they were up to, the party assigned to that section emerged with the news that they had located a 1 per cent. line requiring actually less work than had been expected for the 2 per cent. grade. This is one instance of the character of the work done.

The First Locomotive Shops of the Philippine Railways.

Rapid progress was made considering this careful location, so that by November, 1906, less than five months from the time of landing, nearly all of the main surveys were completed and ground was broken on Cebu. Governor-General Smith turned the first shovel of soil on the fourth of that month. Construction on Panay Island was begun soon after, but small surveying parties continued in the field on all three islands some months longer, making tentative locations for possible extensions and branches of the main system.

To date there has been completed nearly 60 miles of grading composing three sections. Track is laid and ballasted on one section, which will probably be placed in operation this month. Track laying is almost completed on a second section. During the sum-

Grading for a "Wye" at Cebu.

25 cents gold per day of 10 hours, with subsistence, while the capitaces receive one peso, or 50 cents. A scientifically proportioned diet of the most nourishing food is provided, costing the company about 25 centavos per day per man. This total cost of 75 centavos per day for common labor is high for the Philippines and was fixed only after much study of the experiences of the Government and others with Filipino labor. There were two vital considerations. The first was to fix a figure that would be considered fair by the Government and the Filipinos, thus enabling it to be maintained without disagreement throughout the period of construction. The second point was to determine the lowest figure that would attract the best working element among the natives in sufficient numbers to keep the large supervising organization fully occupied at all times.

Wages for common labor were found to vary widely in the archipelago, according to the supply and to the inclinations of employers. At the Marivales quarries in Luzon the rate was 90 centavos and subsistence. On the Toledo road construction in Cebu only 30 centavos with subsistence was paid for nine hours work. These were the extremes. In the former case the work was more arduous than that in prospect on the railroads, while in the latter it was much less so and was performed largely by boys and old men who would not do for railroad construction. From this it will be seen that the fixing of the wage scale was a delicate question, seriously involving the success of the enterprise. Then came the question of subsistence. Verified instances of men trying to live with too little nourishment in the effort to save money when paid entirely in cash with other considerations of organization determined the Chief Engineer to provide subsistence. The chief surgeon of the Philippine Railway Company, after due experiment, settled upon the proportions three-fifths rice, one-fifth beef, one-tenth fish, one-tenth vegetables and the remainder condiments, as the most nourishing composition for the daily diet of the native doing hard physical labor, and this standard was adopted. It may be noted that this ration, served in ample quantities, by a Chinese contract commissary, is much better calculated to forestall fatigue than anything to which the average of the men had hitherto been accustomed.

The fortunate outcome of this liberal policy measured by general results has been seen. A specific comparison of unit costs on the railroad up to date and on road making previously carried out in the Visayan Islands, shows that the railroad company is getting from 50 to 60 per cent. more work for its money than has been returned before by native labor. An unprecedented stability of native labor forces has been attained. The working force does not vary from day to day, as has nearly always been the case heretofore, but the same men are to be found constantly on the work day in and day out, month by month, so that there is growing up for the first time in the Philippines that personal touch between the foremen and their men, which is so essential for efficient construction.

Fill No. 109, Island of Cebu; Philippine Railways.

In connection with wages, the problem of the method of payment was met by an interesting solution. The expense of maintaining a properly bonded staff of paymasters to pay men at short regular intervals would be heavy and besides there would be some physical difficulty connected with transporting by pack animals or cargadores, and handling large quantities of money, weighing something like 150 lbs. for every thousand dollars in the necessary small cash. Therefore the men are paid daily in time checks which are negotiable with certain leading merchants by special arrangement and with Ah Gong, the commissary. The plan works to the complete satisfaction of all but the disreputable characters who were accustomed to hover about the camps and mulct the laborers of their wages often as soon as they were paid. This undesirable condition has been almost entirely eliminated.

The benefits to the Philippine Islands of this use of native labor solely, as compared with the probable results if imported Chinese labor had been used, are many. Chinese labor would have assured the same first class railroad system at a total cost of possibly 5 per cent. less, but the economic gain to the country would probably have ended there. Cer-

A Side Hill Cut and Fill; Philippine Railways.

Grading at Mile 24, Island of Panay.

Clearing a Nipa Thicket; Philippine Railways.

tainly most of the money paid out as wages would have found its way to the Celestial Kingdom, while now it will be put in circulation in the islands to increase the money supply there. Furthermore, an industrial army of 20,000 men will have been trained in the principles of modern industry, and these men will naturally be absorbed except those who will be needed in operation, to very good advantage in the new industrial activity made possible by the railroads which they will have built.

It has now been shown how two of the three most vital considerations in the building of this railroad system have been met and substantially solved. To facilitate the working out of the standardization of equipment and rolling stock, there has been organized a so-called Technical Board, consisting of certain officers of J. G. White & Co. as the contractors, the Philippine Railway Company, two consulting engineers and the engineering executives in the field. This Technical Board co-operates with the Philippine Commission, for all decisions and purchases are subject to the approval of the latter body.

Nearly all the orders for the rolling stock, rails and materials thus far placed have been described from time to time in the *Railroad Gazette*. Some motive power in the shape of an early order of 50-ton mogul locomotives has been in use on construction for several months. Besides the regular [illegible] have been in use on construction a [illegible] number of flat cars which [illegible] part of the ultimate operating equipment. A [illegible] number of box cars have been shipped and a small initial order of [illegible] rolling stock, 24 cars in all, has been placed.

The design of these passenger [illegible] not yet fully decided on and is one of the principal questions now before the Technical Board. Lacking a basis of actual experience under the exact conditions obtaining in the country where the cars will be operated studies are being made of the passenger rolling stock, new and old, on several leading railroads in the tropics, notably the Sudan Government Military Railways, the Great Indian Peninsular Railway and Le Chemin de Fer du Congo. The design of the Philippine railroad passenger cars will be evolved from these studies modified by the judgment of the board as to the probable effect of conditions of operation in the Philippines which have no parallel elsewhere.

In the matter of materials a serious problem was to secure an adequate supply of timber suitable for ties, piles, etc. An order was

Finishing a Cut and Fill to Standard Width of 15 Feet.

placed for 150,000 ties of Jarrah, an Australian hard wood. It was feared that this supply would not be received rapidly enough to keep pace with the shipments of rails, and that the construction might be delayed. As was well-known to the Chief Engineer, some of the Philippine hard woods are eminently well adapted for the above purposes, but heretofore there has appeared to be no way to get the timber out. A special representative was sent down into the Island of Mindanao, remote from the scene of the railroads, to take up the question with the friendly Moro chiefs. Negotiations were successfully completed and hundreds of Moro tribesmen are at work in their own forests with their native knives and the saws supplied them, hewing trees and getting railroad ties out in finished shape. Indications are that this plan will naturally aid in solving the problem of timber supply.

Outlying Buildings of a Construction Camp.

A railroad is being planned to run from Hilo, on the eastern coast of Hawaii, northwesterly 45 miles. It will serve a number of sugar plantations in Hilo and Hamakua districts; at present the sugar is carried to the nearest point on the coast and loaded on

coastwise steamers instead of being shipped everland to a main port. The road will cost about $1,800,000. It is expected that it will eventually be built all the way around the island, going near the lower levels of Mauna Loa, which is an active volcano in the center of the island.

Pennsylvania Two-Cent Law Unconstitutional.

Judges Willson and Audenried, in Common Pleas Court, at Philadelphia last Tuesday, declared unconstitutional the two-cent fare law passed by the last Pennsylvania legislature. The case upon which the decision was made will be taken to the State Supreme Court at once, in the hope of getting a decision before October 1, when the law was to have gone into effect.

The Pennsylvania was the first to attack the law, bringing a suit in the Philadelphia courts to restrain the county of Philadelphia from collecting the fine for violating the provisions of the act, and it is on this suit that the decision is now given. Other railroads have brought similar proceedings in various counties of the state, but no decisions have been rendered, as it is generally understood that the Pennsylvania's suit will be made the test case in the higher court.

The decision of the court takes up 110 typewritten pages. After reviewing its limitations in the present case and declaring the "Pennsylvania Railroad Company is not vested with any immunity from the exercise of the power of the legislature to regulate rates," the court takes up the contention of the company that the two-cent rate is unreasonable, sustains the contention and grants the injunction asked for.

Continuing, the court says:

There remains now to be disposed of the question whether the act is to be denied enforcement on the ground that by reason of the generality of its language it extends to interstate commerce, and thus infringes on the province of the federal law. The question must be answered in the negative. A legislative intent to exceed constitutional rights and to violate fundamental law is never to be presumed if the language of the statute can be satisfied by a contrary construction. The act with which we are concerned is to be regarded as intended to apply only to that part of the passenger business of the railroads over which the legislative power of regulation extends, and since that business is not so confused with interstate passenger traffic as to be insusceptible of separate regulation we hold that the act is not invalid for the reason last suggested.

Upon the whole case we are of opinion, and therefore find, that, although with respect to its title and other matters of form no valid objection to the law exists, its operation, so far as it relates to the Pennsylvania Railroad Company, is objectionable on constitutional grounds for the following reasons:

As a regulation by the legislature of the rates of fares for passengers on the lines constructed by the plaintiff under the act of April 13, 1846, between Harrisburg and Pittsburg and Pittsburg and Erie, the act violates an existing contract between the plaintiff and the Commonwealth, and so contravenes Article I, Section 10, of the Constitution of the United States.

As a regulation of the plaintiff's intrastate passenger business in its entirety, the act under existing circumstances is unreasonable and confiscatory, and by depriving the plaintiff of its property without due process of law, violates Amendment 14 of the Constitution of the United States. * * *

Viewed as an alteration or revocation of the plaintiff's franchise, to establish * * * such rates as, within the maxima fixed by the second proviso of Section 21, of the act of April 13, 1846, its president and directors may deem reasonable, the act under consideration violates Article XVI, Section 10, of the constitution of Pennsylvania * * * by establishing so low a maximum rate of fare as to render that branch of the plaintiff's business unremunerative, but providing no compensation for the loss thereby occasioned.

We accordingly adjudge that the act of April 5, 1907, cannot be enforced so far as concerns the Pennsylvania Railroad Company, and that the county of Philadelphia should be restrained from demanding fines and attempting by action to collect them, if the maximum which that act attempts to establish be disregarded by the plaintiff.

Under the head of "plaintiffs' requests for findings of fact," the court affirms that:

The method used in ascertaining the expenses of handling the complainant's intrastate passenger business is the correct one.

That the percentage realized under existing rates of fare, upon the cost of the property, is not unfair or unreasonable, and that the percentage under the new law would not be fair or properly compensatory.

That cost of conducting railroad business for several years has been greatly and constantly increasing.

That a reduction in intrastate rates will most probably compel a corresponding reduction in interstate rates.

That the average rate per mile for carrying intrastate passengers does not now exceed two cents a mile.

That reduction of rates would not be likely to lead to increase of business.

That a uniform rate of two cents could not, in all probability, be obtained from all passengers, and is neither advantageous to the public nor just to the company.

That there is no evidence that the legislature investigated the matter before enacting the law.

In the defendant's requests for finding the court refuses the following:

In determining whether the maximum rate, as specified in the act, is improper, all the traffic and receipts of the plaintiff within the state, and subjected to the control of the legislature, must be taken into consideration. The passenger traffic cannot be segregated and considered without reference to receipts from the express and freight traffic and all other sources of corporate earnings.

The opinion of the court goes exhaustively into the many and intricate questions of law involved in the case. It is shown that, with the exception of the Philadelphia & Trenton Railroad and the Allegheny Valley Railroad, the leased lines of the Pennsylvania Railroad were vested with the same rights as to rates of toll and transportation charges as those conferred on the plaintiff company. While the Pennsylvania is operated under a charter granted under the old state constitution, nevertheless the company accepted the constitution of 1873, so that, as above stated, the company is not vested with any immunity from the exercise of the power of the legislature to regulate rates by virtue of grants thereof by the commonwealth to any of the corporations whose railroads it has leased or acquired.

The court states a large number of legal principles involved in the case, and cites decision affecting unreasonableness, confiscation, contract abrogation and the like, and declares that public service corporations in Pennsylvania are entitled to look for a rate of return, if their property will earn it, of not less than the legal rate of interest.

As to immunity from rate regulation on the line between Harrisburg and Pittsburg and any branch line to Erie constructed under the authority of the act of 1846, the court says that—

"The act of incorporation by which this immunity was conferred, being accepted by the plaintiff when it constructed its road on the faith thereof, constituted a contract between it and the commonwealth, whose obligation the latter could not impair. Neither the act of May 3, 1855, nor the constitutional amendment of 1857, nor the constitution of 1873 could have any such effect. * * * When the legislature alters or revokes a corporate franchise under Article 16, Section 10, of the constitution of 1873, it is necessarily implied that such franchise was, in its opinion, injurious to the citizens of the commonwealth. When the legislature, without providing for compensation, endeavors by general law to annul the charter right of a railroad company to establish its rates in accordance with a certain schedule and attempts an unreasonable regulation of its rates, this is a violation of the constitutional provision that no injustice shall be done to its corporators.

The court also considers the failure of the legislature properly to investigate passenger earnings and their proportion to freight business. This is discussed for the reason that the court was called upon to determine whether or not a two-cent maximum rate was a reasonable regulation so far as concerns the Pennsylvania Railroad. After analyzing the figures submitted during the trial of the suit, the court reaches the opinion that upon an actual investment of $32,548,802 of its own money, the Pennsylvania's probable earnings for 1907 for the passenger business within the state would yield a return of 5.1 per cent. on the basis of the rates charged at present. This would be less than legal interest.

"It is improbable that the doing away with commutation tickets and the exaction of a two cents per mile fare from those who have been using such tickets would serve to increase the net profits of the plaintiff, since, in all likelihood, such a change would so reduce the number of suburban riders and the amount of the higher rate business that such passengers incidentally bring to the company as to practically offset the increase of receipts due to the increase in fare."

The court does not agree with the county's contention that the freight business will not be affected by an increase in commutation rates, or that the passenger business is so combined with freight business as to be indistinguishable in the joint result. On the contrary, the opinion declares that experienced railroad men say that the business is readily distinguishable and further that "the legislature itself, in the very act now under discussion has, for the purposes of regulation, attempted to segregate the passenger traffic of the railways and to deal with it as if it existed as a thing apart from all else."

"If pushed to its logical result," says the opinion, "the argument advanced would justify a law requiring that the railroad companies of the state should carry all intrastate passengers without charge and look to their freight business for reimbursement of expenses and for a return on their investment in the business, which, of course, is the reductio ad absurdum."

GENERAL NEWS SECTION

NOTES.

The Missouri Pacific has made increases averaging 10 per cent in the wages of 2,000 clerical employees.

The Texas State Railroad Commission has ordered the railroads to report train accidents promptly to the commission by telegraph.

In the Federal Court at Jamestown, N. Y., September 6, the Grand Jury returned indictments for illegal freight rates against the Standard Oil Co. and the New York Central and the Pennsylvania railroads.

The Mexican government has just released two Americans, railroad conductors, who have been in prison more than a year on the charge of murder, but who now are released unconditionally with no charges against them.

Officers of Mexican railroads are complaining that the Southern Pacific is devoting its freight cars to the needs of sugar cane traffic and other heavy business in Louisiana and Texas to the neglect of shipments destined for Mexico.

In the United States Court at Lincoln, Neb., September 10, the Burlington, the Northwestern and the Union Pacific obtained a temporary injunction to prevent the Nebraska State Railroad Commission from reducing freight rates on grain.

Commercial travelers of Chicago and west of there complain that the railroads in the West and Southwest have increased their extra baggage rates from 12½ per cent. of the passenger fare to 18 per cent.—an increase which evidently was made to offset the reductions which the state legislatures ordered in passenger fares.

The Southern Pacific has ordered the discontinuance of the sale of liquors on the trains of the company within the territory of Arizona, a law having been passed in that territory requiring the payment of a tax of $300 a year for each train in each county; and the Southern Pacific runs six trains a day through five counties.

Near Murdock, Neb., on the morning of September 6, the passengers in the chair car of an express train of the Rock Island road were robbed by three masked men with pistols who, until a moment before the robbery, had been riding peacefully in the car as passengers. The conductor endeavored to repulse the robbers, but their four "guns" were more than a match for his one.

The Pennsylvania Railroad has reported to the Department of Internal Affairs of the state of Pennsylvania that the line of its road from Philadelphia to Pittsburg is 348.9 miles long, or about five miles less than the distance hitherto shown in the company's timetables. The reporters are now figuring out how much the company has cheated the public annually in consequence of the use of this erroneous figure in computing passenger fares.

Between Milwaukee and Cedarburg, Wis., recently a length of 25,000 ft. of copper trolley wire was stolen from the line of the Milwaukee & Northern Electric Railway, all in a single night. The wire, weighing 500 lbs. per 1,000 ft., was all in place over the tracks, and the thieves must have had a "giraffe" wagon to enable them to commit the theft so quickly. The loss to the railroad company is about $3,000, and at last accounts there was no clew to the thieves.

According to the newspapers the use of Barclay's automatic printing telegraph on the lines of the Western Union Telegraph Company has been much extended since the strike. This apparatus which, at the receiving station, prints telegrams on the regular blank, like any other typewriter, is in use on lines between New York and Boston, New York and Philadelphia, New York and Pittsburg, New York and Boston and New York and St. Louis. It was described in the *Railroad Gazette* of June 9, 1905.

The Secretary of State of Missouri has been enjoined by Judge Pollock, of the United States Court, at St. Joseph from annulling the Chicago, Rock Island & Pacific Railway's charter for its refusal to stop its through trains at Lathrop, a junction with the Atchison, Topeka & Santa Fe, for which the Rock Island was fined in the state courts and appealed to the Federal court, thus ignoring the statute prohibiting corporations doing business in Missouri from appealing from state to Federal courts. The hearing will be held next Monday.

President A. B. Stickney, of the Chicago Great Western Railroad, in an affidavit filed in the Federal court at St. Paul last Monday, says that if the commodity and the 2-cent passenger rates, now in controversy in Minnesota become effective his road will be financially ruined. It will suffer a reduction of 22 per cent. on fine grains, 28 per cent. on corn, more than 42 per cent. on hard coal and nearly 26 per cent. on soft coal. The company accepted the freight tariff promulgated by the State Railroad Commission in 1906, though by so doing it sustained a loss in revenue of 22 per cent. It was hoped to make up this loss in increased traffic, but this hope was not fully realized.

At Milwaukee it is reported that the principal railroads of Wisconsin are considering the complete abolition of commutation tickets. Under the law of that state, which now forbids discrimination with minute particularity, every town to or from which desired commutation tickets are not sold is expected to complain of the discrimination practiced by the railroads in favor of other towns at which commutation privileges are granted. It is also reported in Milwaukee that the sale of local single-trip tickets has increased on many of the roads to a marked degree since the reduction of all fares to 2 cents a mile. This increase of traffic has been particularly noticeable on Sundays, and numerous bits of circumstantial evidence are cited to support the statement made.

Controlled Manual on the Burlington.

The Chicago, Burlington & Quincy is preparing to install on its line from Aurora to Savannah, Ill., the manual block system arranged for the use of the single-track control apparatus which is made by the General Railway Signal Company, of the type which has been in use for the last few years on several hundred miles of the single-track lines of the Illinois Central. The officers of the Burlington expect to rapidly extend the use of controlled manual signals over about 2,000 miles of their single-track lines.

Cautiousness Extraordinary.

The Standard Oil Company shies when a railroad company tenders money to its officers! When the western lines made interstate fares 2 cents a mile the mileage credential was no longer necessary, and notice was given that such credentials would be redeemed by the Western Passenger Association at their face value. The Standard Oil Company returned 187 which had been in use by its representatives. In due time the Association sent the company a check for $1,776.50, but the check was returned. The legal department wrote to the General Passenger agents of the various lines asking for copies of the circular announcing the redemption, and if such circular had been regularly filed with the commission, and if the action had official cognizance. In the meantime, the mileage bureau is holding the check.—*Exchange.*

Disastrous Derailment at Norris, Iowa.

Twelve persons were killed and about the same number injured at Norris, Iowa, on September 6, when a northbound passenger train of the Chicago, Rock Island & Pacific was derailed at or near the station while running at full speed. The derailment occurred just at the moment that the engine of the passenger train passed the engine of a freight which was standing on the side track, and the engine and first three cars of the passenger train were thrown with great violence against the freight engine. All of the passengers killed or injured were in the smoking car, which appears to have been the third from the engine.

Six Passengers Killed at Caledon, Ont.

In the derailment of a special passenger train, heavily loaded, on the Canadian Pacific near Caledon, Ont., about 40 miles west of Toronto April 3, six passengers were killed and a large number were injured. The train was traveling on a steep descending grade around a sharp curve and appears to have been thrown off the track by excessive speed. The engineman is 23 years old and he had made but two trips before this in charge of a passenger train. The speed at which the train was traveling as it approached the curve was so high that an experienced track foreman, who was at work on the track, warned his gang of men to leap over the fence to safeguard their lives, the foreman feeling sure that the speed, which was about 35 miles an hour, was too high for the curve.

Chicago Railways Company Not in Possession.

The order recently entered by Judge Grosscup in the United States Circuit Court directing the receivers of the Union Traction Company, which operates the street car system on the north and west sides of Chicago, to turn these properties over to a new corporation called the Chicago Railways Company for 20 years, has been reversed by the United States Court of Appeals. The decision of the higher court remands the case to the United States Circuit Court and leaves the situation where it was before the formation of the Chicago Railways Company.

The Court of Appeals said that Judge Grosscup had no power to give possession to the Chicago Railways Company without the

consent of the bondholders and stockholders of the underlying companies, and that the only manner in which the railways company could obtain possession of the traction properties was through negotiations with the stockholders and the bondholders.

The action of the Court of Appeals hinged entirely on the question of jurisdiction. The power of Judge Grosscup to issue the order in favor of the Chicago Railways Company was the only thing assailed. The opinion, by Judge Brewer, of the United States Supreme Court, praised the wisdom of the order, but declared that legally it was wrong.

The Noise Nuisance on Street Cars.

Blowing of whistles by conductors of South Side street railway cars as signals for stopping and starting must stop. The ear-splitting communication between the conductor and motorman was dispensed with yesterday by order of the President. In days past the conductor took delight in blowing his whistle as close as possible to the passenger's ear, the more inoffensive the passenger the louder the signal. President Mitten says that "the car whistle is a relic of barbarism and of the cable epoch now consigned to students of geology. In the future conductors will rely on the bell cord, which does not interfere with the comfort of passengers." The conductor's blasts have been mistaken for the notifications of the policemen at crossings, and now even the use of the whistle to warn teamsters out of the track is forbidden.—*Chicago Record-Herald.*

The American Locomotive Company.

In the last fiscal year the American Locomotive Company did the largest amount of business since its organization six years ago. It built new shop buildings and power plants and installed machinery and equipment at its different works, particularly at Schenectady, Dunkirk, Richmond and Montreal; these improvements cost $1,692,859, and were paid for out of the extraordinary additions and betterment fund of $2,000,000 created last year. An equal amount has been set aside to carry on similar work next year. During the past year, $5,000,000 5 per cent. notes, maturing in five equal annual instalments from October 1, 1907, to October 1, 1911, were issued to provide working capital. Last spring the structural steel department at Montreal was sold to the Structural Steel Company, Ltd., and the Locomotive & Machine Company of Montreal will hereafter build only locomotives, steam shovels and rotary snow plows. In the following statement of earnings, income from investments, etc., is included in gross earnings.

	1907.		Changes.
Gross earnings	$49,515,486	Inc.	$6,967,610
Expenses	42,744,381	"	6,659,011
Net earnings	$6,771,105	Inc.	$308,599
Fixed chrgs., bills payable, &c.	412,898	"	131,086
Available for dividends	$6,358,207	Inc.	$177,513
Div. on preferred, 7 per cent.	1,750,000		.....
Div. on common, 5 per cent.	1,250,000	Inc.	937,500
Surplus after dividends	$3,358,207	Dec.	759,987

Surplus	$1,358,207	Inc.	$241,378

Progress on Panama Canal.

The excavation of the Panama canal is now one-tenth completed. The work done in August, despite the heavy rainfall of 11.89 in., amounted to 215,625 cu. yds. more than was done in July, and surpassed all previous records.

The total amount of material to be excavated was estimated in June, 1904, to be 111,280,000 cu. yds. Since then and up to August 31, an aggregate of 10,863,681 yds. had been excavated. There are now sixty-three steam shovels at work and 34 will soon be received. The present force in constant employment on the Isthmus consists of 30,500 men. Reports from the Isthmus show that the health records are better than in most of the larger cities of the United States.

President Johnson on Restrictive Legislation.

From the advance sheets of the Norfolk & Western annual report we take the following comment by President Johnson on the legislative situation.

The rapidly progressing development of the coal areas tributary to your lines makes it increasingly evident that the demands upon your management for transportation cannot be properly met without the complete double tracking of the line from Concord to Columbus. This work, while important to the interest of the stockholders, is equally important to the welfare of the commonwealths traversed by your lines and to the property of their citizens who are striving to develop the natural wealth of their states and to broaden the market for their mineral and other products.

It therefore goes without saying that any policy which hampers the development of railroads, or by depleting their revenues lowers their credit and thus repels investors who would otherwise purchase their securities at fair prices, cannot but be fraught with disaster both to the states and to the railroads. It is not believed that such a policy will commend itself to the dispassionate judgment of the communities served by your lines, or that in the effort to correct abuses that may exist unjust treatment will be accorded to corporations that are honestly endeavoring to fulfil the purposes for which they were chartered.

It is only 11 years since your railroad passed through a receivership and foreclosure and a drastic reorganization, and it certainly cannot be seriously claimed that the small dividends since paid to the shareholders have yielded even a just return upon its capital. The owners of your property are entitled to the same good faith which is properly exacted from them, and no temporary prejudices or misunderstandings can excuse or justify action which would deprive a railroad shareholder of the rights and remedies which are guaranteed to all classes of the community.

Fire Protection in Altoona Yards.

The Pennsylvania Railroad is to put fire extinguishing apparatus on all of the 26 locomotives used in the freight yards at Altoona, Pa., and most of these engines are already equipped. This action is a result of the determination on the part of the company to provide, without reference to the city fire department, for a complete fire-fighting system in its yards. The Altoona yard is divided into five fire districts, each with an alarm whistle.

In the Pittsburg yards the fire organization, which is also to be adopted at Altoona, is as follows: The conductor of the crew is the "foreman," and is the man to direct the work of a crew when called to answer a fire alarm. The flagman is designated as the "hoseman," it being his duty to see that the hose is removed from the reel and coupled to the water attachment as promptly as possible. The two brakemen of the crew are designated as "nozzlemen." Weekly tests are made to promote efficiency.

Foundry Cooling.

A letter from the Bellevue Pipe & Foundry Co. to the American Blower Co., Detroit, Mich., says that in order to keep the foundry cool enough to work in during the hot summer days the steam coils of the hot-blast heating system were filled with cold water and the fan run as for heating. The experiment was a success and as a result not a day was lost in the moulding room. The American Blower Co. has given special attention to the matter of proper heating and ventilation of foundries by a system which makes it possible to cool and ventilate with equal satisfaction in the summer time, and thus save much lost time as well as maintain the efficiency of the plant while in operation.

Railroad Y. M. C. A. at Baltimore.

The Baltimore & Ohio Railroad Company has awarded a contract for the erection of a new Y. M. C. A. building at Riverside, Baltimore, to J. J. Walsh & Sons, of that city. The building will cost about $33,000 and it is to be ready for use March 1. It will be of brick, 36 ft. x 100 ft., two stories high, with attic and basement. On the first floor will be a reception hall, game room and reading room, and on the second the assembly room, one class room, four bedrooms, ladies' retiring room, buffet, kitchen and two toilet rooms. The attic will be taken up by one large dormitory. New association buildings have been built at Brunswick, Cumberland, South Chicago, Newark, Holloway and several other places, and it is contemplated to still build others.

The Dramatis Personae.

A prominent railroad man, in close touch with the southern roads, gives the following partial explanation of recent occurrences:

The zone of the Southern states in which the antagonism between the state and the railroads has become most acute has been in North Carolina, Georgia and Alabama. These three states are represented, respectively, by Gov. Robert B. Glenn, Gov. Hoke Smith and Gov. Comer. Gov. Glenn was formerly a Southern Railway attorney, Gov. Smith made his money chiefly by prosecution of damage suits against railroads, and Gov. Comer is a farmer. Gov. Glenn is opposed in North Carolina by a United States Circuit Judge, Peter C. Pritchard. Gov. Comer is opposed in Alabama by United States Judge Thomas G. Jones. Gov. Smith is "layin' low and sayin' nuthin'."

Gov. Smith says that he has a scheme that will outscheme the Governors of North Carolina and Alabama in their bids for the Democratic nomination for the Presidency, though he has given no intimation as yet as to the details of his plan. Hoke Smith's father was born in Vermont, and he has no war record; Gov. Glenn's father was killed in the Confederate Army; Judge Thomas G. Jones was wounded several times in defence of Alabama as a Confederate soldier; the father of Judge Pritchard was killed on account of his Union predilections, together with other East Tennesseans in the beginning of the civil war; Gov. Comer took no part in the war.

The Southern Railway, both in Alabama and North Carolina, capitulated to the state authorities, but the Louisville & Nashville has not done so. The L. & N. is managed by one of the most dominating and commanding railroad spirits in the United States, Milton H. Smith, who defies and hates Comer and will take advantage of every right that he has under the Federal law.—*New York Times.*

"Courteous" and Absolutely Equal Treatment."

General Manager E. A. Handy, of the Lake Shore & Michigan Southern and its controlled lines, has issued to employees of the operating department a circular in which he says:

The following outlines in a general way the relations which the management desires to see established between its employees and the public. They are presented for your individual guidance and observance.

The public judges a railroad corporation very largely by the treatment it is accorded by the agent representing the company, in whatever capacity he may be employed.

A reputation for fair dealing, with courteous and absolutely equal treatment of all customers, is as essential to the success of the railroad as it is to the success of any other business.

The interest of the farmer, the manufacturer, the mine owner, the merchant and the railroad is mutual, and efficient transportation facilities are necessary to the success of all.

The good will and friendship of the communities served by our companies is the most valuable asset they can have; and the strongest recommendation for promotion an employee in any department can possibly have is the fact that by uniform courtesy and kindly accommodation of patrons he has secured for himself and for the road the good will and friendship of the community in which he is located.

We earnestly ask our employees to be governed by the above, in spirit as well as in letter.

MANUFACTURING AND BUSINESS.

The Atlantic, Quebec & Western will soon be in the market for ties to be used on its line now building from Port Daniel, Que., to Gaspe Basin, 80 miles.

V. I. Smart, Signal Engineer of the Chicago & Eastern Illinois, has been appointed Assistant Professor of Transportation at McGill University, Montreal, Can.

K. W. Blackwell has resigned as Managing Director of the Montreal Steel Works, Montreal, Can., but remains President. W. F. Angus, Secretary, has been appointed General Manager.

A. L. Whipple, who has been Eastern Representative of the Curtain Supply Co., Chicago, since the formation of that company, has been appointed Eastern Manager, with headquarters at the New York office, Park Row building, New York city.

The contracting office of the Virginia Bridge & Iron Company, Roanoke, Va., heretofore at Little Rock, Ark., has been transferred to New Orleans, La. The office will be in charge of F. E. Golian, C. E., of the Atlanta office, who has been with the company for some time.

Lewis O. Cameron, of Atlanta, Ga., Manager of Sales in the Southern district of the Pressed Steel Car Company, New York, was married on September 4 at Calvary Episcopal Church, New York, to Miss Louise Wann, of that city. The bride is the daughter of Mr. and Mrs. Charles Wann, of New York, and niece of F. A. Wann, General Traffic Manager of the San Pedro, Los Angeles & Salt Lake.

Iron and Steel.

The Kanawha & Michigan has ordered 3,000 tons of rails.

The Toledo & Ohio Central has ordered 4,000 tons of rails.

The Hocking Valley has given an order for 5,000 tons of rails.

The Erie will shortly give a contract for 1,100 tons of bridge steel.

The American Steel & Wire Company has announced an advance of $1 a ton on its wire products.

The New York Central is receiving bids for an additional 2,000 tons of steel to be used on its New York terminal.

The Atlantic, Quebec & Western will soon be in the market for rails, to be used on 80 miles of line now under construction.

The McClintic-Marshall Construction Company has received an order for 3,000 tons of structural steel for the new open hearth works of the Pittsburgh Steel Company.

OBITUARY NOTICES.

A memorial of Samuel Spencer, late President of the Southern, has been published. It consists of a minute adopted by the Voting Trustees and the Board of Directors of the company in joint meeting shortly after Mr. Spencer [illegible] rehearses his work in connection with the growth of the railroad company of which he was the first President.

*Courteous: Showing well-bred consideration; affable.—*Dictionary.*

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Apalachicola Northern.—E. A. Fauntleroy, of [illegible], Mo., has been appointed Receiver.

Chicago Junction.—H. E. Porter, Pittsburgh, has been elected also Secretary. R. B. Thomas, Assistant Treasurer, has been elected Treasurer.

Colorado Southern, New Orleans & Pacific.—I. H. Evans, General Superintendent of the Third district of the St. Louis & San Francisco, has been elected Vice-President and General Manager of the Colorado Southern, New Orleans & Pacific, with office at Beaumont, Tex.

Mexican Central.—E. W. Cartlidge, Assistant to the Vice-President at Boston, Mass., has been appointed Assistant to the Vice-President at Mexico City, Mex.

Missouri & Louisiana.—Charles S. Keith, Vice-President and General Manager, has been elected President. John A. Sargent, Traffic Manager and General Superintendent, succeeds Mr. Keith.

Raritan River.—G. C. Chittick has been appointed Auditor with office at South Amboy, N. J.

St. Joseph & Grand Island.—W. N. Purvis has been elected Secretary, with office at St. Joseph, Mo., succeeding F. W. Russell. W. M. Mooney has been appointed Acting Auditor, with office at St. Joseph, succeeding to the duties of F. C. Uhlman, who went to the Virginian Railway.

Tehuantepec National.—H. W. Morris, Assistant to the Vice-President, has been assigned to other duties and his former position has been abolished.

Tonopah & Tidewater.—B. W. Fernald has been appointed Auditor, with office at Los Angeles, Cal.

Operating Officers.

Baltimore & Ohio Southwestern.—James Donahue, Trainmaster of the Springfield division, has been appointed Trainmaster of the Indiana division, with headquarters at Seymour, Ind., succeeding E. G. Owens, resigned to go into other business.

Canadian Pacific.—A. Stevens, chief train despatcher at Vancouver, B. C., has been appointed Superintendent at Winnipeg, Man., succeeding J. T. Arundel, transferred.

Chicago, Rock Island & Pacific.—The headquarters of J. C. Nolan, Superintendent of the Louisiana division, have been moved from Ruston, La., to El Dorado, Ark.

Colorado & Southern.—H. E. Renick, Trainmaster at Denver, Colo., has been appointed Assistant Superintendent of the Fort Collins, Clear Creek and Pueblo districts, with office at Denver.

Erie.—The offices of C. C. Riley, Superintendent of Transportation, and G. W. Kirtley, Assistant Superintendent of Transportation, have been moved from Jersey City, N. J., to New York.

Fitzgerald, Ocilla & Broxton.—M. W. Gant has been appointed Trainmaster, with office at Fitzgerald, Ga.

Georgia, Florida & Alabama.—W. R. Parsons has been appointed Trainmaster at Bainbridge, Ga., succeeding to the duties of D. L. Turner, Jr., Acting Trainmaster.

Kalamazoo, Lake Shore & Chicago.—James Grant, Secretary, has been appointed General Superintendent, with office at South Haven, Mich., succeeding Blaine Gavett, resigned to go to another company.

Missouri Pacific.—See St. Louis & San Francisco.

Missouri Southern.—J. T. Fredricks has been appointed General Manager, with office at Leeper, Mo., succeeding P. H. Walsh, resigned. H. A. Radtke has been appointed Superintendent, with office at Leeper, Mo., succeeding C. M. Phelps.

Northwestern Pacific.—W. S. Palmer, General Superintendent of the Northern district of the Pacific system of the Southern Pacific, has been appointed General Manager of the Northwestern Pacific, succeeding James Agler, resigned.

Panama.—J. A. Smith has been appointed General Manager, succeeding W. D. Bierd.

Paris & Great Northern.—W. H. Upton has been appointed General Superintendent, with office at Paris, Tex., succeeding E. W. Dickson.

St. Louis & San Francisco.—J. A. Frates, Trainmaster at Springfield,

Mo., has been appointed General Superintendent of the Third district, with office at Chaffee, Mo., succeeding J. H. Elliott. J. G. Lorton, Superintendent of the Valley division of the Missouri Pacific, has been appointed Superintendent of the Northern division of the St. Louis & San Francisco, succeeding J. E. Hutchison, promoted. See Colorado Southern, New Orleans & Pacific, under Executive, Financial and Legal Officers.

Southern Pacific.—W. R. Scott, Superintendent of the Western division, has been appointed General Superintendent of the Northern district of the Pacific system, with office at San Francisco, Cal., succeeding W. S. Palmer, resigned to go to the Northwestern Pacific. J. H. Young, formerly General Superintendent of the First district of the St. Louis & San Francisco, succeeds Mr. Scott, with office at Oakland Pier, Cal. See Northwestern Pacific.

Tehuantepec National.—W. N. Cartwright, Superintendent of Transportation, has been appointed Superintendent, with office at Rincon Antonio. J. H. Sayers has been appointed Terminal Superintendent at Coatzacoalcos, V. C., succeeding J. J. Lewis, resigned.

Traffic Officers.

Chicago, Indianapolis & Louisville.—The office of Traffic Manager, held by the late Charles H. Rockwell, has been abolished. B. E. Taylor has been appointed General Freight Agent, succeeding O. C. Carter.

Louisville & Nashville.—W. A. Russell, Assistant General Passenger Agent, has been appointed General Passenger Agent, succeeding C. L. Stone, who is now Passenger Traffic Manager of the Missouri Pacific.

Engineering and Rolling Stock Officers.

Baltimore & Ohio.—Lucius T. Gibbs has been appointed Electrical Engineer, succeeding W. D. Young, resigned.

T. H. Russum, supervisor car department, has been appointed to the new office of Superintendent of the Passenger Car Department and his former office has been abolished. J. J. Tatum, general foreman car department at Mt. Clare, Baltimore, Md., has been appointed to the new office of Superintendent of the Freight Car Department. The offices of both are at Baltimore, Md. J. F. Bowden, general foreman locomotive department at Trinidad, D. C., has been appointed Master Mechanic at Parkersburg, W. Va., succeeding J. P. Dorsey, resigned.

Chicago & Eastern Illinois.—V. I. Smart, Signal Engineer, has resigned. L. C. Hartley, Assistant Engineer of the Pittsburg, Cincinnati & St. Louis at Logansport, Ind., succeeds Mr. Smart.

Chicago & North-Western.—John Charlton, foreman of shops at Antigo, Wis., has been appointed Master Mechanic of Chicago terminals, succeeding L. M. Carlton, resigned.

Erie.—Charles James, Master Mechanic at Galion, Ohio, has been appointed Master Mechanic at Port Jervis, N. Y., succeeding G. A. Moriarty, resigned to go to another company. E. S. Fitzsimmons, general foreman boiler maker, succeeds Mr. James.

Missouri Pacific.—W. L. Calvert, Master Mechanic of the Valley division, with office at McGehee, Ark., has been appointed to the new office of Master Mechanic of the White River and Memphis divisions, with office at Carter, Ark. J. T. Johns succeeds Mr. Calvert. W. A. Bedell has been appointed Master Mechanic at Van Buren, Ark., succeeding B. Donahue, resigned. The White River and Memphis divisions were formerly under the authority of the Master Mechanic at Van Buren.

Oregon Short Line.—C. C. Stroufe has been appointed Assistant to the Chief Engineer, with office at Portland, Ore.

Pennsylvania Lines West.—See Chicago & Eastern Illinois.

Purchasing Agents.

Northern Pacific.—L. Crassweller, Assistant Purchasing Agent, has been appointed Purchasing Agent at Tacoma, Wash.

LOCOMOTIVE BUILDING.

The Bessemer & Lake Erie, it is said, has ordered 21 locomotives.

The Tehuantepec National is said to be in the market for locomotives.

The Jamaica Government Railway is said to have ordered two locomotives.

The Atchison, Topeka & Santa Fe denies having ordered a number of 16-wheel Mallet compounds, as reported in the *Railroad Gazette* of August 16. This type of locomotive will not be used by the road for some time to come.

The Grand Rapids & Indiana has ordered four simple consolidation (2-8-0) locomotives from the American Locomotive Co., for January, 1908, delivery.

General Dimensions.

Type of locomotive	Consolidation
Weight, total	178,000 lbs.
Weight on drivers	152,000 "
Diameter of drivers	56 in.
Cylinders	21 in. x 28 in.
Boiler, type	Belpaire wide firebox
" working steam pressure	200 lbs.
" number of tubes	314
" material of tubes	Charcoal iron
" diameter of tubes	2 in.
" length of tubes	174 "
Firebox, length	102 "
" width	62¼ "
" grate area	44.5 sq. ft.
Heating surface, total	2,530.0 "
Tank capacity	6,000 gals.
Coal capacity	24,000 lbs.

Special Equipment.

Air-brakes	Westinghouse
Bell ringer	"Little Giant"
Boiler lagging	Keasbey & Mattison
Brake-beams	Greeo
Couplers	Kelso and Pitt
Headlights	Star
Injector	Nathan
Piston rod packings	Grand Rapids & Indiana
Valve rod packings	Grand Rapids & Indiana
Safety valve	Kunkle
Sanding devices	Leach
Sight-feed lubricators	Nathan
Springs	Railway Steel-Spring Co.
Steam gages	Ashton
Steam-heat equipment	Grand Rapids & Indiana
Tires—tender wheel	Schoen

The Butte, Anaconda & Pacific, as reported in the *Railroad Gazette* of August 2, has ordered four simple consolidation (2-8-0) locomotives from the American Locomotive Co., for November delivery.

General Dimensions.

Type of locomotive	Consolidation
Weight, total	185,000 lbs.
Weight on drivers	167,000 "
Diameter of drivers	52 in.
Cylinders	21 in. x 28 "
Boiler, type	Straight top
" working steam pressure	200 lbs.
" number of tubes	270
" maker of tubes	Shelby
" diameter of tubes	2 in.
" length of tubes	12 ft. 10 "
Firebox, length	108 "
" width	60 "
" material	American Locomotive Co.'s standard
" grate area	45 sq. ft.
Heating surface, total	2,646 "
Tank capacity	6,000 gals.
Coal capacity	12 tons

Special Equipment.

Air-brakes	Westinghouse
Axles	Cambria steel; Coffin process
Bell ringer	"Little Giant"
Boiler lagging	Keasbey & Mattison
Brake-beams	Standard Steel Car Co.
Brake-shoes	American Brake-Shoe & Foundry Co., steel back
Couplers	Major
Headlights	Dressel
Injector	Ohio
Journal bearings	Ajax metal
Piston-rod packings	Jerome
Valve-rod packings	Jerome
Safety valve	Ashcroft
Sanding device	Leach
Sight-feed lubricators	Detroit
Springs	Railway Steel-Spring Co.
Steam gages	Ashcroft
Tires—driving wheel	Latrobe
Tires—truck wheel	Latrobe
Tires—tender wheel	Griffin

CAR BUILDING.

The Tehuantepec National is said to be in the market for cars.

The Utah Light & Railway Company, Salt Lake City, is said to have ordered 50 cars.

The Eldorado & Wesson has ordered one coach from the Hicks Locomotive & Car Works.

The Beaumont & Great Northern has ordered one coach from the Hicks Locomotive & Car Works.

The American Steel & Wire Company, Chicago, as reported in the *Railroad Gazette* of August 30, has ordered 25 cars.

The Stephenville, North & South Texas, Stephenville, Tex., has ordered 20 box cars of 60,000 lbs. capacity from the American Car & Foundry Co., one first-class coach from the Hicks Locomotive & Car Works, and one combination caboose from the Handlan-Buck Manufacturing Co.

The Chicago & Illinois Midland has ordered six flat cars, three of 80,000 lbs. capacity and three of 60,000 lbs. capacity, from the Hicks Locomotive & Car Works. These cars will be 41 ft. and 36 ft. long, 8 ft. 11 in. and 8 ft. 9 in. wide, over all. The special equipment includes:

Brake beams	Simplex
Brakes	Westinghouse
Couplers	Tower
Draft rigging	Harrison twin spring and Miner tandem
Paint	Hicks standard

The Atchison, Topeka & Santa Fe, as reported in the *Railroad Gazette* of August 23, has ordered 10 wooden 70-ft. steel underframe combination automobile and horse cars from the American Car &

Foundry Company for November delivery. The special equipment includes:

Brake-beams	Chicago Railway Equipment Co.
Brake-shoes	Perfection
Brakes	Westinghouse
Brasses	Hewitt
Couplers	Janney
Draft rigging	Miner
Lost guards	Seale
Journal boxes	Franklin
Springs	Simplex Railway Appliances

The Union Pacific, as reported in the *Railroad Gazette* of August 9, is building 25 all-steel box cars of 100,000 lbs. capacity at its Omaha shops. These cars will weigh 37,400 lbs., and will measure 40 ft. long, 8 ft. 10⅛ in. wide and 7 ft. 11 in. high, inside measurements. The special equipment includes:

Bolsters, truck	Buckeye
Brake-beams	Waycott
Brake-shoes	Congdon steel back
Couplers	Climax
Door fastenings	National safety
Doors	Security
Draft rigging	Sessions
Journal boxes	National Malleable Castings Co.
Trucks	Andrews cast steel side frame
Wheels	Davis cast steel

RAILROAD STRUCTURES.

BUFFALO, N. Y.—The Delaware, Lackawanna & Western, it is said, is building a reservoir to have a capacity of 25,000,000 gallons, to supply water for the company's engines, also for its East Buffalo shops. The reservoir is to cover an area of 15 acres.

DUNSMUIR, CAL.—The shops of the Southern Pacific at this place are to be enlarged, by an addition 100 ft. long, and six stalls are to be added to the roundhouse. The company also proposes to put up shops about 1,000 ft. long at Chestnut, one mile south of Dunsmuir.

NEW WESTMINSTER, B. C.—The Great Northern has submitted plans for a proposed station to be built at this place.

NEW YORK, N. Y.—The bids recently opened for the construction of the Queens approach for the Blackwell's Island bridge were: Maryland Steel Company, $758,600; Buckley Realty Construction Company, $797,804; Williams Engineering & Contracting Company, $809,345, and the Richard Henningham Company, $914,170. No award has yet been made.

PORTAGE LA PRAIRIE, MAN.—For some time negotiations have been in progress between the Grand Trunk Pacific and residents of this place to build a joint traffic and railroad bridge over the river here.

PORT DANIEL, QUE.—Bids will soon be asked for by the Atlantic, Quebec & Western for bridges to be built on its line between this place and Gaspe Basin.

SACRAMENTO, CAL.—The Northern Electric Company will build a large highway bridge over the Sacramento river.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

APALACHICOLA NORTHERN.—This road is now open for traffic from River Junction, Fla., to Apalachicola, 80 miles.

ATCHISON, TOPEKA & SANTA FE.—Contract is reported let by this company to Ransom & Cook for grading its new yards at Chanute, Kan. Work is also to be started by Harvey Stuyvers on a new roundhouse and shop buildings.

BUFFALO, ROCHESTER & PITTSBURGH.—This company, it is said, is getting estimates for double-tracking its main line from Butler, Pa., northeast to Punxsutawney, 62 miles.

BULLFROG-GOLDFIELD.—See Tonopah & Goldfield.

CANADIAN NORTHERN QUEBEC.—Construction work on the Montfort branch has been finished and the line is now open for freight traffic between St. Jerome and St. Sauveur.

CANADIAN PACIFIC.—Contracts are reported let by this company to McDonell & Czowski, of Vancouver, B. C., for improving the main line grades around Field, B. C. The work involves cutting two tunnels aggregating about a mile and a half, one on each side of the Kicking Horse river, and putting up two bridges. The cost of the work, it is said, will be about $1,500,000, and it will take about a year and a half to finish it. (May 24, p. 727.)

CACHE VALLEY.—This road, which runs from Sedgwick, Ark., to Light, in Green county, has been sold to a syndicate of which J. D. Goldman of St. Louis is President, A. Bertig of Paragould, Vice-President; H. A. Culver, Second Vice-President; S. C. Dowell, Treasurer, and G. W. L. Brown, General Manager, all of Walnut Ridge. The new owners propose to extend the north end of the line from Light east to Paragould, 28 miles, and the south end northeast to Walnut Ridge, 10 miles, or southwest to Newport, 40 miles. (March 15, p. 380.)

CENTRAL OF GEORGIA.—This company [illegible] on improvements which were to cost about $[illegible] reduction of rates ordered by the Georgia Railroad Commission.

CHICAGO & NORTH WESTERN.—The extension from Gregory, S. Dak., to Dallas, 36 miles, has been finished and trains are now run from Homestead through to Dallas.

On the Ashland division the line from Antigo, Wis., to Bryant, has been extended northwest to Van Ostrand, 17.1 miles.

This company has started proceedings in the Superior Court to condemn 97 parcels of land in Chicago near the site of its proposed new terminal station.

DENVER & GULF.—This company has increased its capital stock from $2,000,000 to $10,000,000. The company was chartered this spring to build from Denver, Colo., southeast to Snyder, Okla., [illegible] miles. (May 10, p. 663.)

FLINT RIVER & GULF.—See Gulf Line.

GRAY'S POINT TERMINAL.—See St. Louis Southwestern.

GREAT NORTHERN.—On the Minot division a new line called the Crosby line, has been opened for business from Berthold, N. Dak., northwest to Lignite, 55 miles.

GULF LINE.—Under this name the Flint River & Gulf, operating from Hawkinsville, Ga., southwest to Bridgeboro, 77 miles, has been taken over by this new company. The lease of the Hawkinsville & Florida Southern, which owns the first 44 miles from Hawkinsville south, is also taken over. An extension is projected from Bridgeboro southwest to Bainbridge, 60 miles.

HAWKINSVILLE & FLORIDA SOUTHERN.—See Gulf Line.

INTERCOLONIAL.—The Intercolonial is reported double-tracking its Point du Chene branch from Moncton, N. B., to Painsec Junction, eight miles. The cost of the improvements will be about $300,000.

LAKE SHORE & MICHIGAN SOUTHERN.—A contract for grading is reported let to M. C. Connors, of Appleton, Wis., at $45,000. The amount of material to be removed is estimated at 280,000 yds. and the work is to be finished by December.

LARIMER & ROUTT COUNTY.—New Hampshire and Massachusetts capitalists have organized this company, with a capital of $1,000,000, to build a line from a point on the proposed extension of the Larimer, Hahn's Peak & Pacific, at the Colorado-Wyoming state line south into North Park, terminating near the mouth of Grizzly creek, Colo.

MINNEAPOLIS & ST. LOUIS.—The Missouri river division, built under the name of the Minnesota, Dakota & Pacific, has been opened for business from Conde, S. Dak., west to Lebeau, 115 miles. (Aug. 23, p. 215.)

MINNESOTA, DAKOTA & PACIFIC.—See Minneapolis & St. Louis.

MORGANTOWN & KINGWOOD.—This road has been extended and is now in operation from Kingwood, W. Va., south to Rowlesburg, 18 miles. (July 12, p. 53.)

OHIO RIVER & NORTHERN.—Work, it is said, has begun on this line, projected from Midland, Pa., down the Ohio valley to Wellsville, thence north to Lisbon, Ohio, where connection is to be made with the Lake Erie & Western. All the right of way has been secured. The project is backed by P. F. Smith and W. P. DeArmitt, steel and coal men of Pittsburg, and other eastern and Ohio capitalists. J. L. Francis, of Chicago, is also interested.

OPELOUSAS, GULF & NORTHEASTERN.—See Texas & Pacific.

ST. LOUIS SOUTHWESTERN.—The Gray's Point (Missouri) Terminal Railway has given a mortgage to secure funds for construction and improvements of the line, new yard facilities and terminals. Plans are also under consideration for an extension of the road.

SAN FRANCISCO, IDAHO & MONTANA.—Grading, it is said, has been started on this line from Caldwell, Idaho, on the Oregon Short Line, southwest to Winnemucca, Nev., on the Southern Pacific main line, 196 miles. (Aug. 30, p. 248.)

SARATOGA & ENCAMPMENT.—This road has been opened for business from Walcott, Wyo., south to Saratoga, 24 miles. (May 24, p. 728.)

SEABOARD AIR LINE.—On the Sarasota branch, the sixth division, under construction between Terra Ceia Junction, Fla., and Terre Ceia, 5.4 miles, has been finished and is open for business.

SOUTHERN PACIFIC.—On the Coast division, the Coast Line Railway has been opened for business from Santa Cruz, Cal., to Davenport, 11.4 miles.

SOUTHERN RAILWAY.—Announcement is reported made by this company that, owing to recent adverse railroad rate legislation in some of the southern states, and to general conditions, the double tracking of the road between Chattanooga and Ooltewah Junction, Tenn., and north to Greensboro, N. C., has been suspended. Con-

tracts had been reported made for double-tracking work in Tennessee aggregating several millions of dollars.

Stephenville, North & South Texas.—This road has been opened for business from Stephenville, Tex., south to Alexandria, 13 miles. (Aug. 30, p. 248.)

Tennessee Railway.—This road has been extended from Montgomery, Tenn., south to Smoky, six miles.

Texas & Pacific.—The Opelousas, Gulf & Northeastern is now in operation from Melville, La., southwest via Opelousas to Branch, 41 miles. Track is being laid south from Branch to Crowley, 15 miles, and this section is to be opened for business September 15. This extension is ultimately to be built to a point on the Gulf of Mexico. An extension is also to be built from the northern terminus to a point on the Mississippi river.

Tonopah & Goldfield.—This company recently finished the Bullfrog-Goldfield line from Goldfield, Nev., south to Bullfrog and to Rhyolite, 81 miles. An extension is projected from Gold Center, near Bullfrog, south to Greenwater, Cal., about 50 miles. (May 31, p. 760.)

Union Central.—Incorporated in Texas with a capital of $225,000 and office in Dallas, to build a line from Dallas, Tex., southeast through Kaufman, Henderson, Anderson, Cherokee, Nacogdoches, San Augustine and Sabine counties to the Sabine river, on the Louisiana state line, 225 miles. The incorporators include: W. J. Hogue, W. R. Stout, W. S. Maple, M. C. Gillette, of Dallas; W. H. Marsh, of Tyler; T. B. Poindexter, J. J. Stubbs, of Wortham; J. B. Gordon, Fairfield; H. H. Hyde, Houston, and James A. Lucas, Edgewood.

Wichita Falls & Northwestern.—This company, which was incorporated last year to build a line from Wichita Falls, Tex., northwest to the Red river, thence through Oklahoma to Mangam, Okla., 90 miles, is now in operation from Wichita Falls north to Kell, Okla., 27½ miles. It is reported that the directors recently decided to issue bonds to secure funds to finish the 32 miles of line between the Red river and Frederick, Okla.

Youngstown & Ohio River.—This company has given a mortgage to secure funds, of which $1,500,000 will be used to cover the cost of construction. The line is building from Salem, Ohio, to East Liverpool via Lisbon, and will operate into Youngstown over the Youngstown & Southern. The company has leased the Pittsburg, Lisbon & Western from Salem to Washingtonville, seven miles. The Youngstown & Ohio River is being built by the Cleveland Construction Company. It is to be in operation by December of this year. (March 15, p. 394.)

RAILROAD CORPORATION NEWS.

Apalachicola Northern.—E. A. Faulhaber, of St. Louis, Mo., has been appointed Receiver of this road, which runs from River Junction, Fla., where it connects with the Atlantic Coast Line, the Seaboard Air Line and the Louisville & Nashville, to Apalachicola, Fla., 80 miles.

Arkansas Valley.—See Atchison, Topeka & Santa Fe.

Atchison, Topeka & Santa Fe.—At the annual meeting on October 24, the stockholders will be asked to ratify the lease to this company of the Fresno County Railway and to ratify the purchase of the Arkansas Valley, the Holly & Swink and the Eastern Oklahoma. These companies have been controlled through stock ownership.

Brooklyn Rapid Transit.—See Coney Island & Brooklyn (Electric).

Canada Atlantic.—The stockholders will vote on September 24 on the amalgamation of this company with the Grand Trunk, which bought it two years ago. The road runs from Depot Harbor, Ont., to the Vermont state line, 400 miles, and leases or controls 58 miles of branches.

Canadian Northern.—The Dominion Securities Corporation, Toronto, and William A. Read & Co., New York, are placing an issue of $1,500,000, series O, equipment trust 4½ per cent. notes issued by the Imperial Rolling Stock Company, a subsidiary of the Canadian Northern. The notes mature in 10 equal annual instalments beginning June 1, 1908, and are secured on 750 box cars, 170 dump cars, 140 flat cars, 25 cabooses, four snow plows, 21 ten wheel locomotives and 29 passenger train cars.

Chicago, Burlington & Quincy.—A quarterly dividend of 2 per cent. on the $110,839,100 capital stock has been declared, raising the annual dividend rate from 7 per cent. to 8 per cent. An extra dividend of 6 per cent. on the stock was also declared; both are payable October 1. The new rate will pay the Great Northern and the Northern Pacific, who own nearly all the stock of the C., B. & Q., for their expense in paying the interest on the joint 20-year, 4 per cent. collateral bonds which they issued in 1901 in exchange for that stock; the extra dividend just declared repays the two companies for the difference during the last six years between the interest they paid and the amounts they received in dividends. The bonds were exchanged on the basis of $200 in bonds for $100 in stock.

Chicago Great Western.—President Stickney, on his recent return from England, said that plans were nearly completed for new financing which would take care of the needs of the company for the next 10 years.

Coney Island & Brooklyn (Electric).—The stockholders of this company, which is a subsidiary of the Brooklyn Rapid Transit, have agreed to forego the dividends for the next two years in order to pay for improvements. The quarterly dividend was passed last spring. (May 10, p. 664.)

Eastern Oklahoma.—See Atchison, Topeka & Santa Fe.

Fort Wayne, Cincinnati & Louisville.—See Lake Erie & Western.

Grand Trunk.—See Canada Atlantic.

Great Northern.—At the annual meeting on October 10, the stockholders are to act on a proposition to buy all the properties of the following companies which make up the system: The St. Paul, Minneapolis & Manitoba, the Eastern of Minnesota, the Willmar & Sioux Falls, the Park Rapids & Leech Lake, the Minnesota & Great Northern, the Duluth, Watertown & Pacific, the Dakota & Great Northern, the Montana Central, the Duluth, Superior & Western Terminal, the Montana & Great Northern, the Billings & Northern, the Spokane Falls & Northern, the Columbia & Red Mountain, the Washington & Great Northern, the Seattle & Montana, the Minneapolis Union Railway and the Duluth & Superior Bridge.

Holly & Swink.—See Atchison, Topeka & Santa Fe.

Interborough-Metropolitan.—The quarterly dividend of 1¼ per cent. on the $45,380,300 cumulative preferred stock due October 1 has been passed. No action has yet been taken on the 7 per cent. dividend on the Metropolitan Street Railway stock guaranteed by the New York City Railway, but the usual quarterly dividend of 2¼ per cent. has been declared on the stock of the Interborough Rapid Transit. (Aug. 30, p. 248.)

Interborough Rapid Transit.—See Interborough-Metropolitan.

Lake Erie & Western.—At the annual meeting on October 2, the stockholders will vote on the proposed merger with this company of the Fort Wayne, Cincinnati & Louisville, which runs from Fort Wayne, Ind., to Connersville, with a branch from Newcastle to Rushmore, 129 miles in all.

Metropolitan Street Railway.—See Interborough-Metropolitan.

National of Mexico.—Arrangements have been made for extending the $8,500,000 outstanding 5 per cent. four-year notes maturing October 1, 1907, being part of an authorized issue of $10,000,000, until April 1, 1909, at the same rate of interest. This extension is at the option of the holders of the notes; they may have the notes redeemed on the original date of maturity, at par, but those who are willing to have them extended will receive new notes and $35 additional in cash for each $1,000 note.

New York Central Lines.—Gross earnings for the month of August, 1907, were as follows:

	1907.		Changes.
New York Central & Hudson River	$9,264,420	Inc.	$640,911
Lake Shore & Michigan Southern	4,135,926	"	312,520
Lake Erie & Western	188,666	Dec.	20,570
Chicago, Indiana & Southern	248,516	Inc.	17,837
New York, Chicago & St. Louis	884,757	"	75,188
Michigan Central	2,474,261	"	298,780
Cleveland, Cin., Chicago & St. Louis	2,471,386	"	106,100
Peoria & Eastern	259,136	Dec.	27,047
Cincinnati Northern	95,341	"	19,705
Pittsburgh & Lake Erie	1,519,196	Inc.	261,993
Rutland	293,568	"	6,050
	$22,135,473	Inc.	$1,712,057

Toledo, Ann Arbor & Detroit (Electric).—The property of this company, which has been in the hands of a receiver since August, 1906, is to be sold under foreclosure on September 16. The upset price is $80,000. The road is partly built between Toledo, Ohio, and Ann Arbor, Mich.

Union Pacific.—The syndicate headed by Kuhn, Loeb & Co., New York, which underwrote the $75,000,000 convertible 4 per cent. 20-year bonds last spring, expires on September 16. The last instalment was paid on September 10, and it is understood that this amount, which was about $30,000,000, was at once used to take up the notes issued to the Pennsylvania for Baltimore & Ohio stock. It is said that the syndicate disposed of only about 2½ per cent. of the bonds.

Western Pacific.—It is said that this company has acquired control of the Yosemite Valley Railroad, which was recently opened for traffic from Merced, Cal., to Yellowstone Park, 85 miles.

Yosemite Valley.—See Western Pacific.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 370 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Pres't. and Editor*
E. A. SIMMONS, *Vice-President*
RAY MORRIS, *Secretary*
R. S. CHIBBLM, *Treas.*
I. B. RIKER, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Man'g Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
RODNEY HITT
GEORGE L. FOWLER
FRANK W. KRAEGER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIII., No. 12. FRIDAY, SEPTEMBER 20, 1907.

The salient item in the statistics of the railroads of the country for the fiscal year ending with June, 1906, which have just been reported by the Interstate Commerce Commission, is the average of gross earnings, which, for the first time, exceeds ten thousand dollars a mile. This figure differs but slightly from that given by Poor. The fact that the growth of business on existing railroads is much more rapid than the extension of railroad lines is also indicated by the statement of the density of freight traffic, which in the present report is 982,401 ton-miles per mile of line, an increase of no less than 14 per cent. over the year preceding. Another aspect of the same fact is the length of four-track railroad in the country, which now aggregates 1,280 miles. The number of cars owned by the railroads, passenger, freight and service, has now almost reached two millions. The next report—which will be for a date already three months past—will show a figure farther from the two million mark than the present one. The number of persons employed by the railroads has also reached a round figure—a million and a half—which will be surprising to the reader who has not watched the prodigious growth of the transportation industry. This is an increase of 50 per cent. over the record of so recent a year as 1901.

The results of the tests made to determine the pressure of locomotive wheels against the rails when rounding curves reported by George L. Fowler elsewhere in this issue are a very important contribution to the knowledge on this subject which up to this time has been vague and unsatisfactory. Wellington and Forney wrote from a theoretical and somewhat crude experimental standpoint on the action of wheels and trucks on curves and the Williams Bridge wreck on the New York Central more recently brought out a great mass of more or less conflicting theoretical calculations based on widely different assumptions. While Mr. Fowler's experiments unfortunately were not carried out fully enough to warrant formulating a law expressing the relation between speed, curvature, wheel loads, wheel base and the side pressure against the rail, the incomplete data obtained give grounds for casting doubt on the theoretical calculations which give results much lower. Some of the complex stresses involved must have heretofore been overlooked or misapplied in making assumptions. The best proof of this is that in the case of the Williams Bridge wreck all of the facts tend to show that the rails were spread by the action of the locomotive while all the calculations so far published give stresses which are below the ultimate strength of the fastenings. It is to be hoped that further tests along this line will be carried out in the near future in order to establish definitely the pressures which must be safely provided for. The apparatus has been perfected sufficiently to give reliable results under any normal conditions of speed, curvature and wheel loads, and nothing now remains but for some railroad to provide the necessary track and locomotives to be tested.

A member of the motive-power department of a large road writes to ask for information as to the average natural life of passenger cars, especially on large systems having branch lines on which such cars can be run after they become unsuited for main line service. We do not know that any statistics on this subject have ever been compiled. Car men, when asked this question, generally answer, "about 25 years." But they do not mean by this that as a result of deterioration the car at the end of that time is suitable only for the scrap heap. Passenger cars are maintained at all times in condition to transport passengers safely; therefore from the standpoint of their physical condition their lives are without a limit. Freight cars not infrequently reach a state of such general dilapidation as to be condemned, but not so with passenger equipment. When passenger cars are condemned, it is because they have become so antiquated in style and arrangement as to be unfit for further use. This is the basis for the 25-year estimate. During that period, and even a shorter one nowadays, a car will have passed through all the stages of service from the splendors of the "crack" limited, down through local and branch line service, to end up possibly in a work train or some such humble service before going finally to the scrap heap.

The rate of depreciation allowed in the rules of interchange for passenger cars might be taken by the uninformed as a basis from which to compute the average life of passenger equipment. That is not the case, however. When the passenger rules were first adopted —in 1890—they contained no provision for valuation of destroyed cars. The committee appointed to revise these rules in 1900 included in their proposed revision a clause for settlement for destroyed cars, in which allowance for depreciation was made at the rate of 4 per cent. a year up to 60 per cent. of the original value of the car. This was rejected by the association, however, and the code remained without such a clause until 1906. The present revised rules were then adopted, and for the first time terms for settlement for destroyed cars were laid down. The depreciation allowance is at the rate of 3 per cent a year up to 50 per cent. of the original value of the car. This figure is altogether arbitrary.

however, and was agreed on in response to the demand that the rules contain such a clause. It is thought by many to be too high, this doubtless being the case when one's own car is destroyed; when it comes to paying somebody else's claim the allowance probably seems much too small.

One of those entries not conspicuous in itself, but whose variation upward casts its deep shadow ahead, appears in the item "taxes" on the railroads of the country as returned for the years 1905 and 1906 in Poor's Manual soon to be published. For the year 1905 the taxes were $54,553,620; for 1906 they were $68,169,833, an increase of $13,616,213, or about 25 per cent. During the same years railroad mileage of the country increased only about 2½ per cent., and total railroad assets which, in a rough way, may be regarded as the "gross" object of taxation, increased somewhat less than 8 per cent. Taxation, in ratio, thus went up ten times as fast aud far as mileage and three times as fast as total railroad valuation. But this is not all and is a meager and deceptive test, for the taxes for 1906 were, in fact, based on assessments and on tax methods in force during the previous years and before "corporation baiting" got its full sweep and swing. The data of railroad taxation are, practically, two years behind, and not until next year, at the very earliest, shall we be able to measure the reach of the new taxation impacts due to state legislation during the year past. A good many legislatures have been giving the subject attention adversely to the railroads, and in two or three states, like New Jersey, the changes have been severe, almost revolutionary. The outcome is not yet. But we venture to predict that when the final accounting is had in the courts and elsewhere of the railroads as creditors of the public the increment of taxation will cut no small figure. If it results in harmonizing the medley and welter of tax expedients in the various states there may be a final gain even if coupled with some antecedent loss. Meanwhile, as a theoretical study, at least, economists may well stand aghast at the complexities of applying existing mazy and hybrid railroad tax methods to state or federal plans of "revaluation."

Organizations of shippers to bargain for freight rates are proposed by a correspondent in another column. Shippers do thus organize to some extent now; and the National Industrial Traffic League, lately formed, proposes to cover the wide field more systematically than it has been heretofore covered. The only new suggestion offered by our correspondent, therefore, is that Boards of Trade be clothed with some official authority. This suggestion is offered with evident diffidence, as well it may be; for a trade organization which is to have real authority to speak for individual shippers should have only very limited powers. Perhaps the power to advertise itself as a public body, to gather facts and to record and certify to votes or letter ballots would be about all that it would be safe to begin with. The desideratum is to establish a body which could promptly and truly represent all of the shippers and receivers within a given territory—perhaps a county or half a state—while still retaining the close relations between individuals and the central organization that is to be seen in the Merchants' Association of New York and like organizations in other cities. The statutes forbidding preference for one shipper over another are now everywhere construed very strictly, so that a railroad traffic manager who wishes to consult "the public" before making a change in a rate must be careful to find out just who the representative of the public is, or rather, just what "public" a given representative has the right to speak for. Hence the need of a shippers' organization recognized by the state. If a voluntary and unincorporated merchants' association should freeze out a single merchant, a railroad manager dealing with the association would have to be on his guard against being jailed for discrimination. Is it practicable to establish an efficient and impartial shippers' committee which all classes of shippers would support?

In the point made by our correspondent concerning the partisanship of state railroad commissions there is a slight suggestion of humor. These bodies have indeed become so intensely partisan, and their partisanship so pleases the public, that the old idea of an unprejudiced commission seems in danger of dropping out of sight. In the new law passed this year in Georgia, the radical members of the Legislature have gone so far as to intimate that the less a candidate knows about railroading and about law, the better will be his chance of appointment. What other interpretation can be put upon that clause of the statute which names the qualification of candidates and in so doing expressly stipulates that these two branches of knowledge shall be ignored? We have called this humorous; but probably we are wrong. The fear of getting pro-railroad men on commissions seems to be a serious matter; and in other states than Georgia. Is it impossible to get fair-minded men who are not devoid of legal and railroad knowledge? Even the carefully prepared New York state law, fathered by Governor Hughes, seems to assume that the Public Service Commissions are liable to pursue the same headlong, ignorant course pursued by the legislatures, for it provides for a regular salaried lawyer as adviser to each of the two commissions. Governor Hughes himself, a thoroughly public spirited man, seems to be possessed by this same notion that only through partisan commissions can the railroads be curbed; for in selecting 10 commissioners, he seems to have found only two who were familiar with railroad affairs. It would be hard to find another state where there has been even this slight recognition of "the other side." In the present state of mind of the governors and legislators of many of our states the only way for a commission to satisfy what seems to be public sentiment is to proceed with feverish speed to "jump on" the railroads at every vulnerable point. As long as this is so the least that the conservative legislator or the conservative adviser of a governor can do is to see that a lawyer, presumably level headed and not carried away by the ill-considered behavior of the legislatures, is appointed to stand by and restrain zealous commissioners, so that their course shall be somewhere within the bounds of reason. But what a commentary on the meaning of "Commission!" The normal function of a commission—which is a committee—is to investigate and report upon the whole of a subject—that is to say, to fairly set forth all aspects of it. Partisanship is excluded, almost, by the word itself. If the present tendency continues the statutory legal advisers will be the real commissioners; for a man possessing accurate and intimate knowledge of a subject must inevitably prevail finally over a man, or a dozen men, swayed only by impulse. Georgia has provided for a legal adviser to the Commission, the same as New York.

There are indications that the problem of securing better rails is rapidly approaching solution, and that this favorable result is primarily due to publicity of the bad condition, which has enabled the American Railway Association to act for all the railroads in a united investigation. A significant incident is that the Bethlehem Steel Company offers to furnish rails for a moderate advance on the $28.00 price, with .04 phosphorus and a 20 per cent. discard from the ingot. If for an increased cost of less than 25 per cent. the railroads can have rails which are reasonably safe and with a life more than double, a considerable improvement in the situation is manifest. It will be recalled that following the publication of statistics of breakage and a large number of representative photographs showing the kinds of breakage, the American Railway Association, on the initiative of Mr. Wilgus, discussed the subject at its Chicago meeting, to which representatives of the manufacturers were invited, and this discussion was followed by the appointment of a committee. There are now in session meetings of a sub-committee of the American Railway Association's committee, consisting of Mr. Richards, of the Pennsylvania; Mr. Isaacs, of the Southern Pacific; Mr. Montfort, of the Louisville & Nashville, and Mr. P. H. Dudley. In conference with them are four representatives of the manufacturers: Mr. Wood, of the Maryland Steel Company; Mr. Bostwick, of the Carnegie Company; Mr. Carhart, of the Illinois Steel Company, and Mr. Abbott, of the Lackawanna Steel Company. This sub-committee will report early next week, and there is possible, indeed there is some hope for, an agreement on specifications acceptable to the manufacturers. The attitude of the manufacturers has entirely changed, apparently, if words count for anything. Both Mr. Schwab and Judge Gary have made public statements to the effect that their rail orders have stopped, awaiting an agreement on specifications acceptable to the railroads. Judge Gary adds a statement of that kind of truth which is self evident, but which has more than a commonplace value in view of the development of facts about defective steel rails and the firm attitude of the railroads. Judge Gary says:

> "The time has gone past for the great corporations to ignore the public and the public interest. 'The public be damned' policy, if that phrase was ever actually used, will not go in these days. The heads of our great industrial enterprises can never adopt that attitude, not alone as a matter of policy but in the interest of their own undertakings."

The only feature of the distressing collision in New Hampshire, reported this week, that is at all novel, is the statement of the cause, given by the officers of the road to the newspapers, which is clear

and frank, and evidently as full as can be asked for at this time. The officers even tell us the length of service of the two men between whom lies the responsibility for the error in the telegraphic order delivered to the freight conductor. This is a detail which is always of interest to the public. The recognition of this fact by railroad officers nowadays is perhaps to be credited to the Interstate Commerce Commission, which asks this question in connection with the reports of accidents which are required by the Federal law. The New Hampshire collision is due to an error of the same class as that which figured in the disaster at Salem, Mich., only eight weeks before. Despatchers' and operators' errors of all kinds, when they are aggregated for 225,000 miles of road, as they are in the records now furnished to American newspaper readers, are so numerous that no detail is unfamiliar. That the victims of this collision were in a light car, placed in the train between heavier ones, is also commonplace. There seems to be no end to the life of old passenger cars, although their use between heavy ones has been vigorously denounced these many years. This collision, like Salem, might be made the text for an instructive study of the best way to secure safety under the American despatching system. But why should such a study be made? Has not every railroad superintendent and trainmaster long since become convinced that the system has in it more loop holes for danger than any division officer on earth can watch and safeguard? As in repairing a thin dam made of bad material, new leaks will develop in one part while attention is being centered at another. At least, this is the incontrovertible verdict that the public is obliged to render on the basis of known results, whatever railroad officers may believe or may be trying to accomplish. The Boston & Maine is spending large sums of money on automatic block signals. It recognizes the absolute necessity for the adoption of the space interval principle in running trains, in place of the time-interval-and-train-despatcher method. As on most other roads, the process of introducing the better method is slow. Even the state railroad commissioners of Massachusetts, Indiana and New York, who recognize the need of the block system, are slow. Possibly this slowness is financially justifiable. But meanwhile people are being killed by the car-load.

MORE DIFFICULTIES IN GEORGIA

The Georgia Railroad Commission finds that the gross rate reductions received through the instrumentality of the commission by 69 Georgia cities and towns, based on the business of 1906, amounted to $1,896,199. But Commissioner Joseph M. Brown points out that, in the meantime, the price of commodities affected has actually increased. "It is clearly proven," he says, "that the reduction in freight rates, although the unjust discrimination caused by them required that they should be made, signally failed to reach the masses of the people. And let me add that the increase in prices has often been made at the expense of even the retail dealers."

Mr. Brown continues: "It is, therefore, certainly pertinent to ask, 'Shall the transportation facilities necessary for the commerce and intercourse of the people of Georgia be made subservient to the demands for other and greater dividends for the manufacturers of Georgia and of other states from which Georgia jobbers buy? Ought not the railroads to be protected in the power to furnish to the people prompt and safe service for person and property, and should not future reductions in their revenues be made on such items as will reach the masses of the people?' There are thousands of citizens of Georgia who own railroad stocks and bonds. Shall their sources of support be destroyed for the purpose of giving other dividends to the manufacturers and jobbers? Remember, again, there are tens of thousands of people in Georgia who are members of the families of railroad employees. Shall they be reduced to beggary by bankrupting the railroad companies in order to give the manufacturers and jobbers another dividend? In the mean time it is certainly pertinent to ask directly the question which is clearly inferred from the facts I have adduced, viz.: 'Wherein has it benefited the people to reduce the freight rates?'"

Of course Mr. Brown is not arguing a case for the railroads. His point of view is not that railroad rates have been made too low, but that the wicked manufacturers, all over the state, are charging too much. Why not appoint another full-powered committee to supervise all wholesale and retail prices? The step is not a very long one, and the citizens of Georgia could then buy shoes at a dollar a pair, or whatever price the commission in its wisdom might fix. There is abundant historical authority for this. Rhode Island, for example, decreed in 1786 that merchants must accept at par the unredeemable, depreciated paper currency in payment for their goods. There were no ifs, buts or ands about this decree, yet somehow it failed of its purpose, because the unregenerate merchants closed their shops. We leave it to the reader to apply the parallel, if there is one, in this example of rate regulation *in extenso*.

THE ERIE AND THE SOUTHERN DIVIDENDS.

At a time when the cost of capital is so great that it is practically out of reach, except in small quantities, it is not surprising that the Erie Railroad, perhaps the most prominent example in the country of a financially top heavy system, should be chary of its dividend payments. And when to this high cost of money is added local legislative hostility, discouraging new investment at the same time that it reduces the earning power of present investment, it is natural that the Southern Railway should adopt the conservative course of cutting its preferred dividend from five to three per cent, to release funds much needed for improvement work. In the 1907 fiscal year, the Southern earned $56,657,991, as against $53,641,436 in the same months of the year previous, but net decreased nearly two millions in that same period, and it may be safely hazarded that the company did not earn more than the requirements on the three per cent. basis. But it is also true that expenditures for maintenance of way, structures and equipment have been on so liberal a basis, during the past two years, that money is being plowed back into the property, and operating expenses are somewhat higher than strict necessities of upkeep would require. In the 1906 year the company charged maintenance of way and structures at approximately $1,034 per route mile, locomotives at $2,632 per locomotive, passenger cars at $955 per car, and freight cars at $72. It is obvious that these figures represent, as they have represented for some years past, a wholesome and commendable effort to do as much work on the property as possible out of earnings, and the Southern, like all the roads in its territory except, perhaps, the Louisville & Nashville, has urgent need of this sort of rehabilitation. Last fall, the new financing of the road and the continuous betterment expenditure out of earnings began to bear fruit, and the road was apparently earning its full preferred dividend and some two and one-half per cent. on the common besides. But all this year the expense account has been mounting fast, especially in labor costs, both by the hour unit and by the efficiency unit, while there is scarcely a state which the lines pass through that has not sought to reduce the company's income and at the same time to increase its taxes and to regard all failure of service as wilful, as President Finley has pointed out, and to penalize such failures heavily. As we see it, when a railroad is making every effort and spending all available funds—even funds which might properly be credited to the dividend account—in an attempt to perfect its physical condition; excessive taxes, excessive damage awards and penalties for unsatisfactory performance tend directly to wrecked trains, and cost human lives. The southern legislatures may eventually learn that promiscuous attacks on the credit and earning power of their carriers, combined with enforced additions to the expense accounts, do not lead to better railroad conditions in the South; in the meantime there must be wrecks, and dividends must be passed.

The case of the Erie is quite different from that of the Southern. When the 1907 earnings were given out, it was shown that there had been a substantial increase, not only in gross, but in net, in spite of the prevailing costs of labor and materials. According to the face of these returns, which cannot be analyzed until the detailed statement of transportation and maintenance costs is published, dividends on the preferred stock were earned twice over, and they were declared at the usual rate, but made payable in 1917, four per cent. warrants for the amount being given to stockholders.

The Erie has a highly competitive position in trunk line territory; it is terribly burdened by the sins of its fathers, and the skill and courage of its president in putting the road on its feet, financially and physically, has been one of the noteworthy achievements of the last decade. But money for improvement work it must have, both to continue the grade revision, now well in hand, and to provide additional heavy equipment, and the ordinary channels through which money is procured are, to all intents, closed to the Erie at present. With a good surplus, the management may well have hesitated to pass the dividends, not only in justice to the stockholders, but because of the effect on the company's credit. The warrants represent what may be called an enforced loan of $2,-

500,000 at four per cent., while it is quite certain that the market rate for this sum would have been in the neighborhood of double that rate; more rather than less. The problem of the Erie may be stated as that of keeping its property in condition and continuing to do business until the other trunk lines grow up to its capitalization. There is no longer any question that it is urgently needed as a carrier, and it should normally show good increases, year by year, until the debt looks less formidable in proportion to the traffic than at present. But meantime it is unavoidable that new capital should be put into the property, and the year 1907 has been a crucial one in securing this capital, bringing out, as it has, two interesting expedients, the expensive, discounted-paper type of loan, last spring, and the economical dividend warrants, this fall. It is rather curious to note that the cash value of these warrants at the present time bears just about the same relation to their par value that the reduced Southern dividend bears to the full five per cent.

Train Accidents in August.[1]

Our record of train accidents occurring on the railroads of the United States in August includes 18 collisions and 25 derailments and three boiler explosions, 46 accidents in all. This record is not published in full except in the cases of the few accidents which are especially prominent—in the present instance four collisions and eight derailments. The record of "ordinary" accidents—which term includes, for our present purpose, only those which result in fatal injury to a passenger or an employee or which are of special interest to operating officers—is given at the end in the shape of a one-line item for each accident, showing date, location, class and number of deaths and injuries. This record is based on accounts published in local daily newspapers, except in the cases of accidents of such magnitude that it seems proper to send a letter of inquiry to the railroad manager.

The accident most fatal to passengers in August appears to have been that at Kelly, Pa., on the 6th, where five passengers and one trainman (the engineer) were killed and 18 passengers were injured. Southbound train No. 6 was derailed by running into a freight car which had fallen upon the southbound track in consequence of a break-in-two in a northbound freight. The passenger train was running about 40 miles an hour. The engine was wrecked and three passenger cars were overturned.

The derailment at Red Rock, Okla., on the 1st, is reported as unexplained. Both of the passenger coaches, together with the baggage car and the locomotive, fell into the ditch.

The derailment on the Chicago, Rock Island & Pacific, at Thompson, Neb., on the 22d, was due to the opening of a derailing switch in front of a passenger train when it was too late for the train to be stopped. The tender, mail car and baggage car were overturned and the engineman was killed. The train was running at about 25 miles an hour. The point of derailment was the approach to the crossing of the Burlington road, and the signalman—who decamped immediately after the derailment—is supposed to have become confused and to have assumed that the train approaching was on the Burlington track. There was, in fact, no Burlington train in sight.

The accident at Kingsley, Miss., on the 22d, was the derailment of a freight train which fell against the cars of a work train standing on a side track, causing the death of seven laborers of the work train.

The butting collision at Sapulpa, Ind. T., on the 24th, is reported as due to the failure of the train despatcher to issue the proper order to the eastbound train. Of the killed four were trainmen and the fifth was reported as unidentified.

The collision at Foul Rift, N. J., on the 15th, was due to the neglect of an operator to deliver an order to the southbound train. This operator (at Belvidere Junction, two miles north of Foul Rift) was ordered to hold a southbound freight, but he did not do so, and this train collided with a northbound train. The engineman of the northbound train was killed and three trainmen were injured. The operator was not the regular attendant at that station. A coroner's jury found the operator responsible, but recommended that no legal action be taken against him because of the failure of the despatcher to comply with the rule which requires meeting orders [if practicable] to be sent so that the superior train shall receive them at some station before it reaches the appointed meeting place. Whether or not the words which we have shown in brackets were in the rule, or, if in it, were given weight by the jurymen, does not appear. The jury deliberated 12 hours.

The derailment at Chester, Mass., on the 4th, was due to the runaway of a heavy eastbound freight train on a 1½ per cent. grade, about 20 cars being wrecked. The train after running about 10 miles at a high speed collided with an empty engine which was backing down the grade, but the empty engine, though damaged, did not leave the track. The derailment of the freight appears to have been immediately due to damage sustained by its engine when it bumped the empty engine. The failure to control the speed of the freight train was due to neglect of the train crew to test the air after taking on four cars at the front end of train at the top of the grade. Investigation indicated that an angle cock between the fourth and fifth cars was not opened, so that when occasion required an emergency application it could not be made upon the whole train. In ordinary service on this grade freight trains are controlled by hand brakes, the air being used in emergencies.

The derailment at Melrose Junction on the 7th was due to the runaway on a steep grade of a freight train made up of 50 cars loaded with coal. It occurred about 3 a.m. The train had been run properly for about nine miles down the grade but then became uncontrollable, and after running about three miles at high speed was thrown off the track at a derailing switch, the engine and 42 cars falling down a bank. One trainman was injured. The failure to control the speed appears to have been due to mismanagement of the air-brakes by the engineman.

These two runaways, though not resulting in any fatalities, are among the most costly wrecks of the month.

The collision at Auburn, N. C., on the 6th, was investigated by a coroner's jury; and the cause, as given in the words of the conductor, was "I simply forgot my orders, that's all"; and a similar neglect seems to have been the cause of the butting collision at Dalton, Ga., on the 8th.

The derailment at Tulsa, Ind. T., on the 30th, due to a train running on to a burning bridge, is reported as the fourth serious train accident near that place within a few days, all believed to have been due to the malicious acts of train wreckers.

[1] Abbreviations and marks used in Accident List:
rc.....Rear collision.
bc.....Butting collision.
xc.....Other collisions: as at crossings or in yards. Where only one train is mentioned, it is usually a case of a train running into a standing car or cars, or a collision due to a train breaking in two on a descending grade.
b.....Broken.
d.....Defective.
dr.....Defect of roadway.
eq.....Defect in car or engine.
n.....Negligence.
unf.....Unforeseen obstruction.
unx.....Unexplained.
derail.....Open derailing switch (negligence of engineman or signalman).
ms.....Misplaced switch.
acc. obst.....Accidental obstruction.
malice.....Malicious obstruction of track or misplacement of switch.
boiler.....Explosion of boiler of locomotive on road.
fire.....Cars burned while running.
Pass.....Passenger train.
Ft.....Freight train (includes empty, engines, work trains, etc.).
*Wreck wholly or partly destroyed by fire.
†One or more passengers killed.

Of the 22 serious electric car accidents reported in the newspapers in the month of August, seven are reported as having each

caused one or more fatal injuries, namely, Westerly, R. I., Odell, Ill., Brooklyn, N. Y. (two), Alliance, Ohio, La Crosse, Wis., and Charleston, Ill. The last mentioned, occurring on the 29th, was a butting collision causing the death of 14 passengers. This was reported in the *Railroad Gazette* of September 6 and 13.

Uniform Classification—Significant Testimony.

The proposal to establish one uniform classification of commodities for all freight tariffs in the United States, which has been before the country for 15 or 20 years, has been favored by the Interstate Commerce Commission and by various state railroad commissions and has been constantly opposed by railroad men, by all railroad men we believe, who are fully conversant with the subject, except those who have deemed it their duty to try to comply with the wishes of the advocates of the change in spite of the difficulties of the task. At last, however, we have a strong voice on the conservative side from a state railroad commissioner, Mr. Mayfield of Texas. Mr. Mayfield has had long experience and his epitome of this matter is a forcible one. It is in a letter to O. P. Gothlin, member of the Ohio Railroad Commission. He says:

"In my judgment, uniform classification is little short of an illusion; it is absolutely impracticable and altogether unwise. Classification is but a process of rate making, and uniform classification, to be of substantial value, must be followed by uniform rate making, which at once demonstrates the utter absurdity of the whole scheme.

"Such a thing as uniform classification cannot be maintained within the limits of even a state, much less the Union. For example, take the conditions that prevail in the state of Texas, where rates on state commerce are prescribed absolutely by agents of the government, and uniformity in all respects is looked after with especial care.

"The railroad commission of Texas has prescribed a classification of its own, and the fact remains that not exceeding 15 per cent. of the commerce of this state is governed by this classification, and I dare say the same general conditions prevail in the territory of Official, Southern and Western classifications.

"Within this state we have upwards of 40 separate commodity tariffs, and most of these separate tariffs embrace innumerable commodities, and the whole of them means nothing more nor less than a classification different from that prescribed in the Standard Classification.

"There are many factors to be considered in rate making, and an important one is the character and density of a commodity for which a rate is prescribed. These conditions shift and differ as you shift and change from one section of the country to another, and rates must be prescribed taking into consideration those shifting conditions; and, therefore, I repeat that the scheme in my opinion is visionary and absolutely impracticable."

The school which the Pennsylvania Railroad has established for the training of telegraph operators and station agents at Bedford, Pa., was opened on Monday last, September 16. The manager is Mr. J. F. Cessna. It is estimated that the Pennsylvania will need 700 additional operators to comply with the federal eight-hour law which goes into effect next March. Students are to be taught not only the work of the telegraph office, including the rules for handling despatchers' orders, but also the general duties of station agent, including practice in keeping station agents' accounts. It is expected that the course will require from six to eight months, and "immediately upon its completion graduates will be provided with salaried positions." A nominal charge of $2 a month is made for tuition. The company advertises for students between the ages of 17 and 25 possessing good health and a fair knowledge of English, mathematics and geography; "men of ability, energy, decision and action." As the *Railroad Gazette* is constantly setting forth in all departments of railroading the highest ideals that it knows of, it will be ungracious to question the judgment of that officer of the Pennsylvania who seeks men like General Sherman or Bismarck or Gladstone to fill the position of telegraph operator; but unless he pays a good deal higher wages than prevail on most railroads he will probably have to put up with men possessing perhaps one, two or three of the four virtues which he names. Men of 25 who possess any of them in a marked degree will be found to be now getting from $75 to $100 a month, and they don't have to work alone out in the woods. Candidates 17 years old may possess the first two or three, at least potentially; but to possess all may be a disadvantage. It may be better if the young men do not develop the third and fourth until after they have been trained awhile. Possibly this neighborly criticism applies only to the press agent, however. The main idea of the school is highly commendable. It is unbusinesslike to depend for recruits on self-taught operators, acquiring their knowledge in the offices of all kinds of station agents; and this notwithstanding the fact that innumerable high railroad officers began their careers in that way; and it is worse than unbusinesslike to set a labor union rule in the matter of apprentices.

When one says that history repeats itself he usually refers to events, more or less alike, which have occurred a few hundred or thousand of years apart; but History, like all the rest of us now lives a fast life, hence we read of "experiments" with hoops for delivering orders to moving trains (on the Pennsylvania Railroad) which "began late in 1906." It is about 20 years, if memory serves, since the successful use of hoops in this way in Iowa was reported in the *Railroad Gazette*. Several American railroads adopted the practice some years since, however, so perhaps History is not particularly interested. The Pennsylvania has introduced a modification a holder for holding up two hoops, one for each of the two engines of a double-header. Each of the 57 block offices on the Middle Division is supplied with three holders and 50 hoops. As the Pennsylvania has an enterprising signal department the reader may be inclined to surprise at this evidence of progress in a method of train management which has to do with old-fashioned practice—practice which does not have much use for signals. An explanation, or partial explanation, may be found in the fact that the Middle Division is the one least advanced in signaling. There being no heavy and frequent passenger service on the division, the company's investments in automatic signals and short block sections have been allotted to other divisions. On the New York Division and other well-signaled sections the strictly modern method of conveying running instructions to enginemen wholly by fixed signals is in vogue to some extent; and the use of tissue-paper orders, to be handled by greasy hands and read by dim lights, is correspondingly lessened. The hoop is a highly useful device (though it has done little for the pockets of American exploiters of railroad appliances); but we may hope some time to get beyond it.

The French papers are criticising the poor results that were obtained by the state in the operation of its railroads for the year 1906 in comparison with those obtained by the private companies. According to the report that has been issued, the net gain for the five great companies was as follows: The Nord, 8,500,000 fr.; Est, 8,000,000 fr.; Paris, Lyons & Mediterranean, 8,500,000 fr.; Orleans, 1,600,000 fr., and the Ouest, 1,700,000 fr., while the state system falls behind with a net loss of 300,000 fr. It is estimated that had the state system increased in the same proportion as the other roads it would have shown a net gain of 846,000 fr., whereas in reality it fell 1,346,000 fr. below this figure. From which it is argued that the state management is not equal to that of the private companies.

Chicago, Milwaukee & St. Paul.

Official mention is at last made in an annual report of the Pacific coast extension, but even now the undertaking is not described in any detail. The official map published with the report just issued makes no note of the new line, the only direct mention of which is as follows by President Earling:

"Companies organized under the laws of South Dakota, Montana, Idaho and Washington have undertaken and are now engaged in the construction of a line of railroad from the Missouri river to Seattle, Tacoma and other Puget Sound points. It has long been apparent that an outlet to the Pacific Coast would be of great benefit to the property of your company, and accordingly your company has advanced, and is now from time to time advancing, sums of money to aid those companies in the construction of this line. Each of the companies is progressing satisfactorily with its work, and it is expected that the entire line will be completed during the year 1909. In the opinion of the directors, large and important benefits will result to your company and also to the western companies through the interchange of the constantly increasing traffic between the Great Lakes and the Pacific Coast."

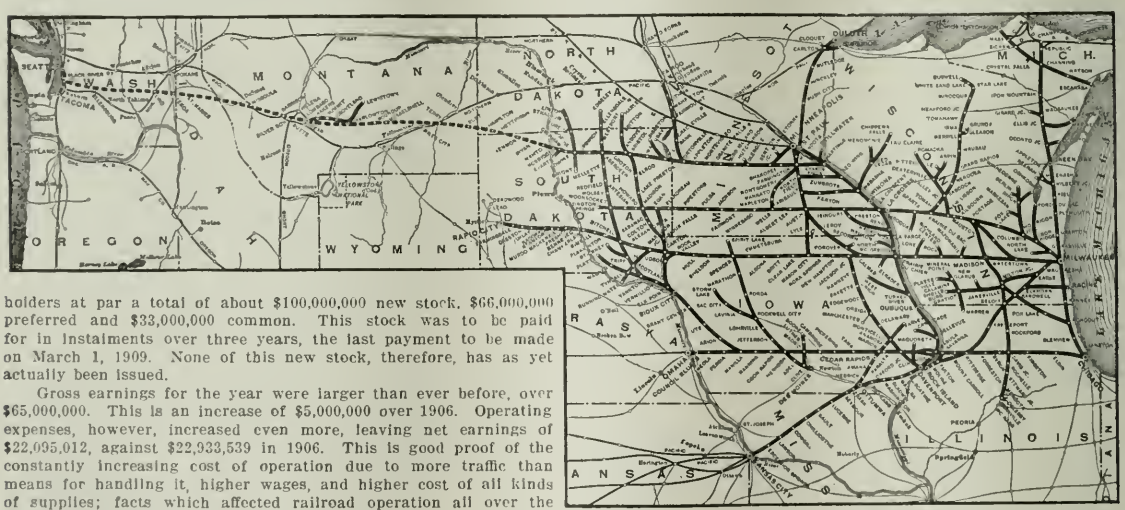
However, as was the case a year ago, there are indirect references to the new project much more definite and striking. Two years ago there was no item of "advances to other railroad companies" on the St. Paul's balance sheet. Last year this item appeared with about $9,500,000 so advanced. On June 30, 1907, it had increased to $32,339,271, which may be roughly taken as the cost of the new extension up to the present time. There has at the same time been a large increase in the stock of material and fuel on hand, as shown on the balance sheet. The value of this was $2,700,000 in 1905, $4,900,000 in 1906 and almost $6,000,000 on June 30, 1907, the increases probably representing stocks accumulated for use on the new line. The map shown herewith, including the Pacific extension, is one recently issued by the passenger department. The line should be in operation as far as Butte, Mont., some time in the first half of 1908. An article describing progress on the western end of the extension is published on another page of this issue; a similar article appeared in the *Railroad Gazette* of July 19, 1907. The country through which the western part of the extension is to pass was described in the issue of September 21, 1906.

Roswell Miller, chairman of the board, has been quoted as follows in regard to the Pacific extension:

"The line will be 150 miles shorter from Chicago to Seattle than the

Northern Pacific, and about 80 miles shorter than the Great Northern. Over the mountains the grades will be from 1⅞ per cent. to 1⅝ per cent. compensated. The Northern Pacific grades are in all cases 2½ per cent., and many of them are not compensated, and therefore average as high as 2⅝ per cent. Aside from the mountain grades, the St. Paul will have a much lower grade than the Northern Pacific, and the mountain grades are so bunched that they will not impede traffic. The extension is compelled by physical conditions to run along the Northern Pacific for a considerable distance, and to cross it several times. This, however, does not apply to much territory which produces a large business and therefore the competition will not be severe. The estimated cost of the extension will be $40,000 a mile for the main line, which includes equipment, and $30,000 a mile for branches. This contemplates a strictly first-class road in all respects."

While the fact of the Pacific extension is at last officially recognized in an annual report, the means by which the bulk of the new capital necessary for its construction is being raised—in itself the most important single event in the history of the St. Paul for the past year—is not even hinted at, except as the balance sheet shows a liability of $24,690,000, representing subscriptions to capital stock. The only new stock issue which is directly mentioned is that of $25,000,000 common stock made last fall. This amount of new stock had been authorized by the shareholders on October 4, 1902, following a threatened break with the Union Pacific over the division of through rates to the coast. Since that time it had remained in the treasury unissued, suggestive always of the possibility of an extension of the St. Paul to the coast. Twenty-five million dollars, however, is only a small part of the money which will be necessary before the St. Paul has its own through line from Chicago to Puget Sound. Consequently, late in December, there was offered to stockholders at par a total of about $100,000,000 new stock, $66,000,000 preferred and $33,000,000 common. This stock was to be paid for in instalments over three years, the last payment to be made on March 1, 1909. None of this new stock, therefore, has as yet actually been issued.



Chicago, Milwaukee & St. Paul.

Gross earnings for the year were larger than ever before, over $65,000,000. This is an increase of $5,000,000 over 1906. Operating expenses, however, increased even more, leaving net earnings of $22,095,012, against $22,933,539 in 1906. This is good proof of the constantly increasing cost of operation due to more traffic than means for handling it, higher wages, and higher cost of all kinds of supplies; facts which affected railroad operation all over the country in the late fiscal year.

Freight earnings and revenue freight ton miles each increased about 10 per cent. The principal increases in tonnage were as follows: Flour and other mill products, 168,125 tons; wheat, 71,869 tons; fruit and vegetables, 53,114 tons; bituminous coal, 158,110 tons; iron and other ores, 565,054 tons; stone, sand, etc., 130,704 tons; lumber, lath and shingles, 100,989 tons; petroleum and other oils, 72,252 tons; castings and machinery, 92,154 tons; commodities not specified, 463,159 tons. The only decreases in tonnage were in barley; oats; corn; sash, doors, blinds and other forest products; lime, cement and plaster. Although there was an increase of 6 per cent. in the tonnage of agricultural products as a whole, these comprised a slightly smaller percentage of the total than in the previous year. The St. Paul's traffic, in fact, is so diversified that the company's dependence is not on any one particular product. With the development of the central West the road has become more than a granger line and carries large quantities of manufactures, coal, lumber and general merchandise. The Pacific extension should open up large new traffic areas which will not only furnish large quantities of raw products to be shipped eastbound, but will demand in return the manufactures of other products of the East and central West; in both directions the St. Paul will get a long through haul.

Less was spent on maintenance of way than in the preceding year. Less rails and ties were laid, and less was spent on ordinary roadway maintenance. Per mile of road, maintenance of way cost $827, against $856 in 1906. The St. Paul has long been noticeable among the railroads of the country because it spends so little per mile on keeping up its line. The particular reason for this is that it has so large a proportion of branch-line mileage. Taken as a whole, it is a local road with most of its mileage on the prairies, where the cost of track maintenance is at a minimum. With completion of the Pacific extension and the establishment of this as the St. Paul's one dominating through route, the cost of roadway maintenance per mile operated will tend to increase. At present the amount spent appears to be about the minimum with which the property can be kept in proper condition.

Maintenance of equipment stands at $8,600,000, against $5,600,000 in 1906, an increase of $3,000,000, or over 50 per cent. This large increase appears to have been mainly due to the charging of $3,346,610 to operating expenses for replacement of equipment, against $694,646 in 1906 and $682,389 in 1905 similarly charged. The increase in the total expenditures last year on this account is perhaps most strikingly shown in the item "maintenance of equipment per revenue train-mile," which increased from 19.27 cents to 27.99 cents. The increase is also shown when the account is analyzed into its separate units. The cost per locomotive was $2,548, against $1,454 in 1906; $775 per passenger car, against $663 in 1906, and $102 per freight car, against $46 in 1906. The marked increase in the locomotive and freight car items suggests that these classes of equipment have been maintained at a minimum or below during recent years, as well as the tremendous traffic handled during the year. The St. Paul builds more of its locomotives and cars than any other railroad. Improvements to its Milwaukee shops, costing $652,000, have been made during the year, and at present these shops can turn out 10 locomotives a month and 28 freight cars a day.

Conducting transportation shows an increase of $3,083,088, or 15 per cent. There were large increases under various heads. The item, engine and roundhouse men, which increased $232,000 in 1906, was larger by $561,000 last year. Fuel and other supplies for locomotives increased $283,000 in 1906 and $877,000 in 1907. Train service and supplies increased $156,000 in 1906 and $364,725 in 1907. Switchmen, flagmen and watchmen, after rising by $183,000 a year previous, increased $269,000 last year. Station service and supplies increased $260,000 in 1906 and $324,000 in 1907. Use of cars and locomotives increased, $125,000 in 1906 and $152,000 in 1907. This last item shows an increase of nearly 300 per cent. in two years and probably represents the pressing into service of foreign cars to relieve the extreme car shortages.

The St. Paul's new line from Chamberlain, S. Dak., on the Missouri river, to Rapid City, 219 miles, is finished and nearly ready for operation. The Chicago & North-Western, starting from the Missouri river at Pierre, S. Dak., has also been pushing a line to the principal city of the Black Hills district, and the two roads reached their destination at about the same time this summer, thus adding another to the many points at which the St. Paul and North-Western are keen competitors.

Considerable second-track work has been done during the year, as well as reduction of grades at various points on the line. Large improvements of this sort are still necessary to put the existing lines which will be used as the eastern end of the through line to Puget Sound in shape for heavy through traffic. Aside from such general improvements, it is not probable that the St. Paul, with the tremendous project of the Pacific extension on its hands, will undertake any large amount of new building in other directions.

it was, in fact, announced last spring that some $9,000,000 worth of new extensions and improvements had been indefinitely postponed. In order to carry the new stock issues at the present dividend rates it will be necessary for the Pacific extension to make a strong showing from the first, for the existing lines cannot bear the whole burden alone. It is entirely probable that the extension will do this, in spite of the fact that it is being built at the highest cost of labor and materials ever known. Yet if the earlier transcontinentals were built at a cost nearly as low in some cases as one-half what the St. Paul is paying, they run through long stretches of country which for years were barren of traffic. To-day enterprise and development in the Northwest are at a maximum. The new country which the St. Paul opens up should be rich in traffic from the start. Such business will be in addition to the developed and profitable through traffic to and from Puget Sound.

The principal results of the last two years' operation are summed up in the following table:

	1907.	1906.
Mileage worked	7,049	6,961
Passenger earnings	$12,102,196	$11,125,345
Freight earnings	44,115,059	40,187,710
Gross earnings	69,548,554	55,423,053
Maint. way and structures	8,820,998	5,955,432
Maint. of equipment	8,789,757	5,508,046
Conducting transportation	22,782,468	18,699,381
Operating expenses	58,453,542	42,489,514
Net earnings	22,095,012	22,933,539
Betterments and improvements	1,415,747	4,764,556
Net income	14,988,644	13,323,231
Surplus for the year	5,072,463	7,009,896

Shippers' Organizations to Bargain for Rates.

New York, Sept. 3, 1907.

TO THE EDITOR OF THE RAILROAD GAZETTE:

The *Journal of Commerce*, quoting a statement made by Mr. Plant, of the Southern Railway, in the suit against that company by the state of North Carolina, to the effect that "there should be a mutual understanding between the railroads and the public and an equitable arrangement as to rates," says: "This is a new position for railroad men to take, but it is eminently judicious in purpose. Heretofore railroad managers have claimed the right to fix rates for themselves and with sole regard for the interests of the railroads, adjusting them in such a way as to secure the largest return that the conditions of traffic will admit of. State railroad commissions, on the other hand, have been apt to be arbitrary and to assume that rates should be made as low as the traffic will bear without being discontinued by bankruptcy of the roads. If the business is to go on successfully regulation and operation must be brought into amicable relations. Those responsible for the management of railroads must arrange their schedules of rates, but this should be done with the fullest publicity and a complete disclosure of the conditions supposed to justify them."

The editor of the *Journal of Commerce* is right in declaring that the public ought to be represented; yet he ignores the fact, even while referring to it, that the public is represented already—by the state railroad commissions. What is the reason for this? The editor, like the rest of us, evidently is painfully aware that most of the state commissions are of doubtful value to the public. And the trouble is not because the commissions are not devoted to the public. They certainly aim with zeal to stand up for the public as against the railroads—although ostensibly they are independent bodies, of judicial temper, devoted to justice whether justice be for or against the railroads. No; the weakness of the commissions is due to their ignorance and their mistaken political zeal.

Mr. Plant's suggestion should not fall to the ground however, notwithstanding this blind and one-sided attitude of the present representatives of the public. The public which deals with the railroads—that is to say, the shippers—might well appoint representatives of its own. Probably the most satisfactory arrangement for carrying on negotiations between railroads and shippers that has ever been tried was that established through the traffic bureaus, such as were quite popular in St. Louis and certain other cities some 15 years ago, and which still continue to give efficient service in some places. It is only repeating an elementary truth to say that the "authority" who deals with the railroads on behalf of shippers, should, first, know accurately and in detail the needs and desires of the people whom he represents, and, secondly, should be enthusiastically devoted to the interests of these people. The average state railroad commissioner is enthusiastically devoted to those voters or the representatives of those voters who, he believes, will rule at the next election. It might be well even to go so far as to have boards of trade incorporated, and perhaps given some semblance of authority. That would be better than to continue our present farcical arrangements. Even in such a situation as that of the present year in Kansas where the railroads and the state commissioners reached a compromise on freight rates, there still seems to be a sad lack of harmonious purpose. The need of the day is a railroad commission of strong business men [illegible], politicians and country lawyers should be kept in the rear.

I want to say a word also for the railroads. The *Journal of Commerce* in proposing that the freight traffic manager in fixing his rates, shall make "complete disclosure" of the conditions on which he bases his decisions is quite superfluous. That is an idea that can never be put in practice. To even approximate a full understanding between the railroad and the public as to the reasons for a 10 per cent. increase in the rate on an important commodity, it would be necessary to hold a six days' public debate. Only by prolonged discussion would it be possible to settle the difference between the freight agent's estimate of the conditions and the estimate supported by the other side.

The only feasible way to make freight rates, in most cases, is by bargaining. The railroads must be allowed—at least in the beginning—to proceed on the theory of what the traffic will bear. The soundness of this theory is not shaken by the fact that it has often been abused by shortsighted traffic managers. It is proper for the public to see that the traffic manager does not punish traffic by charging it what it will *not* bear, but restraint of an overzealous freight agent is far different from cutting his head off. Anyone who tries to reverse the true theory of rate making only stultifies himself. "Complete disclosure" of conditions is a good goal at which to aim, and shippers may rightfully be on their guard constantly against unnecessary concealment by the railroads; but the theorist must deal with conditions as he finds them. Even state operated railroads are obliged to ride rough shod over his theories.

PROFESSOR.

Safety at Crossings Without Whistling.

Philadelphia, Pa., Sept. 16, 1907.

TO THE EDITOR OF THE RAILROAD GAZETTE:

I have just read with interest your editorial of last week on the Noise Nuisance. Many sensitive railroad men as well as thousands of sensitive passengers will endorse your denunciation of the loud whistle and the careless engineman. You might well have gone more fully into particulars. One of the most useless functions of the locomotive whistle is the regular enforcement of the rule regarding whistling for highway crossings, where such crossings are guarded by a flagman and in many cases by both flagman and gates. This unnecessary practice is observable in many places; and it appears to be kept up in spite of the fact—not in ignorance of it—that at hundreds of crossings in this country and Europe a saner practice prevails. On the New York, New Haven & Hartford many years ago an order was issued that where crossings were provided with attendants, the whistle need not be sounded. The attendants probably in most cases had in their cabins electric bells warning them of the approach of trains. On the Boston & Albany as much as 30 years ago, whistling was abandoned at crossings which were watched, as well as at many others also. At that time many of the gatemen's cabins had no electrical connection. An officer of the legal department of that road said in substance that the disuse of the whistle at these crossings had not increased the company's burden of expense either by adverse rulings of the judges in law suits, or by added severity in the awarding of damages by juries. The notion that every time a railroad relaxes its precautions at highway crossings even a hair's breadth, it incurs new dangers in the courts, is imaginary.

There are many highway grade crossings in England, a common American impression to the contrary notwithstanding; and the whistle nuisance has been done away with in that country long since, if, indeed, it ever existed to the barbarous extent which obtains in this country.

Why should not our ideas of whistling be reversed? Why not begin with the presumption that in ordinary circumstances whistles are not needed; that they should be used only by order or permission of municipal authorities? Why do cities and towns allow unrestrained use of locomotive steam whistles for calling in flagmen, for giving switching signals in large yards, and for other things of secondary importance, when hand bells or small mouth whistles or hand motions would answer just exactly as well? It is to be confessed that town officials are negligent in matters of this kind, perhaps as generally as are railroad superintendents, but in the universal apathy of railroad officers, it might be a good thing to stir up the municipal authorities.

O. F. M.

A Few Phases of Railroad Science.

TO THE EDITOR OF THE RAILROAD GAZETTE:

There never was a time in the history of railroading when so many people were coming forward to explain why this difficulty existed, and how that trouble could be eliminated if only the other fellow would do so and so. Some of these are instructive, some amusing, and some are neither.

Why we are getting this flood of explanation is of course quite

plain. It is simply because the troubles exist, and so far all the explanations offered have not reduced one trouble, nor have the suggested remedies, with one or two exceptions, been worth the time it took to write them. The exception par excellence is, of course, that of James J. Hill, and when his words are carefully considered and stripped to the bone they amount to simply this. The railroads of America that are in trouble must get busy and spend money, spend lots of it and spend it right. The people who put in their time offering other remedies are like the wild turkey in the trap, they go doddering around looking for a hole where there is none but will not get down and use the only opening that exists.

That this remedy should be unpopular goes without saying, but the fact must be recognized sooner or later that the art of making bricks without straw went out about the time the children of Israel followed Moses out of Egypt. Corporations as well as individuals when they find themselves in trouble can look back and see where they have been doing something wrong, and the sin of the railroads has been the heart breaking race for the prize of a larger "net increase over the same period last year." The object in itself is all right, but the mistake has been in the foolish idea that too great a proportion of this increase was theirs to salt away and keep. It was not, and now they must go back and dig it up again, or if it is gone beyond reach mortgage their future that they may have a future. And the one that does this first will win out first.

The science of railroading like some others is not an exact science. It is still lop-sided and has many anomalies. For instance, while the country as a whole has been advancing by leaps and bounds, business increasing in all directions, and the "net increase over same period last year" has steadily grown, what do we find in the detail of the railroad service? While the car service man is sending in nice little essays on the car situation, cars are standing out of service waiting repairs. The real car man, the man who actually keeps them in condition to be moved, is told to go ahead and rush them out, but do not exceed your expenditure for the same period last year. While loaded cars and empties are waiting to be shunted the yardmaster is howled at by the trainmaster to get a move on and do the work, but do not exceed your expenditure for the same period last year. While the trainmaster is explaining that he cannot move trains without engines, the motive power man is screamed at to get out the locomotives and keep them in good repair, but do not exceed your expediture for the same period last year. The roadmaster is explaining that he cannot get men to work at the old rates, he is told to go ahead and do the work, but do not exceed your expenditure for the same period last year. The superintendent is explaining that the volume of business has outgrown his facilities, that he can no longer handle a traffic that has increased 100 per cent. while his trackage, etc., has increased 10 per cent., or not at all, but he gets the same song, with variations, and the farce goes merrily on.

Never mind that some of the cars are getting older every year, and there are many more of them. Don't take into account that the locomotives are each year more expensive to keep in running order, and the man we pay $2 to to-day is not doing the work a $1.75 man did before. Don't acknowledge that your rails are one year older, that your roadbed requires more labor as your ballast wears thin, shut your eyes to the fact that anywhere off your road the section men can get better pay than you offer. Don't see all, or any of these things, let them all stand still while we make up our "net increase over same period last year." But don't stand still too long, for things that move have a way of running over things that stand still, and there is a pretty general break in the line and a scramble for money. Will the supply be equal to the demand?

Our diagnoses of the evils that afflict us are often wrong, and it follows that the remedies applied are useless. At a meeting of a railroad club some weeks ago the head of the passenger and ticket department read a paper that was very good indeed, and he covered so much ground that by the time he got through you had the feeling that he must surely be the Alpha and Omega of all railroading. While the members were throwing bouquets at him one gentleman during his congratulatory speech told a little story on the side. In this story there was a fat passenger who complained of the dust in the car, the heating appliances, and finally he cursed the whole outfit on account of being jolted by the engine driver's rough handling of the train. The gentleman who told the story had been in the car with the grumbler, but whether he told the yarn to simply amuse the members of the club, or whether he intended it as a gentle hint to the passenger man that he was not the whole thing I cannot say. I do not even know how it struck the company generally but it sounded good to me. Here was a passenger who might be taken as a fair sample of 95 per cent. of all the passengers who traveled on this road. He knew nothing about the head of the passenger department, he was not interested in the man who sold him his tickets, nor did he care a red cent for the conductor, but he had a grievance against the motive power department through the engineer who had jolted him, and against the car department for his other ills, and if he continued to patronize the road or left it for a rival they and they alone would be responsible.

Here was food for thought surely. It was not a new thought to me but brushed up some old ones. Now how many passengers who might travel by a rival line is the passenger department solely responsible for securing and keeping for their own road? I have traveled on railroad trains for 20 years, meeting all sorts and conditions of passengers, and I am prepared to say they are very few. That the passenger department does secure a small number goes without saying, but as for keeping them they have less than nothing to do with it. A passenger man may induce a man, or number of men, to travel by his road once, but if the cars are dirty, the road rough, and the train badly handled he can't get him again, and these are items he has nothing to do with. While if none of these exist, if the cars are right, the road smooth and the train well handled these will attract the passenger in the first place, becoming known to him through that best advertising medium in the world, a satisfied patron, and they will keep him though he never heard of the passenger department or its representatives. And the thought in my mind is was this what the gentleman meant when he told his little story? This may appear somewhat insipid, but it leads us to one more phase of the science of railroading, and how it works out in detail at the present day.

Take any of the railroads where they enter a large city, and let us visit the roundhouse and shops where the locomotives are cared for, and the men to run them are trained, with all that both these employ, and there we will find a man in charge who bears the title of, we will say, master mechanic. Now who is he and what training was necessary for his position? Here is his history: After receiving a good common school education he enters a railroad shop and by constant hard work, honesty, sobriety and much more than average ability, he has risen step by step during 20, 25 or maybe 30 years to the position he now holds. And to fill that position he requires all the knowledge and experience he has gained during a term of years that would have turned him out a lawyer, a doctor or two or three more of the learned professions. And what is his work like? Well, we have no space for a detailed account of that, but we might say he is simply chained to the wheels of the locomotives under his charge, and they never stop rolling, Sunday, Monday, night and day they go on and he must follow. His day is an emergency, and his night is as restful as that of a doctor with a good practise. All his hard earned knowledge and experience fails him at times and he is thrown back on that mother wit that was his only capital to start with, but there is one thing he must not do, and that is to fail, not for a day, not for an hour; there is too much depending on him for that.

Well, a short life and a busy one for him, and so long as he is well paid he has no kick, but is he? A short distance away from him in the same city we find a young man in charge of the same company's ticket office. Who is he, and what was the training necessary to enable him to fill his position? We find he breaks even with the master mechanic at the time they both leave school. But he goes into a comfortable office from 9 to 5 each day and learns to fill in forms and require a good knowledge of time cards. In a year's time he is as fit as ever he will be to fill the position he now holds, but he is too young, so we will give him five years, during which time he has lived soft and had time and opportunity to enjoy life. And now we find him in his snug little job where he must sell tickets, answer questions, and send in his reports. When he can he extends the passenger business of his road, but we have seen that he hasn't really much to do with that.

Now which one of these men is most considered by the railroad employing them, and which one receives the greater money consideration from their respective positions? The ticket agent!

I have used the master mechanic as an illustration for the reason that his salary comes the nearest to being equal to that of the ticket agent, but the same thing or more may be said of the roadmaster, the trainmaster, the car foreman, the general shop foreman, the roundhouse foreman and many others, but these hard-working unfortunates are so far behind the passenger department man in all that makes life worth living, and especially in the matter of salary and pickings, that the comparison would be odious, but, odious or not, let us look at one more. The roundhouse or locomotive foreman. He has charge of the care and despatching of the locomotives that do the work of the railroad, of the mechanics who repair them, the cleaners who wipe them and the firemen and engineers who run them. To do this he should be a mechanic for he must decide as to whether an engine is fit to continue running without more than light over night repairs. He should know more than the men under him of the business in hand as he must direct these men, and decide what each shall do. What engineer shall take this run and what fireman is best fitted for that engine, etc. Then it is he who must despatch these engines each day for yard service, extra and regular freight trains and passenger trains. So that he is really responsible if the fast express does not leave on time, if the freights are delayed in starting and if the yard crews have to wait on their engine.

Now this would seem to be a rather important position and the man who fills it worthy of consideration and encouragement. But what are the facts? On nearly all the railroads in America this man is paid about 60 per cent. of what the engineer is paid, and about 85 per cent. of what the fireman receives for his work. Yet he is "over" these men or is expected to keep them up to the mark, to "jolly them along," to maintain discipline and obtain results generally. With such object lessons as the foregoing before them young men of common sense and the ability that would carry them through the long years of training necessary to fit them for the positions of master mechanic, shop foreman, etc., are not entering that branch of the service, and small blame to them.

The condition is not a natural one, and for that reason must pass away, but it will cost the railroads of America much money in passing. It is largely in their own hands to say how much, by applying the old principle that a stitch in time saves nine.

Let us just glance at this again. Suppose we go out looking for material to be worked into—item, one master mechanic; item, one ticket agent. We find two young men of 23 years of age, smart, bright young fellows both, with about the same amount of natural ability, and the same education. We take them in hand and we turn out our passenger man fully equipped for his duties in three years, and 20 years later we begin to look for our master mechanic to chip his shell and give us an idea of what he can do. Now if it takes 20 years to make a master mechanic, or a man thoroughly competent to keep in serviceable condition so important a part of a railroad equipment as the locomotive, there should be some encouragement offered for men to enter that branch so that the supply may not run out.

As I said before, I only use the position of master mechanic as an illustration; the same thing applies to the man who has charge of the balance of the rolling stock, and to the man who is responsible for the condition of the permanent way.

Never in the history of railroading on this continent have there been so many accidents due to the failure of equipment as at present. There has been volumes written on the few important accidents that were attributable to a failure of that complex piece of machinery, the brain of man, but what do they amount to, compared to the number due to failure of locomotives, cars and track? I am not speaking now only of the accidents where human life is lost, and that appear in our little table of statistics, but to the hundreds that do not appear there, but are nevertheless eating the heart out of the railroads, and could be so largely prevented by the expenditure of money in inspection, repairs and maintenance. And this brings us back to Mr. Hill's text: Get busy and spend money, and spend it right, and don't forget the human element. The railroad that is the last to increase the pay of its employees is the one that will be left behind in the race; eventually it must pay the price, but it will find itself paying it to the culls, while the other fellow has the good men. That "net increase over the same period last year" may suffer a little for a short time, but it will grow stronger and better with a much more healthy growth in the future.

In North America 30 years ago there were two great railroads growing, and fighting each other step by step whenever they came within striking distance, and between rounds they swatted all the smaller roads that even cheeped in the shell. And this in a vast country whose progress was even then retarded for want of further railroad extension. Year by year since that time they have carried on the war while the country has advanced so rapidly that while one of them was spending hundreds of thousands of dollars to prevent a new road cutting into what they considered their own particular territory, their own line was blocked with a congestion of the very traffic they wanted to prevent the new road getting a portion of, and after it was through they were so busy trying to keep up with the natural increase in their own business they had no time to find out whether the other fellow got any business or not. Now if railroading was an exact science here was an object lesson that might sink into the mind, but did it? Oh no! As soon as they get through throwing money away in that little fire they see another and rush to smother it with good, real money. In all the history of this 30 years war I cannot find that the money spent and the effort put forth has ever resulted in one dollar's worth of benefit to the side spending it, nor that it has been effectual in doing more than very slightly checking the country's advance, and that is after all what they were trying to do, though in all justice to them we must acknowledge they did not know it, nor do they yet.

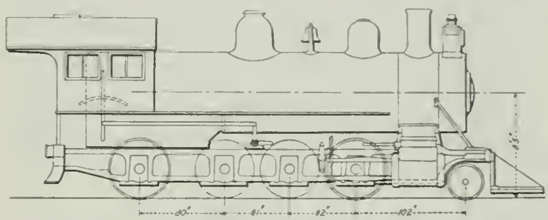
I have never forgotten that incident in the life of David Livingstone, the explorer, where the dogs are turned loose to pursue the lion, but instead of trying to do the work for which they had been raised and fed they "went to fighting among themselves"—and how as a child I did hate those dogs! The same feelings are finding expression to-day among the grown-ups, in the appointments by the various governments of railroad commissions, and the future will show us whether or not this is the panacea we have been looking for. Personally I feel that it is not, but it is nevertheless the best that can be done until such time as the old generation shall have passed away, and newer and more enlightened counsels shall prevail among the railroads themselves. When the small matters in the details of the service shall be hunted out, more attention given to vital principles, wasted energy directed into legitimate channels and the science of railroading be brought to the point where it may more nearly approximate an exact science. F. J. M.

Pressure of Locomotive Wheels Against the Rails.

BY GEO. L. FOWLER,
Associate Editor of the *Railroad Gazette*.

There has been some discussion in the *Railroad Gazette* during the past year (see especially the issues of March 15 and March 22) regarding the stresses that the wheels of cars and locomotives exert on the track on curves of various radii. In the issue of March 22, the results of calculations for New York Central electric and Atlantic locomotives were given. On a 3 deg. [illegible] min. curve it was estimated that the lateral thrust against the rail exerted by the leading truck wheel of the electric locomotive was 6,410 lbs. at 40 miles an hour and by the leading driver 4,710 lbs. For the Atlantic locomotive at the same speed the lateral thrust of the leading truck wheel was estimated at 7,830 lbs. and the leading driver at 6,260 lbs., the speeds being the same. The weights on the wheels were 26,000 lbs. on the truck wheels, and 34,250 lbs. on the drivers of the electric locomotive; and 21,250 lbs. and 52,500 lbs. on the truck and driver wheels of the Atlantic engine respectively.

I have recently been investigating the lateral stresses imposed by car wheels on curves and am led to believe that the calculated



Outline of H4a Consolidation Locomotive; Pennsylvania Lines West.

stresses mentioned above are too low. In this investigation an H4a locomotive of the Pennsylvania Lines West was used to accelerate the car used in making the tests, and incidentally I obtained a number of digrams of the lateral wheel stresses of this engine, one of which is shown herewith. The speed at which this was taken was 30.61 miles per hour and the place was on the outer rail of a curve of 4 deg. 25 min., with a superelevation of the outer rail of $3\frac{7}{8}$ in., corresponding to a speed of 36.66 miles an hour. The engine was of the consolidation type, with the following distribution of weight and a wheel arrangement spaced in accordance with the dimensions given on the accompanying engraving.

Total weight of engine	174,300 lbs.
Weight on truck wheel	18,200 "
" " first driving wheel	36,400 "
" " second " "	39,800 "
" " third " "	40,100 "
" " fourth " "	39,800 "

The lateral thrust as weighed by the track instrument was for the

Truck wheel	13,430 lbs.
First driving wheel	11,450 "
Second " "	13,000 "
Third " "	12,215 "
Fourth " "	11,170 "

I have no comment to make on this other than to say that, as the purpose of the investigation was not to ascertain track stresses for locomotives, no examination was made of the engine to determine the amount of play in the bearings, flange play or any of the other elements that would affect the results.

Attention is called to the fact that the thrust was greatest on the front truck wheel and that there was a decided falling off at the first driver. The second driver followed with a pressure nearly equal to that of the truck wheel, and the last two driving wheel pressures were decreasing quantities.

When the engine was running backward the rear driver exerted a heavier pressure than did the truck wheel when running forward at the same speed.

The work on cars has led to the conclusion that only a long series of carefully conducted experiments will make it possible to evolve the law governing these pressures, as a momentary change in the adjustment of the moving parts with relation to each other will have a measureable effect. And, further, these diagrams that were made by a very sensitive and carefully calibrated apparatus, indicate that the calculations based upon the usual hypotheses give results that are too low for average working conditions, though a

peculiar and momentary position of the moving vehicle or engine may cut them down below that called for by the calculations as the pressures evidently vary from instant to instant between wide limits.

In explanation of the sudden rise in pressure shown on the diagram after the passage of the first driver it should be said that

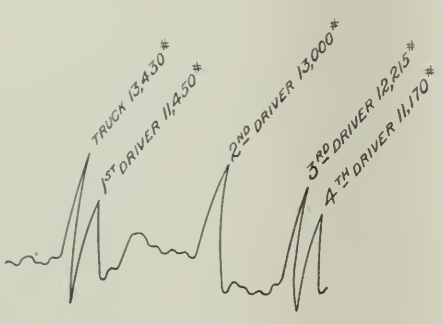


Diagram of Lateral Thrust of H4a Locomotive on 4½° Curve at 30.61 Miles Per Hour.

the initial pressure on the apparatus was accidentally raised just at that instant by a slight movement of the pressure pump which was being used to regulate a small leak in the hydraulic recording apparatus.

Railroad Statistics of the United States for Year Ended June 30, 1906.

The Interstate Commerce Commission has issued an advance abstract of its annual report for the year which ended 15 months ago, from which the principal items are shown in the table below. The preliminary report for the year under review was given in the *Railroad Gazette* November 30, 1906.

Railroad Statistics for Years Ending June 30.

	1906.	1905.	1904.	1903.	1902.
Miles complete	224,363	218,101	213,904	207,977	202,472
Increase, 12 months	6,262	4,197	5,927	5,505	5,234
In hands of receivers	3,971	796	1,323	1,185	1,479
Locomotives, No.	51,672	48,357	46,743	43,871	41,228
Cars, owned, passenger	42,262	40,713	39,752	38,140	36,991
Cars owned, freight	1,837,914	1,731,409	1,692,194	1,653,782	1,546,132
Cars owned, total	1,958,912	1,842,871	1,798,561	1,753,389	1,640,220
Employees	1,521,355	1,382,196	1,296,121	1,312,537	1,189,315
Per 100 miles of road	689	637	611	639	594
Total stock and funded debt, in millions	$14,570.4	$13,805.3	$13,213.1	$12,600.0	$12,134.2
Stock & debt pr mile road	67,936.0	65,926.0	64,265.0	63,186.0	62,301.0
Gross earnings, millions	2,325.8	2,082.5	1,975.1	1,900.1	1,726.4
Average per mile	10,460.0	9,598.0	9,306.0	9,258.0	8,625.0
Passengers carried, millions	800.0	738.8	715.4	694.9	649.9
Carried 1 mile, millions	25,175.5	23,800.1	21,923.2	20,915.8	19,690.0
Tons freight car'd, millions	1,631.4	1,427.7	1,309.9	1,304.4	1,200.3
Carried 1 mile, millions	215,877.6	186,463.1	174,522.1	173,221.3	157,289.4
Av. rate per ton-mile, mills	7.5	7.7	7.8	7.6	7.6
Av. pass. fare pr mile, cts	2.0	2.0	2.0	2.0	2.0

Examining the totals for the year 1906 more in detail the following items will be found of interest:

An increase in mileage exceeding 100 miles appears for 26 states and territories (17 a year ago). The operated mileage for which returns were made was 222,340.30 miles, including 7,865.97 miles of line used under trackage rights. The aggregate length of tracks of all kinds was 317,083.19 miles, classified thus: First main track, 222,349.30 miles, as just mentioned; second track, 17,936.25 miles; third track, 1,766.07 miles; fourth track, 1,279.66 miles, and yard track and sidings, 73,760.91 miles.

The number of corporations reporting was 2,313. During the year companies owning 4,054.46 miles of line were reorganized, merged or consolidated. The corresponding figure for the year 1905 was 3,802.02 miles for the year ending June 30, 1906, the mileage of roads operated by receivers was 3,971.43 miles, or an increase of 3,175.61 miles as compared with 1905. The number of roads in the hands of receivers was 34.

The locomotives, excepting 1,090, were classified as: Passenger, 12,249, freight, 29,848, and switching, 8,485.

The cars were thus assigned: Passenger service, 42,262; freight service, 1,837,914, and company's service, 78,736.

The average number of locomotives per 1,000 miles of line was 232, and the average number of cars per 1,000 miles of line was 8,810. The number of passenger miles per passenger locomotive was 2,055,309, showing an increase of 6,751 miles as compared with the previous year. The number of ton-miles per freight locomotive was 7,232,563, showing an increase of 541,863 miles.

Of the capital outstanding, $11,570,421,478, there existed as stock $6,803,760,093, of which $5,403,001,962 was common and $1,400,758,131 preferred; the remaining part, $7,766,661,385, represented funded debt, consisting of mortgage bonds, $6,266,770,962; miscellaneous obligations, $973,647,924; income bonds, $301,523,400, and equipment trust obligations, $224,719,099.

Of the total capital stock outstanding 33.46 per cent. paid no dividends. The amount of dividends declared during the year was $272,795,974, being equivalent to 6.03 per cent. on dividend-paying stock. For the year ending June 30, 1905, the amount of dividends declared was $237,964,482. The total amount of funded debt (omitting equipment trust obligations) that paid no interest was $287,954,851, or 3.82 per cent. Of the total amount of stock outstanding $2,257,175,799 were reported as owned by railroad corporations, and of railroad bonds $641,305,030 were so reported.

The number of tons of freight carried one mile per mile of line was 582,401, indicating an increase in the density of freight traffic of 121,005 ton-miles per mile of line.

The average revenue per passenger per mile for the year carried out to three decimals was 2.002 cents. For the preceding year the average was 1.962 cents. The ratio of operating expenses to earnings for the year 1906 was 66.08 per cent.; for 1905, 66.78 per cent.

Gross earnings $2,325,765,167, were $243,282,761 greater than for the year 1905. Operating expenses ($1,536,877,271) were $146,275,119 more than in 1905. The gross earnings in detail were: Passenger revenue, $510,032,583—increase, $37,337,851; mail, $47,371,453—increase, $1,945,328; express, $51,010,930—increase, $5,861,775; other earnings from passenger service, $11,314,237—increase, $274,095; freight revenue, $1,640,386,655—increase, $189,613,817; other earnings from freight service, $5,645,222—increase, $564,956; other earnings from operation, including unclassified items, $60,004,087—increase, $7,684,939.

The operating expenses assigned to the four general classes were: Maintenance of way, $311,720,820; maintenance of equipment, $328,554,658; conducting transportation, $836,202,707; general expenses, $59,752,230; undistributed, $646,856. Operating expenses averaged $6,912 per mile of line; increase $503 per mile.

The income from operation (net earnings) was $788,887,896; increase $97,007,642. The net earnings per mile of line for 1906 averaged $3,548; for 1905, $3,189, and for 1904, $2,998. The amount of "other" income was $256,639,591, including income from lease of road, $119,604,619; dividends on stocks owned, $66,861,656; interest on bonds owned, $20,537,011, and miscellaneous income, $49,636,305. The total income of the railroads ($1,045,527,487)—that is, the net earnings and income from lease, investments and miscellaneous sources—is the amount from which fixed and other charges against income are taken to ascertain the sum available for dividends. Such deductions aggregated $660,341,159, thus leaving $385,186,328 as the net income for the year ending June 30, 1906, available for dividends or surplus.

The amount of dividends declared was $272,851,567, leaving as the surplus from the operations of the year $112,334,761. The figures for income and expenditures are compiled from the annual reports of leased roads as well as of operating roads, and thus necessarily include duplications in certain items.

The total number of casualties to persons was 108,324, 10,618 killed and 97,706 injured. These figures include the casualties to persons trespassing, of whom 5,381 were killed and 5,927 were injured. The total number of casualties to persons other than employees from being struck by trains, locomotives or cars was 5,127 killed and 4,905 injured. With regard to trainmen—that is, enginemen, firemen, conductors and other trainmen—it appears that one trainman was killed for every 124 employed and one was injured for every eight employed. With respect to the number of miles traveled, the figures for 1906 show that 70,126,686 passenger-miles were accomplished for each passenger killed, and 2,338,859 passenger-miles for each passenger injured. For 1905 the figures were 44,320,576 passenger-miles for each passenger killed, and 2,276,002 passenger-miles for each passenger injured. Other details of casualties have been reported in the quarterly bulletins, which have been published in the *Railroad Gazette*.

Die Work.

In a paper before the convention of the Master Blacksmiths' Association, G. H. Steward stated that the use of dies for forming pieces that would formerly have been made by hand had grown to great proportions. Citing the practice of the Altoona shops of the Pennsylvania Railroad, he said that they now have complete sets of dies and formers for steel car work and are using them on the buildozer for making all parts of steel passenger, baggage, mail and dining cars from the deck moulding at the top to the trucks, excluding the welding of the rods and similar parts. The cost at first was high, owing to the dies being charged to the first lot of cars; but now the work can be done for one tenth what it would cost to do it by hand, and better results are obtained. In all there are 1,054 dies in use at this place for the different pieces that are formed.

As for the material from which the dies should be made, it has been found that, usually, cast-iron is the best. But where they are to be used under the drop hammer or where a sharp corner is to be formed it will be found to be necessary to use cast-steel for the

purpose as cast iron will not be strong enough to withstand the strain. In this, as in all other matters, good judgment must be used in order to secure the best results.

In constructing dies for hot work, especially for pressing, it is well to use plenty of material, so as to have them of sufficient strength, as there is a loss of both time and money when a die breaks at a weak point.

It is also good practice to core out dies that are to be used for large work, as this serves not only to reduce the weight, but forms air chambers that will materially assist in keeping the back part cool besides giving an opportunity to circulate water through the casting if it is required, as unsatisfactory results have sometimes been obtained when the die has expanded under the influence of the heat.

Progress on the Western End of the St. Paul's Pacific Extension.

Nearly all of the preliminary work connected with the driving of the new 8,000-ft. tunnel through the main range of the Bitter Root mountains on the Pacific coast extension of the Chicago, Milwaukee & St. Paul has been completed. The location through this district has been finally settled and a few hundred feet of the tunnel have already been driven. This, together with the preliminary work noted above, constitutes the progress made on this section of the line during the past summer. Thus, briefly stated, this does not look like much, but in reality it amounts to considerable. The work preliminary to active operations in the tunnel involved the

Unfinished Grade on the St. Joseph River.

perfection of a large organization and the installation of considerable heavy machinery at a point several miles distant from any present railroad connection. With this now accomplished the contractors, Winston Brothers Company, expect that progress on the tunnel will be rapid.

Along the St. Joseph river from Ferrel, Idaho, to Lake Chatcolet the line is about one-tenth completed. During the summer all of the right-of-way has been cleared and all the heavy cuts have been opened; also considerable light grading in the vicinity of St. Joe and St. Maries has been finished. The heavy cut through the village of St. Maries is just being opened by steam shovel.

The specifications for the main line call for a 0.3 per cent. maximum grade and 3 deg. maximum curves, but along the river between St. Joe and St. Maries considerable temporary line, with some 10 deg. curve, is being built. This line is a detour around a hill which will eventually be pierced by a tunnel. This tunnel will be through solid rock all the way and the temporary track around it is being built with the intention of having trains in operation by the spring of 1909, some time before the tunnel could be finished.

Two locating parties are now engaged in locating a branch from St. Maries up the St. Maries valley, through Santa, Idaho, and thence over the divide into the Palouse wheat country. This will be the first branch to be built on the western extension and will tap some of the richest timber land in Idaho.

It is now generally admitted, even by officers of the company, that trains will be operated by electricity from the eastern end of the big Bitter Root tunnel westward for some ten miles down the St Joe valley and through eastern Washington to some point west of Tekoa, to be determined later. This will probably be the first stretch of transcontinental train line in the country to be operated

The Village of St. Maries, Idaho.

by electricity. The power will be obtained from the St. Joseph river between Ferrel and North Fork. The flowage rights have already been secured; during the summer the surveys for the location of the dams were completed. Plans are now being drawn and active work will commence in the immediate future.

It is proposed to build 11 dams across the river, varying in height from 20 to 75 ft. The total development will be 180,000 h.p.,

Cross Sectioning on Cliff Along St. Joseph's River.

making it one of the biggest hydro-electric propositions in the West. This amount of power will be considerably in excess of the requirements of the railroad and to dispose of the residue high tension transmission lines are to be built to Spokane and also to the Coeur d'Alene mining district in the vicinity of Wallace, Idaho.

The main line of the new road goes through Tekoa, Wash., 35

miles south of Spokane. Up to the present no official announcement of any arrangements for running trains into Spokane has been made. The prevailing opinion in the vicinity is that the St. Paul will use the tracks of the Spokane & Inland Empire Railroad (electric) between Tekoa and Spokane; it is inconceivable that no arrangement will be made for entering the metropolis of eastern Washington.

Progress during the summer between Tekoa and Ellensburg, Wash., has been made more rapid than in Idaho. Considerable of the grade has been finished, probably 35 per cent. Between Ellensburg and the Cascade tunnel the work is in a much more advanced stage. Miles of line, including the trestles, have been finished. Considerable progress has been made on the steel bridges. Easton, near the eastern end of the tunnel, will be made a division point.

The situation at the Cascade tunnel is about like that at the Bitter Root tunnel. The preliminary work of organization and installation of machinery was completed during the summer and the bore has been well started. It is probable that a temporary line will be built over the divide so that trains may be operated previous to the completion of the tunnel.

Between the tunnel and Seattle the line is nearly finished and it is possible that the track will be laid this winter. Work on the grade between Seattle and Tacoma has been actively pushed all summer and will soon be finished. But little terminal work has been done either in Seattle or Tacoma. Roughly speaking, the line between Puget Sound and the Columbia river is 50 per cent. nearer completion this fall than is that portion between the Columbia river and Butte. It has been announced that the line from Seattle to eastern Washington, using the temporary switch-back over the Cascade divide, will be in operation in time for the next year's eastern Washington wheat crop.

July Railroad Law.

The following abstracts cover the principal cases decided in the federal courts during July:

Joint liability between connecting carriers.—The mere fact that the destination of a shipment received by a railroad company for transportation is beyond its own line or that it was received from another railroad company to be transported to a point on its own line does not create any joint responsibility between the two railroad companies where the shipment over each line is under a separate contract which limits its liability for loss or injuries to such as may occur on its own line. McGuire v. Great Northern Railway Co., 153 Fed. Rep. 434.

Duty to provide safe place for work.—Though it is the general rule that a master is to provide a safe place for an employee to work, there are many qualifications of the rule. Thus it is held that the jacking up of the end of a railroad car for the purpose of repairing the trucks is an exception. Work of this character is a part of the duty of the servants making the repairs and there can be no recovery against the railroad company for an injury resulting to a fellow servant from their negligence in doing the work if the appliances were sufficient. Moit v. Illinois Central Railroad Co., 153 Fed. Rep. 354.

Adverse possession of land grant lands.—The Supreme Court decides that a railroad company which has complied with all the terms of a congressional land grant as fixed by Congress and by the act of the state legislature after the acceptance of the grant has such title to lands within the place limits of the grant that title by adverse possession may be acquired by an occupant though a final certificate and patent have not been issued. Iowa Railroad Land Co. v. Blumer, 27 Sup. Ct. 709.

Remedy for unreasonable interstate rate.—The rule that an action at law to recover excessive interstate freight charges cannot be maintained until the commission has acted on the question will not prevent a federal court which has suspended a proceeding of this character, pending action by the commission, from granting relief as a court of equity, on a petition filed after the commission has acted, stating in substance the commission's findings and report, and this more especially where the carrier through its attorneys has stipulated in open court that a decree of restitution might be made in case the finding was in favor of plaintiff. Southern Railway Co. v. Tift, 27 Sup. Ct. 709.

Reasonableness of rates.—The mere fact that an interstate rate has been duly published and filed by a carrier with the Interstate Commerce Commission is insufficient to raise the presumption in law that the rate is reasonable. In testing the reasonableness of an increased freight rate the expenditures of the carrier for permanent improvements should not be charged to the current or operating expenses of a single year. Illinois Central Railroad Co. v. Interstate Commerce Commission, 27 Sup. Ct. 700.

Duty of employees to observe rules.—Where the rules for guidance of an engineer or other employee in given circumstances are plain and unambiguous and have been assented to by the employee, his failure to observe such rules or his disobedience of them at a time when he is capable of observing them is negligence as a matter of law and will prevent a recovery of damages for his injuries resulting therefrom. The rule was applied in a case where an engineer approaching a switch which was not protected by signals, took his chances of passing it in safety at a high rate of speed in violation of his rules and was injured. St. Louis & San Francisco Railroad Co. v. Dewees, 153 Fed. Rep. 56.

Assumption of risk by brakeman.—A brakeman riding on cars and looking toward the rear of the train was injured by striking the eaves of a building which projected slightly over the track. The eaves had been in this position for over 15 years, during which time no accident had occurred. There was ample room on the top of the car for the brakeman to perform all his duties without incurring any danger from the eaves and the brakeman was fully informed as to the position and location of the eaves. The court held that the danger was an open and visible one and was assumed by the brakeman and he could not recover damages for his injuries. Southern Railway Co. v. Carr, 153 Fed. Rep. 106.

Abandonment of right of way.—A railroad company wrongfully holding a right of way for a spur track to certain factories which belonged to another company is not entitled to retain possession on the theory that the route was abandoned because the rightful owner constructed a track over another route which it was compelled to do because of its inability to obtain possession of its own right of way and the new route was temporarily adopted without any intention of abandoning the other route. Atlanta, etc., Railroad Co. v. Southern Railway Co., 153 Fed. Rep. 122.

Filing of rates on inland transportation of goods to or from foreign countries.—The rates of transportation from places in the United States to ports of trans-shipment and from ports of entry to places in the United States of goods carried on through bills of lading are required to be filed and published under the amended interstate commerce act. This requires filing where the goods are carried under an aggregate through rate which is the sum of the ocean rate and the domestic rate, or if carried under a joint through rate by virtue of a common control management or arrangement of the inland and ocean carriers. Armour Packing Co. v. United States, 153 Fed. Rep. 1.

Obligation of purchasing railroad to assume contracts of predecessor.—The Circuit Court of Appeals of the Sixth Circuit holds that the Ohio statute allowing railroad companies to purchase non-competing lines and providing that the purchasing road shall be subject to all the "duties, obligations and restrictions" of the predecessor company does not require the purchasing company to fulfill a contract to carry a shipper's product at a rate agreed upon with the former company. This is not an "obligation" within the meaning of the statute, the purchaser never having agreed to assume the liability. Rice v. Norfolk & Western Railway Co., 153 Fed. Rep. 497.

Speed of trains.—It is a general rule of general acceptance among the courts that in the absence of a regulating statute or ordinance a railroad company may run its trains at such a rate of speed as it deems convenient for the conduct of its business without being guilty of negligence *per se* in case a derailment occurs and injures one on its train by permission but not as a passenger. Chicago & Northern Railway Co. v. O'Brien, 153 Fed. Rep. 511.

Construction of indictments under Elkins law.—Judge Hazel announces as a rule for the construction of indictments under the Elkins law that any doubts as to the correct construction of the statute should be resolved in favor of the evident intention of Congress that equality among shippers should be maintained and unjust discrimination and favoritism of all kinds condemned, leaving the question whether the existing conditions justified the difference in rates charged to be determined as one fact on the trial. He also holds that the act is not restricted to departures from an established tariff rate, but is violated if any other advantage is given to a shipper whereby a discrimination is practiced. United States v. Vacuum Oil Co., 153 Fed. Rep. 598.

Evasion of interstate commerce law by use of different routes.—The words "between any points" in Section 6 of the Interstate commerce law making it unlawful for any common carrier or party to any joint tariff to charge a shipper a greater or less rate for transportation "between any points" as to which a joint rate is named thereon then is specified in the schedule filed with the commission in force at the time is not limited to points on the established route but forbids the transporting of property between different terminals in different states at a greater or less rate than the established rate though over different routes. United States v. Pennsylvania Railroad Co., 153 Fed. Rep. 625.

Duty of local carrier to file rates.—The provision of the interstate commerce law requiring several common carriers operating a through line engaged in interstate commerce to file schedules of rates constituting the basis of a through interstate rate, intends that each carrier though operating a line wholly within a state must comply with the provision, if it is a portion of a through route engaged in interstate commerce through a common arrangement with other connecting carriers. United States v. New York Central & Hudson River Railroad Co., 153 Fed. Rep. 630.

Solenoid Signals on the Manhattan Elevated.

The Interborough Rapid Transit Co. has recently put in service on the sharpest curves of the elevated lines 21 semaphore block signals, operated by solenoids energized by current taken from the third rail. The current for the track circuit is also obtained from the third rail. Eight of these signals have been installed at the reverse curves on the three-track Ninth avenue line at 110th street, four on the Third street curve of the Sixth avenue line, four on the Murray street curve of the same line and five near Coenties Slip on the Second avenue line, a total of 21. Twenty more will shortly be put in service at other curves on the Second and Third avenue lines. Nine signals of this type, but controlled with an alternating

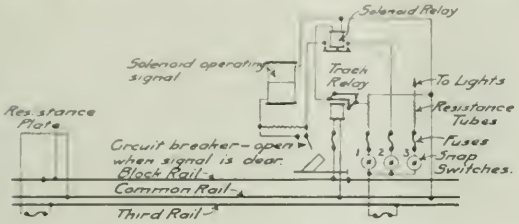

Fig. 1—Diagram of Connections for Solenoid Signal.

current track circuit, have been in use for more than 1½ years on the West Farms elevated extension of the subway. The signals at Murray street and Third street on the Sixth avenue line replace mechanical signals operated by track instruments which have been in use at these points for many years. Four of the signals at 110th street are for the middle express track, which is used by southbound express trains in the morning and by northbound expresses at night.

The apparatus and circuits for a typical block section are shown diagramatically in Fig. 1. Only one of the track rails is insulated for the block section, which varies in length for the different curves on which the signals are used. At the outgoing end of the block the third rail is connected through a fuse to a resistance plate having two taps at the upper end, one of which is connected to the insulated track rail and the other to the opposite or common track rail, which is grounded for the return power circuit. The resistance is adjusted to give a difference of potential between the two track rails of 10 volts. At the entering end of the block the two track rails are connected together through a two-point track relay, which is wound to pick up at three volts. The normal difference of potential of 10 volts is sufficient to care for the widest variations in voltage of the third rail current passing through the resistance plate.

Fig. 3—High Semaphore Solenoid Signal for Manhattan Elevated.

At the signal, a tap from the third rail connects to a bus bar on which are three snap switches, one in the solenoid relay circuit, one in the solenoid circuit, and one in the signal lamp circuit. When no train is in the block the track relay is energized and its two contacts are closed. Current from the third rail passes through switch 1, resistance, track relay armature, solenoid relay coil and thence to common rail or ground. Current also flows through switch 2, armature of solenoid relay and resistance of 3,000 ohms to solenoid coil and thence to ground, holding the signal in the proceed position.

When a train enters the block the track relay opens, releasing the spring-actuated quick-break solenoid relay, whose armature carries 600 volts. This breaks the solenoid circuit and permits the signal arm to go to stop by gravity. An oil dash pot is provided to cushion the shock of the moving arm. When the train passes out of the block the track relay picks up causing the solenoid relay in turn to pick up. A current of 600 volts then flows through the solenoid relay armature and the circuit breaker which is closed. This gives a powerful circuit in the signal solenoid to move the signal down, but as soon as the arm reaches the proceed position the circuit breaker opens, cutting in the high resistance and allowing only a small current, enough to hold the signal in the clear position, to flow through the solenoid.

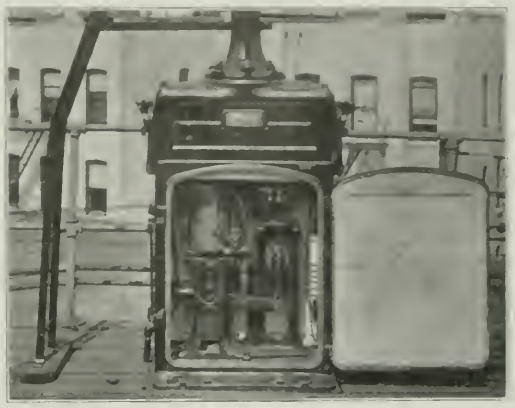

Fig. 2—View of Mechanism of Solenoid Signal.

Fig. 2 shows the signal mechanism enclosed in the iron case at the foot of the mast. The solenoid plunger is connected to a pivoted lever to which the dash pot is fastened at its outer end. The signal pull rod is fastened about midway between the solenoid plunger and the dash pot. Resistance tubes are mounted on one side of the case and the circuit breaker attached to the signal rod can be seen just above the dash pot. In the upper part of the case are the two relays and the snap switches. The entire mechanism is simple, strong and compact and cannot easily get out of order. Good results have been obtained from the special track relays employed, which are made with carbon points on the springs bearing on german silver pedestals. The quick-break solenoid relays, carrying 600 volts, have also proved entirely satisfactory. Pittsburg insulated joints of the latest pattern are used in the track and are said to be standing up well under the heavy traffic which passes over them. On the northbound local track at 110th street,

Fig. 4—Centrally Pivoted Semaphore Signal for Express Track at 110th Street.

56 trains pass in one hour from 8:40 to 9:40 a.m., and in 24 hours 771 trains use the northbound local track at this point.

Fig. 4 shows the special signal arm used for the middle express track at 110th street. Owing to the narrow clearance of only 40 in. between trains on the middle track and outside tracks, a standard semaphore arm could not be used unless elevated above the tops of the cars. The centrally pivoted arm shown was therefore designed. It is 36 in. long and 6 in. wide, and when in the clear position the upper corner is about 6 in. below the window sill of a car. The arm is made of sheet metal in two pieces, hinged with a spring so as to prevent damage in case a projection on a car should strike either end. It is painted red with white bands on the front side and white with black bands on the back side. The signal mechanism is in a case supported on the elevated structure below the deck. Four signals of this type are in use.

All the signal apparatus was furnished by the Union Switch & Signal Co., Swissvale, Pa., but the signals were installed by the regular force of the Interborough Rapid Transit Co. under the direction of J. M. Waldron, Signal Engineer.

Wages and Retail Prices of Food in 1906.

The annual investigation of the Bureau of Labor into wages and the retail prices of food, the report on which has just been placed in the hands of the printer, shows that in the principal manufacturing and mechanical industries of the country average wages per hour in 1906 were 4.5 per cent. higher than in 1905, the regular hours of labor per week were 0.5 per cent. lower, and the number of employees in the establishments investigated was 7 per cent. greater. The average full-time weekly earnings per employee in 1906 were 3.9 per cent. greater than in 1905.

During 1906 wages were increased generally in nearly all industries, 40 of the 41 industries covered by the investigation showing some increase. The greatest increase was in the manufacture of cotton goods, where the average wages per hour in 1906 were 11.2 per cent. higher than in 1905. In the manufacture of electrical apparatus and supplies the increase was 10.1 per cent. In street and sewer work done by contract the increase was 8.7 per cent.; in iron and steel, Bessemer converting, 8.5 per cent., and in the manufacture of cigars, 8.4 per cent. In the manufacture of bar iron the increase in wages per hour was 6.9 per cent. and in the building trades, 6.1 per cent. Briefly stated, two industries showed an increase in hourly wages of more than 10 per cent., 7 industries an increase of 5 per cent., but less than 10 per cent., and 31 industries an increase of less than 5 per cent. In one industry—paper and wood pulp—there was a decrease of 1.1 per cent. In the industries as a whole, weighted according to importance, the increase in hourly wages was 4.5 per cent.

The fact should be borne in mind that these figures apply only to wageworkers in manufacturing and mechanical industries and do not show conditions, so far as salaried employees are concerned.

The retail prices of food, weighted according to consumption in representative workingmen's families, were 2.9 per cent. higher in 1906 than in 1905. As the advance in wages per hour from 1905 to 1906 was greater than the advance in the retail prices of food, the purchasing power of an hour's wages, as measured by food, was greater in 1906 than in the preceding year. In 1906 the purchasing power of an hour's wages as expended for food was 1.4 per cent. greater than in 1905, and the purchasing power of a full week's wages was 1 per cent. greater in 1906 than in 1905, or, in other words, an hour's wages in 1906 in the manufacturing and mechanical industries of the United States would purchase 1.4 per cent. more food than an hour's wages in 1905, and a full week's wages in 1906 would purchase 1 per cent. more food than a full week's wages in 1905.

The price of food was higher in every month of 1906 than in the corresponding month of 1905. The increase over the corresponding month of the preceding year, which in February, 1906, was only 0.4 per cent., grew steadily greater throughout the year, the price in December, 1906, being 5.1 per cent. above that of the preceding December. The price in December, 1906, was 4.8 per cent. higher than the average for the year 1906, which year showed a higher average than any other year during the seventeen years, 1890 to 1906, covered by the investigation of the Bureau of Labor.

The increase in prices in 1906 over 1905 applied, in unequal degree, to 25 of the 30 articles included in the investigation. The articles which showed the greatest advance in prices are lard, 9.8 per cent.; evaporated apples, 9.1 per cent.; fresh pork, 8.8 per cent.; dry or pickled pork, 8.7 per cent.; bacon, 8.1 per cent.; ham, 7.3 per cent., while the advance in fresh fish and mutton exceeded 5 per cent. The only articles which showed any material decrease are flour and sugar.

The articles which showed the most marked advance in prices in December, 1906, over December, 1905, are butter, 15 per cent.; lard, 13.9 per cent.; fresh pork, 12.2 per cent.; dry or pickled pork, 11.6 per cent.; bacon, 11.1 per cent. and ham, 9.8 per cent. The only articles which showed any marked decline in price in December, 1906, from the price in December, 1905, are potatoes, 5.8 per cent., and flour, 4.8 per cent.

As compared with the average for the ten-year period, 1890 to 1899, the average wages per hour in 1906 were 24.2 per cent. higher, the number of employees in the establishments investigated was 42.9 per cent. greater, and the average hours of labor per week were 4.6 per cent. lower. The average earnings per employee per full week in 1906 were 18.5 per cent. higher than the average earnings per full week during the ten years, 1890 to 1899.

The retail price of the principal articles of food, weighted according to family consumption of the various articles, was 15.7 per cent. higher in 1906 than the average price for the ten years, 1890 to 1899. Compared with the average for the same ten-year period, the purchasing power of an hour's wages in 1906, as measured by food, was 7.3 per cent. greater, and of a full week's wages, 2.4 per cent. greater, the increase in the purchasing power of the full week's wages being less than the increase in the purchasing power of hourly wages because of the reduction in the hours of labor.

The table following shows the per cent. of increase or decrease in wages per hour, hours of labor per week, the purchasing power of wages, etc., in 1906 in the manufacturing and mechanical industries, as compared with each year preceding, back to and including 1890, and as compared with the average for the ten years, 1890 to 1899:

Per Cent. of Increase (+) or Decrease (—), in 1906, as Compared with Previous Years.

Year.	Employees.	Hours per week.	Wages per hour.	Full-time wkly earnings per employee.	Weighted according to family consumption.	—Retail prices of food—Purchasing power— Hourly wages.	Full-time weekly earnings per employee.

Twenty-five Passengers Killed at West Canaan, N. H.

In a butting collision on the Boston & Maine, near Canaan, N. H., about 4.26 o'clock on the morning of September 15, 25 passengers were killed and as many more were injured. Canaan is between White River Junction and Concord, and is 18 miles east of White River Junction. The collision occurred in a dense fog where the enginemen approaching each other could see nothing until they were very near together. Both were running fast, the freight on a down grade of about 50 ft. to the mile. The passenger train was No. 30, southbound; and the northbound train (freight) was No. 267. An order had been delivered to the freight intended to give it the right of the road over passenger train No. 34, but, by a mistake in transmitting or copying, the order as delivered read "No. 30," and this caused the collision. Most of the victims were in a passenger car of comparatively light construction which was immediately behind a heavy baggage car and was completely telescoped by it.

An officer of the road issued a statement of the cause which says: "Train 267 arrived at Canaan at 4:10, on time. Train 30, consisting of engine, baggage car, coach, smoker and one sleeping car, left White River Junction at 3.55 a.m., 45 minutes late. Train 34 left White River Junction at 5 a.m., one hour and 36 minutes late. At East Andover, 27 miles south of Canaan, an order was sent 267 (and the same order to trains 30 and 34 at White River Junction), giving the former (267) 40 minutes on the time of train 30 and 30 minutes on the time of train 34, these orders being repeated back and completed in the usual manner.

"At Canaan orders were sent 267 annulling the former order and giving it one hour and ten minutes on the time of 34. The same order was given to No. 34 at White River Junction, both were repeated back to the despatcher, and, according to the records, exactly as sent, although, for some as yet unexplained reason, the order which was delivered to the engineer and conductor of No. 267 at Canaan gave them one hour and ten minutes over train 30, which had not then arrived at Canaan. This order should have read 'No. 34,' and, according to the despatcher's records, it was so sent and repeated by the Canaan operator. This discrepancy can be cleared only by a thorough investigation, which will be made at once."

This seems to indicate that the conductor of the freight, having been informed (erroneously) that No. 30 was 70 minutes late, and having calculated that this would permit him to go to the next station, went on in disregard of the right of passenger train No.

34 for No 34, according to the *Official Guide* is due at Canaan at 4 20, only 10 minutes after the time (4 10) given in the statements as the time that the freight arrived there; but another statement says that the freight conductor held an order received at West Hanover that No 34 was 40 minutes late.

The error lies between J A Crowley night despatcher at Concord, who has been in the service seven years, and John Greeley, night operator at Canaan, who has seen 23 years' service.

The Uniform Bill of Lading.

The proposal to have the new uniform bill of lading which was agreed to at Chicago adopted formally by the Interstate Commerce Commission is not going to have plain sailing, after all. In the order issued by the Commission on the eighth of July, calling upon all railroads to appear in Washington, October 15, to present their objections, if they had any, it was stated that the petitioners and all the railroads in Official Classification territory had approved the form, but objections are now likely to be presented by the Freight Claim Association and by a conference of bankers and freight receivers, which was recently held in New York city. The Freight Claim Association embraces in its membership, of course, many claim agents of roads not in Official Classification territory. The president of the Association, Mr. R. C. Richards, has issued a circular calling the attention of the members to that clause in the proposed bill, which makes the carrier liable for fire loss for 48 hours after freight has arrived at destination, and he suggests that, in view of the hearing to be held at Washington, October 15, each road should carefully consider whether it approves this clause.

Quoting the fire-loss clause (printed in italics below), Mr. Richards says:

"This would, if adopted, presumably make the carrier liable as an insurer for such damage until 48 hours had elapsed after notice had been given of the arrival of the property and in case of loss or damage occurring after that time 'The burden to prove freedom from such negligence shall be on the carrier or party in possession.'

"In the following states of the Union the liability of the carrier now ceases as soon as the property (if in less than carload lots) is unloaded into the freight house and ready for delivery; if in carload lots—when the car has been placed on delivery track; no notice being required:

"Georgia, Illinois, Indiana, Iowa, Massachusetts, Missouri, North Carolina, Pennsylvania, South Carolina, Tennessee.

"No argument is necessary to demonstrate that this rule, which has been announced by the highest courts of the states above mentioned, is much more favorable to the carrier than the one intended to be prescribed in the proposed uniform bill of lading.

"In the states named below, the liability of the carrier as an insurer now ceases as soon as the property has been unloaded and is ready for delivery (if in less than carload lots), or placed for unloading if in carloads and consignee has had a reasonable time (which may be less than 48 hours) to unload. No notice being required:

"Arkansas, Kansas, Kentucky, Louisiana, New Hampshire, Vermont, West Virginia, Wisconsin.

"This rule, which the Supreme Courts of the states last mentioned have held to be the law, is also distinctly more favorable to the carrier than the one proposed in the bill of lading under discussion.

"In the following states the liability of the carrier now ceases after the property has been unloaded and is ready for delivery (if in less than carload lots), and if in carload lots after car has been placed for delivery and notice has been given or sent to the owner of the arrival and a reasonable time to take possession (which may be less than 48 hours, depending upon the circumstances of the case):

"Alabama, California, Minnesota, Mississippi, Oklahoma, Ohio, Michigan, New York, Texas.

"The rule adopted in these states is unquestionably as favorable as the one proposed for adoption in the bill and I believe will, upon careful consideration, be found to be more to the interest of the carriers. In the other states the question seems not to have been determined.

"I understand that in none of the states is the burden of proof now on the carrier to show itself free from negligence where claim is made for loss or damage to property held by it as a warehouseman; on the contrary, the burden is now on the owner to show that the property was damaged by the negligence of the carrier. If the clause referred to in the proposed bill of lading is agreed to by the carrier and printed in the bill, the burden of proof would be changed and the carrier would in all probability, in view of the well known tendencies of juries, be made liable as an insurer until the property was actually delivered to the consignee, even though the loss or damage was brought about by violence of mobs or strikers and without any negligence on the part of the carrier who was compelled to hold the goods in its freight house because the consignee neglected or refused, for his own convenience, to remove the same.

"There would seem to be no good reason why the railroads of the country should voluntarily assume such additional liability, the burden of which the law has never imposed upon them and which if assumed might in a single instance (such as the destruction of large terminals by fire originating without the carrier's negligence, but caused by mobs) amount to hundreds of thousands of dollars.

"I am advised that there is no provision in the law empowering the Interstate Commerce Commission to change the law of the land or the rules of evidence or to require interstate carriers to use a bill of lading containing such provisions. * * *"

So much for Mr Richards' objection. The New York complainers are from two classes; first heavy receivers of cotton, hay, grain and fruit and provisions, and, second, members of the New York State and the American Bankers' Associations. These merchants are constantly paying for thousands of dollars' worth of merchandise on drafts supported by bills of lading and both merchants and bankers desire to have all bills of lading more thoroughly protected against fraud. Their main trouble is with forged and altered bills of lading. This danger, so far as it can be dealt with by the railroads, is an obscure one, for it can be completely met only by employing a most experienced, intelligent and upright business man at every little shipping station in the country. Courts have in many cases held that a bill of lading given for freight not actually delivered did not bind the railroad. The bankers want to have all bills serially numbered or otherwise safeguarded so that the banks can treat them as incontestable. In England, they say, this difficulty has been provided for by statute.

The conditions of the proposed uniform bill, as printed by the Interstate Commerce Commission, are given below. The foot notes indicate additions which will be proposed by the American Bankers' Association.

UNIFORM BILL OF LADING—ORIGINAL.

———— ———— Railroad Company.

Received subject to classification and tariffs in effect on the date of issue of this Original Bill of Lading at ————, ————, 1907, from ————

————, the property described below, in apparent good order, except as noted (contents and condition of contents of packages unknown), marked, consigned and destined as indicated below, which said company agrees to carry to its usual place of delivery at said destination, if on its road; otherwise to deliver to another carrier on the route to said destination. It is mutually agreed, as to each carrier of all or any of said property over all or any portion of the said route to destination and as to each party at any time interested in all or any of said property, that every service to be performed hereunder shall be subject to all the conditions, whether printed or written, herein contained (see conditions on back hereof) and which are agreed to by the shipper and accepted for himself and his assigns as just and reasonable. In issuing this bill of lading this company with respect to the portion of the route beyond its own line acts only as agent and agrees to transport only over its own line.

Nothing herein contained, however, shall be construed as exempting the initial carrier from the liability, if any, imposed upon it by law for loss, damage, or injury not occurring on its own line or its portion of the through route or occurring after said property has been delivered to the next carrier.

*If the word "order" is written in connection with the name of the party to whose order the property is consigned, the surrender of the original bill of lading, properly endorsed, shall be required before delivery of the property.[1] Inspection will not be permitted on order bills of lading unless permission is endorsed on the original bill of lading or given in writing by[2] the shipper.

If the word "order" does not so appear, the bill of lading is "not negotiable," and said property may be delivered without requiring such surrender.

NOTE.—The foregoing will appear on the front, or first, page of the bill of lading.

The bill of lading is to be signed by the shipper and [by the] agent of the carrier issuing same, and space should be provided for such signatures.

The detail arrangement respecting such other matters as customarily appear on the face of the bill of lading will be later prescribed.

CONDITIONS.

SECTION 1. The carrier or party in possession of any of the property herein described shall be liable for any loss thereof, or damage thereto, except as hereinafter provided.

No carrier or party in possession of any of the property herein described shall be liable for any loss thereof or damage thereto or delay caused by the act of God, the public enemy, quarantine, the authority of law, or the act or default of the shipper or owner, or for differences in the weights of grain, seed, or other commodities caused by natural shrinkage, or discrepancies in elevator weights. *For loss, damage, or delay caused by fire occurring after 48 hours (exclusive of legal holidays) after notice of the arrival of the property at destination or at port of export (if intended for export) has been duly sent or given, the carrier's liability shall be that of warehouseman only. Except in case of negligence of the carrier or party in possession (and the burden to prove freedom from such negligence shall be on the carrier or party in possession)* the carrier or party in possession shall not be liable for loss, damage, or delay occurring while the property is stopped and held in transit upon request of the shipper, owner or party entitled to make such request[3]:

*The committee of the American Bankers' Association proposes a slight change in this paragraph and also proposes six new clauses to be inserted as indicated by the six following footnotes:

[1] When the bill has been surrendered it shall be immediately canceled. This provision shall apply even though the bill is marked not negotiable.

[2] By the holder thereof whether for value or for collection.

[3] Who, in the case of an order bill, shall be the holder thereof

or resulting from a defect in the property or from riots or strikes. When in accordance with general custom, on account of the nature of the property, or when at the request of the shipper the property is transported in open cars, the carrier or party in possession (except in case of loss or damage by fire, in which case the liability shall be the same as though the property had been carried in closed cars) shall be liable only for negligence, and the burden to prove freedom from such negligence shall be on the carrier or party in possession.

SEC. 2. No carrier shall be liable for loss, damage, or injury not occurring on its own road or its portion of the through route, nor after said property has been delivered to the next carrier, except as such liability may be imposed by law, and any carrier shall be entitled to recover from the common carrier, railroad or transportation company on whose line the loss, damage or injury shall have been sustained the amount of such loss, damage, or injury as it may be required to pay to the owner of such property or to the holder of this bill of lading, provided that it has given notice to such carrier, railroad or transportation company at least 15 days before the payment of such claim, but no obligation respecting such recovery is hereby assumed by or imposed upon the shipper, owner, or consignee.

SEC. 3. No carrier is bound to transport said property by any particular train or vessel, or in time for any particular market or otherwise than with reasonable despatch, unless by specific agreement endorsed hereon. Every carrier shall have the right in case of physical necessity to forward said property by any railroad or route between the point of shipment and the point of destination; but if such diversion shall be from a rail to a water route the liability of the carrier shall be the same as though the entire carriage were by rail.

The amount of loss or damage for which any carrier is liable shall be computed on the basis of the value of the property (being the bona fide invoice price, if any, to the consignee, including the freight charges, if prepaid) at the place and time of shipment under this bill of lading, unless a lower value has been agreed upon or is determined by the classification or tariff upon which the rate is based, in either of which events such lower value shall be the maximum amount to govern such computation, whether or not such loss or damage occurs from negligence.

Claims for loss, damage, or delay must be made in writing to the carrier at the point of delivery or at the point of origin within 60 days after delivery of the property, or, in case of failure to make delivery, then within 60 days after a reasonable time for delivery has elapsed. Unless claims are so made the carrier shall not be liable.

Any carrier or party liable on account of loss of or damage to any of said property shall have the full benefit of any insurance that may have been effected upon or on account of said property.[*]

SEC. 4. All property shall be subject to necessary cooperage and baling at owner's risk. Each carrier over whose route cotton is to be transported hereunder shall have the privilege, at its own cost, of compressing the same for greater convenience in handling or forwarding, and shall not be held responsible for deviation or unavoidable delays in procuring such compression. Grain in bulk consigned to a point where there is a railroad, public or licensed elevator may (unless otherwise expressly noted herein, and then if it is not promptly unloaded) be there delivered and placed with other grain of same kind and grade without respect to ownership, and if so delivered shall be subject to a lien for elevator charges in addition to all other charges hereunder.

SEC. 5. Property not removed by the party entitled to receive it within 48 hours (exclusive of legal holidays) after notice of its arrival has been duly sent or given, may be kept in car, depot, or place of delivery of the carrier, or warehouse, subject to a reasonable charge for storage and to carrier's responsibility as warehouseman only; or may be, at the option of the carrier, removed to and stored in a public or licensed warehouse at the cost of the owner and there held at the owner's risk and without liability on the part of the carrier, and subject to a lien for all freight and other lawful charges, including a reasonable charge for storage.

The carrier may make a reasonable charge for the detention of any vessel or car or for the use of tracks after the car has been held 48 hours (exclusive of legal holidays) for loading or unloading, and may add such charge to all other charges hereunder, and hold such property subject to a lien therefor. Nothing in this section shall be construed as setting aside any local law or rule affecting car service or storage.

Property destined to or taken from a station at which there is no regularly appointed agent shall be entirely at risk of owner when unloaded from cars or until loaded into cars, and when received from or delivered on private or other sidings shall be at owner's risk until the cars are attached to and after they are detached from trains.

SEC. 6. No carrier will carry or be liable in any way for any documents [or] specie, or for any articles of extraordinary value not specifically rated in the published classification or tariff, unless a special agreement to do so and a stipulated value of the articles are endorsed hereon.

SEC. 7. Every party, whether principal or agent, shipping explosive or dangerous goods, without previous full written disclosure to the carrier of their nature, shall be liable for all loss or damage caused thereby, and such goods may be warehoused at owner's risk and expense or destroyed without compensation.

SEC. 8. The shipper, owner, or consignee shall pay the freight and all other lawful charges accruing on said property before delivery. If upon inspection it is ascertained that the articles shipped are not those described in this bill of lading the freight charges must be paid upon the articles actually shipped.

SEC. 9. Except in case of diversion from rail to water route, which is provided for in Section 3 hereof, if all or any part of said property is carried by water over any part of said route, such water carriage shall be performed subject to the liabilities, limitations and exemptions provided by statute, and to the conditions contained in this bill of lading not inconsistent with such statutes or this section, and subject also to the condition that no carrier or party in possession shall be liable for any loss or damage resulting from the perils of the lakes, sea, or other waters, or from explosion, bursting of boilers, breakage of shafts, or any latent defect in hull, machinery, or appurtenances; or from collision, stranding, or other accidents of navigation, or from prolongation of the voyage. And any vessel carrying any or all of the property herein described shall have the liberty to call at intermediate ports, to tow and be towed, and assist vessels in distress and to deviate for the purpose of saving life or property.

The term "water carriage" in this section shall not be construed as including lighterage across rivers or in lake or other harbors, and the liability for such lighterage shall be governed by the other sections of this instrument.

When property is carried under a rate which includes marine insurance the liability of the water carrier shall cover all risks insured against and shall at least equal the liability hereunder for rail carriage in closed cars.

SEC. 10. Any alteration, addition or erasure[*] in this bill of lading which shall be made without an endorsement thereof hereon, signed by the agent of the carrier issuing this bill of lading, shall be without effect, and this bill of lading shall be enforceable according to its original tenor.

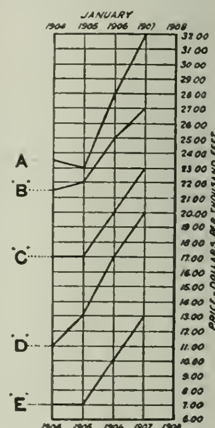
[*] So far as it is consistent with the terms of the contract or policies of insurance.

But this provision shall not apply to property on which order bills have been issued unless such bills are marked "shippers load and count." (S. L. & C.)

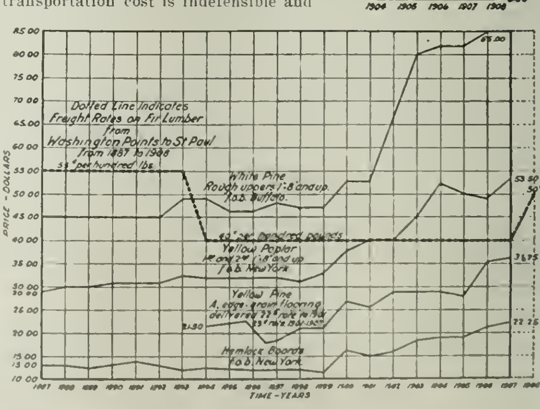
[*] Fraudulent or otherwise.

Increased Cost of Lumber.

The following diagrams from the report on increased lumber prices, issued by the United States Department of Agriculture, show how great the increases have been in the last 20 years, and especially in the last five years. Lumber prices, prior to 1893, show little change, and the tonnage handled by the railroads was of relatively slight importance; but in 1893 the railroads, having an excess of eastbound empty cars on account of the steady increase in westbound merchandise shipments and construction material, created by the growth of the Pacific Coast country, lowered the freight rate to a 40 per cent. basis in an effort to encourage the lumber industry and to get a back haul.



From 1893 until 1900, although the tonnage increased, the lumbermen secured only a moderate advance in prices, but in recent years conditions have changed materially. The prices of lumber have almost doubled and the principal difficulty the lumberman has had has been to get his product hauled to eastern markets. The demand for cars has exceeded the supply and the railroads have been compelled to send empty cars across the continent for this purpose. In the face of these conditions, it is claimed by the railroads that the continuance of a rate which does not bear its proper share of the transportation cost is indefensible and indicates that other traffic is being saddled with a burden not co-ordinate with the factors which should determine proper rates. The diagrams, as shown, tend to indicate that the old rates inaugurated to fit the conditions of 1891 are not co-ordinate with the conditions which exist to-day. A 10 per cent. increase from the Pacific Coast to St. Paul and Minneapolis has been proposed and is apparently justified by existing conditions.



Prices of Washington Fir Lumber.

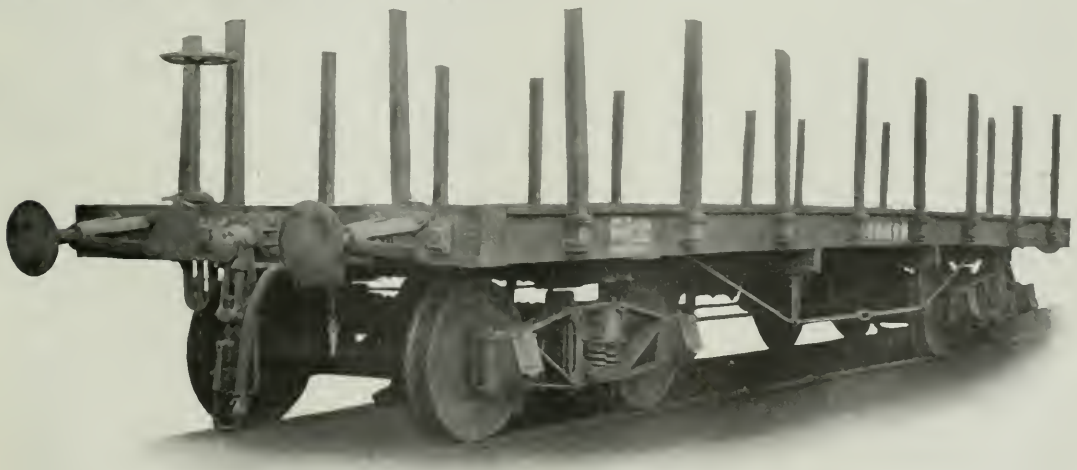
A Fir car siding and roofing, 1 in. x 4 in., or 6 in.
B Fir flooring, 1 in. x 4 in. or 6 in., 10 ft. to 16 ft.
C Fir drop siding, 1 in. x 6 in., 10 ft. to 16 ft.
D Fir car sills, rough, 35 ft. to 40 ft.
E Fir railroad ties, 7 in. x 9 in. x 8 ft.

American Cars for Chinese Railroads.

The Middletown Car Works, Middletown, Pa., has recently built and shipped to the Sun Ning Railroad in China a number of 20-ton box and flat cars which are a combination of United States and German standard construction. The Sun Ning Railroad is a short road being built in Central China by native capital and in some of the details of its equipment it reflects the influence of the German engineers in charge of the Shantung Railroad. The gage of the road is 4 ft. 8½ in. and in most other respects the standards employed in the United States have been followed but the coupling attachments of these cars are of German design and were imported from Germany by the builders. The center line of draft is 3 ft. 5⅝ in. above the rails and a form of screw coupling is employed with the usual side buffers. The car bodies and trucks are built to M. C. B. standards throughout.

20-Ton Box Car; Sun Ning Railroad.

The box cars have wooden underframes and bodies with corrugated iron roofs. They are 29 ft. 6⅜ in. long, 8 ft. ⅜ in. wide and 6 ft. 4 in. high, inside measurements, and 32 ft. long over end sills. The trucks are of the diamond arch bar type with double I-beam bolsters and channel swing plank. Cast-iron wheels 33 in. in diameter, M. C. B. axles with 3¾-in. x 7-in. journals and M. C. B. boxes are used. The cars are fitted with Westinghouse air-brakes with 8-in. cylinders. The flat cars are 32 ft. long and 8 ft. 9 in. over the floor, and are identical in other respects with the box cars.



20-Ton Flat Car; Sun Ning Railroad. Built by the Middletown Car Works.

Vanadium Steel.

For several years the question of the use for modern metallurgy has been that of investigating the several alloys of steel that have a tendency to modify the texture of the metal so that it may be better and better adapted to the diversified requirements of modern industries. The addition of a foreign metal may result in increasing the resistance to shock, or raising the limit of elasticity, or in increasing the ductility of the steels so that these various modifications necessitate a very careful study of the alloy. The last to be used, and one which, for many years, has attracted a great deal of attention among metallurgists, is vanadium.

Before pointing out the characteristic properties of vanadium steel our readers will permit of a short digression regarding vanadium itself. At the beginning of the last century vanadium was discovered and christened "Erithrone" by a professor of mineralogy in Mexico, Del Rio, who first gave the new metal the name of "panchrome." An analysis of a specimen of this mineral sent to France by Humboldt, led Collet Descotils to admit the presence of chromium, but not that there was a new metal, and Del Rio himself retracted his first opinion and attributed the brown appearance of Zimapan to a basic chromate of lead. Thus, scarcely had it become known before it was disowned by its discoverer and was relegated to Zimapan without arousing any controversy whatever. Thirty years after, in November, 1830, Berzelius wrote to Dulong that: "M. Sofstrom, Director of Mines at Fahlun, in examining a sample of iron that was remarkable for its extreme softness, had detected the presence of a substance * * *." This new substance, which was somewhat more abundant in the pig than in the puddled iron, and consequently more abundant in the slag, was called "vanadium," a word taken from Vanadia, a surname of Freya, one of the principal goddesses of Scandinavian mythology. Vanadium was thus rediscovered, but the investigation of its properties has only been consummated recently.

In 1841 vanadium was found in a large number of iron and copper mines, and French science claims the honor of having recognized it as one of the most widely diffused of the metals of the crust of the earth. The masses of bauxites of the south of France contain it in notable quantities, from which it is obtained for use in ceramics just as the clays are. But the actual amount contained is very small, being from 0.09 to 0.06 per cent. at Rovest and in Calabria. The researches of Dienlafait, of MM. Osmond and Witz show that the basic slag of the oolithic mineral of Mazenay contains more than 1 per cent. of vanadium. In short, it appears that the rocks in which vanadium occurs are those formed by the deposits of ancient seas that have dried.

The content of vanadium rarely reaches 0.1 per cent. in those

minerals in which it is encountered. The principal minerals are vanadinite, which is a chlorovanadinate of lead; chilecite, a double vanadinate of lead and copper; dechinite, acroxene and enoynchite, which contains a large proportion of zinc. The presence of arsenic produces cuprodecloizite. These minerals are very numerous and, not to weary the reader, it may simply be added that one of the minerals that is richest in vanadium is the vanidiferous mica, roscoelite. To recapitulate, the principal minerals from which vanadium is obtained are: Vanadinite, which is found in Spain and which contains about 40 per cent. of lead, from 12 to 13 per cent. of vanadic oxide and silicon, some iron and silver; the vanadiferous ores of Colorado and the vanadiferous deposits of South America.

The metal vanadium is obtained by concentrating the oxide which is reduced in the presence of the oxide of iron in an electric furnace as in the production of aluminum. The two processes produce a ferro-vanadium, which frequently contains 80 per cent. of vanadium.

Vanadium was first used in the preparation of a black ink that was compounded by Berzelius, and then in coloring where it replaced the old process using the sulphate of copper. Extracted from the Creusot slag, it cost about $27 a pound and sold for $90. It was also used in ceramics and even in therapeutics.

The use of vanadium in metallurgy dates from 1896, when M. Choubley, Manager of the Firminy works, made a number of tests on ordinary steel tempered at 1,650 deg. Fahr. and annealed at about 480 deg. Fahr. to which a powder composed of the oxide of vanadium and aluminum was added. Although these tests were fruitless at first, the following results were finally obtained:

	Ordinary steel.	Vanadium steel.
Limit of elasticity	48,760 lbs.	70,625 lbs.
Ultimate strength	56,500 "	74,304 "
Elongation	10 per cent.	11.3 per cent.
Contraction of area	54 "	47 "

This shows an increase of 44.8 and 31.5 per cent. for the limit of elasticity and ultimate strength respectively. M. Chowbley decided to use a ferro-vanadium to add to the steel bath. This steel hardened in a remarkable manner under the influence of a rise of temperature.

More methodical investigations were undertaken by Mr. Arnold, a Professor in the Mechanical Institute of Sheffield in 1900. Vanadium was introduced as ferro-vanadium containing a small quantity of aluminum with the following results:

—Chemical analyses.— Combined carbon.	Estimated aluminium.	Aluminum per cent.	Estimated vanadium.	Vanadium, per cent.	Remarks.	—Physical properties— Limit of elasticity in lbs. per sq. in.	Ult. strength in lbs. per sq. in.	Elongation, per cent.	Reduction of area, per cent.
					Steel.				
1.00	0.04	0.07	0.12	0.14	11 mins. before pouring.	43,600	68,760	6.5	6.9
1.02	0.53	0.09	0.50	0.29	With the charge	43,760	77,140	8.5	10.0
1.00	0.53	0.36	0.50	0.58	21 mins. before pouring.	65,660	86,625	7.0	7.6
0.80	0.33	0.45	1.00	1.11	10 min. before pouring.	52,760	78,045	10.0	17.6
1.04	0.92	0.21	1.00	0.77	With the charge	59,530	85,075	7.5	9.3
					Iron.				
0.05	0.12	0.05	1.00	0.85	10 mins. before pouring.	20,460	26,445	37.0	12.0

These results are very interesting and show what they are for themselves; an almost pure steel containing 1.10 per cent. of carbon had a limit of elasticity of about 30,500 lbs. per sq. in. of section and an ultimate breaking strength of 60,900 lbs. By referring to the table it will be seen that an addition of 0.14 per cent. of vanadium without making any appreciable change in the ductility of this steel raised its limit of elasticity by about 13,200 lbs. and its ultimate strength by about 79,000 lbs. Again the addition of 0.30 per cent. of vanadium raised the ultimate strength to 77,150 lbs. per sq. in., and 0.60 per cent. to 92,425 lbs. According to Mr. Arnold there is nothing to be gained by adding more than 0.60 per cent. of vanadium, for steel containing 0.77 per cent. gives almost identically the same results as that with 0.58 per cent.

The tempering makes it possible to obtain remarkable mechanical results with tools of vanadium steel, for the ⅝ in. in diameter of the following composition:

Vanadium	0.268 per cent.
Nickel	2.54 "
Carbon	0.156 "
Manganese	0.42 "
Phosphorus	0.022 "
Sulphur	0.028 "

The physical properties of the annealed metal were:

Ultimate strength	88,575 lbs. per sq. in.
Limit of elasticity	81,175 lbs. per sq. in.
Elongation	31 per cent
Contraction of area	57.5" cent

After having been treated to about 3,650 deg. Fahr., which brought it up to a cherry red, it was plunged into cold water and then, without being reheated, it gave the following results:

Ultimate strength	95,500 lbs.
Or an increase of more than 147 per cent	
Limit of elasticity	88,475 lbs
Or an increase of more than 181 per cent.	
Elongation	10.0 per cent.
Reduction of area	18.3 per cent

These figures show a great increase in ultimate strength and limit of elasticity.

An examination under the microscope shows that vanadium tends to delay the separation of the carburets, which facilitates the operation of tempering, which can be done by merely raising it to a temperature of 1,600 deg. Fahr., and then immersing it in water without allowing for any reheating. Vanadium so hardens the molecular elements of the steel, such as the ferrite, that it is possible to bend a square bar cold without developing any fracture. Finally, one of the characteristics of vanadium steel is the very small proportion of contained carbon, which is usually from 0.10 to 0.15 per cent.

Vanadium steels may be divided into three classes: (1) Steels containing vanadium only; (2) steels containing vanadium and nickel; (3) steels containing vanadium and chromium.

The first usually contains from 0.10 to 0.15 per cent. of carbon and from 0.15 to 0.25 per cent. of vanadium. Vanadium has almost as much of an effect as the carbon upon the steel, and the fact that the tensile strength of almost pure iron, that is iron obtained electrolytically, is increased, for example, from 24,000 lbs. to 27,000 lbs. per sq. in. of section by the addition of a few tenths of vanadium, is certainly very remarkable and the obtaining of so great an effect with so small a cause can be classed among the marvels of modern science. The following are some interesting results that have been obtained by the addition of vanadium:

	—In lbs. per sq. in.— Ultimate strength.	Limit of elasticity
Soft steel, low in phosphorus	27,200	25,400
Carbonized by casting in a graphite crucible	28,100	25,000
With 0.50 per cent. of vanadium added	42,570	33,550
With 1 per cent. of vanadium added unannealed.	62,460	49,750
Same as above, annealed	45,235	37,050

This 1 per cent. vanadium steel is ordinarily used for pieces subjected to vibration, for it resists tensile stresses admirably and is elastic.

The second class of vanadium steels are those containing vanadium and nickel. Usually the proportions are from 0.20 to 0.40 per cent. of vanadium and from 2 to 6 per cent. of nickel. With these steels the tensile strength obtained ranges from 35,000 to 39,000 lbs. per sq. in. with a limit of elasticity of from 22,500 to 31,500 lbs., and an elongation varying from 30 to 35 per cent. After tempering the tensile strength and the limit of elasticity rises to 99,000 lbs. and 88,000 lbs. respectively, while the elongation is reduced to from 8 to 10 per cent. The nickel has a peculiar action in this respect that, up to a content of 8 per cent., it makes the steel hard, and that from 8 to 15 per cent. it makes it brittle so that it can be broken with a hammer; and that from 15 to 25 per cent. its ductility increases rapidly beyond which it remains stationary. Vanadium makes nickel steel more homogeneous and diminishes the tendency to brittleness which the nickel causes, though it is true that it is rarely used where the nickel content is more than 8 per cent. Owing to the fact that the nickel gives the metal a high capacity to resist shock, these steels are especially adapted for use in piston rods, cranks, coupling rods, small shafts and the like.

The third class of vanadium steels comprise those containing vanadium and chromium, and the best proportions are those included within the following limits:

Carbon	0.20 per cent.	0.40 per cent.
Chromium	1.00 "	1.00 "
Vanadium	0.20 "	0.20 "

Chromium increases the resistance to shock and the tensile strength, but it has a tendency to produce a very hard metal and one that is difficult to work hot, while welding can only be successfully done electrically, because of the tendency of chromium to oxydize and change into slag. The addition of chromium makes the metal difficult to cut and to work cold, and the Carnegie Steel Co. has found no better method of cutting sheets and plates made of chrome steel than to use a smooth disc revolving at high speed. This disc is 6 ft. in diameter and is mounted in the same way as a circular saw and can cut plates up to 6 in. in thickness. A jet of steam is made to impinge continuously against the metal on the line of the cut. The addition of from 0.15 to 0.25 per cent. of vanadium will counterbalance the tendency of the chromium and facilitate the cutting of steel sheets.

These steels are especially adapted for making crank shafts, propeller shafts, locomotive and car axles, vertical shafts, etc.

The following results show very clearly the influence of vanadium upon chrome steel:

Steel.			—Lbs. per sq. in.— Ultimate strength.	Limit of elasticity.	—Per cent.— Elongation.	Reduction of area.
carbon manganese			25,150	14,855	35	60
" plus 0.50 per cent.	chromium		32,250	20,640	33	61
" " 1.00 "	chromium		36,120	23,220	30	57
" " 0.10 "	vanadium		32,250	27,090	31	60
" " 0.15 "	vanadium		34,185	29,025	26	59
" " 0.25 "	vanadium		36,665	32,250	24	59
" " 1.00 "	chromium					
and 0.15 "	vanadium		44,795	34,185	21	57
" plus 1.00 "	chromium					
and 0.25 "	vanadium		58,050	46,085	19	16
" plus 1.00 "	chromium					
and 0.15 "	vanadium					
tempered			78,025	67,080	16	18
" plus 1.00 "	chromium					
and 0.25 "	vanadium					
tempered			90,235	75,140	12	45

The conclusion reached from all of these investigations which have been carried on in recent years is that vanadium can be used to replace nickel, tungsten and molybdenum in the steel alloys.—*Revue Industrielle.*

Electric Locomotives of the Pennsylvania Railroad.

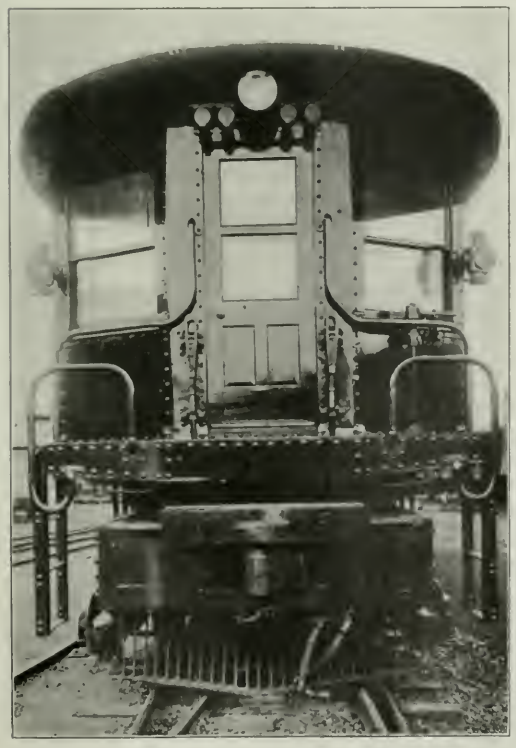
With a view to determining the type best adapted to pulling its heavy passenger trains through the New York tunnels, the Pennsylvania Railroad has in progress a series of experiments upon electric locomotives. Through the experiments, which are being conducted on its West Jersey & Seashore division and the Long Island Railroad, the company intends to determine some of the general characteristics of the electric locomotive and to secure operating data based on actual service.

Of the two direct-current locomotives now undergoing tests, one is equipped with four 325 h.p. geared motors and the other with four gearless motors in order that the relative merits of the two types may be determined.

The locomotive with gearless motors has one of its trucks equipped with two 320 h.p. motors supported by springs from the main journals and wholly independent of the truck frame, while the other truck has two 300 h.p. motors rigidly fastened to the truck frame. This arrangement will demonstrate the advantages of the two methods of motor suspension under the same conditions of service.

In exterior appearance the two locomotives are almost identical. They resemble somewhat a short truck passenger car with few windows and large wheels. The trucks are of the four-wheel type having frames placed outside the wheels, with pedestal boxes and adjustable wedges similar to those used in locomotive practice. On account of their short wheel base the trucks have a tendency to tilt in operation, and thereby shift a portion of the effective load from one pair of wheels to the other. By an ingenious automatic switching mechanism the power delivered by the motor on the heavily loaded axle is increased and the power delivered by the motor on the lightly loaded axles diminished in proportion to the difference in axle loads. By this expedient the pulling power of the locomotive is increased.

Side View of Electric Locomotive; Pennsylvania Railroad.



End View of Electric Locomotive; Pennsylvania Railroad.

The outer-end casting of each truck carries the coupler, draft spring and buffer arrangement, so that strains caused by pushing, pulling and buffing are taken directly by the truck frames and do not come upon the underframe of the cab, except as they are transmitted between bolsters through the center sill. In order to allow sufficient lateral play when the locomotive is coupled to a long passenger car with considerable overhang, the coupler head has a free movement of 15 in. on either side of the center line of the truck. To facilitate coupling and uncoupling on curves, the coupler can be swung sideways and its uncoupling pin raised by means of levers at the end of the cab, which can be operated from the platform.

Driving wheels are 56 in. in diameter, with removable tires secured by retaining rings. They are carried by axles 8 in. in diameter at the center, provided with 6-in. x 11-in. journals.

The spring rigging is of the locomotive type, with semi-elliptical springs over the journal boxes, and equalizers between the springs. To prevent teetering, the equalizer beam is not provided with a fixed fulcrum, but instead supports two nests of helical springs, which in turn help to support the truck frame.

The collector shoes are attached to the four end journal boxes, and are made of two castings forming a spring hinge, with one wing lying in a horizontal plane, and sliding on top of the third rail. The current passes from the third rail through the collector shoes and the heavy cables connected thereto to the fuse-boxes fixed near the shoes.

The cab is entirely of metal, its underframe composed of a center sill, built of two 10-in. channels, side sills of 7-in. x 3½-in. angles, plate bolsters and end sills. Within the cab the apparatus is distributed along the sides, leaving a passageway through the middle. The equipment on one side of the cab consists of three main reservoirs, a sand-box with electro-pneumatic valves underneath, a switch group, two line switches, a case of diverters, and two sets of storage batteries. That on the other side consists of a compressor, a compressed air cooler, a fan and motor, a reservoir for control apparatus, a sand-box, two line switches, a whistle reservoir, a motor cut out, a switch group, and a case of diverters.

The locomotive control mechanism is in duplicate, and placed in diagonally opposite corners of the cab, so that the motorman can operate a locomotive, or group of locomotives, from either end of the cab, in either direction. By means of a special grouping of switches it is possible to obtain a constant flow of current without a break, when changing from series to series parallel, and from series parallel to full-multiple. The preliminary tests made with the locomotive proved that by means of this system of grouping switches, the acceleration of the locomotive could be made practically uniform. Both ends of the cab are provided with sockets, so that when two or more locomotives are coupled together connections can be made by means of these sockets, and the group of locomotives can be simultaneously operated and controlled by the motorman of one locomotive.

Hung from the ceiling in the center of the cab are two plug switches and another ammeter shunt. The conductors from the third rail shoes are connected to one switch, and the trolley cable is connected to the other.

The switches in the switch group are operated by air pressure. The air valve is actuated by a control magnet on a 14-volt circuit. When current flows through the magnet armature opens the air valve, admitting air behind the piston, which closes the switch through which the main current flows. By breaking the control circuit the armature of the magnet is released, which closes the air passage from the reservoir and prevents the egress of air from the cylinder. A spring under the piston pushes it up, and thus opens the main circuit. The line switches are actuated in a similar manner, and also open when an excess of current flows through them by the air valve, admitting air behind the piston, which closes the switch through which the main current flows. By breaking the control circuit the armature of the magnet is released, which closes the air passage from the reservoir and prevents the egress of air from the cylinder. A spring under the piston pushes it up and thus opens the main circuit. The line switches are actuated in a similar manner, and also open when an excess of current flows through them.

The cab can be lighted by three lamps, which are in series with the lamps with the headlights; but normally these lamps are to be concealed. Five more lamps, which are in series, are distributed over the ceiling, to assist in lighting the cab when repairs are under way, but are not used when the locomotive is in service.

The storage batteries are in two sets so that they can be charged alternately by being placed in series with the motor of the air compressor, one set being charged while the other set is in service, the alternation being made each day.

Locomotives are equipped with hand, straight air, automatic and high-speed brakes. The principal dimensions, which are the same for both locomotives, are:

Number of pairs of driving wheels	4
Diameter of driving wheels	56 in.
Axles	diameter, 8 in.; journals, 6 x 11 "
Length, inside couplers	37 ft. 10½ "
Length over platforms	35 " 8 "
Wheel base of trucks	8 " 6 "
Total wheel base of locomotives	26 " 1 "
Width, cab	10 " 1⅜ "
Width, body	9 " 11¾ "
Height, rail to top platform	5 " 5 "
" " " roof	13 " 4 "
" " " bell (extreme)	14 " 5⅜ "
Weight: Locomotive No. 1001 (geared motors)	175,100 lbs.
Weight: Locomotive No. 1002 (gearless motors)	195,200 "

Rapid Transit Conditions in New York.

The report of the Board of Rapid Transit Railroad Commissioners for the city of New York for the year 1906, presumably the last report which this body will make, since it has now been superseded in its functions by the Public Service Commission of the First District, contains much interesting data about passenger traffic in New York City and presents graphic estimates of what traffic in future years may be expected to be. We show the diagrams illustrating traffic movement, which the commission has prepared.

The total number of passengers carried in the subway during 1906 was 149,778,370, as indicated by ticket sales. The smallest number of passengers carried any one month was 8,555,795 in August, 1906, and the largest number was 15,609,516 in December. These months of minimum and maximum traffic showed increases of 41 and 14 per cent., respectively, over July, which was the month of minimum traffic in 1905, and December, the month of maximum traffic. The average number of passengers carried per month in 1906 was 12,466,786. The heaviest traffic was at the Brooklyn bridge station. Over 19½ million people boarded trains at this station during the year, and if it be assumed that an equal number left the trains there, over 39 million people, exclusive of those transferring from one train to another, passed through the station. Twice as many passengers used the Brooklyn bridge station as any other single station on the road.

The 10 busiest stations in order of their importance are:

1. Brooklyn Bridge.
2. Grand Central.
3. 14th street.
4. Times Square.
5. Fulton street.
6. 23d street.
7. 116th street.
8. 125th street and Lenox avenue.
9. Astor place.
10. Wall street.

On the maximum week day, December 24, 1906, 605,246 passengers were carried.

As an indication of the future growth in the city's population, Fig. 1 shows the population of the city in its five boroughs from 1800 to 1905, as obtained from the United States and state censuses. Based upon the average rate of growth per decade, from 1870 to 1900, the curves have been extended to 1930.

Fig. 2 indicates the paid passenger traffic in New York City and its several boroughs from 1901 to 1906, inclusive, with the curves extended to 1916.

Fig 3 shows the detailed variation in the traffic on the surface, elevated and subway lines for the same years as before. The general laws governing the variations in the population and traffic of Greater New York can best be observed by studying Figs. 1 and 2. Considering all the boroughs grouped into one great population center, it appears that during the four years ending June 30, 1905, the total number of paid passengers traveling on all street railways—surface, elevated and subway roads—increased practically in a straight line, that is, the increment in each succeeding year was about the same. During 1906, however, there was a sudden marked increase in the traffic. While the average increment for the four preceding years was only about 63,000,000 per year, during 1906 it amounted to nearly 110,000,000. No census of the population of the Greater City was made in 1906. It is therefore impossible to determine whether this large additional number of riders is due to a corresponding increase in the population, or to an increase in

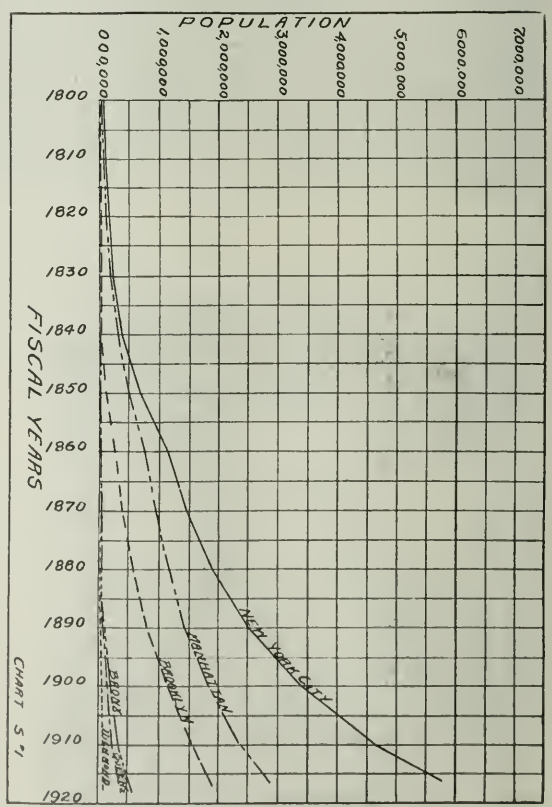


Fig. 1.

the number of riders per capita, but an increase in the population is the most probable cause, as will appear later. The growth of the travel in the boroughs separately has not always been parallel with that in the whole city, as was notably the case during the last three years. During 1902 and 1903, the increases were practically uniform in each borough; the amount of increase in each borough being greater in the order of the size of population of the boroughs—that is, the increase was smallest in Richmond and largest in Manhattan.

During 1904 and 1905, with the travel in the whole city still

increasing at a uniform rate, there was a loss in the rate of increase in the travel in Manhattan, and a corresponding gain in all the other boroughs, but mainly in Brooklyn. This may be accounted for by a temporary movement of some of Manhattan's population to the other boroughs. The only reason that can be ascribed for this migration was the interference with travel in Manhattan due to the building of the subway.

In 1906, when the notable increase in the number of paid passengers in the whole city occurred, there was a general increase in the rate of travel in all the boroughs. This was a greater rate

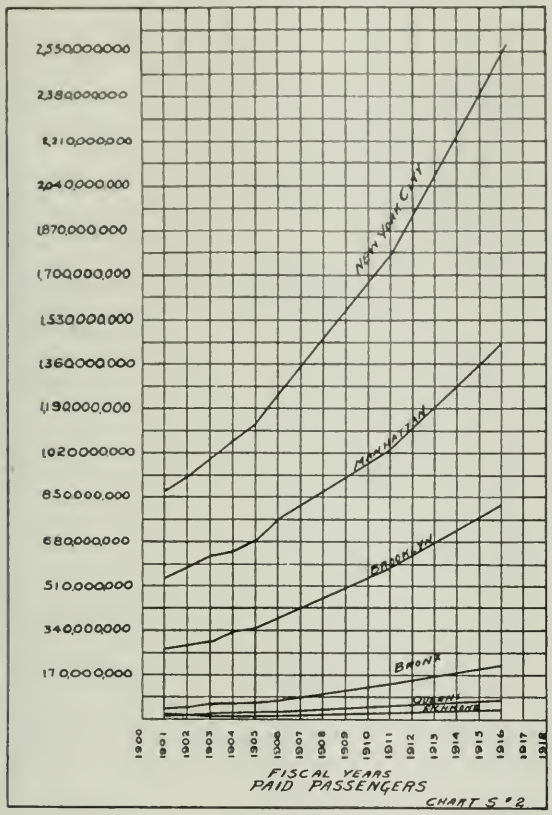

Fig. 2.

than had prevailed during any of the preceding years which have been considered. Manhattan recovered more than was lost during the years 1904 and 1905. All the other boroughs made material gains.

In the upper portions of Manhattan, a territory which was not conveniently accessible before the subway was opened, a great many apartment buildings have been erected. There has been a large movement into this district, the subway stations located here alone have handled nearly 8,500,000 passengers during the fiscal year of 1906. Assuming that most of these people have come into the city from the outlying suburbs in New Jersey, Long Island and Westchester, a total of nearly 17,000,000 additional passenger fares are accounted for on the subway alone.

It would appear, therefore, as already stated above, that the pronounced growth in 1906, in the total number of paid passengers traveling in the whole city, can only be accounted for by a corresponding increase in the city's population. This is probably due to the operation of the city's first subway, a great many suburban people having been induced to come into the city in view of the increased facilities afforded. It is now proposed to take up each borough, more or less in detail, and finally to make some speculations with regard to the transportation requirements within the next decade.

In the borough of Richmond 15,571,889 paid passengers were carried during the fiscal year of 1906; 8,957,414 of these were carried on the surface lines, the remaining 6,614,475 on the steam roads; the daily average was nearly 43,000. During the last five fiscal years the number of passengers carried increased at a fairly uniform rate. The total increase for the five-year period was about 28 per cent. This borough now has on an average about two inhabitants to the acre. It is estimated that its population may be about 100,000 in 1916, or a little less than three to the acre. Approximately 60 per cent. of all the passengers in Richmond, about 26,000 per day, are now transported to and from Manhattan by ferry. The increases in population and passengers transported will probably be greater than indicated above. However, assuming that the same rates are maintained, in 1916 there should be approximately 26,000,000 paid passengers carried in Richmond. About 15,000,000 of these will have to be provided with transportation to and from Manhattan. Each inhabitant of the borough now rides 210 times per year; in 1916 he would ride about 260 times. There are now 130 miles of single track operated in Richmond. The transportation problem here can be taken care of for many years to come by the natural expansion of the present systems to develop new territory and an increase in the car mileage to meet the added demands of the growing population.

In the borough of Queens the conditions are somewhat similar to those in Richmond, except that the population is larger and has increased about twice as fast.

In 1906 the population was 208,596. The completion of the tunnels now under construction will probably cause a phenomenal growth in the population. Based on a normal ratio of growth, however, it is estimated that it will be about 300,000 for 1916. In studying the traffic, the Long Island Railroad has not been included. There were 22,115,729 paid passengers riding on the surface lines during 1906, an increase of nearly 100 per cent. during the five fiscal years, as against the 28 per cent. increase in Richmond. The number of rides per inhabitant is smaller in this borough than in any other. In 1901 there were 73 per capita per

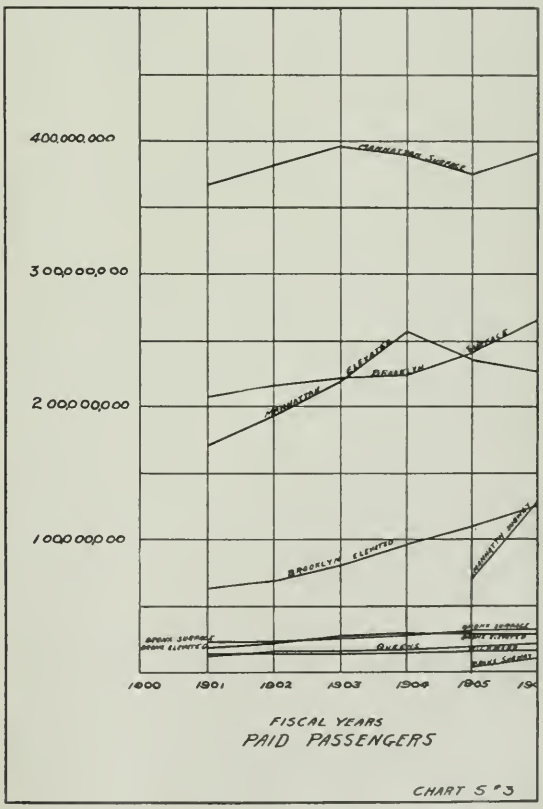

Fig. 3.

year; in 1906, 106. If the traffic increases as rapidly during the next decade as it has during the past five years, in 1916 the travel in Queens borough will equal over 88,000,000 paid passengers. To carry this traffic within the borough, as was the case in Richmond, it will only be necessary to increase the car mileage as occasion demands, and to add to the trackage in undeveloped territory. This does not dispose of the passengers whose objective point is Manhattan; these must be provided with facilities for crossing the East river.

The statistics are not directly available from which the number

of people bound to Manhattan can be determined. It has been estimated, however, that about 60 per cent. of the riding passengers both in Richmond and in Brooklyn cross to and from Manhattan each day. Using this same ratio, then about 53,000,000 people, exclusive of Long Island Railroad passengers, will have to be transported across the East river from Queens in 1916, either by ferries, bridges or tunnels.

The Blackwell's Island bridge and six tunnels are now being constructed between Manhattan and Queens. Two of the tunnels enter Manhattan at Forty-second street and are known as the Belmont tunnels; the other four are the Pennsylvania tunnels through Thirty-second and Thirty-third streets. The bridge provides for two elevated and two trolley tracks; in all there will be five tracks in each direction. The Pennsylvania tunnels will probably be used mostly by Long Island commuters. If these tracks are omitted from consideration three tracks in each direction will still be available for the use of this borough. These facilities should be in operation within four years. Their combined maximum capacity should be over 133,000,000 per year, with a maximum hourly capacity of over 73,000 in one direction. If all passengers are to be provided with seats, then the above figures would become approximately 60,000,000 and 33,000,000, respectively. The residents of Queens will therefore have ample facilities for reaching Manhattan for many years to come.

During the fiscal year of 1906 389,555,025 paid passengers were carried on the street railways in the Brooklyn borough, a daily average of over 1,067,000. This represented 278 rides per inhabitant for the year.

The elevated lines carried 125,221,831 and the surface lines 264,333,194, or about 32 and 68 per cent., respectively, of the total number. Over 60 per cent., or approximately 234,000,000, of all of the above passengers were carried to and from Manhattan over the bridges and ferries. There has been a slight increase each successive year in the rate of increase of the total passengers carried. Considered separately, the riders have increased faster on the elevated than on the surface lines.

The number of surface riders in 1906 was about 27 per cent. greater than in 1901. During the same period the amount of single track operated has increased less than 2 per cent., and the car mileage only about 11 per cent. This has resulted in a greatly increased crowding on all lines. For the same five fiscal years the population has grown less than 18 per cent. Each inhabitant has taken 189 rides on the surface cars during 1906, as compared with 174 rides during 1901.

If the same rates of increase which have prevailed during the past five years are maintained for a decade, in 1911 the number of paid passengers carried on the surface roads in Brooklyn will amount to about 336,000,000; in 1916, to about 426,000,000.

These figures do not represent the maximum rates at which passengers will have to be carried during the rush hours. During these hours it is estimated that transportation will have to be provided on the surface lines at the rate of over 100,000 per hour in one direction in 1911, and 140,000 per hour in 1916.

The travel on the elevated railroads in Brooklyn has very nearly doubled, while the surface roads were gaining 27 per cent. To carry this enormous increase of traffic only 9.346 miles of single track have been added, or only 11 per cent. more than was operated in 1901. The car mileage during the same period has not increased 60 per cent. It appears, therefore, that the increase in facilities on the elevated railroads has not kept pace with the growth in the traffic. The whole transportation system, both surface and elevated roads, is greatly overburdened. It is obvious that in order to provide relief for Brooklyn's population the subway systems must be extended into and through the borough as quickly as possible. When this is done the surface lines will be greatly relieved; they can then be depended upon to fulfil their proper functions, that is, furnish the necessary short-haul service. Long-distance passengers will be provided for on the elevated and subway lines. The capacity of the present surface and elevated lines is about 280,000,000, if moderate crowding is permitted during the rush hours.

From careful estimates it is believed that not far from 560,000,000 paid passengers will have to be provided with transportation in Brooklyn on all lines during 1911, and 800,000,000 during 1916. Deducting the capacity of the present facilities, subways should be built by 1911 to accommodate 280,000,000 people, and by 1916, 520,000,000 people.

To furnish this service with only moderate crowding, one four-track railroad operating ten-car trains should be completed across the East river and into Brooklyn within the next five years; and one more within five years afterwards, or two altogether during the next decade.

If, however, all passengers are to be provided with seats during the rush hours new subways must be provided for 370,000,000 passengers by 1911, and 610,000,000 by 1916, or two four-track railroads must be constructed to Brooklyn within the next five years, and four within the next decade.

The population of the Bronx borough at the end of the fiscal year 1906 was 288,417. It has grown over 38 per cent. during the last five fiscal years. During the same period the number of paid passengers carried on the surface lines, or, it may be said, the travel within the borough, has increased at a uniform rate of more than 36 per cent. The corresponding increase in the passenger car mileage has been less than 27 per cent., consequently the service now provided is not as good as it was five years ago. The trackage is sufficient, and adequate surface car transportation in this borough can be furnished for some years by increasing the car mileage or number of cars in use.

The elevated and subway traffic in the borough represents the travel to Manhattan. The number of paid passengers using the elevated road increased at a uniform rate up to 1904. The next year there was a very slight increase, due wholly to the opening of the West Farms branch of the subway, which had been in operation for seven months. In 1906 the use of the subway caused a falling off in the number of elevated passengers. Apparently the subway has had no effect upon the travel on the surface lines in The Bronx. Probably about 42,000,000 paid passengers will be carried on the surface lines in 1911, and 57,000,000 in 1916.

Manhattan's population was 2,167,585 for the 1906 fiscal year. This represented an increase of about 15 per cent. in five years. The traffic on all the lines in the borough has increased nearly 39 per cent. during the same time, but the growth has not been uniform throughout the whole period. The percentage of increase for each succeeding year was less than that for the preceding year up to 1905. For 1906, as already stated, there was a marked increase in the travel on all lines. While in each year the total travel has increased over that of the preceding year, the same thing cannot be said of the surface, elevated and subway lines when considered separately. During 1902 and 1903 there was a steady increase in the number of paid passengers carried on both the surface and elevated roads. In 1904 there was a falling off on the surface lines and a corresponding increase on the elevated lines. This was probably due almost entirely to the interference with the surface cars caused by the construction of the subway. But the surface and elevated lines showed a loss in 1905, which combined was equivalent to the travel on the subway during that year. Most of the subway passengers, however, were drawn from the elevated lines. There were nearly 21,000,000 less passengers using the elevated than in 1904—a loss of 10 per cent., instead of what should have been a gain of nearly 20 per cent., due to the subway travel. During 1906 the surface roads gained a little over the previous year, but the elevated roads continued to lose passengers.

In the fiscal year of 1906 the surface cars in Manhattan carried 391,354,877 paid passengers. This was a total increase of about 7 per cent. in five years. It has already been shown that the population of the borough increased 15 per cent. during the same period. Each inhabitant rode 194 times during 1901, as compared with 181 times in 1906. It is therefore apparent that the public are not riding on the surface cars as often as formerly. There are several reasons for this. The subway traverses a section of the city which had not formerly been provided with rapid transit facilities; therefore, those who had been compelled before to use the surface cars immediately changed to the subway. Again, a great many have moved their homes from lower Manhattan into upper Manhattan and The Bronx, and in consequence have become patrons of the elevated and subway roads. The number of passengers carried in 1906 does not represent the maximum number carried per year during the last five years. In 1903 there were 396,570,435 surface car passengers, amounting to nearly 200 rides per capita. This was the summit year of the surface car travel. The changes in the trackage and car mileage have not corresponded with the variations in the traffic. The former has increased about 14 per cent., but the latter only about one-half of 1 per cent. The density of traffic, or number of paid passengers per car mile, has increased over 6 per cent.

At present, if there were greater facilities for the long-distance travel, the traffic on the surface lines would be materially less. The surface lines should be wholly available for the short hauls. If the traffic growth on these lines for the five years just past is maintained for a decade the paid passengers would then be about 419,000,000 in 1911, and 448,000,000 in 1916. This number can probably be taken care of on the present surface lines without excessive overcrowding, provided the street conditions are so regulated as to reduce to a minimum the obstruction to car movement, and the size of all the cars in service is increased to the dimensions of the largest cars now being used. It would be of great benefit if the movement of vehicles on the car tracks were prohibited, or at least restricted, particularly during the rush hours. Careful investigations made by the Merchants' Association during 1903 will confirm these statements.

It has already been pointed out that a large number of former patrons of the elevated changed to the subway as soon as it was opened. The elevated and subway roads in Manhattan are considered together, since they both provide for the long-distance travel. The combined traffic on the two systems during the fiscal

year ending June 30, 1906, was 355,331,924 paid passengers, 227,538,369 riding on the elevated roads and the remaining 127,793,555 using the subway. In five years the number of long distance riders has increased over 108 per cent. The number of such riders per inhabitant has been 91 for 1901, and 164 for 1906. The enormous gain indicated above was accompanied by a corresponding loss on the surface lines. It is unlikely that such an increase in the elevated and subway traffic will be maintained for more than a few years at the most, it merely represents a change from one system to another. The more nearly correct conditions will be shown in the increase in traffic on all lines. Moreover, since Manhattan and The Bronx are interconnected by both the elevated and subway lines, it will be desirable to consider these two boroughs together in arriving at any conclusion relative to the traffic on these two systems.

The population of Manhattan and The Bronx has been estimated at 2,456,002 for the fiscal year 1906. It will probably be about 2,740,000 in 1911, and 3,170,000 in 1916. The total paid traffic for the last five fiscal years has increased about 41 per cent., to 818,273,413 per year, or an average of about 2,242,000 per day. The number of rides per capita is now about 333. The above total paid passengers are distributed as follows: Surface lines, 422,567,025; Elevated lines, 257,786,756; Subway, 137,919,632. The surface lines carry about 52 per cent. of the total traffic, and the elevated and subway lines together the remaining 48 per cent. It appears therefore, that at present in Manhattan and The Bronx the traffic is about equally divided between the surface roads in one case and the elevated and subway in the other, while in Brooklyn and Queens only about one-third of all passengers were carried on the elevated lines.

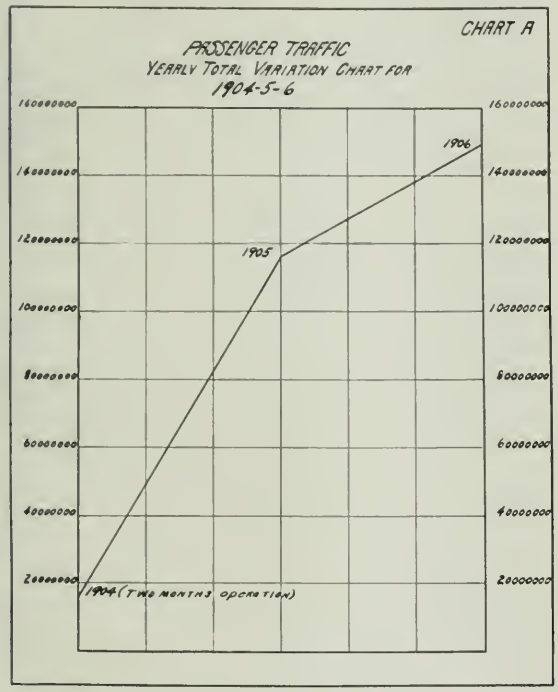

Fig. 4.

At the 41 per cent. rate of increase for five-year periods the total traffic in Manhattan and The Bronx will be about 1,153,000,000 in 1911 and 1,626,000,000 in 1916, daily averages of 3,131,000 and 4,454,800. Transportation must be provided for the rush hour conditions, or maximum number carried in one hour in one direction. The capacity of the existing elevated and subway roads, based on such conditions, if all passengers are to have seats, is not far from 200,000,000 per year; if moderate crawding is to be permitted, about 300,000,000. The estimated number of surface car riders has already been stated—for Manhattan, as 419,000,000 in 1911, and 448,000,000 in 1916; for The Bronx as 42,000,000 in 1911, and 57,000,000 in 1916. Deducting these figures and the estimated capacity of the existing elevated and subway lines from the total estimated traffic to be taken care of in 1911 and 1916, we have either, when seats are furnished, 492,000,000 and 921,000,000, or, with moderate crowding, 392,000,000 and 821,000,000 passengers, respectively, for whom transportation must be provided in new subways yet to be constructed.

Under moderate crowding two additional subways must be completed within five years and four within ten years. If seats are to be provided three additional four-track subways will have to be put in operation within the next five years and three more within a decade in order that the inhabitants of Manhattan and The Bronx may be transported to and from their daily business in comfort and decency.

The Railroads of Mexico.*

BY ERDIS G. ROBINSON, C.E.,
Formerly of the Engineering Department of the Mexican Central.

V

(Concluded.)

OPERATION.

As the railroads of Mexico have been located and built by American engineers and contractors, so have they been managed by men who have been thoroughly schooled in the services of the large companies of the United States. In Mexico, however, they have found problems and conditions not encountered in their previous experience, at least not in equal degree; and this was to have been expected when is considered the different national, natural and racial conditions. In the following table is given an analysis of the operating expenses of the roads of the two countries by means of which a comparison may be made. The figures for the Mexican roads are obtained by averaging data taken from the reports of the Mexican International, the National of Mexico, the Mexican Central Ry., and the Mexican Railway. The figures in the second column are taken from reports of roads operating in the western part of the United States through regions where prevail conditions most closely resembling those of Mexico. The third column gives figures (taken from Mr. Wellington's well known book written many years ago) to represent the railroads of the entire United States.

TABLE II.—*Operating Expenses of Mexican and American Roads.*

Percentages due to different accounts.

Account.			Mexico.	Pacific roads (U.S.).	U. S. (A.M.W.)
Locomotive expenses:	Fuel		26.3	11.0	7.6
" "	Water		1.3	0.6	0.1
" "	Oil and waste		0.8	0.8	0.8
" "	Repairs		7.4	8.0	9.2
Total locomotive expenses			35.8	20.4	18.0
Car expenses:	Supplies		1.0	1.6	0.5
" "	Repairs		8.6	7.5	10.0
" "	Mileage		0.4	2.0	2.0
Total car expenses			10.0	11.1	12.5
Wages account:	Locomotive		8.0	10.0	6.4
" "	Cars		5.4	8.0	8.5
" "	Switching		1.8	2.5	1.6
Total wages account			15.2	20.5	16.5
Track expenses:	Rails		1.2	3.0	2.0
" "	Adjusting		6.3	9.5	10.0
" "	Ties		5.0	5.0	3.0
Total track expenses			12.5	17.5	15.0
Miscellaneous and general			26.5	30.5	38.0
			100.0	100.0	100.0

Referring to this table (Table II.) it will be seen that the locomotive account for the Mexican roads shows 75 per cent. heavier than for the Pacific roads and double that for the roads of the entire country. The figures for oil, waste, repairs, etc., are almost identical for the three columns, the difference being in the water and fuel accounts.

The high cost of locomotive fuel is due to the scarcity of coal lands in Mexico. Aside from the fields adjacent to the line of the Mexican International in northeastern Mexico the roads must rely on coal imported from England and the United States, the cost of which is necessarily high, due to foreign costs and long haul. During the early years of the operation of the Mexican Central its coal was hauled from El Paso, a distance of 1,220 miles from its southern terminus. This not only added very materially to the cost of coal but affected the hauling capacity of the road. Many locomotives are equipped for burning wood, though this source of fuel is rapidly diminishing so that branch lines are built and extended to tap new timber areas. The Mexican Central following the exploitation of the oil fields located on its San Luis division, is operating some of its locomotives with this fuel and will add to their number as future developments may seem to justify. For the year ended June 30, 1905, this road expended for fuel amounts distributed as follows:

For coal	3,851,043	pesos.
" wood	765,868	"
" oil	998	"

During this time the use of oil was in the experimental stage, but

*The first article was published in the *Railroad Gazette* of July 12, 1907; the second, in the issue of Aug. 9; the third in the issue of Aug. 30; the fourth in the issue of Sept. 6.

the figures give an idea of the proportion of coal and wood used by that road.

The table gives the part of the operating expenses due to locomotive fuel. To consider the matter in a different light we find that on the Mexican roads the receipts for each dollar spent for locomotive fuel is $6.35 while for the roads in the United States the receipts are $12 for each dollar.

Likewise the high water account indicated a scarcity of water along the lines of the Mexican roads. In truth this matter of water supply is one of the vexatious problems. Long stretches of roads cross arid areas where rain falls at intervals possibly of several years, and though ever increasing efforts are being made to provide wells, reservoirs and pipe lines, still there are sections of roads where water stations cannot be provided, and it becomes necessary to haul water in tank cars, not only for locomotive use, but also to supply the stations and section-houses along the lines. Since every car thus hauled means one car less of revenue freight, the operating capacity of the road is at once affected as with long haul on coal cars. It is true that this condition is not uncommon on some of the roads in the southwestern states, but it is believed does not prevail so generally, as one will be led to think from noting the proportion of water service cars in use in the different cases.

These conditions, which cause such high locomotive fuel and water expenses, bring the total locomotive account on the Mexican roads to the high figure already noted. It will be noticed that costs of locomotive oil and repairs show almost no difference, as would be expected.

Passing to the second part of the table, car expenses, it will be of interest to observe the difference in car mileage, the ratio of these accounts being 1:5, and this comparison includes only the standard gage lines of the Mexican roads.

The third division offers an interesting comparison but is difficult to analyze, since the figures depend upon so many contributing influences. It will be noticed that on the American roads this item totals 25 per cent. above that for the Mexican roads, and that the car wages are 33 per cent. higher, while locomotive wages are but 20 per cent. above the Mexican charges. It would seem that the lower wage rate prevailing in Mexico would account for this difference, all the more since there is a larger proportion of natives employed in the car service. These facts are stated more in detail in the following tabulation:

TABLE III.—*Analysis of Wage Account.*

Class of wages.	Per cent. Tot'l operat'g expenses. Mexico.	U. S.	Per cent. Wage account. Mexico.	U. S.
Wages of locomotives	8.0	10.0	52.5	48.8
Wages of car service	5.4	8.0	35.5	39.0
Wages of switching act	1.8	2.5	12.0	12.2
	15.2	20.5	100.0	100.0

However, the amount in the wage account does not vary uniformly with the wage rate, since the efficiency of the labor must be considered, nor with the tonnage hauled. These points and others may be gathered from the few miscellaneous figures tabulated in Table IV., as well as the futility of attempting to discover a general rule involving these figures.

In the subdivision giving track expenses there will be noticed a considerable difference in the cost of adjusting track, due again to the lower wage rate in Mexico where all the section men and foremen and many of the roadmasters are Mexicans, and to the lighter tonnage of traffic over the Mexican roads.

TABLE IV. *Miscellaneous Data.*

	Mex. Ry.	Nat. of Mex.	Mex. Inter.	Mex. Central.	U. S. roads.
Average haul, freight-miles	116	165	210	237	..
Train load, tons	93	240	202	282	335
Employees, per mile	..	333	273	407	637
Per cent. Mexicans	..	93.3	77.8	88.3	..

It is believed that the differences shown in the table (Table II.) are typical although equal differences may be noted between roads in different parts of the United States. It should be added that the figures for general and miscellaneous expenses include items which if strictly classified would come under some of the special headings and that it has been the intention to note differences between certain well defined accounts.

The reports as made by railroads usually give a summary of operating expenses classed under four headings, namely, Maintenance of Way, Maintenance of Equipment, Conducting Transportation and General Expenses. In the following list this classification has been followed, and it will be noted that there is no very vast difference indicated in the table.

	Roads Mexican	U. S.
Maintenance of way	15.8	19.8
Maintenance of equipment	19.2	20.7
Conducting transportation	57.5	53.5
General	7.5	4.0

It would be expected that the various conditions noted would tend to increase operating expenses of the Mexican roads. It has been shown that the locomotive expense is greatly in excess of the same account on roads in this country and would more than counterbalance the evident saving in wages and maintenance expenses. There are other factors which would tend to cause heavy operating expense: The topography of much of the country is such as to lead to heavy construction expense and consequently to a high interest account, and this notwithstanding the liberal subsidy payments provided by the Mexican Government amounting at times to 10 per cent. of the total national expenditures; and also in past years the effect of the fluctuating currency on the earning capacity of the roads. It would seem then that these factors tending to increase the operating expenses of the roads would result in higher freight or passenger rates if the operating ratio is to be maintained at a figure approximating that prevailing in this country. The degree of approximation is shown in the following list:

	Mex. Ry.	Nat. of Mex.	Mex. Inter.	Mex. Central.	U.S. roads.
Ratio operating expenses to earnings	61.4	64.9	58.7	67.4	66.8

This leads naturally to a brief discussion of the matter of rates charged on the Mexican roads as compared to rates charged on roads in this or other countries, and the following figures are taken from such reports as are accessible:

	Receipts—Freight, per ton-mile, cents.	Pass'g'r, per pass.-mile cents.		Receipts—Freight, per ton-mile, cents.	Pass'g'r. per pass.-mile cents.
Mex. Inter.	1.09	1.85	United States	0.77	1.96
Nat'l of Mexico	1.48	1.85	France	1.31	....
Mexican Ry.	2.18	1.60	Germany	1.2	....
Mexican Central	1.11	....	Austria	1.3	....

From this tabulation it will appear that the freight rates in Mexico are very high as compared to the passenger rates of that country, being more per ton per mile than passenger per mile; that freight rates are somewhat higher than freight rates in this country, though comparing not unfavorably with western roads, and those rates prevailing in European countries; and that the passenger rates are much lower on the Mexican roads. The low passenger rate is mainly due to the large proportion of third class passengers for which service the rates are not more than one-half those charged for first class passage, although the charge probably covers all that the service is worth. On the Mexican International, whose report covers this matter, the third class coaches carry 65 per cent. of the total number of passengers; while on the Mexican Railway the percentage is 76, and on the Mexican Central 73.

It must not be forgotten in this connection that the rates charged by the Mexican roads are subject to the approval of the Government and are fixed only after an agreement between the Government and the railroad companies.

When considering the railroads of Mexico many are inclined to think of them as being dependent upon their business relations with the United States. This is true to the extent that we are always dependent upon our neighbors either as individuals or as nations, and is equally true as to the United States. It is a fact, however, that those Mexican roads built to develop the resources of that country are the most prosperous properties, as the following figures may seem to indicate. The table gives the classification of freight traffic on four of the Mexican roads.

Classification.	Mex. Ry.	Mex. Central.	Nat. of Mex.	Mex. Inter.
Forest products	5.2	11.0	16.0	6.1
Agricultural products	41.5	21.9	22.4	11.0
Animal products	1.9	3.8	2.9	2.1
Mineral products	26.3	54.0	46.3	75.5
Manufacturing, mdse, etc.	25.1	9.3	12.4	5.3
International freight	27.1	34.8	....	....

As a side remark it may be added that an examination of the figures forming the foundation of this table discloses some interesting facts. It will be noticed that the Mexican Railway (Vera Cruz line) handles the greatest proportion of agricultural tonnage. This will be explained by the fact that the largest maguey fields of the republic lie adjacent to this road, and that the pulque, that great national tipple produced from this plant, makes up 42 per cent. of the total agricultural tonnage. It follows from this that there would result a shrinkage of 17 per cent. in the total freight business of the road if the country were to enforce a prohibition law—a contingency however, let us hasten to add, which is in no immediate danger of coming to pass. Another very noticeable figure in the table is that giving proportion of mineral tonnage on the Mexican International. Seventy-six per cent. of the mineral tonnage of that road is made up of product of coal mines, coal amounting to 57 per cent. of the total tonnage of the road.

A commission appointed by the Swiss Government to determine the amount of power which would have to be generated to operate all of the railroads in Switzerland by electricity has reported that the maximum daily consumption at the wheels would be 1,200,000 h.p. hours. This would be equivalent to 3,000,000 h.p. hours generated at the turbines, or a continuous mean output of 125,000 h.p., with 10 per cent. efficiency of transmission. The ratio of mean to maximum load is estimated at 1 to 5 so that an installation of 625,000 h.p. would be required. The State Railroads and the St. Gotthard, operating 1,690 miles, would consume 90 per cent. of the total energy generated.

GENERAL NEWS SECTION

NOTES.

A press despatch from Knoxville, Tenn., says that the Southern Railway is to lay off 1,000 men from its shops, 400 of these being at shops in that city.

In Hinds county, Mississippi, the Illinois Central has been indicted by the Grand Jury for issuing passes to persons not entitled to them in violation of a law of 1884.

At Little Rock, Ark., September 9, a fine of $10,000 was imposed on the St. Louis Iron Mountain & Southern for illegally issuing free transportation to members of the legislature two years ago.

The Attorney-General of Wisconsin holds that chapter 102 of the laws of 1907, the "Full-Crew law," requires that there shall be two brakemen on every passenger train of more than three cars.

The State Railroad Commission of Oregon has issued an order requiring the Southern Pacific to run an extra train in place of No. 12, from Roseburg to Portland, 198 miles, whenever No. 12 is two hours or more behind time. A similar order has been issued in relation to certain trains between Portland and Pendleton, 231 miles.

The Waverly (N. J.) Transfer of the Pennsylvania Railroad (near Newark) sorts package freight into 250 cars daily which are despatched to 121 different points west and south. All this is fast freight. As each train from New York or the East is switched into Waverly a small army of 210 loaders transfer its contents piece by piece to the 200 cars drawn up along the platform. A force of 199 clerks is kept busy all the time on this work and that of the full car lots which also go through Waverly.

Charles Alfred Johnson, a fireman on the Bradford division of the Erie Railroad, has received from General Manager J. C. Stuart a complimentary letter, accompanied by a handsome gold watch and chain, sent in recognition of Mr. Johnson's courage and coolness in the management of a runaway freight train one night last March. The train, which was a long one, became uncontrollable on a steep descending grade and the engineman, finding that the air-brakes did not hold, jumped off. He advised the fireman to follow, but Johnson concluded to stick to the train. He reversed the engine and then went back and assisted the brakemen in setting hand-brakes for 2½ miles. The train was wrecked at a derailing switch and Johnson was buried under the wreckage for four hours, but came out only slightly injured.

Governor Warfield on the Southern Situation.

Governor Warfield, of Maryland, in a recent address at the Jamestown exposition, took a conservative position with regard to legislative activities in the South. He said, in part:

Baltimore has contributed of her capital and her enterprising men to this great development of the South, and has invested over $200,000,000 in southern railroads, southern cotton mills, southern street railways, southern coal mines, timber lands, and factories. Her financiers and capitalists have had faith in the integrity and credit of the South. The question confronting us to-day is, shall that confidence be destroyed? Has it been shaken by the recent attitude of some of the people of the South toward corporations and corporate interests?

If the South is sure of herself, and will need in the future no outside capital—if she has resources of her own sufficient for her further development—then the course these people are pursuing may prove all right, though it seems to me that your local capital needs exactly the same protection that outside capital requires, and that without this it will not seek investment in the development of your matchless resources. But if she does need outside financial aid, then they are doing their best to kill the goose that has been laying the golden eggs.

Don't forget that the bonds and mortgage securities of the South to-day represent actual money. There is very little fictitious valuation. I can say from personal knowledge and experience in connection with these investments, and on the testimony of our most conservative financiers, that the water has been squeezed out and we have now the substance.

And these bonds and securities are held by your people and by our people, by your institutions and by our institutions, and by capitalists who have supplied to the South the means by which it has wrought its new prosperity. So it follows that you cannot touch the securities without at once affecting your own people and your own best interests, and the favor and steadfastness of those who have helped you through all the years.

It happens that I belong to the political party which is dominant throughout the South, and that I believe firmly in its tenets, but I do not believe in the antagonism which has arisen in some sections to capital and laws calculated to make harder the future of our beautiful South in its efforts to realize the destiny that belongs to its people and its extraordinary natural wealth. And when I say this, I do not want to be understood as referring, in any sense, to the state executives who have fearlessly taken care that the laws of their respective states are obeyed. By all means let us see that the laws are enforced and that the guilty are punished, be they rich or poor, high or low. But let us not be unmindful of the dangers that come from mere crusades that appeal to public clamor and take no thought of the morrow.

I take no stock in the idea that great organizations of capital are manned by bands of criminals. I believe that with but few exceptions their executive officers are loyal citizens who are anxious to correct mistakes in methods and to do what is right and obey the laws.

Entertainment Committee, 1908, M. C. B. and M. M. Conventions.

At a meeting of the Executive Committee of the Railway Supply Manufacturers' Association at Atlantic City in June last, the General Chairmen for the several committees for the 1908 M. C. B. and M. M. conventions were appointed. Chas. P. Storrs, of the Storrs Mica Co., Owego, N. Y., was named as General Chairman of the Entertainment Committee. As it is necessary for this committee to do much of its work prior to the meeting in June next, Mr. Storrs has already selected his staff, which will consist of the following: Herbert Self, Crandall Packing Co.; E. H. Walker, Standard Coupler Co.; J. Will Johnson, Pyle-National Electric Headlight Co.; S. W. Midgley, National Car Coupler Co.; Bertram Berry, Heywood Bros. & Wakefield Co.; Cornell S. Hawley, Consolidated Car Heating Co.; F. O. Brazier, Murphy Varnish Co.; A. G. Langstron, Jenkins Bros.; Ross F. Hayes, Curtain Supply Co.; C. M. Garrett, Farlow Draft Gear Co.; J. L. Connors, Ralston Steel Car Co.; Geo. H. Forsyth, Forsyth Brothers Co.; W. J. Walsh, Galena-Signal Oil Co.; H. E. Oesterreich, Wendell & MacBuffie; John M. Stayman, Gold Car Heating & Lighting Co.; Philip J. Mitchell, Philip S. Justice & Co.; Leonard J. Hibbard, American Brake Shoe & Foundry Co.; J. S. Seabury, Massachusetts Mohair Plush Co.; E. V. Stebbins, General Storage Battery Co.; T. C. DeRosset, The T. H. Symington Co.; Edw. D. Welles, Chas. H. Besley & Co.; J. C. Younglove, H. W. Johns-Manville Co.; Richard S. Chisolm, *Railroad Gazette*, and Clayton W. Old, American Blower Co.

Education of Apprentices on the Santa Fe.

The Atchison, Topeka & Santa Fe has established a system of instruction and training for apprentices along the lines of the system which has been so successful on the New York Central Lines. F. W. Thomas, hitherto Engineer of Tests, has been placed in charge, with the title of Supervisor of Apprentices. There will be established at each shop on the system a regular course of instruction with an apprentice foreman or instructor in charge, who will devote his entire time to the apprentices. Careful and regular instruction in all of the practical work essential to a proper mechanical training will be given the boys. Also they are to receive instruction in shop arithmetic and the rudiments of mechanics and mechanical drawing. The company will provide the lesson papers, reference books, drawing instruments, boards, sketch books, etc., free of charge. The school sessions will be held three times a week, for the first two hours of the day, wages being paid the same as while at work. The system is now being established at the Topeka shops, the largest on the Santa Fe, and will be extended to the others as fast as practicable.

Care will be exercised in the selection of the apprentices. They must be physically and morally acceptable. They will be taken on six months' probation. If at the end of that period they appear possessed of the necessary qualifications they will be permitted to proceed. If they appear to be suited better for some other branch of the service they will be transferred. If unsuited to railroad work of any character, they will be dropped.

New Testing Laboratory.

Gulick-Henderson & Co., Inspecting Engineers, Pittsburgh, Pa., have established at 439 Third avenue, Pittsburgh, a laboratory for chemical and physical tests of metals, coal, coke, clay, etc., using methods similar to those of the United States fuel testing plant. In a circular recently issued, the firm emphasizes its policy of personally supervising the manufacture of the product to be inspected and also supervising the work of their own inspector while the manufacture is going on. J. W. Henderson began work in the iron and steel business in 1887 in the laboratory of the North Chicago

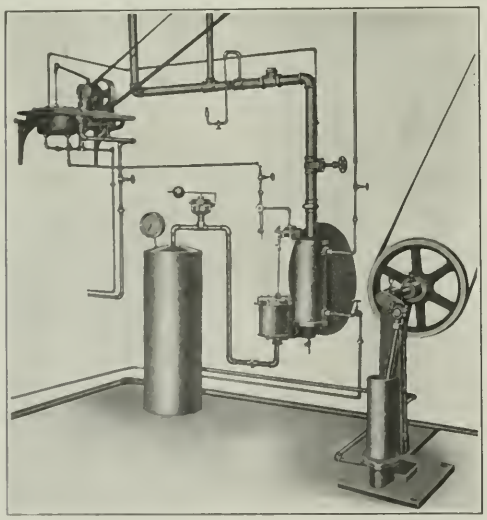
Rolling Mill Company. He was for some time Superintendent of the Cleveland Car Wheel Co., McKees Rocks, Pa., and then became Manager of the Butler Car Wheel Company's plant at Butler, Pa., where he remained until going into business for himself. Henry Gulick, Jr., has for the last six years been in charge of the inspection of railroad equipment near Pittsburgh for Robert W. Hunt & Co., Chicago.

Fines Railroads for Not Watering Stock.

The foregoing headline, taken from a daily paper, does not refer to action taken by the New York State Public Service Commission in connection with the Wall street operations of the New York-Chicago All-Electric Air Line; neither has it any connection with the fattening of stock (or bonds) alleged to have been perpetrated by Mr. Harriman; it is the action of Judge Hazel in the United States Circuit Court in the cases brought by the Government against the Lake Shore & Michigan Southern and the New York, Chicago & St. Louis for violating the law providing that cattle shall be fed and watered and given a rest every 28 hours. The railroads pleaded guilty and were fined $2,000 and $800 respectively. On the next day Judge Hazel imposed fines of $800 on the Grand Trunk, $200 on the Erie, and $200 on the Wabash for violation of the same law.

The United States Gas Machine.

An efficient individual gas plant for factory and shop use is shown herewith. It is designed to use without waste or residuum either crude distillate or gasolene of 58 to 65 deg. specific gravity, yielding a high degree of heat under any pressure desired. The gasolene is stored in a tank of 100 to 500 gals. capacity buried in the ground, and is pumped to the small tank shown in the illustration. The pump is automatic, permitting only 2 qts. of gasolene inside the building at one time. Exhaust steam is used in vaporizing the fluid and a perfect bunsen flame is delivered by the burners without the use of air mixers on them. The machines are made in sizes capable of supplying 250 to 2,000 ft. of gas an hour. They have been approved by the National Board of Insurance Underwriters.

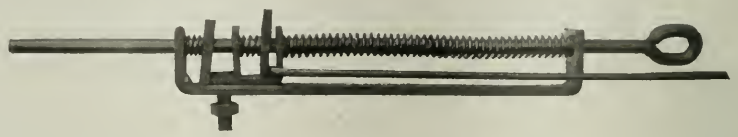


United States Gas Machine.

The plant may be installed in any building, or on a car for portability, and delivers gas at any pressure desired through a single line of pipe or hose. Three machines of the type shown are in use at the Hicks Locomotive & Car Works, Chicago Heights, Ill., with satisfactory results. Three locomotive tires can be expanded and removed in four minutes without disturbing wheels or trucks. Welding and forging are also done more quickly and cheaper than by methods previously used. The machines are made by the United States Gas Machine Co., Muskegon, Mich., successor to the Garland-Vila Manufacturing Co., and have been perfected within the past two years.

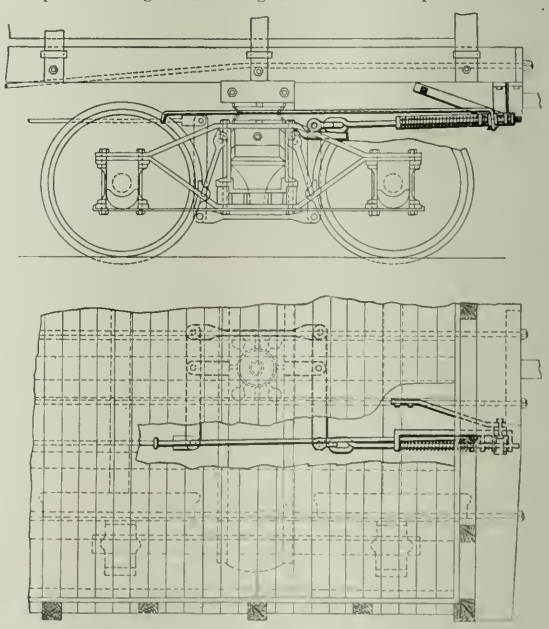
The Atlas Slack Adjuster.

The Atlas slack adjuster, shown in the accompanying engravings, is designed to be positive in action, simply made of few parts, easily maintained and of low first cost. It works on an entirely different principle from most of the slack adjusters now in use, one adjuster being attached to the car body near each end and connected by a take-up rod with the free end of the truck dead lever. This take-up rod passes through a single holding clutch composed of a perforated case-hardened steel dog, fulcrumed on the head of a bolt and automatically forcing the take-up rod through this clutch as the brake shoes wear down, so as to take up slack and shorten up the connection to the dead lever. This take-up operation is accomplished by a second friction clutch sliding on the take-up rod, and



The Atlas Slack Adjuster.

normally held in one position by a strong spring. This take-up clutch has a lost motion connection through a reach rod to the live lever or top rod. When the live lever moves beyond a predetermined maximum distance at any brake application it exceeds the limits of lost motion in the reach rod connection and pulls the take-up clutch along the take-up rod, compressing the spring. When brakes are released, the spring expands and the take-up clutch, gripping the take-up rod, is carried back to its original position, forcing the take-up rod through the holding clutch to a new position of adjustment. The holding clutch holds the rod and the connected dead lever in this new position, which is the correct one to preserve the standard brake-shoe clearance and piston travel, until the shoes wear down more, when the adjuster again comes into action to take up the slack.



Application of Atlas Slack Adjuster to Pennsylvania Railroad Stock Car.

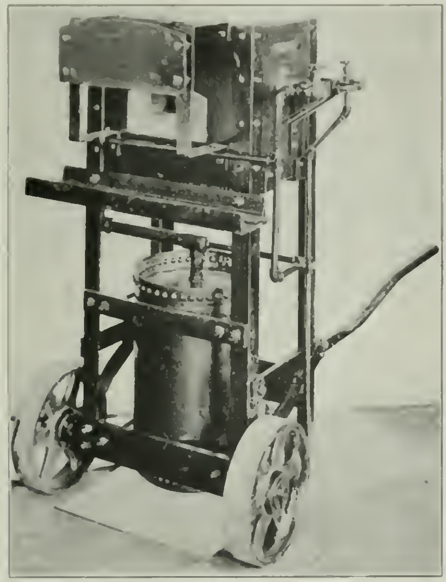
The principal advantages claimed for the device over other types of ratchet adjusters attached to the piston rod or brake cylinder are: It takes up slack on the truck where the slack appears without disturbing any other part of the brake rigging. It maintains running piston and hand brake travel at the adjustment made when the car is standing still. Exactly the right amount of slack is taken up, whether large or small, whereas ratchet adjusters do not take up until an excess of travel equal to more than one tooth is reached. The truck brake-levers "float," and there is no tendency to twist the truck out of square when brakes are applied, due to the eccentric pull of the top rod, amounting to

4,000 lbs. or more with a lever arm of 20 in. from the center pin. The pull of the top rod is taken back to the car body with the Atlas slack adjuster. New brake shoes may be applied without adjusting piston travel, the proper adjustment being automatically attained with the first brake application. It maintains an efficient hand brake at all times and also maintains more uniform braking pressure throughout a train of cars equipped with it, because the piston travel and cylinder pressures are more nearly equalized.

The device is the invention of W. H. Sauvage and is sold by the Sauvage Safety Brake Co., sole licensees, 20 Broad street, New York.

A New Portable Oil Furnace.

A new style of portable oil furnace for heating rivets is shown herewith. It was produced in response to a demand for a small oil furnace which was really portable. It can be wheeled about easily by one man and quickly attached to the shop compressed air line at any point. Also it can be run out of doors to any part of the steel car repair yard, where compressed air is available, and made ready at once for rivet work. It takes up little floor space,



A New Portable Oil Furnace.

and can be put in such places as the top of a locomotive tender, thus bringing it right to the work. It is mounted on three wheels, one of which is swiveled, making it easy to handle. Two handles are provided for use where it is to be rolled some distance; ordinarily one man can move it about, much like a wheelbarrow. The weight is so distributed that in the trucking position none is carried by the operator, the load being balanced on the axle.

The furnace is designed so that the lining may be renewed easily. Standard shapes of brick are used and the furnace dimensions are such that any standard fire brick will fit into place without chipping; therefore no special tiles have to be carried in stock.

Deflector plates are placed across the front of the furnace to protect the operator from the heat. Also the door is placed at a convenient height above the floor. The burner is designed to economize in both air and oil; also that the combustion will be practically noiseless, thus doing away with an annoying feature of high-pressure burners. With the tank full of oil, which is one day's supply, the furnace weighs about 400 lbs. It is made by The Railway Materials Co., Chicago.

New Haven Stockholders.

According to a recent statement, the New York, New Haven & Hartford Railroad, on May 1 last, had 14,220 stockholders. Of this number 14,000 stockholders own less than 400 shares each, while 84 have 1,000 shares and over. The largest individual holder is the New England Navigation Co., with 55,558 shares. The directors of the company own approximately 15,589 shares, the largest holder being J. P. Morgan, with 5,077 shares.

Exports of Locomotives.

The foreign demand for American made locomotives continues to increase. During the seven months of the current year up to July 31 the exports of them were valued at $4,813,418 compared with $3,024,491 for a similar period of 1906, and $2,486,281 in 1905. The following table shows the distribution of these exports:

Exports to	1907	1906
Europe	[illegible]	$6,[illegible]
British North America	1,184,100	[illegible]
Cent. Am. and Brit. Honduras	[illegible]	[illegible]
Mexico	[illegible]	[illegible]
Cuba	270,795	154,061
Other West Indies and Bermuda	[illegible]	[illegible]
Argentina	100,766	172,165
Brazil	529,106	[illegible]
Other South America	516,330	482,856
China	5,925	[illegible]
British Australasia	[illegible]	[illegible]
Philippines	[illegible]	
Other Asia and Oceania	291,354	106,500
Total	$4,813,418	$3,024,491

The average price paid was slightly over $9,000. The shipments to British North America show the largest gain. The equipment exports to this section of North America have been particularly heavy in the last few years due to the railroad development there. But the greater part of the movement is over for a time at least. This is shown by the steel rail exports, which have fallen off considerably. Naturally, locomotives would be the last to show this decline, for the rolling stock would be the last cared for and the requirements of the Canadian West are not yet quite satisfied in this respect. The Far East, especially Japan, has been making increased demands on American manufacturers. The railroad development of Central and South America has been steady throughout this period.—*Wall Street Journal.*

174 Hours from London to Milwaukee.

According to a Milwaukee paper some passengers arrived in that city at 11 a.m., August 23d, in exactly one week from London; or, allowing for the difference of six hours in time, in 174 hours. The party left London on Friday, August 16th at 11 a.m., going by way of Southampton and across the Channel to Cherbourg, whence they sailed at 6 p.m. on the "Deutschland" for New York. The time to New York harbor was 5 days, 18 hours. Landed at Hoboken on the 22d at 3.04 p.m.; carriage to Jersey City; left Jersey City by Pennsylvania Railroad, 4.14 p.m.; arrived Chicago 8.55 a.m. on the 23d (Union Station of the Pennsylvania and the Chicago, Milwaukee & St. Paul); left Chicago by the C., M. & St. P. 9 a.m.; arrived Milwaukee 11 a.m.

TRADE CATALOGUES.

Electric Motors.—The Sprague Electric Company, New York, has published three bulletins devoted to electric motors for driving machinery. Bulletin No. 229 goes into the advantages of motor drive for printing shops and illustrates and describes motors and auxiliary equipment suitable for this work. It gives a list of plants of this kind equipped with the company's motors. Bulletin No. 230 describes the electric equipment of the plant of the W. Wesel Manufacturing Company at Brooklyn, N. Y. It has two d.c. Sprague generators and 192 round-type motors. The numerous illustrations show the application of the motors to different tools. Bulletin No. 231 describes Sprague motor equipment for linotype machines. Bulletin No. 108 takes up the Sprague dynamometer for testing gasolene engines.

Injectors.—The Hayden & Derby Manufacturing Company, New York, has published a catalogue devoted to Metropolitan injectors, H-D attachments, H-D noiseless water heaters, strainers and drip funnels and Hancock swing check valves. The catalogue is unusually full. It gives all the dimensions and capacities as well as prices of the different sizes and types of injectors and directions for connecting and operating them, including suggested remedies for difficulties. Similar information is given for the other specialties described. The catalogue is fully illustrated with half-tones and line drawings.

Electric Heating Devices.—Catalogue No. 4523 of the General Electric Company, Schenectady, N. Y., describes some interesting heating and cooking devices for marine use. These include stateroom heaters, water heaters, cooking and laundering utensils, soldering irons, etc. The two forms of heating units used are illustrated and described.

Data for Reinforced Concrete Design.—The Trussed Concrete Steel Co., Detroit, Mich., has prepared a limited edition of a handbook of tables and information for use in designing reinforced concrete structures. The preface states that the data given represents a large amount of careful and exhaustive work by the engineers

compiling it, and is based on extensive experience in the design and construction of work of this character. The book, which is 4¾ in. x 7⅝ in., contains 106 pages and an index and is carefully illustrated. It bears the title, "Kahn System Standards."

Valves.—Catalogue No. 9 of the Golden-Anderson Valve Specialty Company, Pittsburgh, Pa., describes and illustrates Anderson cushioned non-return valves of different types and sizes; Anderson reducing valves; "clean seat" valves, blow-offs and check and hand stop valves; also Golden tilting steam traps and Anderson counterbalanced valves and other specialties.

Graphite.—The September number of *Graphite*, published by the Joseph Dixon Crucible Company, Jersey City, N. J. contains the first instalment of an article on power transmission by manila fibre rope. The article takes up the advantages of this form of transmission as compared with belt drive and other methods.

Car Heating.—The Gold Car Heating & Lighting Company, New York, has published a pamphlet describing its temperature regulator. The workings and advantages of this device are fully described and illustrated by line drawings.

Wheel-Truing Brake Shoes.—A circular being distributed by the Wheel-Truing Brake Shoe Co., Detroit, Mich., is in the shape of a disk of cardboard, on which is concisely set forth the advantages of the wheel-truing shoe.

MANUFACTURING AND BUSINESS.

The Commonwealth Steel Company, St. Louis, Mo., has moved into its new offices on the sixteenth floor of the Pierce building.

The American Car & Foundry Company, New York, shipped 10,347 cars during August, the largest number ever shipped by the company in any one month.

The Railway Equipment Corporation, Philadelphia, Pa., has declared the regular monthly dividend of 1½ per cent. on its $1,375,000 capital stock and an extra dividend of 3 per cent.

The Schoen Steel Wheel Company, Pittsburgh, Pa., is said to be preparing plans for an open hearth steel plant and finishing and blooming mill, to cost about $1,500,000, at McKees Rocks, Pa.

W. T. Clark, Assistant Mechanical Superintendent of the General Electric Company, Schenectady, N. Y., has resigned to become Superintendent at Beloit, Wis., of Fairbanks, Morse & Co., Chicago.

Theodore H. Bailey, Assistant General Manager of the General Electric Company, Schenectady, N. Y., has gone to the St. Louis Car Company, St. Louis, Mo., to take charge of the automobile department of that company.

At the annual meeting of the stockholders of the Westinghouse Air-Brake Company, Pittsburgh, Pa., on October 1, action is to be taken on the proposed increase of the capital stock from $11,000,000 to $14,000,000.

We are informed that the Railway Steel-Spring Co., New York, has decided to build in the neighborhood of Chicago one of the largest and best equipped spring works in the country. The company has not yet decided on the exact location.

H. N. Pendleton, Superintendent of the Republic Iron Works, Pittsburgh, Pa., of the National Tube Co., Pittsburgh, has been appointed Superintendent of the National Rolling Mills of the same company at McKeesport, Pa., succeeding J. B. Ayres, resigned.

The fire at the works of the Falls Hollow Staybolt Co., Cuyahoga Falls, Ohio, on September 13, which destroyed the greater part of the building of the rolling mill, did not do any great damage to the principal machinery. The company expected to be able to fill all orders as usual within a few days.

C. Dickens Sternfels, for the past three years in charge of the Publicity Department of the Arthur Koppel Company, Pittsburgh, Pa., has resigned to assume charge of the Publicity Department of the Standard Roller Bearing Company, Philadelphia, Pa. He has been succeeded in the Arthur Koppel Company by John T. Cawley.

Contracts are reported let for the electrical equipment of the Fruitvale, Cal., power house to be built by the Southern Pacific as follows: Boilers, Parker Boiler Co. of Philadelphia; condensers and steam auxiliaries, H. R. Worthington; turbines and generators, Westinghouse Machine Co.; and for motors and other car equipment, General Electric Co.

Charles H. Merz, of London, a highly distinguished electrical engineer who has had charge of the most important railroad electrifications in Great Britain, is in New York at the Holland House, for about 10 days to September 30, when he will continue his journey to Australia. He has been commissioned by Thomas Tait, Chief Commissioner of the Victorian Government Railways, to investigate and report on the possible electrification of Melbourne's suburban lines, where the traffic is greatly congested.

Iron and Steel.

About 23,000 tons of steel will be required for two proposed bridges to be put up at St. Louis, Mo.

The Carnegie Steel Company is said to have recent orders for 60,000 tons of rails for delivery in 1908.

The Delaware & Hudson has ordered 500 tons of steel bridge material from the American Bridge Co.

Contracts will shortly be given for steel for bridges to be built at Philadelphia, as described under Railroad Structures.

The New York Central, the Chicago, Milwaukee & St. Paul and the Erie, it is understood, are in the market for a large amount of steel for bridges, for which contracts will be let shortly.

It is authoritatively stated that the Baltimore & Ohio has not given an order for rails, but has a 60-day option from the United States Steel Corporation, under which the road can give its orders this fall.

Recent quotations for pig iron, billets and iron and steel products as compared with those of the corresponding date of last year are as follows:

	1907.	1906.
Foundry No. 2, Cincinnati	$21.25	$18.75
Bessemer, Pittsburg	22.90	19.60
Bessemer billets, Pittsburg	29.50	28.00
Forging billets, Pittsburg	33.00	34.00
Open hearth billets, Philadelphia	31.00	30.50
Wire rods, Pittsburg	36.00	34.00
Rails, East	28.00	28.00
Iron bars, Pittsburg	1.70	1.60
Steel bars, Pittsburg	1.60	1.50
Tank plates, Pittsburg	1.70	1.60
Beams, Pittsburg	1.70	1.70
Angles, Pittsburg	1.70	1.70
Sheets, Pittsburg	2.50	2.40

OBITUARY NOTICES.

George A. Ingersoll, formerly Secretary and Treasurer of the Cleveland & Pittsburgh, died last week, after an operation, at the age of 80 years.

Ferman J. Stout, General Manager of the Lake Shore Electric, died at Toledo, Ohio, on September 14, after a short illness. Mr. Stout was born in 1858 at Deerfield, Mich., and began railroad work in 1873 as a brakeman on the Lake Shore & Michigan Southern. After serving successively as freight conductor, passenger conductor, car distributor and Trainmaster, he was, in 1891, made general yardmaster at Toledo, Ohio. In 1893 he was appointed Superintendent of Transportation of the Lake Erie & Western and of the Toledo Belt. He was made General Superintendent of these roads in 1895, and in 1900 left steam railroad work to become General Manager of the Toledo, Fremont & Norwalk Electric, being later appointed to the position he held at the time of his death.

M. Dewitt Woodford, formerly President of the Cincinnati, Hamilton & Dayton, died a few days ago at Kalamazoo, Mich. Mr. Woodford was born in 1838 at Fredonia, N. Y., and began railroad work in 1853 as a telegraph operator on the Erie. After a few years he went to the Michigan Central, where he served for five years as chief train despatcher and then was made also Superintendent of Telegraph. In 1872 he went to the Great Western of Canada, now part of the Grand Trunk, as Assistant General Superintendent. Three years later he returned to this country as Assistant Treasurer of the Chicago & Michigan Lake Shore, now part of the Pere Marquette. The next year he was made Superintendent of the United States division of the Canada Southern, and in 1880 was appointed General Superintendent of the Fort Wayne & Jackson, now part of the Lake Shore. The next year he was also General Manager of the Toledo, Ann Arbor & Grand Trunk, now part of the Ann Arbor, and in 1882 resigned from both positions to go to the Wheeling & Lake Erie as General Superintendent. He was made Vice-President and General Manager of this road in 1883, and was Receiver of the property from 1884 to 1886; he was then given his former title, and in 1889 was made President and General Manager. During part of his early years of service on the Wheeling & Lake Erie, he was also General Superintendent of the Cleveland & Marietta, and later Vice-President and General Manager of that road and General Manager of the Toledo Belt. In 1899 he was made Vice-President and General Manager of the Cincinnati, Hamilton & Dayton, of which he was elected President in 1890. From 1893 to 1899 he was also President of the Cleveland, Loraln & Wheeling. He resigned from the Cincinnati, Hamilton & Dayton in 1904.

MEETINGS AND ANNOUNCEMENTS.

[illegible]

Engineers' Club of Philadelphia.

At a meeting of this club to be held September 20, a paper is to be presented with the title "A Recent Visit to the Quebec Bridge," illustrated with lantern slides, by Silas G. Comfort.

Street Railway Association.

At the meeting of the American Street and Interurban Railway Association to be held on the steel pier at Atlantic City, N. J., October 14-18, papers will be presented as follows:

"Technically Trained Men and the Electric Railway Profession," by Prof. H. H. Norris, Cornell University.

"National Fire Protection Association," by Ralph Sweetland, Boston.

"Influence of Design of Structures on Economy of Operation," by H. L. Crampton and William McClellan, New York.

"Package Express Business," by P. P. Crafts, Clinton, Iowa.

"Freight Interchange with Steam Railroads," by H. H. Polk, Des Moines, Iowa.

"A Department of Publicity," by J. Harvey White, Boston, Mass.

"Advertising," by A. W. Warnock, Minneapolis.

"Problems of a Small Road," by H. S. Cooper, Galveston.

"Use of Tee Rail in Cities," by C. Gordon Reel, Kingston, N. Y.

"Public Policies of the Past and Future," by C. Loomis Allen, Utica.

"Interurban Fares," by Theodore Stebbins, New York.

There will also be a discussion on the "Reduced Fare Agitation," and on "Depreciation from the Financial and Managerial Standpoints."

There will also be interesting papers and reports at the meetings to be held the same week of the American Street and Interurban Railway Accountants' Association, which meets in the Chalfonte Hotel; at the American Street and Interurban Railway Engineering Association, which meets on the steel pier, and at the American Street and Interurban Railway Claim Agents' Association in the St. Charles Hotel.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Intercolonial.—Hon. George P. Graham has been appointed Minister of Railways and Canals.

New Jersey Railroad Commission.—The members of this commission are: Joseph W. Congdon, President, Edmond Wilson and Borden D. Whiting. James Maybury, Jr., is Acting Secretary.

Rhode Island Railroad Commission.—Joseph P. Burlingame, Providence, is Railroad Commissioner. David J. White, Pawtucket, is Deputy Railroad Commissioner.

Operating Officers.

Chicago, Rock Island & Pacific.—W. M. Whitenton, Superintendent at Trenton, Mo., has been appointed General Superintendent of the Choctaw district, with office at Little Rock, Ark., succeeding H. M. Hallock, resigned.

Great Northern.—S. A. Walker, Assistant Superintendent of the Montana division, has been appointed Superintendent of that division, with office at Havre, Mont., succeeding J. McNaught, resigned. F. E. Gerrish succeeds Mr. Walker, with office at Havre. F. S. Elliott, Assistant Superintendent of the Kalispell division, has been appointed Assistant Superintendent of the Spokane division, with office at Spokane, Wash., succeeding W. Willerton, resigned. W. R. Smith, Assistant Superintendent of the Spokane Falls & Northern, succeeds Mr. Elliott, with office at Whitefish, Mont. J. M. Doyle succeeds Mr. Smith, with office at Spokane.

Louisiana Western.—C. F. Davis has been appointed Trainmaster of Terminals at Lake Charles, La.

Missouri, Kansas & Texas of Texas.—George Stoner, Trainmaster at Denison, Tex., has been appointed Acting Superintendent at Greenville, Tex., during R. J. Sullivan's leave of absence on account of ill health.

New York Central & Hudson River.—I. H. McEwen has been appointed Assistant Superintendent of the Mohawk division.

St. Louis & San Francisco.—J. H. Jackson, Trainmaster at Newburg, Mo., has been appointed Trainmaster at Springfield, Mo., succeeding J. A. Frates, promoted. F. G. Faulkner, chief train despatcher, succeeds Mr. Jackson.

Robert Sidell has been appointed Trainmaster at Sherman, Tex.

Wabash.—A. F. Heim, Trainmaster at Decatur, Ill., has been appointed Trainmaster of the Ninth and Thirteenth districts, with office at Decatur, succeeding C. F. Handshey, resigned to go to another company. Arthur K[illegible] succeeds Mr. Heim as Trainmaster of the Sixth, Seventh and Eighth districts.

Traffic Officers.

Buffalo & Susquehanna.—See New Orleans Great Northern.

Chicago Great Western.—J. H. Sayl[illegible] has been appointed General Agent at Milwaukee, Wis., succeeding W. H. Lord, resigned to go into other business. C. J. Longw[illegible]am has been appointed General Agent at Duluth, Minn., succeeding C. D. Thompson, resigned to go into other business.

Colorado Midland.—Morel[illegible] Law, General Agent at Kansas City, Mo., has resigned to go to another company.

New Orleans Great Northern.—Edward A. Niel, Traffic Manager of the Buffalo & Susquehanna, has been appointed also Traffic Manager of the New Orleans Great Northern. G. B. Auburtin has been appointed Assistant General Freight and Passenger Agent, with office at New Orleans, La.

Northern Central.—See Pennsylvania.

Pennsylvania.—George D. Dixon, Freight Traffic Manager, has been appointed to the new office of General Traffic Manager. George D. Ogden, Assistant General Freight Agent, has been appointed General Freight Agent. G. H. Cobb, division freight agent of the Northern Central at Baltimore, Md., succeeds Mr. Ogden. The offices of all are at Philadelphia, Pa.

Tampa Northern.—J. H. McWilliams, formerly Traffic Manager of the Georgia, Florida & Alabama, has been appointed General Freight and Passenger Agent of the Tampa Northern, with office at Tampa, Fla.

Engineering and Rolling Stock Officers.

Atchison, Topeka & Santa Fe.—T. E. Layden, Assistant Engineer of Tests, with office at San Bernardino, Cal., has been appointed Engineer of Tests, with office at Topeka, Kan., succeeding F. W. Thomas, transferred.

Baltimore & Ohio.—S. A. Jordan, Division Engineer of the Cleveland division, with office at Cleveland, Ohio, has been appointed Division Engineer of the Philadelphia division, succeeding A. A. Miller, resigned to go to another company. E. V. Smith, Assistant Division Engineer at Cleveland, succeeds Mr. Jordan. J. B. Myers, Division Engineer of the Shenandoah division, has been appointed Division Engineer of the Cumberland division, with office at Cumberland, Md., succeeding J. R. Leighty, resigned to go to another company. P. H. Petri, Assistant Division Engineer at Newark, Ohio, succeeds Mr. Myers.

Central of Georgia.—R. L. Doolittle has been appointed Assistant Master Mechanic at Macon, Ga.

Chicago & Alton.—W. E. Emery, roadmaster of the Chicago & North-Western at West Chicago, Ill., has been appointed Engineer of Maintenance of Way of the Western division of the Chicago & Alton, with headquarters at Kansas City, Mo., succeeding C. G. Delo, promoted.

Chicago, Lake Shore & Eastern.—M. S. Monroe, general foreman of locomotive repairs, has been appointed to the new office of Master Mechanic, with headquarters at Joliet, Ill., and his former position has been abolished.

Denver & Rio Grande.—See Rio Grande Western.

Illinois Southern.—Thomas Yeager has been appointed Master Mechanic, with office at Sparta, Ill., succeeding M. W. Fitzgerald, assigned to other duties.

Mexican Central.—R. D. Gibbons, Master Mechanic at Monterey, has been appointed Master Mechanic at Aguascalientes, succeeding J. M. Fulton, resigned to go to the El Paso & Southwestern. J. A. Lewis succeeds Mr. Gibbons.

Mobile, Jackson & Kansas City.—B. H. Gray, Master Mechanic of the New Oreans Terminal, has been appointed Superintendent of Motive Power of the Mobile, Jackson & Kansas City, with office at Mobile, Ala.

New Orleans Terminal.—See Mobile, Jackson & Kansas City.

Oregon Short Line.—See Union Pacific.

Pere Marquette.—J. F. Deimling, formerly Chief Engineer, has been reappointed to that office, succeeding E. K. Woodward, resigned.

Rio Grande Western.—A. H. Gairns, Master Mechanic of the Denver & Rio Grande at Denver, Colo., has been appointed Master Mechanic of the Rio Grande Western at Salt Lake City, Utah, succeeding E. G. Haskins, transferred.

Union Pacific.—H. J. Harris has been appointed Division Engineer of the Utah division and the Wyoming district of this road and of the Oregon Short Line, with office at Salt Lake City, Utah, succeeding R. B. Robinson, resigned.

Wabash.—H. C. Ettinger has been appointed Master Mechanic of the

Decatur and Springfield divisions, with office at Springfield, Ill., succeeding E. F. Needham, promoted.

LOCOMOTIVE BUILDING.

The Harriman Lines have ordered 125 locomotives from the American Locomotive Company.

The Morristown & Erie has ordered one consolidation locomotive from the American Locomotive Company.

The Chekiang Railroad, China, has ordered four mogul locomotives from the American Locomotive Company.

The Hanyang Iron Company, China, has ordered an additional four-wheel locomotive from the American Locomotive Company.

The Northwestern Pacific, as reported in the *Railroad Gazette* of August 30, has ordered four 10-wheel and two eight-wheel locomotives from the American Locomotive Company.

CAR BUILDING.

The New York Central Lines are understood to be figuring on 15,000 cars.

The Baltimore & Ohio, it is said, will soon be in the market for 5,000 steel cars.

The St. Louis Southwestern has ordered 15 tank cars of 80,000 lbs. capacity from the American Car & Foundry Co.

The Grand Trunk, as reported in the *Railroad Gazette* of September 6, has ordered 25 coaches from the Pullman Company.

The Emlenton Refining Company, Emlenton, Pa., is said to have ordered 20 steel tank cars from the Pressed Steel Car Company.

The Carnegie Steel Company, it is said, has ordered nine gondola cars and five flat cars from the Pressed Steel Car Company.

The San Antonio & Aransas Pass, as reported in the *Railroad Gazette* of July 26, has ordered 10 coaches from the Pullman Company.

The Brooklyn Rapid Transit is in the market for 200 cars. They will be like those ordered last spring, the specifications for which were published in the *Railroad Gazette* of March 29.

The Standard Oil Company, it is said, has ordered 500 steel tank cars of 80,000 lbs. capacity. The order is divided among the Standard Steel Car Company, the Pressed Steel Car Company and the American Car & Foundry Company.

The Boston & Maine, as reported in the *Railroad Gazette* of August 30, has ordered 1,000 box cars of 80,000 lbs. capacity from the Pressed Steel Car Company for December, 1907, delivery. These cars will weigh 39,000 lbs. and will measure 36 ft. long, 8 ft. 6 in. wide and 8 ft. ½ in. high, inside measurements. Bodies will be of wood and underframes of metal. The special equipment includes:

Bolsters	Pressed steel
Brake-beams	I-beam, 15-lb. section
Brake-shoes	Steel back, Am. Brake-Shoe & Foundry Co.
Brakes	Westinghouse
Couplers	Gould (steel)
Doors	Security
Drsft rigging	Miner on 500 cars; Westinghouse friction on 250 cars; Gould friction on 250 cars
Dust guards	Flexible
Journal boxes	Symington on 500 cars; Franklin on 500 cars
Paint	B. & M. standard
Roofs	Murphy
Springs	Coil, M. C. B. standard
Trucks	Fox pedestal

RAILROAD STRUCTURES.

Buffalo, N. Y.—Local reports say that the New York Central will enlarge the waiting room at the Exchange street station, and construct subways for passenger travel, to replace the overhead bridges.

Caldwell, Idaho.—The San Francisco, Idaho & Montana will ask bids this month for a 750-ft. bridge over the Snake river. F. H. Richardson, Chief Engineer, Caldwell.

Defiance, Ohio.—Negotiations are pending between the Indiana, Columbus & Eastern Traction Company and the Defiance County Commissioners to put up a new concrete bridge 80 ft. wide consisting of four spans to replace the steel bridge over the Auglaize river, which the traction company claims is not strong enough to carry its cars.

Ensley, Ala.—The Atlanta, Birmingham & Atlantic, it is said, has bought a large plot of ground near this place as a site for yards.

Fort William, Ont.—The Canadian Pacific, it is said, intends erecting a great dock, six new freight sheds, a large cleaning elevator and other necessary accommodations to build up a great shipping trade on the lakes.

Contracts are reported let to Wylie & Balfour for masonry work, and to the Canadian Bridge Co. for the steel superstructure of a bridge to be built over the Kaministiquia river for the Grand Trunk Pacific.

Mobile, Ala.—The Mobile & Ohio has decided to spend $200,000 for wharves and improvement of dock facilities.

Philadelphia, Pa.—Bids are in for four bridges, one over the Pennsylvania tracks at Belmont and Girard avenues to cost $85,000, of which the city is to pay $65,000 and the railroad $20,000; another at Thirty-first street and Columbia avenue over the Pennsylvania tracks to cost $54,000, of which the railroad is to pay $36,600; and two along the Torresdale boulevard; one over the Newton branch of the Philadelphia & Reading, and the other over Tacony creek.

Springfield, Ill.—The Illinois Traction Company has leased the ground now occupied by the Springfield Consolidated Railway Company's car barns. Large barns and a passenger station are to be built on the site.

Washington, D. C.—The Baltimore & Ohio expects to occupy the new union station October 1.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Alaska Home (Electric).—Organized with a capital of $200,000 to build an electric line from Valdez, Alaska, north into the copper country, about 180 miles. Work, it is said, is now under way, and it is expected to finish the first 34 miles this year. Henry D. Reynolds, of Valdez and of Seattle, Wash., is interested.

Arkansas, Louisiana & Gulf.—This company, projected from Pine Bluff, Ark., south to Monroe, La., 133 miles, for which grading contracts were let this spring, will begin track-laying about the first of next month, it is said. (July 5, p. 27.)

Atlanta, Birmingham & Atlantic.—According to a statement of an official of this road, the Alabama division has been extended from Roanoke, Ala., west to Wadley, 13 miles, and this section is now open for traffic.

Bainbridge Northeastern.—This company, incorporated in Georgia with a capital of $200,000 is said to have started work on a line from Bainbridge, in Decatur county, northeast to Pelham, in Mitchell county, 35 miles. The company also proposes eventually to build through the counties of Thomas and Grady in Georgia, and through Florida to a point on the Gulf coast. Incorporators include: E. Swindell, E. J. Willis, R. O. Allen, L. H. Tonge and B. B. Lane, all of Bainbridge, Ga. G. W. Saxon, of Tallahassee, Fla.; M. P. Flinn, of Chattanooga, Tenn., and L. E. Gellersstedt, of Troy, Ala.

Boston & Providence Interurban.—The Massachusetts Railroad Commission recommends that a certificate of public exigencies to build railroads be issued to this company. The applications for certificates of the New York & Boston, the Boston, Lowell & Lawrence and the Boston & Eastern have been denied.

Brooklyn Rapid Transit.—Vice-President T. S. Williams announces that plans are about finished for the Flatbush avenue extension to the Manhattan bridge. This work, including third and fourth tracking of other lines, is to cost $8,600,000. Permission to build the extension will be asked for at once. About $600,000 is to be spent to re-enforce the elevated structure, and $400,000 to finish the Brighton Beach line.

Canadian Pacific.—The report of this company for the year ending June 30, 1907, gives the total length of all lines as 10,239 miles, including 823 miles under construction. An agreement has been made with the Northern Colonization Railway Company to build an extension of this road from Nominingue, Que., west to Rapide de L'Original, in Wright district, 34 miles, and to take a lease of it; also with the St. Mary's & Western Ontario to lease that company's line on its completion from St. Marys, Ont., to a connection near the village of Embro, with the proposed extension of the Tilsonburg, Lake Erie & Pacific Railway, about 15.25 miles. The work authorized in 1904 to build a line from Sudbury, Ont., south to Bolton, 226 miles, to provide a route between Toronto and the main line is to be opened for freight traffic this year. The company has authorized a branch from Moose Jaw, Sask., on the main line, northwest 50 miles, and it is probable that this branch will be extended an additional 100 miles; another branch is to be built from Regina, Sask., on the main line to a point near Saskatoon, 165 miles.

Considerable progress has been made with the work west of Lake Superior, where 747 miles are under construction; two-thirds of the grading has been finished and 270 miles of track laid; rails and fastenings for the balance are on hand. It is expected that about 200 miles of the double-track work between Winnipeg, Man., and Fort Williams, Ont., will be ready for use this year, and the entire work finished in 1908. During this year in eastern Canada the Guelph & Goderich branch in Ontario, 80 miles, was finished and is now in operation. About 20 miles of grading on the Walker-

ton & Lucknow Railway, which is to be 38 miles long, has been finished. It is expected that 50 miles of the second track that is being laid will be ready for operation between Ste. Anne and Smith Falls, and the rest of the 108 miles is to be finished in 1908.

CENTRAL OF GEORGIA.—The company during the year ending June 30, 1907, added to its road new side and spur tracks aggregating 51.05 miles, and the length of side and spur tracks is reduced 3.5 miles by remeasurement or by abandonment. The company also during the year made improvements to its yards at Albany, Athens and Savannah, Ga., and similar work is now under way at Industry, Macon and Columbus, also on new passing tracks on the Atlanta division, including a new yard at Griffin. Steel bridges were put in, including one over the Tallapoosa river consisting of five deck truss spans each 150 ft. long, one over the Coosa river with three spans each 149½ ft. and one 200 ft. long, of through steel trusses. A bridge was built over the Cahaba river 168 ft. long; and one 55 ft. long over White Sulphur Springs creek is yet to be erected. The company laid new 70-lb. rails on 9.64 miles and 80-lb. rails on 95.25 miles.

CHICAGO, MILWAUKEE & ST. PAUL.—The report of this company for the year ending June 30, 1907, shows that the second track on the La Crosse division from Watertown Junction, Wis., north to Portage, about 45 miles, has been finished. Similar work is under way on the River division from River Junction, Minn., north to Richmond, 10 miles; and from Lake City, Minn., south to Wabasha, 12½ miles. Work is also under way at various points revising the grades and improving the alinement. President A. J. Earling announces that the companies, which were organized under the laws of South Dakota, Montana, Idaho and Washington, are now building the line from the Missouri river in South Dakota west to Seattle and Tacoma. Money has been advanced by the C., M. & St. P. to aid these companies, and work is progressing satisfactorily. It is expected to have the entire line to the Pacific coast finished during 1909.

COWETA, FRANKLIN & TROUP.—Incorporated in Georgia with $300,000 capital to build about 50 miles of railroad from a point either on the Central of Georgia or the Atlanta & West Point, in Cowet county, west via Franklin to a point on the Atlanta, Birmingham & Atlantic, in Heard county. The incorporators include: T. C. Lane, J. W. Daniel, R. M. Litford, R. G. Grain, F. S. Loftin, J. W. Ray and D. B. Whitaker, of Franklin; J. E. Dunson, of La Grange; W. C. Wright and W. H. Brannon, of Newnan.

DANVILLE & SOUTHEASTERN.—See Illinois Traction.

DENVER & GULF.—This company, incorporated in Oklahoma last spring to build a line from Denver, Colo., southeast to Snyder, Okla., 500 miles, has let contracts, it is said, for building 100 miles from Texhoma, Okla., north towards Denver. (May 10, p. 663.)

DENVER, NORTHWESTERN & PACIFIC.—This road is now in operation from Denver, Colo., west to Kremmling, 126 miles. According to a reported statement of President D. H. Moffat, work is to be pushed to completion. Contracts have been let for extending the line west to Steamboat Springs, and work is under way on a tunnel through the mountain. The extension is to run west to Salt Lake City. (March 15, p. 383.)

ELKINS LIGHT & POWER COMPANY (ELECTRIC).—Incorporated in West Virginia to build a north and south electric line in that state through Taylor, Barbour and Randolph counties, touching the cities of Grafton and Elkins. The cost of the proposed line is said to be about $1,000,000. The incorporators include: United States Senator S. B. Elkins, R. O. Kerns and H. G. Davis. The office of the company is to be at Elkins.

ERIE.—A contract is reported let to the Patterson Co., of Pittsburg, Pa., for grading three miles of the Genesee River Railroad. The work involves the excavation of about 1,000,000 cu. yds. (June 21, p. 917.)

FAIRMONT & SOUTHERN.—This company, recently incorporated in Pennsylvania to build a line from Bellington, W. Va., north to Pittsburgh, Pa., 125 miles, is said to have secured all the necessary right of way as well as money to carry out the project. The United States Steel Corporation is said to be back of the project. (Sept. 6, p. 277.)

FINDLAY-MARION RAILWAY & LIGHT COMPANY.—At a recent special meeting of this company, the proposition to sell the right-of-way, franchises and other property of the company was rejected. All the engineering work and other preliminaries have been finished and financial arrangements made to build a 17-mile electric line over a private right-of-way, with easy grades and curves. Construction work is to begin in the spring. G. W. Meeker, Secretary, Columbus, Ohio.

FORT WORTH & RIO GRANDE.—See St. Louis & San Francisco.

ILLINOIS TRACTION.—This company, it is said, controls the Danville & Southeastern, incorporated in Illinois, with a capital of $10,000, and office at Danville. The company proposes to build a line from Danville to a point in the southeastern corner of Georgetown township, Vermilion county. The incorporators include: W. H. Carnahan, G. M. Mann, C. Zelly, H. E. Bramble and C. E. Cox all of Champaign.

JOPLIN & PITTSBURG (ELECTRIC).—An officer writes that the general contract for building an extension of this road has been let to A. L. Register & Co. of Philadelphia, Pa. The road is in operation from Columbus, Kan., north via Scammon, Wier, Chicopee and Pittsburg to Frontenac, 12 miles. One extension is being built from Frontenac north to Curranville, five miles; one from Pittsburg southeast to Joplin, Mo., 25 miles, and another, from Scammon west to Mineral, 5½ miles. About five miles of the extensions have been finished. Maximum grades 1.4 per cent and maximum curves 4 deg. There will be four steel bridges for which contracts are let. Joseph J. Hein, President, Kansas City, Mo., W. W. Calhoon, Vice-President, Carthage, Mo.; J. A. Prescott, Secretary and Treasurer, R. E. Richardson, Chief Engineer, Kansas City, and D. L. Robinson, Assistant Secretary and Treasurer, Buffalo, N. Y.

LEHIGH & LAKE ERIE.—See Lehigh Valley.

LEHIGH VALLEY.—The report of this company for the year ending June 30, 1907, shows that this company operates 1,440.22 miles of railroad, of which 579.14 miles is second track, 56.18 miles three track, and 20.47 miles four-track. There is also 1,067.29 miles of yard tracks and sidings. There was a decrease of 4.74 miles of first track due to the removal of colliery branches, and a change of the old main line at Allentown to third and fourth tracks. During the year 44.65 miles of company's sidings were added, and 5.84 miles of private sidings. About 20,000 tons of new 90-lb. rails were laid. Eleven steel bridges to replace lighter metal structures, and 17 replacing wooden structures and trestles were also added. An additional cold storage building and dock, with machinery at Milwaukee, Wis., was authorized and this work is now under way. The Lehigh & Lake Erie, a 10-mile double-track terminal line in Buffalo, N. Y., is expected to be put in operation this month. The new double-track 1,800-ft. steel bridge over the Susquehanna river and the reduction of grades and change of alinement from Wysox, Pa., to west of Towanda has been put in service. Work is now under way on three new transfer bridges and a freight yard to have a capacity of 1,000 cars at the National Docks at Communipaw to relieve the congestion at the Jersey City terminal. The cost of this improvement will be $350,000.

MILWAUKEE NORTHERN (ELECTRIC).—This company was incorporated in Wisconsin to build an electric line from Milwaukee north via Cedarburg, Grafton and Port Washington to Sheboygan, with a line from Cedarburg northwest via Westbend to Fond du Lac, a total of 100 miles. About 15 miles built. An issue of bonds was recently authorized to pay for the line from Cedarburg to Fond du Lac, also to make other extensions, and for double-tracking work. (Aug. 1, p. 137.)

MISSOURI, KANSAS & TEXAS.—This company during the year ending June 30, 1907, according to its annual report, improved its lines by replacing old rails with new 85-lb. rails on 179 miles of road. The work of reducing grades is being pushed from Atoka, Ind. T., south to the Red river; and clearing and masonry work has been finished on this section. The construction of permanent track has been begun and it is expected to have rails laid this year. From Atoka northeast to McAlester work is under way reducing the grades at Springtown and at Limestone Gap, also north of that place at Crowder. Surveys for grade reduction will soon be finished as far north as Parsons, Kan.

NEW YORK CENTRAL & HUDSON RIVER.—The New York State Public Service Commission (Second district) has ordered the elimination of the Main street crossing at Tuckahoe, on the Harlem division. The cost of this proposed work will be about $130,200; also the crossings at Mount Vernon avenue, Oak street and Fleetwood avenue of the same division in Mount Vernon to cost about $357,000.

NORFOLK & WESTERN.—The report of this company for the year ending June 30, 1907, shows that work was started on an extension of the Tug Fork branch, 2.13 miles up the right fork of Sand Lick, in West Virginia; also an extension above Pageton, 4.03 miles. A short spur track from this branch has been built to the United States Coal & Coke Company's Works. The Dry Fork branch, formerly the Iaeger & Southern, has been extended 1.32 miles. The Superior branch has been built from Davy up Davy creek to the works of the Superior Pocahontas Coal Company, 0.75 miles. An extension of the Honaker branch to Blacks Ford, on Clinch river, is being built 1.12 miles. An agreement has been made with the Lynchburg (Virginia) Belt Line & Connecting Railway Company for trackage rights. The line is expected to be finished this year and will be 22.12 miles long with branches 2.07 miles.

The Big Stony Railway has made improvements to many of its bridges, including the one over New river and to its roadbed. An extension is being built from Interior, Va., to the line between

Giles county, Va., and Monroe county, W. Va., 6.21 miles, where connection is to be made with the Interior & West Virginia Railroad. This latter company is building a line from the proposed connection with the Big Stony through Monroe county, W. Va., to the Craig county, Va., line, 17.55 miles, where connection is to be made with the Virginia & Potts Creek Railroad. The V. & P. C. is building a line from the proposed connection with the Interior & West Virginia through Craig county to Potts creek in Alleghany county, 11.15 miles, on which work is under way as far as Paint Bank, 4.2 miles.

The Pocahontas & Western has track laid for 3.12 miles and began operation in May on 2.90 miles to the Boissevain Works of the Pocahontas Consolidated Collieries. Grading is under way on 3.81 miles from the present end of the track to the Thorn works of the same company. The Guayandotte & Tug River has secured nearly all the right of way for its main line, to be 62.27 miles long, between Clarks Gap, W. Va., and Wharncliffe. It has also located the Barker Creek branch, 10.7 miles long, from the mouth of Pinnacle creek up Guyandotte river, and secured most of the right of way. An extension of this branch has been located to a point on Guyandotte river above the mouth of Slab Fork, 3.03 miles. Branches have also been located as follows: Pinnacle Creek branch, 7.35 miles, and Still Run branch, 3.56 miles.

During the year 67.50 miles of main track were relaid with 85-lb. rails and 10.19 miles of the Winston-Salem district were laid with re-sawed 85-lb. rails. The work authorized and under construction includes second-track between Forest Va., and Montvale, which has been put in operation with the exception of a small section to be finished this year; tunnel work and roadbed for second track west of Vivian, W. Va., 2.7 miles, for which right of way is being secured; similar work east of Welch, W. Va., 1.5 miles, on which grading is under way; second track, including two tunnels from Davy, W. Va., to Claren, three miles; tunnel work and roadbed for second track from Claren to Wilmore, seven miles, on which tunnel work is to be finished next year; second track from Wilmore to Iaeger, 4.1 miles, of which 3.34 is now in operation, the rest to be finished this year; second track work west of Iaeger siding, 2.3 miles; between Devon and the present east end of second track at Lick Fork, 8.3 miles; between East Ironton, Ohio, and Hanging Rock, 5.6 miles, and between Valley crossing and Joyce avenue, Columbus, eight miles, of which 4.69 miles is in operation.

Ohio Roads (Electric).—The Ohio State Board of Public Works recommends that the abandoned tow path of the Hocking canal from Lancaster southeast to Nelsonville, 33 miles, be leased to the Logan & Athens Construction Company. This company agrees to begin work in six months on a railroad over this route.

Peoples Railway Construction Company.—This company, which was recently organized in Texas to build a line from Dallas, Tex., southeast via Canton and Tyler to Leesville, La., about 225 miles, has surveys made from Canton to Tyler, 38 miles, and expects to let contracts for some of the work about the first of next month. (July 26, p. 111.)

Port O'Connor, Rio Grande & Northern.—More than 100 miles of grade on this line has been finished and track-laying will soon begin. The first division to be finished will be from Port O'Connor, Tex., north to Yoakum, 90 miles. The main line is to run from Port O'Connor, on the Gulf, north to San Antonio, 190 miles. Branch lines are to be built from Gonzales north to Smithville, 50 miles; from Yoakum north to La Grange, 61 miles, and from Seguin northwest to New Braunfels, 15 miles. At Port O'Connor, the Gulf terminus of the line, it is planned to lay out a city and to develop it into an important deepwater port. W. S. Hipps & Co., Houston, are the contractors. L. A. Gueringer, Chief Engineer, Victoria. (See Texas Railway, March 15, p. 393.)

Rochester, Scottsville & Caledonia (Electric).—Surveys, it is said, are being made by this company for an electric line from Rochester, N. Y., southwest over a private right of way via Scottsville, Caledonia and Le Roy to Pavilion, from which place branches are to be run to Warsaw, Rockglen, Perry and Glen Iris, a total of about 100 miles. E. Strathy, Chief Engineer, Rochester.

Russellville & Ozark Mountain Traction.—Surveys reported made and rights of way secured for building this proposed electric line from Russellville, Ark., north to Dover, 10½ miles. A. J. Robinson, President, Pine Bluff, Ark.

St. Louis & San Francisco.—Work, it is said, is soon to be started on the proposed extension of the Fort Worth & Rio Grande from Brady, Tex., southeast to San Antonio, 150 miles. (Aug. 16, p. 189.)

Shawnee Central.—This company was incorporated last spring with $10,000,000 to build a line from Muskogee, Ind. T., via Shawnee to Childress, with an 80-mile branch from Shawnee to Tulsa. According to a reported statement of President J. M. Aydelotte, of Shawnee, contracts for building the line, over surveys already made, are to be let at once. Dr. W. S. Woods, of the National Bank of Commerce, Kansas City, Mo., is the chief promoter of the project. (July 12, p. 54.)

Southern Pacific.—Contracts are said to have been given by this company for a power house to be built at Fruitvale, Cal., aggregating between $800,000 and $900,000. This seems to mean that the company has decided to electrify its bay lines. This central station will serve the Oakland, Berkeley, Alameda and Fruitvale lines. The cost of carrying out these plans is in the neighborhood of $2,000,000. The Alameda lines will be the first to be electrified.

Tanana Valley.—An officer writes that this company, which operates a road 26 miles long, is building an extension of about 20 miles. When this work is finished the road will run from Chena, Alaska, to Chatanika, 41 miles, with a branch to Fairbanks, five miles. Ten miles of track has been laid on the extension. The maximum grade is 2.4 per cent. and the maximum curve 20 deg.

Taylor, Somerville & Gulf.—Surveys made and rights of way reported secured by this company for building its proposed line from Taylor, Tex., east to Somerville, 60 miles. (July 19, p. 83.)

Toledo Junction.—Incorporated in Ohio with $100,000 capital to build a line about eight miles long from near Waterville to Acorn. A new station is to be established on the Wabash and the Toledo, St. Louis & Western. C. B. Wagner, H. C. A. Ehlert, E. C. Snyder, M. I. Brown and C. F. Ferron, all or Toledo, are incorporators.

Wheeling & Lake Erie.—The annual report of this company for the year ending June 30, 1907, shows that on the Toledo-Pittsburg division, 4.32 miles of 90-lb. rails were laid from the west end of the Norwalk, Ohio, yard to Huron Junction and at various points between New Cumberland and Leesville. On the Cleveland division 17 miles were also laid with 90-lb. rails between Twinsburg and Middle Branch. On the River division 70-lb. rails were laid on 4.1 miles to replace 56-lb. rails. There were 19 industrial tracks added aggregating about 4.5 miles, eight passing tracks aggregating four miles, and over 23 miles of new yard tracks laid at various points of the line. In addition there were over five miles of loading and team tracks put in at various points.

RAILROAD CORPORATION NEWS.

Aurora, Elgin & Chicago.—An initial quarterly dividend of three-fourths of 1 per cent. on the common stock has been declared, payable October 7.

Chicago, Burlington & Quincy.—The stockholders at the annual meeting on November 6 are to be asked to approve the purchase of the company's leased lines in Nebraska, Kansas, Colorado and Wyoming.

Chicago, Milwaukee & St. Paul.—This company is reported to have bought the Washington, Idaho & Montana, which runs from Palouse, Wash., to Harvard, Idaho, 20 miles, and is being extended through Bovill to Collins, where it will connect with the St. Paul's Pacific extension.

Erie.—It is said that this company intends to retire its $5,000,000 one-year notes issued last spring with its cash surplus on hand, part of which was made available by paying its dividends in scrip. (Aug. 30, p. 248; May 24, p. 728.)

Interborough-Metropolitan.—It is said that this company has offered to sell to New York city the Belmont tunnel under the East river, which is being built by a subsidiary company, for a price said to be $8,000,000. If the city buys the tunnel the Interborough-Metropolitan offers to operate it. The north tube of the tunnel is ready for experimental operation and the south tube is nearly finished.

Minneapolis, St. Paul & Sault Ste. Marie.—The stockholders have authorized the issue of $14,000,000 additional common and $7,000,000 additional preferred stock. Of this amount, $4,300,500 will be offered to shareholders for subscription at par during the coming year.

New Orleans Railway & Light.—A dividend of five-eighths of 1 per cent. on the $10,000,000 five per cent. non-cumulative preferred stock has been declared, payable October 15. Hitherto, beginning with 1906, the full dividends have been paid, quarterly. The company controls all the street railways in New Orleans, 52 miles, as well as all the lighting interests.

Toledo, Peoria & Western.—The annual report for the year ended June 30, 1907, shows gross earnings of $1,300,216, an increase of $6,822; net earnings, $212,148, an increase of $35,578. Net income, after interest charges and rentals, was $1,672, which compares with a deficit of $21,642 in the previous year.

Trinity & Brazos Valley.—The directors have voted to increase the capital stock from $300,000 to $500,000.

Washington, Idaho & Montana.—See Chicago, Milwaukee & St. Paul

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 870 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON.

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Pres't. and Editor*
E. A. SIMMONS, *Vice-President*
RAY MORRIS, *Secretary*
R. S. CHILDS, M., *Treas.*
I. B. RIKER, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Man'g Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
ROONEY HITT
GEORGE L. FOWLER
FRANK W. KRUEGER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIII., No. 13. FRIDAY, SEPTEMBER 27, 1907

President Mellen, of the New York, New Haven & Hartford, has announced that in the matter of the pending merger of his corporation with the Boston & Maine he will "stand pat" and not press the merger until Massachusetts sentiment upon the subject undergoes a change. His statement throws into the foreground of the Massachusetts field where state politics and the merger are now in high ebullition, a situation that is at once suggestive and amusing rather than practical and concrete. The New Haven Company now holds hard and fast through its trustees some 120,000 shares or about two-fifths of the outstanding Boston & Maine stock. Not many single blocks of the stock of size and importance remain outside the 120,000 shares and of the holders of the shares not in that big "bunch" a large majority undoubtedly want the merger and yearn for the addition of one per cent. in dividends in the proposed share for share exchange. The New Haven has not formal and legal control of the Boston & Maine. But "standing pat" it has moral and, in a very large sense, practical control present and prospective; it has drawn an impassable dead-line against any outside and rival control of the Boston & Maine; it is saving some $180,000 a year in dividend payments on the remainder shares; and, in times of general fiscal stress, it is postponing the cares of Boston & Maine operation and direct responsibility for improvements. So placed on his battlements of vision it is hardly strange that President Mellen is willing to put forth his gentle placebos as he watches the surging railroad politics of the Bay State sure to subside at about the date of the next meeting of the state legislature into passionless levels of common sense.

There was a discussion at the September meeting of the New York Railroad Club about the comparative merits of the electric and steam locomotive that, in its general tone, indicated a coming together of the interests represented by the two rival powers. It was recognized by both sides that the ill-advised claims of ill-informed advocates should be given scant consideration. One electrical engineer came forward with the broad admissions that it would cost much to electrify any road and that for existing traffic it was doubtful if that cost would be warranted by the savings that would be effected. There are, however, other important advantages, possibilities of greater train frequency, absence of smoke, more rapid acceleration, high speeds possible on adverse grades and the like; all of which would tend to attract traffic. On the other hand figures were given in which it was shown that the cost of operating and maintaining electric locomotives was far in excess of that required for the steam machine, and this was supplemented by the usual claims as to the advantages of a multiplicity of units, and the flexibility of operation that would be thus obtained. Yet with these two opposite positions there came from each an acknowledgment that the other possessed advantages that would force its consideration and adoption in certain places to which the rival power was not well adopted. In all this discussion it must be remembered that there is much of surmise. Locomotive statistics at best are elusive and unsatisfactory, and when it comes to electric operation there has not yet been enough of it to afford facts for valuable comparisons. The cost of operation and maintenance of the electric locomotive are for the most part based on the estimates of car operation costs, and that this is a sound basis is by no means sure. This will be evident from statistics of various locomotive costs on roads using different types of engines. For example, to take extreme cases, no one would think of basing the probable costs of the heavy Pennsylvania consolidations on the statistics of the New York elevated roads when they were operated by steam, and it seems equally unreasonable to base the probable performance of heavy locomotives on what is now done in the subway. It is coming to be generally felt that the electric locomotive has a field of usefulness which will be constantly widening, but that this field is not yet large enough to include the whole realm of railroad operation. We hope and believe that this fair-minded discussion at the New York Railroad Club marks the end of hysterical claims and counter claims as to the advantages and disadvantages of the electric locomotive. The course to be pursued is to pay close attention to details, watch the results of every development and then make use of such advantages as may be developed by experience.

THE GROWTH OF TRAFFIC.

The preliminary statistical report of the Interstate Commerce Commission for the year ending with June, 1906, shows one fact of great significance, which deserves more attention than it has received. The increase in freight traffic during that year was altogether unprecedented, and equal to the aggregate increase for the three years next preceding.

For five years this traffic has been:

Years.	Millions of ton-miles — Total.	Over previous year.	Per cent. of increase.
1902	157,289	10,212	7.0
1903	173,221	15,932	10.1
1904	174,522	1,301	0.9
1905	186,463	11,941	7.4
1906	215,878	29,415	15.9

The increase of traffic which had been 29,174 millions of ton-

miles for the three years from 1902 to 1905, was thus 29,415 millions in the one year from 1905 to 1906. This alone is sufficient to account for the traffic blockade of the last year. We had had great and sudden increases theretofore, but none like this. The largest increase in any one year had been 18,939 millions of ton-miles, from 1897 to 1898. From 1893-94, the year of lightest traffic for a number of years, to 1898, the increase was 38 per cent.; from 1902 to 1905, 42 per cent.; from 1898 to 1902, 18½ per cent. It certainly seemed unreasonable that in a single year after 1905, when traffic was already much larger than ever before, there should be a further increase of 16 per cent.

Of course this is a rate of growth which cannot be maintained. It would mean that traffic, and approximately production, should more than double every five years; and in a country where the growth of population is not more than 2 per cent. a year this is, of course, impossible.

Actually, however, the growth of traffic in this country is one of the marvels of the world's industrial history.

The 80,335 millions of ton-miles in 1894 has become 215,878 millions in 1906, an increase of 144 per cent. in 12 years, which is an average of nearly 10 per cent. yearly. This has been possible only by the development of mineral resources, in which the production per man employed is great in weight, distant from markets, giving many ton-miles per ton produced. The number of ton-miles per inhabitant in 1906 must have been approximately 2,540. There is nothing comparable to this in any other country.

While there has been some growth in traffic in every year but one since 1894, the fluctuations have been great. Aside from a trifling decrease from 1896 to 1897, we have gains (in millions) of 18,939, followed by 9,590, 17,932, 5,478, in the years from 1898 to 1901. To make accurate provision for a growth so fluctuating is not possible. Facilities increased at the rate of 10 per cent. a year would have been superfluous in 1901 and 1904 and inadequate in 1898 and 1906. The programs for tremendous increases in facilities made by a very large number of companies two years or less ago, if they could have been executed in the shortest possible time, as was intended in many cases, would most probably have exceeded the requirements of traffic. Inability to secure all the capital needed has postponed many of these enterprises, and if the money could have been secured it is hardly probable that the men and materials could have been had. It is true that a large part of the improvements were needed for the prompt and economical conduct of the traffic as it was. But we may be pretty sure that provision for an annual growth of 16 per cent., like that of 1906, would be excessive.

Passenger traffic has never grown in this country like freight traffic. It was lighter in 1895 than in 1891; and not quite 14 per cent. greater in 1899 than in 1891. But since 1899 the growth, if not so great as that in freight traffic, has been much greater than that in population. The 25,176 millions of passenger miles in 1906 were more than twice as great as the travel in 1897; and in these years the growth of trolley travel has probably been greater in proportion. The steam railroad travel in 1906 was at the rate, approximately, 296 miles per inhabitant, which is not equaled in any other country for which we have statistics. Since 1901 this travel has been

	—Millions of pass'g'r-miles—		
Year.	Total.	Over previous year.	Per cent of increase.
1902	19,690	2,336	13.4
1903	20,916	1,226	6.2
1904	21,923	1,007	4.8
1905	23,800	1,877	8.6
1906	25,176	1,376	5.8

The growth is constant and rapid, but not equal to that in freight. Since 1895 the gain has been 106½ per cent. in passengers and 153 per cent. in freight; since 1901, 45 per cent. in passengers and 47 per cent. in freight. In the census year the travel was 211 miles per inhabitant; in 1906, as we have said, about 296 miles.

THE DIFFUSION OF RAILROAD SHARES

A somewhat cheering symptom of the past year of stress in American railroad securities has been the repeated reference to the increased number of separate holdings of shares in railroad corporations. Not infrequently nowadays railroad presidents in interviews for publication or in their annual reports "point with pride" to their waxing number of shareholders. Sometimes the fact is illusory or even negative in its meanings. A big holder of shares in a conservative railroad—say an insurance or trust company—decides to split up its block for disposal in the market and does so successfully; or, again, a big speculative holder of intrinsically speculative railroad stocks decides to subdivide and "unload." That means, usually, the substitution of a lot of small speculators for one big one, an enlarged area of speculation, the raising—and shearing—of a new flock of Wall street lambs, and a positive evil. But, taking the railroads as a body, diffusion of shares is a wholesome sign. It is of special import in such a period as the present one of collision of railroads with the constituted authorities; and, as one branch of railroad science, hereafter it is to be hoped that the statistics of share distribution will be fuller, more accurate and detailed and brought down closer to date than heretofore.

There is difficulty in securing such returns. In some large railroad companies the changes are few and slow, in others very rapid. Many shifts of actual ownership take place without transfer on the books of the company, or with transfer considerably delayed. A trustee may hold, for a time at least, an undivided block of shares for a number of beneficiaries. A broker may do the same for a considerable number of customers. A single stock owner may hold shares in 20 roads, and his individuality is thus multiplied by 20—the flaw of the official returns of the number of depositors in our savings banks thus repeating itself. Some of the blanks of state railroad commissions exact returns of the number of stockholders in the independent railroad corporations. But they generally omit the enumeration for shareholders of component, subsidiary and leased properties, who often far exceed those of the parent company. Yet, even with these limitations, it ought not to be hard to obtain significant returns. Some errors will remain, but they will be in the nature of constants not affecting very seriously the absolute variations of ownership, upward or downward, from year to year, which will tell their own story.

The last and most trustworthy official statement of the number or railroad stockholders in the country goes back three years to the year 1904. In February, 1905, at the request of the United States Senate, the Interstate Commerce Commission gave the numerical returns of railroad shareholders as of June 30, 1904. The total was 327,851. Even for that somewhat remote time the comparisons and contrasts are interesting. There were 55 companies which returned each an enumeration of 1,000 stockholders or more, headed by the Pennsylvania with 44,175 and the Atchison, Topeka & Santa Fe with 17,823, many of the 55 companies being leased lines. The contrasts between the distributive holdings of conservative properties and the centralized holdings of speculative properties are vividly indexed in those returns. One finds Boston & Albany with 8,417 stockholders, Boston & Maine with 7,402, Illinois Central with 9,123, New Haven with 10,842, Old Colony with 5,371, and Baltimore & Ohio—the original ultra-conservative road of the country, and one of the oldest—with 7,132. Contrast with these, Southern Pacific, which had but 2,424 shareholders; Louisville & Nashville with 1,672; Cincinnati, Hamilton & Dayton with 1,558; Missouri, Kansas & Texas with 1,509; Missouri Pacific with 1,861; St. Louis & San Francisco with 1,521; Erie with 4,309, and Wabash with 1,974. It is impressive to note that several of these large systems are surpassed in diffused stock by, for example, the leased Morris & Essex with 2,450 shareholders, and the old Boston & Lowell with 2,168. Some allowances in special cases must, of course, be made. The large distribution of the Atchison (17,823) dates back to original conservatism and diffused investment at Boston; Union Pacific, with stockholders numbering 14,256 in 1904, had in much earlier years its long period as a moderately conservative investment; and allowances have to be made for the effect on stock in certain cases of reorganization and receivership as well as of special Wall street conditions. But these and similar facts do not seriously impair the fact, conspicuous in 1904 though probably somewhat less conspicuous to-day, of diffused holdings in conservative roads and centralized holdings in the roads which are speculative.

During the three years since 1904 there has been, as an absolute fact, a vast increase in distribution. The holders of New Haven stock have increased by several thousand. During the first quarter of the present year the holders of New York Central increased about 2,200 and of Pennsylvania by over 5,000. When the November, 1906, dividend was paid, the Pennsylvania had 40,409 shareholders. The May, 1907, dividend went to 45,496 holders of record. Between May and August 1, there was a further increase of 2,000, bringing the number of stockholders to 47,500, the highest point in the company's history and also probably the largest number of shareholders ever possessed by any American railroad. Of these, 25,100 were men and 22,400, or over 47 per cent., were women. The following table, from the *Wall Street Journal*, shows the rate and

amount of dividends and the number of shareholders of the Pennsylvania during each of the last ten years

Year	An. rate	Dividends	No. of shareholders
1897	5 per cent.	$6,402,170	22,015
1898	5	6,465,230	23,725
1899	5	6,855,260	24,920
1900	6	8,781,170	26,032
1901	6	10,857,072	26,305
1902	6	12,252,491	28,675
1903	6	14,792,031	41,474
1904	6	17,938,031	44,360
1905	6	18,117,927	44,030
1906	6½	19,869,261	40,490
1907, May	7	10,906,784	45,496
1907, August	7		47,500

To some extent, doubtless, these increases in the number of shareholders of standard railroads during the recent era of low prices, were transitory, but they show a strong trend toward a wider distribution of railroad ownership among small investors. Other causes working in the same direction have been active and forceful. Railroad investment and reinvestment during the two earlier years of the three were extensive, even if affected somewhat by competitive investment in street railways and industrials. Surplus capital during that period was fairly abundant. During the three years, roads for many years speculative have become dividend payers and with enough promise of dividend continuance to attract steady investment. Moreover, there have been large issues of new stock and sales of rights and the convertible bond has been another distributive factor which will not grow less as the periods of convertibility mature. The result is an increase in the number of railroad stockholders of large but undetermined magnitude and not, apparently, much affected by popular and governmental attack on the roads; which, in fact, has probably been a good deal offset by the attraction to investors of low prices and high dividend returns of good railroad shares. As a rough guess, the 327,851 railroad stockholders of 1904 in this mid-year of 1907 probably have risen to about 500,000. Banking houses and trust companies that hold stocks for foreign holders, and the savings banks that, as trustees, hold an immense mass of railroad securities for the poor, enlarge what may be called the "popular" distribution of railroad holdings much further.

Excluding railroad bonds and senior securities, and limiting the subject to shareholders alone, one finds in the half million or more of them in this country a distributed interest so large that it becomes a popular interest also. Shareholders are not all voters, and the "widow and orphan" plea has of late been overworked. But the great and growing size of the stock-owning railroad interest suggests the larger question why there cannot be in the future a closer and more sympathetic relation between the railroads and the people. Cannot the railroads, without any threat even of state ownership, be set before the people as a kind of heritage, a part of their own wealth and heirship, subject only to the conditions of honest financing on the one hand and efficient public service on the other? Is such a view of the future too idealistic after the present fret and fume of the "railroad question" has ended and pasaion subsided into sense? Perhaps so; but at least the ideal is one to be toiled for. It will not be reached or even approached so long as demagogism foams at one extreme and the selfish craft of the railroad speculator burrows at the other. Radicalism and selfishness never yet have solved such a great public problem and never will. Its real solution must work out through the slow processes of time and experience. Among those processes the constant extension of railroad ownership must be welcomed as one of the most promising. A wide public ownership of its securities gives the American railroad system more basic strength. It accents the contrast—in the long run if not at once—between individual and quasi-popular ownership. It emphasizes the adjective in the trite phrase "public service" as strongly as it does integrity and judgment blended with tact in railroad administration. It reserves final control to the stockholder as a safeguard against abuse, and makes for the publicity that is the most resonant keyword of corporate betterment. That such expansion of railroad stock-ownings begins to be cited now by railroad authority itself adds official tribute to its value.

THE STATION AGENT.

One of the newspaper cartoonists has depicted a station agent, endowed with three pairs of arms, sitting in the middle of his office, the picture of distraction and anxiety, trying to do a half dozen things at once; answering the telephone, filling switch lamps, holding the train-order signal, reporting a train on the telegraph wire, delivering a mail bag and attending to passengers desiring to buy tickets or to have questions answered, and in addition he is using his toes, checking baggage with one foot and marking a dry goods box with the other. This last is the only express-agent function dealt with in the picture. This is by no means all fiction. With only pardonable exaggeration the picture man gives quite a fair notion of the multiplicity of duties that often presses upon the single attendant at a small station, within the five minutes preceding the departure of a train. If quick witted, energetic and ambitious, a man in such a situation often performs a variety of functions in a way that would do credit to an expert prestidigitator. Yet even the most phenomenally active clerk often has to neglect some of his customers from lack of time, while the "average" station agent, almost necessarily deficient in training, nearly every day leaves some of his patrons dissatisfied. The demands on his time are so numerous and various that only the most agile mind and best trained hands could meet them; and, admittedly, the country agent's mind is agile in only a few directions. From the causes here suggested the service at small stations is everywhere imperfect, and our cartoonist has only reminded us of what has been a common sight for half a century. Can anything be done about it?

We have taken up a subject on which it seems impossible to say anything new, because, we are glad to see, a few railroad officers are doing something new. No enterprising superintendent would be at a loss how to make a forward move in the improvement of his station service, if only he dared to spend twice as much money on it as he now does; but possibly it will be helpful to look again at some of the elements other than money. That is an important one; and nobody can expect to work any great improvement in station service without increasing its cost; but, given the money, how should it be expended? A simple increase in salary is a very crude measure, for the most that can be expected from it is to get better men, who will all the more quickly resign and find jobs paying higher salaries.

In view of the irresistible tendency among all intelligent country people to migrate to a city, it would seem far better to do everything possible to improve the agents now at country stations than to try to improve the service there by filling agencies with higher priced men who have had better training elsewhere; for "elsewhere" usually means a city or a large town. Every added year that an agent stays at a small station there is an added prospect that domestic ties will help to keep him there; and an added reason for educating him.

The education of a station agent is a complicated process, but we may perhaps divide it into three stages: the elementary things that he learns by doing them, as assistant agent, under the supervision of his boss; the "advanced" instruction in the same line, which he receives from the traveling auditor or other outside man, or by reading suitable books and adjusting his acts to his increased knowledge; and education in politeness and tact, which is likely to be a comparatively slow growth, for it comes from dealing with men, and the country agent does not have a large or an inspiring variety of men to deal with.

Certain recent measures to improve station agents will be recalled by the reader. One road has put on an increased force of district freight agents and arranged to have them travel more; visit each station oftener. It seems likely that this will afford proportionately too much benefit to the moderately large points and too little to the one-man station; but the principle is good. One or two roads have had frequent profitable meetings of 50 or 100 agents, the meetings being addressed by officers of the Freight Traffic and Passenger Traffic departments. One road did a good thing by more liberally supplying small stations with helpers, thus encouraging the agents to make themselves better. But what has called our attention to this matter at this time is a brief notice in a Missouri paper telling of what has been done by Mr. W. M. Whitenton, Superintendent of the Missouri division of the Chicago, Rock Island & Pacific at Trenton, Mo., who has had a meeting of station agents to "talk shop." Like others before him, Mr. Whitenton seems to be giving undue attention to stations other than the smallest, but we will trust that he may get down to the lower level later. The public, especially the traveling public, wants good service at the smallest stations.

Mr. Whitenton has had several similar meetings before. He says that it will be his policy to foster this frequent exchange of ideas. He holds, rightly, that the agent is a molder of public sentiment toward railroads. "It is he who meets the seeker of informa-

tion about routes and schedules with either polite accommodation or surly indifference. It is from his treatment that the patron takes on a mood of satisfaction or hot resentment. The patron goes back home and, the next day, is called as a juror in a damage case; and his feelings govern his action." Mr. Whitenton intends to have all small claims against the railroad promptly settled, and is looking after the practice of his agents in this respect. This is a feature of Rock Island policy concerning which *Railroad Gazette* readers have already been informed. This superintendent aims to make the agent at the small station see that he can make of himself an important personage, by treating the public with the same politeness that is practiced by the storekeeper or the banker.

Two things are noticeable in this movement. First, it is the superintendent who is managing it, and, second, he is taking for his model, not the experienced ticket seller or freight clerk at some large station, but the local storekeeper or banker. Local agents on American railroads have been instructed too exclusively by traffic men and traveling auditors. We have not the slightest word to say against these men, for their work is invaluable; but the superintendent ought to be able to better their instruction in some directions. He is or should be more thoroughly acquainted with local conditions; and, probably, in most cases the division superintendent is a man who has had a larger all-round experience. He ought to be by far the biggest man whom the station agent regularly sees.

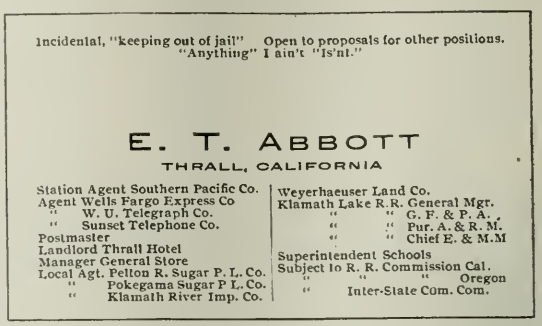
In taking the local retail merchant as a type to be imitated this superintendent recognizes an essential principle. This merchant may not dress so well, or keep books so well as the station agent, and he may know far less; but he has a more powerful incentive to please his customers; and that is where railroad agents lack. As one of the Chicago & North-Western agents has said, the grocer puts on his smile with his clothes the first thing in the morning; and he keeps it on all day. Another reason for emulating the storekeeper is that he is nearby. An agent who tries to take lessons from a better agent may see him only once in three months. The storekeeper who is also postmaster is a useful man to study. He might not be worth ten dollars a month on a railroad; but he "aims to please." Probably he has been selected as postmaster largely for that reason.

The superintendent who sets out to raise the quality of his agents must recognize his obstacles. The bank clerk or store clerk learns to be a successful banker or merchant because he has for teacher the proprietor, constantly "on the job." The railroad superintendent, coming around only once a month, must try in some way to make up for the infrequency of his visits. One reason why conductors manifest a more uniform degree of efficiency than agents is because conductors are thrown together where they can more effectively learn from each other.

Again, it is to be borne in mind that learning from each other is not an ideal educational process for agents, or for conductors, either; though it should be diligently carried out where nothing better is available. Essays by agents, telling other agents how they do certain things, have accomplished a great deal of good; but in view of the fact that the third course in the station agent's education—training in affability and alert anticipation of customers' wishes—is the one which is now engaging attention, and of the fact that these qualities are not likely to be described in instructive detail and with enthusiasm by a modest person who exercises them, it will be much more effectual to educate in some other way. The superintendent, as teacher, should show to his agents vivid word-pictures of actual men who have achieved excellence in the diplomatic art. If the superintendent is not himself a good lecturer let him hire a man who is. Follow the teaching theory to the further extent of requiring the pupils to show in writing how well they have grasped what has been told them.

The young country station agent is susceptible, probably in a large majority of instances, of a tolerably satisfactory polish; the question is whether a strong railroad, employing brilliant men for general officers can afford to continue to let such agents educate themselves, and as a result reap two-cent fare laws, passed by disgruntled legislators whom nobody has ever tried rationally to placate.

The most difficult agent to deal with is the one who does his work well but is usually so cold-mannered or weary as to be classed by passengers as "cross." It is inexcusable to appoint such a man. The best way to test a candidate in this respect is to see how well his sense of humor is developed. We have no form of test examination to offer, but by way of illustrating the point we will mention an agent who evidently has this sense—Mr. E. T. Abbott, of the Southern Pacific. Our opinion of Mr. Abbott's fitness is based on his card, a copy of which reads:



Incidental, "keeping out of jail" "Anything"

Open to proposals for other positions. I ain't "Is'nt."

Mr. Abbott, we venture to guess, would make a good lecturer for station agents' meetings.

Car Efficiency for Three Months.

The Car Efficiency Committee of the American Railway Association has issued a statement for the three months to April 1, 1907, showing freight car performance, and car balances, and giving some comparisons with the records for the last six months of 1906 (which were noticed in the *Railroad Gazette* of August 30). The average ton miles per car per day for the three months were: Group 1, 164; group 2, 364; group 3, 363; group 4, 226; group 5, 341; group 6, 307; group 7, 531; group 8, 368; group 9, 252; group 10, 350. (The groups correspond to those of the Interstate Commerce Commission.) We quote the principal explanatory paragraphs of the report:

"This bulletin is the first general compilation covering a period subsequent to the increase in the per diem rate which was made effective on certain roads December 1, 1906, and is therefore of interest for purposes of comparison tending to show the effect of the increase on the car movement. Although the weather conditions during the period covered by this report were not favorable to a high car mileage, the general average shows a decrease of but seven-tenths miles per day as compared with the last six months of 1906. The heaviest decreases in mileage occurred on the roads which were not parties to the car hire agreement, while the car hire roads, with but few exceptions, about held their own. The decrease on all car hire roads averaged but .64 per cent., while the non-car hire roads show an average decrease equal to 5.53 per cent.

"These results would seem to indicate that the increase in the per diem rate to 50 cents, which was made effective July 1, 1907, on all roads in the Association should bring about a general improvement in the movement of cars.

"The generally accepted unit of car performance is the 'average miles per car per day,' but in considering this item, the 'per cent of loaded mileage' and the 'average loading' should not be lost sight of. An increase in the average miles per car will not benefit a road individually if the increase is made by empty mileage, although such an increase tends toward an improvement in the general efficiency when the movement is made for the purpose of delivering empties to a connection. Neither is there anything gained by an increased per cent. of loaded mileage if the loading of the individual car is decreased proportionately, unless the light loading is in lieu of empty mileage and is made with a view to stimulating movement toward connecting lines and thus facilitating the general interchange of cars. For these reasons, it is equally unsatisfactory to consider the per cent. of loaded mileage aside from the other units.

"For the purpose of combining these various factors and securing a unit which will take them all into consideration, we show an 'average ton-miles per car per day.' This, we believe, provides a very good unit of performance for individual roads, although it is not claimed that it will be useful in comparing one road with another, there being many things entering into this figure which vary according to the operating conditions on the several roads, such as length of haul, capacity of equipment used, class of freight handled, etc.

"By comparing the 'average ton-miles per car per day' for the period of this report, with the figures for the last six months of 1906, it is noted that there was a decrease of only three ton-miles per car per day, or .91 per cent., which is a very satisfactory showing for three winter months. An improvement will also be noted in the 'per cent. of cars in shop' which decreased from 5.48 to 5.02, indicating the efforts which were being made by the railroads to increase the efficiency of their cars.

"There is little change in the figures under 'per cent. of cars on line.' Only about 54 per cent. of the business handled by the

railroads of the country is done with 'home' cars which confirms the oft repeated assertion that there already exists a virtual freight car pool, comprising practically all the freight cars in the country albeit such 'pool' is without regulation other than that provided by the per diem rules. That this general interchange will from time to time be extended rather than restricted, is inevitable, and that this condition is conducive to a higher efficiency and a consequent economy in operation, than would be possible under a less flexible system of interchange, can hardly be controverted. To be entirely equitable, however, such a system should be regulated by rules which would safeguard the rights of car owners and insure to them the use of their proportion of the equipment, or adequate compensation for any loss they may sustain by reason of an unequal interchange of cars. This principle has been twice affirmed by the American Railway Association."

The New York, New Haven & Hartford, which threatens to withdraw from the per diem agreement because of the cost of borrowed cars, owns 19,970 cars, has an average of 15,712 of these cars on its own lines, and has an average of 20,661 foreign cars on its lines. In other words, it owns about four-sevenths as many cars as are needed to do its business. It is to receive within the next six months 17,000 new cars. An interesting freight car item not shown in this report, but received from another source (a daily newspaper) is that in the month of June the Baltimore & Ohio, moving cars about 67 million miles, made them average 30.5 miles a day. In May, with a still larger movement, the average was 31.7 miles. These averages show about 10 per cent increase over the Baltimore & Ohio figures shown in the above-mentioned report.

More Railroad Agitation.

Minnesota is the last state to bid for notoriety in the regulation of railroads, and North Carolina, Alabama and Georgia will have to find some new thing with which to attract attention. In Minnesota, last week, Governor Johnson felt called upon to express his condemnation of Judge Lochren of the Federal court for lecturing the legislature. It appears that the Judge, in granting a temporary injunction against the enforcement of the freight rate reductions ordered by the legislature, gave pretty free expression to his opinion of the intelligence and judgment of the legislators, declaring that "such legislation is vicious, and a disgrace to the civilization of the age." What effect the Governor's utterances may have had on the public mind we do not know; but on Monday of this week, Judge Bunn, in a state court, the Ramsey County District Court (St. Paul), issued a writ of mandamus against the Northern Pacific to compel that road to put into effect the freight rate law which Judge Lochren had ordered suspended. Judge Bunn's writ is made returnable October 5. The latest move in Alabama is the sending of a circular by the Montgomery freight bureau asking shippers to give preference to railroads which have not resisted the enforcement of the state laws reducing rates—though Alabama has a law forbidding boycotts. In Texas the Attorney General on Saturday last entered suits against ten different railroads for failure to provide sufficient equipment and neglect in keeping track in order; for alleged failure to operate passenger trains on schedule time; for alleged refusal to receive a loaded car from a connecting line; for alleged failure to maintain a train starter at Fort Worth; for alleged refusal to furnish the commission with a statement of legal expenses; for alleged refusal to turn over a loaded car to a connecting line, and for alleged failure to provide passenger depot accommodations at Denison. In South Dakota the State Railroad Commission, at a meeting held September 20, voted to order all passenger rates in that state reduced October 15 to 2½ cents a mile.

The Public Service Commission of the Second District of the State of New York has issued a code of regulations for the reporting of railroad accidents, which, like the rules for the inspection of steam boilers heretofore noticed, are in the main highly commendable. In making its rules and its classification of accidents as nearly as practicable like that already in use by the Interstate Commerce Commission, the New York Commission has been considerate of the railroad superintendent who has to report accidents to a number of different authorities and whose work is much simplified if he is able to use the same report for all of the different persons or boards to which he must send the information. But in the list of accidents which must be reported by telegraph the New York Board has called for much more than will ever be used. To require telegraphic reports of all collisions involving freight trains will be to burden the telegraph wires to no purpose, for the great majority of the collisions do not demand the attention of a State Board—or, at any rate, they are so numerous that a State Board cannot afford to give attention to them in detail. In the last quarterly bulletin issued by the Interstate Commerce Commission the total number of collisions was 2,078; but more than half of these were classed as miscellaneous, meaning, in most cases, slight accident in yards; and of the 817 rear and butting collisions only 23 were considered of enough prominence to have their causes explained in the bulletin. If the list of 23 prominent cases were expanded to include ten times as many it would still contain only about one-fiftieth of all the collisions and would almost certainly include every case which could be instructively dealt with by a Government board. And it is to be remembered that the Government record excludes all collisions in which the damage to cars, etc., is less than $[illegible]. Telegraphing to Albany all minor accidents resulting in serious injury to any person would also seem to be in large measure superfluous. To be scalded by escaping steam from a broken gage glass is a serious injury; but a report of the accident by mail the next day would seem to be sufficient for all practical purposes.

Officers of the Pennsylvania Railroad who have been trying to arouse municipal officers and other authorities to do their duty in relation to the tramp nuisance, have succeeded in starting up a considerable public interest, if we may judge by editorial expressions which are quoted from prominent papers in Philadelphia, Pittsburgh, Buffalo, Rochester, Cincinnati, Chicago and other cities. These newspaper utterances evince a uniformly sensible attitude. The editors see clearly that the railroads deserve better treatment from the cities and towns. Also, they condemn the unfair practice, common among local officials everywhere, of sending tramps to the next town. Gifts of money for railroad fare and freedom from merited punishment are fully granted to almost any kind of a vagrant on condition that he leave town. This usually aggravates the difficulty which the railroads have to deal with, and does nothing to improve the situation.

Missouri, Kansas & Texas.

The annual report of this company is usually a more interesting document for general reading than that of most railroads, for it is the custom for the officers to discuss the most important facts bearing on the prosperity of the company in some detail instead of giving merely the bare record of the financial and operating results of the year. This custom has not been affected by the important changes in the executive heads of the road during the past two years. Henry C. Rouse, Chairman of the Board, died on April 30, 1906, and was succeeded by Adrian H. Joline, previously Counsel to the company at New York. In November of the same year F. N. Finney, President of the road, resigned, and Mr. Joline succeeded also to his office, becoming Chairman of the Board and President. In the annual report of the company for the year ended June 30, 1907, Mr. Joline, with the viewpoint of the trained lawyer, discusses the present problems which are confronting railroad managers the country over.

In the first place, he frankly admits that notwithstanding the large amounts of new equipment which have been bought during the last five years by the Missouri, Kansas & Texas, the company has found it impossible to keep up its equipment with the increase of its traffic. He then discusses the railroad legislation of the first half of 1907 in the various states and territories through which the road runs. Three new laws in Missouri—one reducing freight rates, one passenger rates and one abolishing bridge arbitraries—are likely, if finally put in effect, to reduce gross earnings of the road by $250,000. In Kansas freight rate reductions will cost the road about $100,000 a year, and a general reduction in passenger rates to 2 cents a mile is probable. In the Territory of Oklahoma freight rates have been reduced and the constitution of the new State of Oklahoma just adopted fixes 2 cents a mile as the maximum passenger rate. Texas has passed a number of laws increasing the expense of railroad operation and giving the railroad commission larger powers over rates, and has also changed the tax laws in such a way that the company's taxes will probably be increased by $200,000 a year. These laws directly affect the company. There is also an interesting example of the indirect effect of railroad legislation. Arkansas has passed a 2-cent-a-mile law, and although the Missouri, Kansas & Texas has not a mile of road in that state, the establishment of the 2-cent rate in Arkansas compels it to reduce through rates from the north to Texas in order to meet the rates of its competitors which operate through Missouri and Arkansas to Texas. As Mr. Joline well says in summing up the railroad legislation of the year, the rate reductions not only deplete the company's revenues from traffic moving wholly within each state, but also those from interstate traffic, the rates on which usually have to be reduced to correspond with the intrastate rate.

The following is an interesting summary by Mr. Joline of the general railroad situation as it affects both the road of which he is the head and other railroads:

"The condition of the crops along your system, although backward, is satisfactory, and promises a large yield. An increased acreage has been planted in cotton, which is expected to offset any decrease in production, which might otherwise have resulted from unfavorable weather conditions during the season of planting and growth. Harvesting, and consequently the movement of the crops, is later than usual. The outlook for the coal business is better than it has been for several years past. The failure of the wheat crop in Texas, and the great damage to that crop in Oklahoma, are factors rather to

your company's advantage than otherwise, as comparatively little wheat is produced along your road, and Texas mills must now draw their supplies from districts where your company is able to compete for the tonnage on most favorable terms. The movement of live stock promises to be fully up to our ability to take care of it. Commercial activity continues unabated throughout the communities served by your railroad; in fact, the industrial development of the territory tributary to your line is advancing with such vigor that only great disaster may check its growth. While the year under review has been one of remarkable prosperity, still, all things considered, it is confidently expected that the earnings will be as satisfactory during the current fiscal year.

"Yet, in spite of the increasing gross earnings and the bright outlook for continued prosperity, the situation of the railroads in the United States is not especially a happy one. We find ourselves without facilities adequate to handle all the traffic offered for shipment, and in an endeavor to meet the requirements, tracks and terminals become congested, motive power and equipment run down, roadway is impaired, men are overworked and other evils ensue tending to make transportation more difficult and vastly more costly for the railroads, as well as unsatisfactory to the public. The remedy for these evils lies in enlarging facilities and increasing equipment, but strange to say, the public, so vitally interested in the question of transportation, has assumed an attitude of hostility towards railroad corporations which has manifested itself in so many forms of oppressive and restrictive legislation as almost entirely to destroy the credit of railroads so far as obtaining new capital for improvements is concerned. At the same time it is impossible for the average railroad company to make extensive betterments from its current earnings, in view of the tremendous increase in the cost of labor, material and supplies. The policy of increasing the burdens on railroads and at the same time diminishing their earning power is neither just nor reasonable. Operating expenses are necessarily inflated to such an extent as to leave little or no balance after the payment of fixed charges and constantly increasing taxes. The legislatures of the several states demand impossibilities and require a reduction of rates, already the lowest in any country, without recognizing the fact that they are depriving the railroads of their income which in most cases would be expended in payment for betterments absolutely necessary for the safe, economical and expeditious movement of traffic. They call for expenditures while refusing to let the railroads earn the money to meet them.

The people of this country are not hostile to railroads; it is the greed and ambition of politicians which are responsible for the unjust requirements imposed. It is gratifying to observe that in Texas the press has, in the main, exhibited a due sense of the right, recognizing the necessity of railroad development in that great state and contributing to the defeat of the two-cent rate bill introduced in the Texas legislature.

"The law-makers have been aided in their assaults by the labor unions. The generous increase in pay and the shortening of the hours of labor have not been productive of increased efficiency. A spirit of unrest, discontent, and almost insubordination has permeated the ranks in nearly all the branches of the railroad service all over the country, and offers a problem for which we can suggest no satisfactory solution, principally because of the scarcity of labor, and especially of the experienced labor required for the safe and efficient operation of railroads. It is a source of gratification to know that these troubles are less serious with your company than with others. Our men are, in the main, loyal and faithful, and if they were left to themselves, without interference from ambitious and self-seeking outsiders, would readily admit that they receive fair treatment and are accorded their just rights.

"Railroad managers have good reason to view the future without optimism. They feel misgivings as to their ability to maintain the present standard of efficiency or to produce net returns as large as those of former years. Statistics show that while so far in 1907 there has been a substantial increase in the gross earnings of railroads as a whole, the net earnings have not gained proportionately.

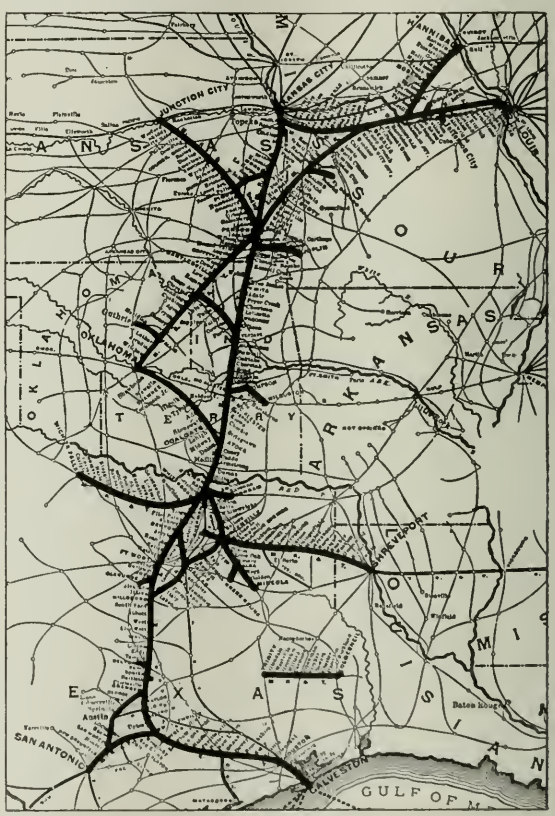
"The general conditions seriously affect your company, but it is believed that the exceptional development of the country tributary to your railroad will be reflected in future substantial increases in gross earnings; and that on completion of improvements now under way and such others as your company will doubtless find the means of undertaking, such economies in operation may be effected as will offset and perhaps overcome the adverse influences now so prevalent. There are hopeful signs of a growing realization in the mind of the public and of public officials of the true attitude of the railroads, evidenced by a more conservative tone in the recent utterances of the press and of representatives of the government who have hitherto proclaimed radical opinions on this subject; their modified views being the result, doubtless, of the extraordinary depreciation in the value of securities and the consequent uneasiness respecting the future prosperity of our country resulting from the indiscriminate agitation against railroads and the attacks on corporations in general. We believe that the American people are too intelligent and too thrifty to allow themselves to be misled by demagogues into a continuance of a policy which cannot fail to do incalculable injury to the general business of the nation."

When the actual results of the year for the Missouri, Kansas & Texas are considered, it is seen that it was exceptionally fortunate as compared with most other railroad companies. Gross earnings increased over $5,000,000, or 24 per cent., while net earnings increased over $2,700,000, or 48 per cent. This in a year when operating expenses were eating up most or all of the gains in gross earnings made by many other roads. It is apparent, however, from the monthly statements that the same tendencies which have been increasing operating expenses on other roads—in particular the high cost of labor and material—began to show themselves on the Missouri, Kansas & Texas before the end of the year. The road earned 4 per cent on its common stock after fixed charges and preferred stock dividends in the first six months of the fiscal year and only 5 per cent. in the whole 12 months.

Freight earnings increased $3,400,000, or 23 per cent., as a result of the largely increased movement of cotton, live stock, coal, ore, lumber and merchandise. The only commodity which showed material decrease in tonnage was grain, which, however, had nearly doubled in 1906 over 1905. Even in the case of this commodity the reduction in tonnage is less than one-half of 1 per cent.; though grain furnished only 9 per cent. of the total tonnage as against 11 per cent. in 1906.

Passenger earnings showed a gain of $1,120,000, or 22 per cent., due principally to two causes; the rapid growth of the country through which the road runs, and the popularity of the "Katy's" passenger service. Passenger earnings in 1905, the year of the St. Louis Exposition, were $4,900,000. They rose last year to $6,200,000. In February, 1906, a fast mail train was put in service between Parsons, Kan., and Denison, Tex., in connection with the St. Louis & San Francisco. Largely as a result of this service, during the last fiscal year the mail earnings have increased $148,000, or 39 per cent.

Operating expenses were larger by $2,250,000, or 15 per cent., yet in spite of all the unfavorable conditions mentioned, the ratio of operating expenses and taxes to gross earnings was 68 per cent., as against 73 per cent. in 1906 and 75 per cent. in 1905. Operating expenses include over $500,000 spent on betterments to the lines in Texas where the State does not allow improvements to be capi-



Missouri, Kansas & Texas.

talized. The proportion of conducting transportation to gross earnings—for years the weakest point in the operation of the road—has been slightly reduced. It was 40 per cent. in 1905, 39 per cent. in 1906, and 38 per cent. last year. The cost of conducting transportation was 20 per cent. larger than in 1906.

Maintenance of way cost less in total and per mile operated. The cost per mile was $1,129 against $1,231 in 1906. The road leases its entrances to Kansas City, San Antonio and Galveston and several stretches of track on its branch lines, including a new connection from Austin, Tex., to San Marcos, 30 miles, owned by the International & Great Northern which it began to use July 1, 1906. Therefore the unit maintenance of way figures are probably too low, for the M., K. & T.'s share of the maintenance of some of the leased lines is likely to be included in the rental. The total payments for rentals for the year were $478,500. Unit figures for maintenance of equipment cannot be worked out as detailed figures for the operating accounts are not given in the report.

One of the great weaknesses of the road has been its heavy grades in the southern part of Indian Territory, which have greatly hindered efficient operation. Work is now under way on the reduc-

tion of both north and southbound maximum gradients to 0.4 of 1 per cent compensated between Atoka, Ind. T., and the Red river, the Texas boundary. The clearing and concrete work has been finished and providing it is possible to get the necessary labor, the lack of which has been one of the greatest difficulties throughout the undertaking, all the grading will be finished this fall. Certain sections of the new line are already nearly ready for operation and it is expected that heavier trains can be run over this part of the road by the end of the year. North of Atoka, between that point and McAlester, Ind. T., the cutting down of the two largest southbound and a northbound grade has been begun. This part of the road also, as improved, it is hoped to put in service before the end of the year. Surveys for grade reductions as far north as Parsons, Kan., are under way and nearly finished. When all these grade reductions are finished there is to be a 0.4 of 1 per cent grade from the Red river north to Muskogee, Ind. T., and a 0.3 of 1 per cent grade from Muskogee north to Parsons, Kan. It is expected that on the new grades an engine will be able to haul double the freight tonnage which it can pull at present over this part of the road.

The principal results of operation are given below for the last three years—a fine record of progress:

	1907	1906	1905
Mileage worked	3,072	3,043	3,043
Freight earnings	$18,102,825	$14,968,831	$14,131,335
Passenger earnings	6,278,608	5,157,881	4,935,592
Gross earnings ...	26,183,959	21,159,145	20,041,095
Maint. of way and structures	3,467,910	3,740,211	3,643,201
Maint. of equipment	2,914,953	2,044,313	1,925,195
Conducting transportation	9,903,801	8,224,348	8,114,061
Operating expenses	17,249,134	14,990,298	14,568,436
Net earnings	8,934,825	6,168,847	5,472,659
Net income	3,682,311	1,653,088	1,267,191
Year's surplus	3,162,311	798,124	29,049

Chicago & North-Western.

The most noticeable fact in the record of the Chicago & North-Western this year is that there was no appropriation from income for construction, improvements and permanent additions, as there has been for years past. For the last seven years such annual applications of income to the betterment of the property have averaged over $4,000,000 a year, and in 1906 there was $6,000,000 thus set aside. The failure to make any such appropriation last year is a striking change in policy, for the company has long been notable for the large improvements to its property made out of surplus income year by year. The change may have been due to the difficulty of raising railroad funds in the present market and the consequent desirability of having as large an amount of surplus funds on hand as possible, or it may be connected with the new system of stock available for future issue. There is no likelihood at the present time, when the cost of labor and materials is at a maximum and when new stock could be sold only at a minimum figure, that a further extension of one of the company's western lines to the Pacific coast will be undertaken. But as long as there is this large amount of stock in the treasury the possibility of a through line to the coast by a company which already covers two-thirds of this distance, but which now gets an average haul of only 144 miles on all its freight traffic, will be a live one.

The year's gross earnings were thoroughly satisfactory. They increased $5,400,000, or 8 per cent, over 1906, but operating expenses were $5,000,000 larger, leaving a nominal gain of only about $400,000 in net earnings. Passenger earnings increased more proportionately than freight earnings, 12 per cent for the former against 7 per cent for the latter. The largest increase was in earnings from first class passengers, the smallest in earnings from commutation passengers. There was a slight reduction of the passenger-mile rate during the year, due probably to the reduction of fare to $2\frac{1}{2}$ cents a mile early this year in Wisconsin, but in spite of this the average passenger train earnings per mile increased by 6 per cent. The earnings per ton-mile were exactly 9 mills, a slight increase over the previous year, and there was an increase of 3 per cent. in the earnings per freight-train mile. Car loading was more efficient by 6 per cent., but the trainload increased only 0.4 per cent.

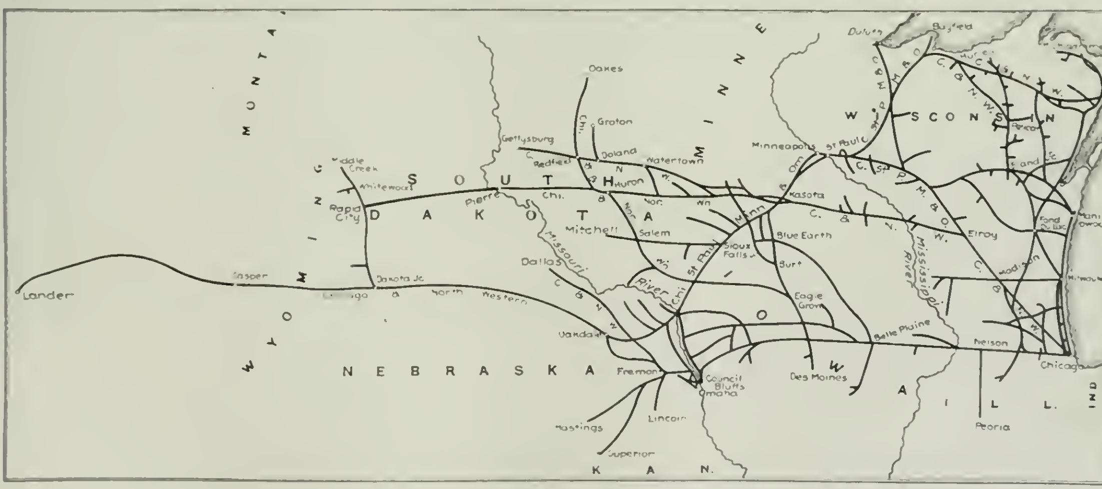
The North-Western analyzes its maintenance expenditures in considerable detail, perhaps because they have long been so low that frankness is essential. It is one of the few roads which gives separate figures for renewals and repairs of equipment. From these we learn that nothing was spent on replacement of passenger cars during either of the last two years, and nothing on new locomotives purchased for replacements in 1907, while between $2,000,000 and $3,000,000 was spent on renewal of freight cars in each year. The following table gives in some detail the unit maintenance charges for way and equipment during the last two years.

Unit Maintenance Expenditures.

	1907	1906
Maintenance of roadway and track per mile*.	$866	$678
Maintenance of way and structures, per mile.*	1,185	929
General repairs of locomotives, per locomotive.	1,684	1,559
Reprs and renwls locomotives, per locomotive.	1,684	2,340
Of passenger cars, per passenger car.....	475	455
General repairs, freight and work cars, per car.	46	35
Reprs and renwls, freight and work cars, pr car	84	83
Of freight cars, per car.†	84	84

*Not including trackage.
†Not including work cars.

These equipment figures are low, lower than would seem possible for a road like the North-Western, if it were not that it has been



Chicago & North-Western.

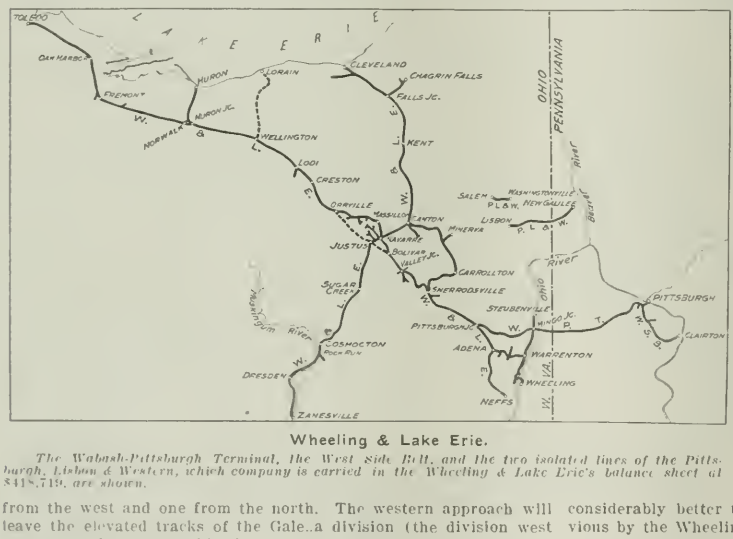
depreciation accounting prescribed by the Interstate Commerce Commission for use in the fiscal year now under way.

Not having any such ambitious plan on hand—openly, at least—as its neighbor and competitor, the Chicago, Milwaukee & St. Paul, the North-Western has not during the year, expanded its capital to any such extent as the St. Paul. In fact, more new stock was issued in the 1906 than in the 1907 fiscal year. In February, 1907, an issue of $24,400,000 common stock was made, bringing up the total capital outstanding to $124,000,350, of which $22,400,000 is preferred and $101,950,000 common. At the annual meeting on October 18, 1906, however, additional common stock sufficient to bring the aggregate capital of the company to $200,000,000 was authorized, so that the North-Western has nearly $75,000,000 common spending so little for years. The appropriation of $2,200,000 for freight and work car renewals is all that saves that item from being entirely too small in this day of high costs, to keep the freight equipment intact. Last year, for the first time in the history of the road, there was over $1,000 per mile spent on maintenance of way. This includes all charges under that account, that is, repairs and renewals of interlocking plants, block signals, bridges and culverts, buildings and fixtures, docks and wharves, fences, road crossings, signs and cattle guards and sundry miscellaneous charges, besides the direct charges for roadway and track which, as shown in the table, amounted even last year to only $866 per mile. As in the case of the St. Paul, which spends even less per mile on maintenance of way, the large proportion of branch line mileage and the

long stretches of road in prairie regions where for most of the year the traffic is light, goes far to explain this fact; yet in comparison with other high grade properties, the amount spent by the North-Western in maintaining its permanent property is astonishingly low.

Three new lines have been opened for traffic during the fiscal year: the extension from Casper, Wyo., west to Lander, 148 miles, bringing the westernmost terminus to within 200 miles of Pocatello, Idaho, on the Oregon Short Line; a relief and connecting line 123 miles long, north and west of Manitowoc, Wis., and a parallel double-track line 50 miles long from Milwaukee south to a connection with a similar line previously built extending north from Chicago, this last piece of construction giving the North-Western four main tracks between Chicago and Milwaukee. The extension from Pierre, S. Dak., on the Missouri river, west to Rapid City, 164 miles, has been opened for traffic since the close of the fiscal year. It is not, however, yet connected with the eastern lines because the bridge across the Missouri river at Pierre is not yet finished. This bridge is being built by the Pierre & Fort Pierre Bridge Railway Company. Its substructure of seven masonry piers is finished. The steel superstructure consists of four fixed spans each 350 ft. long and a draw span 445 ft. long. It is expected that the bridge will be opened for freight traffic by the end of next week. One or two other short extensions, which will be found listed in the Railroad Construction column, have also been undertaken.

Plans for the new passenger terminal in Chicago are indicated in the report. The new terminal is to have 16 tracks elevated above the plane of the street, with two elevated four-track approaches, one from the west and one from the north. The western approach will leave the elevated tracks of the Galena division (the division west toward Omaha) near Ashland avenue and run eastwardly 1.12 miles to Jefferson street. The northern approach will leave the elevated tracks of the Wisconsin division (comprising the lines running northwest and north from Chicago) near Carpenter street and run 0.90 miles southerly to Jefferson street, from which the combined tracks of the two approaches will run 0.3 miles to the terminal at Lake street. There was charged to construction in capital account during the year $196,640 on account of the new terminal, and the balance sheet shows a further item of $4,900,000, "Real estate in suspense and advances on account of the new Chicago passenger terminal."



Wheeling & Lake Erie.

The Wabash-Pittsburgh Terminal, the West Side Belt, and the two isolated lines of the Pittsburgh, Lisbon & Western, which company is carried in the Wheeling & Lake Erie's balance sheet at $418,719, are shown.

Various miscellaneous improvements were made during the year, including new freight terminal buildings at Omaha and an overhead highway bridge 1,757 ft. long across the new Proviso freight yard at Melrose Park, just out of Chicago on the Galena division. After the close of navigation this year a new iron ore dock 1,461 ft. long and 50 ft. wide is to be built at Ashland, Wis. There was an increase of $312,000, or over 600 per cent., in the item "repairs and renewals of docks and wharves" under operating expenses, due largely to extension of the company's coal dock at Ashland, Wis., and other similar improvements there.

Two purchases made during the year suggest the trend of the times in eliminating subsidiary companies dealing with the smaller and sometimes independent parts of railroad operation. At Milwaukee the railroad bought two grain elevators with a total capacity of 1,500,000 bu., which adjoin the North Western terminal in that city. The bridge company which has owned the railroad bridge across the Mississippi river at Clinton, Iowa, heretofore operated under lease, was also purchased.

The Chicago, St. Paul, Minneapolis & Omaha, which operates 1,700 miles of the North-Western system, had gross earnings of $11,000,000, net earnings of $5,000,000, net income of $2,800,000 and surplus for the year, after paying 7 per cent. on both its common and preferred stock, of $756,000. The Chicago & North-Western received $1,029,000 in dividends from its subsidiary.

The principal results of the last two years' operation of the Chicago & North-Western Railway are summed up in the following table:

	1907.	1906.
Mileage operated	7,551	7,429
Passenger earnings	$16,111,789	$14,441,415
Freight earnings	49,083,246	45,802,853
Gross earnings	68,878,931	63,481,578
Maint. way and structures.	8,904,941	6,864,898
Maint. of equipment	8,713,026	9,032,135
Conducting transportation	25,990,596	22,786,687
Operating expenses	44,789,025	39,789,009
Net earnings	24,089,906	23,692,479
Net income	15,740,566	14,800,553
Dividends	7,910,178	6,483,914
Betterments and additions		6,000,000
Year's surplus	7,830,388	2,316,639

Wheeling & Lake Erie.

It was in June, 1905, that B. A. Worthington, now First Vice-President and General Manager of the Wheeling & Lake Erie and the Wabash Pittsburgh Terminal, came to these properties. The Wheeling & Lake Erie, therefore, has now been two full fiscal years under the new management. The operating results obtained have been strikingly successful. The road's great handicap has been, and still is even more at present, lack of funds. The problem is not one of getting traffic but of taking care economically of business that can be obtained.

A year ago important improvement projects were under way. A new issue of $35,000,000 fifty-year, 4 per cent. bonds had been created and $12,000,000 of this issue used to secure $8,000,000 three-year, 5 per cent. notes which were sold in August, 1905, at 95. Part of the $7,600,000 cash thus obtained was used in paying off floating debts, the rest in putting under way various improvements. The most important of these were a cut-off from Bolivar, Ohio, northwest to Orrville, 22 miles, which was to reduce the distance between these points by 6.6 miles, maximum curvature from 9 to 3 deg. and maximum grade from 1 per cent. to 0.4 per cent.; and also a branch, 35 miles long, from the main line to Lorain, on Lake Erie. According to the annual report of a year ago, it was expected that both these new lines would be finished by the end of 1906. A good deal was done on each of them but some time ago work was abruptly stopped because of lack of funds. Not only was it still impossible to sell bonds, but the strongest railroads in the country had to give considerably better terms than those secured less than a year previous by the Wheeling & Lake Erie to place any of their short-term notes.

The balance sheet shows how much the Wheeling & Lake Erie is now in need of money. Cash on hand stood at $2,500,000 on June 30, 1906, against $659,000 a year later. Current liabilities on June 30, 1907, exceeded current assets by over $1,500,000. Although there is probably not a railroad in the country which could not at once profitably use new funds in improving its property, the Wheeling & Lake Erie is a conspicuous example of the handicap of lack of ready capital. The main line between Pittsburgh Junction and Huron Junction can scarcely carry any more traffic than it does, until it is double-tracked. During the busy months of the past year the traffic density on this stretch of single-track was at the annual rate of over 7,000,000 ton-miles per mile of road. The profitable economy of double-tracking this section has been conclusively proved by the records of the operating department, yet there seems to be no immediate probability that this work, the important grade reduction in the neighborhood of Massillon already referred to, or the completion of the Lorain branch where much profitable traffic awaits the road, can soon be carried out. With roads like the Pennsylvania and the New York Central postponing improvements because they cannot get funds, the Wheeling & Lake Erie has no chance at present of making satisfactory borrowings.

In spite of handicaps to economical operation, the operating results for the year were exceedingly satisfactory. In the year previous even with the loss of traffic due to the coal strike, gross earnings increased 15 per cent. and net earnings 63 per cent.; last year gross earnings again increased 15 per cent. and net earnings 28 per cent. Of the increase of $1,528,600 in the gross earnings of 1907 over those of 1905, 32 per cent., or less than one-third, was spent

for operating expenses notwithstanding increased costs for labor and materials, while 68 per cent. was saved for net earnings. As a result, net earnings per mile of road were $1,522 in 1907 against $2,164 in 1905, a gain of 109 per cent., while the operating ratio was reduced from 79 per cent. in 1905 to 71 per cent. in 1906, and 67 per cent. last year.

Such favorable results were brought about largely by that most important operating economy, increase in train and car loading. The average train carried 422 tons of revenue freight in 1905, 508 tons in 1906 and 605 tons last year, a remarkably high figure for a road with considerable branch-line mileage. Including company freight, the average trainload last year was 643 tons. The average loaded car-load has increased from 26 tons in 1905 to 31 tons last year. At the same time earnings per freight train mile have increased 78 cents in the past two years, while the cost of running a train one mile is larger by only 27 cents. The ton mileage increased 17 per cent. in 1907 over 1906, although only 4 per cent. more freight train miles were run. Compared with 1905, tons hauled one mile increased 49 per cent. last year, with an increase of only 4 per cent. in train mileage.

The passenger results show the effect of the two-cent passenger law in Ohio. While the volume of passenger traffic in 1907 was about the same as in 1905, there was a decrease of $46,366, or 7 per cent., in the passenger train earnings in the two years. The average receipts per passenger-mile were $1.81 in 1905, $1.81 in 1906, and $1.66 in 1907.

Detailed figures for the four principal operating expense accounts are given this year for the first time. There was somewhat less spent on maintenance of way than in the previous year. Maintenance of equipment on the other hand was larger by 19 per cent., due, according to Mr. Worthington, "to the large increase in volume of traffic handled and increased equipment to be taken care of with little increase in facilities for keeping it in repair." From the tables given in this year's report it is possible to work out the amounts spent by the Wheeling & Lake Erie for maintenance per unit of track and of equipment during the last four years. These figures are given in the following table:

Unit Maintenance Expenditures 1904 to 1907.

	1907.	1906.	1905.	1904.
Maintenance of way per mile	$1,618	$1,793	$1,657	$1,555
Repairs and renewals				
Per locomotive	2,007	1,595	1,662	2,091
Per passenger car	435	735	612	721
Per freight car	35	31	26	28

Interest in this table centers in the equipment maintenance. It is evident that, taking the last four years as a whole, the equipment has been undermaintained, particularly the freight cars. The inventory of freight equipment seems to prove this point as, instead of the expected increase in number of freight cars which so busy a year as 1907 would be likely to demand, there are 147 less freight cars listed. There is, however, a discrepancy between this table and a statement in the first part of the report that during the year 2,009 new gondola cars of 100,000 lbs. capacity were added to the equipment. These are not shown in the inventory. They appear to be cars leased from the Wabash, for which $195,000 is included in the income account as rental. It is not likely that this item of rental includes the ordinary maintenance of these cars, therefore they have been added to the total freight car equipment as of June 30, 1907 shown in the inventory to get the total figure used in working out the figure for maintenance per freight car in 1907. If these 2,009 cars had not been included—and perhaps as they were new cars and may have come to the Wheeling & Lake Erie late in the fiscal year, it would have been equally fair not to include them—repairs and renewals per freight car for 1907 would have amounted to $41 instead of $35 as shown in the table. This does not affect the general conclusion, however, that the road has been and is spending less for maintenance than is necessary to keep its equipment in proper condition.

A statement of classified tonnage is also given for the first time in this year's report. This shows that products of mines make up 70 per cent. and manufactures and merchandise 23 per cent. of the road's total tonnage. There was a particularly large increase last year in the tonnage of bituminous coal and bar and sheet metal carried. The total revenue tonnage was 9,608,590 tons, against 8,571,240 tons in 1906. An unusual figure included in the report is the percentage of "unbalanced" traffic, that is business moving in one direction for which no equivalent traffic was moved in the opposite direction, a class of traffic which tends to reduce train loading and economy of operation. This was 32 per cent. of the total traffic in 1905, 38 per cent. in 1906 and 41 per cent. last year. With this increasing difficulty to contend with, the showing of the operating department appears even more satisfactory. The average net tonnage per locomotive-mile was 571 tons against 633 tons per train-mile. Gross tonnage per train-mile—a figure not often given—was 1,298 tons and gross tonnage per locomotive-mile 1,169 tons.

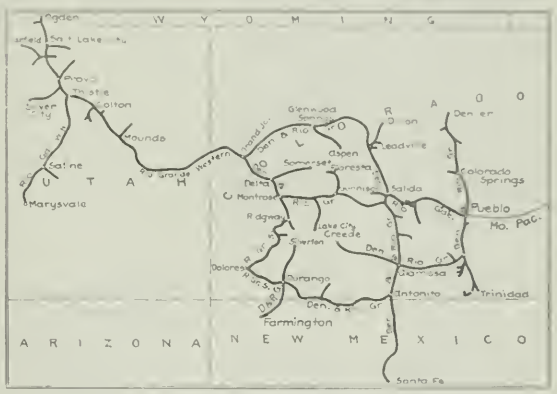
The showing of the Wheeling & Lake Erie is particularly interesting because its operations are not so large as to obscure a comprehensive view of the happenings of the year. With something like microscopic clearness, it represents in many ways the situation of the other railroads of the country. It has plenty of [illegible] and is well operated but suffers a severe [illegible] because its traffic has outgrown its facilities and it cannot borrow money to make improvements which would soon pay for themselves in greater efficiency of operation.

The following table sums up the growth of the property during the last three years:

	1907.	1906.	1905.
Mileage worked	442	442	442
Gross freight earnings	$[illegible]	$[illegible]	$[illegible]
Gross passenger earnings	[illegible]	[illegible]	[illegible]
Passenger per mile	[illegible]	[illegible]	[illegible]
Gross earnings	[illegible]	[illegible]	[illegible]
Maint. of way and [illegible]	[illegible]	[illegible]	[illegible]
Maint. of equipment	[illegible]	[illegible]	[illegible]
Conducting transportation	[illegible]	[illegible]	[illegible]
Operating expenses	[illegible]	[illegible]	[illegible]
Net earnings	[illegible]	[illegible]	[illegible]
Net income	[illegible]	[illegible]	[illegible]

Denver & Rio Grande.

The Denver & Rio Grande this year presents a strong showing. Both Colorado and Utah enjoyed general prosperity. Labor was peacefully employed at good wages and the mining industries from which the road gets 80 per cent. of its tonnage and 50 per cent. of its revenue, were prosperous. At the same time there was a large movement of general traffic; manufactures, merchandise and general merchandise furnishing together 11 per cent. of the tonnage and 53 per cent. of the revenue, against 9 per cent. of the tonnage and 30 per cent. of the revenue in 1906. Instead of cutting down appropriations for betterments and new equipment, as several other roads did last year, the Denver & Rio Grande increased its appropriations for these purposes by $375,000, with a total of $1,525,000 devoted



Denver & Rio Grande.

to such purposes. The use of most of the net income in this way is justified by President Jeffery for two reasons; first, because securities cannot be sold except at great sacrifice, and, second, because the authorized bond issues are not far from used up. The total of unissued bonds available for additions and improvements is about $3,100,000—$2,100,000 Denver & Rio Grande first-mortgage 4 per cents. and $1,000,000 Rio Grande Western first consolidated mortgage 4 per cents.

Comparison is made between the condition of the property last year and in 1896, 11 years earlier. The reason for selecting 1896 for comparison is because that year marked the resumption of dividends on the preferred shares (at the rate of 2 per cent. instead of at the present rate of 5 per cent. a year) after the trying period from 1893 to 1895. During the 11 years, improvements and additions have been made from income at a cost of over $12,000,000, an average of more than $1,000,000 a year. During this period gross earnings increased 114 per cent. and net earnings 96 per cent. With an increase of only 33 per cent. in fixed charges, 200 miles of narrow gage line were changed to standard gage and 375 miles of line added to the mileage of the road. The mileage of second track increased 121 per cent., the number of locomotives 46 per cent. and their tractive power 110 per cent.; the number of freight cars 72 per cent., and their tonnage capacity 115 per cent. This is a record of steady advancement if not of extraordinary progress.

The gross earnings last year were $21,400,000, an increase of $1,700,000 or 9 per cent. over 1906. Operating expenses increased $1,150,000, leaving net earnings of $8,150,000, an increase of $575,000 or 8 per cent. The gross earnings per mile were $8,564, nearly $4,000 a mile more than for the year ended June 30, 1896, and net earnings per mile were $3,263, or about $1,350 a mile more than 11 years earlier. Of the increase in gross earnings, $1,280,000 came from freight; $345,000 from passenger, and $99,000 from express, mail and miscellaneous earnings.

The maintenance charges were about the same as in the pre-

ceding year except that a great deal more was spent on repairs and renewals per freight car. Maintenance of way and structures per mile cost $940, against $975 in 1906 and $826 in 1905; repairs and renewals were $2,275 per locomotive, against $2,277 in 1906 and $1,970 in 1905; $500 per passenger car, against $607 in 1906 and $466 in 1905; and $76 per freight car, against $67 in 1906 and $44 in 1905. In judging the maintenance of way figure it must be remembered that 795 out of the 2,500 miles operated are narrow gage; the maintenance of equipment figures also include as large or a larger proportion than this of narrow gage equipment. Therefore, figured on standard gage line and equipment, the unit charges would probably be somewhat higher.

Conducting transportation rose from $6,600,000 to $7,400,000, an increase of 12 per cent. Every item but three under this account shows an increase. The largest of the three decreases is in "injuries to persons," due to the large increase in this item in the previous year because of the disastrous collision at Adobe, Colo., on March 16, 1906; the other two decreases are small, one in advertising, the other in "other expenses." The principal increases were in engineers and firemen, fuel for locomotives, roundhouse men, freight train service, passenger train service, station service, and switchmen, flagmen and watchmen. Per diem payments rose from $204,000 in 1906 to $308,000 last year, an increase of 51 per cent.

Apparently the Denver & Rio Grande is one of the roads on which the recent car shortages have fallen most heavily. "Clearing wrecks" rose from $39,000 in 1906 to $69,000 last year, an increase of 77 per cent., which suggests the increasing laxity of railroad operating labor.

Two new extensions in the Bingham district, Utah, to the newly developed mines and smelters in that region were finished during the year and are now in operation. Already it has been necessary to improve them because the tonnage of low-grade ores to be moved from the mines to the smelters has rapidly increased. The two branches are together 28 miles long, and about $245,000 Rio Grande Western 4 per cent consolidated mortgage bonds were issued during the year on their account.

In regard to the Western Pacific, President Jeffery says that work has been delayed by the general scarcity of labor, a difficulty accentuated in its case by the demand for men in San Francisco following the earthquake and fire of April, 1906. On June 30 there were 177 miles of track laid and grading was being done faster than it had been during the preceding 10 months or a year. There has been slow progress at certain important tunnels which must be finished before the through line can be opened. As these threaten to delay the whole work, especial attention is now being given to hurrying this branch of the work and the contractors have been pressed as strongly as possible to make more satisfactory progress. It is hoped and believed that the Western Pacific will have a continuous line of rails from Salt Lake City, Utah, to Oakland, Cal., by September 1, 1908, or very soon thereafter.

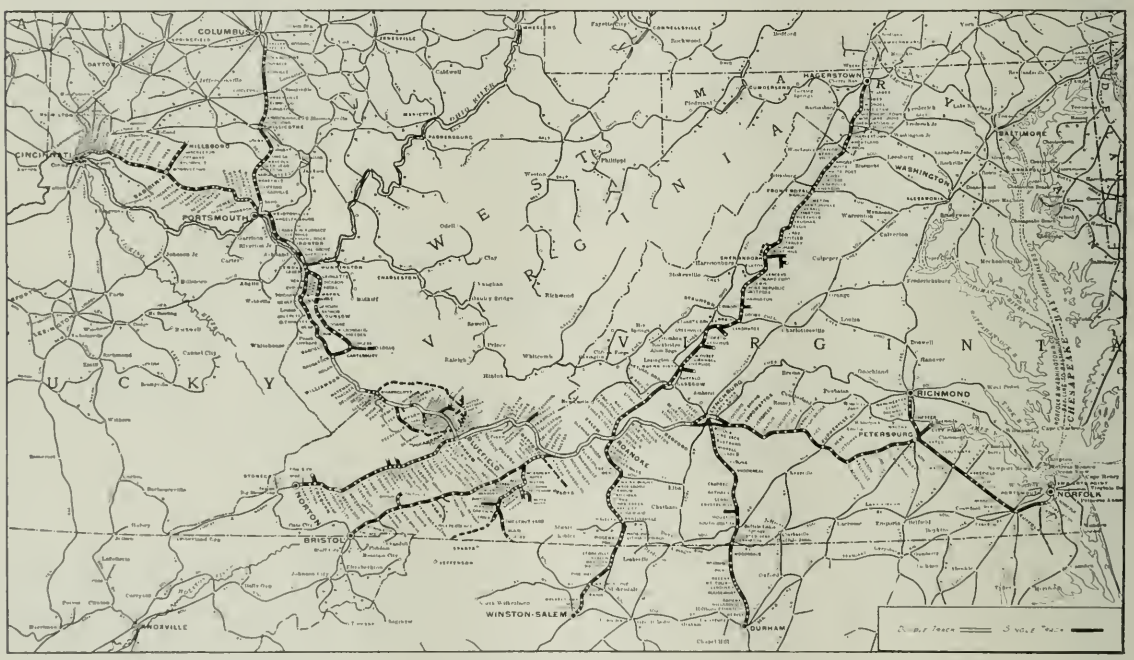
The results of the last two years' operation are summarized below:

	1907.	1906.
Mileage worked	2,500	2,477
Passenger earnings	$4,954,159	$4,609,428
Freight earnings	15,223,165	13,943,556
Gross earnings	21,409,042	19,686,115
Maint. way and structures.	2,349,841	2,415,353
Maint. of equipment	2,940,743	2,566,411
Conducting transportation.	7,418,699	6,621,986
Operating expenses	13,252,142	12,104,172
Net earnings	8,156,929	7,581,943
Net income	4,176,797	3,712,474
For betterments, etc.	1,645,000	1,270,000
Year's surplus.	244,944	156,839

Norfolk & Western.

During the past year the dividend rate on Norfolk & Western common stock was again increased, so that now 5 per cent. annually is being paid instead of 4 per cent. as in the year before and 3 per cent. in 1905. The road's statement, however, shows a distinct recognition of the present strained condition of the market for railroad funds and of the general uncertainty as to the future of the financial and industrial situation. Extension projects which were spoken of in the report of a year ago as "important improvements yet to be undertaken" are not mentioned at all this year. Smaller appropriations are made out of the surplus income of the year for betterments and equipment than in the year previous. The company is evidently holding cash and postponing improvements. As a result of this policy, the cash on hand stands at $4,400,000, against $4,150,000 on June 30 of the year before and $6,300,000 in 1905. The cash item for 1907, however, will be almost doubled on receipt of $4,076,000 in deferred instalments of payments on the new convertible bonds which were issued during the year.

Last fall the stockholders authorized $34,000,000 convertible 4 per cent. bonds. Of this amount $14,576,000 was offered to stockholders at par last December. Not all was taken by them, but as the issue was underwritten, the company obtained cash for the whole amount, less the underwriter's commission. Stockholders' payments for the bonds were to be made, 10 per cent. on January 31, and 60 per cent. on May 31. From the item shown on the balance sheet, of $4,076,000 deferred instalments on these bonds, it appears that part of the underwriting agreement must have been the postponement of part of the underwriters' payments until some date later than June 30. The $10,000,000 which was earlier paid in had apparently already been used by that date. It is reflected in an increase of $18,000,000 in the assets of the company over June 30, 1906. The Norfolk & Western, like all the other railroads which secured new funds at the end of 1906 on terms which then seemed



Norfolk & Western.

liberal, was fortunate to have made its arrangements at that time, for it could hardly have obtained money three months or six months later, and the record shows that the whole amount of these funds was urgently needed to care for the needs of the property, which were expanding with or faster than the earnings.

Gross earnings in 1907 were $31,200,000, against $28,500,000 in 1906, an increase of 9 per cent. Operating expenses, however, increased 15 per cent., the actual increase being almost as much as the increase in gross earnings. In consequence, net earnings were $11,650,000, a gain of only $227,000 or 2 per cent. over the previous year. There was an increase of 15 per cent. in fixed charges, which included taxes heavier by 35 per cent. than in 1906, and, as a result, net income was only $7,000,000, against nearly $7,500,000 in 1906. Common stock dividends were larger by over $600,000 than in 1906, but the betterment appropriation was only $250,000, as against $2,250,000 in the year before, the equipment appropriation, however, being $996,652, as against $700,000 in 1906. These appropriations together were smaller by $1,703,348 than in 1906. In this way in spite of an increase of nearly $500,000 in the amount charged against income for discount on bonds, final surplus for the year was kept at about the same figure as in 1906. If the management could have foreseen the present state of the railroad financial market and the tremendous increases which were to come in the cost of railroad operation, it is probable that they would not have increased the rate of distribution on the common stock as they did, although, thus far at least, the Norfolk & Western is clearly able to pay that amount, having earned 7 per cent. on the common stock last year after appropriations for betterments and other miscellaneous charges, and 9 per cent. if these deductions are included in the surplus after preferred dividends.

There was an increase of 16 per cent. in passenger earnings, due to an increase in number of passengers carried and slight increases in the passenger haul and passenger-mile rate. Freight earnings increased 8 per cent. owing to the same three causes in similar proportions. For the first time in a number of years there was a decrease in the trainload, which fell from 579 to 569 tons.

There was a small decrease in coal shipments and in shipments of pig and bloom iron, while coke tonnage showed a small increase and ore tonnage an increase of 11 per cent. The largest other tonnage increases during the year were in grain; stone, sand, etc.; lumber; cement, brick and lime, and merchandise.

The principal cause for the large increase in operating expenses was the much greater cost of conducting transportation, which increased from $8,400,000 to $9,800,000, a gain of 17 per cent. Some of the comparative figures for the two years under the operation branch of this account were as follows: Station service (freight), $627,000, against $493,000 in 1906; yardmen, $438,000, against $347,000 in 1906; passenger trainmen, $203,000, against $177,000; road enginemen and firemen (freight), $1,691,000, against $1,413,000; other supplies for locomotives, $101,000, against $74,000; elevator and longshore labor, $175,000, against $133,000; loss and damage, $366,000, against $208,000; clearing wrecks, $121,000, against $99,000. Here are clearly shown the large cost of supplies, the greater cost and smaller efficiency of labor, and the general decreased efficiency of operation which is likely to come with great increases in business.

The maintenance accounts both show increases. Maintenance of way per mile rose from $1,856 in 1906 to $2,077 last year. Besides this there was $2,194,000 spent for construction betterments out of the Betterment Fund which has been set aside out of the surplus earnings of this and previous years. Maintenance of equipment as a whole included $813,000 for replacements and $160,000 credited to the equipment fund, about the same total amount as was charged in the previous year. Not including replacements, repairs cost $1,921 per locomotive, against $2,203 in 1906; $690 per passenger car, against $677 in 1906, and $55 per freight car, against $51 in 1906. Considering that these include repairs only, the amounts spent are liberal.

A year ago contracts had been let for building two single-track branches which together were to furnish a new low-grade line south of the city of Lynchburg, Va., shown on the map. The company's right to apply the power of eminent domain in building this cut-off under the guise of two new branches, was questioned in the courts. The Supreme Court of Appeals of Virginia decided that the railroad did not have the power to condemn land for these two branches whose dominant purpose was to relieve traffic congestion, as construction of auxiliary sections of road for the purpose of relieving traffic congestion was not within the branching powers of the company. This decision necessitated the organization of the Lynchburg Belt Line & Connecting Railway Company to which the Norfolk & Western is to sell this cut-off line in consideration of the sum of $2,748,785—its estimated cost—which is payable February 1, 1913, with interest at 5 per cent. from February 1, 1908. A trackage agreement is to be made with the Lynchburg company for use of its tracks. The cut-off, which is to be finished about the end of this calendar year, will be about 22 miles long.

President Johnson sums up the present railroad situation as it affects his property as follows:

"The policy of your management has been to supply adequate facilities [illegible] fully employ all such facilities were they now completed and in use.

"The rapidly progressing development of the [illegible] territory tributary to your lines makes it increasingly evident that the demand on your management for transportation cannot be properly met without complete double-tracking of the line from [illegible], Va., to [illegible], Ohio, which will involve the construction of 150 miles of second track in addition to that already authorized, and such additional passing sidings and other facilities east of [illegible] and elsewhere, and such equipment as may be necessary to maintain the proper equilibrium in the carrying capacity of the system.

"This work, while important to the interests of the stockholders, is equally important to the welfare of the commonwealths traversed by your lines, and of their citizens who are striving to develop the natural wealth of their states and to broaden the market for their mineral and other products. It therefore goes without saying that any policy which hampers the development of the railroads, or by depleting their revenues lowers their credit and thus repels investors who would otherwise purchase their securities at fair prices, cannot but be fraught with disaster both to the states and to the roads. It is not believed that such a policy will commend itself to the dispassionate judgment of the communities served by your lines, or that in the effort to correct abuses that may exist, unjust treatment will be accorded to corporations that are honestly endeavoring to fulfil the purposes for which they were chartered. It is only 11 years since your railroad passed through a receivership and foreclosure and a drastic reorganization, and it certainly cannot be seriously claimed that the small dividends since paid to the shareholders have yielded even a just return on its capital. The owners of your property are entitled to the same good faith which is properly exacted from them, and no temporary prejudices or misunderstandings can excuse or justify action which would deprive a railroad shareholder of the rights and remedies which are guaranteed to all classes of the community. It was with this conviction and in the performance of a duty imposed upon your board of trustees for the shareholders, that it felt itself constrained to take the legal proceedings recently initiated in Virginia for the protection of your interests in connection with the proposed reduction of your rates on passenger traffic; and it is a matter of congratulation that with the concurrence of the representatives of the Commonwealth of Virginia, an arrangement was reached whereby a speedy determination can be had of the important questions at issue without, it is hoped, undue damage to your property."

The principal results of the last two years' operation are summed up in the following table:

	1907.	1906.
Mileage worked	1,876	1,853
Passenger earnings	$4,163,119	$3,598,558
Freight earnings	26,100,946	24,111,891
Gross earnings...............	31,164,381	28,487,706
Maint. way and structures.	3,895,548	3,439,797
Maint. of equipment	5,239,899	4,749,832
Conducting transportation .		
Traffic	537,674	441,678
Operation	9,256,228	7,913,695
Operating expenses	19,514,536	17,064,624
Net earnings	11,649,846	11,423,142
Net income	7,000,319	7,452,375
For betterments and equipment	1,246,652	2,950,000
Surplus for the year	671,552	589,926

NEW PUBLICATIONS.

Electrical Engineering. By E. Rosenberg. Translated from the German by W. W. Haldane Gee and Carl Kinzbrunner. New York: John Wiley & Sons, 347 pages; 6 in. x 9 in.; 333 illustrations; cloth. $2.00.

The book had its origin in a series of lectures delivered by the author, who is chief electrical engineer for the Messrs. Körting Bros. at Hanover, to the workmen and the staff associated with him, so that it is intended for readers of the same class who are interested in the subject but who have not had the advantages of a technical training. In accordance with this general plan the language used is exceedingly simple and readily understood, and the book is, to a great extent, free from mathematical formulae. In fact, they are only used after the theory of the subject in hand has been thoroughly explained. For this reason several matters have been dealt with very completely which, to the mathematically educated man could have been explained in a few lines. The book is exceedingly happy in its elucidation of the general principles with which it opens. It states the facts of the generation of the electric current by a simple galvanic cell, and follows it up consecutively until, if the text is followed carefully, the reader will have a clear idea of the magnetic field, of such instruments as the galvanometer, the solenoid, the ammeter, voltmeter, and of conductors and their insulation, by the end of the first chapter. Not such an idea, to be sure, as would enable a man to design any of these instruments but such that he would understand the principles of their action. Indeed this is what the book teaches. With dynamos and other electrical machines, the reader is taught the principles and mechanics of their construction, but no attempt is made to give information to enable a designer to calculate the wiring of a transformer for example. The scheme for the wiring of electrical machinery is exceedingly difficult to picture to the mind's eye, and here, as in other works of the kind, recourse is had to

diagrammatic representations of the windings and circuits, which are quite different in appearance from the actual machine, so that in this there is no attempt to make a workman, since this is not an instruction book of that sort, but the descriptions are such that an intelligent reader should be able to recognize general types at sight.

Illustrations are given throughout of types of machines made by different builders, but they are not described in detail as the author very sensibly says, in the preface, that such descriptions are readily accessible to interested parties in the business catalogues of the firms which are engaged in their exploitation.

As an example of the character of the work the method of handling the subject of alternating currents can be cited. The author shows how the alternating current is that produced by the earliest machines and cites a number of very simple experiments to illustrate its action and how in this it resembles the direct current, and yet how it differs therefrom, notably in the case of the illumination of the incandescent lamp. Then comes the effect in producing induction currents, followed by the details of the operation of these machines and that through more than a hundred pages of text with only four or five references to mathematical computations and then only after the principles of action had been fully explained. It must not be thought from this that the book is a popular discourse that utters much and says little. The text is clear, concise, consecutive in its arrangement, and requires close and concentrated attention for its proper comprehension. But, given this the careful reader will be repaid at the end by receiving a clear idea of ordinary electrical phenomena and the machinery by which those phenomena are produced and controlled.

CONTRIBUTIONS

Depreciation.

Baltimore, Md., Sept. 18, 1907.

To the Editor of the Railroad Gazette:

There are one or two points in connection with the establishment of depreciation rules for railroad property under the guidance of Mr. Henry C. Adams in charge of Statistics and Accounts for the Interstate Commerce Commission which seem eminently worthy of the widest discussion and consideration that can be given them.

So far as rules have been formulated, amounts appropriated for depreciation are not to be spent in replacing the identical property for which the amounts were appropriated but may be used to replace property of the same kind. The language of Mr. Adams' circular is "an accumulation of engines A, B, C, D and E may be expended to replace engine F and need not be kept as a reserve until engine A or B or C or D or E goes out of service." A consideration of this language makes it evident that numerical replacement is not to be a governing principle in railroad depreciation and that provided accumulated moneys are expended in replacing property of the same kind as that on which the moneys were accumulated it matters not what the product of the expenditure shall be. From this it would appear that railroad managers can argue that if they have, for instance, accumulated $800,000 and against that sum desire to retire one thousand 60,000-lb. cars from service they can spend the $800,000 in the purchase of six hundred 100,000-lb. cars and still maintain the earning capacity of the equipment; for 30 tons multiplied by 1,000 equals 30,000 tons carrying capacity and 50 tons multiplied by 600 equals 30,000 tons carrying capacity. This is all right for the interests of the railroad and the very large shipper, but it evidently neglects the growing needs of the country as a whole except on the theory that interests are to be more and more consolidated and the number of independent small shippers, including the vast farming community, is to decrease. It is questionable, however, in view of present movements in every direction whether this is a sound view to take of future developments, and if it be not then provision should be made for numerical replacement of equipment and no larger number of cars retired from service than accumulated funds will purchase at current prices. This need not prevent the purchase of cars of larger capacity provided the price per car did not exceed the limit of its

There is, however, such a thing as flogging a willing horse to death, and it may be that the establishment of renewal and depreciation funds for such items as ties and rails is going a little too far. That such funds have existed in certain directions in times past is true, but that they are absolutely necessary in the sense that they are so for the replacement of equipment is entirely dependent on the amount of money currently put into the track and included in operating expenses.

Consideration of the essential nature and properties of the articles on which accumulations are to be made seems necessary. A car is an entity complete in itself. A rail for any railroad purpose is not an entity. The track is the entity corresponding to the car. It is known from experience that a car undergoes a slow process of decline despite all the work that can be put on it until it reaches extinction and death, and at that last moment its value to the railroad vanishes, though up to that moment its value was practically as much as at the moment of its birth. Now against this catastrophe provision must be made by depreciation. But does this unavoidable process of gradual decay attach to the existence of a track? In the very nature of the case it would seem the answer must be in the negative for a gradually decaying track would put all the trains in the ditch and bring the whole machine to a standstill. Therefore it would appear that the railroads have been under the positive necessity of maintaining if not improving their tracks currently, and that being the case it seems necessary to establish a *raison d'être* for renewal and depreciation funds for ties and rails.

Statistician, Baltimore & Ohio.

Steel Ties in Germany.

Osnabrück, Aug. 2, 1907.

To the Editor of the Railroad Gazette:

In the current volume of the *Organ für die Fortschritte des Eisenbahnwesens*, p. 190, there appeared an article on "The Behavior of Steel Crossties," giving a brief report, taken from the *Railroad Gazette*, March 1, 1907, of the derailment of a train on Feb. 22 at Mineral Point on the Pennsylvania Railroad on an experimental section of track laid with steel ties. The report concludes with the statement that the committee appointed to investigate the accident was unable to determine with certainty the cause of the derailment, but suspected that at the point at which the derailment began some object had become wedged between the flange of one of the wheels and the rail, thus producing a violent lateral blow. As it was very cold at the time and the steel ties and fastenings were rigid, this lateral blow caused a shearing of the bolts holding down the outer side of the outside rail. The committee, being of the opinion that if the ties had been of wood the resulting damage would have been less severe, it was decided to remove the 3,000 steel ties laid in that part of the track, replacing them with wooden ties.

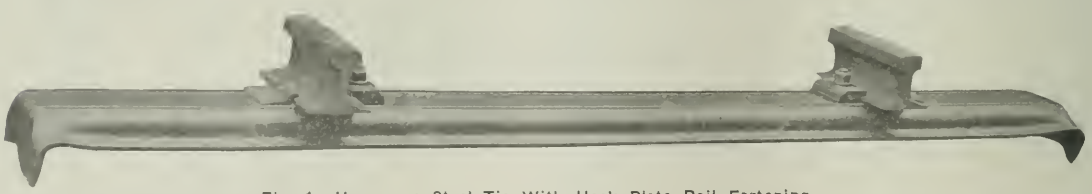

Fig. 1—Haarmann Steel Tie With Hook Plate Rail Fastening.

While it is, of course, impossible for me, without having made a personal examination of the track, to offer a definite opinion as to the cause of derailment, still, having had a long and extensive experience in connection with metal tie superstructure, I venture to submit some information on the subject which may possibly be of interest to many of your readers.

When we began to use metal superstructure in Europe, we suffered many disappointments. It is not as easy as it appears to determine the proper shapes for metal ties and their fastenings. A superstructure equipped with them should have a greater capacity and a longer life than is obtained by the use of wooden ties. It was necessary to determine gradually by means of practical experiments and from the results of operation, those conditions which a metal tie must satisfy. As such are to be considered:

1. Sufficient area in contact with the ballast in order that the pressure on the ballast may not be excessive.

2. Sufficient carrying capacity and length, so that the pressure may be equally distributed.

3. Protection of the upper surface against friction and stresses for to guard against deformation and rupture.

4. Large surfaces of contact at points of attachment, to prevent rapid wear.

5. Relieving points of attachment from secondary strains, e. g., of bolts from side pressure or shearing strains, in order that they

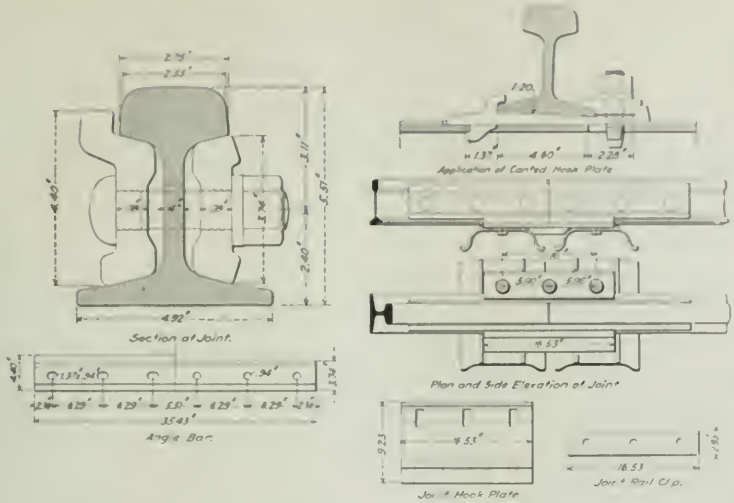

Fig. 2—Details of Standard Track; Oldenburg State Railroads.

may safely fulfill the purpose for which they were designed.

In 1893 the exhibit of our Track Museum in the transportation building at the Columbian Exposition at Chicago met with marked approval by American engineers. Even then the increasing difficulty of obtaining wooden ties, due to the rapid decimation of the forests in the United States, was already bringing into prominence the question of finding a suitable substitute for the wooden tie. The U. S. Forestry department, through Mr. Fernow, had already undertaken a careful study of all the experiments with metal ties that had been made in different countries up to that time.

The samples of many different designs of metal ties exhibited by our Track Museum were taken from tracks where they had been submitted to actual service, and were viewed with considerable interest by American railroad engineers. From the experiments that have been made in recent years by different American railroads, I think I am warranted in the conclusion that in the course of the last 14 years the introduction of some substitute for wooden ties has, in some sections, become a pressing necessity.

I can readily understand that your designers should undertake the solution of this difficult and economically important problem with a certain self-reliance. As already indicated, we in Europe have, in the course of many years, experienced many failures, the reports of which have undoubtedly reached you. Therefore the endeavor to do better is a great incentive to the American engineer. Still, I cannot believe that you will escape disappointments and failures any more than did we when, on the first introduction of metal ties, lacking all experience and without precedents for guidance, we were compelled to go ahead with boldness and self-reliance. Now, however, after years of experimenting and improving, we are happily past the apprentice stage. Whoever in Germany desires to use metal ties has now at his disposal samples of construction that have stood the test of practice. This is convincingly evidenced by the fact that the use of metal ties on German railroads increases from year to year in spite of the fact that during their development defects that had to be overcome were constantly manifesting themselves. According to official statistics there were laid

Year	Metal ties	Year	Metal ties
1902	23,696,000	1905	26,576,000
1903	24,440,000	1906	27,008,000
1904	25,272,000	1907	25,227,000

The statistics for 1906 and 1907 have not yet been published but the consumption has again increased. The so-called "hook plate" has been adopted for many years by the Prussian State Railroad as the standard attachment for metal tie superstructure. Therefore when I state that from 1882 to the end of 1905 58,000,000 of these hook plates have been used in connection with 15,000 miles of track it is evident that we in Germany are beyond the experimental stage, though, to be sure, there is no end of learning, and one must always be ready to adopt improvements. In view of these facts, it will be doubly interesting for your readers to study our newest construction of metal tie superstructure shown by the accompanying drawings of the superstructure we are at present furnishing the Oldenburg State Railroads and which is to be used on a section of 25 miles. The ties

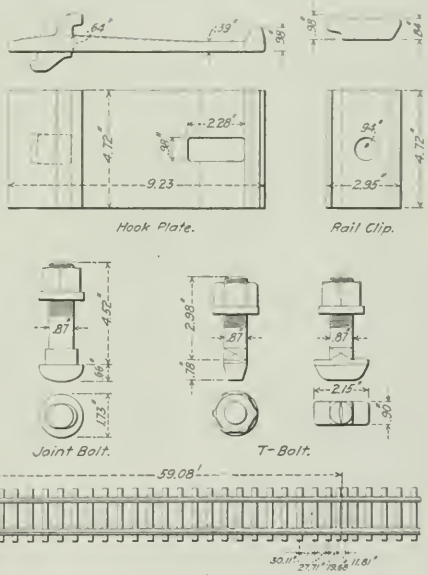

Fig. 3—Details of Standard Track; Oldenburg State Railroads.

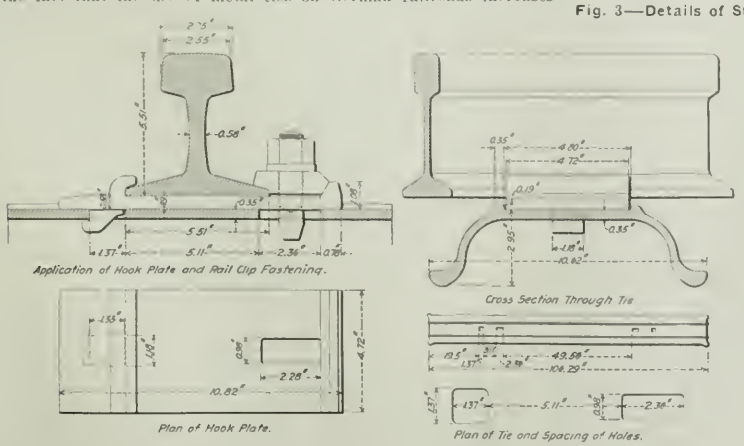

Fig. 4—Haarmann Steel Tie and Hook Adapted to American Track.

are 8 ft. 10 in. long, 10⅝ in. wide, are spaced 30 in. center to center, and weigh about 195 lbs.

The new feature of these ties are two ribs or strips "a" on the upper surface, between which the bearing plates are firmly held. The Würtemberg State Railroads have also equipped a section of road with these so-called "rib ties," as have also the Prussian State Railroads on the Elberfeld-Breslau division. These two ribs offer so great an advantage that the Prussian Railroad administration has adopted them for use on its ties, retaining, however, the width of 9⅛ in. for intermediate ties, while for supporting the joints it is proposed to introduce ties 19 in. wide. The Prussian rib ties are, however, spaced closer, about 22⅛ in., a spacing that corresponds more nearly to American practice. As a consequence of the large number of ties in the Prussian spacing, and also to the somewhat greater weight of rails, 91½ lbs. per yd., the total weight of the Prussian superstructure per yard of track is 453 to 463 lbs., while that of the Oldenburg superstructure, with rails of

86 lbs. per yd., is 411 lbs. The attachment of the rail to the tie is practically the same. Between the foot of the rail and the tie is placed the so-called hook plate or hook stud-plate mentioned above. These hook plates protect the upper surface of the tie against strains and friction, render a special securing of the outside of the rail by means of screw bolts unnecessary, and relieve the clamplate screws on the inside of the rail of all lateral stress. I should imagine that a similar construction would be of value for American conditions, with the possible change of substituting plates of uniform thickness, thus furnishing a horizontal supporting surface to suit the vertical position of the rail customary in America. This change is shown in Fig. 2. With this construction, shearing of screw bolts cannot easily occur, even from side lash occasioned by oscilylation of the engine.

DR. ING. N.C. A. HAARMANN,
Geheimer Kommerzienrat.

The Work of the Cole Superheater.

Prof. W. F. M. Goss presented a paper before the Indianapolis meeting of the American Society of Mechanical Engineers, giving, in outline, the results of tests of the Cole superheater as applied to the locomotive in the testing laboratory of Purdue University.

For the purpose of observing performance, thermometers reading to 750 deg. F. were inserted in each of the two branch pipes extending between the superheater and cylinders, in the discharge side of all loops, six in number, the length of which varied from the normal, and in the upper loop of the right-hand upper flue, which loop is of normal length. All thermometers were in wells thoroughly jacketed by a current of steam flowing from the stream, the temperature of which was sought.

The results show that the degree of superheat in the steam delivered to cylinders is largely affected by the rate of evaporation. Thus in Fig. 1 the average degree of superheat as shown by readings taken from the two branch pipes is plotted against the rate

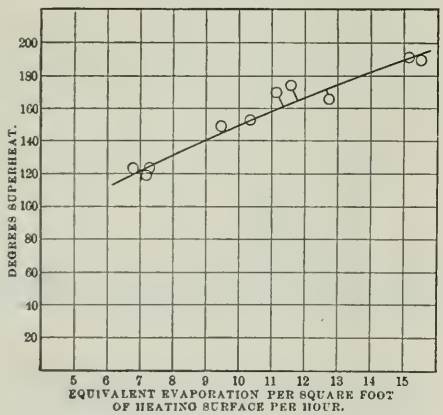

Fig. 1.

of evaporation. It shows that as the evaporation per square foot of heating surface per hour is increased from 7 lbs. to 15 lbs., the degree of superheat rises from 122 deg. to 188 deg. F., due doubtless to the fact that the superheating surface, as compared with the direct heating surface, absorbs a greater portion of the total heat as the rate of evaporation increases. For all tests represented upon this diagram each pound of steam delivered received from the direct heating surface approximately 1,160 B.t.u. and from the superheating surface from 70 to 104 B.t.u. depending upon the rate of power at which the boiler was worked.

Another expression of the fact to which attention has already been called is well set forth by Fig. 2 which shows the per cent. of the total heat taken up by the water and steam which is absorbed by the superheater, plotted in terms of smoke-box temperature. It will be seen that as the temperature of the smoke-box changes from 600 deg. F. to 800 deg. F., the heat absorbed by the superheater rises from 5.6 per cent. to 8.5 per cent. of the total taken up by the water and steam.

The degree of superheating obtained from loops of different lengths is shown graphically by Fig. 3. It will be seen that the amount of superheating obtained increases rapidly as the loop is increased in length. This results from the fact that each increment in the length of the loop carries the superheating element nearer the firebox and serves to increase the average temperature to which the whole loop is exposed. The effect therefore is twofold; first, that resulting from an increase of superheating surface, and second that resulting from an exposure of that surface to a higher average temperature. The basis for these observations (Fig. 3) was supplied by the superheating loops arranged in three flues making up a portion of the left-hand vertical row. The lower loops in those flues were, respectively, 80 in., 92 in. and 105 in., while the upper loops were, respectively, 71 in., 84 in. and 96 in. A review of the plotted points at once discloses the fact that a higher degree of superheating is obtained from the lower loop of a given length than is possible from an upper loop of the same or even greater length. Comparing results as obtained, it appears

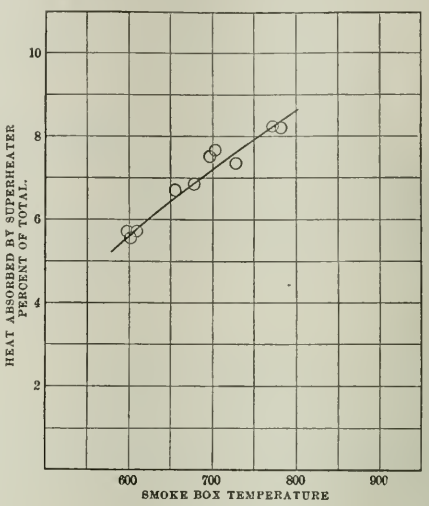

Fig. 2.

that the lower loop in a given flue, while but a few inches longer than the upper loop, gives from 25 to 30 per cent. more superheating effect. This probably is to be accepted as a measure of the advantages which come to that element of the superheating surface which is first to receive the flow of the current of moving gases, though it is not impossible that the lower loop may claim some advantages from its position in the flue.

It has been observed that the average temperature of the steam in the two branch pipes is always less than the calculated temperature, assuming all superheating loops to give the same performance as those which are under observation. A reason for this must be

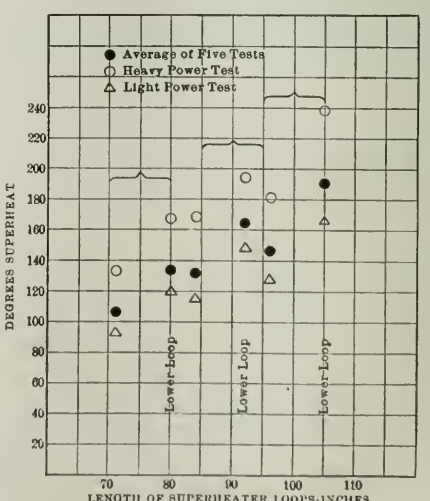

Fig. 3.

found in the difference in the volume or quality of the furnace gases transmitted by the several flues.

CYLINDER PERFORMANCE.

While a full analysis of the cylinder performance of the locomotive must be reserved for another time, it is proper here to note that when served with saturated steam (locomotive "Schenectady No. 2"), its performance under normal condition of running was represented by a range of from 24 to 27 lbs. of steam per indicated

The Use of Superheated Steam on Locomotives in the United States and Canada.*

Aside from an experimental application of a smoke-box superheater on the Chicago Burlington & Quincy, between 1870 and 1874 the first application of superheated steam in North America was made by Roger Atkinson, then mechanical superintendent of the Canadian Pacific, who applied a "Schmidt" smoke-box superheater to a 4-6-0 simple freight engine in 1901. In 1903 E. A. Williams, then mechanical superintendent of the same road, applied a "Schmidt" smoke-tube superheater to two 4-6-0 compound freight engines, and the results obtained from these installations were exceedingly satisfactory, the first engine showing a saving of 25 per cent. over corresponding simple engines and 18 per cent. over corresponding compound engines of the same class, while the latter engines showed a saving of from 15 per cent. to 20 per cent. over similar compound engines using saturated steam.

In 1904 the New York Central applied a "Cole-Field" smoke-tube superheater to a 4-4-2 passenger engine, and in the latter part of the same year the Canadian Pacific bought 41 engines, 21 of which were equipped with this type of superheater, and 20 with the "Schmidt" smoke-tube superheater. Since that date all engines, other than those in switching service, built for the Canadian Pacific have been equipped with smoke-tube superheaters of various types, and on December 31, 1906, there were in service on this road 197 engines equipped with superheaters of the following types:

Type.	Number.
Schmidt smoke-box	1
Schmidt smoke-tube	32
Cole Field tube	21
Cole return bend	55
Vaughan-Horsey return bend	88

At the present time this road has on order 175 locomotives for delivery during the present year, all of which are to be equipped with the "Vaughan-Horsey" type of superheater, which will make a total of 372 engines to which this principle has been applied.

On the railroads in the United States the progress has been far less rapid, and a reasonably complete list of the engines equipped at the end of 1906 is as follows:

Railroad.	Cole.	Schmidt.	Vaughan-Horsey.	Total.
N. Y. C. & H. R.	1	..	..	1
C., R. & Q.	1	2	..	3
Rock Island	6	..	..	6
M., St. Paul & S. S. M.	1	..	..	1
C. & N. W.	1	..	..	1
Boston & Maine	1	..	..	1
L. S. & M. S.	1	..	1	2
Totals	12	2	1	15

With the exception of one engine, viz., the first to which a superheater was applied on the Canadian Pacific Railway, all the engines enumerated above have been equipped with superheaters of the type known as the smoke-tube, this particular engine being equipped with a superheater of the smoke-box type. The Baldwin Locomotive Works has also built a few locomotives equipped with the Baldwin smoke-box superheater. One of these is exhibited at the Jamestown Exposition and was described in the *Railroad Gazette*, June 7, 1907.

The Best Fuel for the Blacksmith Shop.

At the recent convention of the Master Blacksmiths' Association a paper was presented on the best fuel for the blacksmith shop, by J. G. Jordan, of the Texas & New Orleans, who is located at Houston, Tex. Experience of a good many years leads the author to recommend oil for heating and for furnace work, provided the furnace is so made that the oil will not come in contact with the iron while it is being heated. This fuel has been used upon the Texas & New Orleans for making all driving axles, and only one has ever broken, and that was due to over-heating; this with axles, some of which finish 11 in. in diameter. The advantages of oil are that it heats more rapidly than coal, so that the output is increased by its use, besides which it appears that iron will not break, when being bent, so easily when it has been heated with oil as it will when coal is used. In this connection it should be noted that oil can only be used in furnaces or in furnace-like boxes where the blaze is confined. With proper arrangements of this kind, however, it is possible to weld locomotive frames and straighten almost any iron on a car or engine without removing it, and thus avoid the expense of such a removal.

As for cost, if oil can be bought for not more than 4 cents a gallon and coal costs from $4.50 to $5 per ton, oil will be the cheaper fuel to use, as the output in work will be sufficient to cover the difference in price.

As for cost, if oil can be bought for not more than 4 cents a blacksmith fire. For this purpose good coal is the best, and bad coal is no fuel at all. The troubles with low-grade coal are also increased by the receipt of successive shipments from different mines, and when the coal is very bad the difficulties are unending. In fact, in one shop there has been so much annoyance caused by inferior coal that a record is kept of all work done with it, and it is reported as having been executed with bad coal as a protection to the workman. An example of an analysis of coal that is unsuited for blacksmith work is given as follows:

Moisture	5.70 per cent
Volatile matter	18.24 "
Fixed carbon	43.84 "
Ash	27.82 "
Sulphur	4.10

With such a coal as that frames cannot be welded and wherever there is an attempt to use it there will be constant complaint that iron cannot be welded with it, much less steel. It contains too large a percentage of sulphur and ash and not enough fixed carbon to make a coal fit for blacksmith use.

In contrast with this, coal should be bought on specifications, and these should be based upon the following requirements:

Sulphur	1.00 per cent
Fixed carbon, not less than	75.00 "
Moisture, not more than	1.20 "
Ash, not more than	7.00 "

Finally, the best coal that can be bought will be found to be the cheapest in the end.

In the discussion it was asserted that the best coal for blacksmith work is the Blasbur coal. It is a Pennsylvania coal, and its fire can be made to last for five hours with very little cleaning. It makes a good coke, heats clean and causes very little waste to the iron. Another coal that was highly recommended was the Piedmont from West Virginia. This coal produces very little ash, and there is no difficulty in keeping a clean fire.

On the other hand, the Tennessee coal was criticised as being decidedly poor. The fire must be cleaned for almost every alternate heat, and there is always a delay in consequence. The coke is too soft and too light for heavy work and is not worth much. For bad coal it is necessary to have a hard coke and break it up fine.

One speaker recommended gas fumes as best adapted for a tool dresser's furnace.

*Extract from a paper by H. H. Vaughan, Assistant to the Vice-President, Canadian Pacific, presented at the Indianapolis meeting of the American Society of Mechanical Engineers, May, 1907.

Seth Wilmarth's Locomotives.

BY C. H. CARUTHERS.

In reading the early history of the steam locomotive and of locomotive construction one discovers the names of numerous builders who for a time turned out creditable machines and then closed their plants. In some instances these firms soon engaged in other lines of business, but often the closing was final, and after these years it is even more difficult to obtain much reliable data concerning either the personnel of the firms than of the locomotives which they built.

The "Union Works," of Seth Wilmarth, once existing in Boston, Mass., is one of these plants of long ago, of which many of the younger railroad men have probably never heard, and which has become but a shadowy memory to the "old-timers" yet living, although in its day some of the engines bearing its badge-plates were very familiar objects on a number of the leading railroads, and several were of decidedly original types, although these features were attributable to the selection of Mr. Wilmarth as a builder by their designers, rather than to his own inventive genius.

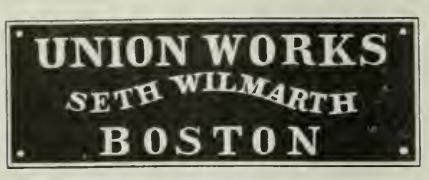
The plant was located on Foundry street, in South Boston, and might be called an off-shoot of the Hinkley & Drury (afterward Hinkley, Williams & Co.) works in which Mr. Wilmarth had previously been engaged, and it is not surprising, therefore, to find the engines of the Union Works very similar in many respects to those of the Hinkley shops.

As nearly as can be determined from the records of dates of construction which have been preserved, the first Wilmarth locomotives came out in 1849 and the last about 1853. Machine tools were also made in the same works, but no existing data seems available to determine whether this feature was continued after locomotive building ceased.

The first authentic record of Wilmarth locomotives appears to be the construction of three for passenger service on the Boston & Worcester Railroad in 1849. These engines were known as "Shanghais," though why, I cannot clearly discover from the various reasons which have been assigned, and had cylinders of 14 in. diameter and 18 in. stroke; driving wheels, 66 in. in diameter; boiler, 46 in. diameter; weight, about 50,000 lbs. The tender was carried on a four-wheel truck similar to those used by Norris at that time. The tracing from which the accompanying illustration is taken was made about eight years ago from a photograph of one of these engines, the "Fury," in possession of an official of the Boston & Albany, who kindly loaned it for the purpose. From this cut it will be seen that the engine is of the inside-connected type, and had double-steam chests, one of each pair containing the cut-off valves which were worked by hooks, most probably of the type illustrated in the *Railroad Gazette* of August 17, 1906, Fig. 6, page 142, although the

owner of the photograph is inclined to think a variable cut-off was used of the type shown in Fig. 5, page 147, in the same issue. As the variable cut-off does not appear to have been used on any road much before 1852 or 1853, it is possible that if the "Fury" had it, it was put on at a later period of the engine's service. It is a matter of regret that the photograph referred to does not show this feature clearly, but as the valve-gear with half-stroke cut-off and drop hooks was used by Hinkley at that time, it is almost certain that this form was used on the "Fury" at first.

Four freight engines and two more for passenger service were also built by Wilmarth for the same road. These passenger engines were somewhat larger than the "Fury" and were built on lines of greater originality, but the freight engines are said to have followed the design of the Hinkley machines very closely.

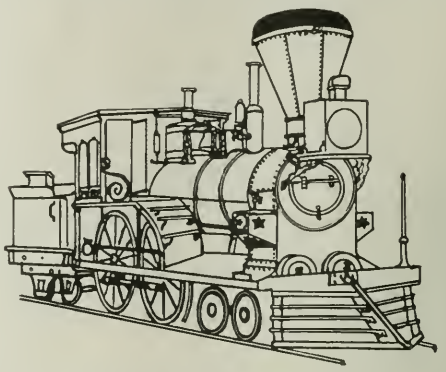


Seth Wilmarth Badge-Plate.

One engine at least was built for the Eastern Railway with two pairs of driving wheels between the firebox and cylinders, a four-wheel truck at the front end and another under the foot-plate; or, as we would now say, a 4-4-4 engine. Another of this class was built for the Old Colony Railroad. Sufficient authentic data has not been available to enable the writer to state positively whether the last eight engines referred to were inside or outside connected, but indications point strongly to inside connections.

A number of passenger engines with outside cylinders and 78-in. drivers were afterward built at these works for the Hudson River Railroad. It is very probable that these engines were of the same general design as two furnished the Pennsylvania about the same time and hereinafter described.

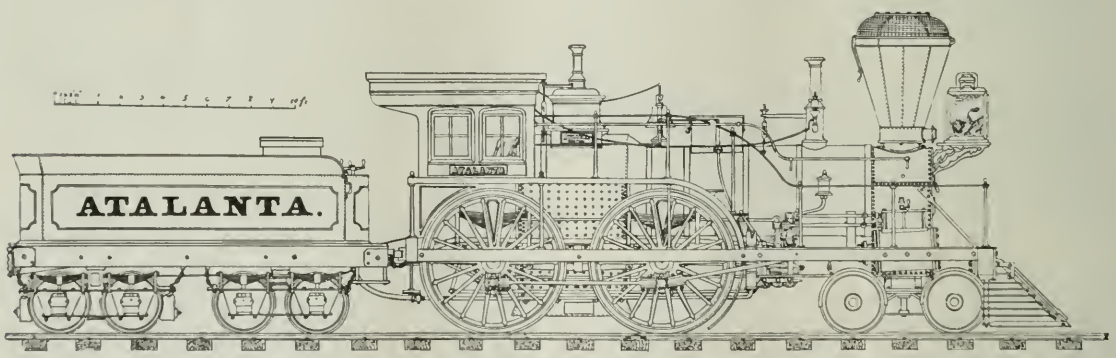
The "Pioneer" was built for the Cumberland Valley Railroad in 1851, and was small and of light construction in every way, even for that early period. It had 9 x 14 in. cylinders, 54-in. drivers, 30-in. leading wheels and 30-in. trailing wheels. Its weight was 26,000 lbs., with about 12,000 lbs. of this on the drivers. It is fitted with Stephenson link motion, and although the present officials of the road seem to think it was built thus, I cannot but think that "D" or "Y" hooks were used originally and the links substituted in later years. The short tender, with a 600-gallon water cistern, is



Boston & Worcester Engine "Fury."

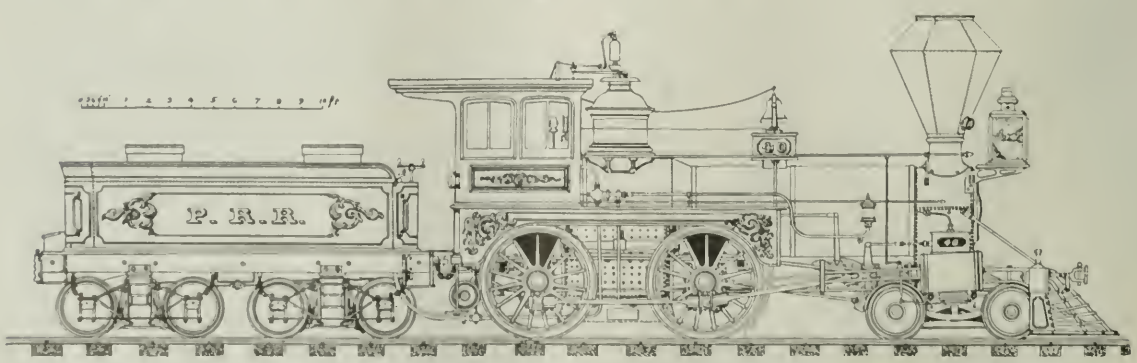
Built by Seth Wilmarth in 1949. Cylinders, 15 in. x 18 in.; drivers, 66 in.; boiler, diameter, 48 in.

placed on an extension of the engine frame behind the cab, and the roof of the latter is also carried back over it, and is provided with canvas curtains at the sides. The sandbox, as shown, was on the engine previous to the St. Louis Exposition, but does not appear in a half-tone from a photograph taken at that place. The steam-chest covers are on the sides of the chests, and the pump is under the foot-plate and is driven by an eccentric on the main axle. The dome is small and is covered by the cab. During the



Pennsylvania Engine "Atalanta."

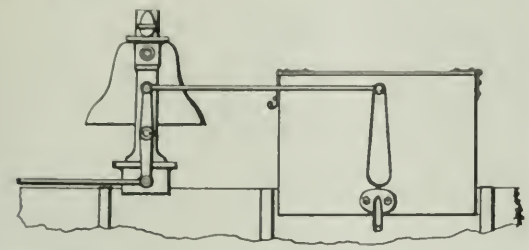
Built by Seth Wilmarth in November, 1852. Wood burner. Weight, total, 59,000 lbs.; weight on drivers, 35,900 lbs.; cylinders, 16 in. x 22 in.; drivers, 78 in.



The "Atalanta" as Rebuilt at Altoona in 1865.

Fitted to burn coal instead of wood. Weight, total, about 62,000 lbs.; weight on drivers, about 38,000 lbs.; cylinders, 16 in. x 22 in.; drivers, 60 in. Scrapped in 1870.

Civil War the cavalry of the Confederate army, under command of General Stuart, raided and burned Chambersburg on July 30, 1864, and included in the property destroyed were the shops and round house of the Cumberland Valley Railroad, but the "Pioneer" fortunately escaped this fire, which damaged some of the company's other engines, as it was then in service and was run to a place of safety. The last time it was run under its own steam was on October 22, 1901, when it was fired up and run by General Foreman J. L. Lawrence out of Chambersburg with the intention of exhibiting it in operation at Carlisle, Pa., during the continuance of a sesquicentennial celebration at that place, but when within about one mile of the two a flue burst and the engine had to be "assisted" into a siding by the track repairmen. It afterward was taken back to

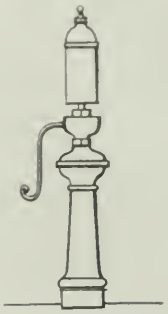


Sandbox, Rod and Connections; "Fury" and Other Engines.

Chambersburg, where it remained until shortly before the opening of the St. Louis Exposition, when it was sent there, and after the close of that show was taken with another ancient locomotive to form part of a museum contemplated by, or under the auspices of, the Baltimore & Ohio, if I have been correctly informed. This museum, however, is either yet in the "proposed" state, or has been abandoned, and the "Pioneer" is lying in a roundhouse at Martinsburg, W. Va., awaiting developments.

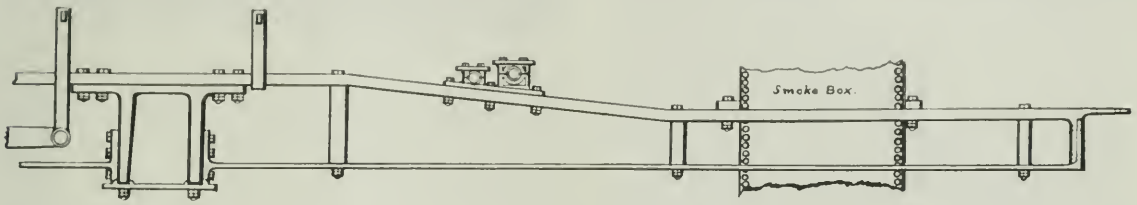
In 1852 two Wilmarth engines of the "compensated" type were built for the Cumberland Valley from designs by Alba Smith, the Master Mechanic of the company. No further mention of them will be made in connection with this article, except to state that the last one passed into the hands of a junk dealer in 1886, and was [illegible] up.

Three Wilmarths, named "Antelope," "Atalanta" and "Eagle," were built for the Pennsylvania in 1852-3. All had 16 x 22 in. cylinders, the "Antelope" and "Atalanta" had 78-in. driving wheels, and the total weight ranged from 55,800 to 61,300 lbs., and that on the drivers from 35,900 to 37,900 lbs. The "Eagle" only had 66-in. drivers, otherwise the engines were uniform in design. Considerable trouble appears to have been experienced with the first two before their service became satisfactory, and this in connection with two serious accidents to one of them caused by running into obstructions on the line at night, gave them an unsavory reputation with the men. Eventually the 78-in. wheels were removed and others of 66-in. diameter were substituted. The safety-valves were all at a later day placed on the dome, and a plain column with the whistle on its top replaced the combined safety-valve and whistle-column shown in the line drawing of "Atalanta" and also in that of the "Fury." The peculiar connection to the sand-valves was also replaced by a straight rod. In 1865 "Atalanta," which by that time was known as No. 40, was partly rebuilt at Altoona shops, as shown in the line drawing. The firebox was arranged to burn bituminous coal, Sellers injectors replaced the pumps, shifting links took the place of the hooks, the outside frames were taken off and other minor changes made as will be evident from an inspection of the two drawings. In this rebuilt form the engine continued in passenger service until 1870, when it was cut up. Its rebuilt appearance as shown is decidedly neat.

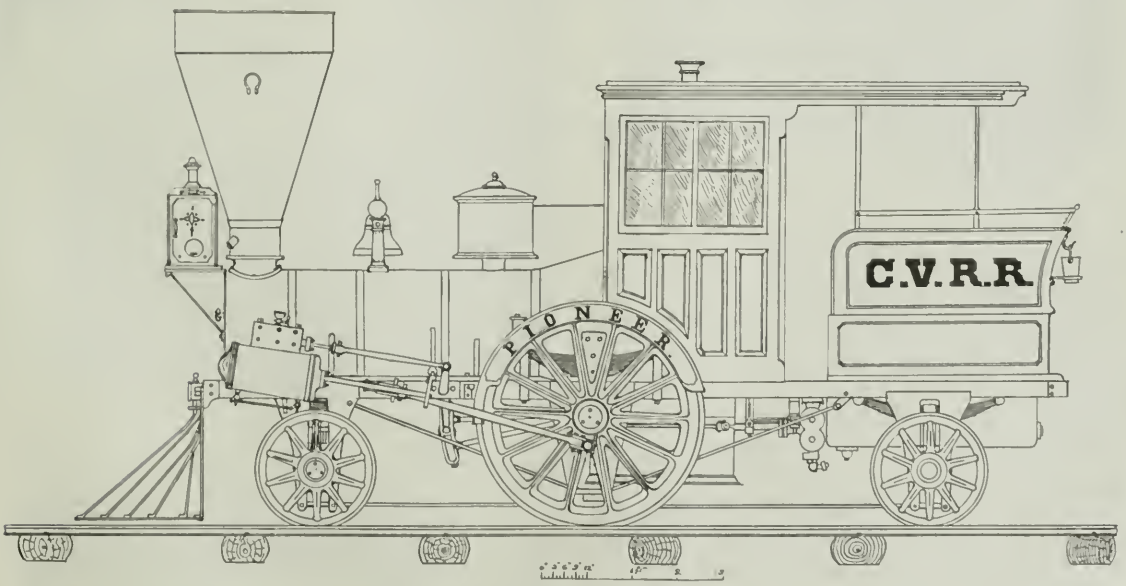


Whistle Stand and Whistle.

Substituted in later years for the combined safety valve and whistle column shown on the "Atalanta" as originally built



Frame of Later Wilmarth Engines.



Cumberland Valley Engine "Pioneer."

One of three "Shanghais" built by Seth Wilmarth in 1871. Weight, 26,-000 lbs.; cylinders, 9 in. x 14 in.; drivers, 54 in.; tank capacity, 600 gals.

The "Antelope" and "Eagle" were transferred in 1865 to the Philadelphia & Erie divison, where they rendered several years' service before going the way of the "Atalanta."

Since boyhood I have heard rather vague statements from some of the older men on different divisions of the road, which when put together imply that a fourth Wilmarth was built for the Pennsylvania Railroad Company, but was lost overboard in its passage from Boston to Philadelphia by vessel and was never recovered In one instance this story named a Smith & Perkins engine as the derelict, but if correct at all the conditions of those days would rather indicate the Wilmarth engine as the "missing link." The most authentic data at my command is a distinct remembrance that an extra tender used on the Pittsburgh division between 1853 and 1860 was often referred to in my presence during boyhood as having belonged to an engine which was lost at sea.

In this connection mention might be made of another engine owned by the Cumberland Valley, which was named "Jenny Lind," and was an almost exact counterpart of the "Pioneer," but bore a badge plate, naming the C. V. R. R. Co. as builder and the date of 1878. From various "earmarks" I believed this engine to have also been a Wilmarth, rebuilt at the time named on the plate, but the company's officials are positive that this is not the case. The "Jenny Lind" differed only from the "Pioneer" in having a longer rear extension of the frame, with a sort of observation room or car for the use of officials built on it and a four-wheel truck underneath. This engine was only cut up within the last two years.

The confirmation of much of the foregoing data is due to the courtesy of M. N. Forney, J. Snowden Bell, Esq., W. H. Taft and various officials and employees of the Pennsylvania and Cumberland Valley railroads.

The Portland & Seattle Railway.

BY H. COLE ESTEP.

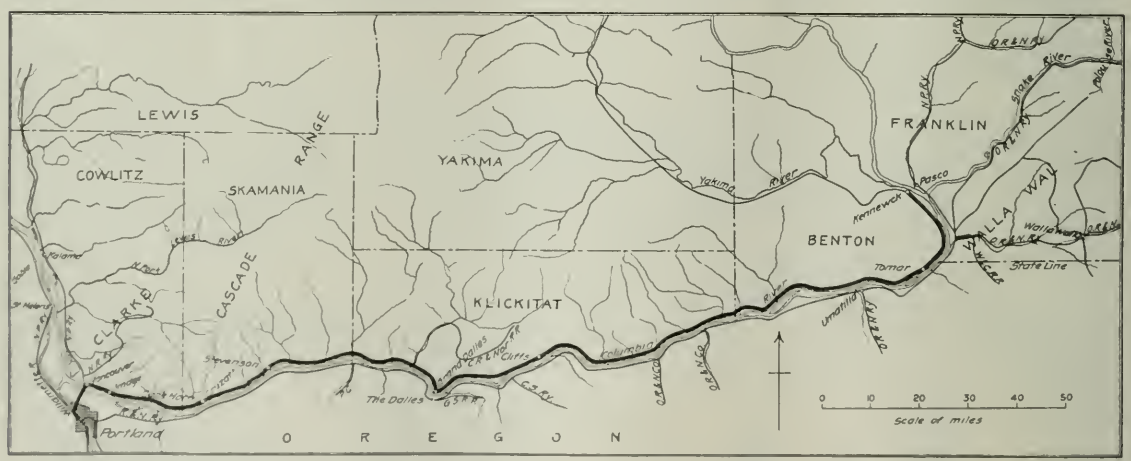
Probably the most spectacular piece of railroad construction in the United States to-day is the new line of the Portland & Seattle from Spokane, Wash., to Portland, Ore., by way of Pasco and the north bank of the Columbia river. The Portland & Seattle is, as is well known, a corporation owned jointly by the Northern Pacific and Great Northern railroads. Its name is scarcely accurate, however, as the line does not go within 180 miles of Seattle.

The road is being built ostensibly to get a direct low-grade freight route between eastern Washington and the coast and thus avoid the haul over the Cascade mountains. At present, on the western side, trains must be lifted from sea level to an elevation of 2,800 ft. in a distance of 75 miles. As a matter of fact, however, the Portland & Seattle would not have been built for years had it not been for the invasion of the state of Washington by the Chicago, Milwaukee & St. Paul and the Union Pacific. As soon as it was certain that these lines were building to Puget Sound, the Hill lines set to work on the Portland & Seattle in order to retain for themselves the only remaining water grade from the "Inland Empire" to tidewater. Construction work on the "North Bank" line, as the portion from Pasco to Portland is called, was actually begun simply in order to keep the other roads out; thus a project which, like all other Washington railroad schemes dates back about twenty years, became a reality.

Preliminary surveys were commenced early in 1905. The location was made during the summer and fall of that year. The locating engineers and their parties who actually did the work of laying out this line deserve the highest praise for the unflinching courage and silent heroism they manifested in the daily performance of their duties. The Portland & Seattle is built for miles and miles along cliffs on the north bank of the Columbia river, ranging from 100 to 700 ft. in height. Not only are there sheer cliffs, but the erosion has worn them into shapes of inconceivable ruggedness,, the famous banks of the Rhine being tame in comparison. Pillars, pinnacles, sharp rocks and deep, narrow, perpendicular walled gorges abound. Only those who have had the experience and know what such work is can appreciate the difficulties encountered in locating a line through such a district. Passengers will ride over the finished track and admire the precipitous scenery, but as the writer stood on the nearly finished grade, which had been literally torn from the cliff by tons of blasting powder, and beheld the ragged face of the mountain, he could not help but think of and admire the splendid courage of the men who, suspended day after day on slender ropes, the sky above, the vicious, swirling river below, had slowly and painfully created a line of railroad over these places. The thought came that it was not dollars, after all, that produced the Portland & Seattle, but engineering skill and courage.

The ultimate purpose is to build a line from Spokane to Portland, a distance of 375 miles, with a branch 75 miles long to Lewiston, Idaho. The work now practically complete is that portion of the main line from Portland to Pasco, 230 miles, and the branch to Lewiston. The Spokane end is not so far advanced. Track laying is in progress between Portland and Pasco at this writing, and all the difficult, subaqueous work on the big bridges near Vancouver has been completed. Fifty miles between Portland and Pasco is being double tracked.

The road from east to west is level or down hill all the way. The maximum grade is 0.2 per cent. compensated for curvature; the maximum curves are 3 deg., spiraled according to the best modern practice. When these facts are considered, some of the difficulties encountered in locating along the tortuous bluffs of the Columbia can be appreciated. From Spokane to Cow creek, in Adams county, Washington, on the main line, and from Lewiston to Washtucna on the Lewiston line, there are no special features.



Map of the Portland & Seattle from Portland, Ore., to Pasco, Wash.

The road through these sections is simply an ordinary first-class line through a broken country. There are six points of special interest on the work, located as follows: Near Cow creek and Washtucna, in Adams and Franklin counties; Pasco and Kennewick; Cliffs and Grand Dalles, in Klickitat county; Cape Horn in Skamania county, and the line from Image, in Clarke county, Washington, to Portland. These will be taken up in the order named.

At the junction of Cow creek and the Palouse river, in Adams county, the Portland & Seattle encounters the most expensive stretch of railroad construction, except that in Devils' canyon, ever known in Washington. The valley is crooked and entered frequently by steep, narrow gulches; the road is built across a succession of "hog backs" and gulches. Eighty-foot cuts are followed by 90-ft. fills in alternation; short tunnels are frequent; high steel trestles are necessary in many places. At one point, near the ranch of James Kennedy, one of the largest of the "hog backs" was pierced by several long, narrow tunnels, which were loaded with many hundred pounds of powder, and then the whole hill was

blown off at one shot. The blast was a decided success and vividly demonstrated the economy of removing large masses of rock by this method.

Approaching Washtucna the line crosses a flat part of the coulee (many peculiar valleys in the region having no direct outlet are called coulees) on a fill approximately 6,000 ft. long and averaging 50 to 60 ft. in height. Here the line crosses the Palouse branch of the Oregon Railroad & Navigation. A concrete arch has been built to permit the latter to pass under the fill. The line

Hydraulic Excavation of a Deep Cut near St. John's.

passes the town of Washtucna on the side of Quality hill, several hundred feet above the village, and proceeding southwestward down the coulee, practically parallels the O. R. & N., the grade being in general about 8 ft. above the older line. Passing Kahlotus, in Franklin county, the line cuts off one corner of Lake Kahlotus on a huge fill, and proceeds, with easier construction, down to Pasco. It was first proposed to cross the lake on a trestle, but the more permanent and satisfactory rock fill was finally adopted.

At Pasco occurs the first crossing of the Columbia river. The Northern Pacific has recently rebuilt its bridge at this point, and the new structure will be used jointly by the two roads. From Kennewick, on the west side of the river, the North Bank line

Erecting First Span of Columbia River Bridge.

proper commences. The construction is fairly easy along the upper Columbia. Fences similar to the snow fences on eastern lines have been erected at dangerous points to keep off drifts of the fine sand abounding in the vicinity. For 20 miles west of Pasco, to Tomar, the line is double tracked. It is single track the rest of the way to Cape Horn, because a double track along the cliffs of the north bank would entail an expense at present altogether out of proportion to its usefulness.

Cliffs, half way down the river, will be a division point and will have a roundhouse, coaling station, switch yard and other usual facilities. About 23 miles below Cliffs is Grand Dalles, opposite Dalles, Ore. The elevation of Dalles is 103, of Pasco, 389, and the distance between them is 130 miles, the average grade being 2.2 ft. per mile.

Below Grand Dalles the difficult solid rock construction commences. Nearly all the grade from this point to within 30 miles of Vancouver had to be blasted out of solid rock cliffs varying in height from 100 to 700 ft. There are 17 tunnels on the line from Pasco to Vancouver. The most notable of these is the Cape Horn tunnel, 24 miles east of Vancouver. It is half a mile long, single track, and bored through solid rock. From Cape Horn (Cruzatt station on the P. & S.) to Vancouver the construction is somewhat easier and this portion is double tracked.

Approaching Vancouver the line leaves the bluffs and curves down across the flats, crossing the east portion of the military reservation on a double-track fill averaging 16 ft. in height. The west end of the reservation, as well as the business portion of the town of Vancouver, is traversed by a double-track pile trestle. The fact that heavy concrete abutment walls are built at all road and street crossings under this trestle indicates that it is the intention to fill it as soon as the work can be conveniently done. At Vancouver there is to be a switch yard and junction with the Van-

Cape Horn on the Columbia River Before Work on the Portland & Seattle Was Begun.

couver branch of the Northern Pacific. This branch, 30 miles long, extending from Kalama, on the main line, to Vancouver, will become a part of the main line of the Northern Pacific as soon as the big bridges and heavy work on the Portland & Seattle between Vancouver and Portland are completed. Northern Pacific trains will be run to Vancouver and thence to Portland on the P. & S., using the magnificent new bridge over the Columbia. The historic old car ferry between Kalama and Goble will be abandoned and the line between Goble and Portland will be used almost exclusively by the Astoria & Columbia River Railroad. The Northern Pacific is now engaged in revising and straightening the Vancouver branch. When this relocation is finished the line will be first-class in every respect, this work being virtually a part of the construction of the Portland & Seattle.

Probably the most interesting section of the Portland & Seattle from an engineering standpoint is the eight miles between Vancouver and Portland. This short stretch includes three large steel bridges, three double-track draw spans, a steel trestle 1,968 ft. long, and one of the largest earth cuts on the road. The road is double-tracked from Vancouver to Portland.

The difficult work on the great Columbia river bridge is completed at this writing. The piers are practically finished. The

bridge, omitting inches, is 2,806 ft. long, divided into ten spans as follows from east to west (i. e., from Vancouver toward Portland): First span, 189 ft.; draw span, 467 ft.; third span, 375 ft.; fourth span, 269½ ft.; fifth, sixth, seventh and eighth spans, each 269 ft.; ninth span, 268 ft.; tenth span, 162 ft. The bridge is double track, its inside dimensions being: width, 24 ft. 6 in.; height, 22 ft. 6 in. A swinging draw is used, which when open, leaves two channels each 200 ft. wide. The piers are set on pile foundations. Those near the center of the stream are 115 ft. high, and at this writing project about 20 ft. above water. The piers are built with concrete cores and granite facings. The steel work is being furnished by the American Bridge Company. The bridge will be the largest and finest in this section of the country.

Following the Columbia river bridge is a steel trestle consisting of 24 82-ft. spans, 1,968 ft. in all, over the swampy end of the island opposite Vancouver. The trestle is followed by another steel truss bridge 1,465 ft. long over Oregon slough, divided into eight spans as follows from east to west (omitting inches): First span, 161 ft.; second, third, fourth, fifth, sixth and seventh spans, each 162 ft., and draw span, 332 ft. A swinging draw is used here also, leaving two 150-ft. clear channels when open.

The line enters northeast Portland, crosses some of the low land on a high fill, and traverses the suburb of St. Johns through a cut approximately 1¾ miles long and 90 ft. deep at the west end. The cut is in earth, sand and loose gravel, and will require the excavation of 1,000,000 cu. yds. to complete it. It is being worked from both ends; from the east end by steam shovel in standard American fashion, while the west end is being sluiced down into the river by hydraulic methods. The water is pumped to the head works through a 10-in. riveted sheet-iron pipe, the stream is played on the earth and the mixture of water and earth is carried back to the river in a sheet-iron lined flume. It is said that 1,600 cu. yds. per day is excavated in this way.

The slopes of the cut are being trimmed by a donkey engine and scraper. The engine is placed on one side of the cut with a cable leading across to the other, to the end of which an ordinary drag scraper is attached. The scraper is started properly and is then dragged down the slope by the engine. It is hauled back by a team, which at the same time drags another scraper down the opposite slope.

The Willamette river is spanned by a 1,700 ft. truss bridge with swinging draw span similar in general to the Columbia river bridge. After crossing the river the line ends at what is called the Portland outside yard, a switch yard built on a plot of ground 150 acres in extent.

The whole road is a splendid monument to American engineering genius and is by all means the most expensive and best built line in the west. The general contractors are Siems & Shields, St. Paul, Minn. The engineering officers of the Portland & Seattle Railway are: N. D. Miller, Chief Engineer; J. E. Turner, Assistant Chief Engineer; B. L. Crosby, Bridge Engineer.

Interior of Main Hall; German Railroad Museum.

Railroad Museum of the German Government.

The German Government has recently established a railroad museum in Berlin of which Germany may justly be proud. It was formally opened by the Emperor some months ago, but only one section was ready that time. All sections of the building are now open to the public. It is housed in the abandoned terminal of the Berlin-Hamburg line, which is situated in the northwestern section of Berlin. The exterior of the building has been left unchanged,

Government Railroad Museum in Berlin.

but inside many changes were made, chiefly in the cellar, where a large power plant was installed to generate steam for heating, electricity for lighting and operating motors, and compressed air to work several models for demonstrating purposes. The exhibition space covers 52,000 sq. ft. and comprises a long main hall with arched glass roof, and a number of smaller rooms in both wings. A few exhibits were so large, however, that they had to be placed outside in the adjoining courtyard.

The museum comprises three large sections: A, railroads; B, marine engineering; C, architectural and construction work. By far the largest space is occupied by the railroad department, which is divided into eight groups. The exhibits represent chiefly modern apparatus, the historical part being limited. Explanatory notes are often given, supplemented by many photographs, drawings and other literature. Many of the models of apparatus can be operated to illustrate their working.

In the first group are rails of all kinds, switches, crossings, sleepers, both old and new. Samples of ballast and material for the maintenance of a road, also the tools used are shown. Of particular interest are sections of wornout rails and sleepers which show the tremendous stresses to which they are subjected on busy lines. The influence of shocks exerted by the rolling stock on the roadbed, etc., is illustrated by samples prepared in a special testing plant. A diagram of the sizes of rails used since 1842 shows clearly the considerable increase in height, length and weight. A complete exhibit of crossing gates used on country roads with the necessary bells, lamps and gate-keeper's houses is also included.

In the next group are models of structures designed for various railroad purposes, such as stations, carsheds, water towers, coaling plants, bridges, tunnels, turntables and the like. The chief exhibit is a fine relief model of the Altona depot which is a good example of a modern German terminal. The first large iron bridge is represented by a model of the Vistula bridge near Dirschau, completed in 1857. Drawings and photographs of old and modern bridges and tunnels give a good idea of this branch of engineering. A model of the ventilating plant of the Kaiser Wilhelm tunnel included in this section can be operated by a small fan.

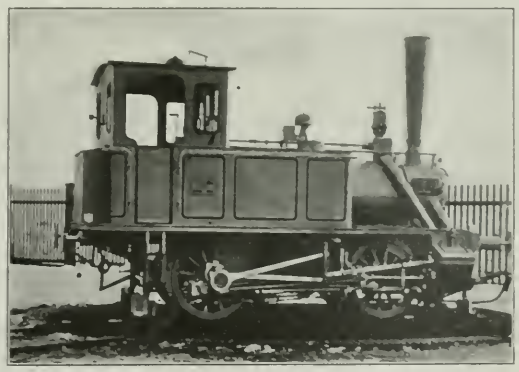
Models of Crossing Gates and Exhibit of Track Tools.

The next section is devoted to signaling and safety devices. No less than 500 devices designed to insure the safety of the traveling public are exhibited. An electrically operated interlocking plant and two mechanical plants are erected and can be operated in connection with a complete track layout, switches and signals outside the building. This is similar to the railroad exhibit of the German Government at the St. Louis exposition in 1904. In addition an electro-pneumatic interlocking plant and a number of block system installations, in full size as well as in miniature, are to be seen inside. Many of them can be operated. They are equipped with telegraphic and telephonic apparatus connected with other parts of the system in order to show the mutual relation of each to the whole. Electric alarms, all apparatus used by the station master, and block signals for single and double track are placed ready for operation. Other new types show the considerable advancement in these devices.

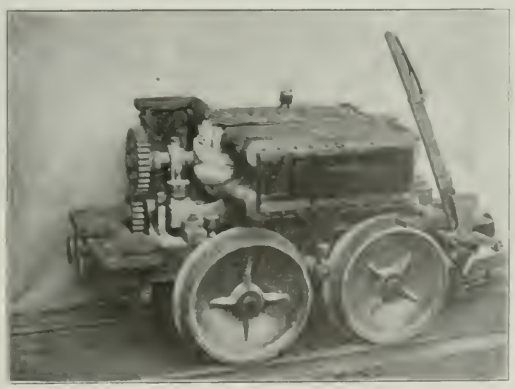
The fourth department is the largest and to the general public the most interesting. It contains locomotives and cars. By far the greatest number of exhibits are models, the rest being photographs and drawings. The models are mostly one-fifth or one-tenth size a few of the exhibits however being originals. These include the engine "Adler" of the first German railroad—Nuremberg-Fürth—of 1835 and the "Borussia" of the Cologne-Minden line of 1858. Modern locomotives for freight and passenger service mountain lines, industrial purposes, etc., are shown by models. Most of these fine models were made by apprentices of the Prussian State Railway shops, while others are presents from manufacturing firms. A full size exhibit represents the cab of a modern express engine and steps have been provided to allow visitors to climb up on the platform. Another full size exhibit is the smokebox of a freight locomotive fitted with a Schmidt superheater which is so extensively employed in Germany, and a third is an old boiler of a locomotive built in 1857 which is cut open longitudinally and illustrates not only the location of the various pipes, valves, grate, etc., but also shows the effect of fire and water on the sheets. Two brake testing racks, each consisting of 20 brakes of the Carpenter and Westinghouse types, respectively, are connected with the compressed air plant and can be used to demonstrate the action of brakes on a 20-car train. Numerous accessories supplement the locomotive section.

A large variety of cars are shown, comprising first, second, third and fourth class passenger vehicles, also workmen's, baggage, mail, funeral, hospital, dining and sleeping cars. The models are mostly one-fifth size and are made with a removable cover to allow in-

Exhibit of Signaling Devices.



A German Tank Locomotive of 1881.



First Electric Truck Built in Germany.

spection of the interior. The most curious object is an open third class carriage of the old Breslau-Freiburg line built in 1843. It contains wooden benches, but has no windows or roof. Full size sleeping compartments of old and new cars are shown. The freight cars supplementing this group are chiefly composed of cars for special purposes, for carrying long iron plates and bars, guns, long trees, glass, liquids, chemicals, cement, cattle, living fish, and the

Model of Old Car Ferry Across the Rhine.

like. Over 400 exhibits show accessories, such as axles, couplers, doors, windows, heating, lighting and ventilating devices, dynamos, etc. A collection of broken axles, worn wheels, bent rods, brake-shoes, tubes and boiler plates is very instructive.

The next section is devoted to the application of electricity as a motive power. Many gifts have been received from the two leading electrical firms, and this section is complete in every way. It shows the development of electric apparatus from the earliest beginnings. Germany was the first country to use electricity for railroad purposes and a large picture on the wall shows the first electric train of 1876 run during the Berlin exposition. The exhibit includes full size controllers, rail-joints, overhead wires, insulators, track switches, underground conduits, motors, etc. The chief attraction is a model one-tenth size of the high-speed car which exceeded 200 kilometers per hour during the 1903 trials on the Berlin-Zossen road. Also the first practical single-phase motor ever built is shown.

The next department covers railroad shops and mechanical appliances. The Prussian Government does not build its own rolling stock, but owns several large shops where cars are repaired and rebuilt, samples of which work are exhibited. On a large table is mounted a relief model of the modern Opladen car shops belonging to the Elberfeld district, and a portion of the locomotive repair shops at the same place. The government devotes much attention to the care of apprentices in these shops, and many samples of their work are placed on exhibition, also models of typical institutes for training such apprentices. The equipment of the shops is represented by exhibits of machine tools, such as lathes for wheel-tires, steam hammers, hydraulic wheel press, jacks for lifting cars and engines traveling cranes, a Dowson gas plant, an attachment for quickly exchanging wornout wheels, etc. In the main hall a large tilting coal wagon unloader is shown by model, a device for changing trucks from the standard to the wider Russian gage, and vice versa, etc. Models of old and new railroad ferries are shown, and also a model representing the only stretch of track in Germany which is too steep for ordinary adhesion trains. The trains are therefore pulled up by a steel cable running over a pulley and attached to a train on the adjoining track going down.

The next department gives a chance to study railroad management from a business point of view. It contains sample printed matter such as rules for stationmasters, engineers, gatekeepers, switchmen, etc., exhibits of devices used in making up trains, communications, tools and uniforms of officials. The method of weighing and checking baggage is illustrated by a full size elevator and scale. There is also a fully equipped ticket office with printing and stamping machine. A collection of railroad tickets from the earliest times is mounted in albums which are locked and carefully guarded. Samples of goods chiefly carried on the freight trains are exhibited in a glass case.

The last group is devoted to the finance and welfare work. Diagrams and literature illustrate the income and expenses of German railroads during the past 50 years and the enormous development of recent times. What Germany does for its railroad employees would be an object lesson to Americans. On German roads when an employee enters the service he is insured for his whole life against sickness and injury. In the museum is a large gilded obelisk which consists of three blocks representing in volume of gold the respective amounts of money spent for the relief of the sick, the injured, and on pensioned employees during the years 1895 to 1904. The total sum amounts to 131,451,321 marks, or $26,300,000. Relief models show exteriors of workmen's dwellings, officers' homes, hospitals and homes for aged employees. The interior equipment of these buildings is shown by pictures and exhibits of medical instruments, beds, disinfecting apparatus, coffee-boilers, clothing and the like.

In the museum building the main hall and the west wing are given up to the railroad department, while in the east wing is an exhibit of marine engineering and civil engineering work. It is not so large but is nevertheless interesting and instructive. A large and modern library and reading room is attached to the museum

Model of First Large Iron Railroad Bridge in Germany Built in 1857 at Dirschau over the Weichsel River.

which in addition to the current journals and books chiefly concerning railroading contains many drawings and photographs and other valuable and rare documents. The museum is a worthy addition to Germany's educational institutions. The railroad man finds here many suggestions and ideas, while the public obtains an insight into many features of transportation about which there was always a mystery.

GENERAL NEWS SECTION

NOTES.

A court in Cass county, Missouri, has held that the law of that state, forbidding the employment of telegraph operators over eight hours a day, is unconstitutional.

Cornelius Burhans, a street car conductor of Brooklyn, N. Y., who has just been retired on a pension of $30 a month, has been a conductor on street car lines in that city for 46 years. He is 72 years old.

The San Pedro, Los Angeles & Salt Lake has contracted for ten million barrels of crude fuel oil to be delivered within the next five years. The price increases from 30 cents a barrel in 1908 to 45 cents a barrel in 1911.

The United States Circuit Court of Appeals of the Eighth Circuit has affirmed the judgment of the District Court, given at Minneapolis last May, fining the Great Northern Railroad $15,000 for granting illegal rebates.

Judge VanDevanter, in the Federal Court, has restrained the state railroad commissioners of Arkansas from enforcing a reduced rate on cotton, which they had ordered to go into effect September 16. The case will be heard October 15.

The Texas Railroad Commission is going to order reciprocal demurrage. The legislature at its last regular session passed a law authorizing the commission to adopt rules and regulations to govern this matter and a public hearing will be given October 8.

Press despatches from Chicago last Monday say that the principal railroads doing business in Kansas have decided to comply with the order of the railroad commission of that state requiring the reduction of all passenger fares to 2 cents a mile on the 1th of October.

It is estimated that the number of colonists arriving in southern California this month will amount to a total of 10,000, about 5,000 having arrived in the first week of the month. It is believed that the number of new settlers in the state this year, up to the end of December, will amount to 30,000.

The State Railroad Commission of Texas has ordered that between competing points the passenger fare by all railroads must be as low as that by the shortest line. The commission has also ordered that the long-and-short-haul rule (as laid down in the Interstate Commerce law) shall be observed in all cases in Texas.

The Missouri, Kansas & Texas has a tie treating plant at Greenville, Tex., which for most of the time for a year or more has not been in operation because the machinery was being changed. Ties will now be treated by the Rueping or creosote process instead of by the zinc chloride process, which was found unsatisfactory.

At a hearing before the New York State Public Service Commission at Buffalo last week, the Secretary of the Corn Exchange gave statistics showing that shippers last autumn had to wait from six to 66 days for freight cars. The longest delay was in the case of an order for 26 cars asked for from the New York Central to be delivered to the City Elevator.

A hundred or more companies and individuals owning refrigerator and tank cars are proposing to form an association. The owners of these classes of cars are not inclined to join the Individual Car Owners' Association which was recently started at Pittsburgh, believing that the Pittsburgh men, mostly coal car owners, will have to sell their cars to the railroads.

In Huron county, Ohio, the Baltimore & Ohio Railroad has been sued for $100 damages for running a train last June from Chicago Junction to Cleveland, 110 miles, in which there was a coupler without an uncoupling chain, thus making it necessary for the brakeman to go between the cars. This suit is prosecuted at the instance of the Ohio State Railroad Commission.

It is announced in Philadelphia that the Pennsylvania and the Reading railroads will, on October 1, reduce to 2 cents a mile all passenger fares now higher than that figure. The expected decision from the higher court in the suit which was appealed by the Pennsylvania Railroad will not be issued before October. The Baltimore & Ohio will also adopt the 2-cent rate in Pennsylvania.

The state health commissioner of Pennsylvania has ordered that sheets in sleeping cars must be long enough to turn over at the upper end 24 in. As the only sleeping cars in Pennsylvania are those run by the Pullman Company, in which the blankets are covered with sheets their whole length, this order would seem to be rather behind the times. The health commissioner also orders that in parlor cars the porters must not brush the clothing of passengers, except at the end of the car. Nothing is said about the application of a rule of this kind to sleeping cars. Probably the commissioner recognizes this as a problem too tough to be tackled offhand.

The Yale and Harvard, the new turbine steamers of the Metropolitan Steamship Company, running between New York and Boston, made their first regular trips on the night of September 18, one steamer leaving Boston and the other New York at 5 p.m., and each reaching their destination the next morning at about 7:30. The distance is 292 miles. The vessels were well loaded with passengers, one of them having 400.

The Superintendent of Motive Power of the Long Island Railroad has been arrested for misdemeanor in allowing a locomotive to be run in the Long Island City yard by an Italian laborer, the engine having run over and killed an engine-inspector while it was in charge of the Italian. Under the Penal Code of New York it is a misdemeanor to allow an engine to be run by a person who cannot read and write the English language.

A statement is going the rounds of the newspapers that in a single year the railroads of the country have been fined over $800,000 for unsatisfactory handling of the mails; and the New York Central is said to have had nearly $37,000 deducted from its compensation in the three months ending March 31 last. Not all of the fines are for slow movement of trains; a considerable portion is for carelessness or neglect in the handling or delivery of bags.

A press despatch from Omaha, September 24, says that the four principal railroads of Nebraska have succeeded in keeping their suits against the state in the Federal Court. They brought injunction suits against the enforcement of a 15 per cent. reduction in certain freight rates which was ordered by the legislature, and the Attorney-General of the state sought to have the questions adjudicated in the Supreme Court of the state. In this he has been defeated.

A reporter at Bloomington, Ill., is the latest expounder of the conservative sensation. He has issued the story about a freight car being lost "unbeknownst." This time it occurred on the Chicago & Eastern Illinois. Conductor Boughter started to set out four cars at Woodland Junction one night recently and found that only three of them were in the train. The train had broken in two some distance back and one car was found off the track; but it was put on again and the train was coupled up and moved on without any serious damage being observed. A following train, however, found the missing car standing nearly upright just clear of the track.

It is reported from the City of Mexico that the judges of the district courts in Mexico have been officially advised to cease their unjust practice of detaining and imprisoning railroad employees on charges of manslaughter when men are killed by trains. There have been many cases where, in consequence of the unavoidable death of a tramp walking on the track, the engineman and perhaps other men on the train have been arrested and imprisoned for months awaiting trial on a serious charge, the officers of the law evidently assuming that someone on the train was necessarily blameworthy. It appears that President Diaz has ordered this practice stopped and that the present notice has been made necessary because the President's order has not been uniformly obeyed. It is gratifying to see that Mexican practice in this respect is in the way of improvement. Before long Mexico will be more civilized than New York city in this respect.

A Tip for the New Haven Road.

According to a story going the rounds of the press, experiments have been conducted by the head of the government college at Caracas, Venezuela, to determine how much electric force electric eels are capable of yielding. Copper wire collars were put around the necks of 100 of these creatures and connections were made between all the collars and a motor, the eels being in a zinc bath. Twenty horse-power current was generated, and with this the scientist ran a mill and lighted up his house and grounds. The power from one eel sufficed to produce a 45-candle incandescent light. It was found that a motor car can be run for 24 hours with 100 eels in a tank 3 ft. long and 1½ ft. square, and weighing complete less than

200 lbs. On this basis it is estimated that the largest ocean steamers afloat can be run with 200,000 eels, producing 40,000 h.p., and contained in a tank not larger than 10 by 10 by 15. This plant, of course, will have to be duplicated so that when the energy in one is exhausted it can be hoisted from the hold to the deck so that the sunlight may infuse new energy into it while the power is furnished by the relay plant.

It is plain that this story did not originate in New York, or at any rate not in Wall street. To be complete it should include a plan for a corporation, with suitable blocks of preferred and common stock, with a prospectus setting forth the number of hatcheries, receiving stations, barrels, trainers, electricians, switch boards, accumulators, etc., that would be required by a concern established to supply eels to all the transatlantic and coastwise steamships. On the New Haven road one night recently a thousand suburban passengers were detained from their dinner tables for an hour or two by the 11,000-volt current going astray and leaving trains standing dead. We are quite sure that no eel, properly trained, would ever be guilty of such dereliction.

Belmont Tunnel Test Trip.

The formal "first trip" through the north tube of the Belmont tunnels under the East river, New York, was made on September 24. The guests included, among others, members of the Public Service Commission of the First district, some of the higher city officials, and officers of the companies operating the subway, elevated and surface lines. The car made the round trip between Third avenue and Forty-second street, Manhattan, and Van Alst avenue and Fourth street, Long Island City. At the luncheon afterward, August Belmont, Chairman of the Board of the Interborough Rapid Transit, said, in part:

"We acquired this franchise in February, 1902, under advice of Strong & Cadwalader that the franchise was perfectly valid, but, notwithstanding, there were certain technicalities to be reviewed. Up to this time the history of corporations in this state was that any company that had undertaken seriously to perfect its franchises and construct the road before the expiration of the franchises was entitled to an extension of the time. We had 18 months to do this work, but we believed that if we went forward earnestly and sincerely we would have no difficulty in obtaining an extension.

"You know the reason why we did not get it. Public clamor against extension in franchises in perpetuity had arisen in the meantime. This was a great injustice to the company, as we were the only one that had actual work under way, and we were trying sincerely to get the work done by the first of January, 1907, and had no obstacles been thrown in the way the work would have been completed during the term of the franchise. I have not a word of regret nor have any of my associates.

"As to the legality of the franchises, the courts have not yet condemned them. As for us, we have still to learn that we have done anything illegal. The city has nothing to say concerning the franchises only as to that part in Manhattan and a small part in Long Island City. The portion under the East river is in control of the state of New York, from which we obtained legal permits. From the bulkhead line in Long Island City to Fourth street we have obtained a grant in perpetuity from the Pennsylvania Railroad Company.

"The company is prepared to operate whenever it can be done under any reasonable and fair arrangements. It is impossible for anybody to make that tunnel pay for three or four years. The business is not there to pay interest on the cost of the tunnel and the equipments. It is not as valuable to us as it is to the city of New York.

"The Interborough company is the only company, in my experience, that can claim the distinction of doing any serious service for the improvement of traffic conditions in Greater New York, in spite of the abuse it has received. I say that the treatment of this company has not been such as to inspire further effort on the part of private enterprise, and until private enterprise is encouraged and confidence restored we won't have any improvement."

Steel Ties on the Bessemer & Lake Erie.

The Bessemer & Lake Erie has completed plans for using steel ties on its lines next year. More than 70,000 will be used for renewals and repairs, where wooden ties are now in use. By the end of next year more than 90 miles of track will be laid with steel ties. Railroads controlled by the United States Steel Corporation are now using over $500,000 worth of steel ties, or enough to lay 150 miles of track. Roads not identified with the corporation are using about 120,000 steel ties on 40 miles of track. During the present year the company has sold about 3,000 tons of ties. A plan has been completed whereby the ties can be insulated, making them available for electric roads.

President Finley on Postponement of Improvements.

The following is from a statement by President Finley, of the Southern Railway: "It has been represented that work has been stopped and forces reduced as a measure of retaliation against adverse state legislation. In no case has this been true. Current railroad income is insufficient to provide funds necessary for extensive improvements and betterments. These can only be provided for, now as in the past, by obtaining new capital. Present financial conditions and the present attitude of investors toward railroad securities are such that it is impossible, for the moment, to sell securities on a basis that any business concern, managed in accordance with sound business principles, would be justified in accepting. It has, therefore, been necessary to postpone many important projects for improvements. Only those will be pushed to completion at this time on which work has progressed so far that the public and the railroad can receive the benefit of their completion at an early date. Other projects have not been abandoned, but will be carried out just as soon as conditions are such that the necessary capital can be secured. Forces have been reduced and expenses curtailed, in the same ratio, in those states in which there has been no adverse legislative action as in others."

Judge Shull on the Two-Cent Law.

In the case of the Susquehanna River & Western Railroad, 13 miles long, Judge Shull, of the Perry County Court, Pennsylvania, has declared the two-cent fare law of that state in derogation of both the United States and the Pennsylvania constitutions. He quotes figures of the company's earnings to show that the enforcement of the rate would be confiscatory. He says that the act is a "caprice of a Legislature many of whose members, without rhyme or reason, facts or figures, information or reputation, were pledged to perform the act in the name of 'reform.' We might say of reform as was said by Madame Roland of liberty in the days of the French Revolution: 'Oh, Liberty, Liberty! How many crimes are committed in thy name!'" To compel this company to comply with the law would rob the bondholders of their securities, deprive the community of the facilities for transportation of freight and confiscate the property and franchises of the stockholders.

Forty Passengers Killed in Mexico.

In a collision between a passenger train and a freight on the Mexican Central, near Aguascalientes, on September 19, 40 or more passengers were killed and 34 injured.

In the South.

A southern railroad had stationed, at a highway crossing, an old negro watchman, whose duties consisted in warning travelers when a train approached. One night a wagon belonging to a farmer was struck, resulting in a bad accident. The company was, of course, sued for damages, and at the trial the old darky replied to the questions put to him in a clear, direct fashion. Among these questions was one as to whether he was sure that he had swung his lantern across the road when he perceived the train approach. The negro replied:

"I shorely did, sah!"

The trial resulted in a verdict for the company and the counsel took early occasion to compliment the aged negro on his excellent testimony. To which the latter replied:

"Thankee, Marse John, but I was shorely skeered when dat lawyer man begin to ask me about de lantern. I was afeared for a minute dat he was goin' to ask me if it was lit or not. De oil done give out some time befo' de accident!"—*Exchange.*

President Diaz's Review of Mexican Railroads.

In his recent message to the National Congress of Mexico, President Diaz gave a review of the progress of railroad construction in that country as follows:

"The unpropitious condition of the foreign markets is the reason that arrangements for the merger of the National Railroad of Mexico and the Mexican Central Railway have not been consummated. A decree was issued on July 6, last, laying down the lines along which the Mexican company that will take over the two properties in question is to be incorporated; but in view of the circumstances it does not seem wise to go on as yet with the incorporation or with the financial operations to which it must give rise.

"Last January the formal inauguration of freight traffic over

the Tehuantepec National across the Isthmus of Tehuantepec took place. During the first five months of operation 123,000 tons of goods were transported across the Isthmus, giving a monthly average of 24,600 tons. The company has received 300 new freight cars which, with those built and repaired at its shops, give an equipment of 1,062 freight cars. The earnings of this railroad have increased by reason of the new freight traffic, the proportion of increase in earnings in the last half year from January to June last, as compared with the same period of the previous year, being 265 per cent.

"The new railroads built in Mexico during the last six months aggregated 171 miles, the largest contributions of new track being those of the lines between Jarita and Columbia, on a branch of the National; the extension of the Pan-American, the line between Ocotlan and Ototonilco, which is a branch of the Mexican Central, the Cananea, Yaqui River & Pacific, and the line from Navajoa to Guadalajara. In addition to the new track, subject to federal jurisdiction, there were new lines subject to state jurisdiction constructed, aggregating 128 miles, making a total of 299 miles of new track constructed during this period. The total length of the railroads of Mexico is 13,882 miles."

Rail Conference.

The following announcement was made last Tuesday: "About 30 representatives of the leading railroads and steel manufacturing companies are in attendance at the conferences. The steel rail question is being thoroughly discussed, and various types of rails which may help to solve the problem are being examined and considered. There is every indication that new types of rails will be agreed upon which will be satisfactory to railroads and manufacturers alike."

University Appointments.

Howard C. Ford, C.E., has been appointed Assistant Professor of Irrigation Engineering and Surveying at the Iowa State College, Ames, Iowa. Mr. Ford is a graduate of the University of Colorado and has been Instructor in Civil Engineering there for three years. Harry J. Kesner, a graduate of the Civil Engineering department of the University of Colorado, has been appointed Instructor in Bridge Engineering in the University of Minnesota. Clement C. Williams and Arthur P. Poorman have been appointed Instructors in Civil Engineering in the University of Colorado. Mr. Williams is a graduate of the University of Illinois and has been for nearly two years on the Delaware, Lackawanna & Western. Mr. Poorman is a recent graduate of the University of Illinois, and has since been in the Weber Concrete Construction Co.

TRADE CATALOGUES.

Ideal Power.—The leading article of the Chicago Pneumatic Tool Co.'s monthly for September is, "The Little Giant Drill Compared with a Stationary Engine and a Locomotive." Asserting that the demand for high-speed portable pneumatic tools is temporary and that good practice will again come back to tools with maximum speed equal to the maximum cutting power of twist drills, comparison of the work done by different classes of such drills is made with a stationary engine and with a locomotive, and a good case made out for the drills. Other articles are, "Sun's Rays Converted into Power"; "Packing Foreign Shipments"; "Compressed Air in Railway Shops," being extracts from the discussion of a paper before the Central Railway Club; "Pneumatic Tools on Egyptian State Railways," and the program of the nineteenth annual convention of the American Boiler Manufacturers' Association to be held in Atlanta, Ga., Oct. 8, 9 and 10.

Drills.—The Cleveland Twist Drill Co., Cleveland, Ohio, sends a celluloid disc which shows, on one side, the feed per revolution per minute with high speed and the carbon drills for wrought iron, machinery steel, and soft tool steel; and, on the other side, the decimal equivalents of fractions. The disc is indestructible, it can be carried in the vest pocket and is a very convenient thing to have.

MANUFACTURING AND BUSINESS.

Edward Laterman has been appointed representative in New York city of the O. M. Edwards Co., Syracuse, N. Y.

F. P. Huntley, for some years Secretary of the Gould Coupler Company, New York, has been elected Vice-President and General Manager. He has been succeeded as Secretary by George G. Milne.

The American Bridge Company, Pittsburgh, Pa., turned out 50,000 tons of fabricated steel during August, which is said to be 1,500 tons more than any structural steel plant has ever finished in one month.

The Union Switch & Signal Co., Swissvale, Pa., has opened the office of its Canadian branch in the Sovereign Bank building, Montreal. V. K. Spicer, Western Manager, will remain in Canada for a few months to get this branch started.

The Pittsburgh Steel Co., Pittsburgh, Pa., has let contracts to the Riter-Conley Company and the McClintic-Marshall Construction Company, Pittsburgh, for buildings at its open hearth steel plant at Monessen, Pa. The work will require 3,500 tons of structural shapes.

According to a Chicago despatch, the Pullman Company is now employing 8,000 men. Early this year its working force was 10,500 men, but the company has caught up with its orders enough to allow of this reduction in employees. No further reduction, however, is contemplated.

The Cuba Railroad recently bought a No. 4 "K" Gates crushing plant built by the Allis-Chalmers Company, Milwaukee, Wis., for use at Camaguey, Cuba. This machine will be mounted on masonry foundation and fitted with smooth head and concaves; it is to be used to crush limestone to 2½ in. size.

The Scullin-Gallagher Iron & Steel Co., St. Louis, Mo., has moved its St. Louis sales department from 412 Lincoln Trust building to 1401 Syndicate Trust building, and its New York sales office from the Trinity building to 1 Wall street. A Denver, Colo., sales office has been opened in the Majestic building.

The Pennsylvania recently equipped a large number of 100,000-lb. capacity cars with Schoen solid steel wheels, replacing cast-iron wheels. The marked capacity of these cars has been increased to 110,000 lbs., with an allowance of 15 per cent. overload because the car bodies and truck frames are amply strong to carry the increased load.

The Chicago & North-Western's plant for treating railroad ties at Escanaba, Mich., is to be enlarged at an expense of $25,000. In addition to the Wellhouse process, now in use, the Rutger creosote process is to be employed hereafter. With the Wellhouse process (chloride of zinc) only soft timbers can be treated to advantage, but with the creosote process hard woods can be treated with profit.

The Chilean Government is asking bids on railroad construction on the state railroads; also for an electric light plant, etc. The estimate is about $600,000. Address Minister of Industry, Communications and Public Works, Santiago, Chile. A concession has been granted Señor Pedro A. Rosseldt, of Santiago, for railroad construction estimated at about $4,000,000. He may be addressed care of the Minister of Industry.

During the traveling engineers' convention in Chicago, special opportunity was given the members to examine in a body the new roundhouse and other up-to-date locomotive terminal facilities that have lately been finished by the Chicago & Western Indiana, one of the belt roads. The roundhouse is equipped with the Miller system for washing out and refilling boilers; it was installed by Julian L. Yale & Co., Chicago. A special train took the convention members to the terminal.

The Cleveland Twist Drill Co., Cleveland, Ohio, has bought the business and plant of the Three Rivers Tool Co., Three Rivers, Mich. The machinery will be immediately installed at the purchasing company's works at Cleveland. J. G. Matthews, former manager of the Three Rivers plant, will have charge of the making of the "Peerless" reamers. The blades of these tools are high-speed steel brazed into a body of low carbon steel. Both solid and expansion types will be made.

The new power stations of the North Shore Electric at Waukeegan and Blue Island, near Chicago, are furnished with alternating current electric cranes made by the Northern Engineering Works, Detroit, Mich. These are 30-ton and 25-ton capacity cranes respectively, 58 ft. and 39 ft. span. The larger crane is equipped with an auxiliary high-speed alternating current hoist. The Black Hills Traction recently installed an eight-ton, 32-ft. span, Northern traveling crane at Spearfish, S. Dak.

The Isthmian Canal Commission will receive bids until October 14 for automatic fire-alarm telegraph systems, marine electric fixtures, fire hose, hose nozzles, fire harness and attachments, firemen's helmets, batteries, dynamite and blasting material, fusible plugs, wire, hoisting engines, shop machines, steel, iron, zinc, copper, brass, rivets, bolts, chain, wrought-iron pipe, cast washers, gaskets, packing, rubber and wire sleeves for dredges, canvas, cotton waste, kerosene, oils, wrenches, ratchet drills, anvils, swage blocks, blacksmith's

mandrel, tire-measuring wheels, crucibles, lamps, dump wagons, piles, bridge timber, etc.

The Isthmian Canal Commission has ordered three steel barges of 400 tons capacity each from the Maryland Steel Company at $59,495, delivery to be made in 120 days. The bid of the United States Steel Corporation was for $85,575, delivery to be made in 225 days. Other bids for the barges were: Newport News Shipbuilding & Drydock Company, $69,000, and Lewis Nixon, $76,950. The lowest bidder for six heavily constructed steel barges for rough work at Panama is the Maryland Steel Company at $125,700, delivery in 200 days, while the steel corporation quoted $135,300, delivery in 230 days. Bids for 12 more steel barges are to be called for soon.

Iron and Steel.

The Atchison, Topeka & Santa Fe has ordered 8,000 tons of bridge steel.

The New York Central & Hudson River has ordered 2,500 tons of bridge steel.

The Lehigh Valley has ordered 2,250 tons of Bessemer rails from the Pennsylvania Steel Co. at $28 a ton.

The Chicago, Milwaukee & St. Paul will soon give an order for 2,500 tons of bridge steel for use on its Pacific extension.

The Carnegie Steel Company has ordered 1,000 tons of fabricated steel from the American Bridge Company for a new power house at its Youngstown plant.

OBITUARY NOTICES.

Samuel Sloan, Chairman of the Board of the Delaware, Lackawanna & Western, and formerly President of that company, died on September 22 at his home at Garrison-on-Hudson. Mr. Sloan was nearly 90 years old.

Henry Clarkson Wicker, formerly President of the Fort Worth & Rio Grande, died on September 20 at his home at Glen Cove, L. I. Mr. Wicker was born at North Ferrisburgh, Vt., in 1840. After graduating from Williston Academy, he began railroad work in 1861 as a clerk in the general freight office of the Chicago & Alton. He was for two years an agent of the Chicago & Milwaukee, now part of the Chicago & North-Western, and in 1866 was made General Freight Agent of the Chicago & Alton. Two years later he was appointed General Freight Agent of the North Missouri, now part of the Wabash, and in 1873 was made joint General Eastern Agent of the Chicago & North-Western, the Chicago, Rock Island & Pacific and the Chicago, Burlington & Quincy. In 1875 he was appointed General Freight Agent of the Chicago & North-Western, being later made Freight Traffic Manager and then Traffic Manager. After being out of railroad service for a year, he was, in 1900, elected President and General Superintendent of the Fort Worth & Rio Grande, from which position he resigned, in the summer of 1901, to become a member of the governing board of the Southwestern Rate Association.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Association of Railway Financial Officers.

At a meeting held in Niagara Falls last week an association was organized, with this name, by the treasurers and financial officers of a number of prominent roads. The President is F. H. Hamilton, Secretary and Treasurer of the St. Louis & San Francisco, St. Louis.

Railway Signal Association.

The annual meeting of this association will be held at Milwaukee, October 8, 9 and 10. The first session will be called at 10 o'clock Tuesday, the 8th. The headquarters of the association will be at the Hotel Pfister.

At this meeting committee reports will be submitted as follows:

Standard specifications for electric interlocking.
Standard specifications for mechanical interlocking.
Automatic block signal systems.
Costs and estimates for installation.

Committee on signaling:

Standard specifications for automatic block signaling.
Foreign current on automatic block signaling.
Signal lamps.
Maintenance of automatic block signals.
Circuits for interlocked signals.
Rubber covered wire.
Maintenance manual controlled signals.
Storage battery.
Office records.
Circuits for manual block signal systems.
Signal definitions.

The Signal Appliance Association has arranged for a theatre party on the evening of the 8th and for carriage rides and other entertainments for the ladies on both Tuesday and Wednesday, on Wednesday evening there is to be a banquet at which the following gentlemen are expected to speak: G. R. Peck, General Counsel of the Chicago, Milwaukee & St. Paul; W. A. Gardner, Vice-President of the Chicago & North-Western; Azel Ames, Jr., Signal Engineer of the New York Central & Hudson River; John I. Beggs, General Manager of the Milwaukee Electric Railway & Light Company, and E. Morse, President of the Simplex Electric Company. The chairman of the exhibit committee is R. A. Patterson, 12 Dey street, New York, and of the local committee of arrangements, W. J. Gillingham, Jr., 1423 Monadnock Block, Chicago.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Alabama Railroad Commission.—The members of this commission are: Charles Henderson, President, Troy, Ala.; W. D. Nesbitt, Birmingham, Ala., and J. G. Harris, Montgomery, Ala. S. P. Kennedy, Anniston, Ala., is Secretary.

Cache Valley.—G. W. L. Brown has been appointed Assistant to the Vice-President and General Manager, with office at Sedgwick, Ark.

Chicago, Indianapolis & Louisville.—L. W. Parker, of Chicago, has been elected a Director, succeeding Gilbert B. Shaw, of Chicago.

Chicago, Milwaukee & St. Paul.—L. J. Pettit, President of the Wisconsin National Bank, Milwaukee, Wis., has been elected a Director, succeeding Joseph Milbank, resigned.

Denver & Rio Grande.—See Missouri Pacific.

International & Great Northern.—See Missouri Pacific.

Kansas Railroad Commission.—The members of this commission are as follows: G. W. Kanavel, Chairman; C. A. Ryker and Frank J. Ryan. E. C. Shiner is Secretary and Rate Clerk.

Louisville, Henderson & St. Louis.—Otto Marx and William Bullitt have been elected Directors, representing minority stockholders.

Missouri Pacific.—A. C. Bird, Vice-President in charge of traffic of this road and of the Denver & Rio Grande, the Rio Grande Western and the Texas & Pacific, has resigned, effective October 1. Mr. Bird has been on leave of absence because of continued ill health for the last two years. J. M. Johnson, Assistant to Mr. Bird, has been appointed Assistant to Vice-President C. S. Clarke of the Missouri Pacific, to Vice-President L. S. Thorne of the Texas & Pacific, to Vice-President C. H. Schlacks of the Denver & Rio Grande and the Rio Grande Western, and to Vice-President Leroy Trice of the International & Great Northern.

Nebraska Railroad Commission.—The members of this commission are: H. J. Winnett, Chairman, J. A. Williams and H. T. Clarke. Clark Perkins is Secretary.

Nevada Railroad Commission.—The members of this commission are: H. F. Bartine, Chairman, Henry Thurtell and J. F. Shaughnessy. E. H. Walker is Secretary.

Oregon Railroad Commission.—The members of this commission are: Thomas K. Campbell, Cottage Grove, Chairman; Oswald West, Astoria, and Clyde B. Aitchison, Portland. George O. Goodall is Secretary.

Rio Grande Western.—See Missouri Pacific.

Texas & Pacific.—See Missouri Pacific.

Operating Officers.

New York, New Haven & Hartford.—W. G. Bierd, who recently resigned as General Manager of the Panama Railroad, has been appointed General Superintendent of the New York, New Haven & Hartford, succeeding O. M. Shepard, assigned to other duties.

Toledo & Indiana.—H. C. Warren, General Superintendent of the Toledo, Port Clinton & Lakeside (electric), has been appointed General Manager of the Toledo & Indiana, succeeding E. Darrow, resigned to go into other business.

Traffic Officers.

Chicago, Indianapolis & Louisville.—The statement published in our issue of September 13 that B. E. Taylor, General Manager, had been appointed General Freight Agent succeeding O. C. Carter was a mistake. Mr. Carter remains General Freight Agent and all correspondence concerning the general freight department should be addressed to him, the office of Traffic Manager, held by the late Charles H. Rockwell, having been abolished.

Chicago, Milwaukee & St. Paul.—J. M. Davis, division freight agent at Milwaukee, Wis., has been appointed to the re-established

office of Assistant General Freight Agent at Milwaukee, effective October 1.

Pittsburgh & Lake Erie.—J. B. Nessle, General Agent at Pittsburgh, Pa., has been appointed Assistant General Freight Agent.

Southern.—C. D. Morris, chief clerk to the General Freight Agent of the St. Louis-Louisville lines, has been appointed to the new office of Assistant General Freight Agent of these lines, effective October 1.

Engineering and Rolling Stock Officers.

Illinois Central.—R. E. Fulmer, Master Mechanic at Paducah, Ky., has resigned to go to another road.

New Jersey Railroad Commission.—Alfred P. Boller has been appointed Civil Engineer, and Boller & Hodge, New York, Consulting Engineers to the commission.

LOCOMOTIVE BUILDING.

The Cincinnati, Hamilton & Dayton is said to be thinking of buying locomotives.

The New York Central Lines are figuring on their usual fall order for locomotives.

The Japanese Government has decided to buy 900 locomotives during the five years beginning with 1908.

The Chicago, Cincinnati & Louisville has ordered five consolidation locomotives from the Baldwin Locomotive Works.

The Austrian State Railroads are asking bids on 43 locomotives, to cost about $800,000, for the Northern lines. Address, Nordbahndirection, Vienna.

The Trinity & Brazos Valley has ordered three simple consolidation locomotives from the Baldwin Locomotive Works.

General Dimensions.

Type of locomotive	Consolidation
Total weight	176,500 lbs.
Weight on drivers	157,000 "
Diameter of drivers	57 in.
Cylinders	20 in. x 28 in.
Boiler, type	Extended wagon top
Boiler, working steam pressure	200 lbs.
Tubes, number	265
" material	Shelby seamless steel
" diameter	2 in.
" length	14 ft. 2 "
Firebox, length	120½ "
" width	39¼ "
" material	Otis steel
Grate area	32½ sq. ft
Heating surface, total	2,169 "
Tank capacity	8,000 gallons
Coal capacity	10 tons

Special Equipment.

Brake-beams	National hollow
Brake-shoes	Diamond steel back
Couplers	Tower
Draft gear	Westinghouse friction
Headlights	Pyle National
Injector	Monitor
Journal bearings	Hewitt
Journal boxes	Franklin
Piston and valve rod packings	Jerome
Safety valve	Crosby
Sanding devices	Leach
Sight-feed lubricators	Nathan
Springs	Railway Steel-Spring Co.
Steam gages	Ashcroft
Tires, driving wheel	Standard Steel Works
Tires, truck wheel	Standard Steel Works
Tires, tender wheel	Standard Steel Works

CAR BUILDING.

The Canadian Pacific is figuring on building 2,000 box cars at its own shops.

The Chicago City Railway, it is said, has ordered 300 Montreal type street cars.

The United Zinc & Chemical Co., Kansas City, Mo., is in the market for 15 tank cars.

The Southern Indiana has ordered 500 gondola cars from the Haskell & Barker Car Co.

The Southern is said to have ordered 500 freight cars from the American Car & Foundry Co.

The New York Central Lines will figure on specifications for rolling stock in a few days.

The Japanese Government has decided to buy 19,000 freight cars and 1,000 passenger cars during the five years beginning with 1908.

The White Pass & Yukon, which recently asked prices on a number of special design cars, intends to build the cars at its own shops about January, 1908.

The Public Service Corporation, Newark, N. J., is said to have ordered 250 additional street cars from the Cincinnati Car Co. Of these, 50 are for November delivery and the rest for delivery during the spring of 1908.

The Italian Government Railroads are said to have decided to ask bids in various countries on about $5,000,000 worth of passenger and freight cars. This is understood to include all the equipment now being figured on, although heretofore the government has reserved a large part of its requirements for its own shops.

The Canadian Pacific has ordered from the Pullman Company eight first-class cars, without smoking rooms; eight second-class cars, five colonist cars and four baggage cars. The first-class cars will measure 65 ft. long and 9 ft. 10½ in. wide over frames, with varnished mahogany outside finish and mahogany interior. The second-class cars will have the same measurements and finish. The colonist cars will measure 67 ft. long and 9 ft. 10½ in. wide, over frames, and will have varnished Douglas fir outside finish and birch, mahogany stained interior. The baggage cars will measure 60 ft. long and 9 ft. 10½ in. wide, over frames, and will have the same specifications as the baggage cars reported in the *Railroad Gazette* of August 24, 1906, except that they are to be heated by direct steam, lighted by Pintsch gas, and that steel backed Diamond S brake-shoes are to be used. Bodies and underframes of all cars will be of wood. The special equipment for all cars except the baggage cars includes:

Body bolsters	Double, C. P. R. standard
Truck bolsters	Double
Brake-beams	Simplex trussed
Brake-shoes	Steel backed, diamond S, flanged
Brakes	Westinghouse, high speed
Center bearings	One of malleable iron and one of steel
Couplers	Tower
Curtain fixtures	Forsyth
Curtain material	Pantasote
Draft rigging	Miner tandem with M. C. B. class "G" spring
Dust guards	Harrison
Heating system	Steam
Journal boxes	McCord
Roofs	C. P. R. standard canvas covered
Side bearings	Susemihl
Springs	Elliptic
Trucks	Four-wheel
Wheels	Paige
Lighting system	Pintsch gas with incandescent mantels
Platforms	Standard Coupler Co.
Seats	Wheeler for first-class and second-class, and C. P. R. standard for colonist cars
Vestibules	Pullman wide

RAILROAD STRUCTURES.

BEAVER, PA.—Arrangements have been made for a joint meeting of the officials of the Pittsburg & Lake Erie and the government engineers to consider the plans for the proposed bridge to be built over the Ohio river here. It is expected that work on the structure will be started this fall. (July 26, p. 110).

CHICO, CAL.—The Northern Electric is reported in the market for a three-span steel bridge, to be built over the Sacramento river between this place and Hamilton City.

EL PASO, TEX.—The Southern Pacific has bought 180 acres of land near this place as a site for enlarged terminal facilities. Tracks are to be laid to have a capacity of 8,000 cars.

GREENVILLE, PA.—Plans are being made by the Bessemer & Lake Erie for a large car shop to be built here. Improvements now under way will cost $300,000.

INDIANA.—General Manager B. McKeen, of the Vandalia, is quoted as saying that extensive improvements are to be made at once on the lines of this company, including six new bridges, several new stations. Many old stations are also to be remodeled.

JACKSONVILLE, FLA.—The St. Johns River Terminal Company, which was formed by the Southern and the Georgia, Southern & Florida, it is said, will at once let the contracts for which bids were opened in July for the two new freight houses here. One of the buildings will be two stories high 30 ft. x 210 ft. and the other one story high 50 ft. x 210 ft.

LONG BEACH, CAL.—The San Pedro, Los Angeles & Salt Lake, it is said, is in the market for a Scherzer bridge to be built over the San Gabriel river.

NEW YORK, N. Y.—The New York Central has given a contract to the McClintic-Marshall Construction Co. for an additional building at its New York terminals. The work will require about 2,500 tons of steel.

Old Orchard, Me.—The Boston & Maine, it is said, has bought about 30 acres of ground as a site for new tracks and a station.

Pittsburg, Pa.—It is reported that negotiations are pending between the West Side Belt and Mayor George W. Guthrie regarding an ordnance to provide for the elevation of bridges along this road in the west end.

Springfield, Ohio.—Plans for the proposed Cleveland, Cincinnati, Chicago & St. Louis new freight house have been made, and bids for the work are to be asked for October 5th.

Tomball, Tex.—Grading is reported under way for the new division freight terminals of the Trinity & Brazos Valley at this place. The work includes a roundhouse, shops and other improvements to cost about $100,000.

Vancouver, B. C.—The Bridge Committee are about to submit a by-law appropriating $1,000,000 for bridges as follows: Granville street, $500,000; Westminster avenue, $150,000; Cambie street, $235,000; Coal Harbor, $55,000, and for contingencies, $60,000.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Apalachian Interurban.—This company was chartered in 1905. It proposes to build an electric line from the eastern end of Tennessee to the seaboard at Southport, N. C. Townships in Henderson and other counties have already voted favorably on the bond issue. W. A. Smith, president, Hendersonville, N. C. (See Construction Record, Mar. 16, 1896, p. 88.)

Atlantic & East Coast Terminal.—An officer writes that this company, which is building a terminal yard at Jacksonville, Fla., has all the grading done and track laid. The line is 2½ miles long and includes a steel bridge, for which contract has been let to the Virginia Bridge & Iron Company. J. W. Richardson, Chief Engineer, Jacksonville, Fla.

British Columbia (Electric).—Work, it is said, has been started by this company on an east line to Chilliwack, B. C., 62 miles. The work is to cost about $2,500,000, and is expected to be finished in about two years.

Buffalo, Rochester & Pittsburg.—Contract has been given to F. Shumaker, of Bellefonte, to lay a second track on nine miles of this road from Brockwayville, Pa., north to Carmen. The work is to be started at once. It includes straightening the road and a tunnel 1,200 ft. long. These improvements will shorten the line about one mile. When this work is finished second track is to be laid from Punxsutawney to Ashland Junction. (Mar. 15, p. 380.)

Canadian Northern.—Vice-President D. D. Mann, of this company, is quoted as saying that a line may be built from Vancouver, B. C., into northern British Columbia, to a connection with the proposed main line west from Edmonton. The project depends on the grant by the provincial government of a substantial subsidy.

Canadian Pacific.—This company, according to its annual report for the year ended June 30, 1907, has 823 miles of road under construction, mention of which was made last week, divided as follows:

ONTARIO DIVISION.

Toronto-Sudbury Line.—Muskoka, Ont., to Parry Sound, 23.3 miles; Parry Sound, Ont., to Byng Inlet, 40 miles; Byng Inlet, Ont., to Romford, 59 miles.

Guelph & Goderich.—Milverton, Ont., to Goderich, 45.5 miles; Listowel branch, 16.5 miles.

Walkerton & Lucknow.—Walkerton, Ont., to Proton, 37.5 miles.

CENTRAL DIVISION.

Stonewall Branch.—Komarno, Man., north to Teulon, 11.9 miles.

Pheasant Hills Branch.—Strassburg, Sask., west to Battle River, Alb., 360 miles.

Wolseley Reston Branch.—Kaiser, Sask., east to Reston, Man., 21.2 miles.

Moosejaw Branch.—Moosejaw, Sask., northwest 50 miles.

Souris Branch Extensions.—Stoughton-Weyburn, Sask., 37 miles; Lauder east six miles, Broomhill to Jackson, 6.9 miles.

Manitoba & North Western.—Yorktown extension, Sheho, Sask., northwest 37 miles; Bredenbury branch, Bredenbury, Sask., south one mile.

WESTERN DIVISION.

Calgary & Edmonton.—Lacombe, Alb., extension 50 miles.

PACIFIC DIVISION.

Columbia & Western.—Midway, B. C., west 2.2 miles.

Kootenay Central.—Golden, B. C., south 15 miles.

Chesapeake & Ohio.—George W. Stevens, President of this company, is quoted as saying that work has been resumed on improvements which were recently suspended, including the completion of 28 miles of double-track work that had been temporarily abandoned.

Chicago & North-Western.—The report for the year ended June 30, 1907, shows that 56,497 tons of rails were laid, most of which were used to replace lighter rails, on 476.61 miles of track. During the year, 38 steel bridges, aggregating 2,361 ft. long, were added to replace wooden structures, and other wooden structures were replaced with masonry arches. The plans for the passenger terminal in Chicago call for 16 elevated tracks on a tract (three blocks) bounded by Lake street on the north, Madison street on the south, Canal street on the east and Clinton street on the west, with two four-track elevated approaches; one from the west 1.12 miles long and one from the north, .9 mile. The combined tracks of the two approaches will extend from Jefferson street to the tracks of the terminal .3 mile. The work of elevating the South Branch tracks parallel to Sixteenth street from a point 550 ft. east of Western avenue to the west line of South Canal street in the city of Chicago, 2.36 miles, has been continued during the year. Three tracks have been elevated to a maximum height of 15.8 ft. on 1.35 miles. The construction of 3,265 lineal feet of retaining walls, five subways, and foundations for three subways has been finished; and 2.53 miles of sidings, yard tracks and industry tracks have been elevated. The work of elevating the main tracks on the Milwaukee line from the end of the present elevation at Balmoral avenue, to the northern limits of the city of Chicago at Howard avenue, 2.74 miles, under way during the year, is all finished except the permanent subways. The plans called for the elevation to a maximum height of 14 ft. of the two existing main tracks; the construction and elevation of one additional main track and the construction of 1.12 miles of freight yard tracks; also the construction of 4,693 lineal feet of retaining walls and 18 subways. During the year, sidings, yard tracks and spurs have been added to serve industries aggregating 72.13 miles. At Sheboygan, Wis., a cut-off 4.12 miles has been finished; at Eland Junction, Wis., the grades of the Ashland division main tracks have been raised, the bridges and culverts permanently replaced and freight yards enlarged and improved. Important grade revisions have also been finished on this division between Sheboygan, Wis., and Bartel, and between Milwaukee and Port Washington. During the year new lines have been opened for traffic as follows: Wyoming & North Western, from Casper, Wyo., west to Lander, 147.89 miles; Manitowoc, Green Bay & North Western, between Manitowoc, Wis., and Eland Junction, and from Pulaski to Gillett, a total of 123.20 miles; Milwaukee & State Line Railway, a two-track line from the Milwaukee line near Lake Bluff, Ill., to an intersection with the same line near St. Francis, Wis., 50.24 miles; the Pierre, Rapid City & North-Western from a point .2 miles north of Fort Pierre, S. Dak., west to Rapid City, 165.48 miles, was opened for traffic in August; the Pierre & Fort Pierre Bridge Railway to connect the P., R. C. & N.-W. line with the Chicago & North-Western at Pierre, 1.79 miles, including a bridge consisting of seven masonry arches, to have four fixed spans each 350 ft. long, and a draw span 445 ft. long, is expected to be opened for traffic this year. The extension from Bonesteel, S. Dak., northwest to Gregory, 25.96 miles, has been opened for traffic, and the further extension of this line from Gregory to Dallas, 4.84 miles, is expected to be finished this year. An extension has been built from Elton, Wis., east 6.6 miles, which is being further extended to Langlade, 3.36 miles. An extension has been finished from near Marathon City, Wis., to Rib Falls, 4.75 miles.

Chicago, Rock Island & El Paso.—See Chicago, Rock Island & Pacific.

Chicago, Rock Island & Gulf.—See Chicago, Rock Island & Pacific.

Chicago, Rock Island & Pacific.—J. W. Robins, General Superintendent, is quoted as saying that grading has been finished on the Chicago, Rock Island & Gulf from Amarillo, Tex., west to the Texas-New Mexico boundary, 69.87 miles, and on the Chicago, Rock Island & El Paso from that point to Tucumcari, N. Mex., 41.12 miles. According to the provisions of the charter track must be laid this year. The company is planning to begin this work shortly.

Chicago, St. Paul, Minneapolis & Omaha.—The report of this company for the year ended June 30, 1907, shows that the company during the year added 8,474 tons of rails on 67.41 miles of track, most of which were to replace lighter rails. The extension from Hartington, Neb., to Crofton, 15.8 miles, has been opened for traffic, and it is expected that the extension from New Castle, Neb., to Wynot, 18 miles, will be opened for traffic this year. During the year second track between Merrillan, Wis., and Augusta, 21.70 miles, was put in operation, also third and fourth tracks, between East St. Paul and a new freight yard near the Harvester works, 3.2 miles, and second track between Duluth passenger station and

St Louis river bridge, 1.86 miles. Work is under way on second track between Altoona, Wis. and Augusta 18.98 miles. This is expected to be put in operation this year. The net increase in the side and passing tracks during the year was 17.96 miles. Work on the Minnesota & Iowa division, changing the line at Minneapa, Minn., between Ottawa and St Peter and between Minneopa and Lake Crystal, has been finished, also on a change of alinement and grade south of Cumberland, Wis. for 2.25 miles.

COLORADO & SOUTHERN.—Local reports state that the Trinity & Brazos Valley is considering the question of removing its tracks from a point near Kirven, in Freestone county, Tex., on its Dallas-Houston line, and building a connecting line to the Fort Worth line at Mexia. The proposed change will shorten the distance several miles over the existing line which joins the main line at League.

DANVILLE & EASTERN ILLINOIS (ELECTRIC).—See Illinois Traction.

DENVER, LARAMIE & NORTHWESTERN.—This company, which was organized to build a line from Denver, Colo., to the northern boundary of Wyoming, 500 miles, is said to have secured all the right of way. In Denver ground has been bought aggregating about 160 acres as a site for terminals. (April 5, p. 499.)

EUNICE, LAFAYETTE & ABBEVILLE.—Incorporated in Louisiana with $1,000,000 capital and office at Lafayette. The company proposes to build a line from Eunice, La., southeast via Lafayette and Abbeville to a point on the Gulf. The directors include J. J. Lewis, President; J. N. Green, Vice-President; C. D. Caffery, Secretary and Treasurer; G. Fusilier, J. J. Stagg, P. L. De Clouet, C. D. Trahan and F. A. Godchaux.

GEORGIA-CAROLINA RAILWAY (ELECTRIC).—Local reports say that a contract is to be given by W. L. Hodges, of Hartwell, Ga., President of this company, to survey its proposed line from Athens, Ga., northeast to Anderson, S. C., 60 miles.

GRAND TRUNK.—Application is to be made by this company for permission to build a branch from St. Lambert, Que., to Brosseau station, thence north and west to the easterly entrance of the Victoria Jubilee bridge. Plans and a profile of the route have been filed.

GREAT NORTHERN.—Contract is reported let to J. H. Stewart, of Grand Forks, B. C., for grading 40 miles on the Vancouver, Victoria & Eastern, between Keremeos, B. C., and Hedley. (March 15, p. 384.)

ILLINOIS TRACTION.—The capital stock of the Springfield Belt Railway has been increased from $5,000 to $500,000. The company is to build a belt line from the McKinley road east of Springfield, Ill., to connect with the line south of the city limits, to avoid sending express cars through the city of Springfield. The Danville & Eastern Illinois has also increased its capital from $5,000 to $500,000. This company is to build a line from Danville, Ill., southeast to Terre Haute, Ind., 50 miles.

INTERSTATE TRANSFER RAILWAY.—This company, organized in Wisconsin to build a line 10 miles long from Superior, Wis., north to Duluth, Minn., has been granted a certificate of public convenience and necessity in Wisconsin. (Aug. 9, p. 164.)

JOLIET & SOUTHERN TRACTION.—This company has been authorized to issue $1,500,000 bonds. It is understood that the proceeds will be chiefly used in the construction and equipment of new lines. Contracts have already been let to the Fisher Construction Co. to do some work. (March 15, p. 385.)

LORAIN & WEST VIRGINIA.—See Wabash.

MEXICAN PACIFIC.—Reports from Mexico City state that this company, which operates 59 miles of railroad in Mexico, proposes to build a branch from Acapulco, Mex., northwest along the Pacific coast. This is said to be a Harriman project, and is eventually to connect with the line which the Southern Pacific is building from Guaymus, southeast down the coast. The Mexican Government has granted a liberal concession to the Mexican Pacific. (Aug. 30, p. 247.)

MIDDLE CAROLINA & WESTERN.—Work, it is said, has been started by this company on its proposed line from Greenwood, S. C., on the Seaboard Air Line and the Southern Railway, southeast to Salada, 29 miles. B. W. Crouch, of Augusta, Ga., is said to be interested in the project.

MISSISSIPPI RAILWAY.—Local reports state that a charter has been granted to this company in Mississippi with $100,000 capital to build a line from Bay St. Louis, Miss., on the Gulf of Mexico, north to Grand Junction, Tenn. J. E. Thornton, of Pass Christian; J. L. Ross, of Mendenhall, and G. C. Sprague, of Brandon, are said to be interested.

MISSOURI & NORTH ARKANSAS.—This company, it is said, has over 1,400 men now at work on its extension between Leslie, Ark., and Searcy, 97 miles. Track has been laid on 23 miles from Leslie, and on 30 miles between Heber and Searcy. It is expected to have trains in operation to Heber by January 1. The road is to be extended southeast to Helena, Ark. (June 21, p. 917.)

MUSKOGEE RAILWAY & NAVIGATION CO.—Incorporated in Oklahoma, with $1,500,000 capital, and offices at Shawnee and Muskogee, to build a line from Muskogee, Ind. T., south to a point on the Fort Smith & Western, in the Choctaw Nation, 55 miles. The incorporators include I. L. Reeves and S. M. Rutherford, of Muskogee, C. R. Dean and C. H. Gillman, of Shawnee.

NORTHERN ELECTRIC.—This company, it is said, will extend its line from Chico, Cal., north via Redbluff and Redding to Kennett, 90 miles. The company is now building an extension from Chico west to Hamilton City in Glenn County, 18 miles.

PITTSBURGH & LAKE ERIE.—Twenty-five tracks, each about half a mile long, are being laid in this company's yards at Aliquippa, Pa.

PUGET SOUND INTERNATIONAL RAILWAY & POWER COMPANY.—This company, which was incorporated in Maine last spring with a capital of $200,000 to build an electric line from Seattle, Wash., north via Everett to Bellingham, about 100 miles, has acquired through a lease the Everett Street Railway and electric light and water properties recently bought by the Stone & Webster interests of Boston, Mass. It is understood this line is to form part of a through electric line between Seattle and Vancouver, B. C. E. W. Purdy is President; C. D. Wyman, Vice-President; Albert K. Todd, Secretary. (See Washington Roads, June 28, p. 949.)

ROBERT LEE & FORT CHADBOURNE.—According to reports from San Angelo, Tex., President Spencer of this proposed line has given a contract to J. T. Hunter to do grading. The proposed route is from Robert Lee, in Coke county, east to Winter, about 30 miles.

ROSWELL & EASTERN.—Residents of Roswell, N. Mex., have granted to this company a bonus of $220,000 and a right-of-way through the town. The company proposes to build a line from Roswell, N. Mex., east to Lubbock, Tex., 120 miles. Edward Kennedy, of Houston, is promoting the project. A company under this name was incorporated some time ago to build from Torrance, N. Mex., south to the Texas state line. (Mar. 15, p. 391.)

SAN DIEGO & ARIZONA.—This company, it is said, has begun building its line from San Diego, Cal., east to Yuma, Ariz., 200 miles. The company was organized in December, 1906, and bought the franchises and property of the San Diego-Eastern, projected over this route. John D. Spreckels is the principal promoter. (March 15, p. 391.)

SOUTHERN.—For suspension of work on this road see statement of President Finley on page 366.

SOUTHERN PACIFIC.—See Mexican Pacific.

SPRINGFIELD BELT RAILWAY (ELECTRIC).—See Illinois Traction.

TRINITY & BRAZOS VALLEY.—See Colorado & Southern.

VALLEJO & NORTHERN (ELECTRIC).—This company has all the right-of-way secured for a two-track electric line to be built from Vallejo, Cal., northeast to Sacramento, about 40 miles. Work is to be started at once. (March 15, p. 393.)

VANCOUVER, VICTORIA & EASTERN.—See Great Northern.

VIRGINIA AIR LINE.—This company, which was incorporated last year in Virginia with $25,000 capital, has increased its capital to $500,000. The company is building a line from Lindsay, Va., on the Chesapeake & Ohio south to Upper Bremo on the James River division, about 30 miles. Reports say that grading is finished from Lindsay to Palmyra, about 10 miles, and that track laying is to begin at once. T. O. Troy, President, Amherst, Va.; J. M. Robertson, Secretary, Charlottesville, Va. (March 15, p. 393.)

WABASH.—The extension, building under the name of the Lorain & West Virginia, from Wellington, Ohio, north to Lorain, about 35 miles, is reported to be now in operation. (May 24, p. 728.)

WASHINGTON, FREDERICK & GETTYSBURG (ELECTRIC).—This company has issued bonds to build and equip about 25 miles of line now under construction from Frederick, Md., north via Thurmont, to Emmitsburg. Grading has been finished on six miles and it is expected to have the line between Frederick and Thurmont finished in November. D. C. Kemp, President, Frederick, Md.

WESTERN PACIFIC.—This company has a total of 234 miles of track laid out of 929 miles of main line as follows: In California 27 miles west from Stockton to a point 52 miles of open; 26 miles from Stockton, north to the Mokelumne river; 27 miles from Marysville northwest to Oroville, and in Utah and Nevada for 154 miles from Salt Lake west to within about eight miles of Shafta, Nev., which will be the junction point with the Nevada Northern running south to Ely, Nev.

There remain three gaps to close, one of 52 miles from Oakland through Niles Canyon; a second of 62 miles from the Mokel-

umne river north through Sacramento to Marysville, and a third of 695 miles from Oroville across the Sierra Nevada to a point just east of Shafta. Work has been started on the 1,600-ft. tunnel in San Francisco, the shaft leading from Islais Creek district north into the southern section of the city, with but eight miles of track to be laid to reach Shafta from the east. It is probable that Salt Lake and Shafta will be connected, a distance of 162 miles, by October 1.

Wisconsin Central.—This company expects to finish track laying on the extension building from Ladysmith, Wis., northwest to Superior, 105 miles, by November first. A steel bridge is being built over the Chippewa river just north of Ladysmith that will probably be finished this month. Work trains can then be run as far north as Douglas county. On the whole line there are to be 45 trestles and five steel bridges.

Wichita, Cleveland & Gulf.—Incorporated in Oklahoma with $50,000,000 capital stock and office at Cleveland, Okla. The company proposes to build a line 634 miles long from Wichita, Kan., south through the counties of Sedgwick, Butler, Cowley and Chautauqua, in Kansas; the counties of Osage and Pawnee, in Oklahoma, and through the Cherokee, Creek and Choctaw nations, and the states of Arkansas, Texas and Louisiana to the gulf. The incorporators include: David Ratner, J. F. Hethering, J. C. Byers, R. L. Lunsford and A. Cecanko.

Youghiogheny & Cheat River.—Incorporated in Pennsylvania with $200,000 capital to build a line from Ohiopyle, Pa., on the Baltimore & Ohio, at the Youghiogheny river west to a point in Wharton township, Fayette county. The incorporators include: E. W. Mudge, President, Pittsburgh; C. B. Ferree, R. G. Campbell, G. C. Landers, H. N. Trimble and C. M. Thorp.

RAILROAD CORPORATION NEWS.

Albany & Susquehanna.—See Delaware & Hudson.

Boston & Maine.—This company has sold to Bond & Goodwin, Boston, $4,000,000 one-year 6 per cent. notes. The proceeds are to be used to refund short term notes. Most of the new notes have been disposed of and the rest are being offered at 100¼. See New York, New Haven & Hartford.

See Fitchburg Railroad.

Chicago & Alton.—Judge K. M. Landis has announced that the promise of immunity from prosecution on account of rebates given the Standard Oil Company of Indiana will be kept. It is believed that this decision removes the most important obstacle to the ultimate consummation of the acquisition of the Chicago & Alton by the Toledo, St. Louis & Western.

Delaware & Hudson.—The United States Circuit Court has handed down a decision in favor of the stockholders of the Albany & Susquehanna in their suit against the Delaware & Hudson for 12½ per cent. annual dividends, as rental, instead of the 9 per cent. which the Delaware & Hudson has been paying on the A. & S. stock since 1902. The point of the suit was that the D. & H. in refunding issues of 7 per cent. and 6 per cent. A. & S. bonds with 3½ per cent. convertible D. & H. bonds had effected a saving in interest charges of which the A. & S. stockholders should get the benefit under the terms of the lease; the latter therefore brought suit for increased dividends, with the above result. (Nov. 2, 1906, p. 124.)

Fitchburg Railroad.—At the annual meeting on September 25, the stockholders annulled their vote of January 30, 1907, authorizing $800,000 bonds for double-tracking between Troy, N. Y., and Johnsonville, and for the elimination of grade crossings, and, instead, authorized an issue of $2,900,000 bonds, part of which are to be used to refund $2,000,000 bonds maturing May 1, 1908, and the rest for the double-tracking and for other improvements. They also authorized the purchase of the Conway Street Railway, a small electric line in Conway, Franklin County, Mass., and authorized the issue of preferred stock and bonds to pay for this property. The bill allowing this purchase was passed last spring by the Massachusetts legislature.

Illinois Central.—In a letter asking for proxies for the annual meeting on October 16, Stuyvesant Fish says that for some time there have been persistent efforts to put the control of the company in the hands of Union Pacific and Southern Pacific interests. The policy of the Illinois Central, operating as it does north and south lines, has been to deal with each of its east and west connections to the best advantage without making exclusive traffic alliances. It delivers more tonnage to connecting lines than it receives from them, and its control would therefore be particularly valuable to the Union Pacific and the Southern Pacific. Although the Harriman interests denied at the annual meeting last year that the Union Pacific had an interest in Illinois Central stock, the Interstate Commerce Commission investigation in February showed that the Union Pacific had bought, before the 1906 stockholders' meeting, nearly 30 per cent. of the Illinois Central capital stock. The annual report for the year ended June 30, 1907, shows an extraordinary increase in net receipts during the last four months. During the first four months they increased $670,000; in the next four months, after the change of presidents, they decreased $570,000, and in the last four months they increased $1,250,000, of which over $600,000 was in the single month of June, and then, although neither mileage nor operating conditions had changed, the month of July, 1907, showed a decrease of $35,000 in net revenue. A resolution of inquiry introduced by Mr. Fish was referred for answer to President Harahan, who was in charge, through an assistant, of the accounting methods which Mr. Fish questioned. Mr. Fish now asks for proxies because of the evident intention of electing Mr. Harriman and others of his selection to the Board of Directors to fill the four places on the Board.

Mr. Harahan has sent out a circular letter answering these statements. He says that the charges that Illinois Central accounts have been manipulated are absolutely untrue, and that the reports of the accounting and traffic officers, called for in the resolution referred to, show this. There has been no change in the relations of the Illinois Central with the Union Pacific and the Southern Pacific. Mr. Harahan then speaks of the reasons why Mr. Fish was dropped from the presidency. He gives specific instances of loans made by Mr. Fish from Illinois Central surplus, of which the Directors disapproved; their other reasons are given in the letter from the Directors to Mr. Fish, which was written last November and a copy of which is enclosed in Mr. Harahan's circular letter.

Interborough-Metropolitan.—See New York City Railway.

Ione & Eastern.—John Raggio, Stockton, Cal., has been appointed Receiver of this road, which runs from Ione, Cal., to Martell, 12 miles. The interest on the $340,000 bonds is in default.

Metropolitan Street Railway.—See New York City Railway.

New York City Railway.—Adrian H. Joline, President of the Missouri, Kansas & Texas, and Douglas Robinson, of the real estate firm of Douglas Robinson, Charles S. Brown & Co., have been appointed Receivers of this property on the petition of the Pennsylvania Steel Company and the Degnon Contracting Company, creditors for about $50,000. A few months ago the assets of the company were given as about $29,000,000 and the liabilities as about $38,000,000. It is alleged that the floating debt amounts to $2,000,000 and that the company cannot pay it. An immediate result of the receivership will be the passing of the guaranteed 7 per cent. dividends on Metropolitan Street Railway stock, and it is believed that since the property is now in the hands of the federal courts, the investigation of the Interborough-Metropolitan's relations with its subsidiaries, which has been carried on by the Public Service Commission for the First district, will have to stop, so far as the New York City Railway is concerned.

New York, New Haven & Hartford.—A special meeting of the stockholders has been called for October 30 to authorize an issue of $35,469,500 additional capital stock. This is to be issued to stockholders and convertible debenture holders at $125 a share to the extent of 25 per cent. of their present holdings; for this purpose, $150 in debentures is equivalent to $100 in stock. There are outstanding $30,000,000 convertible debentures and $121,878,000 stock. Part of the latter is, however, held in the treasury, having been issued by the company to itself in exchange for its own holdings in Consolidated Railway stock.

See editorial columns for President Mellen's attitude concerning the relations of this company with the Boston & Maine.

Pan-American.—The Mexican government is said to have bought the majority of the capital stock of this company. There is $10,000,000 authorized, of which $1,084,600 was outstanding in April, 1906. About 200 miles of road are in operation from San Geronimo, where it connects with the Tehuantepec National, to a point 50 miles from the Guatemala border.

Southern Pacific.—Gross earnings for July, 1907, were $11,451,270, an increase of $2,237,535; net earnings, after taxes, $3,452,587, an increase of $47,568. These returns were compiled after the manner of those of the Union Pacific, which see.

Toledo, St. Louis & Western.—See Chicago & Alton.

Union Pacific.—Gross earnings for July, 1907, were $7,233,994, an increase of $1,026,165; net earnings, after taxes, $3,041,983, a decrease of $79,398. These earnings were compiled in accordance with the Interstate Commerce Commission's new accounting rules, and the figures for the same month in 1906 have been revised to conform with them for comparison.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK.
BRANCH OFFICES AT 375 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON.

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Pres. and Editor* — RAY MORRIS, *Secretary*
E. A. SIMMONS, *Vice-President* — R. S. CHISOLM, *Treas.*; I. B. RINES, *Cashier*; L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Man'g Editor* — GEORGE L. FOWLER
BRAMAN B. ADAMS — FRANK W. KRAEGER
CHARLES H. FRY — HUGH RANKIN
RODNEY HITT — BRADFORD BOARDMAN

CONTENTS

VOL. XLIII., No. 11. FRIDAY, OCTOBER 4, 1907.

The huge figures for the freight and passenger movement in the United States, and its enormous growth within a short period, during which the increase in mileage has been comparatively small, tends to create the impression that there is generally great density of traffic, which impression is strengthened by the obvious fact that many important lines have had at times more traffic than they could handle. Taking the railroad system as a whole, however, the traffic must still be called thin. The movement on the 222,340 miles reported for 1906, if evenly distributed in time and over the railroads, was equivalent to a daily movement in each direction of 181 passengers and 1,330 tons of freight, say one train a day each way with three full carloads of passengers and another with 33 full carloads of freight. Seeing as we do on the more important lines train after train pass much larger than these (though rarely fully loaded in both directions) it is hard to believe this; but by as much as the traffic vastly exceeds this on certain lines, by so much it falls below it on others; and rates which leaving a narrow margin of profit where the traffic is dense, yet yield an abundant return, are not likely to pay the working expenses where it is light. But the average density of traffic is still much greater than formerly. There is nearly twice as much passenger traffic per mile of railroad as in 1897, and quite twice as much freight traffic as in 1895. From 1870 to 1885 the very large increase in mileage frequently reduced the average traffic per mile. Main lines had few interruptions in their growth; but thousands of miles of new lines on the frontier and of branches in undeveloped country often more than counterbalanced this. Now, it is practically impossible to add 10 per cent. to the mileage in a single year, as was often the case formerly, and it is many years since the addition has been as much as 3 per cent.

The New York, New Haven & Hartford Railroad Company's property reaches four states in which it encounters varying statutes of taxation. The appearance recently of its president before a special committee of the Massachusetts legislature as an advocate of direct taxation of the corporation instead of the personal taxation of the stockholder or bondholder is significant, if for no other reason, because it is based on a wide range of experience. The forms of railroad taxation in the country are still infinite. But there appears to be a slow but steady drift toward the New Haven President's suggestion of taxation directly levied by the state on railroad debt at or about par value and on capital stock at nearly market value —usually in practice a little below that value on the theory that any large amount of the stock, if put on sale, would depress the market price. This sweeping dictum of direct taxation by the state based, in the case of interstate systems, on mileage within the state, has the manifest advantage of simplicity and of reaching every holder of stocks and bonds. Its disadvantage is the minor one of taxing a varying market value of the stock and, for example, letting a railroad now and then carry over a new issue of bonds or of stock just beyond the assessment period and thus escape for a year. If the plan, which a number of states adopt, of redistributing tax receipts among the towns, cities or counties through which the railroad runs is also adopted, the equities of the tax adjustment seem pretty complete. In this big, waxing and complicated question of railroad taxation one broad movement may also be noted: When the railroad lines were short, local and isolated the theory of local taxation was naturally dominant. As the lines have consolidated into longer lines and these into systems state taxation has come to the front, the state sometimes collecting for itself, sometimes acting merely as a tax collector for the municipalities and lately, in the case of New Jersey "splitting" the question by taxing "main stems" for state revenue while other railroad property pays local taxes. But the whole system of American railroad taxation is shot through with inequities. Why, for instance, should the resident of Connecticut be taxed on outside railroad bonds but go free on outside railroad stocks without regard to the outside and local taxation which either may bear? Ere long, also, the street railways are going to load the general problem with new enigmas. Just now the street railways may be regarded as fittest subjects of municipal rather than state taxation. Generally speaking their higher valuations are localized to centers of dense population, and the municipality which has yielded franchise rights in its streets has the primary claim to revenue from taxes. But the situation is sure to be modified as the local systems merge, extend into long distance, cross country and interstate systems, are taken up by the steam companies and ultimately—as in the case already of the New Haven—consolidated with them. State equities as against local equities in such a hybrid status of the blended lines will give us some fresh tax problems sure to be puzzling and often polemical.

The ten-wheel locomotive for the Great Western Railway, illustrated elsewhere in this issue, has a number of features that should at least attract the interested attention of American railroad men. Some of them suggest a possible simplification of our own practice, while others go to the opposite extreme and suggest complications that no superintendent of motive power in the United States would

care to advocate. Chief among these is the use of four simple cylinders instead of two. If these four cylinders were of exceptional size and the engine of great weight the reason for their existence would be readily understood. But why four cylinders of 14½-in. diameter instead of two of the equivalent diameter of 20⅛-in.? The one advantage that they possess is that the reciprocating parts are in perfect balance and are light; but it would hardly seem that this advantage could outweigh the disadvantages of the duplication of every working part, the trouble from the inaccessibility of the machinery between the frames, the crank axle and all the accompaniments. A glance at the illustrations will show that inspection of the inside working parts is quite out of the question except from a pit, and it must be remembered that this includes the whole of the valve motion except the end of the rocker and the stem of the outside valves.

The valve motion is designed along lines that are worthy of examination. There are no eccentrics or return cranks, and this may mean a possible simplification. Whether the cross connection from one set of cylinders to the other can be made more cheaply and cost less for maintenance than the usual construction with the Walschaert gear, remains to be seen. Certainly nothing can be much more simple than the return crank, and we hear of very little trouble caused by it; but that is no reason why we should not look into this Great Western scheme.

The care with which the details are worked out will undoubtedly insure the success of the engine mechanically, and under the conditions of English practice, possibly economically also; though if it were to be subjected to the ordinary treatment of locomotives on American roads it would probably not have either of these results to its credit. It stands, however, as a strong exemplification of the position of the English chief of motive power, as compared with his American brother, in that he can design and build such a machine as this without a question, because he is the responsible party and is the dictator as to what shall be built and used; a course of action that would be quite impossible in the United States.

THE EFFICIENT ILLUMINATION OF PASSENGER CARS.

Illuminating engineering is one of the newest of the professions. It is so new, in fact, that the significance of the term is not generally understood as yet. It has been defined as "the efficient use of artificial light"; that is, obtaining the best illuminating effects with the least waste of light. Comparatively few persons understand and appreciate the importance of this, and that the proper placing, reflecting and shading of artificial lights is an art requiring the expert knowledge of a specialist. As a result, most of the artificial lighting of to-day is a succession of examples of "how not to do it."

This lack of understanding and appreciation of the correct principles of artificial lighting is as manifest in passenger train lighting as elsewhere. For while the problem of efficient lighting of cars contains limitations not found in other places, the fact remains that the methods generally in vogue were evolved with little or no thought of the visual comfort of the passenger. For example, it is a fundamental rule that brilliant radiants should be kept out of the field of vision, or else that their intrinsic brilliancy be greatly reduced, as exposed lights, of any but low intensities, strain the eyes, yet ignorance of this rule is responsible for one of the commonest faults of unscientific artificial lighting. A line of brilliant unshaded lights along the ceiling of a car, as is the general custom, tries severely the eyes of all passengers having to face them. No one who has spent any time on a passenger train after dark needs to be told this. Since it is impracticable to place these lamps outside the field of vision, they should be so shaded as to reduce their intensity to a comfortable degree. The popular belief that the more light there is the better one can see is fallacious. There is a limit to the amount of light the retina of the eye can endure with comfort, and more than this produces strain, making it harder to see well than with less light.

The secret of correct illumination lies in properly directing or diffusing the light. For general lighting of cars, where hiding the lights is impracticable, as with gas lamps for instance, opal or, preferably, holophane globes should be used to keep down the intrinsic brilliancy. As a matter of fact, the general practice for illumination of cars is very wasteful of light. Much better results could be obtained at a less cost by actually reducing the quantity of the light and delivering it where it is needed by the use of suitable reflectors.

Electric lighting offers the illuminating engineer the best opportunities for the exercise of his art, of course, the incandescent lamp being the best adapted of any for getting just the results desired. But since this is the most expensive form of car lighting, general practice will continue the use of other kinds for some time to come. Therefore, since present conditions of illumination with these lights are susceptible of considerable improvement, efforts might profitably be directed to the application of methods to get better results from them and thereby not only save money by actually diminishing the amount of light now considered necessary for adequate illumination, but at the same time enhance materially the comfort of the passengers. However, it was stated at the September meeting of the Western Railway Club that by the use of proper methods in reflecting and diffusing the light the effective illumination of cars could be secured at a reduction of about one-third in the amount of electric power now generally used. This being correct, it means apparatus of less capacity, and therefore of less cost, to furnish the power, and lower cost of operation and maintenance. Since the expense is the one barrier to the general use of electricity for car lighting, a means for lessening this obstacle appears to be at hand. But aside from the important desideratum of cost, it seems not improbable that the time is approaching when the scientific illumination of passenger cars will be considered fully as important as their comfortable heating, and almost as necessary as a proper system of ventilation.

THE HARRIMAN REFRIGERATOR CARS.

Beginning October first, the refrigerator traffic on the Harriman lines, including the extremely heavy transcontinental fruit traffic, is being carried entirely in the companies' own cars, 5,000 of which have already been delivered to the Southern Pacific, with 1,600 more to come, the total cost of the equipment being approximately eleven millions. This is the most interesting immediate outcome of the action of Congress in making private car lines common carriers. The Armours formerly supplied the Harriman lines. It was brought out in testimony that the Armour interests owned some 14,000 refrigerator cars, and rented them on a mileage basis of three-quarter cents per mile, going and coming, with a further agreement, in the case of the Southern Pacific, that the Armour Car Line Company should furnish 5,000 cars, or such number as might be necessary to secure to the fruit shipping interests of California a sufficient number of combined ventilator and refrigerator cars for the transportation of fresh fruit and vegetables from California to the eastern states, in return for which the Armour Car Line was given the exclusive privilege of furnishing the refrigerator equipment, so long as it complied with these conditions. Because of the disparity between the volume of deciduous fruit shipments during the summer months and that of the citrus fruits during the winter months, the Southern Pacific Company had believed it would be unwise to provide cars of its own, since these cars would presumably lie idle for a good part of the year. In the Armour organization, the seasons in different parts of the country were utilized to strike a balance, and cars not needed in the California trade could be sent temporarily to Michigan, Texas, Georgia or elsewhere, as the need might be. But the Harriman lines have now bought a third more cars than the entire number formerly furnished them by the Armours, at a cost more than double that which was testified to in 1905 as prohibitive, and it will be a traffic question of great interest to note how the experiment works out, and whether work for the cars can be found, all the year around, in Harriman territory. If not, refrigeration charges must either provide for the dull season, or the cars must be sent out in competition with the Armour cars, and subject to difficulty in dealing with any kind of exclusive contracts to which one-season fruit roads, like the Pere Marquette, may have been able to bind themselves under the new law.

But it may be assumed that these difficulties will not prove very serious. According to the 1905 testimony, the total number of refrigerator cars in the country at that time was about fifty thousand, and the demand had grown to exceed the supply. In view of the tremendous growth of the California fruit industry, it may be hazarded that the present supply of cars will not exceed the present demand, and that mutually satisfactory adjustments can be made. Shipments of California oranges, lemons and grapefruit for the season now closing aggregate nearly 30,000 carloads. Deciduous fruit shipments have also made a high record for the season. Moreover development of an all the-year-round orange crop

to meet the constant demand for this fruit has been carried out so successfully that now there is hardly a day in the year in which orange shipments are not made. On account of the increased acreage coming into bearing, it is estimated that the citrus fruit shipments from California during the season beginning Nov. 1 will reach 35,000 cars. Pre-cooling before fruit is loaded into cars is being resorted to on a greater scale than ever before, with the result that a considerable quantity of fruit and melons that are now spoiled in transit will reach the eastern market in good condition. The Southern Pacific is erecting three ice manufacturing plants for its new refrigerator car service, to avoid the possibility of an ice shortage such as has happened in past years, causing loss to the fruit shippers.

The refrigerator car business on the Harriman lines will be carried on by the Pacific Fruit Express Company, a company controlled by the Union Pacific, and specially organized to take over the traffic formerly handled by the private refrigerator lines. Some doubt had existed on the right of the Union Pacific to own stock in a refrigerator line, but all uncertainty on this point was cleared up at the last session of the Utah legislature. At that session a new railroad law was passed codifying the railroad laws of the state and including in the privileges accorded to the railroads organized under the laws of that state the right to own express and refrigerator lines.

Mr. Harriman has been quoted to the effect that the lines in his system would hereafter be able to give an enlarged and better service and that earnings would undoubtedly be increased from that source. "Whatever they (the Armours) made, we will make," he said, but he left unsettled the question whether this was to apply to profits made wholly on his own lines or not.

HIGH CAPACITY CARS IN GERMANY.

The Prussian minister of public works has asked for proposals for the construction of coke cars of 15 metric tons capacity that shall dump and be self-clearing, and has offered prizes of 10,000, 7,500 and 5,000 marks for the best designs. Commenting on the German situation, the *Journal des Transports* says, that as far as car capacity is concerned, the fact that Germany is so far behind France is probably due to the lightness of the construction of its roadway and bridges. The American high-capacity car, with bogie trucks, has been the subject of quite contradictory opinions in Germany. It was at first rejected in 1891, when the tonnage limits were established, but a trial was afterward made in 1899 under the Essen management, with cars of 30 and 40 metric ton capacities, built after the designs of Talbot and the Pressed Steel Car Co. They passed through a period of disfavor but were taken up again, in 1904, by the Royal Bavarian Railways. These trials were no more successful than those which preceded them, and they have finally yielded to the hostility manifested. The objections that are raised to this type of car are that it is too heavy to be moved readily by men, and cannot be handled by existing facilities, such as turntables, transfer tables and the like; with the result that the cars are seldom used except for the transportation of heavy freight, such as rails.

Upon a further examination of the problem, the German engineers have found that the ratio of tare weight to local can be made almost as low for a four-wheeled car as for one equipped with bogie trucks. For example, the 20-ton standard car with side doors and trap's at the end weighs about 8.5 tons, while the 40-ton car with bogie trucks will not weigh less than 17 tons. It is quite true that a train of 600 tons can be formed of these high-capacity cars on a length 18 metres (59 ft.) less than that required with the four-wheeled cars, but this advantage is considered small when compared with the inconveniences attending the use of such long and heavy cars.

The technical convention of the German Railroad Union has limited the static load per wheel under a full load to 7,000 kilograms (15,100 lbs.), and the total weight to an average of 3,100 kilograms per metre (2,080 pounds per foot) of length over buffers. Still, on some lines where the superstructure and bridges are of sufficient strength, the weight per wheel is raised to eight metric tons, and the latest instructions regarding the maintenance of the superstructure on the main lines make this load of eight tons the minimum. It would seem, then, that the construction of the 20-ton-capacity cars that run for the most part on the main lines, could be modified in such a way that a load of from 7.375 to 7.60 tons could be carried per wheel, by giving the sides a height of 1.8 metres (5.9 feet), so that they could be loaded with 21 tons of coal or 20 tons of coke.

Independent of this increase of capacity there is a demand in German industrial circles for self-dumping cars. Up to the present the cars of this character, that have been built in Germany, have been vehicles intended for the transportation of special bulk loads such as ore, coal, broken stone, limestone and similar products, and usually make the return trip empty. In certain places, where self-dumping cars can be used to advantage they are coming into service, especially for carrying supplies to the large manufacturing establishments of the Rhenish provinces and Westphalia.

Their use is naturally subordinate to the construction of suitable sidings and chutes. Hopper bottom cars have been in use for a number of years in the valley of the Saare and on the Lahn because the structures there are suited to them; but they cannot be utilized where this is not the case. In fact the majority of the interests affected prefer the side discharge.

The position taken is that the rapidity and saving, in comparison with hand labor, of the self-dumping feature, is offset by the fact that such cars can only be used with freight that will not be injured by such a method of handling, and that, even then, they can only be used in connection with special discharging facilities. A limitation is thus imposed upon the utilization of these cars which is a serious obstacle to an increase of their numbers. It may also be added that they cost about 50 per cent. more than the common type of car, and that the ratio of the tare to loaded weights is also unfavorable to them.

These observations will show the difficulties that beset the minister of public works in his search for a type of car that shall combine the advantages that seem to be so contradictory: that is to say, an automatic discharge with a first cost and maintenance charges that shall be low enough to permit it to be used in ordinary traffic.

Railroad officers and other interested parties must look for the results of this contest with some curiosity. For, if a satisfactory solution is found, it is very certain that, in order to use the self-dumping car to the best advantage, it will be necessary to overhaul the station facilities at many points, so as to assure a rapid handling of the rolling stock during periods of congested traffic.

The initiative that has thus far been taken by some of the great industries as well as by the Prussian railroad management, has had its imitators. The State Railroad of Hungary, for example, has just given a trial order for the construction of 10 open cars of 30 metric tons capacity, to have movable sides, and for 50 more fitted with the Talbot system of side discharge.

Nothing is given out about any agreement between the New York, New Haven & Hartford and its western connections in regard to car service, so it is to be assumed that the withdrawal of that road from the per diem agreement has gone into effect; and that for western cars now coming east with freight for New Haven lines that company will have to pay a "reasonable" price per day. What this will be remains to be seen. To the notices, heretofore referred to, which the New Haven received from its connections it replied that it was ready to enter into a "reasonable arrangement"; but this was accompanied by three questions, viz.:

"Do you consider it reasonable to charge this company for the use of cars during the four days after delivery, when this company has no use of such cars because of the operation of the law giving consignees four days free of charge between delivery and final unloading?

"The cars to be delivered by you to this company will vary greatly in value, capacity and condition. How are we to ascertain what would be a reasonable charge per day for any particular car?

"How would you propose to classify cars and what would you consider it reasonable to charge for the different classes of cars to be delivered?"

It is said that most of the roads replied that they considered the per diem rules a sufficient answer to all the questions. In other words an arbitrary rate is the only practicable rate. As the arbitrary rate now in force everywhere else (fifty cents a day) is at present far below the real value of cars and therefore more favorable to the borrower than to the lender the position of the connection would seem to be strong and that of the New Haven weak. The question quoted above might make an interesting assortment of bones for lawyers to pick, but it is hard to see how they can be worth anything for any other purpose. Possibly the New Haven intends to contest in the courts every car service bill presented to it by its connections; but as the city of New Haven is supposed to be still stanchly orthodox, in spite of the supremacy of the Modernists in Yale University (and the wickedness at Hartford which gives us a four-days-free law) we may hope that the officers of the road will instead follow the advice given in the first Gospel, fifth chapter, 25th verse—to agree with thine adversary quickly, while

thou art in the way with him. Happily, the penal clauses of the Interstate Commerce law probably cannot be made to apply to interchange car service rates, so that the rest of this scripture, about being cast into prison, need not be quoted here.

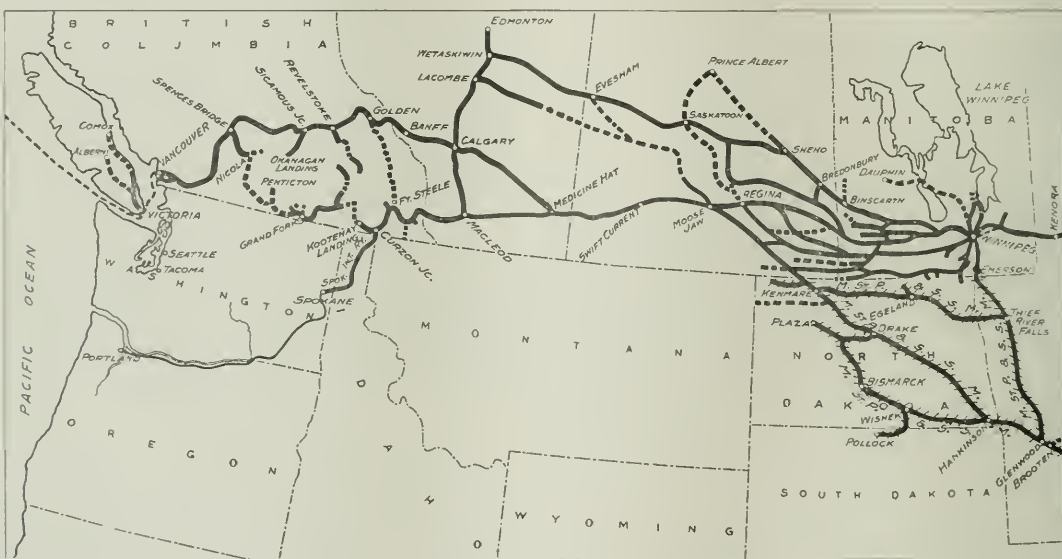
Canadian Pacific.

The Canadian Pacific is a great property. There is no railroad like it as a railroad and no railroad corporation like it as a corporation. It owns a line of railroad from the Atlantic ocean to the Pacific, with thousands of miles of branch and connecting lines in between. Besides lake and coast steamships, it owns a line of steamers from Quebec to Liverpool and another from Vancouver to Yokohama; it owns the Dominion Express Company, which operates the express business over its lines and carries more than half the total express traffic of Canada; it also owns the telegraph lines which serve its territory and receives their profits from commercial business. It owns its own parlor and sleeping cars. It owns a controlling interest in two United States railroads—the Duluth, South Shore & Atlantic, which operates nearly 600 miles of line, and the Minneapolis, St. Paul & Sault Ste. Marie, which operates over 2,000 miles. Finally, it owns directly or indirectly 14,800,000 acres of unoccupied land. No other railroad in the world has such a property as this.

Financially, the company belongs more to London than to Montreal or New York. Its 4 per cent. consolidated debenture stock and stantly increasing in value, after subtracting all expenses of the land grant and a dividend of 1 per cent. on the common stock paid to stockholders in April of this year. It still holds in reserve 12,300,000 acres, besides 2,500,000 acres which it is to receive through a subsidiary.

Of the 12,300,000 acres of land unsold, 8,900,000 acres are agricultural land in Manitoba and Saskatchewan. The British Columbia lands amount to nearly 3,500,000 acres. Some of these, it is known, and many more it is probable, contain valuable mineral deposits. Within a few days the head of the mineral department of the company has been quoted as saying that the Canadian Pacific is spending $1,500,000 on its coal deposits at Fernie, B. C., and that within a year or two the company will occupy an important position in the coal trade of the province. Much of these British Columbia tracts contain lumber, so that western lands, although not at the moment as readily salable as the agricultural lands further east, may in the end prove much more valuable.

The average price received for the 990,840 acres sold during the last fiscal year was also just under $6, but this included a large area for which contracts had been made in earlier years at from $4 to $5 an acre. The average price realized from lands actually sold within the year was over $8 an acre. At this average value—and as the price of the lands is rapidly increasing, the company is likely to receive a much higher average for its holdings—the value of the unsold lands is about $120,000,000, which, added to the $65,000,000 gross already received, would make a total ultimate value of the



Canadian Pacific System; Western Lines.

4 per cent. preference stock are held almost exclusively abroad, where they are highly regarded. This is proved by the fact that the company received more than par for about $6,000,000 of these two classes of stock sold during the last year, when safe 4 per cent. stocks of railroads in the United States were selling considerably below par. Even the company's common stock, which is regularly traded in on the New York Stock Exchange, was held at a level 20 or 30 points above the price at which similar United States railroad stocks were selling, by the large holdings and demand for it in England and on the continent.

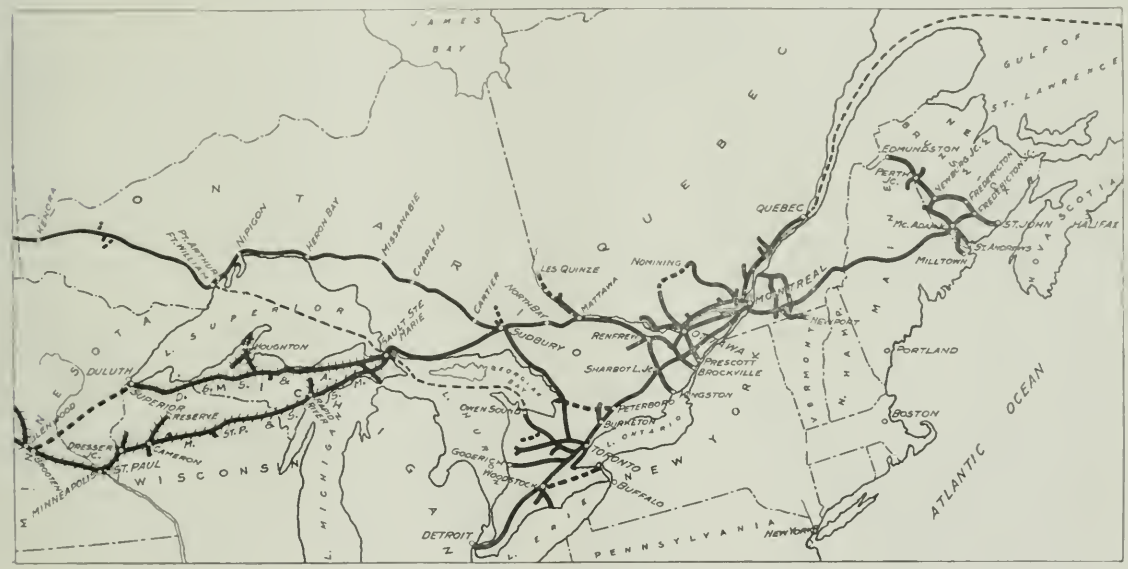
The Canadian Pacific probably has more concealed equities than any other railroad company in the world. The balance sheet by no means records the total value of its holdings in securities and lands. The Dominion Express Company, all of whose stock is owned, was until 1905 carried at $113,000. This figure was then pushed up to $2,000,000 which is said to represent about a sixth of its real value. Common stock of the Canada North West Land Company is carried at par. It has sold on the basis of $100 shares at $1,100 a share.

These are cases where the undervaluation of the company's assets can be plainly seen. In the long list of acquired securities given in the report there are undoubtedly other instances of similar if not as great undervaluation. The most important concealed asset, however, is the item of land holdings mentioned in the balance sheet only by a footnote. The company has already received $58,000,000 in cash or in deferred payments secured by land which is con- company's land grants of $185,000,000. This great asset came along with cash subsidies of $30,000,000 and 713 miles of railroad which cost $35,000,000 to build, from the Dominion or provincial governments. To-day this seems like lavish generosity, but the Canadian Northwest has now an assured and prosperous future. The first trans-continental train was run on the Canadian Pacific on June 28, 1886. At that time most of its lands were of no immediate value whatever to the railroad or to the country. More by far than to any other one cause Canada owes the wonderful development of her western territory to the Canadian Pacific Railway. The inducements offered, of small immediate but great potential value, were necessary to bring about the construction of such a railroad, as was proved by the failure of earlier similar projects to be carried out without such inducements.

For years the absolute master of the railroad facilities of the western part of Canada, the Canadian Pacific is now facing not far in the future serious competition. In the first place, the Canadian Northern threw out a network of rapidly built lines in the wheat growing regions of Manitoba, the longest of which is now in operation as far as Edmonton, Sask.; next came the defeat of the Conservative party, the ally of the Canadian Pacific, in the Canadian elections, and the Grand Trunk Pacific project, backed by the Liberals under the leadership of Sir Wilfred Laurier and the Grand Trunk Railway, which then held an almost complete monopoly of most of the province of Ontario. This meant more serious competition, for a through line from coast to coast with numerous branches and feed-

ers in the western country was to be undertaken. This competition was particularly serious because backed by government credit. The Canadian Pacific replied by beginning construction of various lines in Ontario paralleling the Grand Trunk mileage and reaching its traffic centers, and, not less important by the improvement of its existing lines and a rapid occupation of territory in the great Northwest by new lines. Then there came still a third competitor, J. J. Hill of the Great Northern, who promises to build a through low-grade line from Winnipeg to Vancouver with numerous important branches.

This last challenge the Canadian Pacific has already answered. A through freight and passenger service has been begun from Minneapolis and St. Paul over the Minneapolis, St. Paul and Sault Ste. Marie and the Canadian Pacific's main line as far as Medicine Hat, thence through the southern part of British Columbia to a connection with the new Spokane International Railway, recently completed from Spokane north 141 miles—a road on 51 per cent. of whose stock the Canadian Pacific has a 10-year option and with which it has a close traffic arrangement. This brings it to Spokane, one of the most important Hill traffic centers. But the new route does not stop there. By a traffic arrangement between the Harriman interests, who are willing enough to help along competition with the Hill lines, the Oregon Railroad & Navigation brings the "Soo-Spokane route" down the Columbia river to Portland. From St. Paul to Portland this new route is slightly shorter than either the Great Northern or the Northern Pacific, though this will not be so when the years have been on a large scale. Summing up the progress of the road for five years in a letter read before the Canadian parliament last spring, Sir Thomas Shaughnessy, President of the company, showed that during the five-year period $28,000,000 had been spent on equipment, $44,000,000 on improvements to the existing lines, shops and roundhouses and $45,000,000 for new lines and for new Atlantic steamers. The line improvements include double-tracking and grade revision at various points between Lake Superior and the Rocky mountains, which have been turning the Canadian Pacific from a high grade to a low grade road. There have been particularly large sums spent in improvements and purchases in Winnipeg, the western headquarters of the system. During the last three years about $5,000,000 has gone into terminals, a Canadian Pacific hotel and the acquisition jointly with the Canadian Northern interests of the Winnipeg Electric Railway. The principal double tracking has been from Winnipeg east to Fort William, which involves one change of line about 30 miles long. About 200 miles of this double track is to be ready for use before the end of the year and the whole distance, 427 miles, by the end of 1908, if present expectations are realized. This is a most important improvement, for this stretch of track as can be seen from the map is in reality the throat of the whole system. The network of branch and feeder lines in the agricultural regions between Winnipeg and the Rockies, as well as the through line from the coast, pour their streams of traffic together at Winnipeg. From here there is only one outlet to the eastward. Much of the grain is carried only as far as Fort William, whence the



Canadian Pacific System; Eastern Lines.

Portland & Seattle, the "north bank" road of the Hill lines, is in operation between Spokane and Portland; to Spokane it is a little shorter than the Northern Pacific and a little longer than the Great Northern. It was in July that this route was opened to through passenger traffic, a special limited train being put on between the Twin Cities and Spokane, with a close connection at Spokane for Portland. This route can be traced on the map published herewith, on which the Oregon Railroad & Navigation line from Spokane to Portland is included. How effective it will be as a competitor of the Northern Pacific and of the Great Northern with its low-grade efficient line has yet to be proved.

Against these three sources of severe competition there is the encouraging fact that the development of western Canada is going on so fast that there will probably be business enough for all the railroads which are ready to take it. The Canadian Pacific, moreover, should be in a position, by reason of its numerous improvements and the development of its plant, to handle this more efficiently than its newer competitors. The new lines of the Canadian Northern, at any rate, are of the lightest and most temporary character possible for a large standard gage railroad. The Grand Trunk Pacific is likely to be better built, but hardly up to the Canadian Pacific's standard. The Hill road is really most to be feared in the matter of efficiency, as Mr. Hill is not likely to abandon his lifelong and successful habit of building railroads with low grades whose cost of operation is at a minimum.

The Canadian Pacific's betterments and additions during recent company's lake steamers carry it south to be reshipped to the railroad at Owen Sound on Georgian Bay, thence eastward over Canadian Pacific lines to eastern markets and tidewater.

The five years' record of improvements, summed up by President Shaughnessy, brought the record down to June 30, 1906. Last year $700,000 was spent on ocean, lake and river steamships, $4,500,000 on construction of new lines, $11,000,000 on additions and improvements and $13,500,000 on rolling stock, shops and machinery. This is a record of tremendous progress.

The past year's earnings show that the Canadian Pacific's experience was like that of most other railroads. Gross earnings largely increased, but the cost of operation rose at an even faster rate. Gross earnings were $72,200,000, against $61,700,000 in 1906, an increase of $10,500,000, or 17 per cent., while operating expenses increased $8,200,000, or 21 per cent. This leaves net earnings of $25,300,000, against $23,000,000 in 1906, a gain of 10 per cent. One special reason why operating expenses rose so fast was the severity of last winter, an operating handicap which fell with particular hardship on the Canadian road. For weeks at a time railroad operation was most difficult and for short periods impossible.

The income in net for 1907 was $18,400,000, against $16,000,000 in 1906, and $8,900,000 in 1905. Dividend payments reduced this to $9,300,000, which was the final profit and loss surplus of the year, as no special appropriation for additions and improvements was made. In the previous year there was an appropriation of $5,000,000 for these purposes, but only about $700,000 of it was used, leaving a bal-

ance of $4,300,000 still available. For this reason no new appropriation was made. A good deal of money was received during the year from sources other than those shown in the income account. The total receipts from land sales for the year were $8,300,000. Against this must be set off $1,500,000, the final payment to the Dominion government, on account of land grant bonds, thus leaving the land holdings free and clear to the company. There was $15,800,000 received from sale of new common stock and something over $6,000,000 from sales of preference and of consolidated debenture stock.

The increases in earnings were large. Freight earnings were nearly $46,000,000, against $39,500,000 in the previous year. Passenger earnings increased from $16,000,000 to $19,500,000. These returns indicate the general and unprecedented prosperity of the Dominion, as they follow a year in which the increases over the previous year had been very large. In passenger earnings the great strength of the Canadian Pacific is the large amount of through business, much of it from one seaboard to the other, which goes over its line. Besides the traffic which would naturally come to it from Canadians, Englishmen traveling on this continent as a rule choose the Canadian Pacific for at least one way across, partly because of patriotic feeling and partly because the Canadian Pacific, as a railroad, is so well known abroad. Travelers from the United States also take the trip in great numbers because of the magnificent scenery through the Canadian Rockies, which is unequaled by any transcontinental road in the United States. This large amount of through passenger business does not seem to be reflected in the passenger-mile rate, which is 1.83 cents per passenger per mile, but this figure is much affected by the low rates and large numbers of immigrant passengers.

The bulk of the freight traffic is in two classes of business—grain and lumber. Flour, live stock, fire wood and manufactured articles are listed separately, and all other freight traffic besides these six classes is bulked together in one group, which amounted last year to 4,800,000 tons. The growth of the grain traffic through the tremendous expansion of the road's mileage in the grain-growing districts of Manitoba and Saskatchewan is shown by a large increase in grain tonnage during the last two years. In 1905 there were 59,700,000 bushels of grain carried; in 1906, 82,200,000 bushels, and last year, 93,200,000 bushels hauled by the road. It is evident from the fact that all other articles besides the six classes already mentioned amount altogether to less than 4,800,000 tons, that the coal traffic of the road is not large. The development of the coal measures in British Columbia should result in greatly increasing this article of traffic. Another kind of heavy traffic which is likely to increase in the future is iron ore. Large deposits of iron ore have recently been opened commercially north of Lake Superior, and the Canadian Pacific will receive the haul on these ores from the mines to the manufacturing centers in the East.

Maintenance of way expenditures were $1,115 a mile last year, which appears to be a liberal figure, first, because the proportion of branch-line prairie mileage is large, and, second, because on the lines in the East, south of the St. Lawrence, traffic is light. The cost per mile was about $1,050 in 1906 and $1,000 in 1905. Maintenance of equipment figures are not given in detail. The increase in the cost of conducting transportation was very large. This account stood at $23,800,000, against $18,800,000 in 1906, a rise of $5,000,000, or 26 per cent. Detailed figures are not given under this account, but it is clear that not only the severity of the winter but the greater cost of labor and supplies has had its effect in raising the total of ordinary running expenses. Largely on this account the operating ratio for the year increased from 63 per cent. in 1906 to 65 per cent. last year.

Aside from these handicaps, the road was more efficiently operated than in the previous year. An increase of 193,000,000, or 22 per cent., in passengers carried one mile was taken care of with an increase of only 12 per cent. in passenger-train mileage. In the same way there was an increase of 629,000,000 ton-miles, or 10 per cent., against which there was an increase of only 6 per cent. in freight-train mileage. Empty freight car mileage decreased 10,700,000 car-miles, or 11 per cent., and the revenue trainload rose from 279 tons in 1906 to 295 tons last year. The freight-train earnings per train-mile increased 11 per cent., and the freight-train earnings per mile of road from $4,410 per mile to a little more than $5,000 a mile, a gain of 13 per cent. The passenger-train earnings per mile increased even more than this—17 per cent.

Most of the President's comments in the report are as usual taken up with description of new construction. A branch from Moose Jaw, on the main line in Saskatchewan, northwesterly 50 miles, has already been authorized. This is shown on the map as a completed road. It will shortly be continued 100 miles further. A branch is also projected from Regina, Sask., to Saskatoon, 165 miles. The cost of these branches is to be met by an issue of 4 per cent. consolidated debenture stock. The Regina-Saskatoon line, as shown by the map, is projected further to reach Prince Albert. Up to about a year ago the Canadian Pacific leased the Qu' Appelle, Long Lake & Saskatchewan Railway, which runs from Regina, via Saskatoon, to Prince Albert. This was taken over by the Canadian Northern, which held it during the last winter. In the spring complaint was made that the road had not been operated with any regularity by the Canadian Northern, that at times it had been entirely abandoned, and, therefore, that the Canadian Northern should not be allowed to continue to hold the road. This matter does not appear to have been definitely settled at this time, but if the road should be returned to the Canadian Pacific the branch from Regina to Saskatoon and thence to Prince Albert will probably not be built.

In carrying on construction work the scarcity of labor has made progress slow. Of the 747 miles west of Lake Superior under way at the time of the previous annual report, two-thirds of the grading has been finished, 270 miles of track laid and the rails and fastenings for the rest of the mileage are on hand. In eastern Canada the line from Guelph, Ont., to Goderich, on Lake Huron, is about to be put in operation. On the Walkerton & Lucknow, which is to run from Proton, Ont., to Walkerton, 38 miles, 20 miles of grading was done. On the cut-off which runs on the east side of Georgian Bay, to give the Canadian Pacific its own route between Toronto and the main line, the whole 226 miles is to be ready for freight traffic by the end of the year. This is the line which runs from Kleinburg, Ont., north to Sudbury. It was supposed that $30,000 a mile would cover the cost of its construction, but owing to the difficult character of the country and the greater cost of labor and material, the cost has exceeded the original estimates, and additional funds to an amount not exceeding $10,000 more a mile, are to be authorized. The probable completion of 200 miles of second track between Winnipeg and Fort William has already been mentioned. Second track is also being laid between Ste. Anne's, Que., and Smiths Falls, Ont., 108 miles, of which 50 miles are to be finished before the end of the year and the rest in 1908.

The progress of the Canadian Pacific during the next ten years, the effect on it of the competition just beginning, and the development of Canada which is likely to come about through the great amount of new railroad construction there under way, are likely to be peculiarly interesting. There is a further field for interesting speculation in the probable value of the company's total assets, as it will work out in its effect on the returns to stockholders. The obligations owed to the Dominion government on account of land grant bonds are now fully paid up and all receipts from land sales are a free asset of the company, and, therefore, of the stockholders. Sooner or later there must come a distribution of these assets to the holders of the company's common stock. It is this unknown future equity which largely accounts for the high price at which Canadian Pacific stock is held.

The principal results of the last two years' operations are summed up in the following table:

	1907.	1906.
Mileage worked	9,416	8,777
Freight earnings	$45,885,968	$39,512,973
Passenger earnings	19,528,878	16,041,636
Miscellaneous earnings*	6,079,744	5,408,161
Gross earnings	72,217,518	61,669,758
Maint. way and structures.	10,110,957	9,105,250
Maint. of equipment	9,083,249	7,369,566
Conducting transportation.	23,765,138	18,789,696
Operating expenses.†	46,914,219	38,696,446
Net earnings	25,303,309	22,973,313
Net income	18,376,034	16,012,216

*Including earnings from sleeping cars, express elevators, telegraph and miscellaneous; also profit from ocean steamships. Mail earnings not included.

†Including parlor, sleeping car and commercial telegraph expenses; also expenses of lake and river steamers.

Minneapolis, St. Paul & Sault Ste. Marie.

The Minneapolis, St. Paul & Sault Ste. Marie is a grain carrier, the bulk of whose mileage is in the North Dakota and Minnesota prairies. Its through lines are from Minneapolis to Sault Ste. Marie, from Minneapolis to a Winnipeg connection and from Minneapolis to a Canadian Pacific through connection at the boundary line between North Dakota and Saskatchewan. Within the last two years it has been expanding rapidly by building new mileage in the wheat country of North Dakota. The road is shown on the map of the Canadian Pacific published in another column. The line from Thief River Falls, Minn., west to Kenmare, N. Dak., 296 miles, was finished more than a year ago. It runs through a rich agricultural country where new towns sprang up even before the opening of the railroad, and business and agricultural development have been rapid. Other recent extensions have been in the neighborhood of the Missouri river in North Dakota, particularly the line from Drake to Plaza, on which about $1,400,000 was spent during the last fiscal year.

The effect of this new mileage is shown in various ways in the results of the last year's operations. There was a falling off both in passenger and freight density. There were 52,000 passengers carried one mile per mile of road, against 55,000 in 1906; and 519,000 tons of revenue freight, against 537,000 in 1906. At the same time there was a heavy falling off in the amount of company freight carried. The non-revenue freight ton miles fell from 191,000,000 in 1906 to 169,000,000 in 1907, and the average trainload, including revenue and non-revenue freight, shows a decrease. On the other hand, the

revenue trainload increased from 324 tons to 331 tons. The main line revenue trainload was 385 tons against 382 tons in 1906, and the branch line 202 tons against 172 tons in 1906. The reduction in the amount of company freight carried is, of course, due to the large amounts of construction material for the new extension carried in the previous year. A reduction in passenger and freight density is the usual result of the opening of any considerable amount of pioneer mileage.

The gross earnings of the year increased 11 per cent. over 1906. They were $12,900,000, against $11,600,000. The increase came largely in freight earnings, which were larger by over $1,000,000 than in the previous year. The increase in gross earnings was more than wiped out by the greater cost of operation. Operating expenses rose from $5,800,000 in 1906 to $7,400,000, an increase of 28 per cent. This was due in particular to the difficulties of operation last winter, which was the most severe within the remembrance of living operating officers and which fell on the "Soo" line with particular and remarkable severity. The increase in operating expenses also was due to the greater cost of labor and of almost every class of material and supplies. The gross earnings at the same time were somewhat reduced by the general car shortage. As a result of all these factors the operating ratio rose from 50 per cent. to 58 per cent., and net earnings decreased from $5,800,000 in 1906 to $5,500,000 last year, a decrease of 5 per cent. Fixed charges were $300,000 more than in the earlier year, leaving net income of $2,600,000, smaller by nearly $700,000 than in the 1906 year—this while gross earnings per mile of road increased even with the handicap of the new extension from $5,729 in 1906 to $5,775 last year.

The increase in operating expenses came in both classes of maintenance as well as in conducting transportation. Maintenance of way was larger by nearly $500,000, maintenance of equipment by nearly $400,000 and conducting transportation by $800,000. Even with this increase, maintenance of way per mile stands at only $675, a very low figure. It is, however, much larger than in 1906, when only $476 per mile was spent on way and structures. Even with its large amount of prairie mileage, the larger of these figures is much too low to maintain the physical condition of the permanent way. Repairs and renewals cost $2,370 per locomotive, against $2,397 in 1906; $878 per passenger car, against $957 in 1906, and $42 per freight car, against $39 in 1906. Especially with renewals included, this amount per freight car is not nearly liberal enough to properly maintain the freight car equipment.

There were considerable additions to the equipment during the year, the principal of which were 75 locomotives and 1,000 box cars. The total expenditures on new equipment were about $3,000,000. Maintenance of way betterments, costing a little over $1,000,000, were charged to the betterment fund, to which only $800,000 was appropriated out of income against $1,050,000 in 1906. More than half the expenditure was on grade reductions on the Minnesota division which carries the road's through traffic to a connection with the Canadian Pacific at Sault Ste. Marie.

The following are the costs of some of the individual conducting transportation accounts compared with the previous year:

	1907.	1906.
Engine and roundhouse men	$629,000	$562,000
Fuel for Locomotives	1,263,000	997,000
Water supply for locomotives	56,000	40,000
Oil, tallow and waste	32,000	27,000
Other supplies, locomotives	21,000	12,000
Freight train service	443,000	368,000
Supplies and expenses	36,000	29,000
Switch, flag and watchmen	124,000	36,000
Telegraph expenses	142,000	115,000
Station service	357,000	282,000
Damage and loss to freight and baggage	76,000	53,000
Injuries to persons	217,000	73,000
Operating yards, tracks and terminals	143,000	106,000

The greatly increased cost of carrying on its transportation operations is sharply shown in these contrasted figures. There were decreases in the cost of advertising and in the amount spent for outside agencies; also in damage to property, including live stock. Under general expenses, salaries of general officers increased from $52,000 to $67,000.

The balance sheet shows an increase from $10,000 to $1,948,000 in equipment trust notes outstanding. The current liabilities stood at $2,200,000 on June 30, 1907, against $1,580,000 the year previous. At the same time there was little increase of current assets. Cash on hand at Minneapolis, St. Paul, New York and London amounted to $2,680,000, against $3,180,000 the year before.

Funds for new equipment and better terminal facilities at Minneapolis, St. Paul and other principal points to the extent of about $2,700,000 have been advanced from time to time from surplus earnings. The company's business has grown so fast that large expenditures have been required to keep up with it. In order to replace these advances and to provide funds for other improvements which are greatly needed the stockholders, on September 17, authorized a doubling of the company's common and preferred stock, the total of which now stands at $42,000,000. Of the new stock $4,200,000 is now being offered to stockholders at par. Thus the present time marks the expansion of the road's capital to keep pace with its earnings and prosperity.

The most important extension now projected is a line from Brooten, Minn., northeast about 200 miles to Duluth, which will give the "Soo" line a direct connection with the Duluth, South Shore & Atlantic, also controlled by the Canadian Pacific, and will make it possible for it to carry traffic from North Dakota direct to the head of the lakes. Work on this contract is already under way.

The last three years' results are given below:

	1907.	1906.	1905.

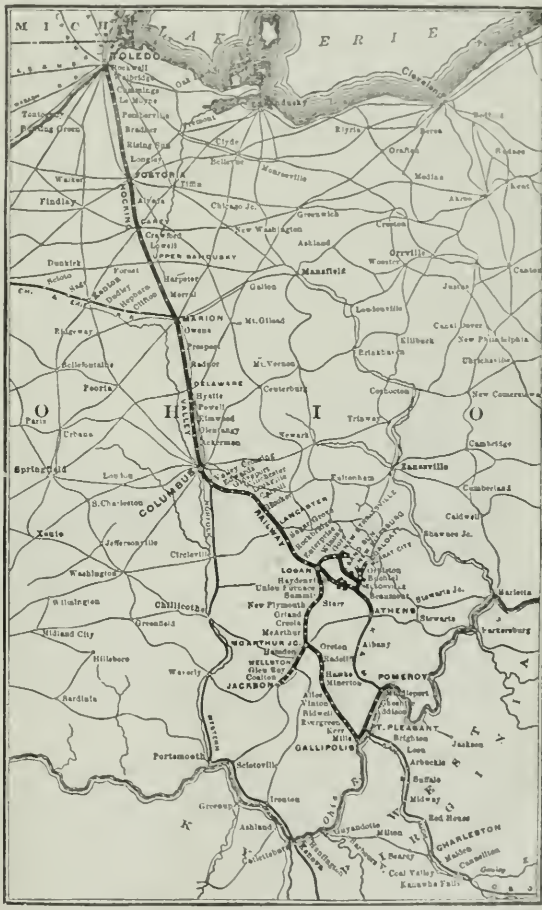
Hocking Valley.

The plan for the consolidation of the Hocking Valley and the Kanawha & Michigan was announced last fall, but the completion of the merger has been held up ever since because of the suit brought by the Attorney-General of Ohio, attacking the ownership by the Hocking Valley of the stock of the Toledo & Ohio Central,



Hocking Valley.

which is a parallel line. If the consolidation is brought about, the $15,000,000 4 per cent. preferred stock of the Hocking Valley is to be refunded in new 4 per cent. bonds and new stock is to be exchanged for Kanawha & Michigan stock. The annual report of the Hocking Valley for the year ended June 30, 1907, shows 11 per cent. earned on the $11,000,000 common stock after the $600,000 preferred dividend. Dividends amounting to $3\frac{1}{2}$ per cent. were paid on common, as compared with 3 per cent. in the previous year. The com-

pany's share, through stock ownership, in the surplus earned by the Toledo & Ohio Central and the Kanawha & Michigan would, if these surpluses were distributed as dividends, bring the amount available for Hocking Valley common up to about 23 per cent.

Aside from the increase in operating expenses because of the high cost of labor and material, the Hocking Valley has had to meet two expenses not common to all companies. These were the flood in the Hocking district last March, and the renewal of a large number of freight cars retired from service because they were so old or so small that it was not worth while to fit them with air-brakes, which change had to be made before September 1, 1907, on all freight cars interchanged with other lines. The cost of flood repairs was about $83,000 and most of this was charged to operating expenses for the year. The cost of the renewals of freight cars were not entirely paid out of the equipment reserve fund; it seems that the annual appropriations to cover depreciation of rolling stock have heretofore been too small. This depreciation fund amounted to $595,000 on June 30, 1906, and $658,000 was added during the year. Of this amount, $852,000 was used to cover 40 per cent. of the cost of new coal and box cars and the entire cost of three locomotives bought for renewal, and for rebuilding and betterment of freight and work cars; while the rest is reserved to pay the semi-annual instalments for three years on the equipment trust notes issued for these cars. The company now has 14,779 freight and work cars, as compared with 14,083 at the end of the previous year. The new equipment ordered consists of 2,000 steel underframe coal cars, of which 1,100 were for renewals and the rest additions, and 850 box cars, of which 550 were for renewals. All the box cars and 1,170 coal cars had been delivered on June 30. The cost of this additional equipment, as well as that of eight new passenger train cars, was $393,000, which includes cash payments and reserve for instalments payable on equipment trust notes. This amount was appropriated from income. On June 30, 1906, there was in the treasury $194,000, the remainder of the proceeds from the sale of 4½ per cent. consolidated mortgage bonds, which have been used from year to year since the creation of the bonds at the formation of the company in 1899. This amount could, under the mortgage, be applied to additions to property and the retirement of existing equipment obligations; all of this was used during the year and $18,000 additional appropriated from the year's income. New repair shops and yards at Logan, Ohio, to cost $300,000 were authorized; work was begun and $12,000 has so far been spent on them.

Gross earnings increased from $6,440,000 to $6,907,000; the increases in coal earnings and passenger earnings were less in proportion than the increase in freight. Tons of freight carried increased from 8,600,000 tons in 1906 to nearly 8,900,000 in 1907, and the greater part of this increase was in freight received from connecting roads and other carriers. The average haul increased from 116 miles to 122 miles. During the previous year, most of the increase in traffic had come from the building up of local freight business owing to the growth of industrials in the territory served by the road. It seems from the above figures that this business has fallen off somewhat particularly since the tonnage of manufactures originating on the road was only 643,000 in 1907 as compared with 663,000 in 1906. The average train load on the entire line increased from 608 tons to 625 tons, the figures for the main line being 655 tons, an increase of 24 tons, while that for the River division was only 250 tons, which compares with the high record last year of 271 tons. The highest figure for the entire line, 678 tons, was reached in 1902. The revenue per ton mile decreased from 0.505 cents to 0.496.

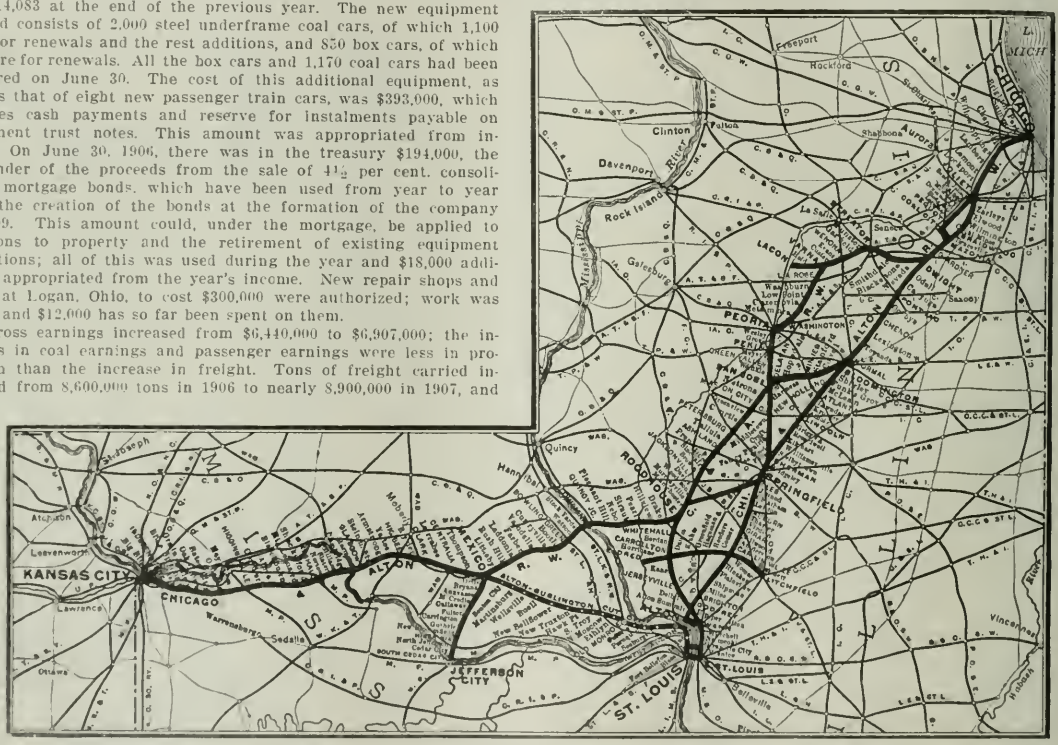
Maintenance of way charges show a large increase, having been $1,984 per route mile in 1906 and $2,325 in 1907; part of this increase is due to the unusual repairs made after the flood already mentioned. Repairs and renewals of locomotives cost $2,151 in 1907, $2,169 in 1906 and $2,579 in 1905. Passenger car maintenance increased from $510 per car to $523 per car, and the maintenance of freight and work cars increased from $63 per car to $71.

The principal results of operation are as follows:

	1907.	1906.
Mileage worked	347	347
Passenger earnings	$807,210	$796,828
Coal earnings	2,900,340	2,802,776
Freight earnings	2,434,277	2,238,833
Gross earnings	6,907,048	6,439,809
Maint. way and structures.	806,625	688,461
Maint. of equipment	1,491,995	1,325,449
Conducting transportation.	2,052,755	1,831,139
Operating expenses and taxes	4,709,809	4,181,744
Net earnings	2,197,239	2,258,035
Net income	1,827,486	1,772,934
Surplus for the year	313,479	753,369

Chicago & Alton.

No railroad during the past year has been the subject of more general comment and interest than the Chicago & Alton. The facts of its reorganization in 1899—matters of record as they were—when given the prominence of a public investigation at a time when railroad financial management was of particular interest, stamped it in the public mind as the crowning example of the methods of high finance. Without attempting to discuss the justice or injustice of all the details of the reorganization, it may be well to mention that, taken in the large, it amounted simply to the substitution of a large par value of securities of low return for a small par value of securities of high return, the natural effect of this substitution being sooner or later reflected in the market price. It is noticeable, in view of the bitter criticism of the reorganization which has often charged that the property was wrecked, that in the past year, after paying the full dividends on the preferred stock, there remained a surplus equal to over 5 per cent. on the total amount of common stock outstanding.



Chicago & Alton.

The striking thing about the Alton's income record for the year is that there was nearly three times as large a proportionate increase in net earnings as in gross earnings, and, furthermore, that there was scarcely any increase at all in the cost of conducting transportation. Gross earnings were $12,800,000, a gain of $1,200,000, or 10½ per cent. Operating expenses increased only a little more than $200,000, or 3 per cent., leaving net earnings larger by over $1,000,000, or 27 per cent., than in the preceding year. This unusual record was not brought about by skimping the maintenance accounts, for as much was spent on maintenance of way per mile operated as in the year before, and more on repairs and

renewals per locomotive, passenger car and freight car. These unit maintenance expenditures were as follows:

	1907	1906
Maintenance of way, per mile	[illegible]	1,172
Repairs and renewals per locomotive	[illegible]	[illegible]
Per passenger car	[illegible]	791
Per freight car	[illegible]	[illegible]

Freight earnings increased 12 per cent., revenue freight tonnage 23 per cent., and revenue freight ton mileage 18 per cent. As there was no change in the operated mileage up to the end of the fiscal year, the freight density also was increased 18 per cent. In spite of the fact that the ton-mile rate decreased 5 per cent., there was a small increase in the earnings per train-mile. Freight earnings per mile of road increased from $7,730 to $8,637, or 12 per cent.

The gain in passenger earnings was 7 per cent., with an increase of 9 per cent. in passengers carried one mile. The average number of passengers per train-mile rose from 49 in 1906 to 55, thus increasing this important passenger economy by 11 per cent. The earnings per train-mile in consequence increased 12 per cent. in spite of a slight decrease in the passenger mile return.

The increase of 15 per cent. in the number of ton-miles of revenue and company freight was handled with an increase of only 10 per cent. in freight train mileage. At the same time the average trainload increased from 381 tons to 409 tons of revenue freight, and from 418 tons to 439 tons of all freight, while the average loaded car carried 21 tons, against 19 tons in 1906. The loaded car miles eastbound increased 15 per cent., against a slight decrease in the loaded car mileage west. The empty car mileage eastbound at the same time decreased 39 per cent., while the empty car mileage west increased 25 per cent. It will be interesting to observe what effect the ownership of the Chicago & Alton by one of its eastern connections will have on these figures of loaded and empty car mileage.

The form of annual report is similar to that adopted by the companies controlled by the Rock Island Company, and is, in consequence, fuller than previous Chicago & Alton reports. The current report for instance contains 35 pages against 26 pages in the report of 1906. The income account is fuller and more clear, and the balance sheet and the consequent changes in the capital accounts of the company are set down in much greater detail. Operating expenses are given in detail for the first time. Each bond issue of the funded debt is carefully described.

The most important improvement was the completion of the air line from Iles, just south of Springfield, Ill., southwest to Murrayville, 34 miles, which is just being put in operation. This line is tangent and has no grades steeper than 16 ft. in a mile in either direction. Ten per cent. of the cost of the whole line has been used in avoiding grade crossings with other railroads, of which there is only one. The line is equipped with modern water stations and 3,400-ft. passing sidings, every six or seven miles. The stations are all built on a uniform plan; the rails are 80-lb., and the line is being thoroughly ballasted with gravel. This cut-off shortens the route from Chicago to Kansas City by five miles and gives the Chicago & Alton, by different routes part of the way, two tracks from Chicago to Murrayville, 222 miles. Through trains from the Kansas City line to the East can now reach the main line at Springfield instead of having to go north as far as Bloomington. The following table shows the advantages of the new route over the old between Roodhouse and Bloomington. On the basis of these figures and last year's traffic the cut-off will save 55,000 train miles on eastbound freight traffic alone.

Old and New Routes—Roodhouse to Bloomington.

	Old line.	New line.
Distance in miles	110.5	105.1
Total rise, ascending grades, ft.	1,059.0	512.0
Total fall, descending grades, ft.	934.0	387.0
Total degrees of curvature	940.0	226.0
Maximum degrees of curvature	5.0	2.0
Controlling grade:		
Northbound, ft. per mile	38.6	15.3
Southbound, ft. per mile	52.8	37.4

The Toledo, St. Louis & Western, which has a through line from St. Louis to Toledo, has bought control of the Chicago & Alton from the Rock Island Company, making payment in collateral trust bonds secured by Chicago & Alton stock. It is not improbable that these two roads—together with the Iowa Central and the Minneapolis & St. Louis—will be brought into a more or less compact system, whose extent can be judged from the map published in the *Railroad Gazette* of August 30, 1907. The purchase of the Alton by the "Clover Leaf" seems to be more to the advantage of the purchaser than of the larger road. If eastbound traffic from Kansas City over the Chicago & Alton is to be, so far as possible, turned over to the "Clover Leaf" in the St. Louis territory, the Alton will lose the benefit of the haul north either to Bloomington, where it connects with the Lake Erie & Western and the 'Big Four;' Dwight, where it crosses the east and west line of the Chicago, Indiana & Southern; Joliet, the Michigan Central connection; Chappelle, where it meets the Lake Shore and the Chicago Terminal Transfer; or Chicago, with its many eastbound lines. Through any one of these junctions the Chicago & Alton gets a longer haul than through a junction with the "Clover Leaf" at St. Louis. The Alton lines between St. Louis and Chicago, however, go far toward being self supporting, as the Alton has a strong hold on Chicago-St. Louis traffic, and there is important coal and agricultural traffic in the territory between the two cities.

The results of operation are summarized below:

	1907	1906
Mileage worked	970	[illegible]
Freight earnings	[illegible]	[illegible]
Passenger earnings	[illegible]	[illegible]
Gross earnings	[illegible]	[illegible]
Maint. way and structures	[illegible]	[illegible]
Maint. of equipment	[illegible]	[illegible]
Conducting transportation	[illegible]	[illegible]
Operating expenses	[illegible]	[illegible]
Net earnings	[illegible]	[illegible]
Net income	[illegible]	[illegible]
Year's surplus	1,010,220	[illegible]

NEW PUBLICATIONS.

Recollections of an Ill Fated Expedition to the Headquarters of the Madeira River in Brazil. By Neville B. Craig, in coöperation with members of the Madeira and Mamoré Association. [illegible] pages. 6 in. x [illegible] in. Published by J. B. Lippincott Co., Philadelphia. Price, [illegible].

In 1878 a bold and apparently well designed enterprise in railroad survey and construction in South America was begun and quickly ended in disastrous failure. It was brilliant and dramatic in conception, but in the execution the drama became a succession of tragedies. The money loss was enormous, as money was counted in that generation; hundreds of lives were sacrificed, while hardships and jungle fevers damaged to an extent not measurable the health of the bold engineers who survived. Nearly one-fourth of those who sailed in the ships sent from Philadelphia to the Amazon and Madeira were drowned or killed by malignant fevers.

Bolivia has more than half a million square miles; is rich in gold, silver, iron, coal, rubber and lands for grain and grazing. It has no sea coast, and on the west the Andes mountains form a barrier, not insurmountable by railroads, but a costly obstacle which when surmounted still leaves a long route by the Pacific ocean and Cape Horn to reach Atlantic ports. From the Atlantic ocean the Amazon is navigable, as is also its tributary, the Madeira, to within about 150 miles of the northwestern boundary of Bolivia. The building of about 240 miles of railroad from this point, rounding the rapids of the Madeira and the lower part of the Mamoné river would make accessible the navigable waters of the Mamoré and its tributaries in Northern Bolivia. It would open an empire to trade.

This magnificent possibility attracted the imagination of a pioneer genius, Col. Geo. E. Church, and, with a faith that never faltered and an ardor that a succession of rebuffs and failures during eight years never cooled, he lived to see his enterprise begin with every prospect of success and end miserably. He was a thorough engineer, and a diplomat with such a winning way that the Brazilian Emperor, the Bolivian parliament and British financiers were alike amenable. And after the British organization had tried and failed, he turned unabashed to his own country and found powerful men ready to help. Franklin B. Gowen, of the Reading Railroad, and Col. Thomas A. Scott, of the Pennsylvania, were alike zealous, although hostile to each other. A son of Col. Scott organized the firm of Mackie, Scott & Co. and contracted to furnish the river navigation. P. & T. Collins, rich and successful railroad builders, contracted to build and equip the Madeira & Mamoré Railroad.

In January, 1878, the first ship, the "Mercedita," overloaded and wretchedly equipped, succeeded in carrying 54 engineers, with laborers, a locomotive and railroad material from Philadelphia, up the Amazon and Madeira, to the railroad's starting point. The second ship, the "Metropolis," was wrecked off Currituck beach and 90 of the adventurers were drowned. In general, the undertaking failed because of bad financiering; in detail, the story of the summer of 1878 is a record of heroism. The survey was made, a short piece of road was built, and then it was all over. Of the engineers, not many survive. Among them are George W. Creighton and C. A. Preston, superintendents on the Pennsylvania Railroad; Joseph S. Ward, of the Reading; Charles W. Buchholz, Consulting Engineer of the Erie, and O. F. Nichols, Consulting Engineer of New York city bridge department. The maps in the book are excellent.

Development of the Locomotive Engine. By Angus Sinclair. 668 pages; 6 in. x $8\frac{3}{4}$ in. Published by Angus Sinclair Publishing Co. Price, $5.00.

The personality of the author, his geniality and his harshness, is apparent in the 33 chapters of this entertaining book. Although he is accurate, so far as can be determined by a hasty reading, in the essential facts and in the more than 400 engravings and drawings which richly illustrate the text, nevertheless the inferences, the sweeping judgments on the great men who have had to do with locomotive development, are frequently not those with which the reader can agree. To disagree with Angus, however, is not at all disagreeable either to him or to his friends. An example of this is the following comment on the life work of the great mechanical

engineer of the London & North Western Railway: "I never heard of any lavish praise being expended on the Webb compounds outside of the designer's immediate friends." And yet most people recognize that Mr. Webb was a great and bold, but too self-confident experimenter; ahead of his time, and one to whom the profession owes much, although he cost his company a great deal of money.

The scope of the book was evidently intended by the author to be strictly that indicated by its title. He shows in 258 consecutively numbered drawings the successive undertakings made by many men to improve the effectiveness of the steam locomotive. In the second chapter, "Early Attempts at Locomotive Construction," 14 drawings are shown. In the third chapter, "Development of Locomotives in Great Britain," there are 13 drawings. In the remaining chapters there are 231 consecutively numbered drawings of designs by American engineers. It would seem, therefore, that the work done in Great Britain has not attracted the author's attention unduly; being Scotch, he has become a very enthusiastic American. Nevertheless, taken as a whole, and without regard to nationality, we have in this book easily the best picture that has ever been given of the progress in designing and also the mistakes and the way they were discovered, the results of trial in service. This has naturally led the author to give many charming paragraphs and chapters to early railroad history. For example, whole chapters are devoted not only to the development of the locomotive, but to the development of the lines of the Baltimore & Ohio, the Erie, work done on the Pennsylvania Railroad and on the Reading, as well as the New England and the western roads; also on the Lackawanna and the Lehigh Valley roads—and all these chapters are interesting and have a value

The portraits and personal sketches of the great locomotive builders and of the many locomotive superintendents and master mechanics who have been concerned in improving the machine form not the least attractive feature. These sketches are lovingly done. The author is a man of warm heart as well as of strong prejudices. These personal sketches are not grouped by themselves; they are distributed throughout the book wherever, apparently, the author has happened to think of them, and it is evidently due to this association of ideas that he reserved for insertion in the last chapter, entitled, "The Locomotive of To-day," an excellent portrait and sketch of Samuel M. Vauclain, Superintendent of the Baldwin Locomotive Works. The concluding tribute is somewhat glowing but it is so nearly correct that it is worth reproducing:

"As General Superintendent over these immense works, Mr. Vauclain has the power of a monarch and it is wielded with a spirit of giving a square deal to the humblest and highest under his charge. Under his broad, kindly management harmony prevails and contentment takes the place of the antagonisms so common in great industrial establishments."

Laying-Out for Boiler Makers. New York: The Boiler Maker. 191 pages; 10 in. by 13 in.; 425 illustrations. Cloth.

The book is something more than its title indicates, for not only does it contain rules and directions for the actual laying out of sheets and the spacing of rivets, but also rules for the calculation of the stresses of the plates and the methods of strengthening them. In a work of this character especial emphasis is put upon the method of doing the work so that an intelligent workman might follow the instructions blindly without any idea of why he was doing it, and get fairly good results. This neglects all discussion of the principles involved, which are matters for consideration when the theoretical aspects of the case only are considered. In one or two instances these fundamental principles are discussed, as in the case of the determination of the shape of a sheet by triangulation, and the statement is distinctly made elsewhere that for the attainment of the highest degree of skill the whole subject should be mastered from a theoretical standpoint.

The book then is essentially devoted to the solution of specific problems, such as the laying out of elbows, tubular, locomotive and Scotch boilers; the repairing of locomotive and other types of boilers; the laying out of steel stacks and miscellaneous problems. The chapter on repairs is especially rich in suggestiveness and while it does not pretend to cover the whole range of what may be needed on the locomotive boiler it does cover a wide range of work for the firebox, such as the renewal of sheets, patching, replacing stays and the like. Then, throughout, the other chapters there are interspersed methods of calculating stresses and of proportioning the metal to sustain them, that will be of value not only to the man charged with the mechanical work of laying out but to the designer upon whom rests the responsibility for the safety of the structure.

Switches and Turnouts. By Howard C. Ives, Assistant Professor of Railroad Engineering, Worcester Polytechnic Institute. Pamphlet. 6 in. x 8½ in.; 28 pp. 50 cents.

In the three chapters which compose this pamphlet, Professor Ives has succeeded in making clear to his students the method of deriving formulae for different kinds of leads, both where the main track is straight and where it is curved. In the last chapter the mathematics involved in the design of the double step switch crossing seems to be an original undertaking and it is well done.

CONTRIBUTIONS

Freight Claim Obstruction.

Pittsburg, Pa., Sept. 30, 1907.

To the Editor of the Railroad Gazette:

I have been much interested in Colonel Prout's address dealing with obstructions in the claim department, printed in your issue of July 19, and in your editorial on the settlement of freight claims, printed Aug. 9. I think the accompanying record of transactions with a railroad which I will call the A. B. & C. should be placed before your readers. Nothing in this record has been altered for publication except the name of the railroad and the names of places and persons.

Bill sent to the A. B. & C., March 14, 1902, for $17.51, covering overcharges on eight shipments from Athens to Sparta, via X. Y. Company and A. B. & C. Railroad. Acknowledgment was made by the General Freight Agent of the A. B. & C. that this claim was valid and a proper claim. Three other claims for overcharge on the same class of goods shipped several months previous were paid promptly. Much correspondence regarding this bill was had during the succeeding year, and we were advised in May, 1903, that all the papers in the case had been lost and duplicate papers were requested. This request came from the Freight Claim Agent of the X. Y. Company. Duplicates were promptly forwarded as requested on May 11, 1903. Continued to keep after this matter from time to time and finally on May 11, 1907, I wrote a personal letter to R. B. Ely, president of the A. B. & C. We very promptly got a letter from the Third Vice-President, H. T. Evans, making apologies, and assuring us that it was their desire to pay claims promptly and that the matter would be attended to energetically and pushed to a final adjustment. We received several calls from a very affable gentleman, representing the A. B. & C. Finally this gentleman advised us that all these papers had again been lost, and asked for a triplicate set, which we furnished in June, 1907. And, in spite of many letters since that date we have received nothing further from them.

This certainly looks like a deliberate attempt to avoid payment by worrying claimants, and as if one of the railroads at least had a professional loser.

MANUFACTURER.

Seth Wilmarth and His Locomotives.

Boston, Mass., Oct. 1, 1907.

To the Editor of the Railroad Gazette:

In reading the article by Mr. Caruthers in your issue of Sept. 27, "Seth Wilmarth Locomotives," it occurs to me that I may supply some features of Mr. Wilmarth's career that Mr. Caruthers was not able to find. At the time these engines were built I was a clerk in the office of the South Boston Iron Company, whose plant was adjoining to that of Mr. Wilmarth, and I was well acquainted with Mr. Wilmarth. His business originally was a general machine shop, until he took up the building of locomotives, and up to this time his business was successful and prosperous; but after a few years he made a contract with the Erie Railroad which brought him to bankruptcy, and his plant and business were sold out. I do not remember about his career after his bankruptcy, but have an impression that he was appointed to some superintendence at the Boston Navy Yard. I understand Mr. Wilmarth made a contract with the Erie Railroad for some 25 or 30 locomotives, which was a very large undertaking at that time, especially for a man of Mr. Wilmarth's limited means, and who was (as was generally the case with industrial manufacturers at that time) obliged to buy his supplies on credit. When he had fairly launched in the manufacture of these locomotives he found that the Erie Railroad could not pay cash, and he was obliged to take notes in payment, and when these notes became due he was obliged to renew them. This situation destroyed Mr. Wilmarth's credit, and he was obliged to realize on his notes as best he could. I understand that for a while he sold these notes to Daniel Drew, who was a banker as well as trustee of the Erie Railroad, at a discount, but this management was short-lived, and he was forced into bankruptcy. Another of the original locomotive builders within a stone's throw of the Wilmarth plant was John Souther, who associated with O. N. Pickering, organized the "Globe Works." I understand that Mr. Souther (who is now living in Boston, 90 years old) designed and made the patterns for the first locomotive which was used on the Old Colony Railroad, and which was named the "Souther." The Globe Works built many engines, covering several years of successful business, up to the time of the Civil War, when they turned their attention more particularly to work for the United States Government.

WM. P. HUNT,
President, Hunt Spiller Manf'g. Corporation.

Control by State Commissions.*

BY ALEXANDER C. HUMPHREYS.

As I understand, we are gathered here to-night by reason of the belief that is happily taking root that there should exist a better understanding between those responsible for the management of public utility corporations and those to whom, in a degree not as yet finally determined, is entrusted the limiting control of these corporations.

It cannot be denied by any one who is competent in the premises and at the same time is fair minded enough to give expression to his honest opinion that there has been in this country, during the last few years, a tendency on the part of the public, a tendency cultivated by the yellow press and temporarily adopted as a vote winner by the politicians, to treat all public service corporations as enemies of the public and, hence, as unworthy of consideration. Unquestionably, in not a few cases this tendency has led to injustice being done to corporations which have been ably and honestly administered in the interest of the public as well as that of the proprietors.

Investigations have been held under state and federal authority which have not been honest investigations even as to intent but have been more nearly of the character of star chamber inquisitions; and this in spite of the ready boast of patriotic Americans that this is a country of liberty and fair play.

Public service corporations have been between two fires. On one side the reformers, some of them of the professional type, making reform their vocation, and others amateurs, zealous, generally honest, usually only partially informed on the subject they attempt to direct in, and bumptious in proportion to their ignorance; on the other side, the greedy professional politicians ready either to "strike" the companies or to serve temporarily as allies to the reformers in the hope of rehabilitating their damaged reputations, as for the moment seemed to point more directly to their final material advantage.

It would be laughable, if it were not so disquieting, to observe the zealous, honest, impressionable, hasty, and, hence ignorant reformer so often pulling the chestnuts out of the fire for the mercenary politicians—the men who are in politics for what there is in it.

I am not here to speak against reform, that is, true reform. There has been need of reform in connection with the matters to-night under discussion; and let us not forget that there has always been such need and there always will be. And let us hope there always will be those ready to fight for reform. Also let us not forget as freedom-loving Americans that no lasting great reform can come from injustice, no matter to whom or what applied. Therefore, in welcoming this pressure for reform, we need be all the more insistent that justice should be meted to all. In spite of the mistakes made through the ill-directed zeal of many of the amateur reformers, we may still find comfort in the reflection that their work and the ready response made by the masses to their appeals indicate that the people at large hunger for better things. Abroad we are credited, or rather debited, with being materialists. But our professional politicians have long since learned that, as a nation, we are idealists and can be influenced, sometimes improperly, by appeals to our moral sense.

The working man has been incited by the yellow journals to believe that capital, as represented in corporations, is necessarily inimical to their interests. I fear that labor is likely to learn, during the next six months or a year at the most, that capital cannot be injured without the ill effects being transmitted to labor. It remains for labor to learn—and possibly for capital to learn—that the two interests must be bound together, no matter what each interest may do to weaken the bond.

Unquestionably much good has been done by the reformers now so active; unquestionably also much harm—unnecessary harm—has been done in the securing of this good.

Apparently the cue has been taken from the head of the government in Washington. With his striking personality, his tremendous force, his restless and almost resistless energy, his enormous capacity for work, his ability to impress his auditors with the belief that his intentions are honest, his supreme self-confidence, his probably honest belief that many of the industrial corporations of the country were conducting their business outside of the law and, with it all and through it all, his unparalleled ability as a politician, President Roosevelt has been able to make a record against the power of capital which is not matched, as far as I know, in the history of the world. The odds at first seemed to be overwhelmingly against him but he has persevered against the odds and has, for the time, won out. The public loves a fighter, especially one who fights against odds. Roosevelt by his audacity has won the applause and votes of the people and apparently still retains their confidence.

*From an address on the "Control of Gas Companies by State Commissions," read at Madison Square Garden, New York, Oct. 1, by Alexander C. Humphreys, President of the Stevens Institute of Technology.

Thus the President has done an immense amount of good, and in the doing he has done an immense amount of harm. It must be the task of history to strike the balance and show whether it rests upon the side of harm or good.

We are all suffering at present from these reform measures so indiscriminately applied. When I say "we" I do not mean those of us who are interested in public service corporations but I mean the people of the United States at large. It will not, [illegible] I fear, before no argument will be required to show that the shrinkage of values which has characterized the recent months of [illegible] has injured the country as a whole. It will be demonstrated that the prosperity of the country—material prosperity—depends upon public confidence and that the west and other parts of the country are mistaken in their claims that they are now strong enough to demonstrate that they are not dependent upon "Wall Street" for financial support. Call the money center what you will, it will never be found that trade can proceed along normal lines while those who are in control at the world's money centers are in doubt as to the future protection to be afforded to capital.

We are now having forced upon us—and we are likely to have it still more strongly forced upon our attention—that sentiment in material things, while possibly intangible and hard to exactly appraise, is very real as to its influence. All of this should need no argument when we reflect upon the fact that only a very small percentage of the business of the world is done upon anything else than credit. And what in the last analysis is credit but confidence in our fellowmen? It is only the belief in the unparalleled material resources of this country generally held by the capitalists at home and abroad which has so far prevented a ruinous commercial panic born of fear as to the effect of the reckless "reform" legislation in which so many states have competed for first place, and the radical innovations which the National Executive has instituted for the control of corporations. And while a panic has thus, for the time at least, been averted, properties have been tremendously depreciated and innocent investors have been injured.

The situation was in part well covered in an address recently delivered at a western college: "The greedy politicians call for expenditures while refusing to let the railroad earn the money to pay for them."

I have stated that some of the investigations which have been held have been conducted unfairly, not in the hope of bringing out the whole truth but in the hope of proving the corporation under fire to be in the wrong. In a paper read last spring before the New England Association of Gas Engineers, in which I endeavored to point out the necessity for the adoption and maintenance on the part of the gas men of America of a uniform system of accounts and records, I gave some cases which have come under my personal observation. I also drew attention to a case reported to me by a friend. A few days before the conversation with me, he had a talk with a prominent judge and they had discussed the results to be expected from an investigation of the character to which I am now referring and which had been carried by appeal into the courts. The judge asked my friend his opinion as to the outcome; my friend being well informed as to the character of the evidence on both sides expressed the opinion that the outcome must, of necessity, be favorable to the corporation under fire. The judge then expressed the opinion that the courts, in spite of the evidence, would not dare to decide in favor of the companies *because public opinion would thus be outraged*. And this was the opinion expressed by a judge generally held in respect. If this was the case a year or more ago, let us hope, for the sake of our country's good, that it is not so to-day.

There are some indications that the tide has commenced to turn and, if these indications are verified, we may well expect to find the politicians changing their tune and preparing to desert reform and return to other practices which, in the past, have put the public service corporations on the defensive and, in some cases, have appeared to force these companies into courses which the politicians now find it to their advantage to condemn. Thus the corporations having been delivered from the fire by the offered refuge of the frying pan, are again threatened with the fire—an uncomfortable position at the best.

Let us hope that the opinion expressed in a recent editorial in one of our New York evening papers has a real foundation in fact, viz.:

"Signs multiply that the fury of destructive legislation has almost run its course."

At least it appears to be true that it does not to-day require as much courage for a public servant, judge or member of a commission, to follow his conscience as opposed to public sentiment and clamor as it would have been, say, a year ago.

In the address just referred to, the speaker—a man of wide experience in the subject treated—traced the history of the development of government in the United States, and showed how the democratic idea had been steadily abandoned in the search for efficiency and also showed the dangers to be apprehended from this

seeking after increased efficiency of control. Let me quote a single paragraph:

"As a result perhaps three-fourths of the relations which the people hold to corporations, municipal and business, are now in the hands of the commissions and bureaus. In the majority of cases, the work is done by incompetent or inexperienced men, and is, therefore, badly done. There is continual interference with the freedom of internal trade and commerce of which we have always boasted ourselves; while the executive, instead of being weakened, has been strengthened by exercise of the power of appointment and removal. But the most illuminating feature of these intervening bodies is that they have been fashioned for the avowed purpose of avoiding or averting the popular control; a tendency which has commanded general acceptance. Their history illustrates the trend towards a central power, verging upon the absolute, retiring so-called democratic government further into the background and promoting the growth of that bureaucracy continually held up to reproach when dealing with the systems of other countries."

The dangers pointed out by this speaker are very real, and, as a self-governing people, we may well regard with apprehension the present tendencies.

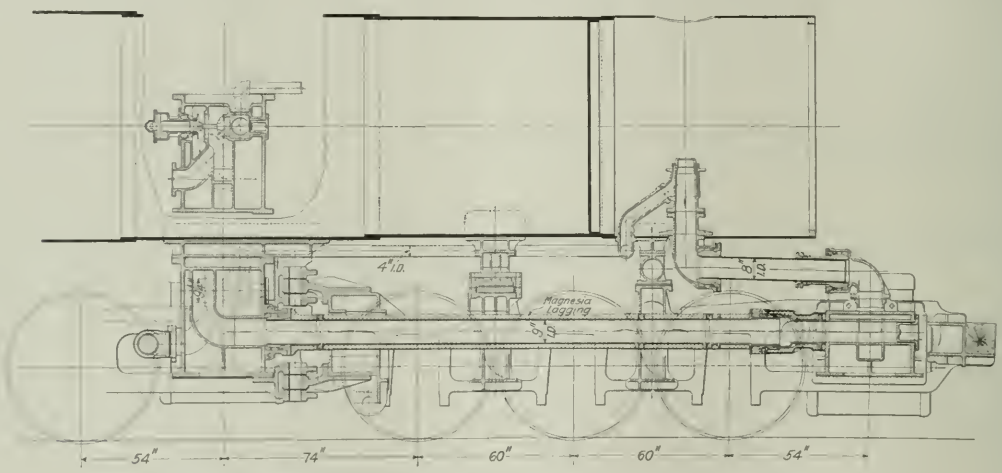
But to-night we are called upon to consider the conditions as they exist and we must recognize that, apparently, the gas companies of the state of New York for some time at least must be prepared to accept a certain measure of control at the hands of one or two state commissions. Our experience with legislative control had not been encouraging and so many of us were led to believe that the men in control should be limited in number and selected for the work in hand. Unquestionably, it is better to be subject to the control of a limited number of honest and capable men, who can, from time to time, add to their knowledge of our business and so be better prepared to render a fair judgment on problems more or less intricate, problems which it has taken some of us a lifetime to solve. But it finally resolves itself into the question of personnel. I think we have reason to believe that the public service corporations of the state of New York can congratulate themselves not only that the old commission has been legislated out of office but also on the personnel of the new commissions. We cannot expect these men at once to know everything about our business, but we can expect that they shall inform themselves as rapidly as possible, and we can expect and demand that they shall render a fair decision in every case based upon their understanding of the evidence. To Fourth-of-July Americans it should be unnecessary to make such a point, but unfortunately it is too often the enthusiastic spread-eagle type of American who needs this kind of reminder the most. Enthusiasm is a grand thing and a people without enthusiasm is started on the road to decay; but enthusiasm uncontrolled by common sense and a dominating spirit of justice is an ever present danger.

Unquestionably the evidence has not controlled in many of the cases which have been carried before the governmental commissions during the last year or two, and, to be more specific, unquestionably the evidence did not control in the cases taken before the old Commission of Gas and Electricity of the state of New York.

But the question of correct judgment cannot rest entirely with the commissions. Having satisfied ourselves how far we can go in acknowledging the jurisdiction of the commission without legal prejudice to our companies' rights, it remains for us to do our utmost to assist them in the fair performance of their duties. We must be frank and fair in the presentation of our data, and we must be all the more careful when we come before them in any specific case. Having exhausted every possible means to prevent our cases before to the commission in accordance with the facts as we understand them, if we fail to obtain what, after full consideration, we believe is justice, then it finally remains for us, as trustees for our bondholders and stockholders, to appeal to the courts for protection and to carry the appeal, as high as it can be lodged. In other words, we must resolve to be absolutely fair ourselves, and, having so resolved and having lived up to the resolve, we must not flinch from the test if we have to fight to the limit for our rights.

Details of Mallet Articulated Compound Locomotive.

A general description of the articulated Mallet compound locomotive that has recently been built for the Erie Railroad by the American Locomotive Company was published in the *Railroad Gazette* of August 16. Allusion was there made to a number of special features which will now be taken up and illustrated in detail. In an engine of this character one of the difficulties that will appeal to the designer will be that of conveying the steam from the throttle to the exhaust of the low-pressure cylinders without leaks or joints that are liable to leak and yet compensate for the varying relative positions of boiler and cylinders. Here there are three movable parts changing their relative positions not only in angu-



Steam Piping Mallet Articulated Compound Locomotive; B. & O. Railroad.

larity but in linear distances, and the steam must flow through the three sides of the varying triangle that they may be considered to represent, starting from one as its source and returning to the same for the exhaust.

Up to the point where the steam is discharged from the high pressure cylinders there is no essential change from conditions obtaining on ordinary locomotives. The special throttle is placed in the dome with a dry-pipe leading forward. This dry-pipe, however, instead of extending on to the front tube-sheet, stops short at 62½ in. in front of the dome and turns up through the shell to a tee upon the outside, from which the steam pipes are led down on either side to the tops of the steam chests of the high-pressure cylinders. This is all shown very clearly by the engravings on pages 171 and 172 of the issue of Aug. 16, where there is also a general description of the steam connections. It is, however, as the steam leaves the high-pressure cylinders that the real interest in the steam passages begins.

It will be remembered that, in the general description of the locomotive, it was shown that the two high-pressure cylinders were not joined on the center line of the boiler but that the half saddle of the one on the left-hand side extended 8½ in. over to the right in order that it might contain the intercepting valve and have the outlet to the receiver in the axis of the engine. By referring to the engravings of the high-pressure cylinders on page 172, it will be seen that the exhaust passage of the one at the right leads back to an 8-in. opening in the rear of the half saddle, and that there is a similar opening in the left-hand cylinder casting to the large exhaust passage leading up to the intercepting valve chamber 9½ in. in diameter near the top of the saddle. These two openings are

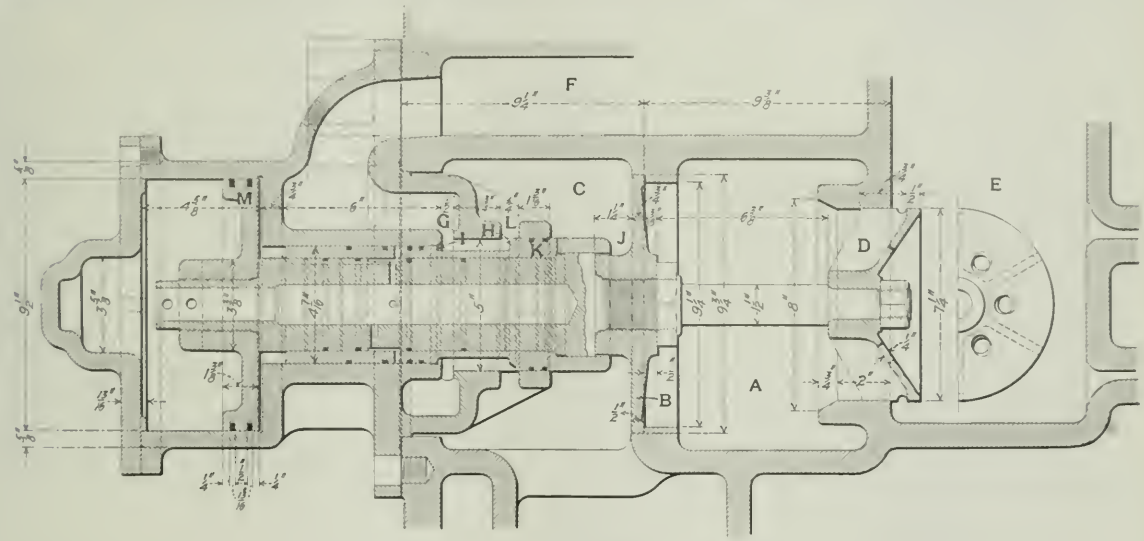
connected at the rear of the saddles by a cast iron return bend, with a clear circular opening 8 in. in diameter and spaced 23½ in. from center to center. It is held to each half saddle by four 1 in. bolts, and the joints are made tight by the ordinary ground cast iron rings with ball joints in the main casting turned on 6 in. radii and with flat faces on the return bend. As there is no motion here the whole passage is rigid.

The steam from both sides is thus discharged into the exhaust passage of the left-hand cylinder and then rises to the intercepting valve. This is of the Meilin type, first used and developed in the two cylinder compounds built by the Richmond Locomotive Works, but differs from that valve in some of the details of its mechanism and in its location on the engine. In the Richmond two-cylinder compound locomotive, the high-pressure exhaust was delivered direct into the smokebox receiver pipe passing in an arch from one side of the cylinder to the other, and the intercepting valve was placed in the low-pressure side. That is to say, the intercepting valve was placed between the receiver and the low pressure steam chest. In operation live steam was automatically admitted at a reduced pressure to the low-pressure cylinder until the high-pressure exhaust had banked up sufficient pressure in the receiver to open the intercepting valve; when that event occurred, and the flow of direct steam to the low-pressure cylinder was cut off, the receiver steam admitted and the engine thrown into compound action.

In the Mallet compound the order of events is the same but the arrangement of parts is different. Instead of placing the intercepting valve at the low-pressure end of the receiver pipe it is allowed to pass forward through the small pipe shown in the engraving of the steam pipes to the main exhaust, the details of which will be considered later.

When this emergency exhaust valve is open there is no tendency to raise the pressure beneath the main valve B of the intercepting valve, and the whole locomotive works in single expansion. If, on the other hand, steam is not admitted to hold the emergency exhaust valve open, the spring closes it and holds it there, which it is arranged to do because the valve is partially balanced by the pressure against the face of the piston and the unbalanced force tending to open it is only that represented by a ring ⅛ in. wide and 5½ in. outside diameter, the difference between the exposed areas of the valve and the piston.

With the emergency valve closed and the intercepting valve in its normally closed position which is that existing at starting, the sequence of events at that time is as follows: When the throttle is opened, live steam is admitted to the passage F outside the valve case and passes down through the port G and, filling the grooved opening in the reducing valve K, presses with equal intensity against the shoulders H and I. As the area of the shoulder H is the larger of the two, because of its larger outside diameter, the valve K, which is merely a sleeve fitted with packing rings for its bearing surfaces, is moved to the right and the live steam flows freely into the chamber C. As the pressure rises in this chamber, it acts upon the whole of the end of the sleeve K, and as this end area combined with that of the shoulder I is greater than that of the shoulder H, it follows that before the pressure in C has risen to the full



Intercepting Valve.

placed, as already stated, in the saddle of one of the high-pressure cylinders and receives the exhaust direct from both of those cylinders. This exhaust steam enters the space A beneath the main valve B, which is held normally closed by the reduced pressure live steam admitted back of it into the space C. Attached to the stem of the main valve and moving with it is the wing piston D. This latter part serves to guide the stem of main valve, and, through the holes in its face and the opening about its rim, permits the high-pressure exhaust to pass on to the passage E, whence it has direct access to the emergency exhaust valve.

In the original Richmond compound the emergency exhaust was in a line and concentric with the axis of the main valve. In this modification for the Mallet compound it is a separate mechanism. By referring to the horizontal section of the left-hand cylinder on page 172, it will be seen that there is an opening on the outside face of the saddle that connects directly with the intercepting valve chamber. The flange (1) of the emergency exhaust casing is bolted to the side of the saddle so that its opening is put in communication with the chamber (2), which is closed by the wing valve (3) held normally against its seat by the spring acting on its stem and located outside the casing. Also attached to the stem of this valve is the piston (4) that is fitted with spring rings and moves in the short cylinder bored in the casing to receive it. When it is desired to work the engine in single expansion for all four of the cylinders, a cock is opened in the cab and live steam admitted through the opening (5) to the space back of the piston, moving the latter ahead, and opening the valve (3) through which the exhaust is boiler pressure exerted on H, there will be enough of an effort exerted on J to push the sleeve toward the left and thus close the opening made by the passage of the shoulder H past the port L. The ratios of these areas are so adjusted that, when the pressure in the chamber C has risen to the point at which it is desired that the initial pressure in the low-pressure cylinders should stand, the sleeve will close the port L.

Steam admitted to the chamber C has free access to the receiver and the low-pressure steam chests; so that as soon as the throttle is opened steam is admitted to all four of the cylinders and the normal tractive effort is exerted.

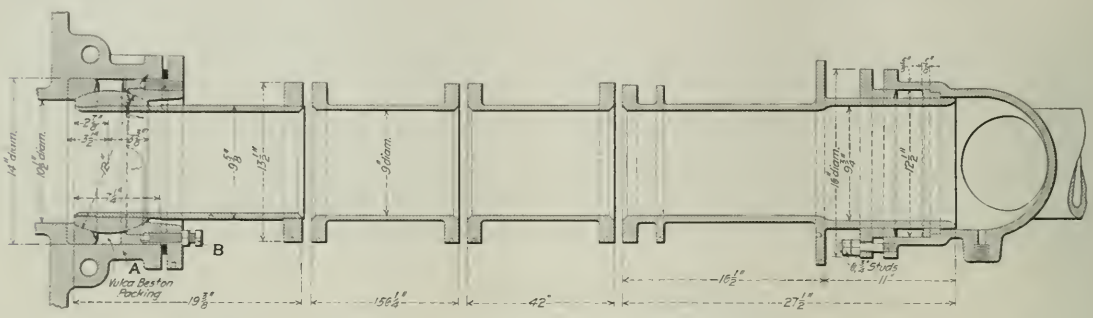
Then the first exhaust of the high-pressure cylinders passes into the space A and fills the passage E and the chamber (2) of the emergency exhaust valve, and when the pressure in these cavities has risen to a point slightly above that existing in the chamber C, the main intercepting valve B is opened by being moved to the left and the high-pressure exhaust is thus given a clear passage to the receiver and the steam chests of the low-pressure cylinders.

As the main valve B is moved to the left it strikes the end of the sleeve K and, carrying it with it, closes the port L and thus prevents the admission of any more live steam to the chamber C and the receiver, and the engine enters upon its compound working. But if, at any time, the additional tractive power that can be obtained in single expansion action is desired, the opening of the emergency exhaust valve from the cab will bring that condition about.

At the rear the stem of the main valve is fitted with a piston

M that moves in a cylinder forming a dashpot and thus preventing any approach to slamming. The surface where the stem is in contact with the inside of the sleeve is fitted with packing rings sprung into place so that leakage of steam is prevented.

When the steam leaves the chamber C of the intercepting valve, it passes out through a passage cored in the saddle to the receiver pipe. As will be seen by referring to the assembled engraving of the steam pipes the passage from the intercepting valve drops down and curves to the front for the receiver pipe connection. Up to this point there has been no necessity for any flexibility in the joints as all parts have been attached to and move in unison with the boiler. With the connection of the receiver pipe this is changed, for not only must there be a possibility of an angular displacement due to the relative positions of the two trucks, but there must be an extension due to the motion that must exist between the frames. The detail of the receiver pipe shows how these requirements are met.



Receiver Pipe.

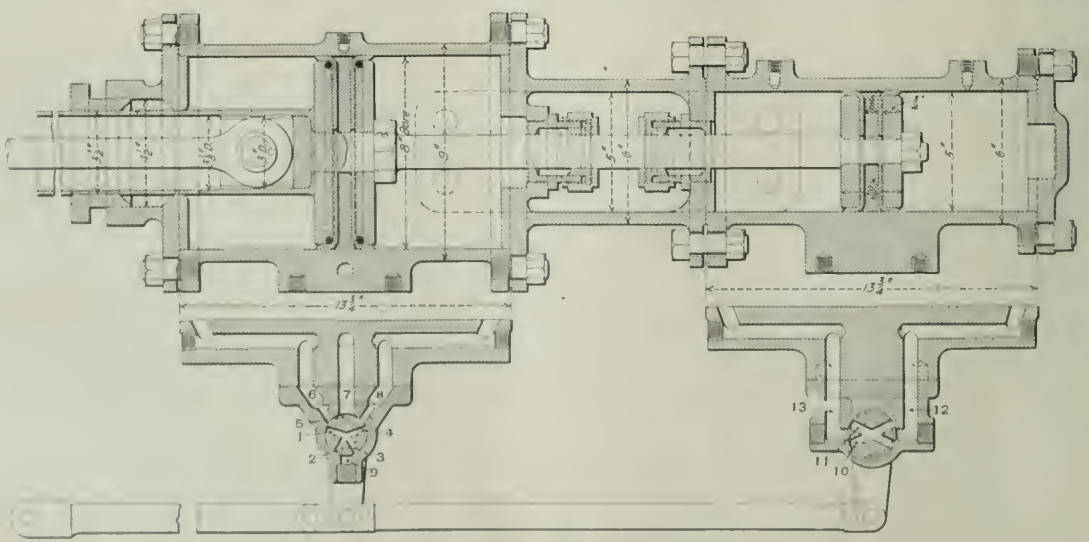
There is an extension A on the front of the high-pressure saddle that is bored out to receive two glands turned to a spherical inside fit and which can be adjusted against the ball-bearing on the pipe by the studs B, so that lost motion occasioned by wear can be taken up and leakage of steam prevented. This is the only flexible joint in the receiver pipe, and is the only one that is necessary because the center line of the pins coupling the two frames nearly coincides with the center of the ball joint, so that the whole of the front truck, with its cylinders, swings around this point and the angular displacement is nearly the same.

The receiver pipe is made in three sections merely for convenience in erecting, and at the front end it passes through an ordinary stuffing box in a tee, in which it has a fore and aft motion by which the variations in length can be made. The joints between the sections are made tight by the insertion of cast rings of V section turned to fit the recesses shown in the ends of the pipe. The tee at the front is a simple iron casting with branches to mate with the admission openings in the back of the low-pressure saddles, and the joint between the two parts is made tight with the usual ground ball joint.

The steam passes through the low-pressure cylinders, doing its work in the usual way and issues from the top through exhaust openings set near the center line of the engine and spaced 7⅝ in. apart from center to center on the two saddles. An exhaust pipe elbow is bolted on to cover both openings and to turn the exhaust back towards the smokebox. This elbow is fitted not only with a universal ball joint by which the exhaust pipe is enabled to swing and keep in line with the corresponding elbow on the smokebox, but also contains a stuffing box and slip joint by which the variations in distance between the centers of the two elbows are taken care of. At the rear the exhaust pipe terminates in another universal ball joint set in the smokebox elbow, so that the exhaust pipe can adjust itself to any and all variations in the relative positions and alinement of the low-pressure cylinders and the smokebox.

The hole above the smokebox elbow is 16½ in. ahead of the center of the stack, so that the interior exhaust pipe is given an offset of that amount in order to bring it in line. In addition to this it has the added peculiarity of an attachment for the emergency exhaust. This exhaust pipe is led forward from the outlet of the emergency exhaust valve to a point just ahead of the front tube-sheet. Here it turns in to the axis of the boiler and thence through another elbow enters the smokebox and connects with the auxiliary exhaust pipe back of the main one. The main casting is made with a flange and short connecting pipe leading to an annular space like a steam jacket about the exhaust passage from the low-pressure cylinders. The exit from this annular space is through a contracted annular nozzle about the main one. With this arrangement there is no interference with the integrity of the low-pressure exhaust at any time, either when starting or when running the engine in single expansion. As the emergency exhaust pipe is connected rigidly to the boiler or parts moving with it at each end there are no flexible joints required in it.

Closely allied to the required flexibility of the steam piping



Valve Arrangement for Power Reversing Gear.

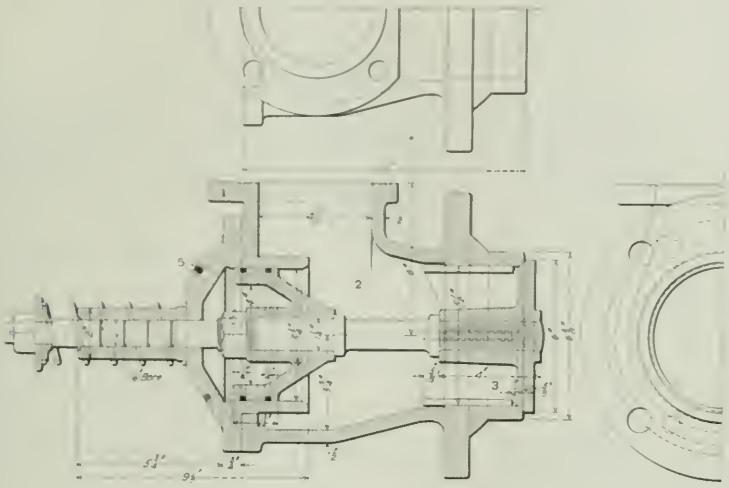
are the connections between the frames and the boiler. The boiler is necessarily supported by both front and rear frames, but it is rigidly attached to the rear one only, sliding supports being provided for the front. The connection between the two frames is by means of pivot pins and is of such a character that the whole tractive effort of the forward cylinders is transmitted to the rear frame through this connection and thence back to the drawbar connecting the tender.

The general arrangement of the connection between the two frames is clearly shown by the assembled engraving of the steam pipes, which is that of the Baltimore & Ohio engine but is the same as that of the Erie. At the rear end of the forward frame heavy cross-tie castings are attached to both the top and bottom rails, and these in turn carry the male sections of a pivotal connection, the female being bolted across the front face of the saddle of high-pressure cylinder and attached to the frames. Two heavy pins complete the connection.

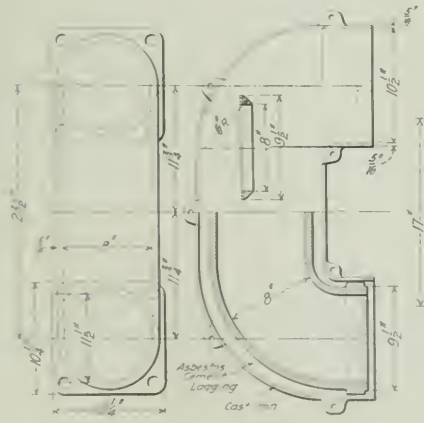
The boiler is fastened to the rear frame at the high-pressure saddle and at three points beneath the firebox, the one at the extreme back end taking the form of the usual buckle plate. This holds the boiler in line with the rear frames at all times and causes a large range of lateral displacement over the front truck; a displacement that increases toward the front end of the machine and at the cylinders is at the extreme, as illustrated by the half-tone engraving of the front on page 174. The boiler is therefore carried on two sliding supports by the front frame. Of these one is placed about midway between the high-pressure cylinders and the front tube-sheet which is intended to carry the whole of the load of the front end of the boiler. The second is intended to serve merely as a guide and centering device to bring the boiler back central with the front frame when it runs out of a curve. It is provided with bearing surfaces but it is expected that the lifting springs with which it is provided will relieve these surfaces of all load.

The general arrangement of this centering device is shown in the engraving of the assembled parts. The casting A is attached to the boiler and has the spring case B bolted to its lower face. The lower face of this spring case is planed smooth and is fitted with a wearing surface provided with oil grooves so as to move easily to and fro across the top face of the heavy frame cross-tie F that is bolted to the frames G G. The spring case contains two nests of helical springs provided with thimbles in whose sockets the stems E E have a bearing. These stems are pivoted in the brackets D which are bolted to the cross-tie F. At the center the two springs have a bearing on the spring case B. It is evident that when the boiler swings to one side or the other of the center lines of the frame and carries the spring case with it, the spring at one end or the other is compressed and tends to push the case, and with it the boiler, back to the central position.

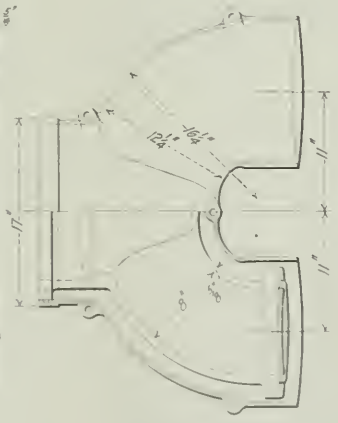
In order to relieve the bearing surfaces between the spring case and the frame cross-tie F of that part of the weight of the boiler that would naturally come upon it and, at the same time, render the centering action of the springs more effective, an upward thrust is exerted against the main casting A. Near the lower edge of this casting there are two hemispherical sockets in which the ends of the relief stems I I are fitted. The lower ends of these relief stems



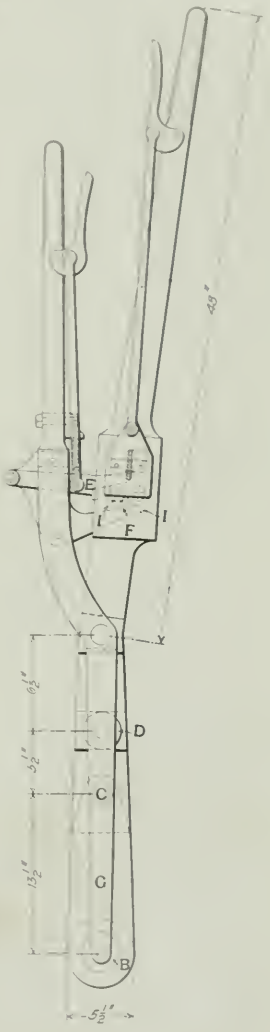
Emergency Exhaust Valve.



Exhaust Passage Connection; High Pressure Cylinder.



Dry Pipe Tee.



Reverse Lever.

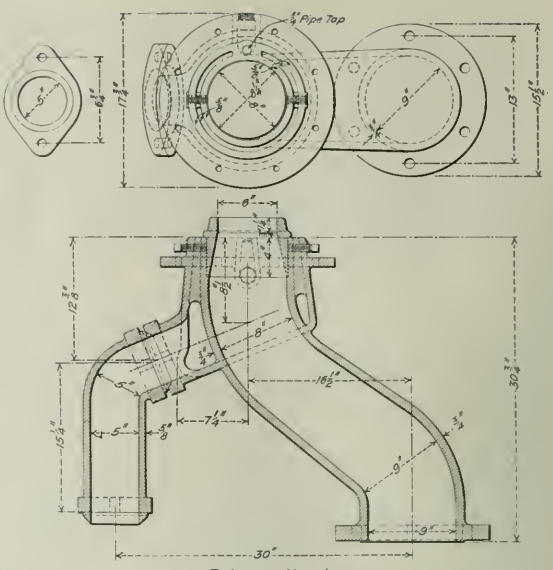
rest in sockets attached to the swinging seats J. These seats are pivoted to a cross-tie H that rests upon the lower rails of the frame. They are held up against the lower ends of the relief stems I by U bolts K K, and these are, in turn, supported by springs which rest upon the cross-tie. These springs are put in position under a tension sufficient to sustain that portion of the weight of the boiler of which it is desired that the surfaces between B and F should be relieved. They also serve to compensate for any angularity that the relief stems may assume due to the lateral motion of the boiler.

By this arrangement the boiler is free to move to and fro across the supporting surfaces without exerting an undue frictional thrust upon the frames and without being raised above its normal position by the auxiliary supports. There is a support back of the centering device upon which the weight of the forward part of the boiler rests and to which attention has been called. This consists simply of castings fastened to the boiler shell and frames and fitted with suitable wearing surfaces that are properly lubricated and with stops so adjusted that the desired fore and aft movement due to the play between the two frames is allowed.

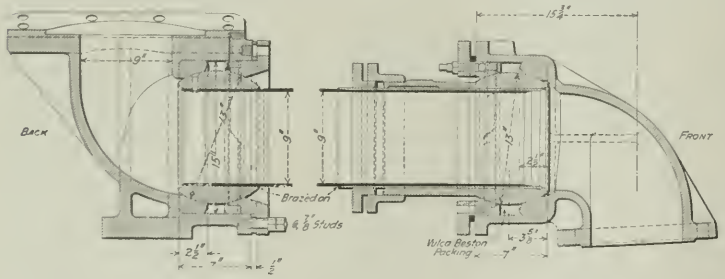
Owing to the fact that there are two sets of valve motions to be moved by the reverse lever an air-operated reversing gear is used. In the cab there is the usual reverse lever attached to the reach rod in the ordinary way and fitted with the regular latch engaging in the teeth of the quadrant. In addition to this the reverse lever is also coupled to the piston rod of the air gear. Back of the main reverse lever and pivoted upon it there is what looks like an auxiliary lever. This is used for the handling of the motion when air is worked. The engraving of the two levers show the relative proportions and their connection with each other. The main lever is pivoted to the reverse lever stand at B; is connected to the piston of the air cylinder at C and to the reach rod at D. It is fitted with the usual latch engaging in notches cut in the quadrant and is also provided with a special latch for locking and limiting the motion of the auxiliary lever.

The auxiliary lever is pivoted on the main one at A, and when a change of cut-off is to be made the latch handle of the auxiliary lever is pressed in and this lifts the main latch by means of the lifting bar E. The lifting of the main latch also frees the auxiliary latch finger F and gives it a freedom of movement between the two lugs 1, 1. The movement of the auxiliary lever to or from the main lever by the distance permitted by the lugs 1, 1, swings the lower end G so that its center is out of line with that of the lower end of the reverse lever at B. As both levers turn about this point the offset thus obtained is practically constant and is utilized to operate the valves of the air and oil cylinders, as will be described later.

There are two cylinders set tandem for the reversing gear. Air is used as a motive power and it is worked in a double-acting cylinder of 8-in. bore. The other, or oil cylinder, is 5-in. diameter. Both pistons are packed with leather cup packing, that for the oil being held by the followers only, while that on the air piston is held out by a spring ring. Packing boxes for the rod are placed between the cylinders and for the trunk piston rod at the air end, where there is a short connecting rod leading to the reverse lever. In operation, whenever the auxiliary reverse lever is in its normal position, the valves of both oil and air cylinders are blanked. This locks the gear for, with the oil cylinder filled, no motion can take place when the by-pass is closed. The connections show the operation of the valve. The valves are simple tapered plug valves: that for the air has a four way opening in addition to an exhaust cavity and that for oil has crossed passages so that the two ends of the cylinder are put in communication whenever the auxiliary reverse lever is pushed forward or back. For example, when the auxiliary lever is pushed forward the lower end of the arm G is drawn back turning the air cock so that the port 1 is opened to the passage 6. 3 is open to the air inlet 9 and the exhaust cavity 5 opens the passage 8 to the exhaust 7. Air is thus admitted to the rear of its cylinder and the motion is moved forward. At the same time the cross passage 10 is turned to allow oil to pass from 12 to 13. For reversing, the air is admitted to the front passage 8 through the port 4 and the by-pass of the oil cylinder is opened by 10.



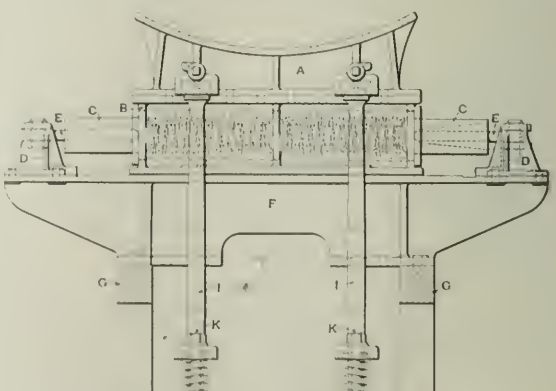
Exhaust Nozzle.



Exhaust Pipe.

By giving the auxiliary lever a slight angular position the passage of oil from one end of the cylinder can be checked to any extent and the moving of the gear be made slowly or rapidly as may be desired. When the gear is to be moved the auxiliary lever must be kept in motion as long as it is desired that the gear shall move, and when the desired notch in the quadrant has been reached, the lever is brought to its normal position relatively to the main lever, the movement stops at once, the ports are covered and the pistons locked.

These are the principal items of interest connected with the locomotive in that they are the details that are essential to permit the proper relative position of the frames on curves. The great size of the machine made it necessary to give close attention to every item of its construction in order that suitable proportions might be obtained, and as such each part of the engine is deserving of close study.



Centering Device for Front Frame Section; Mallet Articulated Compound Locomotive.

Turntable Deflection.*

In investigating a certain turntable it was desired to know whether it had an undue amount of deflection and to that end it was necessary to know the theoretical deflection. The writer was unable to find any ready method for determining deflection and worked out the following graphical solution. The problem was to find the deflection of the table at the guide rail when loaded with a locomotive weighing the same as the rated capacity of the table (in this case 150 tons) and set to balance the table as shown in Fig. 1. The principal dimensions of the table are also shown in this figure. For convenience in solving the problem only half of one end of the table was considered, hence we have to find the deflection of a cantilever beam with several concentrated loads and a varying moment of inertia, the loads being half the weights on drivers and truck. This is shown at the top of Fig. 2. For a rigid analysis both ends of the beam should be considered, due to the different moments obtained from the tender loading, but this is but a repetition of the work shown.

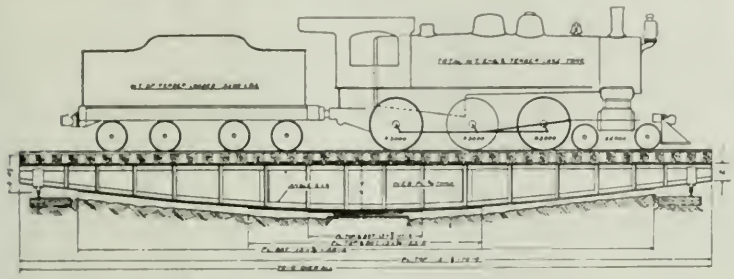


Fig. 1—Locomotive in Place on Turn Table.

Briefly, the process consists in obtaining first, the moments of inertia at the various sections where changes occur, in this case at the beginning and end of each top and bottom plate; second, the moments taken about the center and under each wheel; third, obtaining the value of the moments divided by the moment of inertia; fourth, integrating this value, and fifth, again integrating to obtain a value from which the deflection may be obtained.

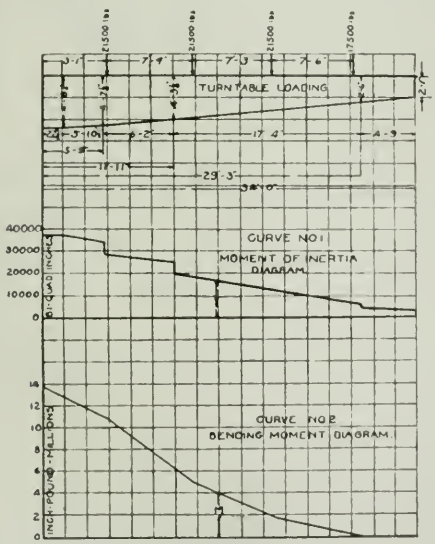

Fig. 2.

In the following:

M = bending moment in inch pounds.
I = moment of inertia in bi-quadratic inches.
E = modulus of elasticity in pounds per square inch.
d = deflection in inches.
C & C¹ = constants of integration.

Curve No. 1 shows the moments of inertia figured at the points indicated and laid down to a convenient scale. The I's were figured by the well known formulæ for built-up sections (method shown in appendix).

Moments were next figured, the latter being laid out at the center and under each wheel load between section 1 at end of table only being considered. This laid down to a convenient scale gave curve No. 2.

In the solution of the problem it is necessary to know the value of $\frac{M}{I}$ (see mathematical solution below), hence curve No. 3 shows graphically the result of dividing the M of curve No. 2 by the I of curve No. 1 and gives an $\frac{M}{I}$ curve from which values may be taken directly.

The next step calls for an integration of values already obtained. Curve No. 4 is a graphical result of such integration and is obtained from curve No. 3 by taking the number of squares under the curve to the right of any point and multiplying it by the value of one square in inches. In the example given one square had a horizontal or abscissae value of 24, while the vertical or ordinate value was 100, hence each square value was 2,400. On curve No. 4 each square was given an ordinate value of four squares of No. 3 or 9,600, the abscissae value remaining 24 as before.

Curve No. 5 is a graphical integration of No. 4, and is derived in the same manner as was No. 4, except that eight square spaces of No. 4 were used for one vertical space of No. 5. The units of $\frac{I}{M}$ diagram are lbs. ÷ (inches)². By integrating we have lbs. ÷ (inches)² for the units of curve No. 4, while further integration gives lbs. ÷ inches. By taking the value of E at 29,000,000 lbs., and dividing the value obtained from the curve at any point by 29,000,000 we get the deflection at that point in inches—the desired result. Mathematically this is shown by the following. (See Church's Mechanics, p. 310.)

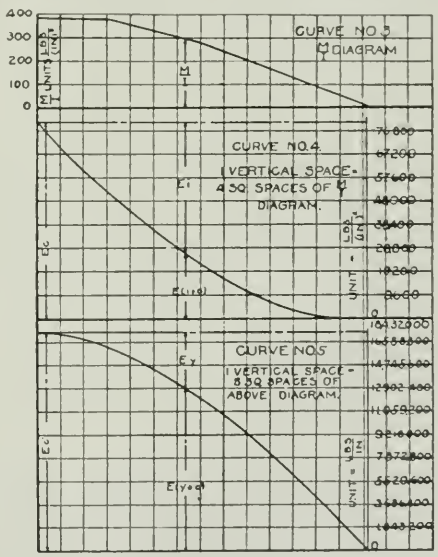

Fig. 3.

The turntable is considered as a cantilever with several concentrated loads and varying I's.

Since, from the moment diagram

$$E I \frac{d^2y}{dx^2} = M, \text{ then } E I \frac{(dy)\, d}{dx} = M dx$$

Integrating,

$$E I \frac{dy}{dx} + c = \int M\, dx, \text{ where } c = \text{constant of integration.}$$

$$\therefore \int M\, dx = E I (i + c), \text{ where } i = \frac{dy}{dx}$$

hence $M dx - E I c = E I i$, but

$$E I i = E I \frac{dy}{dx} \quad \therefore E I i\, dx = E I\, dy, \text{ integrating}$$

$$\int E I i\, dx = E I (y + c'), \text{ where } c' = \text{constant of integrations.}$$

Since the origin is at the right of the curve this reverses the signs.

*A. A. Kellogg, in *Purdue Engineering Review*.

The deflection at the center is zero.

This method of finding the deflection checked up in the case cited. The deflection by calculation was approximately 19-32 in., while the actual deflection, taken by an engineer's level, was $\frac{5}{8}$ in., when the table was loaded as shown.

Acknowledgment is due to a paper on "Car Bolster Stresses" by Prof. W. K. Hatt, of Purdue University. (*Railroad Gazette*, Dec. 23, 1898.)

APPENDIX.

Method of Obtaining I of Section.

I of web = 1-3 bh³ (Church's Mechanics, p. 94).

I of angles = 2 (I_g + F d²), where,

I_g = moment of inertia about gravity axis, from handbook.

F = area of angle from handbook.

d = distance from center line to center line of gravity of angle.

I of top plate = I_g' + F' d'², where,

I_g' = moment of inertia of plate (if small, this may be neglected).

F' = area of plate.

d' = distance from center line to center line of gravity of plate.

Rivet holes to be deducted from I of section:

Through angles and web = F'' d², where,

F'' = area of rivet hole.

d = distance from center line of section to center line of rivet hole.

Through top plate = F''' d''² where,

F''' = 2 (area 1 rivet hole).

d'' = distance from center line of section to center line of hole.

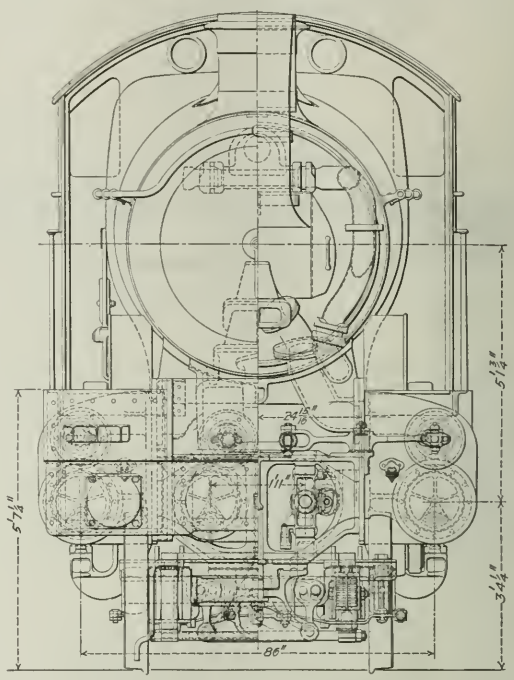
Total I of entire section = 2 [(I of web + I of angles + I of top plate) — (F d² of rivet holes.)]

Four Cylinder Simple Express Locomotives; Great Western Railway.

Through the courtesy of Mr. G. Jackson Churchward, Chief Mechanical Engineer of the Great Western Railway of England, we illustrate and describe herewith the latest type of locomotive built at Swindon Works for hauling express passenger traffic on that line. The wheel arrangement is 4-6-0, and there are four single-expansion cylinders placed two inside and two outside the frames, each pair of cylinders operating a separate pair of coupled wheels.

The inside cylinders are placed forward of the bogie center, and the outside ones to the rear. The inside cylinders drive the crank axle of the leading coupled wheels, while the outside cylinders are connected to the intermediate coupled wheels. The two cranks on each side of the engine, i. e., one inside and the other outside of the frames, are 180 deg. apart and at right angles (90 deg.) to the cranks on the opposite side. This arrangement greatly improves the turning moment, and as the two pistons on each side of the engine are always moving in opposite directions, a simplified form of valve mechanism is rendered practicable. In these engines the valve gear is of the Walschaerts type in duplicate, one set actuating a pair of piston valves 8 in. in diameter and of extra length, allowing the passages to the cylinders to be practically straight. Inside admission and outside exhaust are adopted, and the exhaust passage is an extension of the valve chest. The inside piston valve in both cases is actuated directly by the Walschaerts gear, and motion is conveyed to the outside valve by connecting the two valve spindles by a cross-lever having equal arms fulcrumed on the frames. Neither eccentrics nor return cranks are employed for operating the gear, motion being derived from the reciprocating movement of the inside crossheads, each of which carries a connection to its own combining lever and also a connection through a rod extending back and operating the link for the valve motion of the opposite side of the locomotive.

The two inside cylinders are cast in one piece with the smokebox saddle, but their center is considerably in advance of the saddle, this being a natural consequence of the location of the cylinders over the leading bogie axle. The boiler is of the Great Western standard type, viz.: coned throughout the length of the barrel and fitted with Belpaire type of firebox and extended smokebox.

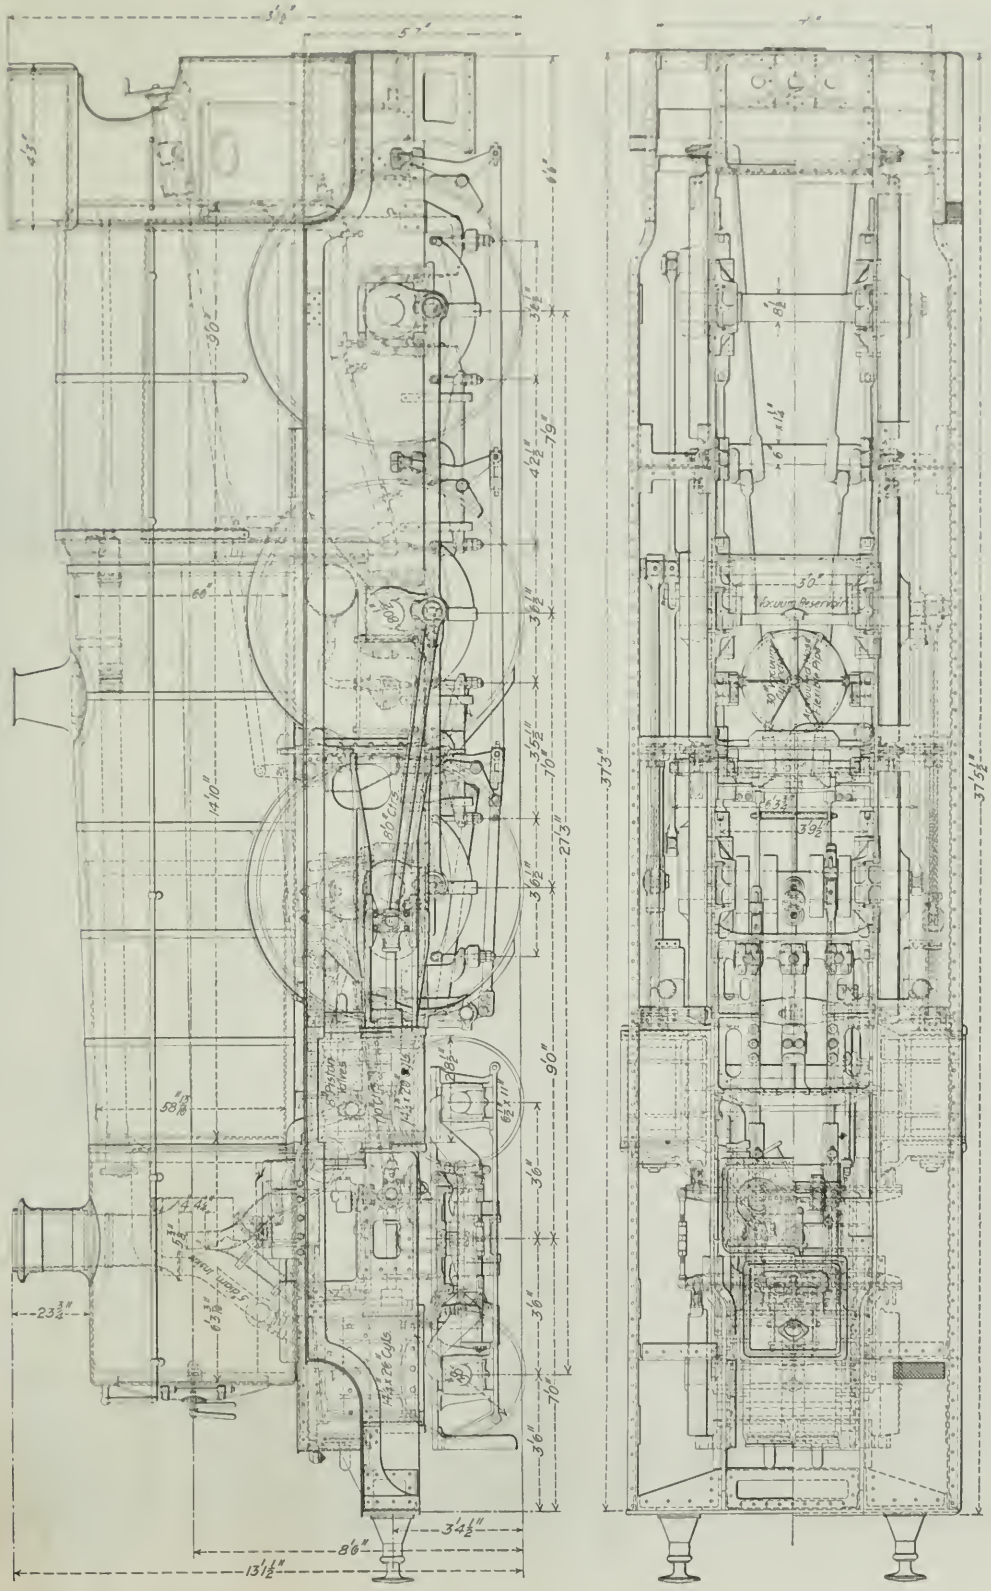


Half Cross Section and End Elevation.

No dome being provided, steam is collected by a pipe having branched ends, each of which has an upturned mouth near the front of the crown sheet on each side, the throttle valve being in the smokebox.

The crank pin end of the connecting rod for the outside cylin-

Four Cylinder Single Expansion Locomotive; Great Western Railway of England.



Plan and Side Elevation of Four-Cylinder Single Expansion Express Locomotive; Great Western Railway of England.

ders is of the solid bush type. The end of the crank pin has a fine thread cut on it and the cap is screwed on and secured by a threaded taper pin through it. The side rods are secured in the same manner.

These locomotives rank among the most powerful express passenger engines in Great Britain. With ample cylinder and boiler power, an adhesion weight of nearly 60 tons and a high working pressure, they possess all the necessary features toward success in the particular work for which they have been designed.

They have leading dimensions as follows:

Cylinders (four) diameter	14½ in.
Piston stroke	26 "
Bogie wheels, diameter	3 ft. 2 in.
Coupled wheels, diameter	6 " 8½ "
Bogie wheelbase	7 " 0 "
Coupled wheelbase	14 " 9 "
Total wheelbase	27 " 3 "
Boiler, diameter (front end)	4 " 10¾ "
" diameter (firebox end)	5 " 6 "
" height of center from rail	8 " 6 "
" length of barrel	14 " 10 "
Heating surface, total	2,142.91 sq. ft.
Grate area	27.07 "
Working pressure	225 lbs.
Weight in working order	171,584 "
Adhesion weight	131,710 "
Tractive power	23,775 "

The tender carries 6 tons of coal and 3,500 gallons of water. It weighs 40 tons when full.

Production of Lumber in the United States.

The Bureau of the Census, in connection with the Forest Service of the United States Department of Agriculture, has issued a bulletin showing the production of lumber, lath and shingles by states and species in 1906, 1905 and 1904. The figures cover returns from 21,077 mills in 1906, 11,666 mills in 1905 and 18,277 mills in 1904. The total lumber production (excluding lath and shingles) for the United States, in thousands of feet, board measure, was 37,490,067 in 1906, 30,502,961 in 1905 and 34,127,165 in 1904. The state showing the heaviest production of all kinds of lumber in 1906 and in 1905 was Washington, with 4,305,053 thousand feet in 1906 and 3,917,166 in 1905. In 1904, Wisconsin was the state of largest production, with 2,623,157 thousands; Washington was second, and Louisiana third. In 1906 there were 15 states whose production exceeded one billion feet of lumber, board measure. These states, arranged in order of production with the figures given in thousands of feet board measure, are as follows:

Washington	4,305,053	Texas	1,741,473
Louisiana	2,796,395	Pennsylvania	1,620,881
Wisconsin	2,331,395	Oregon	1,604,894
Michigan	2,094,279	California	1,348,559
Mississippi	1,840,250	North Carolina	1,222,974
Arkansas	1,839,368	Maine	1,088,747
Minnesota	1,794,141	Virginia	1,063,241
		Alabama	1,009,783

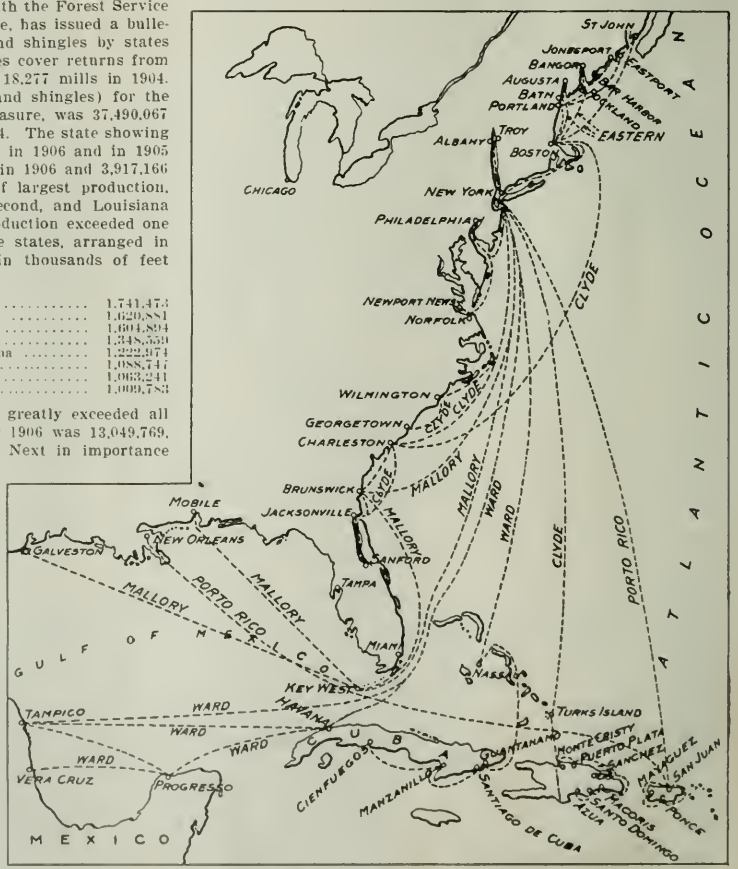
The production of yellow pine, of course, greatly exceeded all other kinds of lumber and the total figure for 1906 was 13,049,769, the unit being 1,000 ft. B. M. as heretofore. Next in importance comes Douglas fir, with 4,969,843. White pine is next with 4,582,102; then hemlock, 3,508,031; oak, 2,816,077; spruce, 1,615,940. These six kinds of wood were the only ones the production of which amounted to one billion feet B. M. or more. Of the lesser woods, maple was the most important, followed in order by cypress, poplar, redwood, red-gum, chestnut, basswood, cedar, birch, cottonwood and ten other specifically enumerated varieties. Louisiana leads in the production of yellow pine. The great Douglas fir states are Washington and Oregon, and, between them, they produced all but about 200,000 of the production. Minnesota and Wisconsin have a very large lead in the production of white pine. Pennsylvania, Wisconsin and Michigan are the chief hemlock states, while the production of oak is spread with some evenness over 11 states, and is found on a lesser scale in 26 others. Kentucky being the chief producer, with West Virginia next and Tennessee third. About a third of the entire production of spruce comes from Maine, with Washington a poor second and New York third. In New York, however, the figure given is for the year 1905, as the totals for 1906 are not yet available.

Looking at these summaries in another way, it is seen that Washington is a great producer of Douglas fir, spruce, cedar and yellow pine. Louisiana is the most important single producer of yellow pine and also much the largest producer of cypress. Wisconsin contributes white pine, hemlock, basswood, birch and a number of other lesser cuts; Mississippi, yellow pine, oak, red-gum and cottonwood; Minnesota, white pine, almost to the exclusion of other woods, but with some spruce and tamarack. Yellow pine furnishes almost the entire production of Texas, although some oak is manufactured, while California divides her cut between redwood, yellow pine, Douglas fir, oak, sugar pine, white fir and a number of other woods of less importance, and easily leads all other states in this relative diversity of production.

Yellow pine is now produced by 38 states and territories, and is the most widely produced lumber of all. Oak comes next and is manufactured in 37 states and territories; ash in 35; elm in 32, and white pine in 30, specifically enumerated, but the manufacture of ash and elm is of comparatively little importance, the total for both woods being 421,140 thousand feet. Hemlock, maple, spruce, poplar, basswood, cottonwood, beech and hickory are also cut almost all over the country, while redwood, the production of which is almost equal to the combined production of elm, ash and beech, is cut only in California. Sugar pine is cut in only two states, California and Oregon; tamarack in three, Michigan, Minnesota and Wisconsin; white fir in eight, and Douglas fir in ten.

The Consolidated Steamship Lines.

The routes of the various companies controlled by Charles W. Morse and his associates, and united as the Consolidated Steamship Lines, are shown on the accompanying map. It will be seen that they cover all the important Atlantic ports and the three most important Gulf ports, besides reaching the two largest ports of



The Consolidated Steamship Lines.

Mexico, Yucatan, Cuba, Santo Domingo, Porto Rico, and the Bahamas. The principal coastwise lines not included in the consolidation are the Old Dominion Line from New York to Norfolk, Va., the majority of whose stock is understood to be controlled jointly by the Southern Railway, Seaboard Air Line, Atlantic Coast Line, Norfolk & Western and Chesapeake & Ohio; the Ocean Steamship Company of Savannah (Savannah Line) from Boston and New York to Savannah, Ga., owned by the Central Railroad of Georgia; the Morgan

Line from New York to New Orleans and Galveston, owned by the Southern Pacific, the Merchants & Miners' Transportation Company, understood to be held, with the Boston & Philadelphia Steamship Company, whose property it operates, as a watch dog to prevent undue competition by the Morse interests with the New Haven road, and the Maine Steamship Co., formerly an independent line from New York to Portland, Me., but now presumably controlled by the New Haven road also. The Merchants' & Miners' services are between Boston, Norfolk, Newport News and Baltimore; Providence, Norfolk, Newport News and Baltimore; Norfolk, Newport News and Baltimore; Savannah and Baltimore; Savannah and Philadelphia; Boston and Philadelphia; Philadelphia, Fall River and Providence, and Savannah and Norfolk, and the company operates a fleet of 24 vessels. The Old Dominion fleet consists of five seagoing vessels, with an aggregate tonnage of 19,700, and nine river steamers. The Savannah Line has ten vessels, with an aggregate gross tonnage of 42,235; the Morgan Line has 19 seagoing vessels with an aggregate of 45,377 tons, approximately, and the Maine Steamship Company has three ships, aggregating somewhat above 8,000 tons, in addition to two sound steamers running on the newly affiliated Neptune Line.

In addition to these well-established concerns, the Brunswick Steamship Company has recently established an independent service between New York and Brunswick, Ga., with four 3,000-ton ships, and another ship is building. In the off-shore service, to which the Cuba and Porto Rico lines of the Consolidated Steamship Company belong, there exists the enormous independent fleet of the United Fruit Company, and subsidiary carrying lines; the Red D Line, the Munson Line, and several other concerns. It must not for a moment be assumed, therefore, that the Consolidated lines have a monopoly of coastwise traffic, although they operate something like half of the coastwise tonnage which is under the American flag.

The routes covered by the companies owned and operated by the Consolidated Steamship Lines are as follow:

Mallory Steamship Co.—*Texas Division*—Between New York and Galveston, Tex., via Key West, Fla.
Mobile Division—Between New York and Mobile, Ala., via Brunswick, Ga.

Hudson Navigation Co.—*People's Line*—On Hudson River between New York and Albany.

Citizen's Steamboat Co.—*Citizen's Line*—On Hudson River between New York and Troy.

Clyde Steamship Co.—*New York Division*—Between New York, Charleston, S. C., and Jacksonville, Fla. Between New York, Wilmington, N. C., and Georgetown, S. C.
Boston Division—Between Boston, Charleston, S. C., Brunswick, Ga., and Jacksonville, Fla.; freight only.
Philadelphia Division—Between New York and Philadelphia; freight only.

The Yale; Metropolitan Line.

Between Philadelphia, Norfolk, Portsmouth and Newport News, Va.
West India Division—Between New York, Turk's Island, Monte Cristy, Puerto Plata, Samana, Sanchez, Marcoris, Santo Domingo City and Azua.
St. Johns River Division—Between Jacksonville and Sanford, stopping at Palatka, De Land, Astor, Enterprise, and intermediate landings.

Eastern Steamship Co.—*Portland Division*—Between Boston and Portland.
Kennebec Division.—Between Boston and Augusta, Me., via Bath, Richmond, Gardiner and Hallowell.
Bangor Division—Between Boston and Bangor via Rockland, Camden, Belfast, Bucksport and Winterport.
Portland, Rockland & Machias Division—Between Portland and Rockland via Boothbay Harbor and other intermediate landings.
Boothbay Division—Between Bath and Boothbay, Pemaquid and various points on Sheepscot Bay.
Mount Desert and Blue Hill Division—Between Rockland and Bar Harbor landing at various points on Penobscot Bay.
International Division—Between Boston and St. John, N. B., via Portland, Lubec and Eastport. Also between Boston and St. John direct.

Metropolitan Steamship Co.—*Direct All-Water Route*—Via Long Island Sound and the Atlantic Ocean between New York and Boston; formerly freight only; passenger turbines added.

New York and Cuba Mail Steamship Co. (Ward Line).—Cuba Division—Between New York and Havana; and New York and Cienfuegos.
Mexico Division—Between New York and Vera Cruz; and New York and Tampico.

The New York and Porto Rico Steamship Co.—*New York Division*—Between New York and San Juan, P. R., between New York and Mayaguez and between New York and Ponce.
New Orleans Division—Between New Orleans and San Juan, P. R.
Porto Rico Island Division.—Between San Juan and Arecibo, Aguadilla,

The Havana; Ward Line.

Mayaguez, Guanica, Ponce, Jobos (Aguirre), Arcoyo, Humacao, Port Mulas (Viegues Islands), and Fjardo.

The following table gives in statute miles the length of the various routes:

Mileage of Consolidated Steamship Lines.

	Statute miles.		Statute miles.
MALLORY LINES:		International Division.. 351

*Viegues Islands.

The vessels owned by the Consolidated Steamship Lines are summed up in the following table:

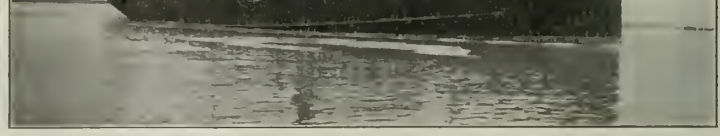
Steamships and Steamboats Owned by the Consolidated Steamship Lines.

	No. of vessels.	Gross tonnage.*
New York & Cuba Mail Steamship Co., (Ward Line)....	24	76,634
Clyde Steamship Company.....	25	55,145
New York & Porto Rico Steamship Company.....	12	32,618
Mallory Steamship Company	12	45,014
Eastern Steamship Company	19	23,542
Metropolitan Steamship Co.	6	18,103
People's Line (Hudson Navigation Company).....	4	7,951
Citizen's Line (Citizen's Steamboat Company).....	4	3,938
Total	106	262,945

*Gross tonnages in this table as supplied by the company; not checked.

The largest of these ships are the "Saratoga" and "Havana," of the Ward Line; 6,400 tons gross, twin screw, built in 1907 and 1906, respectively. The "Brazos," building for the Mallory Line, is to be above 6,000 tons; the "San Jacinto" is 6,096 tons, and the "Denver" 4,539. In the entire fleet controlled there are six vessels with a gross tonnage of 5,000 or larger. These represent a very great increase in size and speed from the characteristic coastwise vessel built before the Spanish war. The opening up of Cuban and Porto Rican trade since 1898 has been noteworthy, and the existing fleets engaged in traffic with these islands bear witness to it. An elaborate study of American coastwise development was printed in the *Railroad Gazette*, Aug. 15, 1902, in which it was shown that in 1892 there was only one steamer of 4,000 tons in regular coastwise service between United States ports, while the typical ship of the period had a gross tonnage rather under than over 3,000. The 3,000-ton ship still prevails on the coast, but the Morgan Line now has three 6,000-ton ships, two 4,800-ton ships and eight 4,600-ton ships, and the present tendency is to build boats of about 6,000 tons for the best services.

Next to the Morgan Line, the most important line on the coast is the Ward (if we except the group of lines forming the United Fruit tonnage), and this is the principal Consolidated holding. The Clyde, Mallory and Metropolitan lines have been prominent on the coast for a great many years, and Clyde's "John S. McKim," built in 1844, was one of the pioneers of steam coastwise service in this country. As is well known, the new 23-knot triple-screw turbine steamers "Yale" and "Harvard" have recently been added to the Metropolitan fleet. They are the fastest merchant vessels under the American flag, and maintain a 15-hour all-water service between New York and Boston. It is unfortunate that the new owners of these properties should have found it necessary first to load up the original lines with new capital and then issue a sufficient amount of collateral trust bonds and Consolidated Steamship stock to exchange for the values thus created. As a result of the first part of this process, the vessels are capitalized at the enormous total figure of $326.48 per ton, and this figure is obtained by taking the sum of the underlying capitals only. The holding company capital would work out at a much higher figure, which scarcely needs to be discussed. By comparison, it may be noted that the fleet of the Royal Mail Steam Packet Co. (179,668 tons) is capitalized at the rate of $54.29 per ton, approximately, and the Union Castle Mail Steamship Co. (260,634 tons) at $49.77.



The San Jacinto; Mallory Line.

African Railroads in Algeria and Tunis.

The question of routes for communication in Algeria was one of the most difficult to meet during the period of the French conquest. In 1830 it was reported that there was not a single road, for it is well known that the routes of travel used by the Arabs were hardly wide enough for a single horseman. The first roads were, therefore, built by military authority, while the first railroad program for Algeria was not drawn up until 1857, and then it was by a decree issued in accordance with a proposition from Marshal Vaillant. Three years afterwards the work was begun and in 1862 the line from Algiers to Blida was opened for traffic. This was followed by the construction of the other lines that now form the system of the Mediterranean colonies of France.

The topography and character of the soil control the location of the railroads. Algerian commerce is one that is dependent, for the most part, on agriculture, to which should be added an extract industry that is still in the early stages of its development. So that the productive zone of the Tell has developed in a strip of variable width, lying along the coast from east to west. Although the sea affords an excellent highway along this strip and the coasting traffic has developed the cities of the litoral and kept them in communication with each other, it is, nevertheless, important that they should be placed in communication with the valleys and plains lying back of them in this region. Hence the project of a railroad nearly parallel to the coast from the Tunisian frontier to that of Morocco, a project which has been enlarged since 1881 by the extension of the line to Tunis about 985 miles from Goulette-Tunis to Tlemcen. Some of the valleys, which unfortunately do not run into each other, have indicated in advance the general line of the road, and have served, in a way, to partially facilitate building it. Such valleys are those of the Medjerda, Seybouse, the West Sahel and Chelif, so that the road cannot be strictly parallel to the coast. It was also turned aside by the massive mountains of Kroumirie, Babor and Djurdjura. In short, the road is not parallel to the coast for the same reasons that the lines from Marseilles to Toulon and from Port-Vendres to Barcelona are not.

In the second place, each of these plains or valleys along the maritime region must be approached through its port, which, at the same time, has his own supply business and its own commercial output to attend to, from which it follows that lines have been built at right angles to the coast from Guelma to Bone by the valley of the Seybouse, 34 miles; from Constantine to Philippeville, 54 miles; from Beni-Mansour to Bougie by the West Sahel, 55 miles; from Tiaret and Relizane to Mostaganem by the valley of Demena, 125 miles, and from Perregaux to Arzeu from Ain-Temouchent to Oran, 43 miles. We may add the local line from Oran to Arzeu, 27 miles, and the roads from Tizi to Ouzou, 33 miles; from Blida to Berrouaghia, 51 miles, and from Bone to St. Charles, 62 miles. These roads serve the richest region in the whole colony. They obtain traffic from cerials, fruits, grain, wine and some mineral products, such as the phosphates of Tebessa. There is also a large passenger traffic.

But though the elevated high lands are in a way less richly endowed with natural resources it is nevertheless worth while to give that territory the advantages of convenient means of transportation for the sake of the alfalfa territory on the south side of Saida and the palm groves of Biskra. The high plateaus on the extreme southern side of Algeria, especially those of the southwest, have, throughout all times, been inhabited by a population that was

the least submissive of any in the colony. There has been, therefore, a political and strategic interest in giving to the corps of occupation a means of rapid communication with this less pacific and more suspicious section of the country. Hence, beyond the high lands it has been profitable to unite the region of the Tell with the oasis of the Algerian Sahara, Figuig, El Goléa, Ghardaia, Ouargla and Touggourt, where the date plants are marvelously developed, and where the traditional carpet industry still occupies several thousand artisans. By the lines which it has been proposed to build it is finally expected to enrich the Mediterranean ports with the commerce of the caravans from the desert and from the Soudan, and it is believed that by attracting traffic from the Trans-Sahara by way of Figuig, Morocco can be held under French influence. It is for these reasons that these lines penetrating into the interior have been undertaken. Into the department of Constantine three lines have been built, one towards Tedessa, 79 miles, on the Tunisian frontier and the center of the flourishing phosphate industry, whose products, thanks to the railroad, find an outlet at Bone. A second towards Ain-Beida, 58 miles, and a third towarda Biskra, 125 miles, bringing an important passenger traffic into this city, which is a source of revenue for it, and is also a valuable means for exploiting the palm industries of the Rir. The Biskra line is now to be extended to Ouargla. On the west, however, principal line of penetration is that which pushes in from Aezeu-Perregaux to Saida and Ain-Sefra. This was finished in 1887 and serves for exploitation of the alfalfa products of the high lands of South Orania, while its strategic and political importance seem now to have exceeded its commerce since the Oases of Touat and Tidikelt were occupied in 1900, and especially since the recent operations against Figuig and the difficulties that have arisen in Morocco.

In addition to this, the line has been still further extended towards the south since 1900. In 1901 it ran as far as Duveyrier; in 1902 to Beni-Ounif, at the gates of Figuig, 397 miles from the Mediterranean, creating a true center of population and of commerce. On the 16th of last October the Minister of the Interior, M. E. Etienne, opened the last extension to Beehar. An old project was to run the line to Igli, but French political interest is evidently pushing on the rails on to Kenadsa and probably beyond.

A prolongation of the Grand Central Road from Tunis to Tlemcen on towards Morocco is also being built, and a law of the 29th of December, 1903, authorized the building of a trunk line from Tlemcen to Lalla-Marnia on the Morocco frontier, whence it can be extended at any time still further west towards Fez, Mequinez and the Atlantic. It will thus serve as an efficient means for the pacific entrance into Morocco.

Finally, the two lines which were recognized in 1900 to be of great public advantage, namely, that from Ain-Mokra to Jemmapes, 40 miles; and that from Ain-Beida to Henchela, 30 miles, have been finished. The influence of the Algerian system is quite manifest, and for a long time there has been a general demand for a real connection between Ain-Beida and Tebessa and between Biskra and Ouargia; between Setif and Bougie, Tenes and Orleansville, as well as double track for the Grand Central over the Boura-Aumale-Affreville, which has a length of about 150 miles from east to west. The main system of railroads in the Mediterranean colonies takes no account of this lack. For a comparatively small sum the existing roads, which are about 1,900 miles long, could be extended so as to make connections with each other, such as the Paris, Lyons & Mediterranean, the Eastern Algerian, Western Algerian, the line from Bone to Guelma and the State Railroad. The multiplicity of the companies increases the general expenses and prevents the undertaking of large projects, and frequently leads to a false spirit of jealousy between them. For example, Philippeville has for a long time complained that by means of reduced rates the Eastern Algerian has drawn off the traffic which naturally belongs to it to Algiers or Bougie, and it is only recently that the company has begun to make through rates and run connecting trains. As all the roads do not have the same gage, it follows that there must be frequent transferring of passengers and trans-shipment of freight, which are unceasing causes of delay and expense. This is due to the fact that the first Algerian lines were built at a time when the narrow gage system was not contemplated at all, and when they wished to give the colony a system based on the large metropolitan roads of the more thickly inhabited countries. The Grand Central Railway was built with a gage of 4 ft. 8½ in. and should be finished throughout with the same gage. Recently the spurs which make direct connection with it have been built to that gage.

With the exception of the one from Biskra, all of these branch lines have the standard gage. The others that penetrate into the interior, which were built after the Grand Central, have profited by the experiences with the narrow gage, and have, for the most part, been built with a narrower gage, that is, from 3 ft. 3⅜ in. to 3 ft. 5 in., by which greater economy in rapidity of construction has been obtained.

Finally, all the railroads, which are given a certain annual subsidy by the state, under the form of guaranteed interest, have a natural tendency, although it is not in accord with public welfare, to obtain these subventions in construction rather than by an improvement of their service. Consequently they have failed to agree to any lowering of rates and improving of rolling stock. A minimum amount of income is quite sufficient for them and they expend it to-day in attempting to exploit new enterprises rather than to increase their current revenue.

A portion of these shortcomings will be very slow in disappearing. The law of December 19, 1900, gave Algeria a separate civil service and budget, and it reserved for the general government the right to purchase the existing lines, to modify their constitution and to extend them. The recent trip into Algeria of M. Gouthier, Minister of Public Works of the former cabinet, seems to have had for its object a study, on the spot, of these serious questions. On the 30th of May, 1906, a plenary assembly of the financial delegations decided upon the proposition of the government to purchase the East Algerian Railway and have it exploited by the colony.

The Tunisian railroad system, although connected with that of Algeria and forming a part of it, has fewer defects. As in Algeria, the main line in Tunis has a number of important branches. The large military port of Bizerte has been connected with Tunis, 73 miles, and from Tunis itself lines have been built out towards Zaghouan, 53 miles; Hammamet-Sousse-Kairouan, 129 miles, and Moknine, 30 miles from Sousse. All of these lines have been built by the same company, namely that of Bone-Guelma. The branch line from Bizerte, which runs along the coast and connects directly with the Grand Central, is the only one which has a gage of 4 ft. 8½ in.; the others have a gage of 1 ft. 3⅜ in., or one meter.

Further south, Sfax, which, in 1897, was opened as a deep-water port, has been connected with Gafsa and Metlaoui, 151 miles, by the Gafsa Phosphate Company which, in a few months, and without any assistance from the state, has built the whole line; this road will also be of meter gage, and is one of the finest industrial enterprises in the whole regency. Finally, as authorized by the law of April 30, 1902, the Tunis government has borrowed $8,000,000 for the extension of its railroad lines, and is now either building or has in contemplation lines between Bizerte and Nefzas, Tunis-Pont-du-Fahs and Kef, the same point, and Kalaa-es-Senam, in order to reach the rich region of Moktai, Kairouan and Sbiba, and, by a prolongation of the Sousse-Kaironan and the Sousse-Sfax lines, to connect the southern line between Sfax and Gafsa with the Tunisian system. A trunk line, which will be of strategic importance, will also connect the road leading to Nefzas and Bizerte with the trunk line of the Medjerda and Algeria. It is interesting to note that the greater portion of these new Algerian or Tunisian lines owe their existence to the discovery of rich mineral deposits. There is also a striking proof of the development of the extract industry in the Barbary states, which were, up to this time, exclusively agricultural. In Tunis there was the prospect of the mines south of the Sfax-Gafsa lines that were considered before the high plains and plateaux at the center had developed their value to any extent. The Kalaa-es-Senam line was built because they wished to exploit a new phosphate deposit which had been discovered in the Moktan region. The Nefzas line is intended for the transportation of the minerals along that road. This economical transformation of the colonies has its counterpart in the development of the ports; Bougie, and especially Bone, which the fortunes of Algeria and Oran have eclipsed, are now taking on a new lease of life, and the Nefzas mineral resources have given to Bizerte the essential conditions of a prosperous port and an attractive point for a heavy tonnage. The future of Bizerte as a coal depot depends upon this road.—*Moniteur Industriel.*

Twenty-fifth Anniversary of the Abt Rack-Road.

In the early part of August was celebrated the twenty-fifth anniversary of the Abt rack-road system of traction. Twenty-five years ago the Harz mountains were suffering from the lack of railroad facilities to transport to market their store of timber, building stone, lime and ore. The examination of the various economic problems connected with building a railroad into the heart of the mountains was intrusted to Albert Schneider, manager of the Halberstadt-Blankenburg Railroad. After careful examination he recommended building a standard gage, thus providing for free interchange of cars at all junctions. He insisted on the superior advantages of the standard as compared with the narrow gage, subsequent results bearing out the correctness of his position, and proving that in following his recommendation no mistake was made.

The serious problem that confronted Mr. Schneider was to build a standard gage road without too great a length of line. For its solution Mr. Schneider turned to Roman Abt, who had been associated for many years with Riggenbach, the inventor of the ladder rack. To meet the requirements of the Harz railroad, Abt designed the rack-road that bears his name, and a locomotive for combined adhesion and rack traction, a system of construction that has since found application in all parts of the globe.

On Aug. 1, at a reception to Mr. Abt at the home of Privy Councellor Schneider in Harzburg, the latter presented to Mr. Abt, now

President of the Gotthard Railroad, a cup, a beautiful sample of the goldsmith's art, the cover of which bore an image of St. Christopher, thus typifying that Roman Abt had, by his invention, carried him and his project across difficulties to success. Excursions over the road were followed by a banquet at Blankenburg at which the mayor announced that the city authorities had named a street in honor of Roman Abt.

Recent State Railroad Legislation.*

The past year bears many resemblances to the period of the Granger agitation. Railroad legislation by the states, however, has been far more widespread. Not only the states in the central and far West but those in the supposedly more conservative Atlantic seaboard region have taken a large part in passing railroad laws. In their number and in the wide range of subjects with which they deal, if not in their severity, the laws affecting railroads passed at the recent sessions of the state legislatures are entirely unprecedented. It has been calculated that the number of such laws passed within the last year is about three hundred. Ten state legislatures alone at their recent sessions passed 177 different laws affecting railroads.

The legislation deals with almost every department and innumerable details of railroad operation and management; from reduction of passenger fares to dusting of passengers cars; from establishing railroad commissions more powerful than any ever before created to requiring railroads to run only eight-wheel cabooses.

Twenty states have passed laws reducing passenger fares, this last not including Ohio, which reduced passenger fares to two cents a mile in the spring of 1906. Arkansas, Georgia, Illinois, Indiana, Iowa, Michigan, Minnesota, Missouri, Nebraska, Oklahoma, Pennsylvania, Virginia, West Virginia and Wisconsin have fixed passenger rates at two cents a mile, though certain of these have slight exceptions to this requirement, such as providing that small railroads may charge more. The governor of Kansas has recently intimated that he will call a special session of the legislature unless the Railroad Commission acts to secure a two-cent fare. North Carolina has established 2¼ cents a mile as the legal rate on roads 60 miles long or over; Alabama, 2½ cents a mile on roads over 100 miles long. In South Dakota the Railroad Commission has been ordered to make a valuation of the road, and then proceed to establish rates at not over 2½ cents a mile. It is to be observed that such reductions have been made, not on the basis of density of population or of travel, but indiscriminately; in the West and South, as well as in the thickly populated states of the eastern seaboard.

Freight rates have been reduced by the legislatures of Alabama, Michigan, Minnesota, Missouri, Nebraska, Nevada, North Carolina and, through the Railroad Commission, in Georgia, Iowa, Kansas and Texas. Iowa has also made an appropriation for an investigation of freight rates, under which if an interstate rate is lower than an Iowa rate, the latter will be considered prima facie unreasonable—this in face of the generally higher expense of handling local than through traffic.

Next in importance to these rate reductions are the so-called "reciprocal demurrage" laws, which provide that a railroad which does not furnish cars when demanded by a shipper must pay a penalty for each day that the cars are not available. Such laws have been passed in Alabama, Colorado, Indiana, Kansas, Minnesota, Missouri, Oregon, South Dakota, Texas, Vermont and Washington.

Another set of laws which, though often entirely justified, bear heavily on the operating expenses of railroads, are those limiting or regulating the working hours of employees. Such have been passed in Connecticut, Indiana, Kansas, Maryland, Minnesota, Missouri, Montana, Nebraska, New York, North Carolina, South Dakota, Texas and West Virginia. In many cases they will involve rearrangement of the operating divisions, sometimes with consequent changes and abandonment of facilities already in existence.

Laws of the same general class, though usually dictated by the labor unions rather than by necessity, are those fixing the minimum number of men to be employed in a train crew, which has been prescribed by law in Arkansas, Indiana, Kansas, Texas and South Dakota. A set of enactments also tending to raise the cost of railroad operation, are those extending the railroad's liability as an employer for accidents to employees, due to negligence of fellow-employees or in part to contributory negligence by the injured party. The employer's liability has been broadened in Iowa, Kansas, Michigan, Nebraska, Oklahoma, Pennsylvania, South Dakota and Wisconsin. There are also two states, Indiana and Minnesota, in addition to Massachusetts, which has had such a law for about a year, in which the use of the block system is now compulsory on the order of the Railroad Commission.

Many new railroad commissions have been established, most of which are "strong," that is, have the power to make rates. Alabama is to have a commission of three members, elected by popular vote. Colorado's new commission of three members was to have taken office on June 10, but the commissioners have been enjoined from exercising their functions. In Michigan, there are to be three commissioners, instead of one. Montana, Nebraska, Nevada, New Jersey and Pennsylvania have established railroad commissions. The New Jersey and Pennsylvania commissions do not have the rate-making power. In Arkansas and Iowa the powers of the existing commissions have been greatly enlarged. New York leads all the states in the strength of its new commissions. The New York commissions, in fact, mark a distinct step in advance in the regulation of railroad corporations.

These general groups cover the most important of the new railroad measures. Besides, there are a great number of other miscellaneous provisions affecting railroads. Fair distribution of freight cars under heavy penalties; the building of private sidings; the establishment of joint passenger stations at the intersection of two or more lines; the recording and investigation of railroad accidents; payment for confiscation of coal for railroad use; the registration of railroad lobbyists; the use of safety appliances; the placing of telephone pay stations in railroad stations; the improvement of train rules; the blocking of frogs and switches, and the use of electric headlights, are all required by one or more of the new laws. Still others prohibit a railroad from transporting its own products or manufactures except for its own use; require railroads to be fenced on both sides; fix the minimum age of night telegraph operators and towermen; bring express companies and private car lines under the power of the railroad commission; increase (in six states) the taxation of railroads, and require the carrying of passengers on freight trains. In Kansas any railroad officer or employee failing to do this last is liable to imprisonment as well as fine. Vermont has made any train employee found intoxicated liable to imprisonment for one year, besides subjecting a railroad company to $3,000 fine for employing trainmen known to have drinking habits. These are merely instances of the miscellaneous laws on railroad subjects. Some of them are obviously in the direction of a better standard of railroad operations; some of them are meddlesome and unjust.

In spite of the fact that many of the most important of the new laws are and for some time will be under determination by the courts, it is possible in the large to reckon the causes and results of this great anti-railroad legislative sweep. There is no doubt that there was much justification for it. By discriminating contracts, by selfishly influencing legislation, by petty but obnoxious regulations, and by arbitrary exercise of power, the railroads as a class—there were, of course, striking and satisfactory exceptions—laid up for themselves a store of pent-up hostility whose flood-gates have of late been thrown open. This hostility was increased by ignorance of railroad problems.

As with all too long delayed reforms, the pendulum swings too far. There is no doubt that many of the railroad laws recently passed are most unjust. They will hurt the railroads and eventually and in consequence the communities which adopted them. They have already resulted in abandonment of many railroad improvements. It will take time to get rid of the dross in the new legislation—the politics, the demagogery and the injustice; but there should remain from the refining process, the gold—higher standards of railroad operation, a franker relation between railroads and the public, and the elimination of the railroads from politics. Added to this will be the contingent advantages of the wisdom brought by the widespread investigation of rate problems under court direction and the knowledge gained from experiment and experience in railroad regulation.

This is the bright side of the anti-railroad legislation of the past year. Most of it, whether justified or not, is severe in its effect on the net earings of railroads; much of it, unjust; yet as its result there should come a period of fairer dealing and better understanding between the railroads, their patrons and the State.

*From an article in the *Boston Evening Transcript* by Hugh Rankin, Associate Editor of the *Railroad Gazette*.

Foreign Railroad Notes.

The Pilgrims' Railroad to Mecca has now more than 500 miles of track laid. There are 1,000 miles more to build to reach Mecca.

An official investigation of conduct of traffic on the part of the Siberian Railroad east of Lake Baikal, made for the Minister of Railroads, has brought to light an astonishing condition of things. Enormous quantities of freight have been delivered to persons to whom it was not consigned, and in many cases the actual consignees have recovered for the loss of the freight which it was pretended had not arrived. This has been going on since 1904, and the total loss is said to amount to the incredible sum of $5,000,000. The discovery, after all, was made by accident. A policeman fished out of the Angara river a bundle of documents, which turned out to be a report of a previous inspector, which some interested party had stolen, and, as he supposed, made away with.

GENERAL NEWS SECTION

NOTES.

Suit will be begun in the courts by the Green Bay & Western Railway to test the two-cent passenger law passed by the last Wisconsin legislature.

On Sunday, September 29, the number of freight cars passing Lewistown Junction, Pa., on the Middle division of the Pennsylvania Railroad, was 8,630, or nearly 600 cars more than the best previous day's record.

Dwight C. Morgan who, with 20 engineers to assist him, has been engaged for a year and a half in making a valuation of railroads in Minnesota, announces that the results will probably be known within a year.

A member of the State Railroad Commission of Washington is in St. Paul, Minnesota, to arrange for a conference of the commissioners of the states through which run the railroads between St. Paul and the Pacific coast, with a view to considering uniform action on freight rates.

At San Francisco, September 27, the Grand Jury in the Federal court returned indictments against the Southern Pacific Company and the Pacific Mail Steamship Company for violation of the Interstate Commerce law in making discriminatory rates on freight from Asia to Chicago and New York.

Press despatches from Toledo, September 28, report a strike of railroad clerks in that city which is said to have been participated in by about 400 men. The roads named are the Wheeling & Lake Erie, the Toledo, St. Louis & Western, the Ohio Central, the Hocking Valley, the Michigan Central and the Pere Marquette.

The railroads of Nebraska failed in their effort to secure from the Federal court an injunction restraining the officers of the state from enforcing the reductions in rates recently ordered, but the counsel of one of the companies says that the roads will continue their efforts to secure a judicial decision on the validity of the laws.

The New York Central has taken off 10 trains from the Yonkers branch of the Putnam division and has reduced the number of cars in many of the trains which are still running. These trains are run to accommodate the local traffic between Yonkers and New York city, and it is said that this traffic over this line has fallen off.

The Missouri Pacific, answering a suit of the Attorney-General of Missouri, declares that ownership by the company in coal mining companies and an elevator company are necessary to the proper conduct of the business of the road; that is to say, necessary for a regular supply of fuel and for the proper accommodation of grain shippers.

The state railroad commissioners of Massachusetts have called upon the Boston & Albany to report, for the three weeks ending October 19, all passenger train delays of over 10 minutes, except those on runs of less than 25 miles. Business men of Boston and other cities have made many complaints of exasperating delays and long continued annoyances.

The Huntingdon & Broad Top Mountain, which originates a considerable quantity of coal for New England, has notified shippers that it will hereafter charge them $2.50 each on cars going to points on the New York, New Haven & Hartford. This, evidently, is a precautionary measure, to guard against loss by reason of difficulty in collecting car service from the New Haven road, which has withdrawn from the per-diem.

The Illinois Traction System, operating interurban electric roads in Central Illinois, is said to have abolished the use of oil lamps for tail signals on cars, and to have adopted instead electric lights, which are fed through storage batteries, thus insuring the continuity of the lights even if the power current should be cut off. This company has also adopted the use of red flags instead of green for the day-light tail signal.

Governor Comer, of Alabama, has written letters to all the members of the legislature of that state advising them that he is going to call a session about November 2. The Governor's principal object appears to be to secure compliance by the Louisville & Nashville and the Central of Georgia with the rate-laws recently enacted in Alabama, all of the other companies in the state having put the reduced rates in force.

The Duluth, South Shore & Atlantic Railroad hereafter will carry no baggage on passenger trains except travelers' proper belongings in the true sense of the term. Boxes of provisions, bags of potatoes, cans of oil and the like will be carried only by freight. The new order is to prevent the demoralization of the passenger service which has attended the transportation of hunters each fall for many years. With their bulky and awkward baggage it has been impossible to maintain schedule time.

On the Galveston, Harrisburg & San Antonio caution signs have been set up 500 ft. from every curve of 4 deg. or more for the purpose of warning engineers against running through the curve at excessive speed. These signals are set 7 ft. from the rail on the engineer's side, on posts. The blades are fish tailed and are painted yellow, while the supporting posts are painted white on the front, and the sides and back brown. First class trains are to reduce the speed to not more than 30 miles an hour, and all other trains to 18 miles an hour.

On September 25 the Attorney-General of the United States, acting on information gathered by the inspectors of the Interstate Commerce Commission, ordered the prosecution of 37 railroads for 287 violations of the safety appliance law. Besides a number of prominent railroads which have been prosecuted before, there are several small lines in the list, as, for example, the Chesapeake Beach, the Detroit & Toledo Shore Line, the Louisiana Western, the Nevada-California-Oregon, the St. Clair Tunnel Co., and the Williamsport & North Branch.

The steamer "Harvard," of the New York and Boston through line, reached New York on Monday afternoon last nine hours behind time, having been delayed that much in starting from Boston harbor on account of a high wind. According to one statement the wind was blowing 85 miles an hour. Some of the passengers demanded to be taken back to Boston, but the captain said that that could not be done. The steamer arrived in New York at about the time that she should have begun her eastward journey, and the eastward passengers had to wait about three hours before they could start.

The circulating "newspaper library" of the Southern Pacific, established some years ago for the benefit of the track-repair men and their families in the desert regions of Arizona and other parts of the Southwest, now has 200 distributing centers, to which 4,000 newspapers, magazines and books are supplied every week. The packages of papers are thrown off at the section houses, a distinctive whistle signal being given by the engine of the train which brings them. The distribution of the papers to the several families is in most cases managed by a woman, the section master's wife, we suppose.

During the present month the Railway Mail Service Department is to weigh all mails on all routes. Congress having made a special appropriation of $300,000 for this purpose, with a view to securing a more accurate basis of compensation than by the weighing at different times in different parts of the country, as has been the custom. It is also said that the Postmaster-General, supported by the President and the Attorney-General, has decided to count Sundays in the number of days used as a divisor in ascertaining the average weight per day; that is to say, the total quantity carried on a given route during a week of seven days is to be divided by seven to get the daily average, instead of being divided by six, as heretofore.

The new law of the state of New York, limiting the working hours of telegraph operators, went into effect on October 1 (the same date on which a similar law went into effect in several other states). A New York City reporter finds that several of the roads are unprepared to comply with the law, and the reason appears to be that competent telegraph operators are very scarce. Someone on the New York Central estimates that that company will have to increase its force by about 1,000 men. A press despatch from Poughkeepsie says that the New York Central has rescinded its order making a reduction of $2.50 or more a month in the wages of operators whose hours have been reduced from 12 to eight. It is said that 460 operators, presumably those who recently struck and left the service of the Western Union and Postal Telegraph companies, have left New York city to take situations in other places, and that 300 of these are now working for railroads. Forty of the strikers are now employed by wireless companies.

Cost of the Grand Trunk Pacific in Eastern Canada.

At the time the Grand Trunk Pacific Railway project was before Parliament four years ago, it was estimated that the eastern division from Moncton, N. B., west to Winnipeg, Man., 1,800 miles, would cost in the neighborhood of $100,000,000. But with the increased cost of labor and of material of all kinds it is probable that the outlay will be fully 25 per cent. more than was expected. Labor which was then available at $1.50 and $1.75 per day is now $2.25 and $2.50. Ties that were to be had in abundance a year or two

ago at 30 cents each, are now bringing 60 and 75 cents, while in some instances the contractors have been unable to obtain sufficient supplies at any price. Rails are dearer, food is more expensive, everything, in fact, that enters into the execution of this enterprise, is increasing in price.

A considerable part of the eastern division across Northern Ontario is through a region so remote as yet from existing railroads that construction would be very costly. To put parties in the field throughout the whole 1,800 miles from Moncton to Winnipeg would involve much greater outlays than the transcontinental commissioners feel justified in incurring.

The Railroad Regulation Movement.*

As a result of legislation already enacted, railroads are now subject to vastly more regulation and are conducted with far more publicity and are held to a far stricter accountability than any other form of capital or enterprise. There is no serious wrong which a railroad can do that is not susceptible of substantial correction, and generally such correction can be accomplished by public officers without expense to the individual. Therefore it would seem that all that is required is for the public authorities to enforce the numerous laws already in effect. Strange to say, however, the principal talk is about further railroad regulation.

Railroad regulation is the political field most easily cultivated and most fruitful in results to the politician. It is human nature to be distrustful and critical with respect to great wealth, and this distrustful and critical sentiment has generally settled especially on the railroad, for in most communities the railroad is the most tangible and obvious form of accumulated wealth.

But the political advantage of attacking the railroads is a commodity which is consumed in the using. The politician who scores by securing railroad regulation feels that to continue his success he must score again by securing still further railroad regulation. His rivals feel that they must find other ways to score in the same game so as to restore their prestige. Competition is said to be the life of trade, but competition among the politicians is proving almost the death of the railroad trade.

Striking illustration of the political competition in railroad regulation is shown by the unwillingness of Governors and legislators to leave the state commissions the administration of the subjects within the jurisdiction of the commissions. Apparently there is fear lest the commissioners get political credit which others are anxious to appropriate. Thus we find in states where the commissions have ample power to reduce rates and have the machinery for making thorough investigation to ascertain whether rate reductions are proper that the legislators, with the approval of the Governors, rush in to make reductions on their own account and without investigation. Governor Hughes' veto of the 2-cent rate bill in New York was a striking exception—an exception which proves the rule.

Passenger travel is a luxury to a much greater extent than is the transportation of freight. It is absolutely necessary for people to have fuel, and food and clothing, but it is rarely absolutely necessary for people to travel. Therefore, from the public standpoint, passenger rate reduction is even more unimportant than are freight rate reductions. Passenger business is far less profitable to the railroads than is the freight business. Therefore, from the railroad standpoint, passenger rate reduction is much more unjust than freight rate reduction. Yet passenger rate reduction is the form of rate legislation which has proved most popular with legislatures. The only explanation is that a reduction in passenger rates is more obvious to the voter and therefore has more political advantage.

For several years the railroads have been struggling to meet a demand for transportation which has increased far more rapidly than it has been possible to increase facilities. The most earnest and persistent efforts have been made to meet the demand; the difficulties have been enormous. Probably no class of persons in the country has been under such a severe and prolonged physical and mental strain as railroad officers and employees. My experience is that railroad officers have striven more faithfully than any other class in the country to comply with both the spirit and the letter of the laws regulating them.

Yet the railroads have had no credit for their efforts, or for what they have accomplished. The public has been talked into a remarkably hysterical frame of mind. It is generally accepted that the psychology of the crowd is a different thing from the psychology of the individual. If then we look at the public as a separate entity, we have the condition of a very nervous person who is beset by a multitude of physicians, each of whom is suggesting some different form of disease which the person has and some different sort of cure. We know the unfortunate results which always follow in the case of a nervous individual when he comes under the influence of even one physician who is an alarmist. We are beginning now to realize how a similar condition may exist with respect to the public as a whole with reference to the railroads.

Railroad companies, generally speaking, are earning less than a fair return on the value of their property. The Atchison, Topeka & Santa Fe in the year ended June 30, 1907, the most prosperous in its history, earned only 6½ per cent. on its total capitalization. The par value of its capital is not believed by its officers after a careful study of the problem to represent any more than the present value of its property. What other business in its most prosperous year would earn as small a percentage?

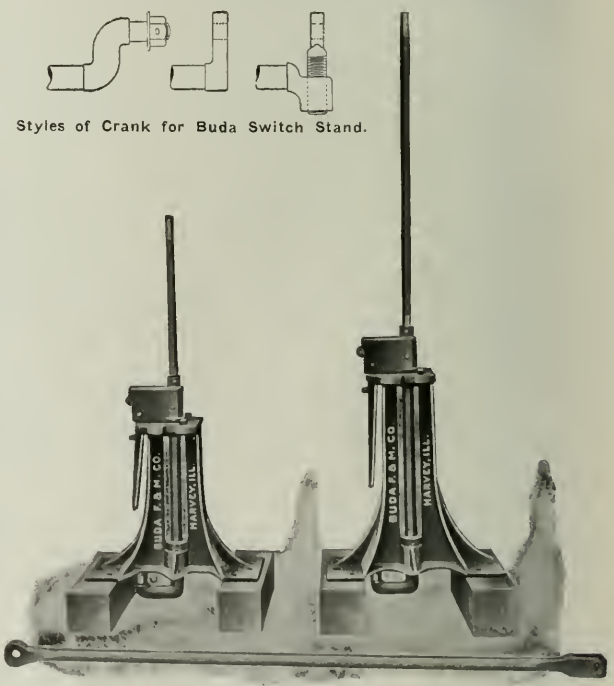
Railroad agitation will never cease as long as the politicians believe it is profitable. It will cease to be profitable when the public fully understands the present conditions and their consequences. We have heard in the past a great deal about undigested securities. We are now suffering from undigested railroad laws. Before passing more laws the Federal Government and the states ought to take time to understand and enforce the laws they have. If they do not, the ingenuity of politicians can forever suggest new laws to pass. In a word, I say to each of you as good citizens and in the public interest fully as much as in the railroad interest, do your best to discourage the professional maker of anti-railroad laws, and do your best to encourage the administrator of the laws already made to study the facts thoroughly and then enforce the laws accordingly. What the public needs is a fair investigation of the facts and intelligent enforcement of the laws already passed.

*Abstract of an address by Walker D. Hines, General Counsel of the Atchison, Topeka & Santa Fe, before the Traffic Club of New York.

A New Form of Switch Stand.

A new high and low form of switch stand has been added to the 50 or more styles which the Buda Foundry & Manufacturing Co., Chicago, makes. This form is built to meet the demand for a

Styles of Crank for Buda Switch Stand.



New Buda Switch Stand.

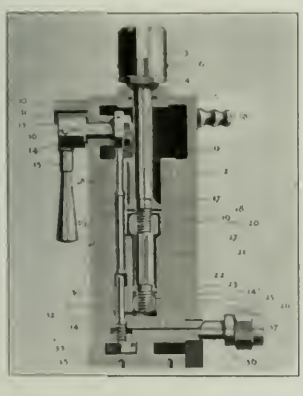
stand combining lightness and strength. The frame, the lever and the housing over the latter are malleable iron. The housing protects the lever against snow and ice, and also makes a convenient place for the switch lock. The mast and crank are wrought steel. The illustration shows the style having the crank of the turned-up toe form, with which it is impossible to remove the switch rod when the stand is locked. The rod can be taken off only when the stand is in an intermediate position. Other designs of cranks are provided, as shown in the small cut. The turned-up or turned-down toe has the switch rod shown with the stands. Where the stand has a horizontal rigid crank, or adjustable crank, as in the other designs, the connecting rod has a jaw at each end. By extending the crank below the base the use of a straight rod is permitted, which is considered an advantage. The stands may be had either two-way or three-way. The frame has no bolts, avoiding the possibility of its being tampered with.

Price's Automatic Stop.

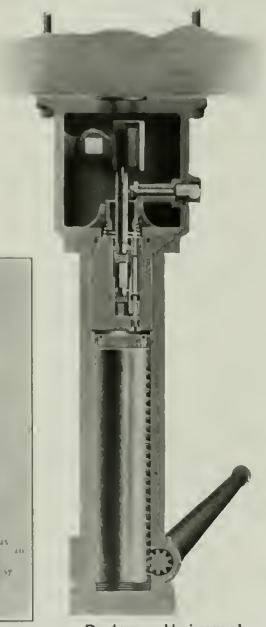
An automatic stop devised by Prof. H. W. Price, of Toronto University, is in experimental use on six miles of the Intercolonial Railway near Moncton, N. B., and two locomotives are equipped with the apparatus. There are no visual signals on this section of the road and the arrangement is essentially an apparatus for applying the air-brake, in case an engine overruns the point where it should stop. When the stop signal operates, it blows a whistle in the cab of the locomotive. The trial equipment is on single track and is controlled automatically, through track circuits, the same as visual automatic block signals.

The New Dudgeon Universal Jack and Hydraulic Pump.

The first hydraulic jack was patented by Richard Dudgeon in 1851. Improved forms were brought out by him in 1873 and 1884, and all of these types are still made. Recently a jack has been designed which embodies a number of new features intended to meet the demand for a compact light-weight jack, easily operated and controlled and combining great power with high speed. It has a double pump, which enables the ram to be run out under a light load with twice the speed of the single pump. Under a heavy load a quarter turn of the valve handle throws out the large pump and gives the action of a single pump jack. The special feature of this jack, however, is the assembling of all the valves in one valve chamber and the reduction of their number from the usual arrangement of three-pressure valves and two suction valves to one pressure valve and two suction valves, of which only one is used at a time.



Dudgeon Universal Force Pump.



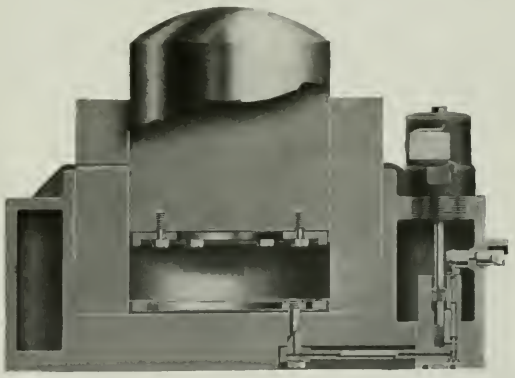
Dudgeon Universal Beam Jack.

The accompanying sectional view of a portable hydraulic force-pump shows all of the essential features which are embodied in the new types of jacks. The arrangement of valves and pumps is very similar, but in the jack the pump and valves are built inside of the movable ram, which is raised by discharging the fluid through the bottom of the ram into the cylinder. In the jacks the valves are controlled by the valve handle on the head by means of a spring-mounted push tube on which the valve cam bears.

As will be seen from the illustration the three valves are mounted in tandem, one over the other, in a single valve case on one side of the pump cylinder. The two top valves are suction valves and are free to move on or off their seats, while the single pressure valve at the bottom is normally closed by a spring. When the valve handle is turned to the left to a horizontal position all three valves are free to seat. This is the position for using both pumps. On the up stroke of the pump the liquid is drawn from the reservoir in the head past the two upper valves and into the upper and lower cylinders through the small ports at the bottom of these cylinders. On the down stroke the upper valve is seated, cutting off the supply reservoir and the liquid displaced by the two pump plungers flows past the two lower valves into the discharge passage. When only one pump is wanted the valve handle is turned vertically downward and the cam on the inner end of the valve handle shaft forces the upper valve off of its seat. The liquid in the upper cylinder churns back and forth past the upper valve, but the middle valve is still operative and prevents the return of the liquid from the small bottom pump. To release the pressure the handle is turned horizontally to the right, causing the cam to force all three valves off of their seats, which allows the liquid to flow back into the reservoir at the top. The reduction in pressure can be graduated to any required degree and can be instantly arrested by returning the valve handle to the vertical position. The pump illustrated weighs only 31 lbs. and is designed for working pressures up to 1,500 lbs. per square inch.

The only differences in the construction of the jacks is the addition of a push tube inside the ram surrounding the piston rod and resting on a stiff spiral spring on top of the cylinder. The top end of this tube bears against the valve handle cam and the lower end bears against the top valve spindle. A pin is also provided on the piston rod head which bears against the top end of the push tube when the pump handle is forced clear down. This allows the jack to be lowered in the usual way by the pump handle without turning the valve handle. The valve chamber, being on one side of the cylinder, is always submerged, and the jack can be used in a horizontal position with a full run-out equally as well as in a vertical position. The valves are easily removed by taking out the ram and unscrewing the bonnet under the pressure valve. If for any reason one or more of the valves should stick or obstructions lodge on the seats, they can be forced off by the valve handle and the pump operated by a few quick strokes. The liquid churning through the valves would then remove any obstruction or dirt on the seat.

Two special types of jacks made with this construction are also shown in the illustrations. One is a 500-ton ram and force-pump combined which was made for lowering to its seat a 500-ft. truss bridge which was floated into position. The other is a new type for straightening shafts or for use where a downward movement of the ram is required. The pump is mounted in the barrel between the ram and the reservoir and the ram is returned by a rack and pinion arrangement at the lower end of the casing. The reservoir flange is provided with bolt holes for attaching the jack to the bottom of the beam, as shown. A large number of other special types of jacks are made on this principle. Richard Dudgeon, 24 Columbia street, New York City, is the maker.



500-Ton Hydraulic Ram and Dudgeon Universal Force Pump Combined.

Freight Car Situation in the Northwest.

The following notes on the railroad situation in the Northwest are published in the newspapers as the conclusions of Interstate Commerce Commissioner F. K. Lane:

(1) The railroads have added to their equipment as many cars and engines as could be expected of them during the past year, and with few exceptions their equipment facilities are adequate, or would be if eastern roads would make reasonable prompt returns.

(2) In this respect the railroads of the Northwest have done better than those of most other sections. Great Northern has in the past 18 months increased its equipment facilities, for illustration, more than any other railroad with 6,000 miles of road, with the exception of Pennsylvania.

(3) The acute car congestion last winter was due to causes other than equipment supply to a much greater extent than is generally supposed.

(4) Last winter was the worst climatically within the memory of living operating officials. No precaution against such conditions is adequate.

(5) Traffic congestion has already begun and is now acute in Montana and on the coast.

(6) Congestion throughout the Northwest may be as severe as

a year ago for short periods, but the general situation will be better for the following reasons:

(a) Presumably a normal winter, or at least a less severe winter than last.

(b) More equipment and power and other facilities, including spurs, double track in spots, sidings, etc.

(c) The benefit of extraordinary efforts a year ago to meet an extraordinary situation, shippers as well as carriers having learned new tricks.

(d) Less traffic, the grain crop being smaller and many large industries curtailing output, to say nothing of the postponement of new enterprises.

(7) High prices for grain will cause a larger early rush of grain traffic than last fall, though somewhat later in starting, the crop season being late. This will support the volume of general traffic to the country until the first of the year, the purchasing power of farmers being fully equal to that of a year ago.

(8) A sharp decline in tonnage is expected early in the new year.

(9) There is danger of another fuel famine, but not as distressing as that of last winter.

(10) Lumber traffic on the coast is congested because it has outgrown the facilities of the Hill and Harriman lines and the mills cannot create an ingoing traffic in proportion to their output.

(11) Completion of the St. Paul's Pacific extension will afford only slight and temporary relief to the growing traffic of the Western country. All transcontinental lines will have to be double-tracked before very long.

(12) As an offset to the more favorable operating prospects than those of last year there are reciprocal demurrage and other restrictive provisions imposed on the railroads which will tend to aggravate a car congestion.

(13) The situation has been complicated by the unrest and inefficiency of labor and the exorbitant and sometimes unreasonable demands it makes on the railroads.

The territory which raised the most wheat last year is prairie country where snow storms and blizzards are most embarrassing to the railroads. The most prolific sections this season are in the valleys and on timbered areas where a rough winter does the least harm.

Adams Express Company Officers.

George F. Baker, President of the First National Bank of New York, has been elected a member of the board of managers of the Adams Express Company, succeeding Caleb S. Spencer, of Boston. The Board of Trustees, provided for in a recent vote by the shareholders, has been organized as follows: L. C. Weir, B. W. Rowe, Charles Steele, Dumont Clarke and G. F. Baker. William M. Barrett has been appointed Vice-President in charge of the Pennsylvania, New England and New York departments. Edward A. Taft has been appointed General Manager of the New England department, Henry E. Huff General Manager of the Pennsylvania department, G. D. Curtis General Manager of the Western department, and Joseph Zimmerman General Manager of the New York department, including the bureau of traffic and the bureau of tariffs.

Disastrous Collision Near Bellaire, Ohio.

In a butting collision between a passenger train and a freight on the Baltimore & Ohio at Shicks, Ohio, near Bellaire Junction, on September 28, seven passengers and two trainmen were killed and 15 persons were injured. The cause of the accident is given in the newspapers as the misplacement of a switch by an operator in a signal tower.

The Railroad Department of McGill University.

The department of railroads of McGill University, Montreal, is to broaden its work this year. V. I. Smart, who has been Signal Engineer and Assistant Engineer of Maintenance of Way of the Chicago & Eastern Illinois, is to have charge of the department of railroad engineering, including the theory and practice of location and construction, maintenance and operation. Signaling, a new course of instruction, is also to be established under Mr. Smart. The railroad department is to have a laboratory of its own in its new building. Clarence Morgan, formerly Treasurer of the Rutland Railroad, is the head of the department.

"Pay-as-You-Enter" Street Cars for Chicago.

The Chicago City Railway Company is having built, and expects to receive during October and November, 300 cars which will be arranged for testing the "pay-as-you-enter" feature, which originated, and is in general use, in Montreal. Should the results with these 300 cars justify the adoption of the scheme, the remainder of the company's standard equipment, comprising about 500 double-truck cars, will be adapted to this feature. This will require only lengthening the platforms and rearranging the doors. The entrance portion of the rear platform will accommodate 20 passengers, and it is hoped that this will be ample to avoid delay, even at busy corners. Overcrowding of cars is to be prevented by the conductor, who from his post on the rear platform will notify intending passengers to take the next car, when his is fully loaded.

TRADE CATALOGUES.

Signal Lamps and Lanterns.—Catalogue No. 120 of The Adams & Westlake Co., Chicago, presents recognized standards for signal lamps and lanterns made by this company. The large number of special styles also made, which meet the demand for patterns other than standard, are omitted from the catalogue. Beginning with an illustrated description of the "Adlake" non-sweating balanced-draft, the book covers the various kinds of lamps for steam and electric railroad use, telegraph train-order signals, lanterns, miscellaneous lamps, lamp parts and switch and signal box locks. All colored signals, lenses, etc., are printed in their appropriate colors. There is an appendix containing the signal rules of the Standard Code. The book is 6 x 9, bound in cloth, and has 200 pages.

Paint.—The National Paint Works, owned by Elliot & Cheesman, Williamsport, Pa., has published the seventh edition of "The Review of Technical Paints for Metal," by F. P. Cheesman. The pamphlet takes up various paint troubles and tells how to avoid them. It describes different kinds of paint and their advantages and disadvantages, and then discusses coating for reinforced concrete and cement and the methods of painting bridges, elevated railroad structures, power plants, steel cars, etc. Different paints made by the National Paint Works are then described in detail and instances given of the structures on which they have been used.

Ore Handling Cranes.—The Brown Hoisting Machinery Company, Cleveland, Ohio, has just issued a pamphlet on locomotive grab-bucket cranes for handling ore, coal, etc. The standard bucket supplied has a rated capacity of 24 cu. ft. of ore. The pamphlet is illustrated with scale drawings of the crane mounted on two bogie trucks and on a four-wheel rigid truck, and with half-tones of the crane in operation under various conditions showing its flexibility.

Metallic Packing.—The H. W. Johns-Manville Company, New York, is distributing a pamphlet describing Morris metallic packing, for which the company has exclusive selling rights. It is made by the Morris Metallic Packing Company, Philadelphia, Pa. The pamphlet shows different varieties of it as applied to valve stems, reciprocating rods and very large rods; also for high-pressure marine service.

Chicago, Burlington & Quincy.—The passenger department of this company is distributing picture postal cards showing beautiful views along the Mississippi river.

MANUFACTURING AND BUSINESS.

E. W. Buechling has been appointed to the new office of Assistant Manager of Sales of the Pittsburgh Automatic Vise & Tool Co., Pittsburgh, Pa.

The Consolidated Mining & Steel Company will, it is said, spend about $700,000 putting up a large iron and steel plant near Guernsey, Wyo. F. O. Olsen, Pittsburgh, Pa., is interested.

Cars began running September 28 on the electric street railway system of St. Petersburg, installed by the Russian subsidiary company of the Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa.

Lee Holliday has been appointed Signal Engineer and Agent of the Union Switch & Signal Co., Swissvale, Pa., and will have charge of the Southwestern district, with headquarters at St. Louis, Mo., succeeding F. G. Ashton, resigned.

J. W. Lawler, formerly Superintendent of the foundry department of the Madison Car Works, has been appointed Superintendent of the iron and foundry department of the St. Charles plant of the American Car & Foundry Company, New York.

The United States Steel Corporation has bought, probably through the American Steel & Wire Co., the National Steel & Wire Co., of New Haven, Conn., which was recently sold for $650,000 in bankruptcy proceedings. The National Steel & Wire Co. has two large plants and is capitalized at $5,000,000.

The McKenzie, Holland & Westinghouse Power Signal Company, Limited, has been incorporated in England by Westinghouse interests and owners of certain British signal patents. Half the stock is held by the Westinghouse Brake Company, Limited, of London.

The new company will build a plant adjoining the Westinghouse Brake Company's shops at King's Cross, London.

J. E. Ham, formerly with the Hazard Manufacturing Co., Wilkesbarre, Pa., has been appointed representative of the Waterbury Company, New York, for the introduction of its higher grades of insulated wires and cables. Mr. Ham's office will be at the Waterbury Company's branch office, 108 La Salle street, Chicago, Ill.

The Betts Machine Co., Wilmington, Del., makers of heavy machine tools, are still busy with ordered work although there is a falling off in railroad inquiries. The following are among recent shipments: One 84-in. tire mill, with universal chuck table, to the Richmond Works of the American Locomotive Co., one 8-ft. boring and turning mill to the Great Northern, at Devil's Lake, Minn., one 8-ft. boring and turning mill to the Georgia Railroad at Atlanta, Ga.; one 52-in. car wheel borer, motor-driven, to the Mississippi Central at Hattiesburg, Miss.; one 15-in. slotter, motor-driven, to the Davenport Locomotive Works, Davenport, Iowa; four 15-in. slotters to the Rendville, Mass., shops of the New York, New Haven & Hartford, one 6-ft. boring and turning mill to the Chicago, Milwaukee & St. Paul at Dubuque, Iowa; one motor-driven No. 2 horizontal boring machine to the Brooklyn Heights Railroad, Brooklyn, N. Y.; one 8-ft. boring mill, one No. 2 horizontal boring machine and one 84-in. planer, all motor-driven, to the Southern Railway at Knoxville, Tenn., and six motor-driven 66-in. tire mills to the Schoen Steel Wheel Co., McKee's Rocks, Pa.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

American Society of Civil Engineers.

At the meeting of this society, October 2, two papers were presented, one on Reinforced Concrete Towers by D. W. Krellwitz, and one by C. W. Smith on Reinforced Concrete Pipes for Carrying Water Under Pressure. Both of these papers were printed in the August proceedings.

American Railway Association.

Announcement is made that the fall meeting of this association will be held at the Waldorf-Astoria, New York city, on Wednesday, October 30, 1907. It was originally intended to hold the fall meeting at Norfolk, Va., on Oct. 23, but on account of the important nature of the business to be considered and the fact that a larger attendance can be secured at New York than at Norfolk, the President of the association, with the unanimous approval of the Executive Committee, at the request of a large number of members, has decided to call the meeting as above noted at New York city on Oct. 30.

American Society of Mechanical Engineers.

At a meeting of this society to be held in the Engineering Societies Building, New York, October 8, the subject will be "Industrial Education." College technical courses and student apprenticeship courses will be discussed at length. A paper by Prof. John Price Johnson on the "College Technical Courses and Apprenticeship Courses" offered by manufacturing establishments will be read. An address will also be delivered by Dr. Henry S. Pritchett, President of the Carnegie Foundation, and one by Prof. Dugald C. Jackson, of the Massachusetts Institute of Technology, and President of the Society for the Promotion of Engineering Education.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Boston & Albany.—A. H. Smith, Vice-President and General Manager of the New York Central & Hudson River, has been elected also Vice-President and General Manager of the Boston & Albany. Edgar Van Etten, Vice-President of the New York Central & Hudson River and of the Boston & Albany, heretofore in charge of the Boston & Albany, remains at Boston as Vice-President but no longer has charge of the operating department. He will perform such duties as may be assigned to him by the President and Senior Vice-President of the New York Central & Hudson River. J. H. Hustis, General Superintendent of the Western district of the New York Central & Hudson River, has been appointed Assistant General Manager, with headquarters at Boston. See Boston & Albany under Engineering and Rolling Stock Officers.

Chicago & Alton.—Edwin Hawley has been elected Vice-President; T. H. Hubbard, Vice-President of the Toledo, St. Louis & Western, has been elected Chairman of the Board of the Chicago & Alton. T. P. Shonts, President of the T., St. L. & W., has been elected Chairman of the Executive Committee of the C. & A. J. S. Mackie, Secretary of the Colorado & Southern, has been elected Secretary and Assistant Treasurer of the C. & A. and F. H. Davis, Treasurer of the Minneapolis & St. Louis, has been elected Treasurer of the C. & A.

Colorado Southern, New Orleans & Pacific.—See Eunice, Lafayette & Abbeville.

Delaware & Hudson.—W. H. Williams, Assistant to the President, has been elected Third Vice-President.

Eunice, Lafayette & Abbeville.—George A. Clark, formerly Vice-President and General Manager of the Colorado Southern, New Orleans & Pacific, has been elected Vice-President and General Manager of the Eunice, Lafayette & Abbeville, which is about to be built.

Houston & Brazos Valley.—C. H. Brightwell has been appointed Auditor, with office at Velasco, Tex., succeeding P. F. Combs, resigned.

New York Central & Hudson River.—See Boston & Albany.

Orange & Northwestern.—J. J. McEwen, Jr., has been appointed Auditor, succeeding T. C. McCampbell, resigned. J. O. Sims, Jr., has been appointed Treasurer, succeeding W. W. Reid, resigned.

St. Louis, Rocky Mountain & Pacific.—A. W. Newman has been appointed Assistant Secretary.

Toledo Railway & Terminal.—Leslie Reddish, assistant chief clerk to the General Manager, has been appointed Car Accountant, succeeding Albert Beck, resigned to go into other business.

Tonopah & Tidewater.—The general offices have been moved from Oakland, Cal., to Los Angeles.

Operating Officers.

Alabama Great Southern.—See Cincinnati, New Orleans & Texas Pacific.

Boston & Albany.—See Boston & Albany under Executive, Financial & Legal Officers.

Chicago, Rock Island & Pacific.—R. C. St. John, Trainmaster of the Pine Bluff district of the Arkansas division of the St. Louis, Iron Mountain & Southern, has been appointed Trainmaster of the Memphis district of the Arkansas division of the Chicago, Rock Island & Pacific.

Cincinnati, New Orleans & Texas Pacific.—W. S. Andrews, Assistant to the General Manager, has been appointed General Superintendent of Transportation of this road and of the Alabama Great Southern, with office at Cincinnati, Ohio.

Erie.—T. J. English, Superintendent at Youngstown, Ohio, has been appointed Assistant to the General Manager. F. J. Moser, Superintendent at Huntington, Ind., succeeds Mr. English. E. C. Allen, Assistant Superintendent at Galion, Ohio, succeeds Mr. Moser.

J. H. Klein, Trainmaster at Huntington, Ind., has been appointed Trainmaster of the Chicago division, succeeding H. D. McClelland, transferred. D. I. Jones, chief despatcher, succeeds Mr. Klein.

Grand Trunk.—D. Cromble has been appointed Assistant to the General Transportation Manager, with office at Montreal, Que., succeeding A. A. Tisdale, resigned to go to another company. M. S. Blaiklock, Superintendent of the Eastern division, has been appointed Engineer of Maintenance of Way, with office at Montreal. H. E. Whittenberger, Superintendent of the Kansas City Southern at Pittsburgh, Kan., succeeds Mr. Blaiklock, with office at Montreal.

Kansas City Southern.—See Grand Trunk.

New York Central & Hudson River.—The office of J. P. Bradfield, Assistant General Manager, has been transferred from New York to Buffalo. L. H. Van Allen, Superintendent of the Buffalo division, has been appointed General Superintendent of the Western district, succeeding J. H. Hustis, promoted. S. R. Payne, Superintendent at Rochester, N. Y., succeeds Mr. Van Allen. T. W. Evans, Assistant Superintendent at Jersey Shore, Pa., succeeds Mr. Payne. See Boston & Albany under Executive, Financial and Legal Officers.

St. Louis, Iron Mountain & Southern.—See Chicago, Rock Island & Pacific.

Southern.—W. M. Deuel, Superintendent at Rock Hill, S. C., has been appointed Superintendent of Terminals at Atlanta, Ga. E. M. Newell, Superintendent of the Mooresville division, succeeds Mr. Deuel, and the Mooresville division is merged with the Winston-Salem division. F. P. Pelter, Superintendent of the Chattanooga division, has been appointed Superintendent of the Nashville division, and the Chattanooga division is merged with the Atlanta and Knoxville divisions.

Traffic Officers.

Chicago, Burlington & Quincy.—A. C. Maxwell, chief clerk to the General Freight Agent of the Lines West of Missouri River, has been appointed General Agent at Keokuk, Iowa, succeeding J. H. Jarnett, who takes Mr. Maxwell's former position.

Grand Trunk.—See Grand Trunk Pacific.

Grand Trunk Pacific.—John W. Loud, Freight Traffic Manager of the Grand Trunk, has been appointed also Freight Traffic Manager of the Grand Trunk Pacific.

Mexican Central.—The office of Passenger Traffic Manager formerly held by W. D. Murdock, who resigned because of ill health, has been abolished and the duties of that office will hereafter be performed by the General Passenger Agent.

Tonopah & Tidewater.—George I. Hughes has been appointed General Eastern Agent at New York. F. M. Jenifer has been appointed General Agent at Goldfield, Nev.

Engineering and Rolling Stock Officers.

Ann Arbor.—See Detroit, Toledo & Ironton.

Baltimore & Ohio.—L. E. Haislip, Assistant Division Engineer of the Pittsburgh division, has been appointed Assistant Engineer of the Wheeling division, succeeding J. J. Smiley, resigned. T. H. Brown succeeds Mr. Haislip.

Bangor & Aroostook.—O. Stewart, Superintendent of Motive Power and Equipment, has retired after 60 years of railroad service. H. Montgomery, Assistant Superintendent of Motive Power and Equipment, succeeds Mr. Stewart, with office at Milo Junction, Me., and his former position has been abolished.

Boston & Albany.—R. D. Smith, Mechanical Expert of the Lake Shore & Michigan Southern, has been appointed Assistant Superintendent of Motive Power of the Boston & Albany, with office at Albany, N. Y., in charge of Boston & Albany matters and such other duties as may be assigned to him.

Chicago, Rock Island & Pacific.—E. E. Chrysler, general foreman at Chickasha, Ind. T., has been appointed Master Mechanic at that place.

Detroit, Toledo & Ironton.—W. G. Wallace, Superintendent of Motive Power of this road and of the Ann Arbor, has resigned.

Erie.—E. I. Dodd, Mechanical Engineer of the Pullman Company, has been appointed Assistant Mechanical Superintendent of the Erie, with office at Meadville, Pa.

Florida East Coast.—O. M. Carter, formerly Captain in the engineer corps of the United States Army, has been appointed Consulting Engineer of the Florida East Coast in connection with the extension across the Florida keys.

Grand Trunk.—See this company under Operating Officers.

Hocking Valley.—W. L. Mattoon, Division Engineer of the Zanesville & Western and of the Corning division of the Toledo & Ohio Central, has been appointed Principal Assistant Engineer of the Hocking Valley and the Zanesville & Western, with office at Columbus, Ohio, succeeding Parker S. Cott, resigned to go to the Sunday Creek Coal Company at Athens, Ohio. D. C. Holtzbery, Division Engineer of the Eastern division of the Toledo & Ohio Central, succeeds Mr. Mattoon, with office at Columbus, Ohio. P. R. Black succeeds Mr. Holtzbery, with office at Bucyrus, Ohio.

Lake Shore & Michigan Southern.—See Boston & Albany.

Seaboard Air Line.—J. J. Hanline has been appointed Master Mechanic at Atlanta, Ga., succeeding A. J. Poole, promoted.

Toledo & Ohio Central.—See Hocking Valley.

Zanesville & Western.—See Hocking Valley.

Purchasing Agents.

Michigan Central.—See New York Central & Hudson River.

New York Central & Hudson River.—S. B. Wight, Purchasing Agent of the Michigan Central, has been appointed Purchasing Agent of the New York Central & Hudson River, succeeding Dexter Fairchild, resigned.

LOCOMOTIVE BUILDING.

The Texas Railroad Commission has notified the railroads of that state that they must get additional locomotives.

The Fo-Kien Railway, China, has ordered two six-wheel tank locomotives from the American Locomotive Company.

The Mexican Sugar Refining Company, El Potrero, Vera Cruz, is said to have ordered three locomotives from the H. K. Porter Company.

The Harriman Lines, as reported in the *Railroad Gazette* of September 20, have ordered 30 mogul locomotives, 10 Atlantic locomotives, 43 consolidation locomotives, 24 ten-wheel locomotives and 18 six-wheel switching locomotives from the American Locomotive Company.

CAR BUILDING.

The National of Mexico, it is said, is contemplating buying some all-steel postal cars.

The Mexican Central, it is said, is thinking of buying some all-steel passenger coaches.

The Philadelphia Rapid Transit, it is said, will order 200 Montreal type street cars within a few weeks.

The Texas Railroad Commission has notified the railroads of that state that they must increase their rolling stock.

The Chicago, Rock Island & Pacific has ordered one compound steam motor car from the American Locomotive Company.

The Southern denies having ordered 500 freight cars from the American Car & Foundry Company, as reported in the *Railroad Gazette* of September 27.

The Las Vegas & Tonopah has ordered four cabooses from the Pullman Co., for February, 1908, delivery. These cabooses are in accordance with the San Pedro, Los Angeles & Salt Lake standard.

The New Orleans Great Northern has ordered from the Western Steel Car & Foundry Co. 200 steel underframe composite gondola cars of 80,000 lbs. capacity, 200 steel underframe flat cars of 80,000 lbs. capacity, 300 all-wood box cars of 60,000 lbs. capacity and 65 all-wood stock cars of 60,000 lbs. capacity.

RAILROAD STRUCTURES.

Brandon, Man.—The Canadian Pacific and the city officials have agreed to jointly build a bridge at First street. The question is yet to be decided whether it will be a steel or reinforced concrete structure.

Cheyenne, Wyo.—Local reports say that the Union Pacific will put up a new roundhouse to cost $40,000 and a coal chute to cost $50,000.

Greencastle, Pa.—The Cumberland Valley, it is said, will put up a passenger station here.

Mobridge, S. Dak.—The Chicago, Milwaukee & St. Paul has about finished the pier work on the bridge here. The force is to be transferred to Chamberlain, where a steel bridge is to be built.

Naco, Mex.—Colonel Epes Randolph, of the Southern Pacific, is quoted as saying that the shops of the Cananea, Yaqui River & Pacific at this place will be finished and equipped as originally planned, and that the report that these improvements are to be abandoned is without foundation.

New Orleans, La.—The Texas & Pacific, it is said, is planning to spend a large amount of money improving its terminals and putting up a new passenger station here.

New York, N. Y.—The Interborough Rapid Transit Company, it is said, has filed plans for enlarging the car inspection station and storage house at Seventh avenue and 148th street. A brick addition 60.3 ft. x 96 ft. with a steel frame and steel roller doors is to be added.

North Battleford, Sask.—A contract is reported let to Newman & Co., of Regina, at $100,000 for the superstructure of the bridge to be built over the Saskatchewan river here.

San Angelo, Tex.—The Orient Construction Company is to build a steel bridge 150 ft. long over Jackson creek.

Toledo, Ohio.—The new two-story steel and brick in-bound freight house, 50 ft. x 600 ft., being built for the Lake Shore & Michigan Southern, was to be opened for business October 1st, and the out-bound freight house is expected to be finished about the first of next year.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Alabama Western.—See Illinois Central.

Arkansas, Louisiana & Gulf.—An officer writes that contracts have been let to the Southern Development Co. and work is under way on this proposed line from Monroe, La., northeast to Bastrop, thence north via Rolfe Junction, Ark., to Hamburg, 57 miles, with a branch from Rolfe Junction west to Crossett, five miles. The work is easy; no cuts will exceed 20 ft. in depth and no fills will be more than 25 ft. high. The maximum grade is ½ per cent. compensated for curvature, and maximum curvature is 3 deg. The work

includes a steel bridge and an aggregate of about one mile of pile bent trestles at various points, ranging in length from 28 ft. to 600 ft. About 20 miles of grade work is finished and several of the pile trestles are in place. Track laying to begin October 1. William A. Otis, President; J. M. Parker, General Manager, and E. T. Hood, Chief Engineer, Monroe, La.

Atchison, Topeka & Santa Fe.—Final surveys are reported made for building a line to Burro mountain, N. Mex. The line is to be built from near Silver City and will branch into two divisions at the Mangus divide near Oak Grove Hill, one branch going to Tyrone and the other following the divide via the Comanche, Klondike and Copper Gulf camps to Leopold.

Bloomington Southern.—See Illinois Central.

Canadian Northern.—President William Mackenzie is quoted as saying that this company will build a line this year from Saskatoon, Sask., southwest 30 miles; also that the final plans for the joint terminals to be built at Winnipeg by this company and the Grand Trunk Pacific at an estimated cost of $3,000,000 have been approved.

Cananea, Yaqui River & Pacific.—See Southern Pacific.

Chicago & Milwaukee (Electric).—Announcement is made that this road will be opened for through traffic to Milwaukee by the middle of November.

Chicago Southern.—Track laying is reported finished on this road, which is to run from Chicago Heights, Ill., where connection is to be made with the Chicago Terminal Transfer, south 114 miles to the Indiana state line, at which point connection is to be made with the Southern Indiana, which runs to Terre Haute. (July 12, p. 53.)

Colorado Roads.—A company has recently been formed in Denver to build a tunnel about five miles long through James Park. It is said that when the work is finished the tunnel is to be leased to the Denver, Northwestern & Pacific. The incorporators include T. F. Walsh and C. B. Kountze, of the Colorado National Bank; D. Sullivan, of the Denver National Bank; D. H. Moffat, W. G. Evans, J. W. Springer and others.

Cumberland Valley.—A two-mile connecting line being built jointly by this company and the Philadelphia & Reading at Shippensburg, Pa., is nearing completion. Grading has been finished. This line will be used for exchange of freight.

The belt freight line of this company around Greencastle, Pa., will shortly be put in service.

Denver, Northwestern & Pacific.—See Colorado Roads.

Dillsburg & Wellsville.—Incorporated in Pennsylvania with a capital of $75,000 to build a line from a connection with the Dillsburg & Mechanicsburg branch of the Cumberland Valley at Dillsburg, Pa., southeast to Wellsville, 7½ miles. It has not been decided whether the line shall be operated by steam or electricity. The directors are: A. C. Hetrick, President, Wellsville; R. J. Belt, J. Milligan, W. D. Brougher, I. J. Selple, J. N. Logan, E. W. Shapley, D. W. Beltzel and S. G. Bushey.

Due West Railway.—An officer writes that this company, which is building a line from Donalds, S. C., on the Southern, south to Due West, 4½ miles, has grading finished and the ties laid. (June 7, p. 819.)

Gauley & Birch River.—Incorporated in West Virginia with $300,000 capital to build a line from the mouth of Muddlety Creek in Nicholas county, north via Hookersville to a point near the mouth of Big Birch river in Braxton county, 25 miles. The names of the incorporators are not given. The office of the company is to be at Summerville.

Great Northern.—President L. W. Hill, of this company, is quoted as saying that a good deal of old extension work is nearing completion, the most important being the cut-off between Great Falls, Mont., and a connection with the Chicago, Burlington & Quincy at Billings. Grading on this line is to be finished this year and it is expected to be in operation early next year.

Grand Trunk Pacific.—The Grand Trunk Pacific Construction Company, which has the contract for building 150 miles of this line east of Abitibi river, Que., has sublet some of the work to the J. H. Reynolds Construction Company. Work is to be started on this section early in the spring.

Treat & Johnson, of Winnipeg, who have the contract for building 51 miles of line for this company between Winnipeg, Man., and Portage La Prairie, will sublet some of the work. (June 28, p. 949.)

Gulf, Colorado & Santa Fe.—Surveys are reported being made by this company for a line from Timpson, Tex., east to Center, 18 miles.

Illinois Central.—The report of this company for the year ended June 30, 1907, shows that work has been continued on the Memphis & State line, which is to be a double-track railroad from Woodstock, Tenn., to East Junction, about 15.84 miles, to relieve the congestion of traffic in Memphis by sending freight trains around that city.

The line to Birmingham, Ala., will be ready for use Nov. 1. Trackage rights will be used over the Mobile & Ohio from a point near Jackson, Tenn., to Corinth, Miss., 55 miles, and over the Northern Alabama from Haleyville, Ala., to Jasper, 49 miles, over the Kansas City, Memphis & Birmingham, 41 miles from Jasper to Birmingham. The connecting links built were from a point south of Jackson, east to a connection with the Mobile & Ohio, three miles, and from Corinth, Miss., southeast to Haleyville, Ala., 80.23 miles. The line in Mississippi is being built under the name of the Mississippi & Alabama, 42.41 miles, and that in Alabama under the name of the Alabama Western, 37.82 miles.

The Bloomington Southern has built a line from the connection of the Indianapolis Southern near Bloomington, Ind., to stone quarries, 2.13 miles. This was put in operation in June.

Under the name of the Memphis Railroad & Terminal Company, a company was organized in Tennessee to build a union passenger station in the city of Memphis. The estimated cost of this work is about $3,000,000, and is to be divided between the ten lines entering Memphis.

Indianapolis & Northwestern Traction.—General Manager C. C. Reynolds is reported to have said that this line is to be extended from Crawfordsville, Ind., west to Danville, Ill., 45 miles, to a connection with the McKinley syndicate lines.

Interborough Rapid Transit.—The New York City Board of Estimate and Apportionment has appropriated $850,000 to lay additional subway tracks north from 96th street and Broadway. The plans call for one new track on the east side from 96th street to 102d street, and two on the west side from 96th street to 101st street. The improvements are being made to obviate the necessity for the express trains to cross the local tracks.

Lorain & Ashland.—This company, which last year built a line from Lorain, Ohio, south to Wellington, 22 miles, has rights of way for an extension from Wellington south to Loudonville, on the Pennsylvania Lines West, 39 miles. Recent reports say that the line is to be extended south to the Ohio river probably at Gallipolis, 90 miles south of Wellington, and from this point a line is eventually to be built either by this company or by the Virginian Railway southeast to the northern terminus of that line at Deepwater, W. Va., about 75 miles. There would then be a through line from the lakes to the Atlantic seacoast at Norfolk, Va. (July 5, p. 27.)

Memphis & State Line.—See Illinois Central.

Memphis Railroad & Terminal.—See Illinois Central.

Mexican Roads.—Arrangements are reported made for building a line from Balsas, Guerrero, on the Mexican Central, west to the Port of Zihuatanejos on the Pacific coast, about 125 miles. Henry I. Willey, a mining engineer of Mexico City, is promoting the project. It is said that the Rothschild interests have bought a large tract of land adjacent to the port of Zihuatanejos and are back of this project.

Mississippi & Alabama.—See Illinois Central.

Missouri Southern.—This company has under consideration the question of building a branch from Boyd, Mo., or Tip Top southwest to Van Buren, 10 miles, and eventually further south and west of that place.

Mount Vernon & Eastern.—Incorporated in New York with $1,000,000 capital to build a line from Mount Vernon, N. Y., northeast to Lewisboro, near the Connecticut state line, about 35 miles. The directors include: Oakleigh Thorne, C. Bruce, H. K. Woods and others interested in the New York, Westchester & Boston.

New York Subways.—Bids were recently opened by Bridge Commissioner Stevenson for supplying and installing the electrical equipment of the tracks to extend from the Manhattan terminal over the Williamsburg bridge. The bids were: F. E. Gore, of Gore & Hoey, $343,000; Daniel Moran and the Snare & Trieste Company, joint $396,000. The work is to be finished by January 1.

New York, Westchester & Boston.—See Mount Vernon & Eastern.

New Orleans Great Northern.—This company, it is said, is now operating the extension of its main line north of Angie, La., to Columbia Junction, Miss., 20 miles.

Northern of Maine.—This company has been incorporated with a capital of $500,000 to build a line from the terminus of the Bangor & Aroostook at Fort Kent west to a point opposite the mouth of the St. Francis river; also to build from Fort Kent northeast through Frenchville, Madawaska and Grand Isle to Van Buren, 45 miles, connecting at that point with the Bangor & Aroostook. (March 15, p. 388.)

Northwestern Pacific.—See Southern Pacific.

Oklahoma City Railway (Electric).—Incorporated in Oklahoma to build electric line from Guthrie, Okla., south to Norman and Yukon; also a line from Spencer or Choctaw City west via Oklahoma City to Yukon, a total of about 150 miles. Directors include: A. H. Classen, H. M. Brauer, E. H. Cooke and J. M. Owen, all of Oklahoma City. The company already has a line in operation from Oklahoma City to Britton, which is being extended to Guthrie.

Oregon Railroad & Navigation.—See Oregon Short Line.

Oregon Short Line.—Work is reported under way on a line from Huntington, Ore., at the junction of the Oregon Railroad & Navigation Co.'s line, north along the Oregon-Idaho state line following the Snake river to Lewiston, Idaho, on the Washington state line. At this point connection is to be made with the Oregon, Washington & Idaho, which is building a line west to Texas Ferry, Wash., opposite Riparia, on the O. R. R. & N. Such a line would give the Union Pacific an almost level grade all the way, with two or three exceptions, from Granger, Wyo., to Portland, Ore. The present line of the O. R. R. & N. from Huntington west to the Columbia river grades.

Pennsylvania.—The work which this company has been carrying out on the Pittsburgh division for the new main line between Southwest Junction, Pa., a mile east of Greensburg, east to Beatty, about seven miles, has been finished. The new line, which is known as the Donohue cut-off, has four tracks in place of the two tracks on the old line. From George to Beatty, about five miles, the line is almost straight. On this section a 1,200-ft. tunnel was eliminated, six 4-deg. curves being replaced by two 1-deg. curves, grades reduced and several grade crossings are now carried overhead.

Along the Susquehanna river, from Benton Station, Pa., to Safe Harbor, more than 13 miles, the Columbia & Port Deposit tracks have been elevated at a cost of $1,250,000. This work was done to escape floods when the dam across the river at McCall's Ferry is finished, which will raise the level of the water 60 ft. At the site of the dam the new tracks are 25 ft. above the old roadbed, but the maximum grade northbound is only three-tenths of 1 per cent., with a temporary run down grade of one-half of 1 per cent. at Benton.

Peoples' Railway & Construction Company.—It is reported that Megargle & Co., of New York, will build part of the proposed line from Tyler, Tex., northwest to Canton, about 40 miles, the work to be finished within 18 months. (Sept. 20, p. 340.)

Philadelphia & Reading.—An officer writes that a temporary freight yard is being put in at 19th and Indiana streets, Philadelphia, preliminary to the main work of track elevation.

See Cumberland Valley.

Richmond & Tottenville (Electric).—A company is being formed under this name in New York to build an electric line to connect Richmond, S. I., with Rossville, Kreischersville and Tottenville, about 10 miles. The proposed line is to be laid with 90-lb. rails and will cost about $100,000. T. B. McGovern, 25 Broad street, and C. G. Kolff, 50 Broadway, New York, are said to be interested.

Rio Grande, Sierra Madre & Pacific.—President H. R. Nickerson, of this company, is quoted as saying that extension work on this road will be started as soon as the rainy season is over. The plans call for a line from Nueva Casas Grandes, Chihuahua, southwest via Santa Elena and Ocampo, to a point on the Pacific coast either at Guaymus or at Topolobampo, 300 miles. (July 19, p. 82.)

Shelby County (Electric).—This company, it is said, is building an electric line from Shelbina, Mo., to Salt river, five miles, to which point grading has been finished and track laying is soon to begin. The line is eventually to be extended north via Shelbyville to Bethel, 18 miles. J. D. Dale, of Shelbyville, and other residents of that place are interested in the project.

Southern Pacific.—Contracts are reported recently let for building a section of the Northwestern Pacific projected from Willits, Cal., north to Eureka, 290 miles. The line, which is being built jointly by the Atchison, Topeka & Santa Fe and the Southern Pacific, is finished from Eureka south to Pepper, 50 miles. (March 15, p. 392.)

It is said that the Cananea, Yaqui River & Pacific is making surveys for a branch from Cananea, Sonora, northwest to Nogales, on the Sonora division, about 80 miles.

Southwestern Interurban of Mangum.—Incorporated in Oklahoma with $1,000,000 capital to build lines from Mangum via Francis to Hollis, 37 miles; from Mangum to Granite and Coldell, 40 miles, with a branch from Granite to Hobart, 15 miles, and from Mangum to Altus, 27 miles. The incorporators include: W. T. Funderburk, E. E. Pinkerton, D. J. Doyle, H. M. Ferguson, T. P. Clay and R. C. Echols, all of Mangum.

Union Pacific.—Double-track work now under way on this road, and which it is expected will be finished about the first of the year, will give this company a double-track line from Omaha west to Watson's ranch, three miles west of Kearney and 196 miles from Omaha. (June 7, p. 819.)

See Oregon Short Line.

Virginian Railway.—See Lorain & Ashland.

Winnebago Traction Company.—This company, operating 40 miles of electric lines in Wisconsin from Oshkosh north to Neenah and from Oshkosh west to Omro, which was recently placed in the hands of a receiver, is to be reorganized, and improvements to cost about $300,000 will be carried out. Of this, $200,000 is to be used in building an extension from Omro southwest to Berlin, 12 miles.

Waco, Hamilton & Brownwood.—Surveys are being made by this company for its proposed line from Waco, Tex., west to Brownwood, about 120 miles. (July 19, p. 84.)

RAILROAD CORPORATION NEWS.

Boston & Maine.—At the annual meeting on October 9 the stockholders are to be asked to approve an issue of $6,000,000 bonds to take up floating debt. It is understood that part of the new issue will be used to refund the $4,000,000 6 per cent. one-year notes recently sold.

Chicago & Alton.—See Toledo, St. Louis & Western.

Erie.—Gross earnings for the year ended June 30, 1907, were $53,914,827, an increase of $3,912,193; net earnings, $15,747,788, an increase of $1,617,991. The largest proportionate increase in earnings was from coal traffic. The increase in the cost of maintenance of equipment was rather less, proportionately, than in maintenance of way and conducting transportation. Taxes increased about 40 per cent., mostly on property in New Jersey.

The New York Public Service Commission, Second district, has been holding hearings on the application of the Erie to issue dividend warrants. The issue is being opposed on the ground that it would amount to the railroad's borrowing money from the stockholders without their consent. (Aug. 30, p. 248.)

Metropolitan Street Railway.—Adrian H. Joline and Douglas Robinson, Receivers of the New York City Railway, have been appointed also Receivers of the Metropolitan Street Railway. Minority stockholders of the last named company have formed a protective committee.

Minneapolis, St. Paul & Sault Ste. Marie.—The directors have decided to immediately offer $1,400,000 preferred stock and $2,800,000 common stock at par to present stockholders. One share of new preferred stock and two shares of new common stock are to be issued for every 15 shares of either class of old stock already held. (Sept. 20, p. 340.)

National of Mexico.—Speyer & Company, New York, are offering, at a price to yield 7¼ per cent., the unsold balance of the $10,000,000, 1½-year, 5 per cent. notes maturing April 1, 1909. About $7,000,000 of the notes have already been sold. These notes took the place of the notes originally maturing on October 1, 1907, which were extended for a year and a half. (September 13, page 308.)

New York City Railway.—H. H. Vreeland, President of this company, has been appointed General Manager for the Receivers.

New York, New Haven & Hartford.—The annual report for the year ended June 30, 1907, shows gross earnings of $55,601,936 against $52,984,322 in 1906. Operating expenses were $37,850,081, as compared with $35,222,586 for the previous year, and net earnings were $17,751,854 against $17,761,735. Net earnings of the company's street railroads this year were $3,615,899; from steamship lines $635,127, and income from other sources $2,077,874, making the total income for this year $24,080,755. Deductions from income this year were $15,187,714, as compared with $9,752,115 last year, and net income this year applicable to dividends $8,893,041, as compared with $10,185,377 last year.

Toledo Railway & Terminal.—A verdict for $1,865,021 against this company has been given to the Commonwealth Trust Company, St. Louis, Mo. This sum is the difference between the principal and interest due on the bonds held by the trust company and the $2,000,000 realized from the foreclosure sale.

Toledo, St. Louis & Western.—The directors have ratified the arrangement by which the company gets control of the Chicago & Alton.

Canadian Pacific.—The stockholders have authorized the issue of $8,000,000 additional 4 per cent. debenture stock, of which $101,519,411 is now outstanding. The new stock is to pay for new steamships and several recent extensions and additions. The stockholders are later to be asked to authorize the issue of the remaining capital stock, about $28,000,000 common and $32,000,000 preferred.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 870 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

CONTENTS

VOL. XLIII., No. 15. FRIDAY, OCTOBER 11, 1907.

The electrification of part of the Rochester division of the Erie, which is described in detail elsewhere in this issue, is in some respects more interesting than some of the larger electrification schemes which have received so much attention recently because the road is typical of 75 per cent. of the railroad mileage in the United States. It is single track road running through an agricultural country with a large city at one end and a few small towns along its route. The steam passenger service before electrification consisted of three trains each way a day between Mt. Morris and Avon, and six trains each way been Avon and Rochester. There were only four stops for trains between Avon and Rochester, 19 miles, and five between Avon and Mt. Morris, 16 miles. The electric trains have 28 stops, 22 being flag stations. There are now eight trains each way a day between Mt. Morris and Rochester, and three additional trains each way between Mt. Morris and Avon, connecting with through steam trains to and from Rochester. The all-important question "Does it pay?" is best answered by the following statement of passenger revenue between Rochester and Mt. Morris for the two months of July and August in 1906 before electrification and in 1907 after electric operation was begun on June 27:

Month.	1907.	1906.	Increase. Per cent.
July	$14,175.72	$10,735.20	34
August	15,317.00	11,461.68	34

In these red-lettered times curious are some of the anomalies that arise in the relations of the railroads to civics and politics. In Massachusetts one of the two great parties has just split in twain ostensibly, at least, over the question of the merger of the Boston & Maine system, and has furnished the first instance of a great party schism on such an issue in the nation's annals. Or traveling westward in the trail of Dean Berkeley's star of empire one finds the fledgeling state of Oklahoma and her new constitution. Oklahoma is in that condition of newness, when, if the historical precedent of the other far western states were worth anything, she should be craving railroads and trolleys at any price and leaving corporation baiting to a future when there would be more corporations to be baited. But under the force of the pervasive epidemic she puts two cent passenger fares into her organic law, provides an elective commission and gives it power to regulate public service charges. Yet she veers also toward virtue by adopting a constitution that prohibits stock watering. Here again, by contrast with another commonwealth we find a paradox. Oklahoma, youngest of the states, sets her cherubic face sternly against corporate hydraulics. But how many weeks have passed since the legislature of Connecticut, after two centuries and three-quarters as colony and state and in late years a sufferer from trolley overcapitalization, overruled some 20 vetoes of her Governor aimed at precisely that evil? The new and the old state have each ratified policies exactly the reverse of what would be inferred from civic experience, railroad history and antecedent conditions. Verily when our times are written up by the men of a new era they will find some things that turn logic upside down and make shriek theories of human motive and conduct.

"Alarm and resentment" are felt among trainmen in Canada because, it is said, the Government is too active in prosecuting conductors and enginemen on criminal charges in connection with collisions; and deputations of trainmen from a half dozen prominent cities have been to the Attorney-General with a protest. The plea of the protestants is that the men who have been brought before the courts are not criminals but have only committed errors of judgment. The action of the Government is said to be producing a general "feeling of nervousness." The Attorney-General is quoted as saying that the statutes will or should be changed so that some of the weight of the law will fall on men "higher up." Everyone must sympathize with these nervous trainmen, for it is true that in most cases "error of judgment" is a correct description of offenses of the kind referred to. But these errors produce such terrible results that society has defined them as crimes. This is a crude way of curing the evils aimed at but it is the best that the legislatures have yet discovered. To get an idea of the attitude of people generally on this subject, let any trainman imagine his own wife or mother killed in a collision in Europe or Mexico caused by the "error of judgment" of some trainman. As long as the right or trial by jury remains, however, we cannot believe that any trainman will be punished very severely in America for errors of judgment; for it is always easy to show that other persons, either fellow employees or men "higher up," contributed to the mistake. Juries are disinclined to punish one man when others equally guilty cannot be reached. Unfortunately, too, a good many errors amount to gross negligence, for which the dullest man has no excuse, howsoever strong may be the charge against the superintendent or the fellow employee. But, while the trainman usually can make but a poor show of being oppressed, society on the other hand may well ask whether such a situation as that in Canada does not evidence a deplorable inefficiency in the law. Errors of judgment are not cured or prevented by criminal laws. Gross negligence is not usually punished, even if a clear case is proved. Producing a state of nervous-

ness does little if any good, and it may do much harm, for trainmen need to be calm. The only rational way to make conductors, enginemen and others adequately careful is to apply the slow, detailed methods of good discipline and instruction which educate men to carefulness. Abundant experience has shown the futility of everything else. Canada will do well to turn attention to the officers, as distinguished from employees, if it can thereby make progress in the discipline and training of men; but it is not likely to find a criminal statute an effective means to this end.

Equipment depreciation and renewal is the subject of a careful study of practical equipment accounting by William Mahl, head of the accounting departments of the Union Pacific System and the Southern Pacific Company, which is printed on another page. It is a particularly important subject at this time, when the Interstate Commerce Commission has under consideration the final rules to be adopted for maintenance of equipment accounts. Mr. Mahl speaks out of an experience unusual in length and opportunities for studying accounting problems at first hand. His argument is based on the uniform practice of the Southern Pacific Company since 1890. As against any theoretical system of depreciation he puts himself on record as follows from his 17 years' experience in direct management of equipment maintenance and renewals:

"There has been a fairly approximate average annual charge for equipment vacated per locomotive or per car in service. This charge fixes a unit by which an estimate may be formed of the extent to which a railroad company is making good the depreciation of its equipment. There will be as much difference among the railroads in this charge for depreciation as there is now in the average cost per annum for maintenance of way and structures per mile of road, or for the average cost of repairs per locomotive or per car per annum—in fact, in any cost of operation, and rightly so, because the conditions are not alike on any two properties.

"Appreciating all the difficulties and cost which the keeping of the equipment accounts as contemplated by the commission will impose upon the railroads without any practical compensation therefor, it is to be hoped that the commission will amend its rules by omitting altogether the provision for "Depreciation," and amend the provisions for "Renewal" to represent the current cost of replacing all equipment vacated. This change will furnish the commission with reliable data about the depreciation which has been carried into the operating expenses of the railroads and enable it to order adjustments suitable to each case if any should be necessary."

Mr. Mahl believes that all practical purposes which the Commission has in separating the equipment account into three divisions, "repairs," "renewals" and "depreciation," can be accomplished by employing the two divisions "repairs" and "renewals" as has been done by the Southern Pacific Company for many years. By this system the current cost of replacing the particular type of locomotive or car vacated, less the scrap value, is charged to operating expenses, and this same amount, together with the cash received as the scrap value, credited to a replacement fund, which is used to pay for new equipment of whatever capacity and design bought. In this way the integrity of the capital account "equipment" is maintained, while the actual depreciation during the year is made good from the year's income. The cost of new equipment beyond the amount to the credit of the replacement fund is, of course, charged to capital account. This method is based upon the value rather than the number of the equipment which as the dollar is the general unit of railroad accounting is the more accurate method. Mr. Mahl believes that under this system equipment is adequately maintained over a series of years with the greatest simplicity in accounting methods. The Commission's purpose in planning its new rules is admittedly to find out whether each railroad is under-, over- or exactly maintaining its equipment, facts which obviously cannot be determined from the information which has been furnished by many railroad companies in the past. Yet, if all railroads made as careful returns on this subject of equipment maintenance as do the Southern Pacific and the Union Pacific, would it not be possible for the Commission to arrive at this same information as accurately as by requiring the additional division of "depreciation" in the equipment account, particularly as the percentage of the original cost of equipment which should be set aside as depreciation is as yet entirely undetermined?

FREIGHT CLAIMS.

The suggestion recently made in these columns that the freight agent at every large station should be competent to handle damage claims as skilfully as the general claim agent himself (or, what is just as good, should have a clerk experienced in that work) is being carried out on one large western road, and we are informed that the good results of the change are already manifest. In some cases there is a marked improvement in celerity as well as in the quality of the work done, for most agents are overworked and they sometimes leave claims correspondence unattended to for days.

From this time forward the settlement of freight claims is also likely to be bettered materially, so far as interline claims are concerned, by the time-limit rule lately adopted by the Freight Claim Association. This went into effect September 1. It provides that:

"Settling carrier shall investigate claim to establish validity and apportion liability.

"Inquiry may be addressed direct to agent of interested carrier whenever practicable, and to the freight claim officer only after failure to obtain information from agent, or when necessary from nature of inquiry.

"When agent of another carrier fails to answer within 20 days from date of inquiry, copy of inquiry, with request for reply, shall be sent by express, postal mail, or messenger, to freight claim officer of delinquent carrier. When answer is not received within 30 days to such request or to a direct inquiry to freight claim officer regarding a paid claim, paying carrier may, provided liability is not in its opinion located, charge full amount of claim to delinquent carrier, or if there are two or more delinquent carriers, then to delinquent carrier nearest paying carrier in direction of destination, and shall forward all papers relating to the claim to such delinquent carrier, who shall take the place of settling carrier, and make further investigation and distribution of amount of the claim."

We understand that the majority of the member roads have accepted this rule. It will be observed that the maximum time a claimant must now wait to get his money is 50 days, or, adding the time used up in "lost motion," say two months. This is much better than the indefinite delays, months long, to which he has been compelled to submit heretofore. This should be a welcome improvement to claimants, and help greatly in promoting the friendly feeling for which the conscientious claim agent strives.

In discussing, on August 9, this matter of using all legitimate means to secure and retain the friendliness of patrons, it was suggested that small claims which appeared to be valid, or that were presented by reputable people, be paid at once, without subjecting them to the delay incident to an investigation. In commenting on this point in a later issue, Mr. Calkins, Freight Claim Agent of the New York Central, suggested the possibility of a violation of the interstate commerce laws in following such a practice. That, it seems to us, can easily be avoided. In fact some roads already follow such a policy. They get around the difficulty mentioned by inserting a proviso that should the amount, upon investigation, prove incorrect, adjustment will be made by payment of the difference by the party benefiting in the first instance. We understand that, as a rule, claimants willingly repay the excess where investigation shows they have received too much, thus manifesting their appreciation of the practice. It would be legal, we should think, to insert in bills of lading a clause reserving the right to disregard exact equity in settling small claims. There would be no violation of substantial equity—or at least none worse than occurs unavoidably in hundreds of freight transactions every day—and the law should approve what equity approves.

Aside from the effect which a policy of promptness has in making friends for the road, it has another important advantage in lightening the burden on the claim office machinery by reducing the number of claims awaiting settlement. For example, one Chicago road of about 9,000 miles usually has in its claim offices in course of settlement about 10,000 claims, and every day 700 to 750 new ones are filed. To lighten this load would tend to lubricate the whole clerical machinery of the freight department.

The number of small claims is greater now, proportionately, than ever before. For this several causes are responsible. One is the new severity of the interstate commerce law. Under the old conditions the enjoyment of rebates and other special privileges caused the favored shipper to overlook small losses and damages in many instances; or, more properly, not to regard them as losses. But the abolition of these pleasant conditions, in conjunction with the present agitation and general feeling against railroads has changed this attitude, and shippers and consignees now find causes for filing claims which formerly they failed to notice at all. As a further result of these conditions, bureaus and agents making a business of soliciting doubtful claims for collection have become much more active. They even take up claims long outlawed by the statute of limitations. A further factor is the latter-day practice of large industrial concerns having traffic officers, who give special and constant attention to the matter of freight claims. All this, of course, necessitates largely increased forces in the claim offices and elsewhere, and greater expense to the roads.

The longer a claim is delayed in settlement the more inertia it seems to accumulate and the greater its effect in clogging the office machinery; so that whatever may be the reasons why claims are numerous the only sure way for the claim agent to keep them out of his dreams at night is to take care that they do not remain on

his hands over night, out of hand, out of mind. In thus striving to promote his own peace of mind, he is taking the best means of promoting the interest of his employer.

PENALTY IN CORPORATE MISDOING

The unprecedented condition of the affairs of corporations which has come to pass during the last twelve month, attended by a shrinkage of some $3,000,000,000 in gross market values of securities, especially of railroads in this country alone, has naturally given rise to many theories of causation. Some point to the world-wide character of the symptoms. But in that larger analysis they only deepen a problem which is perplexing the best statists of Europe. Limiting the case to an overland one finds three theories foremost. One is the excess of business over capital. Another is the interference of federal and state authority with forms of active capital, notably that form invested in railroads, and a third is the abuse in the employment of capital. The more rational view of the situation undoubtedly includes all the last three causes annexing the fourth, or world cause, as an outside influence, though one not to be ignored in times when great trading nations are closely tied in fiscal bonds. But with the latter cause, when it comes to remedial theories, we have not much to do, at least not through the agency of federal or state lawmaking save as affected by the customs tariff and questions of reciprocity.

In the search for remedies the question of penalty for corporate misdoing is becoming one of growing prominence and of not decreasing difficulty. The difficulty rests on a double base: First, there is the complexity of the statutes themselves and the mazy procedure of courts which ill-define responsibility and befog the application of the penalties. But the worst obstacle is what one may call the unjust incidence of the penalty. A railroad corporation violates a federal law relating to discrimination in rates and is fined heavily. Upon whom does the penalty fall? Upon the managers? Not at all, save as it may operate as a moral and deterring force. Does it fall upon the corporation? Only as an intermediary organism. In its final and practical incidence the penalty descends upon a body of stockholders scattered, unorganized, unresponsible for the penalized act and innocent as unborn babes. In the domain of nebulous and impossible statistics it would be interesting if we had returns that would show how much of the recent shrinkage of $3,000,000,000 in securities had fallen upon the directly and indirectly guilty, how much upon the guiltless and guileless. We do not know; but that the innocents carry all but a small fraction of the loss is a statement that stands with its own saying.

For some of the railroads technically at fault there must also be offered a minor plea in abatement. Let us illustrate by a familiar and general fact that involves a principle. In this country there are a considerable number of believers in the extreme doctrine of free trade. They hold all protective tariffs in the nature of a governmental crime invading the natural rights of the individual. But, bitterly as they may hate protection, they do not advocate any sudden dash into free trade. They have seen the federal government in partnership with a system which, unjust as they believe it to be, has fostered industries which have a right not to be ruined by a catastrophic and abrupt change of tariff policy; and, it may be added, the government would be seriously and justly blamed were it to adopt any such radical change. But in its attitude, action and policy toward railroad corporations has not the federal executive and legislative branches adopted just such a sudden and calamitous shift? By their lethargy, their lax enforcement of existing law, their executive and statutory lapses did they not stimulate the very misdoing which they now, in a sudden revergence of virtue, seek to undo; and were railroad corporations and managers, finding the federal authority thus in a kind of tacit partnership with an evil, so much to blame as if the same authority had been consistently assertive? To state legislation and its enforcement the same illustration applies. Not until many moons after the fact did even law-abiding Massachusetts invoke its own laws on the subject of street railway consolidation; other states are still sleeping on their statutes; while many other commonwealths have just wakened too suddenly, revived dormant laws and passed others too severe, which, in the main, fling upon the far away and innocent stockholder the burden of any corporate misdoing.

All this is now in the past tense, except as it may modify penalty for earlier guilt. The real question, in the case of corporate violation of law, is the fixing of penalty hereafter to fit both the crime and the criminal. The strong tendency of opinion to-day is obviously in favor of the personal instead of the corporate penalty; the reaching down of punishment through the person to the corporation, but so as to apply the corrective without punishing the stockholder, and, in the case of distributive responsibility for offence, the rigid application of the legal maxim that he who commits crime through others is a criminal himself. Yet even here one finds another of those resistants which technical law—to the confusion of laymen—seems perpetually opposing to practical justice. How long is it since the federal government itself and its executive head, so hot foot now after corporate evils, urged successfully in a rebate case that the prosecution—and, of course, any consequential penalty—must lie against the railroad corporation and not against its manager who happened in the meantime to have become a cabinet officer? That matter of individual responsibility must be clarified in the courts before the theory of personal penalty can be established and applied. But in that direction it now seems as though public opinion, later to be crystallized in law, were slowly outworking. It will almost certainly be the alternative remedy if the penalty, laid on the corporation, proves inadequate as a check.

It will, of course, be urged—in fact, if we are not mistaken, has been urged by President Roosevelt himself—that the suffering of the stockholder when his corporation is punished is a natural and inevitable incident like the hardship of a blameless family when the father is convicted of crime. But in public aspects the cases vary widely. In the one case the penalty visits the real offender, in the other not only non-offenders in the corporation penalized, but of other corporations that are innocent. It is the difference between a limited and specific application of law to an individual crime with immediate civic benefit and the penalizing of a vast group of law-abiding citizens with immediate financial—and public—injury. The immediate injury may, of course, in the end be beneficent as a cure of corporation ills. But the policy is a painful one shot through with the ills of the blameless investor and reaching such a dimension of fiscal calamity that the remedy, even if effective in the end, begins to seem worse than the disease. It rests with our lawmakers and our juriscults of the higher type to discover the way in which corporate misdoing may be penalized without a fine of $3,000,000,000 on the nation and without the visitation of the sins of the guilty few upon the heads of the guiltless many.

New York, New Haven & Hartford.

The New York, New Haven & Hartford Railroad property has, in its swift evolution during the last three or four years, become perhaps the most interesting of the railroad systems of the land. Its earlier traditions of arch conservatism have been supplanted by a policy of bold advance. It occupies a peculiar situation territorially and in its industrial environment. It is positive, not to say assertive, in its relations with the other great roads. It has branched out greatly in its marine business and stands as a pioneer and leader in taking and operating street railway lines on a great scale. Its swift pace, fiscal and physical, however varies one obstacle in any analysis of its annual report. So fast is it making history that annual returns three months old so antedate later facts of importance as to have a savor of the antique. One hardly catches sight of President Mellen's observation car before it has disappeared in the distance. But by joining his annual report with the events of the months next following the fiscal year one can get an impressive view of a picturesque railroad landscape whether seen in detail or entirety.

The very first entry of the report, "earnings from passenger department $26,758,929," has its pith of meaning. Early in the year 1906 Mr. Mellen announced a progressive reduction of passenger rates to two cents a mile on his system. The new rate was to begin on some of its branches in western Connecticut, work eastward and finally take in the whole system, the through New York-Boston rate reduction coming last and beginning with November of 1906. The regular fiscal year ending with June 30, 1907, covers seven months during which this reduction has applied to the New Haven's full mileage (2,006), and for five months, averaged, has applied to the major part of it. The official forecast, based merely on the passenger business of the fiscal year 1905-6, showed a loss, as now recalled, of some $700,000. Instead of such a loss passenger earnings have risen $1,506,805, or from $25,252,124 to $26,758,929—and this with an additional track mileage of less than four miles and upon a system where the use of mileage books at the two cent rate had been exceptionally large. Even allowing for normal increase of regular passenger business and somewhat for development of excursion traffic, the results of the reduced rate as applied to a system with dense passenger travel is extremely vivid and striking. It seems singular that President Mellen has not emphasized this matter in his report until one remembers that there are some re-

versed interests as regards the two cent rate in his own board of directors.

Taking up first the operating results of the steam system alone there is to be noticed the persistency with which passenger receipts jostle those from freight, a feature which demarcates the New Haven among the larger railroad systems of the country. The passenger department brought in $26,758,929 as stated; the freight department $28,386,704. The difference between the two was $1,627,775. In the previous year the difference was $1,994,994. The natural volume of the New Haven's huge passenger business between New York and Boston and reaching laterally the living centers of population in southern New England thus begins again to expand and tend toward overreaching new traffic on freight lines of the system like the Highland division and the increased through freight business. In a remote way it goes to justify the phrase of an old-fashioned New Haven director years ago who extolled the passenger business as "freight which handled itself" as contrasted with the freight which had to be handled. The net earnings from operation of the steam road, $17,751,854, tally very strikingly with the $17,761,735 of the year before. Here the New Haven feels the now trite railroad story of increased cost in operation, of labor and materials and, in its case, as a debtor road in car demurrage, there is to be added the higher per diem charge. Actual operating expenses increased from $35,222,586 to $37,850,081. While gross earnings increased about 5 per cent., operating expense ran up to an increment of about 7 per cent., though the rise in operating ratio from 66.477 per cent. to 68.073 per cent. is not so impressive in those figures. For reasons to be stated later this ratio of operating experse is a matter to be watched closely. This year the net earnings from operation only of street railways ($3,615,899), obviously considerably offset in the interest account, and earnings of the steamship lines together with minor income carry total income to $24,080,755, which fixed charges reduce to $8,893,041 net. Crediting the company with dividends on stock owned by subsidiary companies the surplus over dividends is $1,988,053 compared with $3,718,285 the year previous.

Looking closer into the dividend payments it will be seen that the fiscal year's last quarterly dividend of 2 per cent. was paid on $121,878,100 of capital stock, of which $24,797,700 is held in the treasury of subordinate companies of which the New Haven owns all the stock. It seems to be practically the same as regular treasury stock. But if all this stock is issued, the net income of the main company from all sources of $8,893,041 lacks $957,207 of meeting the then dividend requirement. This minor text brings to the foreground the whole subject of the maintenance of future dividends which in some quarters, spite of Mr. Mellen's repeated denials, has been questioned and which, in connection with the coming issue of new stock to the potential amount of about 354,600 shares, has served to depress the market value of the outstanding shares. Such an issue, if made in full and in the hands of the public, would add nominally $2,836,800 more to the dividend requirement.

But just here come a long series of very important offsets. The company, by its figures in the report, holds 109,948 shares of Boston & Maine stock for which its own shares to an equal number were issued in exchange. The number of Boston & Maine holdings since the end of the last fiscal year has probably been somewhat increased. But taking them as they stand in the report the treasury stock looks very much like a block to be used chiefly in the final liquidation of the Boston & Maine merger, at least as a matter of present or past intention. But whether that particular group of shares is used in the merger or not, that merger by exchange means an addition of $1 per share instead of $8 to the dividend requirement, and would add to it but about $190,000 instead of $1,520,000, reducing the dividend requirement by the difference, or $1,330,000. This would leave a balance over dividends of about $373,000 on outstanding capital of $121,878,100 and reduce to say $2,500,000 the increased requirement when all the forthcoming stock is issued, which will not be until July 1, 1909. In time alone the company since the close of the last fiscal year will thus have had two years in which to fill that fiscal gap.

But there are yet other factors more concrete than mere time. It is true that the fixed charges of the company, especially those represented by leases and interest, have very greatly increased. Those two items for the last fiscal year show an increase of $4,396,203, which at 4½ per cent. capitalizes into a principal of about $98,000,000. At the special stockholders meeting May 31st of the present year, only a month before the close of the fiscal period, President Mellen stated that the amount of money spent by the company during his administration of about 3½ years amounted to about $157,000,000. Probably about $10,000,000 have been added since. Of this about $100,000,000 have gone into securities of other companies; about $40,000,000 into new equipment, real estate, additional tracks and the electric plant on the lower New York division; and the remainder of about $27,000,000 has been spent in positive physical improvements, advances to leased lines, the insurance fund and other forms of capitalization. As to the investments in securities of other companies President Mellen stated officially some months since that $97,750,000 were paying the interest on their cost—in other words one financial hand was washing the other. As illustrations may be taken the Ontario & Western investment of $13,105,185, costing about $45 a share and returning $1.50 per share; the original investment of some $10,000,000 in the New Haven city street railway system returning $400,000 a year, more than covering $350,000 a year of interest on the debenture purchase bonds; and many purchases of the shares of dividend paying subsidiary roads. Of the remainder investment of say $67,000,000, some of it denotes forthcoming profit and some does not; but much the larger fraction falls into the former category, notably the new trackage above New York, betterment of roadbed, removal of "funnels" like that at New Haven, and the new bridges, all carrying out the Mellen Northern Pacific policy of increased train-load and soon to be available after tying up much capital for several years. To the same class of agencies for future business belongs the purchase of new rolling stock, now coming in rapidly and which includes some 17,000 cars and 137 locomotives, all of the up-to-date standard—additions which have a direct bearing hereafter on a solution of the acute car demurrage controversy.

An impressive example of the tied up capital of the company soon to be released and give returns appears in the Central New England account which is published in the report. In the year 1905, before the New Haven secured control of the line its gross earnings were $979,439. In 1906 under New Haven control the earnings had risen to $1,679,449, and the last report now shows their increase of $2,153,366. To the operating expenses of the Central New England ($2,584,413) are charged the high cost of the repair of the Poughkeepsie bridge resulting in a balance deficit over all of $380,499. The early completion of work on the bridge—costing in all $1,500,000—must shift this deficit into a handsome surplus on a property out of whose total securities of $11,630,500—bought at a very low price—the New Haven owns $9,280,623. Indeed the coming prosperity of the line is such that the New Haven faces a somewhat irksome problem in settling with the minority holders before the regular policy of consolidation can be applied to the property.

To meet, then, an increased dividend requirement rising progressively up to the mid-year of 1909 to about $2,500,000, the New Haven should have (1) increased net revenue due to higher train load and diminished ratio of operating expense, and (2) largely increased income from investments non-productive heretofore and immediately to become productive. Besides fresh operating efficiencies such sources of added income as the Central New England, the coast line traffic, increase of business of the electrics, New York terminal electrification and new trackage may be cited as well as the closer welding of the whole system into an operating unity. The adverse factors of the future in the situation are three. One is prospective expenditure for improvements of the Boston & Maine when taken in. A second is the minor one of the Morse steamship rivalry; and a third, of much more importance, is recession of "prosperity" which would quickly affect the industrial conditions of New England. This last is the only real cloud athwart the New Haven's horizon otherwise all but clear. If the business for which the New Haven has been for years preparing does not come the general "recession" will find the New Haven, along with the other railroads of the country, with a good deal of "hay out," to use the rural term. But it will be in a better position to face the emergency than most of the great railroad systems. And the company has never been in a position calling for very serious enforcement of economies, a fact which suggests larger latitude for that purpose, albeit the economies might have to be brought out through some labor troubles.

The situation summarized shows the New Haven in the position of the farmer whose fields are just ripening for the harvest after his capital has been put into the planting and culture. That the necessity will arise of reducing dividends, allowing for every possible adversity, seems a contingency very far removed indeed.

Three other topics of the report are of prime interest and import (1) the electrics, (2) the Boston & Maine merger, and (3) the policy of centralization. Taking up these subjects in the order of their immediate moment, the report drops the old head of the Consolidated Railway Company, the holding corporation now technically non-existent, and there is substituted a statement of "earnings and operating expenses of street railway lines" respectively $10,638,057 and $7,022,158, with a balance over operation of $3,615,899. These returns are very incomplete. They do not include full figures for the year on the Connecticut and Rhode Island systems; and they exclude entirely the returns on some 550 miles of electric trackage in Massachusetts, including the Worcester, Springfield and Berkshire systems; nor do the fixed charges above operation appear in the report to show net loss or gain. The facts are that the New Haven Company now owns or controls street railway lines in Connecticut, Massachusetts, Rhode Island and New York state with a trackage of almost exactly 1,500 single-track miles; with capitalization in market values certainly not less than $100,000,000; gross earnings yearly of about $16,000,000; and probably a deficit of some

magnitude as indicated by the words "A deficit in the returns from their operation was estimated to result for a short term immediately following the acquisition" of the Connecticut Railway & Lighting Company's plant and the Rhode Island trolley system. The technical fiction of non-ownership still excludes the Massachusetts lines from the returns. But it is to be hoped that, as soon as possible, for the information not merely of shareholders but of the world, this great venture of a steam railroad corporation into street railways may be kept as a separate entity and its results, physical, financial and operative, be set forth fully. It is unique in the annals of transportation and of world wide interest and value especially now that it is reaching out into the express and freight business and has vast potential interblendings of steam and electric service. The same clarified and separative treatment should

New York, New Haven & Hartford.

characterize the annual returns of the navigation properties of the company now much expanded and covering new coast line business.

In his official references to the Boston & Maine merger Mr. Mellen repeats in substance his recent public utterances. The situation may be tersely stated: Out of some 300,000 Boston & Maine shares of capital stock outstanding the New Haven Company now holds through trustees probably not less than 120,000—enough for moral, if not practical, control, and sufficient also to check absolutely any future control of the Boston & Maine by rival railroad interests. In the difference of dividends of the two companies the New Haven is paying $120,000 a year which may be called the price—and a low one—of its present position of vantage; and it is saving $180,000 a year by postponement of the merger and exchange of the remainder of 180,000 shares of the Boston & Maine. Hence a "stand pat" attitude of the New Haven company awaiting the subsidence of the political tempest in Massachusetts and the dominance of reason over the frothy rhetoric of platforms and the stump.

The New Haven's broad and deep policy of centralization of properties and separate corporations goes on apace stretching in all directions of its many and diversified interests. During the fiscal year seven lines, steam and electric, were merged in the parent corporation, including the Providence Terminal and the Boston & New York Air Line, and there have been other important mergers since, including the first steps in the consolidation of the maze of holding companies of the Rhode Island trolley roads. The ultimate, still on the horizon, is absolute unity and centrality. It has the disadvantage of disguising the losses and gains of some of the branch interests of the great and complex system, but, provided it leaves clear the workings and outcomes of the electric and navigation properties, the policy spells simplicity, new economies and is sane railroading.

Other features of the report are suggestive and some of them new. The schedule of physical improvements and their stages, some 43 in number, fill alone two pages and a half and index the coming economies by operating efficiency. They include the Harlem six-track construction the costly improvements at New Haven, Providence and Waterbury, the Highland division new tracking, with its tunnel between Terryville and Bristol, the elimination during the last year of 27 grade crossings, the Readville repair shop completed the New York division electrification and other improvements too many to be rehearsed. Incidentally may be mentioned the failure to sell more than $1,000,000 of the preferred 4 per cent stock of the New England Investment & Security Company except at unadvisable prices, the acquisition of the coast steamship properties; and—though not referred to in the report—the extended option of the New York Central on the Ontario & Western at purchase price not likely, for obvious reasons, to be taken up. The description of the street railway lines owned and leased in Connecticut and Rhode Island alone shows a single-track mileage of 951 miles and 2,637 cars. The Massachusetts lines would add half as much again to those figures. For the first time appears a full statement of the insurance fund, amounting to $1,077,846, an increase for the year of $81,366. There are other new features of the report of a railroad corporation whose gross earnings, with the Boston & Maine system absorbed, will reach $150,000,000 a year or go beyond it; but which, far above any question of mere magnitude, in the unique-

ness of its policy and problems is an economic object of absorbing interest.

Annexed are the principal results of the year's operation and the change in the summaries of the general balance sheet:

	1907.	1906.
Mileage worked	2,006	2,056
Passenger earnings	$26,758,929	$25,252,124
Freight earnings	28,386,704	27,247,118
Gross earnings	55,601,936	52,984,322
Maint. way and structures	5,479,089	5,614,978
Maint. of equipment	5,638,784	5,668,524
Operating expenses	37,850,081	35,222,586
Net earnings	17,751,854	17,761,735
Net income	8,893,041	10,185,377
Balance sheet total	374,770,119	239,486,335

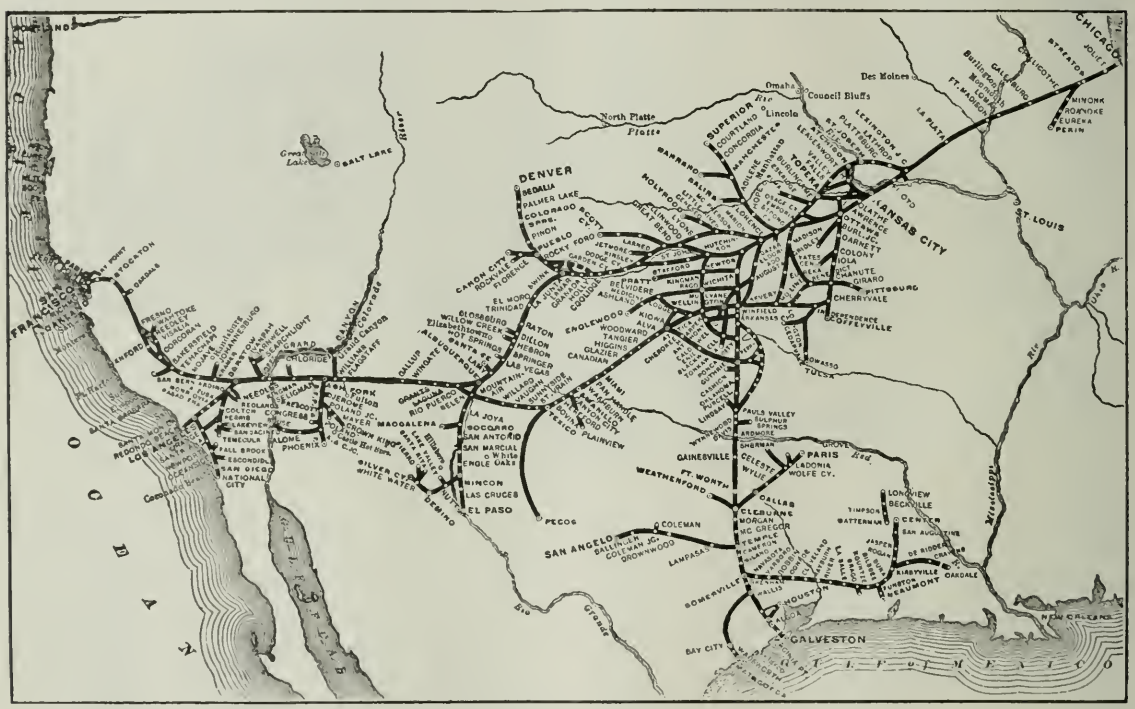
Atchison, Topeka & Santa Fe.

The Atchison, Topeka & Santa Fe again comes forward with a year's record of tremendous progress. That the record of the road since its reorganization in 1896 is nothing short of marvelous is no news, but it is a fact which is constantly receiving added proof. The development has been well rounded, harmonious and general. Not only earnings, gross and net, and surplus for dividends have increased—this last from about $50,000 in 1897 to over $21,000,000 in 1907—but the mileage and influence of the company have been constantly spreading over new sections of the southern half of the great territory west of the Mississippi river and, along with this, the standards of excellence in permanent way have been rising. To-day the Atchison instead of being a lightly built and ill-maintained collection of roads from Chicago to a point nearly 500 miles short of San Francisco, with branches mainly in the bankrupt state of Kansas and in Texas, little more prosperous, is a splendid through route from Chicago to Los Angeles and San Francisco, all the way over its own rails, with thousands of miles of branches and feeders in Kansas—now most prosperous, Texas—a fast growing empire in itself, the new state of Oklahoma, New Mexico, Arizona and California. Instead of being several hundred miles south its interests extend to the north of San Francisco,

where it has during the last year, together with the Southern Pacific, organized the Northwestern Pacific Railway to carry on railroad development in the coast country of northern California. That its policy of expansion is still under way, may be judged from the fact that on June 30, 1907, the company had under construction and nearly ready for operation, 488 miles of new railroad.

It is not to be supposed that the growth in earnings has been only as fast as the growth in mileage. Gross earnings in the year ended June 30, 1897, with 6,444 miles operated, were $30,600,000, or $4,752 per mile of road. Last year the operated mileage had increased to over 9,200 and gross earnings to $93,700,000, or $10,103 per mile of road. This is the first time that gross earnings per mile of road have been $10,000 or over. This 11-year comparison shows not only the great gains in earnings which have come from new lines and new territory, but also the very much greater earning power of the old lines.

The earnings' increases during the last year were large. Passenger earnings rose to $21,200,000, which lacks little of the total freight earnings of the 1897 year, and is an increase of $2,500,000, or 13 per cent. over the previous year. Freight earnings rose from $56,500,000 to $65,500,000, a gain of $9,000,000, or 16 per cent. Mail, express and miscellaneous earnings together increased about $1,400,-



Atchison, Topeka & Santa Fe System.

000. Altogether this makes a total increase in gross earnings of $12,900,000, or 16 per cent.

Operating expenses were $8,900,000 larger than in 1906, of which increase $5,500,000 was in conducting transportation and $2,300,000 in maintenance of way and structures. This left net earnings of $34,800,000, as against $30,800,000 the year before, an increase of $4,000,000, or 13 per cent.

Fixed charges and taxes took about $1,000,000 of this increase. The net income, therefore, was about $3,000,000 larger than in 1906. The dividend rate was 4 per cent. in 1906; the first semi-annual payment in 1907 was 2½ per cent., and the second, 3 per cent., so that the common stock is now on a 6 per cent. basis. Owing to these increases in the dividend rate and an increase of $1,000,000 in the amount of common stock outstanding, the year's dividend payments were larger by about $1,500,000 than in the year before. A new policy was used—or rather a more complete application of an old one—in dealing with the surplus after dividends. This was about $7,950,000 in 1906 and $9,800,000 last year. In 1906, in addition to a small appropriation to the fuel reserve fund, $4,500,000 was set aside for improvements written off, leaving a surplus of $3,200,000 to be carried to profit and loss as the year's final surplus. Last year, besides a similar small appropriation to the fuel fund, $9,600,000, or almost the whole of the surplus after dividends was set aside for improvements, leaving only a nominal final surplus for the year to be carried to the profit and loss account. This is in sharp contrast with the action of the Chicago & North-Western, for instance, which this year abandoned its years-old policy of making a direct appropriation for betterments out of current income. The Santa Fe made what amounted to a further income appropriation by writing off from the book value of "railroads, franchises and other property," $200,000 in cash, the net profits of land sales from the Santa Fe-Pacific land grant, a transaction which does not appear at all in the income account. The total expenditures chargeable to capital account, were $24,200,000, but the deductions out of income reduced this capital charge for the year to about $14,000,000.

The Santa Fe analyzes its maintenance expenditures in some detail. Maintenance of way as a whole, increased faster than the increase in mileage operated, so that the maintenance expenditure per mile of road was considerably larger last year than in the year before. As recently as 1902 only $782 a mile was so spent. This had risen to $1,479 in 1906, while last year $1,648 was spent per mile of line. The maintenance of way cost was largely increased by extensive relocation and reconstruction to reduce grades and curvature. Where, in carrying out this process, parts of the road as originally built were abandoned the cost of construction of the railroad or property abandoned was charged to maintenance of way, while only the additional cost of the new construction was charged to capital account. To state definitely the method followed in such particular circumstances is an exceedingly desirable feature of a railroad report which the Santa Fe has long fulfilled.

The increase in maintenance of equipment was about $850,000. Including a proportion of unlocated maintenance of equipment expenditures chargeable to superintendence, shop machinery and tools, stationery, and other expenses, the unit maintenance costs were $3,037 per locomotive, against $3,101 in 1906; $963 per passenger train car, against $887 in 1906, and $103 per freight car, against $101 in 1906. The same expenditures per revenue freight car mile were exactly the same in the two years, while per locomotive mile and per passenger car mile they were considerably larger. Working out the cost of repairs and renewals according to our usual method, the maintenance cost per locomotive was $2,623, against $2,695 in 1906; $830 per passenger car, against $772 in 1906, and $89 per freight car, against $90 in 1906. These equipment maintenance charges are liberal, particularly as the Santa Fe is generally recognized to have an unusually efficient shop organization.

With an increase of 16 per cent. in revenue freight ton-miles there was an increase of 9 per cent. in both freight-car and freight-train mileage, while the average revenue per freight train mile

increased 6 per cent. The average revenue train load was 320 tons, a gain of 6 per cent. The average carload increased in the same proportion. For the first time in the history of the road the average haul per ton of freight was over 400 miles, having increased from 394 miles to 403 miles during the year. The ton-mile earnings were larger by a very slight percentage.

The passenger earnings, as already mentioned, showed a large increase. With 12 per cent. more passenger miles, the passenger car and passenger train mileage each increased 6 per cent., as did the average passenger revenue per passenger train mile. These figures all show a large increase in the business with a greater economy in handling it.

Almost all classes of freight tonnage increased, the principal exceptions being corn, packing house products other than dressed meats, stone and sand, and forest products other than lumber. There was a large increase in tonnage of agricultural products carried, which rose from 24 per cent. to 25 per cent. of the total tonnage. Two large increases, one under this head, suggest the effects of some of the new extensions as well as the general development of the company's territory. The new lines in Texas must be responsible for part of the increase in the tonnage of cotton, which rose from 176,000 tons in 1906 to 419,000 tons last year. Similarly, the Arizona & California branch from the Ash Fork-Phoenix line west to the Colorado river—a region rich in minerals—must have brought some of the increase in tonnage of ore and bullion which rose from 385,000 tons in 1906 to 530,000 tons last year.

Several new lines were opened for traffic during the year. The Arizona & California has now been extended to Parker, on the Colorado river, 107 miles from its junction with the Phoenix line. It is to be carried across the river and northwest to a junction with the main line at Bengal, Cal. The branch from Barnwell, Cal., to Searchlight, Nev., 23 miles, was opened for traffic on April 1. The line from Kiowa, Kan., via Medicine Lodge, to Belvidere, 49 miles—originally projected as an extension of the Denver, Enid & Gulf, which is now operated as part of the system—was finished during the year. The easternmost extension of the system south of Kansas City, the line from Kirbyville, Tex., eastward, has been put in operation as far as Cravens, La., 57 miles, and track laying is in progress beyond Cravens to Oakdale, La. The branch from Canyon City, Tex., to Plainview, 57 miles, was opened for traffic February 18, 1907. Two small railroads in the beet sugar district of the Arkansas valley in Colorado were bought during the year. They had 68 miles of line in operation at the close of the fiscal year.

Most important of all the new construction was the completion of the Belen cut-off from Texico, N. Mex., west to Belen, 250 miles. Its extension from Belen to Rio Puerco, 19 miles, is nearly finished. Heavy work is now in progress to reduce grades and curvature of the line between Texico and Wellington, Kan., the connection on the east of the new cut-off. By June 30, 1908, it is hoped to transfer all of the transcontinental freight business to the new low-grade line thus created, via Wellington, Texico, Belen and Rio Puerco.

The Phoenix & Eastern Railroad, which runs from Phoenix east along the Gila river to Winkleman, about 100 miles, was sold during the year to the Southern Pacific Company at cost and interest—$2,190,176. Against this there was a net amount of $1,554,474 spent for securities of the Northwestern Pacific Railroad, besides advances of $451,985 to the Grand Canyon Railway.

There were offered to the shareholders by a circular dated May 1, 1907, $26,056,000 of a new issue of 10-year 5 per cent. convertible bonds, a higher interest rate than on previous convertible issues. The stockholders subscribed for $9,943,000 of these and the remaining $16,113,000 was sold to J. P. Morgan & Co. As these transactions took place in July or later, they do not appear in the accounts of the year. The need for issuing these bonds is evident from the item of cash on the balance sheet, which stood at $17,300,000 a year ago, against $8,200,000 on June 30, 1907. In contrast with many other companies it is notable in this connection that no notes or bills payable of the Santa Fe or of any of its auxiliaries are outstanding.

President Ripley sums up the business of the year and the outlook for the future, the latter in an unusually brief and clear presentation of the facts of the present business situation as affecting railroads. His remarks on these two subjects are quoted in full as follows:

> The year was one of extraordinary business prosperity. The rapid colonization of the southwest, the bountiful crops, the discovery and development of mineral deposits and the growth of miscellaneous business, due to the general increase of wealth, all contributed to the increase of traffic on your lines. At times the increase in the volume of traffic was so large that the company's equipment and other facilities were overtaxed and it became impossible to move traffic promptly and satisfactorily. The congestion of traffic on some of your lines and the necessity of moving traffic as speedily as practicable without regard to economy of operation, caused a material increase in operating expenses. On the other hand, climatic conditions were unusually favorable. Your company has begun the new year with its properties in excellent physical condition and with largely increased equipment.
>
> In order to enable the railroad companies of the United States to furnish the additional transportation facilities required by the rapid growth of the country in population and business activity it will be necessary to expend many hundred millions of dollars of additional capital. The power of the railroads to obtain this additional capital has been greatly impaired by loss of confidence of investors in the stability and security of railroad investments, and this loss of confidence has been caused, in great measure, by the unfriendly attitude of a large part of the press, and by the arbitrary action of legislatures and railroad commissions in reducing rates and imposing burdensome restrictions, often without investigation or consideration of the consequences.
>
> The public, apparently, has failed to appreciate that capital invested in railroads yields very moderate returns, having regard to the prevailing rates of interest and to the profits upon capital employed in other kinds of business, and the people, also, has failed to perceive that the whole country is interested in maintaining the prosperity and financial credit of the railroad companies. Few companies in the United States have been more prosperous than your company. Yet even during the year ending June 30, 1907, which was the most prosperous year in its history, net earnings averaged but 6.5 per cent. on the entire capitalization, which is believed to be not in excess of the cost of reproducing your company's properties at the present time. Interest and dividend payments for the year averaged less than 4.6 per cent. on your company's bonds and stocks. For the last 10 years the average net earnings were but 4.82 per cent. on the entire capitalization and the average interest and dividend payments were but 3.71 per cent. on the bonds and stocks. Even these results could be obtained only through the expenditure of enormous sums for construction of extensions and for improvements and additional equipment. During the last 10 years the sums so expended for improvements and additional equipment and for new construction, without counting further large sums expended in purchasing previously constructed branches and extensions, amounted to more than $110,000,000, while the aggregate sums paid to the holders of the preferred and common stock amounted to less than $75,000,000.
>
> It is hoped and believed that the public will soon realize that its recent attitude toward railroad companies in general has not been just to their stockholders and bondholders, and also that unless the confidence of investors in the security and stability of railroad investments is restored, it will be impossible to obtain the additional railroad facilities which are necessary to the development of the country. Under existing conditions, however, your directors have deemed it prudent to suspend various extension projects which were contemplated, and to limit the company's capital expenditures to the completion of improvements to which the company is already committed.

The results for the last two years are given below:

	1907.	1906.
Mileage worked	9,273	8,434
Passenger earnings	$21,171,629	$18,677,817
Freight earnings	65,500,309	56,506,587
Mail, express and miscellaneous earnings	7,011,468	6,616,606
Gross earnings	93,683,407	80,801,010
Maintenance of way and structures	15,286,063	12,949,812
Maintenance of equipment	11,779,847	10,932,033
Conducting transportation	20,538,964	24,089,628
Operating expenses	58,867,901	50,008,485
Net earnings	34,815,506	30,792,525
Net income	21,168,724	18,268,170
Dividends	11,363,723	9,786,910
Betterment appropriation	9,791,226	4,718,985
Year's surplus	13,776	3,227,314

The figures for the fiscal year ended June 30, 1906, are not the same as shown in the last annual report, but are revised to cover lines of the system as now constituted.

Boston & Maine.

Long the railroad ruler of northern New England, itself a consolidation of consolidations, the Boston & Maine is likely soon to be joined with the New York, New Haven & Hartford in a railroad merger which will unite most of the railroads of all New England. To quote President Mellen, of the New Haven, in the annual report of that road printed on another page, "The Boston & Maine is probably as little competitive and is more supplementary and complementary to our system of roads than any other railroad property with which we are now engaged in business." The two roads fit naturally into each other at a succession of different points, and the consolidation, if it comes about, should be of great value to New England in unifying its through lines of transportation.

It was in last February that the first definite rumors came that the Boston & Maine was likely to pass to the control of some other road. For a time it appeared that the New York Central & Hudson River was to be the purchaser. Its annual report issued late in April showed that the Vanderbilt company had invested in over $500,000 Boston & Maine stock. Besides this the American Express Company, controlled by the Vanderbilts, held $3,000,000 stock of the New England road. Soon, however, the burden of probability turned to the New Haven and the *Railroad Gazette* of May 17, 1907, crystallized these rumors into a semi-official prophecy. The final announcement of the facts came early in June through publication of correspondence dated June 4 between Governor Guild of Massachusetts and President Mellen.

The present status of the merger is that the New York, New Haven & Hartford owns not quite $11,000,000 of the $28,000,000 common stock of the Boston & Maine, or a little less than 40 per cent. This amount of stock has already been exchanged for an equal amount of New Haven stock so that the Boston & Maine stockholders who have made the exchange are now getting 8 per cent. instead of 7 per cent. dividends. Meanwhile the whole matter is

held up until next year by the law passed last June forbidding, until the next legislature acts, any further steps toward carrying out the merger.

If he gets control, there is no doubt that President Mellen will apply his well-known "Northern Pacific" policy of general improvement to the Boston & Maine. It needs it. The Boston & Maine is not to-day a first class modern railroad in roadbed or equipment. It has many steep grades on its northern lines, little double track, and is not well ballasted. Some of its locomotives and cars are modern and efficient but a great many of the equipment numbers are filled with antiquated rolling stock. By the end of this year only 286 miles, or about 13 per cent. of the lines, will be block signaled, although the work of equipping 881 miles more at an estimated cost of about $1,000,000 has been begun and is to be completed within three or four years. As a result the road has recently had two or three destructive passenger train wrecks. The annual report of a year ago specifically stated that the lack of needed facilities for locomotive repairs had during recent years become so acute that some of the locomotive repair work was done at outside shops at excessive cost, while at times of special wear and tear, locomotives, badly needed, were kept long out of service while awaiting their turn for repairs in the company's own overcrowded shops. Work was to have been begun last April on the new shops, but the present report does not show that anything further has been done toward providing these needed facilities.

There is one simple ratio, a touchstone of the efficiency of railroad operation, which sums up in itself, directly or indirectly, the Boston & Maine's weaknesses. This is the proportion of gross earnings which is used in the essentially non-productive expense of conducting transportation. Conducting transportation cost on the Boston & Maine last year was 50.6 per cent. of gross earnings, or as much as the Great Northern and Union Pacific managed to get along with in 1906 to cover their total of regular operating expenses, general expenses, maintenance of way and maintenance of equipment, besides conducting transportation. A fairer comparison is the New Haven property with its similar situation and traffic. Conducting transportation in 1907 required 45.5 per cent. of gross earnings on that road—which is considerably less than 50.6 per cent. The Boston & Maine can hardly be, naturally, a more expensive property to operate, for although it suffers from somewhat more severe winter weather, it has nowhere nearly as high a proportion of passenger traffic—whose conducting transportation costs are high, if the statements of railroad managers about the unprofitableness of the passenger business mean anything—as the New Haven, on which passenger traffic makes up nearly one-half of the total. Furthermore, on much of its passenger business the Boston & Maine charges from 2¼ to 3 cents a mile, while 2 cents a mile is the uniform highest rate on all lines of the New Haven system. The meaning of the conducting transportation proportion on the Boston & Maine is not hard to grasp. Half of all the money that is spent for operation produces no lasting result. It may be entirely necessary for a man in moderate circumstances to spend half of his income on food and lodging; for a great railroad it is wasteful and inefficient.

An idea of the character of the northern Boston & Maine lines may be gained from a pamphlet published nearly a year ago dealing with the New Hampshire mileage of the road. Its criticisms may not all be just but they are at least suggestive and not disproved by the general impression gained from traveling on the road in that state. This statement showed that of the 1,100 miles of main track in New Hampshire only 81 miles have second track; that there were few block signals; that there were on the average 48 ft. of wooden bridges per mile, and that as recently as 1905, 27 out of 39 bridges rebuilt were rebuilt of wood; that grades were prohibitive of economical operation; that there was no rock ballast; that passenger-train service was little better than 10 years ago; that mail service, particularly newspaper trains, was very poor; yet that the passenger rate in New Hampshire was 3 cents a mile, against 2¼ cents in Massachusetts.

In general the facts of the case appear to be that the Boston & Maine is in very much the same situation as was the New York, New Haven & Hartford four years ago when President Mellen came to it from the Northern Pacific. The New Haven then had not kept up to the times in improvements to the line and in new equipment and in consequence its operation was inefficient and expensive. All this has to-day been changed and is still further being changed so that the New Haven is becoming more and more efficient as a transportation machine. It is, of course, as yet an open question whether the absolute merger of the two roads will meet with general public approval and be carried out, but if it is, it is safe to say that by the application of similar methods to the Boston & Maine, similar successful results can be obtained from that property.

There are two striking facts in the record of last year's operations on the Boston & Maine, one is the great increase in the cost of operation, the other the fact that, although the total traffic increased, the tonnage of 32 out of the 42 groups of commodities listed decreased. Under the first head, conducting transportation increased by over $2,150,000, the operating pay roll alone being $1,800,000 greater than in the preceding year. Under the second head there were decreases in tonnage of the following classes of traffic:

Agricultural implements	Lime
Brick	Live stock
Bark	Meats, dressed
Boots and shoes	Metal, bar and sheet
Coal, anthracite	Mill products, other than flour
Cement	Ores
Coke	Packing house products—except dressed meats.
Cotton	Petroleum and other oils
Domestics (cotton and wool)	Poultry, game and fish
Flour	Rails, iron and steel
Fruit and other vegetables	Stone, sand and other like articles
Furniture and household goods	Sugar
Grain	Tobacco
Hay	Wines, liquors and beers
Hides and leather	Wool
Iron, pig and bloom	

The increases in tonnage were in the following:

Coal, bituminous	Naval stores
Ice	Paper
Lumber	Potatoes
Merchandise	Wagons, carriages, tools, etc.
Miscellaneous	Wood pulp.

The total tonnage, not including company coal, was 21,765,551 tons, against 21,050,054 tons in 1906.

Gross earnings for the year were $41,100,000, against $39,200,000 in 1906, a gain of just under $2,000,000, or 5 per cent. Of this increase about $1,500,000 was in the earnings of the freight department. The gross earnings per mile of road increased from $17,419 to $18,282.

There was a decrease of $478,000 in maintenance of way and structures and an increase of $225,000 in maintenance of equipment. Per mile, maintenance of way cost $2,144, against $2,353 in 1906. Repairs and renewals cost $1,275 per locomotive, against $1,235 in 1906; $425 per passenger car, against $365 in 1906, and $50 per freight car, against $56 in 1906. These maintenance of equipment figures go far to bear out the statement that the road's equipment, as a whole, is not up to modern standards. They are small for each class of equipment. There must be taken into account, however, the $742,000 spent out of operating expenses for new equipment. Capital account was charged with over $4,000,000 during the year for additional equipment and contracts have been made for still more locomotives and cars to cost $4,500,000. All of these are to be delivered by the early spring of 1908. The large expenditures of these two years for new motive power and rolling stock should go far to bring up the general standard of the locomotives and cars.

Conducting transportation expenses are listed in more detail than by most companies. It has been said that both the Boston & Maine and the New Haven are in reality, from a freight standpoint, nothing more than switching roads for New England as a great manufacturing center. It is suggestive that while $955,000 was spent for freight engineers and firemen, $531,000 went to engineers and firemen of freight switching locomotives. In the same way fuel for road freight locomotives cost $2,400,000, against $1,000,000 for fuel for freight switching engines. The cost of switchmen and yardmen was almost exactly the same as that of all road engineers and firemen, passenger and freight. The cost of fuel has greatly increased during the year, from $4,500,000 in 1906 to $5,300,000 last year. In general, wage payments to freight employees have increased more than to passenger men. The expense of $408,000 for crossing tenders suggests the large number (and incidentally the good protection) of grade crossings. There was $660,000 spent during the year in doing away with these, making a total net expenditure for elimination of grade crossings to June 30, 1907, of $3,800,000. The terminal character of much of the road's mileage is again suggested by the item of freight station service for which $2,300,000 was spent, against $2,000,000 in 1906. The Boston & Maine has to bear a heavy burden in the matter of per diem charges. The freight car service expense was $945,000 last year, against $841,000 in 1906. The expense of advertising during the year increased nearly 75 per cent., due in part, no doubt, to the coming to the road of a new and aggressive General Passenger Agent. Taken as a whole the proportion of conducting transportation to gross earnings greatly increased; from 47.6 per cent. in 1906 to the 50.6 per cent. last year.

The average net earnings per revenue train-mile have slowly but steadily decreased during the last four years. From 49 cents in 1904 the net return has been one cent less each year until it stands at 46 cents in 1907. The average passenger journey is 18 miles, which shows how the commutation travel around Boston overshadows the through business. The Boston & Maine, except for its Boston-Portland lines, lacks the great strength of the New York, New Haven & Hartford in having a through line between two very important cities, or a long through line with heavy travel.

The company owns two electric railroads; one, the street railway at Portsmouth, N. H.; the other, the road from Concord, N. H., to Manchester and Penacook. Together they have 46 miles of line and carried 3,500,000 passengers last year.

There was an increase in the freight haul from 89 to 99 miles during the year. It would be interesting to know exactly what caused this change. Judging from the tonnage statistics, it was probably due more than anything else to the movement of bit-

uminous coal. The bituminous tonnage increased from 1,700,000 tons to 2,400,000, a gain of 40 per cent., and it is probable that at the same time a longer haul was received.

The greater cost of operation is perhaps most accurately seen by the increase in the average cost per locomotive-mile. Averaged against this unit fuel cost 16.4 cents against 14.9 in 1906, and wages 7.7 cents against 7.3 cents, the total cost per mile run was 31 cents, against 29 cents in 1906. On a total of 32,700,000 locomotive-miles, this average increase of 2 cents a mile means a great deal.

One-year 5 per cent. notes were issued during the fiscal year which, on June 30, stood at $3,700,000. These have just been refunded by an issue of $4,000,000, one-year 6 per cent. notes. The reason the company makes such short term note issues which in consequence bear a higher rate of interest, is that the approval of the Massachusetts Railroad Commission is necessary for a security issue which is to run more than one year.

The principal results of operation were as follows:

	1907.	1906.
Mileage worked	2,228	2,228
Passenger earnings	$13,581,164	$13,291,581
Freight earnings	25,212,813	23,717,913
Gross earnings	41,125,257	39,214,203
Maint. way and structures	4,905,227	5,383,302
Maint. of equipment	3,564,246	3,329,013

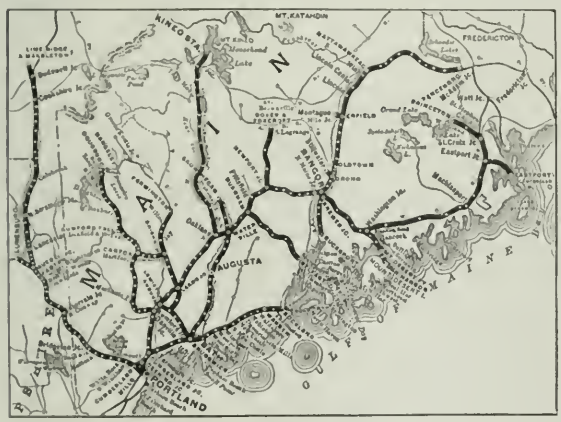
Maine Central.

The Maine Central, which is controlled by the Boston & Maine through ownership of over 50 per cent. of its capital stock, owns all of the Maine mileage in the Boston & Maine system north of Portland, and, in addition, a line from Portland through the Crawford Notch of the White Mountains to a connection with the Quebec Central, just south of Lime Ridge in the province of Quebec. During



Maine Central.

the past year it has been extending its control of the railroads of Maine, where it already owns most of the railroad mileage. The Somerset Railway, 90 miles long, running from Oakland to Moosehead Lake, was acquired in March by purchase of $650,000 of its $736,649 capital stock. The road has not been merged with the Maine Central but is separately operated for the benefit of its owners. Since assuming its control active measures have been taken to properly complete and equip the property, and it is believed that in the not distant future its passenger and freight traffic will so develop that it will not only be self-supporting, but increasingly valuable as a feeder to the Maine Central.

There have also been acquired the Portland & Rumford Falls properties, consisting of the Portland & Rumford Falls and the Rumford Falls & Rangeley Lakes railroads. These roads run from Rumford Junction, near Auburn, Me., to Rumford Falls and Livermore, where there are already large manufacturing industries, and also from Rumford Falls to the Rangeley Lake region. They have been leased for 999 years at an annual rental of $328,000. The lease is given in full in the report. By it the company comes in possession of the franchises of the Indian River Railway, a company organized to build from the Maine-Quebec line to Megantic, Que., on the Quebec Central and the Canadian Pacific. This, with an extension of the Rumford Falls & Rangeley Lakes from Oquossoc north to the boundary, would give the Maine Central a short connection between Portland and these two Canadian roads. Such a line would considerably shorten the rail distance between Quebec and Portland. The Maine Central also comes in possession of valuable terminal property and privileges at and near Portland by this lease. The new acquisitions are already more than self-supporting and are likely to increase in value with the development of water powers and industries along the Androscoggin river.

The last year was a prosperous one for the Maine Central. Gross earnings were $8,400,000 against $7,800,000 in 1906, an increase of $500,000. Of this $178,000 came through the passenger department. Operating expenses, however, increased sharply. The pay rolls for the year amounted to $3,280,000, or 39 per cent. of gross earnings, against 36 per cent. in 1906. This was an increase of $511,000, or nearly 20 per cent. over the pay roll expense of the previous year. Net earnings were $3,200,000 against $2,600,000 in 1906, an increase of 23 per cent. Net income increased even faster, by 42 per cent. Both of these increases, however, are a good deal due to the fact that, following the Interstate Commerce Commission ruling, in 1907 all additions and betterments, amounting in that year to $721,000, were separately reported and deducted from surplus after dividends instead of being included in operating expenses as in 1906. As no figures for 1906 corrected to show comparisons with the new methods are given, it is not possible to tell how much of the increases in net earnings and income are due to this cause. The principal item under additions and betterments is $369,000 for new equipment.

The Maine Central shows an even greater increase in cost per locomotive mile than the Boston & Maine, from 27 cents in 1906 to 30 cents last year. This was due particularly to increase in cost of fuel and wages. The maintenance of way expenditure was $1,274 per mile against $1,940, a very large decrease, due partly to the change in accounting method. Even the present figure seems reasonably liberal in view of the fact that a good many of the lines run through sparsely settled regions and have thin traffic. The heavy winters, however, require many expenditures on the line which roads in more southern regions do not have. It is evident that the Maine Central has in the past been building itself up out of earnings.

Coal, grain, lumber, paper, potatoes, wood and wood pulp, besides merchandise and miscellaneous, furnish the principal articles of tonnage. The largest item of traffic is lumber; the next, wood. Lumber, wood and wood pulp together make up 1,788,000 tons out of a total tonnage of 5,537,000 tons. The average trainload was 280 tons.

The principal results of operation were as follows:

	1907.	1906.
Mileage worked	931	816
Passenger earnings	$2,708,004	$2,572,796
Freight earnings	5,024,116	4,657,389
Gross earnings	8,348,139	7,794,745
Maint. way and structures	1,076,193	1,483,408
Maint. of equipment	2,223,441	1,872,039
Conducting transportation	1,563,129	1,483,980
Operating expenses	5,149,529	5,265,059
Net earnings	3,198,610	2,589,686
Net income	1,748,412	1,232,614
Betterments and new equipment	1,238,949	$28,027
Year's surplus	161,094	56,218

Illinois Central.

A spirited contest is under way for control of proxies at the annual meeting of the Illinois Central next Wednesday. This contest is between E. H. Harriman through J. T. Harahan, the present President of the company, and Stuyvesant Fish, who until last November had for 20 years been President. Four new directors are to be elected. Of the directors whose term expires, Mr. Harriman is one and Mr. Fish another. The contest will center about the re-election of these two men. Mr. Fish appeals to the stockholders for proxies largely on the ground that complete domination of the Illinois Central by the Union Pacific and the Southern Pacific is threatened, which as the Illinois Central is a north and south line originating more business than it receives, would be to the disadvantage of the Illinois Central shareholders. It is not necessary to go into the other charges which he brings against the present management of the road, as it is not possible from the facts which have been made public to form a fair judgment as to their truth or importance.

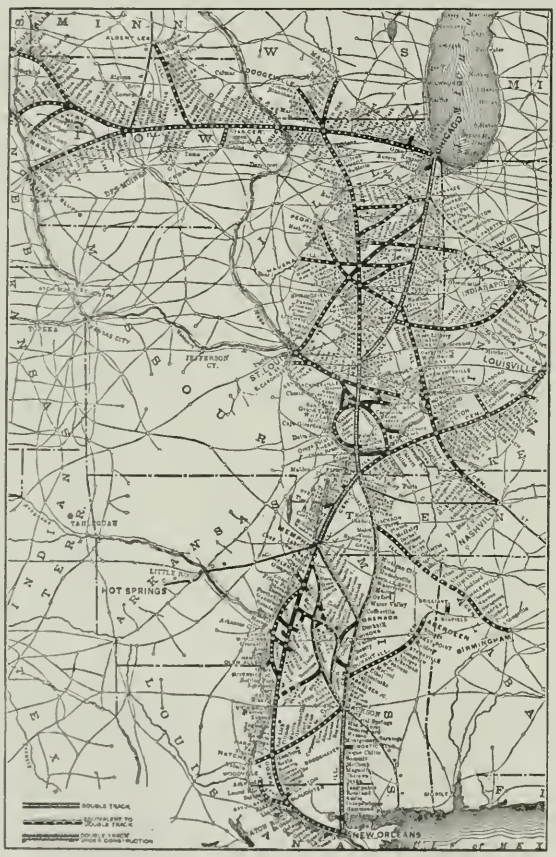
The southwestern railroads are the ones which are showing by far the largest increases in gross and net earnings for the past year. While the Illinois Central is not exactly a southwestern road, nevertheless, its position as the premier through line to the Gulf should give it a large share in the great prosperity of that region. It owns considerable mileage north of St. Louis, earnings on which would not be directly affected by the southwestern prosperity, but most of the mileage south of St. Louis should feel the result of this unusual growth. For this reason the increase of 10 per cent. in gross earnings seems smaller than might have been expected. Gross earnings of Illinois and Iowa railroads in general increased as much as that during the last year, while the increases on the southwestern mileage might reasonably have been considerably larger. Even on the Yazoo & Mississippi Valley, which operates the bulk

of the southern lines, the increase in gross earnings was only 10 per cent.

Nevertheless, the year's results were satisfactory, for in spite of an increase of 10 per cent. in operating expenses, net earnings were 8 per cent. larger than in the 1906 twelvemonth; gross earnings per mile of road increased 11 per cent., and net earnings per mile of road increased 10 per cent.

Operating expenses as a whole were larger by $3,500,000 than in 1906, of which increase $1,900,000, or 25 per cent., was in maintenance of equipment and $1,600,000 or 9 per cent. in conducting transportation. Maintenance of way decreased slightly in the total; per mile operated it was $1,568 against $1,550 in 1906; repairs and renewals cost $2,122 per locomotive against $1,944 in 1906; $775 per passenger car against $819 in 1906 and $92 per freight car against $67 in 1906—this last a large increase.

No specially noticeable gains were made in economy of operation. The revenue train load increased only 3 per cent., from 353 to 364 tons; car loading increased by less than 1 per cent., and net earnings per revenue train mile increased only 4 per cent.



Illinois Central System.

against the increase of 10 per cent. in net earnings per mile of road. With an increase of 6 per cent. in revenue ton miles there was an increase of 3 per cent. in the freight train mileage. Eleven per cent. more passenger miles were handled with an increase of only 5 per cent. in passenger train mileage. Freight earnings per train mile increased 7 per cent. and passenger earnings 3 per cent.

The balance sheet shows that the company needs to borrow money soon, for there was on June 30, 1907, $10,300,000 in bills payable at future dates outstanding, against $1,400,000 a year earlier. This increase represents money borrowed for construction expenditures on the Indianapolis Southern, Yazoo & Mississippi Valley, and the Nashville and the Birmingham extensions and terminals. Against a total of $11,860,000 payable at future dates, the company holds some $29,000,000 par value of bonds free in its treasury. The current assets exceed the strictly current liabilities by $3,200,000, although there was on June 30 only $1,000,000 cash on hand. Both in order to provide more working capital and to finance the large construction expenditures, the Illinois Central will evidently be one of the first railroads to come in the market for new funds as soon as there is an improvement in the demand for railroad securities.

The line to Indianapolis was put in operation last December. It was described in the *Railroad Gazette* of March 15, 1907. The line to Birmingham, Ala., is to be ready for operation by the first of November. Other new construction is a double-track branch from Kensington, Ill., to Hammond, Ind., seven miles, one of whose tracks will be used jointly with the Chicago, Cincinnati & Louisville, giving that road its permanent Chicago entrance, and the other as an electric line by the Chicago, Lake Shore & South Bend, which in return is to give to the Illinois Central trackage rights from Hammond to the United States Steel Corporation's new plant now building at Gary, Ind. A double-track freight line, 16 miles long, is being built around the city of Memphis, Tenn. The Illinois Central has also advanced $120,000 to a company through which the 10 railroads entering Memphis are together building a union station.

The Yazoo & Mississippi Valley, which operates a network of lines in the Mississippi delta as well as the western of the two through lines from Memphis to New Orleans, in all 1,239 miles of line, had gross earnings of $9,500,000, an increase of 10 per cent.; operating expenses of $7,800,000, an increase of 10 per cent., and net earnings of $1,800,000, a gain of 8 per cent. Revenue train load increased from 282 tons to 318 tons or 3 per cent.; while there was a decrease of 9 per cent. in the ton-mile rate and of 2 per cent. in the net earnings per revenue train mile. Maintenance of way cost $1,793 per mile, against $1,810 in 1906 and $1,354 in 1905. There was an increase of 30 per cent. in maintenance of equipment cost.

The following table sums up the operation of the Illinois Central, not including the Yazoo & Mississippi Valley, for the last two years:

	1907.	1906.
Mileage worked	4,371	4,424
Passenger earnings	$11,187,533	$10,004,041
Freight earnings	38,033,271	34,637,124
Gross earnings	56,610,633	51,636,405
Maintenance of way and structures	6,851,450	6,855,173
Maintenance of equipment	9,596,007	7,705,028
Conducting transportation	20,213,508	18,568,355
Operating expenses	37,847,707	34,302,477
Net earnings	18,762,926	17,333,928
Net income	11,687,091	10,862,339
Betterments	3,987,934	4,164,739

Brooklyn Rapid Transit.

The Brooklyn Rapid Transit Company did not make quite as favorable a showing for the year ended June 30, 1907, as in the three years previous. It is not yet in a position to pay dividends on its $45,000,000 stock and probably will not be for some years to come, but meanwhile it is accumulating a large surplus and spending money freely for permanent improvements.

There was a decrease of $116,068 in net earnings and the surplus after all charges was $1,658,444. Last year only $1,090,840 was carried over to surplus, $500,000 having been deducted for contingent reserve fund, a deduction which was not made this year. Gross earnings were $19,381,587, an increase of $908,259, or 5 per cent. In 1906 the increase in gross was 13 per cent., in 1906 11.1 per cent., in 1905, in 1904 and in 1903, 6 per cent. The sudden falling off in growth of gross receipts is due in part to further extensions of the transfer privilege during the year. Of the 511,839,437 passengers carried, 26 per cent. rode on transfers, as against 21 per cent. in 1906. Unfavorable weather, which affected the heavy travel to seashore resorts, also tended to keep down earnings. The surface lines were most affected by both these causes and the result was a decrease of $208,011 or 2 per cent. in gross earnings from these lines. On the other hand, the elevated roads show an increase of $1,065,302 or 18 per cent., as against an increase last year of 14 per cent.

Much of the improvement work carried out during the last three years has been designed to relieve the surface lines in the congested districts by transferring through passengers to and from the elevated roads at outlying junctions. In spite of this the congestion of the surface lines on the Brooklyn Bridge and on Fulton street is now so great that little further increase in traffic can be expected until measures are taken to relieve it. The widening of Livingston street, so long delayed, will do much to help the situation between City Hall and Flatbush avenue, but there is no immediate remedy for the conditions existing at both ends of the Brooklyn Bridge. The opening of the Battery tunnel and the completion of the New York terminal of the Williamsburg Bridge are still some time away, and the complete reconstruction of the Brooklyn Bridge terminals, which has just been begun, is even farther off. It is expected, however, that temporary arrangements will soon be made to run through elevated trains over the bridge during the rush hours, and thus add materially to the carrying capacity of the terminal tracks.

Operating expenses rose from $10,441,377 to $11,465,705, an increase of 10 per cent., although the total car mileage rose only 7 per cent. The principal items which show a large increase in cost are operation of cars, 11.1 per cent.; maintenance of equipment, 9 per cent., and damages, 16 per cent. Notwithstanding unfavorable

weather and the increase in car mileage, cost of operation of power plants increased only 3 per cent., which is a gratifying showing in favor of the new and modern equipment which has been installed during the last three years. The big increase in the item of damages and legal expenses was due largely to the fact that during the year the settlement of pending actions was greatly expedited by the election of a number of additional judges, which increased the capacity of the trial courts about 40 per cent. President Winter has been markedly successful in reducing the number and amount of judgments for personal damages secured against the company during the last five years, and while the actual amounts paid last year increased 16 per cent. the number of cases settled increased 36 per cent.

The total track mileage operated increased from 557 miles in 1906 to 579 miles in 1907. Most of the additional track consists of new sidings and turnouts. The reconstruction of the Brighton Beach line into a four-track road is nearing completion and two tracks are now in use on the permanent location. The entire improvement is to be finished by January 1, 1908. This is the only important construction work being carried on at present, although contracts have been let for the elevated structure to connect the Broadway line with the Williamsburg Bridge elevated tracks. The construction account against which the 4 per cent. refunding bonds of the Brooklyn Rapid Transit Company are issued was much smaller than in 1906. There was $5,703,186 spent, as against $8,414,136 in 1906, a decrease of 32 per cent. Only $762,787 was spent for new cars and electrical equipment, as against $3,460,834 in 1906.

At the beginning of the year there were in the treasury $943,000 refunding 4 per cent. bonds and there were issued by the trustee on account of construction expenditures during the year and for the purchase or exchange of securities, $6,867,000 in bonds, a total of $7,810,000. Of these there were sold only $3,186,000 owing to the poor market, leaving on hand $4,624,000. There was $4,844,934 more expended to June 30, 1907, for which bonds may be issued. The bonds sold during the year brought an average price of only $8.35; the discount, amounting to $371,825, was deducted from the surplus.

The following is a summary of operations for 1906 and 1907:

	1907.	1906.
Miles operated	579	557
Gross earnings	$19,381,587	$18,473,328
Operating expenses	$11,465,705	$10,441,377
Net earnings	$7,915,882	$8,031,951
Passengers carried	511,839,437	452,604,203
Car mileage	68,273,184	63,657,323

NEW PUBLICATIONS.

The Art of Railroading, or the Technique of Modern Transportation. Calvin F. Swingle, Editor-in-Chief. Chicago, Ill.: Railway Publications Society. 7 Vols., 3,230 pages; profusely illustrated. Half leather. $30.00.

Two volumes of the seven are devoted to locomotive engineering; the third is on air-brake practice; the fourth on mechanical examinations; the fifth on locomotive breakdowns; the sixth on machine shop practice, and the seventh on station and train service. When the great mass of technical literature bearing upon these subjects is considered it is of course apparent that it has not all been so condensed as to have been brought within the limits of the work under consideration. Still, the series contains much that will be of value to the man who has not had the advantages of a school training and who has nevertheless an ambition to succeed. He will be taught a great number of facts and a few principles, and it is in the paucity of these matters that the books, like most of their class, are weak. Two examples of work well done and skimmed over follow one another in the first chapter on the duties of the fireman. Where sensible and latent heat are defined the work is so well done and so clearly explained that anyone who can read should be able to understand. But there is nothing to show why a sight feed lubricator delivers oil to the cylinder, and the explanation of the "principle" of the action of the pop valve is confined to a statement of what it does, though the reason can be dug out of the text in another place. So throughout the whole there is plenty of information regarding facts, and plenty of instruction as to what should be done when something definite occurs. In the locomotive section there are full descriptions of the mechanisms of the valves and other working parts, especial attention being paid to the Walschaerts gear, with details of the various extras, as they are called, that enter into the construction of the modern locomotive. By these are meant such parts as gages, safety valves, whistles and the like.

In the volume of mechanical examinations there is a set of tables on the link motion that can be made of great value to anyone who will study them carefully. There are comparatively few who realize the great delicacy of adjustment required in order to secure a proper action of the Stephenson link motion and of the effects of apparently slight changes in the dimensions and location of the parts. These tables show the "effects produced in the distribution of the steam with different laps, leads, travel of valves and points of suspension or locating the stud on the saddle." These are the main points in the variations that are rung in with the link motion but are by no means all. The volume also contains chapters on fuel oil, fuel combustion and modern air brake practice.

In locomotive breakdowns there is sometimes something more than breakdown information proper. The volume is in the form of a catechism and most of the questions and answers have a practical value while others have the appearance of padding. For example, the reply to a question asking how a heavy main rod is to be handled when disconnected is to the effect that someone should be asked to lend a hand. Most of the questions, however, appear to be those that have been genuinely asked and credit for them and for their answers is given to the Brotherhood of Locomotive Firemen's Magazine.

In machine shop practice there is a collection of miscellaneous information starting in at the simple definitions of a primary arithmetic and leading up to logarithms, in a few pages, it passes through "practical geometry" to mensuration, and on to applied mechanics, and then with a brief sketch of the indicator and the methods of calculating horse-power we come to the general description of hand and machine tools with illustrations reproduced from catalogues of manufacturers, and conclude with a chapter on shop kinks. There is very little of this that is original though all of it may be of some value for reference, though of little to show the machinist how work should be done other than that conveyed in the general description of the machines.

The last volume on station and train work is a compilation of a number of papers and addresses that have been delivered by different persons upon the general subject of train handling and which are authoritative in that they emanate from men in positions of responsibility in train work. These are followed by the standard code of train rules, the rules for car loading, with instruction for general station work, concluding with a treatise on telegraphy.

As a whole the work is valuable as setting forth in a general way the salient features connected with certain branches of railroad work, notably that of the locomotive, and without going into these matters with a thoroughness that would make for a perfect understanding of the subject. Cars are not considered at all. The value of such text books is that they may serve as a guide to more extended study and they also serve conveniently for reference for those who wish some specific piece of information and do not care for an extended treatise. The use of the series for such references will be comparatively easy; for, while it is not cross-indexed, it is so arranged that it will be possible to find what is wanted with comparatively little trouble, provided it is there at all.

CONTRIBUTIONS

Parcel Rooms.

New York, Oct. 3, 1907.

TO THE EDITOR OF THE RAILROAD GAZETTE:

Increasing conveniences in railroad service and travel are recognized means of decreasing public hostility. If a standard could be established by the leading lines in the petty matter of collection of fees for holding parcels in the station parcel rooms something would be gained. The lack of uniformity is particularly annoying in New England. It is preferable to collect when a parcel is left as one is not apt to be in a rush.

Again, all newsstands and news companies should be compelled to keep postal cards and possibly stamps, plain paper and envelopes. How often we start on journey, forget a word home or to the office, try to get a postal at the first important stop and receive that chilly response, "We don't keep 'em." GEO. B. LEIGHTON.

Steam and Electric Locomotives.

At the September meeting of the New York Railroad Club a paper was presented on steam vs. electric locomotives that dealt, for the most part, with possible improvements in the steam locomotive, with especial reference to the introduction of the superheater. In discussing the paper C. A. Seley, M.E., of the Chicago, Rock Island & Pacific, said:

All the steam railroads are not to be electrified, at least in our day and generation; neither will a tithe of the magnificent sum of $188,000,000 be spent for superheaters, etc., for the improvement of the 47,000 locomotives now so industriously burning up the company's money. We are altogether too far up in the air in this talk of millions and billions, and the assumptions in this paper are based on united and concerted action and practice which can never obtain until the millennium.

No railroad man believes that blessed epoch to be at hand, although if the views of some of our electrical friends can be believed it is already here. The fact of the two magnificent experiments being made by the railroads in this vicinity in electrification on diverse, and in some ways directly opposed theories and methods, proves my case. It is altogether possible that both are right in their theories and methods, based on their conditions.

The lay mind knows or appreciates nothing of this; hence the

popular cry for electrification, the dear public apparently believing that with the elimination of the smokestack and the other unpleasant concomitants of the steam locomotive and the substitution therefor of the man with the controller handle, all travel and transportation will be made sane and safe, clean, swift, cheap, and in every possible and in some impossible ways, an improvement on present steam railway methods.

The honorable Mayor of my home city came here to New York to investigate steam railroad electrification in order to obtain information that would lead to an amelioration of the horrible conditions brought about by presence within the city limits of Chicago of soft coal-burning locomotives, and there is already a hysterical feeling, bred largely by uninformed newspaper opinion and influence, that Chicago railroads must follow the example of those of New York and electrify.

Does the honorable Mayor, aforesaid, know that the authors of the electrical paper referred to, after closely analyzing and showing by comparison the savings possible by electric operation, go on to state that "the immediate and general adoption of the new motive power by our railroad companies is neither possible nor desirable," explaining that the very magnitude of such operations, coupled with the fact of the youthfulness of the art and the necessity for careful and close analysis of the conditions surrounding each railroad property requires conservative and carefully considered action?

When the chaos now existing north of the Grand Central Station shall have been cleared away, the structures and track equipment are completed, trains running normally, and under electrical power only, and when all the bills are paid, then and then only will we be able to profit by the experience gained in these two applications, so varied, so interesting and productive of discussion and opinion. The New York work of railroad electrification was of necessity, as was also that in Baltimore, and largely on account of tunnels and the traversing of long distances of densely populated sections as well as the movement of a multitude of trains in that territory.

No doubt the evolution of the transportation problem in this city would, sooner or later, without legislative action require the increased movement possibly by the more frequent detached or multiple unit trains, displacing the older transportation methods, and for such movements through tunnels, the comfort of passengers aside from any other consideration is enhanced by electric power. Just how we will take up this matter on the railroads in Chicago remains to be seen, but as yet there is little direct and conclusive information to be gained from New York electrification.

By this time I have probably established myself in your minds as opposed to progress and improvement in transportation methods, but I desire to state that this is not the case. On the contrary I am a firm believer in electric traction wherever there is density of population from which induced travel can be built up by increased transportation facilities. When there is a continued density of population across considerable territory, then electrification is possible and advisable as a railroad main line proposition, otherwise the steam locomotive in the present state of the art.

I will also admit the desirability, although not always conceding the necessity, for electrification of railroads in large cities, particularly those which are terminals and which deal in suburban transportation. I am also a believer in the possibilities in improvement of the steam locomotive and to a certain extent on the lines indicated under discussion.

The performance of superheater engines on the C. P. R., on which the regular coal records and not special test reports shows definite and conclusive savings under weather conditions much worse than we have in the states, should be proof of the value of superheating of locomotives. We are progressing slowly on the Rock Island in superheating. Most of our difficulties have been with details and not with the general principle, and I have no fear but that we and others now taking up superheating will be enabled to improve engine performance.

Modern simple locomotives are, as a rule, carrying too high steam pressure, brought about to some extent by the use of such pressures on compound engines, and we have to realize that a mistake was made for which we are paying dearly in boiler maintenance with no compensating gain in economy.

Dr. W. F. M. Goss contributed a paper last year to the Western Railway Club, based on data, showing conclusively that "the evaporative efficiency of a locomotive boiler is but slightly affected by changes in pressure between the limits of 120 and 240 lbs.," and with an allowable increase of weight for a given boiler better results can be obtained by increasing its capacity than by increasing its strength for carrying higher pressure. With the use of pressures beyond 160 lbs. the difficulty in maintaining boilers, particularly in a bad water district, increases in a startling ratio.

If, then, we take advantage of this, designing boilers for pressures that will contribute to economical maintenance, utilizing also admitted benefit of superheating in further improving the quality of the steam; also eliminating the breakages ensuing on carrying water over into the cylinders, such engines will no doubt give records most favorable as to fuel economy and maintenance.

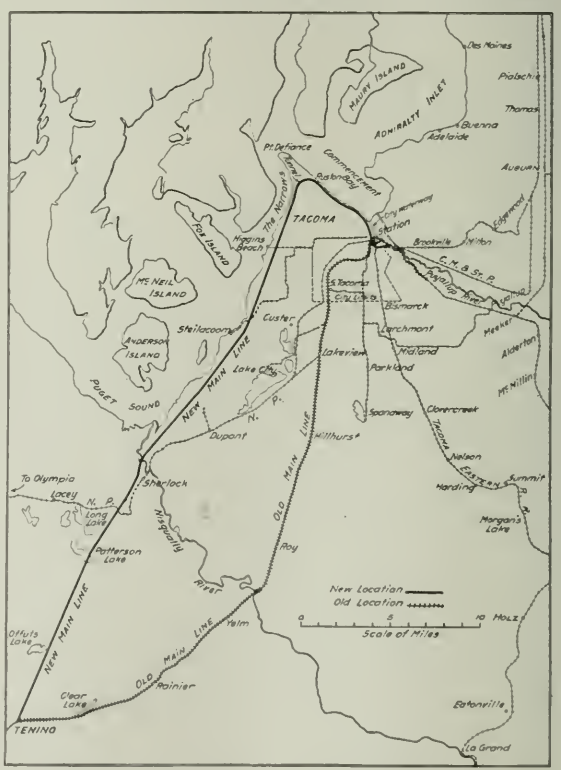
Feed water heating can be perfectly accomplished in stationary practice, but no successful heater has been developed for a locomotive. There may be one produced, but the chances are not in favor of it, as the water should come to a state of rest for precipitation, and this is not possible on a moving locomotive. Prevention is always better than cure, and the best place for feed water impurities is in the outlet of a water purification plant, and it will be found cheaper to take them out there than from the boiler. I have no doubt of getting larger economies in water treating than in heating for purification.

So far, I believe, there is no generally approved smoke consumer for locomotives except a good fireman. The stoker question is just now in a state of development, which is promising, but not yet conclusive. A pneumatic door-opener will decrease the labor of firemen very much and is worthy of attention until a successful stoker is adopted. I do not know if I have saved as many millions of dollars by my recommendations as has the distinguished writer of this paper (referring to Mr. Toltz's paper, not reprinted), but I do agree in the main with him and beg to congratulate him on his defense of the steam locomotive.

The New Tacoma-Tenino Line of the Northern Pacific.

BY H. COLE ESTEP.

At the time the Northern Pacific Railway was built there was nothing in the North Coast region to justify anything but the cheapest possible construction consistent with reasonable safety and economy of operation. But since that time conditions have changed mightily. The territory through which this and other northwestern



Part of Pierce County, Wash.; Showing New Tacoma-Tenino Line.

railroads pass has become comparatively thickly settled and traffic has increased enormously. To meet this demand the roads have been practically rebuilt. The Northern Pacific has been engaged in rebuilding work for 12 years and nearly every mile of track has been changed. There are still, however, a few weak spots in the system, probably the most notorious of which is the Tacoma terminal and the main line from Tacoma to Tenino, 39 miles south. The company has been working on this problem for a number of years, but has just recently begun active operations on a radical relocation of this section of the line.

The problem of getting into Tacoma from the east is easy of solution, the Puyallup river valley forming a natural gateway and a water grade to Commencement bay. But the problem of getting out of Tacoma to the south is very difficult. The bluff rises either vertically or on a 1½ to 1 slope directly from the shore of the bay

to an elevation of about 100 ft. and then shades off gradually, reaching a level plateau at an elevation of 250 ft., five miles back from the shore. Leading down from this plateau are several steep, narrow ravines. These form the only direct approach to the city from the south.

Sixteen miles south of Tacoma the Nisqually river, a stream of considerable size, flows into Puget Sound from the southeast. Access to the plateau back of the city, and the territory south of it, can be gained fairly easily by using this valley. The natural and only logical route for a railroad from Tacoma to Portland is

New Line West of Tacoma Passenger Station.
These tracks are now used for freight transfer.

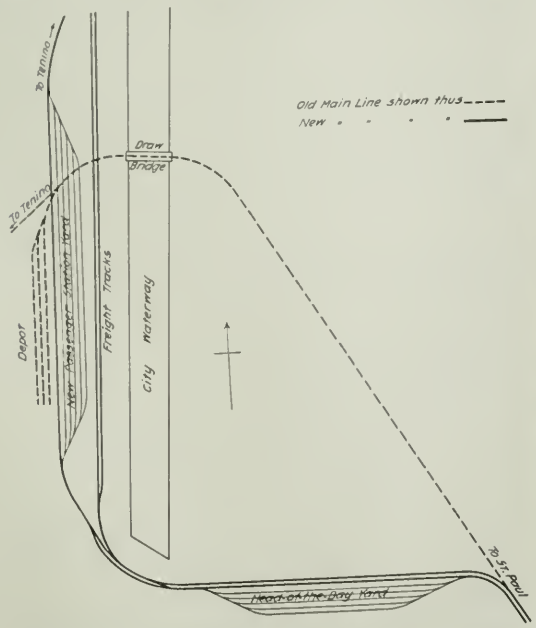
the one which follows the bay shore to the mouth of the Nisqually and then reaches the highland to the south through this gateway. But the construction of a line over this route encounters physical and financial difficulties which the original builders of the Northern Pacific preferred to avoid. They therefore accepted the only alternative and built the main line up the most favorable of the gulches noted above, and thus gained access to the prairie south of the city. This results in a tortuous 2.2 per cent. grade for four miles from Tacoma to South Tacoma, and in what is undoubtedly the most awkward and dangerous terminal arrangement on the coast. Likewise, the present location through the city of Tacoma includes many objectionable features.

The passenger station is approached from the east over a drawbridge which crosses a busy waterway and is open often, causing vexatious delays. Through trains, when ready to proceed, must back out onto the drawbridge and go up the heavy grade to South Tacoma. Trains approaching from the south must come down the same 2.2 per cent. grade, cross at grade the busiest streets of Tacoma and enter the drawbridge which is just at the foot of the hill. Stopping on the bridge, the train is backed up the hill into the station. A more clumsy, dangerous arrangement could hardly be imagined.

Temporary Track Through Tacoma Mill Co.'s Property.

The new location will do away with all of this. Commencing at a point just east of the city the new line, called for the first five miles the Point Defiance line, leaves the main line and turns to the left, passing through the Head-of-the-Bay yards. The tracks then swing around the end of the waterway now crossed by the drawbridge, eliminating this objectionable feature, and proceed due west to Point Defiance. The new passenger station will be located on the site of the present one, but the tracks will be 15 ft. lower. The station will be double-ended and through trains will proceed without switching. Freight traffic will be diverted around the passenger station, using the two freight tracks already built along the bay shore.

The new line, on which construction work is now commencing,



Rearrangement of Tacoma Terminals; Northern Pacific.

Tacoma-Tenino Line near Coal Bunkers.
This illustration shows present temporary tracks.

is 40 miles long from Tacoma to Tenino. The general route is along the shore of Commencement bay for five miles to Point Defiance, thence southward along the east shore of Puget Sound to the mouth of the Nisqually river, thence up the Nisqually valley to Sherlock, crossing the Olympia branch at this point, thence southerly, skirting Patterson lake and Offut's lake, to Tenino, where it joins the present main line.

Aside from the rearrangement of the passenger station and the elimination of the drawbridge, already noted, the new work contains several points of engineering interest, including the line under the bluff near Sperry Mills, the Point Defiance tunnel, and the big fill and bridge crossing the Nisqually valley and river.

From the passenger station to the smelter, four miles west, the line is practically complete. This portion will be double-tracked. Two miles west of the station, near Sperry Mills, the line is flanked by the bay on one side and by a high bluff on the other. For a distance of 500 ft. back of the mill the bluff is practically vertical, and in order to keep it from sliding onto the track a concrete retaining wall, 300 ft. long by 30 ft. high, is being built. Passing through the plant of the Tacoma Mill Company, part of which will be removed to make way for the new line, the track skirts the bay to a point just east of the Tacoma smelter. Here, turning to the south on a 3-deg. curve, the line enters a 4,000-ft. tunnel under Point Defiance. The tunnel is driven through a sandstone formation and the west portal brings the line out to the east shore of The Narrows.

The next point of interest is the crossing of the Nisqually valley. The problem of locating a successful crossing at this point, which baffled the engineers of 30 years ago in laying out the original line, has been boldly solved by two tremendous fills. The river is approached from the north on a long fill varying from 20 to 40 ft. in height. The river itself, which is narrow, is crossed by the customary steel span, and on the south side occurs a duplication of the long, heavy fill forming the north approach. Over 1,000,000 yds. of earth and broken stone will go into these fills. The rest of the line to Tenino, which cuts off one end of Patterson lake, presents no unusual problems and is nothing more than a first-class road through a broken country.

The new line will cost, all told, $5,000,000. It will have 0.3 per cent. maximum grades and 3-deg. maximum curves, whereas the present main line has 2.2 per cent. grades and 8-deg. curves. The location is one of the best pieces of work in the West and was done under the engineering supervision of A. R. Cook, Division Engineer of the Northern Pacific.

Equipment Depreciation and Renewal.

BY WILLIAM MAHL,

Comptroller of the Union Pacific System and the Southern Pacific Company.

The provision in the Interstate Commerce Commission accounting rules effective July 1, 1907, in respect to the charges to be made thereafter to operating expenses under "renewals" and under "depreciation" of the several classes of equipment, has opened a wide field of inquiry and speculation as to the measure of this depreciation. The lack of information on this subject is the cause of considerable perplexity to the railroads; for this reason, percentages for depreciation were adopted and charges growing out of the misunderstanding of the intent of the provision in respect of "renewals" were made, which increased considerably the operating expenses of the railroads for the month of July. The hope is expressed that during the year ending June 30, 1908, sufficient facts on this subject will have been collected to enable the Commission to decide on the percentage of depreciation to be observed by the railroads for the next year for each class of equipment.

In the hope of giving some aid to all concerned in this inquiry, several statements accompany this article bearing on equipment renewals and replacements. These are compiled from data published in the annual reports of the Southern Pacific Company but summarized so as to present the facts in a concrete form. These statements also illustrate a simple method by which the Commission, the investing public, and others interested in the matter may form an accurate estimate of the extent to which the railroads have taken up annually in their operating expenses the cost of equipment worn out, condemned, sold or otherwise disposed of. Any further charge is not within the facts at depreciation applies to the operation of railroads, and it is doubtful if any liabilities thus created would stand in law or would be considered as such in a sale in which the seller contracts to turn over the property free of all debts except outstanding stock and the mortgage debt, or would be recognized as such by the courts in the event of a receivership.

The annual reports of the Union Pacific and of the Southern Pacific state fully the equipment destroyed, condemned or sold and the equipment added during the year, and also the amounts charged respectively to operating expenses, to replacement funds, or to capital accounts. In this illustration of equipment depreciation and renewals, the Southern Pacific has been selected because the even tenor of its operations was not interrupted by a receivership, into which so many railroads were forced during the business depression which followed the panic of 1893, and the accountability for its equipment has not been changed from the policy originally adopted. The value of the statements submitted rest on this policy for, by it, the depreciation was made good in the fullest sense of the term. At some time the precise amount of depreciation must be accurately ascertained, if the data in respect thereof is to be of any value or guide.

In the operation of a railroad, the depreciation is equivalent to the replacement of that which has been worn out, or which was condemned or sold because its further use was unprofitable. The constituent companies of the Southern Pacific Company dealt with their equipment as they did with any other renewals and replacements, that is, they charged to the operating expenses the current cost of a new locomotive or a new car purchased to replace one destroyed, condemned or sold. Nearly all the railroads of the constituent companies had been in operation for a number of years before the Southern Pacific Company was organized. It is safe, therefore, to assume that a considerable depreciation in equipment had already taken place by 1885 and that the time was near at hand when the annual renewals would not be far from the average annual depreciation. The data for the five years from March, 1885, to December 31, 1889, is lacking, but, in the year 1890, Mr. Collis P. Huntington was elected President of the Southern Pacific Company and a definite policy was thereafter observed in respect to equipment renewals. In the closing section of his report for that year the following reference is made to the equipment:

> "There have been destroyed since the year 1885, when this Company commenced to operate these properties, a considerable number of cars belonging to the various companies, the greater part of which were then quite old and of light capacity. Of this number only a part has been replaced, but arrangements will be made to replace the remainder, about 1,150 cars, during the year 1891. Their cost, estimated to be $569,926.65, and representing cars of standard capacity, has been charged up, and this sum is included in the 'Renewal Fund,' shown under the Company's liabilities."

Beginning with 1890 the companies charged to operating expenses the cost of new locomotives and passenger train cars, less salvage, if such cost did not exceed by any considerable sum the cost of the equipment replaced. When the standard capacity of freight cars was 25 tons, and, later on, when this was increased to 30 tons, the companies charged to operating expenses the cost of a new 25-ton or a 30-ton capacity car, less salvage for the old car, for every freight car destroyed, condemned or otherwise disposed of. Exceptions were made in one or two instances in which a large number of old 10, 12 and 15-ton cars of the Oregon & California and of the Central Pacific were condemned; in these instances new cars were added equaling in the aggregate the tonnage capacity of the cars vacated. The companies continued in this course until 1898, when cars of 40 and 50-ton capacity came into use and the price of cars advanced. Prior to 1898 the companies paid $425 to $435 for a standard 30-ton capacity box car complete (the railroads furnishing the air-brake and fixtures), and it was believed to be to the best interest of the companies to make replacement along these lines rather than to take advantage of any technicalities in accounting and to charge a part of such cost to betterments. The use of freight cars of 40 and 50-ton capacity and the much greater cost of steel framing and bodies, the use of passenger train equipment of more costly design, and of locomotives of much greater capacity, made it necessary to modify the former practice in regard to these charges. Since 1898 the increase in wages and in material had also added largely to the former cost of equipment of the same design. The companies, however, have continued to make renewals of equipment along the same lines on which they made all other renewals, that is, at the current cost and have charged to their operating expenses the current cost of replacing the particular type of locomotive or design and character of car destroyed, condemned, sold or otherwise disposed of, less the cash received for it if destroyed on foreign lines or sold, or the value of the old material if destroyed on the home line or dismantled.

The amounts which were thus charged to operating expenses, together with the cash received from sales of, or value of, the old material, were credited to a "replacement fund," which was used to pay for new equipment of the capacity and design then best adapted to the traffic of the railroads. *By these methods two important conditions in railroad management were faithfully observed; first, the integrity of the capital account was maintained, and, secondly, the actual depreciation (i.e. the current cost of the equipment worn out, condemned, sold or otherwise disposed of), was taken up in the operating expenses and made good from the year's income.*

Considerable data relating to equipment matters prior to 1902 was destroyed in the warehouse burned on Pier No. 34, North river, in May, 1907. The data for the six years now submitted, however, will be of greater value in this inquiry than that of the preceding years, because the subject is dealt with during years of great prosperity when the companies condemned and sold equipment liberally, and also because the charge to operating expenses is for equipment at the present high cost and not at the lower cost prior to 1898. In the following tables the cost per annum is based on the average

number of locomotives and cars in service computed monthly. In "repairs" are included the expenditures for repairs and renewals other than replacement for equipment vacated. In "vacated" is included the cost of the equipment destroyed, condemned and dismantled, sold or changed to another class.

No. 1.—Locomotives; Southern Pacific Company.

Year	Average serviceable	Expenditures and charges for		Per locomotive per annum	
	No.	Repairs.	Vacated.	Repairs.	Vacated.
1907	1,691	$5,717,697	$271,820	$3,381.23	$160.74
1906	1,655	5,042,907	767,107	3,047.11	463.60
1905	1,637	5,179,486	142,257	3,164.01	87.59
1904	1,516	5,217,649	70,814	3,442.65	46.49
1903	1,419	4,412,410	197,382	3,109.52	139.10
1902	1,323	3,528,190	247,818	2,666.82	179.78
Average for 6 years	1,540	$4,875,240	$281,862	$3,165.39	$182.70

The large charge for locomotives vacated in 1906 resulted from the fact that a considerable number of locomotives in good condition, but too light for profitable service, were withdrawn. A number of them were sold to saw mills, and to logging and other railroads.

No. 2.—Passenger Train Cars; Southern Pacific Company.

Year	Average serviceable	Expenditures and charges for		Per car per annum.	
	No.	Repairs.	Vacated.	Repairs.	Vacated.
1907	1,700	$1,361,829	$120,889	$801.08	$71.11
1906	1,624	1,191,668	146,950	795.63	90.48
1905	1,566	1,221,568	102,301	780.05	65.53
1904	1,483	1,094,159	128,248	738.00	86.48
1903	1,349	1,013,262	315,930	751.12	234.19
1902	1,300	963,747	124,680	741.34	95.90
Average for 6 years	1,504	$1,141,589	$156,500	$759.20	$104.08

The large charge for cars vacated in 1903 resulted from a charge of $225,000 for cars destroyed by fire on the Alameda Mole.

No. 3.—Freight Train Cars; Southern Pacific Company.

Year.	Average serviceable	Expenditures and charges for		Per car per annum.	
	No.	Repairs.	Vacated.	Repairs.	Vacated.
1907	45,662	$3,875,956	$1,058,274	$88.77	$24.24
1906	44,172	3,173,773	1,289,492	71.85	28.74
1905	44,887	2,889,135	562,053	64.45	12.52
1904	44,571	3,031,840	524,882	68.02	11.78
1903	41,982	2,779,309	512,697	66.20	12.21
1902	38,625	2,380,410	465,372	61.63	12.04
Average for 6 years	42,983	$3,022,404	$732,128	$70.31	$17.03

The large charge for cars vacated in 1906 resulted from the withdrawal of 3,389 cars which, although in good condition, were too light for profitable service. In repairs, are included payments for foreign cars wrecked and the cost of repairing foreign cars while on the company's lines. From records kept for 12 years, the repairs of such cars averaged 7.58 per cent. of the combined repairs of owned and foreign cars.

The per cent. of freight-train cars vacated to the total number of freight-train cars in service at the beginning of each year for the past 17 years was as follows:

Year.	Per cent.	Year.	Per cent.	Year	Per cent	Year	Per cent.
1891	3.44	1896	2.87	1901	3.13	1906	6.83
1892	3.75	1897	2.28	1902	3.53	1907	4.39
1893	3.00	1898	3.54	1903	3.15		
1894	2.57	1899	4.41	1904	3.01		
1895	3.41	1900	3.02	1905	3.48		

Including the large number of cars vacated in the year 1906, the average for the 17 years is 3.63 per cent.

It should be borne in mind that this average of 3.63 per cent. is for cars of wooden construction, of which the cost of a box car probably did not exceed $450, excluding air-brakes. These wooden cars are now replaced by cars largely of metal construction, on which the depreciation will be slight, as, with the exception of cars destroyed or sold because they become unprofitable to use, the damaged or worn-out parts are constantly renewed and the depreciation thus made good. The position of these steel cars is similar to that of locomotives, which are vacated principally because of obsolescence and not of depreciation.

The following statement shows the number of locomotives and cars vacated in each of the six years, the amount credited to the replacement fund, the amount charged to operating expenses, and the amount of salvage:

Year	Locomotives.	Cars: Passenger train.	Cars: Freight train.	Cars: Road service.
1907	34	63	2,949	148
1906	127	47	3,389	103
1905	29	28	1,556	78
1904	17	32	1,367	56
1903	34	78	1,270	33
1902	53	51	1,266	50
Total number vacated	294	299	11,797	468
Total amount credited to replacement fund	$2,733,680	$1,264,139	$6,518,467	$265,504
Total amount charged to operating expenses	1,688,174	938,998	4,392,771	177,717
Scrap value or price realized for equipment sold	1,045,506	325,141	2,125,696	87,787
Av. price per locomotive or per car:				
Credited to replacement fund	9,298	4,228	533	567
Charged to operating expenses	5,742	3,140	372	380
Av. proceeds from sale or salvage	3,556	1,087	180	188

Total credited to replacement fund	$10,781,790
Total charged to operating expenses	7,197,659
Total scrap value or salvage	3,584,131

The sale to saw mills, to logging and other railroads of a considerable number of the locomotives vacated in 1906, added considerably to the salvage value.

Making allowance for the exceptions in the years 1903 and 1906, it will be observed that there has been a fairly approximate average annual charge for equipment vacated per locomotive or per car in service. This charge fixes a unit by which an estimate may be formed by all interested in this question of the extent to which a railroad company is making good the depreciation of its equipment.

There will be as much difference among the railroads in this charge for depreciation as there is now in the average cost per annum for maintenance of way and structures per mile of road, or for the average cost of repairs per locomotive or per car per annum; in fact, in any cost of operation, and rightly so, because the conditions are not alike on any two properties.

The lines of the Southern Pacific Company traverse such an extended area that its equipment is subjected to every climatic condition which affects its service or its life. Therefore, the results here submitted represent about an average of all conditions under which equipment is used or maintained.

From its organization the Southern Pacific Company purchased all equipment for the constituent companies. It did this because it could obtain it on more favorable terms and because a better observance of the adopted standards was secured thereby than if each company dealt separately for itself. The accountability for the equipment vacated, the allotment to the replacement fund or capital account of the respective companies, and the lease, sale or other disposition of equipment owned or purchased was entrusted by Mr. Collis P. Huntington to the writer. In 1886 Mr. Huntington also delegated to him the authority to approve all common standards for equipment for the lines controlled by him east of the Mississippi river, and, in 1894, for the lines of the Southern Pacific Company. In the lines east of the Mississippi river were six constituent companies, each operated by its own officers; the lines west of the Mississippi river comprised originally 26 distinct companies, thus making a total of 32 companies for which all transactions in respect to equipment came under the supervision of the writer up to the time of Mr. Huntington's death in August, 1900. The administration of this trust brought with it a great deal of personal work, and an experience with difficulties and complications which were not apparent until they were met. Much time and labor are required to secure accuracy in accounting for equipment even in so simple a form as that in which the results are reported under the heading of "Equipment" in the annual reports of the Union Pacific Railroad and of the Southern Pacific Company.

Appreciating, therefore, all the difficulties and cost which the keeping of the equipment accounts as contemplated by the Commission will impose upon the railroads without any practical compensation therefor, the writer expresses the hope that the Commission will amend its rules by omitting altogether the provision for "depreciation," and amend the provisions for "renewal" to represent the current cost of replacing all equipment vacated. This change will furnish the Commission with reliable data about the depreciation which has been carried into the operating expenses of the railroads and enable it to order adjustments suitable to each case if any such should be necessary.

Economy Test of 7,500-K.W. Westinghouse Parsons Steam Turbine

On September 1, 1907, an eight-hour economy test was made on turbine No. 253, installed earlier in the year, at Waterside station No. 2, of the New York Edison Co. The test was conducted by the New York Edison Company, under the direction of J. P. Sparrow, Chief Engineer, and the arrangements were carried out in accordance with a mutual agreement between builder and operator, entered into previous to the test. The results, as here given, were obtained by independent computation.

The turbine unit tested is of standard Westinghouse construction throughout. It has a maximum rated capacity of 11,250 kw., and was built to operate on 175 lbs. steam pressure, 28 in. vacuum and 100 deg. superheat. Under these conditions, the turbine unit was guaranteed to have a minimum steam consumption of 15.9 lbs. per kw. hr. at the generator terminals with a normal speed of 750 r.p.m. The electrical efficiency of the generator was guaranteed to be 97.8 per cent., exclusive of friction and windage, at a load corresponding to that sustained during the test. The results of the test detailed below show an economy about 7.5 per cent. better than the guarantee.

During the test period, No. 2 Waterside station sustained practically all of the 25-cycle load on the system, of which the unit under test carried practically 70 per cent., the remainder being carried by the other turbine units in the station. This load was maintained as constant as possible by remote control of the turbine governor by the switchboard operator. Between the first and the last hours of the test, the maximum variation in load was held within 4 per cent. above and below mean. During the last hour, however, the load decreased somewhat. Previous to the test, this

turbine unit had been running on a load of 7,000 kw., which was increased to its test load 10 minutes before the start.

Three-phase electrical load was measured by the two-wattmeter method, using two Weston indicating wattmeters of the standard laboratory type. These instruments were calibrated at the New York Electrical Testing Laboratories immediately before and after the test. Power factor was maintained substantially at unity, and all electrical readings were taken at one-minute intervals.

As a surface condenser was used in connection with this turbine unit, the water rate was determined by weighing the condensed steam delivered from the condenser hot well. This condensation was weighed in a tank mounted on platform scales, with a reservoir above large enough to hold the condensation accumulating between each weighing. These weighings of 12,000 to 13,000 lbs. each were made at intervals of five minutes. By the loop method of connecting the gland water supply the necessity for correcting condensation by an amount equivalent to the weight of the gland water used was avoided. A continuous gland water circuit was used entirely outside of the weighing apparatus, and all overflow from the standpipe was returned to the hot well delivery.

As the circulating water was quite salt, any condenser leakage could immediately be detected by the saliuity of the condensed steam which should be pure distilled water. On this account, condenser leakage was determined entirely by chemical analysis, employing the silver-nitrate test with a suitable color indicator. This method proved extremely sensitive and possessed a decided advantage over the ordinary method of weighing the leakage accumulating during a definite period when the condenser is idle and under full vacuum. As samples of circulating water and condensed steam could be taken at the same time, this method made it possible to discover any change in the rate of condenser leakage taking place during the test, while the method of weighing above described provides only an average result during the period.

In this condensing plant the delivery of the hot well pump is automatically controlled by a float valve in the interior of the hot well. This maintains the water level therein at a practically conatant point, and hence no correction had to be made for difference in level of water in the hot well before and after the test.

Steam pressures and temperatures were determined close to the turbine throttle. As usual, the degree of superheat was obtained by subtracting from the actual steam temperature the temperature of saturated steam at the corresponding pressure carried at the time. All gages and thermometers were calibrated previous to the test at the United States Testing Bureau. Both pressure and superheat were somewhat below the guarantee basis.

Vacuum was measured directly at the turbine exhaust by means of a mercury column with a barometer alongside for reducing to standard barometer—30 in. This also obviated the necessity for temperature correction between the two mercury columns. During the test the vacuum was not maintained quite up to normal.

The following data represents the results of the tests, calculated for the conditions as actually run; i.e., for instrumental errors only:

Duration of test	9:30 a. m. to 5:30 p. m.
Average steam pressure at throttle, lbs. per sq. in. gage	177.5
" superheat at throttle, degs. F.	95.74
" vacuum (referred to 30" Barom.) in Hg.	27.31
" load on generator, kilowatts	9,850.48
" steam consumption, as tested, lbs. per kw. hr.	15.15

Owing to the departure, during the test, from specific operating conditions on which guarantees were based, it was necessary to correct the observed results by the following amounts: Pressure (2.5 lbs. high) correction, 0.25; vacuum (0.69 in. low) correction, 1.84 per cent., superheat (4.26 deg. low) correction, .29 per cent. These corrections were mutually agreed upon previous to the test as representative of this type of turbine. When applied to the observed steam consumption given above, the following results, representing contract conditions, are obtained:

Average corrected water rate during 8-hr. test	14.85 lbs. per kw.-hr.
Guaranteed water rate	15.9 lbs. per kw.-hr.

The load was considerably lower during the first and last hour than during the main part of the test. Neglecting, therefore, these two hours and considering only the six hours period from 10.30 a.m. to 4.30 p.m., the results are as follows:

Average corrected water rate	14.8 lbs. per kw.-hr.
Equivalent water rate	10.65 lbs. b. h.-p.-hr.
Equivalent water rate	9.8 lbs. i. h.-p.-hr.

The two latter quantities are determined by applying conversion factors for generator efficiency and for internal losses.

In connection with these tests, a noteworthy agreement exists between the results noted and those previously obtained from tests of machines of similar design installed in the Manhattan station of the Interborough Rapid Transit Co., New York, and the Long Island City station of the Pennsylvania Railroad, at the same loads and with equivalent operating conditions, the performance of the machines is almost identical. These economic results, while not exceeding in actual steam consumption, the best records of European practice, are extremely good in view of the moderate operating conditions under which the test was conducted.

Progress on the Detroit River Tunnel.

The first section of the twin tubes and caisson of the Detroit river tunnel was successfully sunk in place on October 1, and the work of placing concrete by tremie in deep water is being carried on without difficulty. The accompanying illustration shows the first section, 260 ft. long, being towed down the river from the yard at St. Clair, Mich., where it was built and launched. There will be 10 sections like this, each 260 ft. long, and containing two tubes 23 ft. 4 in. in diameter. The tubes supported in the timber caissons will be sunk in a trench dredged in the bottom of the river and the caissons filled with concrete, completely surrounding the tubes.

Floating the First Section of the Detroit River Tunnel Tubes Into Place.

After concreting of a section has been completed the water will be pumped out of the tubes, a moderate air pressure put on and the work of putting in a reinforced concrete lining 20 in. thick begun from the inside. The tubes are built of boiler plate strongly braced and have a temporary bulkhead on each end which will be removed when the work of lining is begun. For a full description of the Detroit river tunnel work the reader is referred to the *Railroad Gazette*, February 16 and 23, 1906. The tunnel will cost about $10,000,000 and is expected to be completed by June, 1909.

Foreign Railroad Notes.

Express freight trains from Siberia to St. Petersburg and Baltic ports are to run the coming winter for carrying tea, fruit (?), eggs, fish, poultry, game and butter. The time from the River Obi to St. Petersburg will be 254 hours by way of Moscow and 224 hours by the route which passes north of Moscow.

The contract for the construction of a line from the Mer de Glace to the summit of the Jungfrau has been approved. This extension of the present line involves the excavation of a tunnel 2½ miles long under the Friar and the construction of about a mile and a half in the open with an elevator at the end rising to the center of the mountain. In spite of the apparent difficulties of the work, the engineers think that it can be finished in four years and a half of constant work. The capital required for this extension of the line will be $700,000.—*Le Journal des Transports.*

In South Africa railroad cars are used as movable missionary stations. Along the northern extension of the Cape Government Railways, clergymen of the Church of England for the past three years or more have been going up and down the line on locomotives and freight trains acting as missionary pioneers. The Cape government has now given to one of them a railroad car for missionary uses. There is also a similar car in use in the Transvaal and a third in Rhodesia. These cars are fitted up with a sitting room, kitchen and bedroom. They carry illustrated magazines, weekly papers and other literature which is welcomed in regions where good reading is scarce. They are parsonages or rectories on wheels.

Samuel Sloan.

Samuel Sloan, who died on September 25, was nearly 80 years old. He had been in bad health for about a year, although he presided as Chairman of the Board at the meeting of the directors of the Delaware, Lackawanna & Hudson last June. Mr. Sloan was born in Lisburn, Ireland, in 1817, his parents came to this country two years later. He was educated in New York and when he was 15 years old began work in an importing house. He became a partner in this firm, McBride & Co., in 1845, and was its head when he left it 10 years later. He became interested in New York city politics in 1852, and in 1857 was elected to the New York Senate. Two years before he was made a Director of the New York Central & Hudson River, and soon after was elected President of that company. He resigned in 1861 when Commodore Vanderbilt got control. He was then offered the presidency of the New York & Harlem, but declined. He was Arbitrator and Commissioner of Trunk Lines for two years and was then elected President of the Delaware, Lackawanna & Western. This road was then only a short line, getting a little way into the Pennsylvania coal fields. He resigned as President in 1899, being succeeded by W. H. Truesdale, and since that time acted as Chairman of the Board. He had been at various times president of many other roads, including the Michigan Central, the Rome, Watertown & Ogdensburg, and the International & Great Northern. At the time of his death he was a director or officer of 33 companies. He was married in 1843 and his wife and six children survive him.

Samuel Sloan.

A Modern Method of Locomotive Boiler Washing.

At a recent meeting of the Iowa Railway Club E. J. Harris presented a paper descriptive of the equipment used for washing out boilers in use at Valley Junction on the Chicago, Rock Island & Pacific. It is known as the Miller system for washing, changing water in and refilling locomotive boilers. This is comprised of two boilers or heaters, one 5 ft. in diameter and one 6 ft. 8 in. in diameter, both 16 ft. 6 in. long between flue sheets, the smaller placed over the larger and occupying one stall in the roundhouse. Each boiler is filled with flues and has a chamber at each end 2 ft. long, making them 20 ft. 6 in. long at joint of heads. Cold water under pressure from the boiler washing pump is admitted at the bottom of the larger heater, forced through from one heater to the other outside the flues and connection to the roundhouse boiler washing pipes made at top of the top heater. The exhaust steam of the stationary plant and waste water and steam from locomotives in need of boiler washing is used by means of suitable piping connected to the chambers at the ends of the heaters, to heat the cold water, with the result that there is always an abundance of hot water for boiler washing.

When the plant was first installed the steam pipe was connected to the heaters with a Y at one end between the heaters, the idea being that when blowing off the steam would rise to the top heater and hot water fall into the bottom one.

This did fairly good service, but we found when washing two boilers and filling two at the same time it was necessary to cut in a live steam pipe to the heaters to keep the water warm. This was too much of a drain on the stationary boilers, so a plan was developed to admit both steam and hot water to the lower heater. This made a marked improvement, which was still further bettered by the utilization of the waste steam and water of the roundhouse to heat all of the water. To do this partitions were inserted making three sections of the lower heater and two of the top. Waste steam and water was admitted to the central section of the lower heater, the waste steam flowing back through the upper section of flues in middle chamber, forward again through the top section of flues, up through the connecting pipe into lower section of upper heater, back through these flues and forward again in upper section of flues to the escape pipe to roof.

The hot water was made to flow back through the lower section of the flues in the middle chamber of the lower heater and forward again through the flues in the lower chamber to the overflow, thereby getting a perfect circulation through all of the flues of all of the heat obtainable. The results were very satisfactory. A Fahrenheit thermometer placed on the top boiler never registers less than 200 deg. while the usual registration runs from 208 to 212 deg. In fact, it is now necessary to blow off the locomotives into the heater in order to keep the roundhouse free from steam as the escape from the stationary boilers is sufficient to heat the water as evidenced by the continual escape of steam from the overflow pipe at the top of the heater.

With this arrangement the boilers are never allowed to cool except for boiler work, and there have been no cracked sheets since the system has been put into use. This, however, is perhaps one of the least of the benefits derived. The old method of preparing boilers for washing with the heavy power was as follows. Steam was blown off and sufficient cold water admitted to boiler through injector and check to fill boiler. The belly plug was then pulled and sufficient cold water allowed to flow into boiler to maintain a water level in the glass. This was kept up from an hour to one and one-half hours, by which time the boiler would be sufficiently cool to allow its being emptied of water, plugs pulled and washing started. A clear loss of from one to one and one-half hours, as by the new method the blow-off cock is connected to the heater and all of the steam and water blown off in the same time that was formerly used in blowing off the steam alone. The plugs are then pulled and it is found that all of the mud and slush being still hot is very easily washed out, particularly as we are using hot water to wash. Boiler is washed in two-thirds of the time, is washed more thoroughly, plugged and filled with hot water, and if engine is needed the caller is sent after the crew when the fire builder starts his fire in engine. Water being near 212 deg., or boiling point, the engine makes steam rapidly.

One of the heavy engines has been on the turntable under its own steam 25 minutes after the fire was started and where, under the old method, it averaged nine hours after an engine arrived at the cinker pit, to wash the boiler and get it outside ready for its train, the same work is now done in five hours, and with less injury to the boiler, as it never gets cold.

The time saved in doing the work is not the only economical factor. It has been found that under the old method it took about 7,000 gals. of water to cool the boiler, and this at 6 cents per 1,000 gals. cost 42 cents, which is now saved.

Tests were made to determine the saving of coal effected with the results as follows: Engine 1,642 with 3-in. cold water level in glass, water at a temperature of 42 deg. was fired up with 10 sticks of wood (cord), and in 1 hr. 50 min. the gage registered 50 lbs. steam, using 1,368 lbs. of coal.

Same engine with 3-in. hot water level in glass, water at a temperature of 170 deg., was fired up with 10 sticks of cord wood and in 55 minutes gage registered 50 lbs. steam, using 1,020 lbs. coal. Coal in both cases weighed and same man used in building fires.

About 1,600 engines are handled every month at this point, and it was found that the saving in fuel and water during the first 12 months nearly covered the cost of installation. It is also found that the saving in fuel and water amounts to 64 cents per engine as compared with the use of cold water, and that the average saving in these items since the plant was installed has amounted to $515.85 per month.

The new Executive Council of the Italian State Railroads, recently appointed, includes three engineers and two lawyers who belong to the government service, and two engineers and a great landed proprietor outside of the service.

Electrification of the Rochester Division of the Erie Railroad.

BY W. N. SMITH,
Electric Traction Engineer, Westinghouse, Church, Kerr & Co.

The change from steam to electric motive power on a portion of the Rochester division of the Erie Railroad, which took place on the 18th of June, 1907, is the first installation of a single-phase alternating system of electrical motive power on a steam railroad to go into commercial operation. This electrification can justly claim the priority of application of several important features, which are of interest in connection with the discussion on systems best suited for steam railroad electrification. This line was the first to operate electric cars on the single-phase system over the tracks of an operating steam railroad; the first in this country to use 11,000 volts working pressure commercially on a trolley, and the first instance of a heavy electric traction system receiving power from the 60,000-volt transmission line.

All of the construction described below, except that of the 60,000-volt power transmission line and the car bodies and trucks, was designed, executed and placed in operative condition by Westinghouse, Church, Kerr & Co., Engineers, through whose courtesy the drawings and photographs which illustrate this article were furnished.

The section of track equipped is 34 miles long, extending from Rochester over the main line of the Rochester division to Avon, about 19 miles, thence 15 miles over the Mt. Morris branch. The railroad is single track, with sidings at way stations, averaging three to four miles apart. The grades are light, and the curvature for the most part easy, the line being relatively quite straight.

The line was originally laid with 68-lb. rails, but was relaid with 80-lb. rail, taken from another division just prior to the electrification. The roadbed is ballasted with gravel, and the joints are of the Weber type. A single No. 2/0 protected rail bond is applied to each rail joint under the plate, one of the advantages of the high tension single-phase system being that the relatively small current combined with the high impedance of the main circuit renders it unnecessary to resort to heavy bonding. The line crosses a number of bridges, the longest one, that over the Genesee river, about a mile and a half south of Rochester, being 780 ft. long, comprising seven spans. There are also through truss bridges at Rush, and at Caneserauga creek, near Mt. Morris, and a stone arch bridge over Conesus creek, a short distance south of Avon.

The electric service is devoted solely to passenger traffic, which is of the local interurban type. The freight service is handled exclusively by steam as heretofore, as are also the through trains operating between Rochester and Corning over the main line of the Rochester division, a distance of about 94 miles. The steam service between Rochester and Mt. Morris originally consisted of three trains each way daily. The principal villages served are Avon, Genesee and Mt. Morris, the other regular way stations being little more than cross road stops. The population is entirely agricultural, and the Genesee valley traversed by this line is probably one of the most beautiful and prosperous farming regions of New York state. Instead of three round trips per day, the electric service has introduced six complete round trips between Rochester and Avon, and nine between Avon and Mt. Morris.

Rochester Terminal Yard, Four Tracks Electrified, Showing Overhead Span Construction.

POWER SUPPLY.

The power is generated at Niagara Falls, at the plant of the Ontario Power Company, and is transmitted at 60,000 volts, three-phase, over the lines of the Niagara, Lockport & Ontario Power Co. The Iroquois Construction Company built a branch connecting line from Mortimer, about four miles south of Rochester, to Avon, locating it on the Erie right-of-way for nearly the whole distance. The pole construction used on this branch transmission line is of the A-frame type, using two 40-ft. cypress poles, set abreast of each other, and inclined so that their tops are framed together, the butts being joined by horizontal plank braces underground. The conductors are of No. 4, hard drawn, stranded copper cable. The standard length of span between poles is 220 ft., which is shortened at curves where necessary. When crossing over the tracks of the Erie, or other railroads, a special construction of No. 0 copper cables carried on steel towers is used, so reinforced by guys that it is impossible

for a failure of the line to result in dropping the conductors across railroad tracks.

SUBSTATION BUILDING.

The substation building is located in the Y formed by the railroad tracks at Avon, and together with the car shed, is adjacent to the roundhouse and division repair shop. The walls of the building are of brick, resting on solid concrete foundations, the roof and floors being of reinforced concrete. The building is absolutely fireproof. Its dimensions are 39 ft. 8 in. x 41 ft. on the outside and 29 ft. 10 in. high from the top of the foundation to the top of the parapet.

In the basement of the building are located one of the transformer oil tanks and the oil pump. The main floor is divided into three rooms, the main transformer room being 43 ft. x 17 ft. and extending the full height of the structure to allow room for the high tension bus bars, which are carried over the transformers. The remaining space on the main floor is divided into a high tension room 16 ft. 8 in. by 19 ft. 8 in., and the operating room, 19 ft. 8 in. by 24 ft., where is located all the 11,000-volt switching apparatus and the measuring instruments.

SUBSTATION EQUIPMENT.

The transmission line terminates at the lightning arrester yard in the rear of the substation. The three high tension conductors from the lightning arresters enter the substation through glass discs held in 36-in. tile, set in the upper portion of the rear wall of the substation. Within the substation, the wires first pass through three 60,000-volt stick type circuit breakers, mounted directly inside of the rear wall. Thence over bare copper conductors to the three oil insulated choke coils, situated on the mezzanine floor; thence to three oil insulated series transformers, also on the mezzanine floor, from which connections are taken to the power measuring instruments in the operating room. The main connections finally terminate upon a set of copper bus bars in the transformer room directly over the line of transformers.

The 60,000 three-phase current is rendered available for single-phase distribution by means of three transformers of the Westinghouse oil insulated water-cooled type, each of 750 k.w. capacity. For the present installation, two transformers only are used at one time, the third being a spare. The high tension connections are such that in case of one transformer failing while in service, its connections can quickly be taken off of the bus bars and put on the spare transformers. The transformer windings are fitted with taps enabling the three-phase to two-phase "Scott connection" to be used. The low-tension windings can be so connected that either 11,000 volts or 22,000 volts can be obtained, so that in case it should ever be desired to transmit railway current for an extension of 40 or 50 miles to another substation it could readily be done without adding transformers to this equipment. The low-tension windings also have six taps, enabling relatively small variations in the secondary voltage if the same should be necessary to suit operating conditions in the trolley line.

The transformer cases are made of boiler iron. Each rests on a square cast iron base, which is in turn mounted on three pairs of wheels running on an iron substructure in the concrete floor of the room. A track runs lengthwise of the room directly in front of the transformers, a transfer truck running on it, on the top of which there is another set of wheels or rollers, which line up with those on which the transformer cases are set. When it is desired to remove the windings from the transformer case it is only necessary to disconnect the electrical, water and oil connections, roll the transformer off its substructure and on to the truck, which is then pushed to the rear end of the transformer room, where it comes directly under a 10-ton hand hoist.

Two cylindrical iron oil tanks are provided, each of slightly greater capacity than a single transformer. One is located in the basement directly under the transformer room, so that the oil from any transformer can readily be drained into it. The other is suspended from the concrete roof beams at the top of the transformer room, close to the side wall of the building, this being intended to act as a reservoir for distributing oil back into the transformer. The oil is pumped from the lower to the upper tank by means of a steam pump supplied from the boiler room in the adjacent division roundhouse, where steam is always available. From the upper tank oil is fed by gravity into either transformer. It is thus a simple matter to draw the oil off from any transformer if its insulating qualities are found to have depreciated, and the dehydrating, filtering or purifying apparatus can readily be employed with the aid of the pump, and the supply returned again to storage. The oil piping is of iron throughout.

The water circulation is by gravity, the supply coming from the railroad company's water tank system at the adjacent roundhouse, being pumped originally from the Genesee river about a mile distant. An artesian well had been sunk on the premises, but the water was so strongly impregnated with sulphur and other impurities that it was thought best not to introduce it into the copper piping in the transformers, although the cost of such a supply would have been practically nothing.

There are three separate water cooled coils in each transformer case, each one controlled by its own valve, so that the amount of water may be controlled as found necessary under various conditions of load.

The necessary transformation from three-phase to two-phase fits

Overland Bracket Construction for Main Line and Siding at West Henrietta.

in very well with the natural sub-division of the electrified line into two sections, one of which is about 19 miles long, north of Avon, and the other about 15 miles long, to the south of Avon. The connections were therefore laid out to operate the sections upon separate phases of the two-phase secondary system. Either the T or V connection can be used, the latter method being employed at present. Each one of the active transformers therefore feeds a separate section.

The outgoing 11,000-volt feeders run up to the mezzanine floor directly over the operating room, where they emerge from the building through perforated glass disks set in 18-in. round tiles.

A set of call bells is provided so that when the automatic breakers open a bell is rung in the car inspection shed adjoining. Also, if the temperature of any transformer runs above normal, a bell circuit connected to a thermometer in the top of the transformer tank is similarly made to operate. The station itself does not require the continuous presence of an attendant, which is needed in the case of a rotary converter substation. The working force is so organized that the car repair men are always available for manipulating the substation circuit breakers, and the cost of attendance is thereby reduced to a minimum.

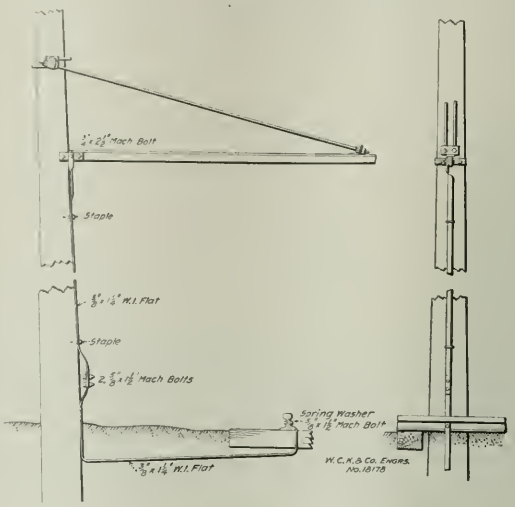
CATENARY TROLLEY CONSTRUCTION.

The overhead trolley construction is in many respects unique. It was the first catenary installation to operate regularly at 11,000 volts. There were few precedents to follow; many of the details of the overhead work are entirely original, and nearly all of them were specially designed for this installation by the engineers who executed the work.

The poles are of chestnut averaging 25 in. in circumference at the top, and about 42 in. at the butt. Most of them are about 35 ft. long, but 40-ft. poles were used where the embankments were narrow and steep, and in span construction. Nearly all the construction is of the bracket type, except at the railroad yards at Rochester, Avon and Mt. Morris, and for some distance at Mortimer, where there is a siding on each side of the main track, which prevented the use of bracket construction. The poles are given about 12 in. rake and are tamped with cobblestones, of which plenty were available from the coarse gravel with which the road is ballasted. Much water bearing gravel and quicksand was encountered in digging the holes and oil-barrels had to be resorted to in many instances to prevent caving in of the holes during pole setting.

The brackets are of an original design, each consisting of a 3½-in. x 2½-in. tee, 10 ft. long, the heel of which is fastened to the pole by a pair of bent straps, the outer end being supported from the pole top by two ⅝-in. steel truss rods, instead of the single rod commonly used for bracket work. The two rods are attached about 27 in. back from the outer end, and run one to each side of the pole, and are fastened there to a pole clamp devised for this work, which grips the top of the pole instead of requiring the bolt or truss rod to pass through it. In this way the timber of the pole is kept intact and does not have a hole bored through it which will admit moisture and induce rot. The two truss rods are threaded at both ends, and at the upper end each one passes through a small iron casting which is in turn carried on a bolt projecting out from the cast iron portion of the pole clamp like a trunnion. The whole construction is extremely rigid, and is stronger and more conducive to a long life for the pole than any bracket hitherto used. Where necessary, at switches, extra long brackets are employed, being lengthened by splicing and an extra truss rod being attached by means of a clamp to the outer end of such a bracket and run to the extreme top of the pole.

The insulator pins are of malleable iron, of a type specially devised for this work. The lower portion of the pin was divided and fitted closely over the flanges of the tee bracket, being provided with a single ⅝-in. bolt, by means of which the lower split portion of the pin is clamped securely against the bracket. The brackets and pins were furnished to the engineers' designs by the Electric Service Supplies Co.

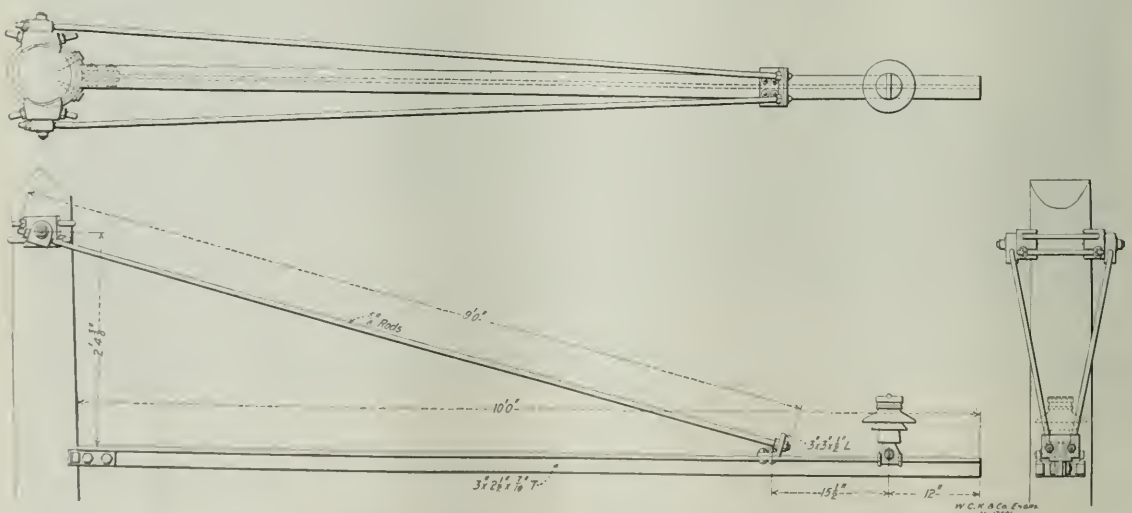


Method of Grounding Trolley Poles; Erie Railroad.

The insulator is of the R. Thomas & Sons manufacture, 6⅞ in. in diameter and 6 in. high, made in two parts, but of the three petticoat type, and known as the No. 3,029. It was designed by the engineers especially for this installation. As most of the overhead work was done during the winter months, and had to be rushed, a quick setting cement of litharge and glycerine was used in place of Portland cement, which not only enabled rapid work in construction, but obviated troubles due to the freezing of hydraulic cement while setting.

The insulator pins are ordinarily about 12 in. from the end of the bracket, but there is a space of 27½ in. between the end of the bracket and the point where the truss rods support it, which enables sufficient variation in location of insulator to meet most of the requirements in shifting the alinement of the trolley wire on curves.

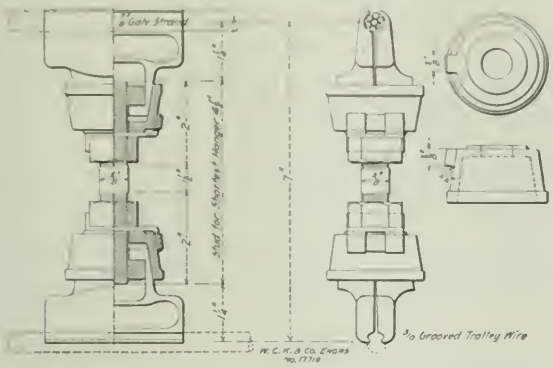
The messenger wire is of "extra high strength" steel, furnished



Standard Catenary Trolley Bracket; Erie Railroad.

by the American Steel & Wire Co. It is of seven strands, and is $^{7}/_{16}$ in. in diameter. Joints are made by using the so-called "open" and "closed" cable sockets, the sockets being sweated on to the abutting ends of the cables and joined by a pin connection through the eyes of the sockets. The trolley wire is No. 000 B. & S. grooved copper, the lengths being spliced with the usual type of soldered splicing sleeve.

The spans on the straight line track are 120 ft. long, and as much shorter than this on curves, as required by the radius of the curvature. The maximum deflection from the center line of the



Standard Catenary Trolley Hanger; Erie Railroad.

track, on curves, is 7 in. each way. The catenary hangers were of the Electric Railway Equipment Co.'s drop-forged type, being modified by the engineers to suit the requirements. The messenger clip and the trolley clip are of the same type but grooved differently to accommodate their respective wires. They are joined by a $^{5}/_{8}$-in. iron hanger-rod, with right-hand threads on each end, the longer rods being flattened in the middle to admit of bending them slightly so as to conform to the divergence of the messenger and trolley wire near the ends of the spans. Both trolley and messenger ears are secured in position by jam nuts. This type of suspension was developed especially for this installation, and is so constructed that there is no possibility of parts coming loose and falling apart on account of vibration. It is also very quickly and easily adjusted on the trolley wires. The hangers are spaced every 10 ft.

The steady strain rods are of treated wood of the Westinghouse Electric & Mfg. Co.'s make, and they are mounted at one side of the bracket instead of directly underneath, in order to give sufficient clearance for the pantagraph trolley on curves where the superelevation results in the tilting of the shoe from the horizontal. Each steady strain rod is hinged to a spool type Thomas porcelain strain insulator, which is clamped to one side of the bracket in such a manner that the hinged end of the rod is almost at the elevation of the top of the tee bracket. The method of attaching the steady strain insulators to the bracket is such that they can readily be shifted along the bracket to follow up any change in alinement of the trolley wire that may be required by curvature or for any other reason. The clamps holding the steady strain insulators are of 3-in. x $^{3}/_{8}$-in. bent iron. The spool type insulators are cemented on to pieces of $^{3}/_{4}$-in. pipe, through which passes the $^{5}/_{8}$-in. eye bolt by means of which they are attached to the bent irons. Steady strains are used only on curves and turnouts and were not found necessary on tangent track.

The tie wires are of No. 9 Extra BB galvanized telegraph wire, because it was thought best not to make too rigid an attachment between the messenger wire and the insulator; so that if a bracket became detached from the pole for any reason, its weight and the shock of detachment would tear the wire clear from the messenger and allow the bracket to fall entirely away from the wire and reduce the chance of steam railroad trains colliding with it. An accident to the electrical equipment of a railroad operating both steam and electric trains may shut down the electric service, but will not automatically place any check upon the steam service, so that accidents to steam trains must be guarded against, as a steam train might easily be wrecked by an obstruction which would automatically prevent power from being supplied to an electric train. This was one of the reasons for installing the system of "ground rods" from the brackets to the rails, which is carried out throughout the installation. Every bracket is grounded to the rail so that an insulator failure will instantly throw off the power, as it will cause a complete metallic short-circuit. There is thus no danger of setting the wooden poles on fire, which would be possible if this precaution were not taken. The burning of a wooden pole would not of itself necessarily cripple the electric service, but it would be quite likely to cause an obstruction dangerous to the passage of steam trains which are, of course, independent of any disturbances of the electric motive power system. Up to the present time, however, there have been no cases where the overhead construction has caused any obstruction to the passage of the steam traffic. The ground rods consist of $^{3}/_{8}$ in. x 1$^{1}/_{4}$ in. flat steel, their upper and lower ends being bolted to track rail and bracket respectively.

The span construction is as nearly as possible similar to the bracket construction, and uses the same type of pin and insulator. A piece of 3-in. x 2$^{1}/_{2}$-in. tee about 30 in. long is suspended from the span wire by hangers of galvanized strand cable, adjustable in length, and fastened to the span wire cable by specially designed clips, the construction forming a sort of stirrup upon which the pin and insulator are carried. The messenger wire rests upon the insulator just as in the case of regular bracket construction. This form is used, not only for spans where there is but one track, but also in the yards at Avon and Rochester, where three or four parallel tracks are electrified. Span construction, in general, was only used where conditions absolutely required it.

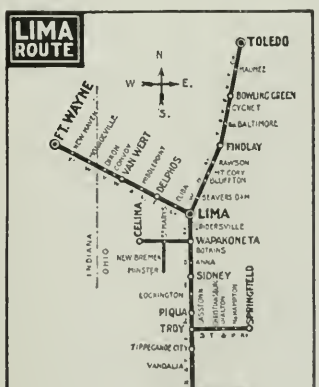
The Rochester yard was a difficult piece of construction on account of the distance between supports which reaches a maximum of 94 ft., where spanning seven tracks, four of which are electrified, and also on account of the uncertain nature of the soil which on the river bank is filled in with gravel and cinders. For these long spans, where it was impossible to use guys of the usual type (the river bank being on one side and the main highway, which gives teams access for loading and unloading of freight cars, on the other side), it became necessary to use self-supporting span construction, and this was done by using the "Tripartite" type of steel pole, set in concrete. This type of pole being constructed of re-rolled Bessemer steel rails is less subject to rust, and consequently more durable than any other available type of metal pole, and all of its surfaces are always open and easy of inspection. On account of the great tensile strength of the material, there is considerable saving in weight, and the fact that it was a standard product, enabled quicker delivery to be made than if special riveted poles of structural steel shapes had been designed for these locations. The span wires consist of the regular messenger cable fitted with cable sockets sweated on at each end, the same being fastened to turnbuckles and pole collars at the tops of the poles. There are two span cables at each pair of poles, the upper one being used to carry the weight, the lower one acting to steady the arrangement and also to act as a relay in case of an accident to the upper span. Similar construction was also used at Avon, where guying of side poles was not always possible.

(To be concluded.)

Electric Railway Competition.

BY RAY MORRIS,
Managing Editor, *Railroad Gazette*.

The *Railroad Gazette* has watched trolley competition closely ever since the inauguration of that competition about 1895, and has from time to time printed accounts of the existing situation in localities where the competition was most severe, and also of the general situation throughout the country. The last one of these general round-ups was printed May 12, 1905, and the method used in obtaining material for the present paper is the same that was used then; that is to say, a letter was written to every interurban line in the country with the request for specific information in regard to through runs, the time occupied in making these runs, the number of cars per day in each direction which made the through run named, steam competition, rates charged by the trolley company, and also by the steam company for its cheapest form of ticket between the points named, and we also inquired whether or not the steam railroad had reduced its fares since the onset of the trolley competition. The accompanying tables contain, in summarized form, the results of these inquiries. It will be seen that the first table includes all interurban runs of 10 miles or more concerning which replies were made to our inquiry. The total number of



Through Routes from Lima.
Toledo to Dayton, 160 miles.

such runs reported was 111, and the total mileage which they covered amounted to 3,361. The average speed of these cars was 19.9 miles an hour, and the average daily service consisted of a fraction under 19 cars in each direction. The average cheapest form of fare on the electric cars cost 1.47 cents per mile, while the average cheapest form of fare on competing steam lines cost 1.85 cents per mile.

* Commutation rate.
† Maximum, not average; incorrectly reported.
[1] Trolley line newly opened for half the distance.
[2] Steam fares reduced from 5 cts. per mile to 2 cts. per mile by trolley competition. Steam has shortest through route and does three-fourths of the through business. Trolley gets nearly all short haul.
[3] Trolley gets most of the business on holidays; all of it, other days.
[4] Electric railway does 97 per cent. of the business.
[5] Steam road abandoned two local trains, result of electric competition.
[6] Trolley time and distance exclusive of 2½ miles in city streets.
[7] Trolley does 90 per cent. of the business.
[8] Steam fares reduced from 2.92 cts. per mile by trolley competition.
[9] Steam road reduced fare 10 cts., but did not thereby affect trolley fares.
[10] Electricity does 95 per cent. of business.
[11] Steam fare reduced by competition from $1.65 to 75 cents.
[12] 94 per cent of business done by electric road in competing territory.
[13] Steam fare reduced from 50 to 30 cents.
[14] Reduction by steam road of 10 cents.
[15] Competes with electrified branch of New Haven road.
[16] Steam does three-fourths rush hour commutation business, electricity does most at other hours.
[17] Steam min. tickets more restricted than electric.
[18] 16 miles of this is third rail.
[19] Third rail, included in above.
[20] Steam fare less in competing territory, but street railway has developed and holds most of business.
[21] Steam has discontinued all but one round trip daily; electric sells through tickets.
[22] Electric has two-thirds of business.
[23] Electric has most of the business.
[24] Electric does 90 per cent. of business.
[25] Electric does 99 per cent. of business.
[26] 500 electric tickets sold to one steam ticket.
[27] Trolley does all the business; steam commutation tickets restricted.
[28] Electric road does 95 per cent. of the business.
[29] Third rail and trolley; Northern Pacific cancelled all local trains between Tacoma & Seattle after electric began.
[30] Trolley does almost all the business.
[31] Steam rate reduced from 2.94 by trolley competition.

Certain general results are quite clearly shown by this compilation. It will be noted that in a number of states, especially in the eastern and central part of the country, the steam railroad fare has this year been reduced to 2 cents a mile by legislative action.

The effect which this will have on trolley competition is as yet problematical. Railroads in Ohio, Indiana and other highly competitive states have generally found it unprofitable to meet trolley competition with a direct cut in fares, but now that this cut has been forced upon them, it will remain to be seen whether or not

On the Road.

Lands the traveling man in heart of every business district with baggage; no cartage.

End of the Week.

A record-breaking trip because he traveled by the electric. Three days to one the old way.

the other advantages of the trolley car over the steam train; that is to say, the frequent service at easily remembered intervals, and the fact that cars run through city streets and past dwelling houses, shops and farms, will balance the newly reduced rate of fare on the steam railroads. It seems highly probable that the street and interurban railway companies will not at all feel the effect of the reduction in fares. Unfortunately, the answers received to the question relative to the existing state of competition between steam and electric roads were very meagre. The writer hoped to get a general statement from each company in regard to the respective amount of business which it was doing as compared with its steam competitor, but the replies received were so few in number that they do not permit of generalization. Some of the answers in specific instances are of great interest, however; thus, the Petaluma & Santa Rosa Company, in California, reports that its steam competitor reduced its fares from 5 cents a mile to 2 cents a mile after the trolley road commenced business, that the steam railroad has the shortest through route and does three-fourths of the through business, but that the trolley gets almost all the short-haul traffic. It is probable that this result is typical of the experience of a very large number of railroad managers; that is to say, where they have to face the competition of an interurban road 20 or 30 miles long, they can scarcely hope to get the short-haul traffic between these points, but are quite likely to get the through haul, especially in hours of maximum travel, if they run a good service at an attractive price. Another example of just this thing is found in the case of the Taunton & Pawtucket Street Railway, 18 miles long, which reports that its competitor, the New York, New Haven & Hartford, does three-fourths of the rush-hour commutation business, while the electric road does most of the business at other hours.

The figures shown in the table for the average cheapest form of fare on the electric cars, 1.47 cents, is a very interesting one.

The Old Way. Freight.

Shipper No. 1: "Great Scott! I ordered those goods 30 days ago by the steam line and not here yet."

The New.

Shipper No. 2: "Yes, I ordered my goods by telephone and here they are the same day. It used to take a week."

In a large number of cases this rate is below the ordinary round trip rate, but it is without a single exception less restricted than the low railroad commutation rates with which it has to compete. The minimum fares on the steam railroads are not infrequently obtainable through the use of monthly commutation tickets, an equivalent form for which on the trolley roads is a ticket entitling the passenger to the same number of rides, but without time limitation. Nothing was more striking in looking over the replies to inquiries than this fact, than that the steam railroads quite invariably found it advisable to restrict the use of their cheapest form of ticket, while the trolley roads with equal unanimity had devised a similar form, but were less anxious to impose restrictions with regard to the user, the time limit or the amount of baggage which might be carried.

The accompanying illustrations taken from an interurban railway circular show very well the controlling reasons which have contributed to the great success of interurban roads in short-haul territory, which can practically be summed up in the word convenience. It is not apparent that the steam railroads are ever going to be able to win back lost short haul business, and it is very doubtful if they want this business. It is far better that suburban and interurban territory should be built up as it is now being built up, so as to supply long-haul passenger traffic, and, above all, freight traffic to steam railroads. In this connection, the policy of the New York, New Haven & Hartford, in controlling substantially all the trolley roads in its territory to a total of over 1,500 miles of electric line, is extremely interesting, and it seems not unlikely that this policy might prove a wise one for imitation in many points of the country outside New England.

The great center of interurban development in this country is Indianapolis, where the steam railroads are much harassed by the competition of the long, fast interurban lines, as may be judged by a glance at a table showing two through lines over 100 miles

Morning.

Gets on the car at her door and lands in the shopping district with out change.

Evening.

No dirt, no smoke, no cinders. A successful day, and all because she goes "the electric way."

long, and six through lines over 40 miles long in the state. Next to Indianapolis probably comes Dayton, then Detroit, then Toledo, then Cleveland, Columbus, Boston and Cincinnati in the order named, and the steam railroads most interested in the suburban and interurban traffic in the vicinity of these cities have not in a single instance made any strong effort to get the trolley lines into their own hands. It seems almost inevitable that the tendency of development for the next 10 or 15 years will be for this form of combination between steam and street railways to take place, so long as the laws remain open and permit it. In England it is impossible for a steam railroad to own and operate a street railway, and it may be only a few years before similar restrictions are placed in this country. In the meantime there are undoubtedly a very large number of places in this country where it would be much to the ultimate profit of the steam railroads to control the electric lines.

As regards the general tendency of interurban development, it is noteworthy that all the important trolley groups of the present day lie between the Great Lakes and the Ohio river, and that they have all arisen as a result of the process of coupling up short local lines originally built in cities and towns and then gradually extended until their ends met. This characteristic is, of course, radically different from that which characterized the growth of the steam railroads in the country. The steam railroads were almost always pushed out to connect distant points, while the trolley lines, at least until very recently, always started as local enterprises and then outgrew their bounds and crowded one another.

Assuming, therefore, that this process of coupling up short lines is the chief characteristic of American interurban development, it is

noteworthy that the process is about completed in the state of Indiana. There are almost no isolated small lines left in the state, where there are some 41 operating street railway companies, all but three or four of which connect with each other. No such complete development has taken place in Illinois or even in Ohio as yet, although these two states perhaps come next to Indiana in interurban importance, and, after mentioning a fairly active state of interurban development in Michigan, and also in New York, Massachusetts, Pennsylvania, New Jersey and Connecticut, of the eastern states, and also in the more densely populated part of the state of Washington, the noteworthy fact is that the rest of the country has scarcely begun building interurban lines at all.

According to the estimate made by the *Street Railway Journal*, there were 63 companies in the year 1906 which earned $1,000,000 or more, as against 53 companies in 1905. There were 44 companies in 1906 which earned between $500,000 and $1,000,000, as against 30 companies in 1905. There were 184 companies in 1906 which earned between $100,000 and $500,000; 100 companies which earned between $50,000 and $100,000, and 90 companies which earned between $25,000 and $50,000, gross earnings in each case being the figure quoted. There were 15 companies which earned more than $5,000,000 each in 1906, as against 14 in 1905, and 20 companies which earned over $4,000,000 in 1906, as against 16 in 1905. The most interesting part of the figures presented was that decreases were practically non-existent, while each of the groups of roads, arranged according to earnings, showed a very substantial gain over 1905. Thus, as we pointed out in reviewing "American Street Railway Investments" last July, the gain of the companies in Group One, having gross receipts of over $1,000,000, was 16 per cent. in 1906 over 1905; the gain in Group Two, having gross receipts between $500,000 and $1,000,000, was 31 per cent.; that of the third group, having receipts between $100,000 and $500,000, was over 24 per cent., and the gain of the group having gross receipts between $50,000 and $100,000, was 29 per cent. When we reflect on these figures and then upon the vast areas in the South and West, where there is practically no street railway mileage, the chances for ultimate profitable development seem almost unlimited.

Table B is a selection from table A of interurban runs of 20 miles or more at an average speed of 20 miles per hour or faster, and is strictly comparable with the table which we prepared in 1905. At this time we obtained an average of 26 miles an hour as the speed of the fastest cars and an average minimum fare of 1.41 cents per mile for the through runs named. This year the average rate of speed is 25.9 miles an hour, practically the same as that of 1905, but the average rate of fare has been increased to 1.56 cents. A number of companies stated in 1905 that they thought fares were too low and there has been a concerted effort since then in several states, noteworthy in Ohio, to increase them.

The "convenience" feature of trolley service, mentioned above, has always seemed to us to outweigh the specific feature of low fares, or at least of extremely low fares, as a stimulation of traffic, and it seems wholly probable that the extremely low fares quoted in some instances can be advanced somewhat without materially affecting business. For example, the International Railway Company, in competition with the New York Central, gives a minimum commutation fare of 0.39 cents per mile; the Toledo, Port Clinton & Lakeside, in Ohio, a minimum fare of 0.91 cents, and the Lewiston, Augusta & Waterville, in Maine, a minimum fare of 0.86 cents. We cannot see any reason why a trolley road or a steam road, either, should carry passengers at a figure below a cent a mile, except possibly in the case of regular daily commutation traffic, which needs special inducements to make it move long distances, but this is not the kind of work which a trolley line is best fitted to do.

Even a casual review of the facts and figures which have been stated in this paper must show that the interurban business in this country is one of very great promise which has as yet scarcely begun to be developed. The conclusion is irresistible—that the steam railroads most affected should work in line with this movement and not contrary to it, and make of the trolley lines useful friends instead of competitors.

A firm which furnished materials for the Prussian State Railroads made presents to clerks who had to do with ordering and accepting of the materials under the immediate direction of higher officials. These clerks regarded these presents as intended to influence their official acts in favor of this firm, and notified their superior officers. Suit was brought against the firm for slander, and it was found guilty. The court found that, whether accepted or not, the offering of such presents is an insult, as assuming the employees to be capable of a dishonorable act. The Railroad Minister has called attention of all employees to this decision and declared that severe measures will be taken against all who accept and all who offer gratuities of this kind; while those who offer them will be excluded from all business with the State Railroads thereafter.

[1] Electric does two-thirds of business; steam commutation more restricted than electric.
[2] Electric does most of the business; steam commutation more restricted.
[3] 90 per cent. of business done by electric.
[4] 99 per cent. of business done by electric.
[5] Steam road owns trolley road.
[6] Third rail and trolley; Northern Pacific cancelled all local trains between Tacoma and Seattle after electric began operation.
[7] For additional service, see under Idaho.

GENERAL NEWS SECTION

NOTES.

The city council of El Paso, Tex., has passed an ordinance prohibiting ticket brokers from doing business in that city.

Kansas and Michigan railroads are abolishing excursion rates with a view to making 2 cents a minimum as well as a maximum.

The New York Central will restore to its telegraphers and signal men the old rates of pay, which were reduced when the eight-hour law went into effect.

The Atchison, Topeka & Santa Fe has made an increase of two cents an hour in the pay of machinists and boilermakers and one and a half cents an hour in the pay of helpers in the shops.

Eleven residents of Hollis, L. I., have begun suits in the Supreme Court against the Long Island Railroad for injunctions to restrain it from the use of soft coal. Each of the plaintiffs demands money damages.

A suit in equity has been begun before the United States District Court at Atlanta, Ga., by the Central of Georgia, which alleges that the 2½-cent maximum passenger rate ordered by the state railroad commission is confiscatory.

It is stated that a contract has been entered into between the Erie and the Baldwin Locomotive Works whereby the latter is to repair one engine a day for the road. The work is to be done in the Eddystone shops near Philadelphia.

Trainmen and shopmen are striking on the United Railways (Havana, Cuba), and strike breakers have recently been brought in from the United States. There is no strike on the Van Horne system or the Cuba Eastern or the Cuban Central.

At the annual meeting of the Boston & Maine stockholders last Wednesday, less shares were voted than were needed for a quorum to elect Directors. This was because the 109,949 shares held by the New Haven, could not, under the act passed by the Massachusetts legislature last June, be voted.

The principal railroads of South Dakota have secured in the United States Court a temporary injunction against the enforcement of the reduction in passenger rates from 3 cents a mile to 2½ cents, which had been ordered by the State Railroad Commission to go into effect October 15.

M. V. Richards, head of the Land and Industrial Department of the Southern Railway, is now making a tour of the southern states with a company of 100 cotton spinners and manufacturers from Europe who desire to study the cotton industry of the south. The visitors come from England, Germany, Austria, France, Belgium, Italy and Portugal.

Mrs. Potter Palmer, who came over from Liverpool on the Cunard steamship "Lusitania," September 13, made the trip from Liverpool to Chicago in 6 days, 11 hours, 15 minutes, apparent time —or 6 days, 16 hours, 45 minutes, actual time. Mrs. Palmer left Liverpool September 7, 9.10 p.m.; arrived New York, September 13, at noon; left by the Pennsylvania special at 3.55 p.m.

At the annual meeting of the Canadian Pacific it was announced that additional steamships will be built or acquired either for the Pacific or Atlantic service and two for the lake service. If it is found impossible to acquire two larger and faster boats for the Atlantic service, they will be built, and the "Empress of Britain" and "Empress of Ireland" will be transferred to the Pacific service.

The Pennsylvania Lines West of Pittsburgh have renewed their contract with the Western Union Telegraph Company and the agreement has been extended to cover the Grand Rapids & Indiana and the Columbus & Sandusky. The agreement is taken to mean that the differences between the Pennsylvania Railroad and the Western Union, which led to the termination a few years ago of the contract with the W. U. on the lines east of Pittsburgh, has been settled.

Through the arrest of Joseph Williamson Oct. 7, the New Haven road believes that it has exposed a system of robbery which has cost the railroad $100,000 a year. For several months the railroad has been much annoyed by the disappearance of large quantities of goods in transit, especially in the neighborhood of this city. The transfer barges were watched recently, and it is said that 20 others, including several tugboat captains, have been engaged in looting cars on the barges.

Western roads have decided that on and after Nov. 1 next tickets sold at second class party fares will not be good in parlor cars or standard or tourist sleepers. They have further decided to cease the practice of transferring baggage free between stations, when the owners of such baggage have not through tickets. Kansas roads have decided that local excess baggage in that state shall hereafter be charged 1⅛ per cent of the 2-cent passenger rate, and that home-seekers' excursion rates shall not apply locally in Kansas, nor shall such rates be made from points in the eastern part of the state to points in the western part.

After Jan. 1 clergymen who have been traveling on half rates on all western railroads will be compelled to pay full fare. The Transcontinental Passenger Association will continue to issue half-fare permits to clergymen so long as the rates are not reduced in Colorado, Montana, Arizona and states west of there to the Pacific coast. The permits may also be continued in Louisiana and Texas, where their withdrawal depends upon the state commissions of those states. The action of the railroads is in line with the announced policy of withdrawing all reduced rate privileges in states where the 2-cent laws are passed.

Vice-President W. C. Brown, of the New York Central, at an address at a luncheon given by business men in Boston last week, announced that beginning October 27 through passenger trains would be run between Boston and Buffalo well-equipped for the best service, meaning, presumably, with a full equipment of dining cars. This change probably means the separation of eastbound Boston cars from the New York cars at Buffalo instead of Albany. Mr. Brown said that $1,275,000 was to be spent for additional main tracks on the Boston & Albany, $1,389,600 for locomotives and $364,000 for passenger cars; most of this within the present year. He predicted that the export freight traffic from the West through the Atlantic ports, including Boston, would continue to increase.

Announcement is made of the following men chosen to constitute a special joint committee to represent western and southern lines in an effort to draft a uniform classification: Southern: W. R. Powe, Chairman; D. M. Goodwyn, General Freight Agent, Louisville & Nashville; D. W. Longstreet, General Freight Agent of the Illinois Central at Memphis; G. R. Browder, Assistant Freight Traffic Manager of the Southern at Atlanta; A. S. Dodge, formerly Vice-President of the Frisco. Western: W. B. Hamblin, General Freight Agent of the Burlington, Chicago; E. H. Wood, General Freight Agent of the Union Pacific, Omaha; R. C. Fyfe, Assistant General Freight Agent of the Cotton Belt; W. M. Hopkins, formerly General Freight Agent of the Minneapolis & St. Louis; R. H. Countiss, agent Transcontinental Freight Bureau.

National Association of Railway Commissioners.

Co-operation between the Interstate Commerce Commission and the state railroad commissions was the dominant note in speech and action of the first day's session of the National Association of Railway Commissioners, holding its 19th annual session in the hearing room of the Interstate Commerce Commission at Washington. Chairman Knapp, of the Interstate Commerce Commission, made co-operation between state and nation the theme of his address opening the convention. The sentiment received hearty endorsement, and the convention lost no time in carrying out the idea by adopting, after liberal discussion, the report of the committee on grade crossings, accompanied by a resolution that a model bill be drafted by committee to present to state legislatures looking to the abolition of grade crossings. The report was presented by Commissioner A. T. Siler, of Kentucky, and its discussion brought out statistics revealing tremendous loss of life at grade crossings throughout the country.

The convention next voted for a uniform system of accounting to be required of both steam and electric lines. The discussion of this report, presented by O. W. Seymour, of Connecticut, and heartily endorsed by Commissioner Decker, of New York, also revealed the desire of the commissioners to make uniformity in state legislation most emphatic.

Florida East Coast Extension.

In denying the rumors that work on the Florida East Coast Railway's extension from Homestead, Fla., southwest along the Florida keys to Key West, about 125 miles, is to be stopped or curtailed, J. R. Parrott, Vice-President and General Manager of the road, who is in charge of the extension, said, in part:

"There is not the slightest intention of abandoning the work of building the Key West extension. We expect to have the road

built to Knight's Key, 66 miles from Homestead, and boats running from that point to Cuba by January 15 ,1908. Since the beginning of the work, construction has been under way on the entire line between Homestead and Key West, forces being at work at both ends and in the middle. In August nearly all the machinery and forces available were transferred to the section north of Knight's Key so as to get that part in operation and have it earning something. In thus concentrating our work we were able to lay off a great many steamboats and launches. This saving was also helped by getting rails laid on 57 miles of line south of Homestead. Before the rails were down boats were used entirely for moving men, material and supplies. On the southern end of the line, Key West north to Bahia Honda, 47 miles, 80 per cent. of the work is about finished. Between Knight's Key and Bahia Honda, 12 miles, are the three viaducts. So far these three openings offer no problems that have not already been overcome in the Long Key opening, which is about finished and which is longer than any of the others. There are 2,500 men employed at present, as against about 1,600 at the same date last year."

American Street & Interurban Railway Association.

The program of entertainment for delegates and guests to the American Street & Interurban Railway Association, and Accountants', Engineering and Claim Agents' Associations at Atlantic City during the week beginning October 14, is an attractive one. On Monday evening Miss Kitty Cheatham will entertain for an hour in the solarium of the Marlborough-Blenheim hotel. On Wednesday afternoon the ladies of the convention will be entertained at the Country Club at Atlantic City, and on the evening of the same day a theatre party will be given. The Supplymen's third annual amateur theatrical performance will be given at Young's Pier Theatre Thursday evening following a trolley trip in the afternoon for the ladies of the convention. On Friday afternoon the men will be given an opportunity to take part in a golf tournament at the Country Club. On Friday evening there will be an entertainment at the solarium of the Marlborough-Blenheim. Delegates and guests will be entitled to use roller chairs, and the Delaware & Atlantic Telephone Co., the Bell Telephone Co., Philadelphia, Pa., and the American Telephone & Telegraph Co. will provide local service day and night and long distance service before 9 a.m. and after 6 p.m. without charge. A. L. Whipple, of the Curtain Supply Co., is Chairman of the Entertainment Committee.

TRADE CATALOGUES.

Concrete Piles.—The Simplex Concrete Piling Company, Tacony, Philadelphia, Pa., has issued an interesting pamphlet describing simplex concrete piles. It is illustrated with unusually good reproductions of photographs showing the piles while being driven; also single piles and groups of piles partially or entirely excavated after being driven. Other photographs show the piles being tested. In one case a single pile was loaded with 50 tons without settlement and with 70 tons with a settlement of ½ in. Other interesting views show piles being driven under difficult conditions, such as close to old walls and inside of buildings where very short piles have to be used. Line drawings show the two types of driving forms used; one has a cast-iron point which is left in the ground and the other an alligator point, which consists of jaws that open so as to be withdrawn with the rest of the form. Other line drawings show different types of foundations, and comparisons of the number, time needed for driving and efficiency of concrete piles and wooden piles. A striking photograph shows a number of wooden piles which failed completely after being driven. Many examples of concrete pile foundations are shown, using the shell, molded, jointed and composite types of Simplex piles.

Turbine Pumps.—The Watson-Stillman Company, New York, is distributing sectional catalogue No. 72 describing Twinvolute turbine pumps; these are made single stage for low heads and two stage for higher duty. The construction and operation of the pumps are described, being illustrated with line drawings and half-tones. The two types are also shown as driven by alternating-current or direct-current motors. Tables give the capacities in gallons per minute at different velocities, the friction head in pipe, the head in feet with equivalent in pounds pressure, theoretical horse-power required to raise water to different heights nad similar information on hydraulics. The catalogue includes a list of other catalogues of hydraulic machines made by the company.

Portable Machine Tools.—A particularly attractive catalogue issued by H. B. Underwood & Co., Philadelphia, Pa., is devoted to portable tools for railroad repair shops. Each tool is clearly illustrated by half-tones and is given a short description. A large variety of tools is shown, including different kinds of portable bars for boring cylinders, valve seats and engine guides. These are shown both in operation and in detail showing parts and attachments, including different cutterheads, etc. Other tools are: Circular planer tools for driving boxes and valve seats, cylinder dome facing machine, portable milling machine, crank pin turning machine, and other apparatus.

Chain Belt.—General catalogue No. 35 of the Chain Belt Company, Milwaukee, Wis., has 287 pages and is attractively bound in cloth. It is exceedingly full and profusely illustrated with half-tones showing many styles of chain belt conveyors in operation. It gives the approximate horse-power of different kinds of chain belts, specific gravities and weights of various substances handled by conveyors and other information of interest. Each kind of chain is illustrated, and full price lists, capacities, weights, etc., given. The catalogue also covers auxiliary parts of conveying systems, including buckets, elevator boots, clutches, gears and other products of the company.

Draft Gear.—A folder published by the Waugh Draft Gear Co., Chicago, consists of a brief statement of the advantages of this draft gear and a number of half-tone illustrations showing relative positions of the parts under different stages of tension and compression; also the manner of applying it to wooden and steel sills. The gear consists of transverse spring plates in groups of eight or more, separated by concave and convex castings, alternating. It is claimed that tests show from 200,000 to 600,000 lbs. spring cushion capacity in 2-in. to 3-in. drawbar travel, with no recoil.

Steam Turbines.—The General Electric Company, Schenectady, N. Y., has issued pamphlet No. 4,531 describing the Curtis steam turbine generator. The line and half-tone illustrations show the complete machine and details of the buckets and other parts. Reports of tests of different sizes of Curtis turbines showing vacuum, superheat, pressure, etc., under different loads are included. One test shows the comparative efficiency of a turbine and a reciprocating engine of equal rating, operating under the same conditions.

Municipal Filtration.—The Pittsburgh Filter Manufacturing Co., Pittsburgh, Pa., has published an illustrated pamphlet describing installations made by the company of municipal filtration plants in a number of cities. The pamphlet includes reports of the operation of certain plants, in which daily comparisons show the color, odor, amount of alkali, incrustants, bacteria, etc., of the filtered and unfiltered water. The pamphlet also illustrates and describes the different filters and auxiliary apparatus the company installs.

Wattmeters.—Bulletin No. 4,527 of the General Electric Company, Schenectady, N. Y., describes the Thomson polyphase induction wattmeters. These can be used for one, two or three-phase circuits. They are made in three types: one for house service, with a metal cover, and two for switchboards, one kind having a metal cover and the other a glass cover. The bulletin gives the capacities, etc., of the different sizes and a number of connection diagrams showing the method of installation on different circuits.

Electrolysis.—The H. W. Johns-Manville Co., New York, has published a small circular on the company's Electroless pipe covering. It speaks of the well-known effect of stray currents on pipe and is illustrated with photographs showing sections of pipe so affected. Electroless pipe covering is made of asbestos paper, impregnated and coated with a waterproof insulating compound.

Snow Plows.—A small pamphlet issued by the Wilder Snow Plow & Manufacturing Co., Worcester, Mass., illustrates and describes the Wilder radial snow plow. It is claimed that this plow is particularly successful on sudden changes of grade and on curves as sharp as 45 ft. radius. It is made for electric railways in two sizes, weighing respectively 38,000 lbs. and 42,000 lbs.

Derails.—The Hayes Track Appliance Co., Geneva, N. Y., has sent out circulars Nos. 47 and 48, consisting of reproductions of photographs showing different models of Hayes derails as applied to different sizes of rails. Other illustrations show installations of these derails at interlocking stations on several roads.

Rock Island Employees' Magazine.—The October number has some good short articles. They include "Staff Meetings an Aid to Team Work"; "Brevity in Telegrams," and "Pointers on Handling Freight." Other matters of special interest to the employees of the system make up the balance of the magazine.

Concrete Construction.—Bulletin No. 16 of the Association of American Portland Cement Manufacturers, Philadelphia, Pa., is entitled "Regulation and Control of Concrete Construction," by E. S. Larned.

MANUFACTURING AND BUSINESS.

The Samson Cordage Works, Boston, Mass., is putting on the market a signal cord with a galvanized steel wire metal center.

W. P. Cosper, Chicago, has resigned as General Sales Agent of the Garton-Daniels department of the Electric Service Supplies Co., to engage in the manufacture of hot water heaters for steam and electric railroad cars.

The Barker Mail Crane Co., Clinton, Ohio, has contracts with the Harriman Lines for the use of the company's all-iron mail crane. The crane is now standard on the Northern Pacific, Chicago, Milwaukee & St. Paul, and the New York, Ontario & Western. They have been installed on 30 railroads.

The increase in capital stock of the Westinghouse Air-Brake Co., Pittsburgh, Pa., from $3,000,000 to $14,000,000, and the distribution of a 25 per cent. stock dividend were considered at the annual meeting of the stockholders last week, but it was decided to act finally at a special meeting called for December 3.

The Washburn Steel Castings Coupler Co., Minneapolis, Minn., will exhibit at the American Street & Interurban Railway Association's convention at Atlantic City a number of types of traction couplers. Only a few of these have heretofore been offered for sale, but the company is now ready to put them on the market in large amounts

The Goldschmidt Thermit Co., New York, will have an exhibit in the music hall on the steel pier at the Atlantic City convention of the American Street & Interurban Railway Association and also a demonstration booth just outside of the pier for showing the welding of street car rails, motor cases, truck frames, etc. The company's new system of using yellow wax as a matrix for the mold is used in repairing motor cases.

John MacD. Greene, Drexel Building, Philadelphia, Pa., has established a brokerage business for the handling of released machinery in connection with the engineering work of the Greene Engineering Co., of which he is President. The Greene Engineering Co. is a specialist in plant modernization and in designing and supervising the construction of elevating and conveying plants of all kinds. Bulletins of released machinery on hand are issued monthly.

Walter B Snow, for some years in charge of the Publicity Department of the B. F. Sturtevant Co., has opened an office at 170 Summer street, Boston, Mass., as a publicity engineer. He is prepared to conduct the publicity departments of a limited number of non-competitive clients and to render special service to others in the form of general advertising, catalogue making, technical writing and investigation. There is room in the fields covered by trade and technical papers for the kind of work Mr. Snow proposes to do, and he is especially fitted to succeed. He has had practical experience in the machine shop and as a shop foreman, and was for some time chief draftsman, and later mechanical engineer, for the B. F. Sturtevant Co., Hyde Park, Mass. He had charge of designing and erecting the new plant of the company at Hyde Park. During his more than 20 years connection with the B. F. Sturtevant Co. he had charge of all the publicity work, including not only trade paper advertising and catalogue making, but preparing special treatises, delivering lectures at technical schools and before engineering societies and writing special articles for the technical press. He had charge of the photographic retouching and printing departments and compiled special mailing lists for circularizing and systematic following. Part of his time was devoted to doing similar work for a large machine tool company and for a maker of steam pumping and condensing machinery. Mr. Snow is a graduate of the Massachusetts Institute of Technology, and is a member of the Society of Mechanical Engineers, and has served as a member of the Publication Committee of that society.

Iron and Steel.

The Maryland Steel Company is reported as having an additional order for 5,000 tons of rails for the Panama Canal; delivery to be made in 75 days.

Official announcement is made by the Bethlehem Steel Corporation that 15,000 tons of high grade open hearth rails have been sold to the Lehigh Valley. The price, it is said, is in excess of $28 a ton.

The Jones & Laughlin Steel Co., Pittsburgh, Pa., is to build one of the largest rail mills in the world at its new plant at Aliquippa, Pa. Work on the new mill will not begin until after the new blast furnaces are blown in. It is said that the company has been guaranteed orders for 1,000,000 tons of rails when the mill is in operation.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Franklin Institute.

At the section meeting held October 10, a paper on the Thermo-Electric Production of Iron and Steel, by Dr. Joseph W. Richards, of Lehigh University, was presented.

Western Railway Club.

The October meeting will be held at the Auditorium Hotel, Chicago, on Tuesday, the 15th inst., at 8 o'clock p.m. A paper on "Steel Tires; Causes of Imperfections and Defects," will be read by George L. Norris, Engineer of Tests, Standard Steel Works, Burnham, Pa.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Apalachicola Northern.—W. C. Myers has been appointed Auditor, with office at Apalachicola, Fla., succeeding A. H. Guest, resigned.

Chicago & Alton.—The following new Directors have been elected: T. H. Hubbard, T. P. Shonts, G. H. Ross, Joy Morton, F. H. Davis, W. G. Beale and H. E. Huntington. The following members of the old Board remain Directors: Edwin Hawley, N. B. Ream, Samuel Felton and J. J. Mitchell.

Chicago, Rock Island & Pacific.—L. K. Luff, Assistant Auditor of Freight Traffic, has been appointed Auditor of Disbursements, succeeding C. F. Balch.

Delaware & Hudson.—W. D. Schofield has been appointed Assistant to the President, with office at New York, succeeding W. H. Williams, elected Third Vice-President in charge of the treasury and accounting departments.

Detroit & Mackinac.—See Erie & Michigan Railway & Navigation.

Erie & Michigan Railway & Navigation.—T. G. Winnett, General Passenger Agent of the Detroit & Mackinac, has been elected also President of the Erie & Michigan Railway & Navigation, with office at Bay City, Mich. S. S. Jenkins has been appointed Treasurer, with office at Chicago. C. W. Luce, General Superintendent of the Detroit & Mackinac, has been appointed also General Superintendent of the Erie & Michigan Railway & Navigation, with office at East Tawas, Mich.

Illinois Valley Belt.—E. B. Ashcraft, Vice-President, has been elected President. A. E. George, Secretary and Treasurer, has been elected Vice-President and General Manager. J. R. Hawkins succeeds Mr. George. The offices of all are at Chicago.

Missouri Southern.—See this company under Purchasing Officers.

New York, New Haven & Hartford.—O. M. Shepard, formerly General Superintendent, has been appointed Assistant to Vice-President John F. Stevens.

Northern Pacific.—A. C. James has been elected a Director, succeeding D. W. James, deceased.

Oklahoma Central.—T. C. Woods has been elected Secretary, with office at Purcell, Ind. T., succeeding W. G. Walling.

St. Joseph Valley.—The officers of this road, which has just been opened from Angola, Ind., to La Grange, 26 miles, are as follows: President, H. E. Buckley; Vice-President, John Fieldhouse; Treasurer, C. H. Winchester; Secretary and Auditor, Strafford Maxon; Superintendent, M. L. Swinehart, and Traffic Manager, G. T. Moore. The general offices are at La Grange, Ind.

St. Louis Southwestern of Texas.—R. C. Fyfe, Assistant General Freight Agent, has resigned to become a member of a special committee of the Universal Classification Committee.

Sonora Railway.—The office of W. G. Sherlock, Assistant Auditor, has been moved from Guaymas, Mex., to Tucson, Ariz.

Tremont & Gulf.—The general offices have been moved from Tremont, La., to Winnfield, La.

Wisconsin Central.—G. W. Webster, Secretary, and S. G. Courten have been elected Directors, succeeding W. F. Vilas and G. M. Cummings, resigned.

Operating Officers.

Arizona & Colorado.—J. W. Williams has been appointed Superintendent, with office at Naco, Ariz.

Chicago, Burlington & Quincy.—J. M. Gruber, General Manager of the Lines East of the Missouri River, has resigned to go to the Great Northern.

Chicago, Rock Island & Pacific.—T. H. Beacom, Superintendent of the Oklahoma division, has been appointed Superintendent of the Missouri division, with office at Trenton, Mo., succeeding W. H. Whitenton, transferred. H. M. Hallock, General Superintendent of the Choctaw division, succeeds Mr. Beacom, with office at El Reno, Okla. T.

F. O. Whiteman has been appointed Trainmaster at El Dorado, Ark., succeeding J. H. Lynch, assigned to other duties.

El Paso & Southwestern.—W. G. Roe, Trainmaster at Carrizozo, N. Mex., has been appointed Assistant Superintendent at Alamogordo, N. Mex. R. C. TenEyck succeeds Mr. Roe.

Florida East Coast.—O. M. Carter has not been appointed Consulting Engineer as stated in this column last week.

Great Northern.—See Chicago, Burlington & Quincy.

Grand Trunk.—J. C. Crombie has been appointed Master of Transportation at London, Ont., succeeding D. Crombie, promoted.

Keweenaw Central.—The office of J. C. Shields, General Superintendent, has been moved from Hancock, Mich., to Phoenix, Mich.

Lehigh Valley.—J. F. Maguire, Assistant Superintendent of Transportation, has been appointed Superintendent of Transportation, with office at South Bethlehem, Pa., succeeding T. H. Pindell, assigned to other duties.

Michigan Central.—J. H. Snyder, Assistant General Superintendent, has been appointed Superintendent at Chicago, succeeding M. B. Snow, who takes Mr. Snyder's place at Detroit, Mich.

Missouri Pacific.—C. H. Bevington, Superintendent of the Omaha division, has been appointed Superintendent of the Valley division, with office at Monroe, La., succeeding J. G. Lorton, resigned to go to the St. Louis & San Francisco. W. E. Brooks, Superintendent of the Northern Kansas division, succeeds Mr. Bevington, with office at Omaha, Neb. W. E. Merrifield, Trainmaster at Sedalia, Mo., succeeds Mr. Brooks, with office at Atchison, Kan.

Oklahoma Central.—W. S. Wells is Trainmaster, with office at Purcell, Ind. T.

Oregon Short Line.—A. D. Stevenson, Superintendent of the Montana division, has been appointed Superintendent of the Utah division of this road and of the Union Pacific lines west of Green river, with office at Salt Lake City, Utah, succeeding W. E. Costello, resigned. W. H. Jones, Assistant Superintendent at Pocatello, Idaho, succeeds Mr. Stevenson, with office at Pocatello.

Pacific & Idaho Northern.—A. L. Wiley has been appointed Superintendent, with office at Weiser, Idaho, succeeding C. M. Hunt, resigned to go to the Oregon Short Line.

Rio Grande Western.—O. J. Ogg has been appointed Assistant Superintendent of the Rio Grande Western at Helper, Utah, succeeding R. R. Sutherland, resigned.

St. Louis, Iron Mountain & Southern.—T. B. Nash, chief despatcher of the Memphis division, has been appointed Trainmaster at Wynne, Ark.

Somerset Railway.—G. H. Foster, Assistant Superintendent, has been appointed Superintendent, with office at Oakland, Me., succeeding W. M. Ayer, resigned, and his former office has been abolished.

Southern.—H. E. Hutchens, General Superintendent at Charlotte, N. C., has been appointed General Superintendent at Birmingham, Ala., succeeding W. N. Foreacre, who takes Mr. Hutchens' place at Charlotte.

Southern Pacific.—Thomas Ahern, Assistant Division Superintendent at Dunsmuir, Cal., has been appointed Superintendent, with office at Dunsmuir, of the new Shasta division, consisting of the lines from Red Bluff to Ashland. D. Burkhalter, Acting Superintendent of the Sacramento division, has been appointed Superintendent of that division. F. M. Worthington, Assistant Superintendent at Tucson, Ariz., has been appointed Superintendent of the San Joaquin division, with office at Bakersfield, Cal., succeeding Mr. Burkhalter, who held that position before being appointed Acting Superintendent of the Sacramento division. A. F. Bowles succeeds Mr Worthington.

Union Pacific.—See Oregon Short Line.

Wrightsville & Tennille.—See this company under Purchasing Officers.

Traffic Officers.

Canadian Pacific.—J. S. Carter, city passenger agent at Nelson, B. C., has been appointed General Agent, passenger department, at Spokane, Wash.

Colorado Midland.—M. R. Sutton has been appointed General Agent at Kansas City, Mo., succeeding Morell Law, resigned to go to another company.

Georgia Coast & Piedmont.—W. R. Bassett, Auditor, has been appointed also General Passenger Agent.

Georgia, Florida & Alabama.—B. C. Prince, Acting Traffic Manager, has been appointed Traffic Manager, with office at Bainbridge, Ga.

Jamestown, Chautauqua & Lake Erie.—J. A. Barry, local manager, has been appointed Acting General Freight and Passenger Agent, with office at Jamestown, N. Y., succeeding to the duties of H. T. Mentzer.

Missouri Southern.—T. J. Dreessen has been appointed General Traffic Manager and Freight Claim Agent, with office at Leeper, Mo.

Prescott & Northwestern.—O. H. Helbig, General Freight and Passenger Agent, has been appointed to the new office of Traffic Manager, and his former office has been abolished. He remains also Secretary and Treasurer.

St. Louis, Brownsville & Mexico.—William Doherty, General Passenger Agent, has been appointed Traffic Manager in charge of both freight and passenger traffic, H. W. Adams, Freight Traffic Manager, having resigned.

Texas & Pacific.—R. T. G. Matthews has been appointed General Agent, passenger department, at Cincinnati, Ohio.

Timpson & Northwestern.—C. W. Gray, rate clerk in the general freight office of the Galveston, Harrisburg & San Antonio, has been appointed Traffic Manager of the Timpson & Northwestern.

Engineering and Rolling Stock Officers.

Alabama Great Southern.—See Cincinnati, New Orleans & Texas Pacific.

Atlantic, Quebec & Western.—W. L. Browne has been appointed Acting Resident Engineer of this road and also Acting Chief Engineer of the New Canadian Company, succeeding J. V. Nimms, resigned. The road is about to be opened for traffic from New Carlisle, Que., to Port Daniel, and work is under way from Port Daniel north.

Bessemer & Lake Erie.—F. W. Dickerson, general foreman, car department, at Greenville, Pa., has been appointed Master Car Builder, with office at Greenville, succeeding W. J. Buchanan, resigned.

Chicago Junction.—J. B. Cox, Chief Engineer, has resigned.

Cincinnati, New Orleans & Texas Pacific.—E. C. Tomlinson, Superintendent of Transportation of this road and of the Alabama Great Southern, has been appointed to the new office of Car Accountant of both roads and his former position has been abolished.

Erie.—T. Rumney, Mechanical Superintendent, has been appointed General Mechanical Superintendent, with office at New York, succeeding E. A. Williams, who resigned last spring. William Schlafge, Assistant Mechanical Superintendent, has been appointed to the new office of Mechanical Superintendent of the Erie grand division and of the New York, Susquehanna & Western, with office at Jersey City, N. J. A. G. Trumbull, Assistant Mechanical Superintendent, has been appointed to the new office of Mechanical Superintendent of the Ohio division and the Chicago & Erie, with office at Cleveland, Ohio.

Lehigh & New England.—W. J. Young, Chief Engineer, has resigned to go to the Alpha Portland Cement Co., Martin's Creek, Pa.

Peoria Railway Terminal.—G. P. Paradis is Engineer of Maintenance of Way.

St. Louis, Watkins & Gulf.—S. H. Spangler has been appointed Master Mechanic, with office at Lake Charles, La., succeeding J. C. Ramsey.

Santa Fe Central.—E. M. Peden is Superintendent of Motive Power and Rolling Stock, with office at Estancia, N. Mex.

Seaboard Air Line.—A. J. Poole, Master Mechanic at Atlanta, Ga., has been appointed to the new office of General Master Mechanic, with office at Portsmouth, Va.

Purchasing Agents.

Missouri Southern.—E. J. Grimes, Auditor, has been appointed Purchasing Agent, with office at Leeper, Mo.

Wrightsville & Tennille.—Hereafter the purchasing department will be in charge of D. R. Thomas, Superintendent, Tennille, Ga.

LOCOMOTIVE BUILDING.

The Wisconsin Central has ordered three locomotives from the American Locomotive Co.

Procter & Gamble, Cincinnati, Ohio, have ordered one locomotive from the Baldwin Locomotive Works.

The St. Louis, Brownsville & Mexico has ordered five locomotives from the Baldwin Locomotive Works.

The Virginia Air Line, Charlottesville, Va., under construction, is in the market for locomotives. See Railroad Construction column.

The New York Central Lines have reserved space with the American Locomotive Company for 148 locomotives. The types will consist of Pacific, similar to those delivered to the Lake Shore last spring, New York Central Lines standard consolidation, 10-wheelers and switch engines.

The Lake Shore & Michigan Southern has ordered nine simple six-wheel switching (0-6-0) locomotives from the American Locomotive Co. The specifications are as follows:

General Dimensions.

Type of locomotive	Switching
Weight, total	154,000 lbs.
Diameter of drivers	57 in.
Cylinders	21 in. x 28 in.
Boiler, type	Straight back
" working steam pressure	180 lbs.
" number of tubes	308
" material of tubes	Charcoal iron
" diameter of tubes	2 in.
" length of tubes	16 ft.
Firebox, length	72 in.
" width	65¼ in.
" material	Steel
" grate area	32.7 sq. ft.
Heating surface, total	2,716 "
Tank capacity	5,100 gals.
Coal capacity	7½ tons

Special Equipment.

Air brakes	Westinghouse
Bell ringer	Sampson
Brake-beams	Buffalo
Couplers	Climax
Headlight	Dressel
Injector	Nathan
Journal bearings	Magnus
Piston rod packings	United States
Valve rod packings	United States
Safety valve	Amerlean
Sanding devices	Leach
Slight-feed lubricators	Nathan bull's-eye
Springs	Railway Steel-Spring Co.
Steam gages	Crosby Thermo
Tires—Driving wheel	Latrobe

The Harriman Lines, as reported in the *Railroad Gazette* of October 4, have ordered 43 consolidation locomotives, 10 Atlantic locomotives, 30 mogul locomotives, 24 ten-wheel locomotives and 18 switch locomotives. Of these engines, 55 are to be oil burning.

General Dimensions.

	Hy. Consol.	Atlantic.	Mogul.	10 wheel.	Switch.
Weight, total	208,000 lbs.	196,000 lbs.	162,000 lbs.	198,000 lbs.	140,000 lbs.
On drivers	187,000 lbs.	105,000 lbs.	140,000 lbs.	150,000 lbs.	140,000 lbs.
Cylinders	22 x 30 in.	20 x 28 in.	20 x 28 in.	22 x 28 in.	19 x 26 in.
Diam. drvrs.	57 in.	81 in.	63 in.	63 in.	51 in.
Boiler, type	Straight top.	Straight top.	Straight top.	Straight top.	Straight top.
Stm press	200 lbs.	200 lbs.	200 lbs.	190 lbs.	175 lbs.
Tubes, No.	413	297	297	355	237
Material	Seamless steel and charcoal iron.				
Diameter	2 in.	2 in.	2 in.	2 in.	2 in.
Length	15 ft.	16 ft.	12 ft. 8 in.	15 ft.	11 ft. 6 in
Firebox, lgth.	108 in.	108 in.	108 in.	121 in.	108 in.
Width	66 in.	66 in.	66 in.	37¼ in.	40¼ in.
Material	Otls steel.	Otls steel.	Otls steel.	Otls steel.	Otls steel.
Grate area	49.5 sq. ft.	49.5 sq. ft.	49.5 sq. ft.	32.1 sq. ft.	30.2 sq. ft.
Htg. surf.	3,403 sq. ft.	2,649 sq. ft.	2,102 sq. ft.	2,094 sq. ft.	1,557 sq. ft.
Water capac.	7,000 & 9,000	7,000 gals.	7,000 gals.	7,000 & 9,000	4,000 gals.
Coal capac.	14 & 10 tons.	14 tons.	11 tons.	14 & 10 tons.	6 tons.
Oil capacity	2,940 & 2,487	2,940 gals.	2,940 gals.	2,940 & 2,487	1,020 gals.

Special Equipment.

Acetylene gas generator	Elliott
Bell ringer	Gollmar
Brake adjuster equipment, freight	Acme
Brake adjuster equipment, passenger	American
Boiler lagging	Magnesia
Brake-beams	Damascus
Brake-shoes	American Brake-Shoe & Foundry Co.
Couplers	Climax steel
Draft rigging	Miner
Feed pipe strainer	Burnham, Williams & Co.
Headlights	Handlan Buck
Headlights, electric	Pyle National
Hose tank	Anaconda
Injector	Nathan
Journal bearings	Hewitt
Journal boxes	National Mal. Casting Co.
Piston rod packings	Paxton-Mitchell Co.
Valve rod packings	Paxton-Mitchell Co.
Safety valve	Crosby
Sanding devices	Leach
Side bearings	Miner
Sight feed lubricator	Nathan
Springs	Railway Steel-Spring Co.
Steam gages	Asheroft
Steam and oil conduits	Franklin Railway Supply Co.
Steam heating equipment	Consolidated
Steam heat reducing valve	Leslie
Tires, driving wheel	Midvale
Tires, truck wheel	Midvale
Tires, tender wheel	Midvale
Truck bolsters	Simplex
Tender truck side frames	Andrews cast steel
Vestibule diaphragms	Acme
Water gages	Nathan
Whistles	Star Brass

CAR BUILDING.

Swift & Co. Chicago, are said to have ordered 100 cars.

The American Railways, Des Moines, Iowa, are figuring on some cars.

The New York, Ontario & Western is in the market for 10 day coaches.

The Columbia & Puget Sound is figuring on two or three new passenger coaches.

The Galveston, Harrisburg & San Antonio is in the market for 10 passenger coaches.

The Arkansas, Louisiana & Gulf has ordered one passenger coach from the Hicks Locomotive & Car Works.

The Virginia Air Line, Charlottesville, Va., under construction, is in the market for cars. See Railroad Construction Column.

The Canadian Pacific denies that it is figuring on building 2,000 additional box cars at its own shops, as reported in the *Railroad Gazette* of September 27.

The Duluth & Iron Range, as reported in the *Railroad Gazette* of July 26, is said to have ordered six passenger cars from the American Car & Foundry Co.

The Duluth, Missabe & Northern is figuring on four first class coaches, four second class coaches, two baggage and mail cars, two passenger and baggage cars and one baggage express car.

The New Orleans Great Northern, as reported in the *Railroad Gazette* of October 4, has ordered from the Western Steel Car & Foundry Co. 65 all-wood stock cars of 60,000 lbs. capacity, 300 all-wood box cars of 60,000 lbs. capacity, 200 steel flat cars of 80,000 lbs. capacity and 200 flat bottom gondola cars of 80,000 lbs. capacity. The stock cars will measure 36 ft. long, 8 ft. 6 in. wide and 9 ft. 6¼ in. high, inside measurements, and 36 ft. 9⅛ in. long, 9 ft. 1¾ in. wide and 13 ft. ¼ in. high, over all. The box cars will measure 36 ft. long, 8 ft. 6 in. wide and 9 ft. 10 in. high, inside measurements, and 36 ft. 9⅝ in. long and 9 ft. ⅝ in. wide, over all. The flat cars will measure 41 ft. long, 9 ft. 6¾ in. wide and 3 ft. 10⅞ in. high, over all. They will have yellow pine flooring. The gondola cars will measure 41 ft. long, 8 ft. 10½ in. wide and 3 ft. 3¼ in. high, inside measurements, and 42 ft. 3⅞ in. long, 10 ft. wide and 7 ft. 3¼ in. high, over all. Bodies will be of wood and underframes of steel. The special equipment for all cars includes:

Bolsters	Pressed steel for all except gondolas
Brake-beams	Pressed steel
Brakes	Westinghouse
Couplers	Climax, steel shank
Draft rigging	Miner
Dust guards	Gould for stock and box cars; Symington for flat and gondola cars
Journal boxes	Gould for stock and box cars Symington for flat and gondola cars
Trucks	Arch bar

RAILROAD STRUCTURES.

Albuquerque, N. Mex.—Work has begun on the new Atchison, Topeka & Santa Fe storehouse, and additions to the local machine shops. (April 5, p. 498.)

Alva, Okla.—The improvements to be made by the Atchison, Topeka & Santa Fe establishing the new grade and straightening the Panhandle branch through western Oklahoma include a large bridge over the Salt Fork.

Fernandina, Fla.—The Seaboard Air Line is planning to rebuild its phosphate elevator recently destroyed by fire at a loss of $150,000.

Fort Smith, Ark.—The St. Louis & San Francisco, and the St. Louis, Iron Mountain & Southern, it is said, will put up large roundhouses and shops at this place.

Fort Worth, Tex.—The Missouri, Kansas & Texas, it is said, has given a contract for putting up a brick freight house 45 ft. x 300 ft., two stories high.

Frederick Junction, Md.—The Baltimore & Ohio has given contracts for building a new bridge over the Monocacy river on the old main line at this place, to the Drake & Stratton Co., of Philadelphia, for the substructure work, and to the McClintic-Marshall Co., of Pittsburgh, for the superstructure. The bridge is to consist of four spans, each about 85 ft. long, with deck plate girders, and will carry two tracks. The work will be pushed to completion as early as possible.

Grand Forks, B. C.—The Canadian Pacific, it is said, will start work next year on roundhouses, repair shops and yards at this place. The cost of these improvements will be about $100,000.

Meridian, Miss.—Engineers are locating the site of a bridge to be built over the railroad tracks.

New York, N. Y.—Contract has been let to J. C. Rodgers for the new bridge over the Harlem river at Madison avenue and 138th street at $1,155,987; the next lowest bid was that of the Phoenix Construction Company, $1,189,626. Other bids were: Williams Engineering Company, $1,197,000; Maryland Steel Company, $1,324,567, and Bernard Rolf, $1,333,333. The work includes building a steel draw span, two approach spans, fender piers, three masonry river piers, masonry approaches, grading, paving and furnishing electric equipment for operating the draw and lighting the structure. The work will require about 2,000 tons of structural steel, and it is thought that the contract for this steel will be given to the American Bridge Company.

The Board of Estimate and Apportionment at a recent meeting authorized an issue of $10,000,000 of stock to pay for buying and improving the property along the South Brooklyn water front from 28th to 36th streets and from 58th to 61st streets. About $6,000,000 of this will be spent for the land and the rest is to be used for putting up docks.

San Angelo, Tex.—The Kansas City, Mexico & Orient, it is said, will soon start work on a combined freight and passenger station here.

Toledo, Ohio.—Announcement is made that the Lake Shore & Michigan Southern will put up a bridge this fall over the mouth of Swan creek, at the foot of Munroe street.

Wilkesbarre, Pa.—An agreement, it is said, has been made between the city and the Lehigh Valley, the Jersey Central, the Delaware & Hudson and the Pennsylvania to eliminate the grade crossings on these roads from South Wilkesbarre to Market street.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Alabama Roads (Electric).—A company is being formed by Richard Tillis, of Montgomery, to build an electric line from Geneva, Ala., on the Louisville & Nashville northeast via Hartford and Slocomb to Dothan, on the Atlantic Coast Line and the Central of Georgia, 40 miles. It is proposed eventually to extend the line from Dothan north.

Alva & Southern.—Incorporated in Oklahoma, with $5,000,000 capital and offices at Alva and at St. Louis, Mo. The company proposes to build about 250 miles of railroad from Kiowa, Kan., south through Oklahoma to the Red river, 250 miles. L. T. McKnight, President and General Manager; J. B. Cheadle, Vice-President, and W. Habiland, Assistant Secretary, all of Alva, and G. E. Autrey, Treasurer, of Granton, Ohio.

Arizona & California.—See Atchison, Topeka & Santa Fe.

Arkansas Valley.—See Atchison, Topeka & Santa Fe.

Atchison, Topeka & Santa Fe.—The report of this company for the year ended June 30, 1907, gives a total of 9,350.28 miles for all the lines included in this system, as compared with 9,189.43 miles in 1906, an increase of 160.85 miles. The 1906 figures have been revised since the last annual report to include additional lines now in the system. The average mileage operated during the year ended June 30, 1907, was 9,273.15 miles, an increase of 120.35 miles, as compared with the preceding year. In addition the company has under construction 488.43 miles, which is almost finished. The Arizona & California has been extended to Parker, Ariz., 106.84 miles from Wickenburg. The Barnwell & Searchlight, from Barnwell, Cal., to Searchlight, Nev., 23 miles, has been finished and was opened for traffic in April. The Denver, Kansas & Gulf, from Kiowa, Kan., via Medicine Lodge to Belvidere, 49.41 miles, has been finished. The Sulphur branch from Davis, Ind. T., to Sulphur, 9.28 miles, was opened for traffic in August, 1906. The Jasper & Eastern has been opened for traffic from Kirbyville, Tex., to Cravens, La., about 57 miles. Grading is finished to Oakdale, La., and track laying is now in progress; of this 5.35 miles were added last year. The Holly & Swink Railway and the Arkansas Valley Railroad, which were bought by this company during the year, are being extended through the beet sugar district of Arkansas valley, Colorado. The new mileage added during the year on these lines aggregates about 68.07 miles. On the Pecos & Northern Texas, the Canyon City (Tex.) Plainview branch, 57.30 miles, was finished and the line opened for traffic in February. On the Eastern Railway Company of New Mexico, extending from Texico, N. Mex., west to Belen, 250 miles are finished, and work is under way on a cut-off from Belen to Rio Puerco, N. Mex., 19 miles, which is nearing completion. Work is in progress to reduce heavy grades and curvature on the line between Texico, N. Mex., and Wellington, Kan.; these improvements are being made to obtain a new low grade line, which it is expected will be ready for operation by June, 1908, for transcontinental freight via Wellington, Texico, Belen and Rio Puerco. This company and the Southern Pacific each has a half ownership in the Northwestern Pacific, which is building a line to connect the California & Northwestern, of the Southern Pacific, at Willits, Cal., with the San Francisco & Northwestern, owned by the Santa Fe, to complete a through line from Eureka, Cal., south via Willets to San Francisco, about 290 miles. The report states that owing to existing conditions, the directors have decided to suspend various extension projects, which were under consideration, and to only finish improvements already under way.

Barnwell & Searchlight.—See Atchison, Topeka & Santa Fe.

Cairo & Tennessee River.—General Manager E. C. Weston is quoted as saying that work will be started shortly on a section of this proposed line from Wickliffe, Ky., east to Hopkinsville, about 108 miles. The Atlantic & Cairo Construction Company has the contract for the work. The line is projected east to Newcomb, Tenn., about 425 miles. (June 14, p. 878.)

Charlotte Harbor & Northern.—An officer writes that this line, which is known as the Boca Grande Route, has finished its line from Boca Grande, Fla., north to Arcadia, 53 miles, and is now in operation. At Boca Grande there is a deep-water harbor at the south end of Gasparilla Island, and extensive dock improvements are now under way. Allen Fouts, Second Vice-President and General Manager, Jacksonville, Fla. (July 26, p. 110.)

Chesapeake & Ohio.—The report of this company for the year ended June 30, 1907, shows that the 19 miles of second main track, mentioned in the last report as being built, has been finished, with the exception of 6.4 miles from Norgeva to Diascund. Contracts have been let for 91.8 miles additional second track, referred to in the same report, except for the section between Concord, Ky., and Crooked Creek, on the Cincinnati division, 10.3 miles. The 6.3 miles between Morrison, Va., and Oriana, on the Richmond division, is in operation, and work on the section between Hawk's Nest, W. Va., and Cotton Hill, two miles, and between Maysville, Ky., and Lawrence Creek, 5.4 miles is almost finished. Work on the remaining 67.8 miles, also on the 6.4 miles between Norge and Diascund has been suspended. A bridge has been built over New river, one mile west of Sewell, W. Va., the second main track being continued to that point and connection made with the Southside branch, paralleling the main line to Hawk's Nest, 11 miles, which has been rebuilt. On the Potts Creek branch, building a 20-mile line from Covington, Va., south to Potts Creek, 18 miles of track has been laid and placed in operation. On the Coal River Railway, in West Virginia, 22.9 miles has been built and placed in operation, and 16.2 miles are under construction.

Chicago & Alton.—See Warrensburg & Clinton.

Chicago, Burlington & Quincy.—This company, it is said, is making surveys for an extension of the line from Herrin, Ill., west to the Ohio river, about 30 miles.

Chicago, Indianapolis & Louisville.—The Indianapolis & Louisville, recently finished from Victoria, Ind., on the Illinois Central, northeast to Wallace Junction, on the main line of the Chicago, Indianapolis & Louisville, one mile north of Quincy, about 47 miles, is reported opened for freight traffic. At Victoria connection is to be made with the eight-mile line already built to the Little Giant and Shirley Hill coal mines. (March 15, p. 381.)

Cincinnati, Hamilton & Dayton.—New yards are reported being laid out north of Hamilton, Ohio, by this company to have four miles of track.

Coal River.—See Chesapeake & Ohio.

Colorado Roads (Electric).—A company, it is said, is being formed in which H. C. Chapman, of New York, is interested, to build an electric line from a point on the Denver & Rio Grande either at Rifle, Colo., or Newcastle, north via Meeker to Craig, 75 miles.

Continental Tunnel Company.—This is the name of the company which proposes to build a line (including a tunnel about five miles long) from Tolland, Colo., on the Denver, Northwestern & Pacific, west to Vasquez, on the same road. It will shorten the D., N. W. & P. about 23 miles and lessen the grade, which on the existing line is 4 per cent. (See Colorado Roads, October 4, p. 403.)

Denver, Kansas & Gulf.—See Atchison, Topeka & Santa Fe.

Denver, North-Western & Pacific.—See Continental Tunnel Company.

Evansville & Terre Haute.—This company, it is said, has just finished a three-mile belt line to the new South Vincennes, Ind., factory district.

Grand Trunk Pacific.—An order, it is said, has been issued by H. A. K. Drury, Inspector for the Canadian Railway Commission at Winnipeg, authorizing this company to open for freight traffic 122 miles of its line from Portage la Prairie, Man., west.

Great Northern.—The Vancouver, Victoria & Eastern, it is

said, has been finished from Oroville, Wash., northwest to Keremeos, B. C., 38 miles, and this section is to be placed in operation at once. Work is under way on the next section from Keremeos northwest to Hedley, 40 miles. (Sept. 27, p. 371.)

On the Minot division the new line from Berthold, N. Dak., northwest has been opened for traffic to Crosby, 80 miles. (Sept. 17, p. 307.)

Granite City & East St. Louis Terminal Railway Company.—This company now operates a seven-mile single-track line for switching and other service, connecting the railroads at Granite City, Ill., with roads at East St. Louis. (March 15, p. 384.)

Holly & Swink.—See Atchison, Topeka & Santa Fe.

Illinois Central.—Work, it is said, is under way on the Yazoo & Mississippi Valley relaying the present track from Natchez, Miss., northeast to Harrison, 27.8 miles, with 75-lb. rail.

Indianapolis & Louisville.—See Chicago, Indianapolis & Louisville.

Iowa Roads (Electric).—Work, it is said, has been started on an electric line from Nauvoo, Ill., to Keokuk and Carthage, and north from Nauvoo to Fort Madison, a total of about 30 miles. The promoters, it is said, have bought the city street lines at Fort Madison and expect to have the entire line ready for operation next spring. The promoters are residents of Nauvoo.

Jasper & Eastern.—See Atchison, Topeka & Santa Fe.

Kansas City & Springfield Southern (Electric).—An officer writes that this company, which was organized some time ago, will build a line from Springfield, Mo., northwest 75 miles to Nevada, with a south branch to Carthage, 40 miles. W. B. Forsyth, President, Chicago, Ill. (March 15, p. 385.)

Lake Shore Electric.—This company, operating about 160 miles of electric lines in Ohio, has recently opened a new line from Sandusky west via Vickery to Fremont, 29 miles. Through trains are now operated between Cleveland and Toledo via Sandusky, Vickery and Fremont; also by the old route via Norwalk and Fremont.

Minco & Monongahela.—Incorporated in Pennsylvania with $120,000 capital to build a 12-mile line from a connection with the Wheeling, Pittsburg & Baltimore branch of the Baltimore & Ohio, about 700 ft. west of Thomas tunnel, to a connection with the Pittsburgh, Virginia & Charleston branch of the Pennsylvania, 1,000 ft. southeast of Mingo creek crossing. S. J. Jones, President; P. Moran, D. Thompson, R. H. Robinson, J. H. Gamble, and Wm. G. Parkinson are directors.

Minneapolis, St. Paul, Rochester & Dubuque (Electric).—Incorporated in Maine, with $25,000,000 capital, to build electric lines in Minnesota and Iowa. E. W. Freeman, President, Portland, Me., and M. H. Bonteil, Secretary, Minneapolis, Minn.

New York, New Haven & Hartford.—The report of this company for the year ended June 30, 1907, which is reviewed elsewhere in this issue, shows that the six-track construction of the Harlem River-New Rochelle branch is well under way; part is to be opened for service this year. The new four-track bridge over the Housatonic river at Naugatuck Junction has been put in service, completing the four-track system on the New York division. The second track from South Braintree, Mass., to Whitman, 10.6 miles, has been put in service; also the second track extension from Nantasket Junction to Cohasset. Satisfactory progress has been made on the second-track work between Seymour, Conn., and Waterbury, about four miles of which is finished from Pines Bridge north. The rest of the work is expected to be finished this year. All bridges over and under grade crossings in Waterbury, Conn., have been finished except the bridge over the freight yard approach. The new freight yard at Waterbury is about finished, and contracts have been let for a new passenger station, as well as an engine house and storage tracks. During the present year the second track on the Highland division, between Danbury, Conn., and Hawleyville, is expected to be placed in operation. On the same division between Waterbury, Conn., and Bristol, second-track work is under way; of this about nine miles from Waterbury to Terryville Summit, is expected to be put in operation early next year, and the rest to be finished before the close of that year. Improvements have been made in the yard and freight facilities at Hartford, Conn. The new double-track line from Needham, Mass., to West Roxbury, 4.5 miles, has been put in operation. Work is still under way on the New Haven cut. This great improvement is to be finished by next January. New shops have been built at Readville, Mass., and are now in operation. Work on the double-track connecting line from the main line station at Providence, R. I., under the river to East Providence, 2.70 miles, including a tunnel about two miles long, has been continued. The portals of both headings have advanced about 2,100 ft., leaving about 2,900 ft. between headings in the tunnel yet to be bored. At Attleboro 11 grade crossings were eliminated, four tracks have been put in, and a new passenger station is nearly finished. The new Scherzer double-track lift bridge over the Connecticut river at Lyme, Mass., is now in service. Considerable work has been done during the year renewing bridges to permit operation of heavier rolling stock, depressing tracks and raising overhead bridges. Twenty-two grade crossings have been eliminated in Connecticut, four in Massachusetts, and one in New York. Work has been begun in Boston eliminating the Dudley street grade crossings, and is nearing completion. The elimination of nine highway crossings at New Bedford, Mass., is expected to be finished in about a year. A new engine house and freight yard are to be built here. The grade crossing elimination work at Main street, East Hartford, is nearly finished.

Norfolk & Southern.—The Eastern district of the Raleigh division has been extended from Farmville, N. C., west to Wilson, 23 miles.

Northern Dakota.—Incorporated in North Dakota to build a line from Edinburg, N. Dak., on the Great Northern northeast to the works of the Pembina cement mines, about 21 miles. The office of the company is at Grand Forks. Thomas Campbell, President, E. Thorwaldson, Vice-President, and D. Bull, Secretary and Treasurer.

Northern Electric.—See Northern Electric of California.

Northern Electric of California.—This company has been incorporated in California, with $25,000,000 capital, to take over the property of the Northern Electric Company, operating an electric line from Chico, Cal., south via Oroville to Sacramento, 105 miles, and to buy the Shasta Southern, operating a line from Chico west to Hamilton City, in Glen county, 18 miles. It is the intention of the new owners to extend the line north from Chico via Red Bluff to Reading, 76 miles, and southeast from Sacramento to Folsom City, 26 miles; also from Sacramento via Woodland north to Hamilton, 108 miles, with a branch from Colusa east to Yuba City, 30 miles. R. Augustus Bray is President of the new company; W. Maginnis, Treasurer, and Curtis Hillyer, Francis C. Van Diense, Martin S. Washburn, Henry C. Mack and Charles Elsey, Directors.

Northwestern Pacific.—See Atchison, Topeka & Santa Fe.

Omaha & Nebraska Central (Electric).—This company, which was organized some time ago, will soon start work on its proposed line from Omaha, Neb., southwest to Hastings, 159 miles. (March 15, p. 389.)

Pecos & Northern Texas.—See Atchison, Topeka & Santa Fe.

Pennsylvania.—The Millsboro branch on the Monongahela division from West Brownsville Junction, Pa., southwest to Millsboro, 11.1 miles, was opened for passenger traffic September 2.

Plans, it is said, are being made by this company for improvements to its yards and tracks at Uniontown, Pa., to cost about $100,000.

Pennsylvania Roads.—It is reported in Pittsburgh that H. C. Frick and other local capitalists will build elevated, subway and surface lines to connect Pittsburgh with Wilkinsburg, East Pittsburgh, Braddock and McKeesport.

Potts Creek.—See Chesapeake & Ohio.

Quebec & Lake St. John.—D. B. Hanna, President of this company, is reported as saying that the branch from La Tuque Junction, Que., to La Tuque Falls, 40 miles, is almost finished, and as soon as the government inspection is made, the line is to be opened for traffic. (March 15, p. 396.)

Rogers Southwestern (Electric).—This company, which is building an electric line from Siloam Springs, Ark., northeast via Rogers to Eureka Springs, 50 miles, has the first 27 miles from Siloam Springs finished. Surveys are now being made on the northern end of the line. When this work is finished a line is to be built from a point seven miles southwest of Eureka Springs south to Huntsville, 22 miles. (March 15, p. 390.)

St. Joseph Valley.—An officer writes that this road has been opened for business from Angola, Ind., west via Crooked Lake, Lake Cage, Orland and Mongo to La Grange, 26 miles.

St. Louis & San Francisco.—Work is reported under way on the branch between Arcadia, Kan., and Cherryvale, changing the alinement and bridges, and putting in heavier rails. The company, it is said, has also made surveys for a cut-off from Minden, Mo., northeast 10 miles to Iantha, on which work is soon to be begun.

St. Louis, Bartlesville & Pacific.—This company, which was incorporated some time ago to build a line from Joplin, Mo., west to Pond Creek, Okla., about 240 miles, has been granted a bonus of $20,000 by residents of that place, and expects to begin grading work about the first of next month. (March 15, p. 391.)

Shasta Southern.—See Northern Electric of California.

Southern.—The Greenville, Elizabeth & Kergs Mill branch of this road has been extended from Wolfs Mill, Miss., 6.6 miles east to Kergs Mill.

Stephenville North & South Texas.—An officer writes that this company, which is building a line from Stephenville, Tex., south via Alexander and Carlton to Hamilton, 44 miles, is now in operation between Stephenville and Carlton, 24 miles, and has track laid on nine miles additional. The grading is being done by Read Bros. & Montgomery, of Stephenville, and the Wisconsin Bridge & Iron Company, of Milwaukee, is putting up two steel bridges; one 100-ft. long and the other 125 ft. The line will have maximum grades of 1 per cent. with maximum curvature of 4 deg. (Sept. 13, p. 308.)

Texas Roads (Electric).—Residents of Greenville, Tex., are organizing a company to build a line from that place via Wolfe City to Bonham, 50 miles.

Tremont & Gulf.—This company has extended its road from Dodson, La., south to Winnfield, about 10 miles.

Union Pacific.—This company, it is said, is planning to build a line from Wamsutter, Wyo., south to Craig, Colo., about 90 miles.

Vancouver, Victoria & Eastern.—See Great Northern.

Virginia Air Line.—An officer writes that contracts have been let to J. N. H. Hornell & Co. for building part of this proposed line from Lindsay, Va., on the main line of the Chesapeake & Ohio, south to Bremo, on the James River division of the same road. Additional contracts are to be let about the first of November. Maximum grades will be 1 per cent. and maximum curvature 6 deg. compensated. Contracts have been let for two steel bridges aggregating about 360 ft. T. O. Troy, President, and W. Washabaugh, Chief Engineer, Charlottesville, Va. (Sept. 27, p. 371.)

Warrensburg & Clinton.—Surveys are reported under way by this company for a line from Higginsville, Mo., on the Chicago & Alton and the Missouri Pacific, south via Warrensburg to Clinton, 50 miles. Captain M. L. Belt, Higginsville, is promoting the project. It is thought that when built the line will be turned over to the Chicago & Alton.

Yazoo & Mississippi Valley.—See Illinois Central.

RAILROAD CORPORATION NEWS.

Boston & New York Air Line.—See New York, New Haven & Hartford.

Brooklyn Rapid Transit.—Gross earnings for the year ended June 30, 1907, were $19,381,587, an increase of $908,259; net earnings, $7,915,882, a decrease of $116,068. Out of net income there was appropriated $442,063 for betterments and additions, a decrease of $138,279; the surplus for the year was $2,002,598, a decrease of $160,011.

Buffalo, Rochester & Pittsburgh.—C. C. Harrison, Jr., & Co., Philadelphia, are offering, at a price to net 5.35 per cent., part of an authorized issue of $3,000,000 4½ per cent. equipment trust bonds dated April 1, 1907. There is $2,100,000 of this issue outstanding.

Canadian Pacific.—At the annual meeting the stockholders adopted a resolution authorizing the lease of the St. Marys & Western Ontario, which is under construction from Embro, Ont., to Sarnia, via St. Marys.

Denver & Rio Grande.—The San Pete Valley, which runs from Nephi, Utah, to Morrison, 51 miles, has been sold to Gould interests and is now a part of the Denver & Rio Grande. The Sterling Coal & Coke Co. and the quarries at Mt. Nebo, to which a branch line runs, are included. The San Pete Valley has $510,000 stock and $815,000 bonds.

Erie.—The annual report shows that a contract has been made with the Hudson & Manhattan, giving the Erie trackage rights through the tunnels now being built and to be built under the Hudson river, as well as terminal facilities in New York. The contract is to become effective as soon as the tunnels are in operation. The Erie has extended for 16 years, from July 1, 1916, its contract with Wells, Fargo & Co. for handling express business on the road.

Great Northern.—An extra dividend of 1½ per cent. will be paid on November 1, at the same time that the regular quarterly dividend of 1¾ per cent. will be paid. The extra dividend is paid by the Lake Superior Co., which owns Great Northern properties other than steam railroads. The Lake Superior Co. formerly held the ore lands which were leased to the United States Steel Corporation and turned over to a board of trustees last fall. The present extra dividend is paid out of surplus derived from the earnings of other subsidiary companies or from the working of the ore lands previous to the above lease.

Gulf & Ship Island.—Gross earnings for the year ended June 30, 1907, were $2,485,949, an increase of $347,171; net earnings, $601,991, a decrease of $79,676; surplus, $317,472, a decrease of $83,803.

Hocking Valley.—The time for the deposit of the stock of the Hocking Valley and of the Kanawha & Michigan under the plan for the consolidation of the two companies has been extended to March 1, 1908. (May 24, page 728.)

Hudson & Manhattan.—See Erie.

Kanawha & Michigan.—See Hocking Valley.

New York, New Haven & Hartford.—The following table, taken from the annual report for the last fiscal year, shows the outstanding debentures of the company, including those of merged lines whose debentures have been assumed by the New Haven. Nearly all of the securities, excepting the convertible debentures and some of the debentures of subsidiary companies, have been issued within the last three years. The amounts outstanding are all in the hands of the public except for $1,766,000 Naugatuck Railroad debentures and $2,700 of the convertible debentures.

	Total Outstanding.	Date of Maturity.
Convertible 3½ per cent. debenture certificates	$11,578,900.00	Jan. 1, 1956
Convertible 4 per cent. debenture certificates	66,100.00	Apr. 1, 1908
Non-convertible 4 per cent. debentures	5,000,000.00	Feb. 1, 1914
Non-convertible 4 per cent. debentures	5,000,000.00	Mch. 1, 1947
Non-convertible 3½ per cent. debentures	5,000,000.00	Mch. 1, 1947
Non-convertible 3½ per cent. debentures	10,000,000.00	Apr. 1, 1954
Non-convertible 4 per cent. debentures	15,000,000.00	July 1, 1955
Non-convertible 4 per cent. debentures	15,000,000.00	May 1, 1956
Naugatuck R.R. 3½ per cent. debentures	2,000,000.00	Oct. 1, 1930
Par value of warrants for convertible 3½ per cent. debenture certificates	18,421,100.00	Jan. 1, 1956
Two-year 4½ per cent. debenture notes	600,000.00	Oct. 20, 1908
Two-year 5¼ per cent. debenture notes	1,250,000.00	Nov. 15, 1908
Two-year 5 per cent. debenture notes	500,000.00	Nov. 15, 1908
Two-year 5¼ per cent. debenture notes	100,000.00	Nov. 19, 1908
Two-year 5 per cent. debenture notes	2,000,000.00	Nov. 22, 1908
Two-year 5 per cent. debenture notes	500,000.00	Nov. 27, 1908
Two-year 5 per cent. debenture notes	370,000.00	Dec. 1, 1908
Two-year 5 per cent. debenture notes	300,000.00	Dec. 5, 1908
Two-year 5 per cent. debenture notes	200,000.00	Dec. 7, 1908
Two-year 5¼ per cent. debenture notes	50,000.00	Dec. 11, 1908
Two-year 5 per cent. debenture notes	400,000.00	Dec. 11, 1908
Two-year 5 per cent. debenture notes	400,000.00	Dec. 14, 1908
Two-year 5 per cent. debenture notes	250,000.00	Dec. 21, 1908
Two-year 5 per cent. debenture notes	200,000.00	Dec. 22, 1908
Two-year 5 per cent. debenture notes	250,000.00	Dec. 24, 1908
Two-year 5 per cent. debenture notes	450,000.00	Dec. 29, 1908
Two-year 5 per cent. debenture notes	500,000.00	Dec. 31, 1908
Two-year 5 per cent. debenture notes	1,500,000.00	Jan. 9, 1909
Three-year 5 per cent. debenture notes	3,500,000.00	Jan. 9, 1910
Three-year 5 per cent. debenture notes	50,000.00	Jan. 10, 1910
Four-year 5 per cent. debenture notes	2,150,000.00	Jan. 9, 1911
Five-year 5 per cent. debenture notes	300,000.00	Jan. 1, 1912
Five-year 5 per cent. debenture notes	6,400,000.00	Jan. 9, 1912
Hartford Street Railway Co.		
4½ per cent debentures, series N	145,000.00	Jan. 1, 1930
4 per cent. debentures, series M	165,000.00	Jan. 1, 1930
Consolidated Railway Co.		
4 per cent. 1954 debentures	4,354,000.00	July 1, 1954
4 per cent. 1955 debentures	2,350,000.00	Jan. 1, 1955
4 per cent. 1956 debentures	2,108,000.00	Jan. 1, 1956
4 per cent. 1955 debentures	1,341,000.00	Apr. 1, 1955
3 per cent., 3½ per cent. and 4 per cent. 1930 debentures	1,000,000.00	Feb. 1, 1930
European loan of 1907	27,985,000.00	Apr. 1, 1922
	$148,734,100.00	

Kidder, Peabody & Co., Boston, are offering at 97 and interest $1,000,000 4 per cent. bonds of 1955, being part of an authorized issue of $5,000,000, of the Boston & New York Air Line, guaranteed principal and interest by the New York, New Haven & Hartford. The New Haven bought the road, which runs from New Haven, Conn., to Willimantic, 52 miles, last year.

Norfolk & Southern.—A special meeting of the stockholders has been called for October 23, to create an issue of $25,000,000 5 per cent., first and refunding mortgage bonds and also some equipment trust notes. The stockholders will also act on a plan for the sale of additional common and preferred stock and of the new bonds and notes. It is said that arrangements for placing part of the new issues are being made with Edward Sweet & Co., as managers of a syndicate.

St. Marys & Western Ontario.—See Canadian Pacific.

San Pete Valley.—See Denver & Rio Grande.

Union Pacific.—The surplus after dividends on the preferred stock, for the year ended June 30, 1907, was $32,350,439, which is equal to 16.5 per cent. on the common stock. This figure does not include $2,015,962 due from the Atchison, Topeka & Santa Fe, the Baltimore & Ohio and the Illinois Central. Including this, the amount would equal 17.6 per cent. on the common stock.

Western Maryland.—This company has sold to John T. McGraw, Grafton, W. Va., its coal plant at Simpson, W. Va., and 3,000 acres of coal lands.

ANNUAL REPORTS.

NEW YORK, NEW HAVEN & HARTFORD RAILROAD COMPANY—THIRTY-SIXTH YEAR.

In accordance with the By Laws of the New York, New Haven & Hartford Railroad Company, the Board of Directors have caused to be prepared a general statement of its affairs for the year ending June 30, 1907, as follows:

For Twelve Months July 1, 1906, to June 30, 1907, Inclusive.

Earnings: From passenger department	$26,758,929.06	
From freight department	28,385,704.38	
From rents	402,398.26	
From telegraph receipts	53,904.62	
Total gross earnings from operation		$55,601,936.32
Less operating expenses (68.073 per cent.)		37,850,081.71
Net earnings, steam railroad		$17,751,854.61
Net earnings, street railways		3,615,809.69
Net earnings, steamship lines		635,127.22
Total net earnings		$22,002,881.52
Add income from other sources:		
Interest and dividends on investments	$1,925,287.58	
Miscellaneous income	152,586.78	
		$2,077,874.36
Total income		$24,080,755.88
Deductions from income:		
Taxes	$3,592,235.93	
Rental of leased lines (Exhibit L)	5,601,846.10	
Int. on bonds, debentures and other liabilities	5,732,742.61	
Miscellaneous charges	257,889.54	
Total deductions from income		$15,187,714.18
Net income		$8,893,041.70
Dividends:		
No. 108—2 per cent. on $83,537,100.00	$1,670,742.00	
No. 109—2 per cent. on 83,584,600.00	1,671,692.00	
No. 110—2 per cent. on 84,471,600.00	1,689,432.00	
No. 111—2 per cent. on 121,878,100.00	2,437,562.00	
	$7,469,428.00	
Less dividends on stock of subsidiary cos.	564,440.00	
		$6,904,988.00
Surplus net income of all lines for the year carried to profit and loss account		$1,988,053.70

While the gross earnings show an increase of about 5 per cent. over the previous year the operating expenses increased about 7 per cent., due to a large increase in wages and in the cost of nearly every class of material necessary in the operation of the property, and to an increase of 25 per cent. in the per diem rate for the use of freight cars.

The six-track construction of the Harlem River & Port Chester Railroad has been continued. A portion of the line will be ready for service during the present year.

The new four-track bridge over the Housatonic River at Naugatuck Junction with a four track Scherzer rolling lift draw, with new signal towers, etc., has been put in service during the year, thus completing the four tracks from South Mount Vernon to New Haven.

The extension of the second track from South Braintree to Whitman, Mass., a distance of 10.6 miles, has been completed and put into service.

The extension of the second track from Nantasket Junction to Cohasset has been completed and put in service.

The second track construction between Seymour and Waterbury has progressed satisfactorily, having been completed from Pines Bridge north, a distance of about four miles. The remainder of the work is estimated to be completed by the end of the present year.

All bridges for abolishing grade crossings in Waterbury have been completed except the new bridge for the freight yard approach. The old freight house has been removed and the business moved to the new. The new freight yard is practically completed. Contract has been awarded for the new passenger station. The whole work planned, including the new passenger station, engine house, and storage tracks, should be completed during the year 1908.

The construction of second track between Danbury and Hawleyville has progressed satisfactorily, and it is estimated the work will be completed during the present year.

The changes in yard and freight facilities at Hartford have progressed. The new double track abutments and bridge across State street and the Valley branch to replace single-track structure, have been completed. The new State street passenger station has been put in service and additions have been made to the Morgan Street freight yard. The completion of the whole work is delayed waiting the completion of other work being done by the Connecticut River Bridge and Highway district.

The second track construction on the Highland division between Waterbury and Bristol, has been prosecuted, but not very rapidly. The double track between Waterbury and Terryville Summit, nine miles, should be ready for service early in 1908. From Terryville Summit to Bristol, which includes the tunnel section, the work will probably not be completed before the close of the year 1908.

The new double-track line between Needham and West Roxbury, Mass., a distance of 4.5 miles, was completed and put into operation in November, 1906.

The work of providing additional tracks and widening the cut through the city of New Haven has been actively prosecuted, and will be practically completed and the new tracks in service by January, 1908.

The construction of the new locomotive repair shop at Readville has been completed. This work includes a new locomotive shop 150 ft. by 900 ft., complete with machinery and cranes, new blacksmith shop 80 ft. by 354 ft., complete with forges, machinery, etc., tire house, iron house, scrap bins, etc. The shops are now in operation.

The construction of the double track connecting line in Providence, including tunnel, has continued. Work was begun at the east end of the tunnel in April, 1906, and at the west end in July, 1906. Owing to adverse circumstances and difficult conditions encountered, and time consumed in installation of necessary plants, the work was not vigorously under way before the fall of 1906. Since that time the work has been prosecuted on both ends of the tunnel with double shifts, day and night. At the close of the fiscal year the advance of the portals of both headings was about 2,100 ft., leaving a distance of 2,800 ft. under the hill between headings. At the present rate of progress, it is estimated that the headings will meet in September, 1908, and the tunnel be completed two or three months later. It is expected the balance of the construction, including the drawbridge over the Seekonk river, will be ready for service by the time the tunnel is.

The elimination of grade crossings in Attleboro, Mass., closing 11 highway crossings at grade, and the construction of four tracks, has been completed, the number of crossings eliminated being included in those reported for the year ending June 30, 1906.

The new Scherzer double-track lift bridge over the Connecticut river at Lyme has been completed and is in service.

Extensive work has been done during the year in renewing bridges to permit operation of heavier locomotives and in depressing tracks and raising overhead bridges to give more clearance for the same, to enable increased train loads. The main lines between New York and Boston and between New Haven and Springfield will be ready for such service within the calendar year.

Grade crossings in the various states were eliminated as follows:

Connecticut	22
New York	1
Massachusetts	4

The electrification of the New York division between Woodlawn and Stamford has been practically completed, and electric service has been inaugurated for local trains between New York and New Rochelle, and New York and Port Chester. The complete change from steam to electric traction for all our passenger service on this section of our line should be made effective during the month of October, 1907.

New passenger stations or increased facilities have been provided during the year at Rockland, Westport, Stepney, Lyman Viaduct, Monument Beach, Lyme, Taunton, Stamford, Putnam, Ashcroft, Attleboro and at Columbus Avenue, Mt. Vernon.

Work is in progress and will be completed during the coming year on new passenger stations or increased facilities at Oakville, New Milford, East Taunton, Dudley street Boston, Bournetown and Pelham.

New freight houses or increased freight facilities have been provided during the year at Massachusetts avenue yard Boston, Danbury, Mystic, Centreville, Pomfret, Housatonic, Stamford, Brewster, East Walpole, Fargo street Boston, Lowell, and a 35 ton electric traveling crane has been installed in the freight yard at Boston.

Work is in progress and will be completed on new freight houses or increased freight facilities at Fairmount, East Bridgeport, Lee, New Milford, Greenwich, Bridgeport, Woonsocket, Bournetown and Centerdale.

A new coal discharging plant has been constructed at South Boston. This includes a wharf 40 ft. by 500 ft. and a new coaling plant with two hoisting towers having a capacity of 13,300 tons.

Additional coaling facilities have been provided at the Shop dock, New Haven.

The Dover Street coaling plant in South Boston was destroyed by fire, and the work of rebuilding same is in progress.

New 75 ft. turntables have been installed at New Haven and South Boston, and an 80-ft. turntable has been constructed at Providence.

A 60-cycle, 2,300 volt, A. C. lighting plant has been constructed at South Boston, and at Danbury an electric lighting plant is in progress of construction. At Berlin an increase in the capacity of the power station by 1,500 k.w. has been authorized.

At Housatonic an improvement in the alignment has been made and two grade crossings eliminated.

The elimination of the Dudley street grade crossing in the city of Boston, including four track masonry, has been commenced. The grade crossing has been discontinued and the work is nearing completion.

The elimination of grade crossings at New Bedford, including nine highway crossings, has been commenced during the year and will be completed about October, 1908. A new engine house and freight yard improvement at the same point is also under way.

Work was commenced in December on the elimination of grade crossings at Main street, East Hartford, and is nearing completion.

Improvements and additions to interlocking and signaling have been made at Marlboro Junction, Slades Ferry drawbridge, Fall River, Boston to Harrison Square, South Braintree, and between East Hartford and Vernon. Improvements are under way at Putnam and between Harrison Square and Mattapan.

Improvements and additions to water stations have been made at East Hartford, Stonington, Simsbury and Southington.

In addition to the work above mentioned, bridges have been strengthened

for heavier engines between Taunton and New Bedford, and such work is now in progress between Waterbury and Winsted, and between Concord Junction and Lowell.

A new double-track steel swing drawbridge on stone masonry piers is being constructed across the Taunton River at Somerset.

A new steel bridge has been constructed across the Housatonic river at Sandy Hook, on the Highland division.

A new double-track roller lift drawbridge is being constructed across the Niantic river at Niantic, and is about 50 per cent. completed.

The long trestle between Saybrook Point and Fenwick is being partially filled and a portion of the same rebuilt.

A new four-track steel bridge with rolling lift has been constructed over the Neponset river in Boston, Mass.

The line between Middletown and Meriden, and between Westfield, Conn., and Berlin, has been electrified, and electric passenger service has been substituted for passenger service by steam.

The Shore Line Division between Tufts and Central Village has been electrified, permitting continuous operation of electric cars between Worcester and New London.

The electrification of the line between East Hartford, Vernon and Melrose is nearing completion.

Contracts for the following new equipment have been made, deliveries under which are in progress:

122 locomotives	650 steel flat cars
35 electric locomotives	1 steel towing steamer
24 parlor cars	160 open electric cars
4 standing sleeping cars	202 closed electric cars
2 compartment sleeping cars	4 electric express cars
4 composite cars	28 electric snowplows and miscellaneous cars
4 dining cars	1 passenger steamer for Fall River Line
4 observation cars	3 steam lighters
500 passenger coaches	13 covered barges
500 refrigerator cars	5 open barges.
11,300 steel underframe box cars	
4,500 steel gondola cars	

Since the last annual meeting 85,120 additional shares of the capital stock of your company have been issued at $200 a share in exchange for 4 per cent. debentures of the Consolidated Railway Company at par. This retired $17,042,000 of indebtedness by the creation of additional capital stock of the par value of $8,521,000.

The merger of the New York, New Haven & Hartford Railroad Company with the Consolidated Railway Company on May 31, 1907, further added 300,000 shares of capital stock, making the total issued capital stock of your company on June 30, 1907, 1,218,781 shares, of which 247,977 shares are held in the treasury of subordinate companies whose capital stock is all owned by your company.

On account of improvements authorized and additional equipment contracted for, the company has issued and sold its debentures maturing in one, two, three, four and five years to the amount of $25,170,000, and has also negotiated through New York bankers a European loan to the amount of 145,000,000 French francs on debentures bearing 4 per cent. interest and maturing on April 1, 1922. To furnish the further funds needed to meet the payments maturing upon contracts for such necessary improvements and equipment required to efficiently handle the business now offering and to maintain a reasonable margin for future needs, the directors recommend that the stockholders of record December 2, 1907, be offered the right to subscribe at $125 a share to additional stock in the proportion of one share of new stock for each four shares of old, and that this right be extended to the holders of the company's convertible debenture certificates dated January 1, 1906, proportionate to their rights as future stockholders; payments to be required on such subscriptions at the rate of 25 per cent. on January 1, 1908; 25 per cent. on July 1, 1908; 25 per cent. on January 1, 1909, and 25 per cent. on July 1, 1909, with the option to the subscriber to pay in full on January 1, 1908, or on any other of the dates mentioned, any balance due. Interest to be allowed at the rate of 5 per cent. per annum on partial payments until stock is issued.

The properties of the Connecticut Railway & Lighting Company, consisting of 193.48 miles of urban and interurban electric lines operating in territory contiguous to your company's electric railways, and of numerous city gas and electric lighting plants, all located within the state of Connecticut, were acquired by lease for 999 years at a varying rental from August 1, 1906, to August 1, 1914, and at a fixed rental thereafter. At the same time, purchases were made of the stock of the Meriden, Southington & Compounce Tramway Company, of the New Milford Power Company, of the Housatonic Power Company and of the stock and securities of the Rhode Island Securities Company.

The Rhode Island Securities Company is the sole owner of the stock of the Rhode Island company, which controls through leases 295 miles of electric railways situated in the cities of Providence and Pawtucket and adjacent territory in the state of Rhode Island, which feed and supplement your lines in that vicinity.

The purchase of the stock of the Rhode Island Securities Company was made with an issue of 4 per cent. 50 year debentures dated May 1, 1907, to the amount of $19,911,000 of the Providence Securities Company (a company whose capital stock is owned wholly by your company), which, in consideration of such ownership, guaranteed said issue of debentures as to principal and interest.

It is believed these properties in themselves will eventually become a source of profit, though a deficit in the returns from their operation was estimated to result for a short term immediately following their acquisition. Their control was important to the protection and growth of other properties in which your company was largely interested, and the increased value of these properties should more than offset any direct loss occurring.

As indicated in the last general statement on November 1, 1906, a maximum passenger rate of two cents a mile figured in multiples of five, became effective on the entire road.

From July 1, 1907, the per diem rate for the use of freight cars was increased from 25 to 50 cents a car. This increase of 100 per cent following an increase of 25 per cent. effective only 12 months previously, meant so serious an additional charge upon our income, estimated at one million dollars per annum, and to territory where the law imposes such restrictions as render us powerless to adopt any measure of protection, impelled us to protest against so unreasonable a charge.

Failing in having this protest respected, or in securing any reasonable measure of relief, the necessary notice, effective October 1, 1907, has been given of our withdrawal from the agreement governing such interchange.

The following lines have been merged, effective upon the dates named, and their outstanding obligations have been assumed and are included in this year's balance sheet:

The Providence Terminal Company, Dec. 29, 1906.
Boston & New York Air Line R. R. Company, Jan. 30, 1907.
Manufacturers' Railroad Company, April 30, 1907.
The Torrington & Winchester Street Railway Company, June 28, 1907.
The Meriden, Southington & Compounce Tramway Company, June 28, 1907.
Pawtuxet Valley Railroad Company, April 16, 1907.
The Waterbury & Pomperaug Valley Railway Company, April 22, 1907.

The balance sheet presented with this report is one made up by a consolidation of the balance sheets of all the companies controlled in the interest of your company through the ownership of all or a majority of their capital stocks, excepting only the New York, Ontario & Western and the Central New England Railway Companies (no obligations having been assumed by your company in connection with those properties other than our investment in their securities), thereby presenting for your consideration a complete statement of all the assets and liabilities of your company, whether resulting directly or through the intermediary of other companies or individuals.

For simplification of operation and that the accounts of our operating results may be intelligibly compared with those of other companies not operating similar properties, the street railways, electric lighting, gas and water supply companies in Connecticut owned and controlled by your company, have been since June 1, 1907, operated under a contract by the Connecticut Company, all of whose capital stock is owned by your company, which provides for the payment monthly of all the net earnings, which results are shown in the Income Account and not included in either the gross earnings or operating expenses of the railroad company.

For similar reasons the steamship lines have been since June 1, 1907, operated under a contract with the New England Steamship Company, all of whose capital stock is owned by your company, and the results treated in like manner.

CENTRAL NEW ENGLAND RAILWAY COMPANY.
Income Account, Year Ending June 30, 1907.

Gross earnings from operation		$2,153,366.51
Operating expenses		2,584,413.46
Operating deficit		431,046.95
Deduct income from other sources		50,547.67
Balance deficit		$80,499.28
Taxes and fixed charges:		
Taxes	$56,879.67	
Rentals of leased lines	106,828.84	
Interest on bonds and other liabilities	103,360.96	
		$267,069.47
Net deficit for year		$347,568.72

The operating expenses include expenditures during the year for rebuilding and strengthening the Poughkeepsie bridge.

The Newburgh, Dutchess & Connecticut Railway Company, the Dutchess County Railroad Company, the Poughkeepsie Bridge Railroad Company, and the Poughkeepsie & Eastern Railway Company were merged with the Central New England Railway Company on June 25, 1907, and their outstanding obligations assumed. As a result of these mergers the capital stock of the Central New England Railway Company and the ownership thereof by the New York, New Haven & Hartford Railroad Company are summarized below:

	Total.	Owned by N. H. & H. R.R.	Owned by others.
Preferred stock	$3,750,000.00	$3,382,876.50	$367,123.50
Common stock	4,800,000.00	4,394,795.38	405,204.62
Total stock	$8,550,000.00	$7,777,671.88	$772,328.12
C. N. E. 1st mort. 5 per ct. bonds	$1,250,000.00	$190,000.00	$1,060,000.00
" gen. mort. income bonds	7,250,000.00	6,318,123.29	931,876.71
" notes	900,000.00	900,000.00	.....
P. & E. 1st mort. 5 per ct. bonds	500,000.00	500,000.00	.....
Dutchess Co. 1st mort. 4½ p.c.bnds	350,000.00	.....	350,000.00
N. D. & C. Col. Tr. 5 per ct. bonds	216,000.00	216,000.00	.....
Inc. income bonds	1,164,500.00	1,156,500.00	8,000.00
Total bonds	$11,630,500.00	$9,280,623.29	$2,349,876.71

The rehabilitation of this property is so far advanced it is believed practicable to commence the payment of a rate of interest, probably not exceeding 3 per cent., upon the general mortgage income bonds from the net earnings for the year ending June 30, 1908.

Early in 1907 the New England Navigation Company acquired by purchase the entire capital stock of the Boston & Philadelphia Steamship Company, running lines of steamers in connection with the rail lines of your company between Boston, Providence and Philadelphia, Pa.

Negotiations were almost immediately entered into with the Merchants & Miners' Transportation Company, reaching the principal ports south from Boston and Providence, resulting in the consolidation of the two companies upon terms which eventuated in the acquisition by your company of a half interest in the Merchants & Miners' Transportation Company and the entering into a close traffic relationship with the same, which it is believed will prove of importance to the protection of your property and the promotion of its revenue.

The operation of the consolidated company since our interest in the [illegible] acquired, indicates the investment will directly return to your company a profit in excess of the interest upon its cost, and the indirect advantages accruing through the influence it is possible to bring to bear upon the entire situation between New England points and the points south [illegible] the Merchants & Miners' and its connections are of even greater [illegible] to your company and the public served by it.

[illegible] high rate of interest prevailing during the past year has rendered [illegible] the sale of any large amount of the 4 per cent. preferred stock

of the New England Investment & Security Company, from which it was expected there would be realized sufficient income to enable it to discharge its indebtedness incurred through the sale to the Consolidated Railway Company of certain securities in electric lines in Massachusetts, referred to in the report for the year ending June 30, 1906, which [illegible] have become the property of your company.

Only about $4,000,000 par value of said stock has thus far been disposed of, and until financial conditions materially improve no further sales are possible except at prices inadvisable.

The interest due has been paid and the properties controlled by the New England Investment & Security Company [illegible] a development which should result within a reasonable time in the payment of the amount of indebtedness due, which payment will be materially hastened by improved financial conditions, rendering possible the sale of its preferred stock without too great a sacrifice.

In the meantime the indebtedness would seem to be adequately well secured.

On May 31, 1907, by authority of the stockholders and in accordance with an Act of the state of Connecticut authorizing the same, a merger was effected of the Consolidated Railway Company and the New York, New Haven & Hartford Railroad Company under the name of The New York, New Haven & Hartford Railroad Company.

The New York, New Haven & Hartford Railroad Company as to-day constituted is the owner directly of all the railroads, electric urban and interurban lines, lighting, gas and water supply companies formerly owned and operated under the separate companies known as the New York, New Haven & Hartford Railroad and the Consolidated Railway Companies.

It was brought to the attention of your Directors early in the present year that a large amount of the capital stock of the Boston & Maine Railroad was seeking a market, and if acquired by interests likely to become the purchasers, the result might be a serious menace to the independence and prosperity of your property. After a long negotiation it was deemed advisable that your company should make the purchase and agreements to that effect were entered into through which your company became indirectly the owner of the same. Such agreements contemplated giving all the stockholders of the Boston & Maine the same terms, but before they became effective legislation was enacted by the commonwealth of Massachusetts prohibiting any further acquisition of stock before July 1, 1908. Inasmuch as the terms agreed upon contemplated a loss of one dollar per annum per share upon all stock to be acquired, it has worked no hardship upon your company thus far, and as the balance of the Boston & Maine stock is widely scattered there is no longer danger of its control passing to interests inimical to those of your property.

The Boston & Maine Railroad is probably as little competitive and is more supplementary and complimentary to your system of roads than any other railroad property with which we are engaged in business, and the operation of the two properties in close harmony with the economies naturally resulting would, judging by experience everywhere upon the system of roads controlled by your company, render possible an improved service and reduced tariffs; and if the Boston & Maine Railroad can be acquired with the good will of the public it now serves it should prove a profitable business venture, but if there is to be only unfavorable criticism, misrepresentation and disparagement, it may be well to proceed no farther, but such investment as has already been made even in that event is justified in that it has removed what could only be regarded as a menace to your property in preventing the control passing in another direction.

New by-laws were adopted on May 31, 1907, increasing the number of Directors to twenty-five, and in accordance therewith the following were elected Directors:

Mr. Lewis Cass Ledyard, of New York.
Mr. Charles M. Pratt, of New York.
Mr. Richard Olney, of Boston.
Mr. A. Heaton Robertson, of New Haven, Conn.
Mr. Frederick F. Brewster, of New Haven, Conn.
Mr. Henry K. McHarg, of Stamford, Conn.

Mr. Alexander J. Cassatt died at his home in Philadelphia on December 28, 1906, and the following minute was recorded upon the records of the Board:

"Alexander J. Cassatt died in Philadelphia, Pa., Dec. 28, 1906. His associates desire to place on record their high appreciation of his services as a Director of this Company and express their sympathy and tender their condolences to his family on the great loss they have sustained.

"Therefore be it

"*Resolved*, That the Secretary be instructed to enter this minute upon the records of the Company and transmit an engrossed copy thereof to his family."

The vacancy was filled by the election of Mr. James McCrea of Philadelphia.

The faithful and efficient services of the officers and employees are hereby acknowledged.

By order of the Board of Directors,
CHARLES S. MELLEN,
President.

STATEMENT OF EARNINGS AND OPERATING EXPENSES OF THE STEAM RAILROAD IN DETAIL, FOR THE TWELVE MONTHS ENDING JUNE 30, 1907.

Earnings.

Passenger Department:		
Regular passengers	$21,075,723.34	
Commutation passengers	1,187,711.17	
Extra baggage	190,607.36	
Special trains, parlor and sleeping cars, etc.	1,378,921.77	
Mails	788,650.05	
Express	2,137,315.37	
		$26,758,929.06
Freight Department:		
Regular	$27,687,481.56	
Hoisting, switching, etc	699,219.82	
		$28,386,701.38
Rents		402,398.26
Telegraph receipts		53,904.62
Gross earnings from operation		$55,601,936.32

Operating Expenses.

Maintenance of Way and Structures:		
Repairs of roadway	$2,564,481.4[illegible]

$374,770,119.52

We have examined the books of the New York, New Haven & Hartford Railroad Company, and its subsidiary companies for the year ending June 30, 1907, and we find that the foregoing General Balance Sheet and Income and Profit and Loss Accounts are correctly prepared therefrom.

All profits and losses of subsidiary companies controlled and operated have been taken up in the account except that the interest on the bonds of the Providence Securities Company so far as it has not been met from the earnings of its controlled companies, has been charged to the guaranty fund provided by the stockholders of the Rhode Island Securities Company on the acquisition of that Company, and we hereby certify that the General Balance Sheet and relative exhibits are properly drawn up so as to show the true financial condition of the combined companies, and that the statements of income and profit and loss are [illegible]

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 375 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Pres't. and Editor*	RAY MORRIS, *Secretary*
	R. S. CHISOLM, *Treas.*
E. A. SIMMONS, *Vice-President*	L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Man'g Editor*	GEORGE L. FOWLER
BRAMAN B. ADAMS	FRANK W. KRAEGER
CHARLES H. FRY	HUGH RANKIN
RODNEY HITT	BRADFORD BOARDMAN

CONTENTS

VOL. XLIII., No. 16. FRIDAY, OCTOBER 18, 1907.

The Atlantic City Hotel Men's Association submitted to the street railroad associations holding their annual meetings this week at Atlantic City a proposition having in view the building of a permanent structure in which to hold their conventions, the building to be used also for the annual gatherings of the Master Car Builders' and American Railway Master Mechanics' Associations. If agreeable to the railroad men to meet at Atlantic City for a period of five consecutive years, beginning in 1909, the plan is to be laid before the organizations of supply men responsible for the exhibits at those conventions. The scheme is to rebuild part of one of the piers which projects into the ocean from the boardwalk so that it would accommodate all the exhibits of the June and October conventions, including heavy cars and locomotives, and provide a suitable hall for meeting purposes—all to be under one roof. Exhibitors will pay a fixed sum for each square foot of space, as is now the case. The bare idea of establishing a permanent meeting place for all of the large steam and street railroad associations is thoroughly good. We are not prepared to commend all the details of the plan as evolved by the Atlantic City Hotel Men's Association, but with certain modifications the scheme could be made acceptable. Those modifications should provide, among other things, for a permanent exhibition of railroad appliances, one that could be visited at any time during the year by those interested. It would not only be valuable to those bent on learning, but would mean a saving of a considerable sum of money now spent by exhibitors for transporting and installing and removing their exhibits. It is to be hoped that the present agitation of the subject will result in a workable plan. As far as the place, Atlantic City, is concerned, it is ideal in respect to location and hotel accommodations. Its present facilities for taking care of the large and constantly growing exhibitions of railroad appliances are limited.

Robert Mather, President of the Rock Island Company, has the distinction of presenting more clearly than it has ever been presented before the curious and anomalous railroad situation into which we have been brought this year. His discussion is so good and so sound that we reproduce it almost entire in another column. The principal points which Mr. Mather makes may be listed somewhat as follows:

(1) The prosperity of the nation depends directly upon the efficiency of its transportation system, so that any decrease in this efficiency affects prosperity instantly.

(2) The national government and the states bargained with private capital for the production of the railroads; if the present-day restrictions to the earning power of securities had originally been made, the railroads would not have been built.

(3) Business has expanded faster than the ability of the railroads to raise funds with which to cope with it has expanded; hence there has been much unsatisfactory service.

(4) Rate reductions are the only effective weapons in freight competition, and the railroads have been the victims, not the beneficiaries, of rebates. No rebate was ever given that was not also received.

(5) Regarding the influencing of legislative action, a condemnatory people should remember that there have been legislative highwaymen, and that these highwaymen were their representatives.

(6) Loaded dice must be excluded from corporation security manipulation.

(7) Railroad regulation must be practical regulation; not a crusade for abstract righteousness.

(8) The power that regulates must also protect.

It is a discouraging reflection that this address, which views complex problems with such conservative wisdom, will, like other conservative addresses, be read by those already in sympathy with its doctrines, and will not be read, in any tangible degree, by those who need to read it the most. But if the Chicago Association of Commerce and all the other commercial associations in the country can be made to see these things clearly; the need to check abuses, but the paramount need to check the highwayman and the demagogue in legislative and executive authority, it may be that the fearful and wonderful crusade against property and prosperity may be deprived of the popular support on which it now so flourishes.

RAIL SECTIONS AND SPECIFICATIONS.

The work of deciding on a new rail section is now in the best hands possible; namely, the American Railway Association and the manufacturers of steel rails. This close relation of the manufacturing interests and the consumers will bring out all that can be said on either side of the question and the ultimate result will no doubt be a section of rail metallurgically correct as regards relation of metal in head, web and flange, allowing the low finishing temperature necessary to produce tough reliable steel and a freedom from great shrinkage strains that always occur in rail sections not properly balanced. The trouble with the American Association of Civil Engineers rail sections was the tacit assumption that the

metal in the 100-lb. rail would be the same as that in the 65-lb. rails; the rails were designed and metal distributed to give the best results as a girder, but the use of the heavier rails soon showed that something was radically wrong with them and it was found to be due more to the section of rail than any other cause. This, we feel confident, will be overcome in the proposed new rail sections which will no doubt be given out shortly and come into general use.

The machinery of the American Society of Civil Engineers has proven to be too slow and cumbersome to handle this problem. All the other societies* stood aside and waited on the American Society of Civil Engineers to give the country a better heavy rail section. Their committee has worked some five years on the matter and has up to this time only concluded that more metal was required in the web and flanges of the heavier rails but has not offered rail sections for consideration by the society. This course forced the matter on the Railway Association and the manufacturers, as a change of the heavier sections was found to be absolutely necessary.

The same can be said as regards the rail specifications. The work of the other societies has been thorough and has no doubt formed a basis of the proposed specifications now under consideration by the Railway Association and the manufacturers. The resulting specifications, we feel confident, will be satisfactory to the other societies which have had this work under consideration, although it is not to be expected that every point in the specifications will be settled at once. Some of the most important matters will have to be left open and tried out with rails rolled to the new sections. The matter of specifications and section of rails are so intimately related that the only satisfactory way is to give a section a thorough trial before stating absolutely what can be expected from it. This has more bearing on the reductions in rolling and final finishing temperature with the new sections. It no doubt will be easier for the mills to modify their methods of rolling with the new than with the old sections. It is to be hoped that the other societies will endorse the proposed specifications as far as possible, and if there are any points that they cannot agree upon, that a thorough series of tests will be made to cover these differences of opinion and that they be settled on their merits.

Many of the conflicting opinions on rails and rail sections today are due in part to the unsatisfactory manner in which rail failures have been reported by the railroad companies, and it is to be hoped that a uniform blank for reporting rail failures will come into general use. Also that the information given by the mill inspectors will be in better shape than heretofore, as it is only by securing better methods of manufacture and a check on same that the best results can be obtained from Bessemer or open hearth steel rails.

INCREASE IN WEIGHT OF FREIGHT TRAINS.

In our issue of July 12 we discussed the tendencies of increase in freight train weights during the last ten years, and showed that this increase had averaged some 60 per cent. We are now able to supplement the figures previously given, with those from another characteristic group of roads, although the increase for this group is somewhat less than the previous average and amounts to about 50 per cent. Insufficiency of the records for the early part of the period makes a more exact presentation of data impossible.

In the case of the Chesapeake & Ohio, for example, where the records have been carefully kept, the increase of weight of eastbound trains on the James river division was from 2,350 tons in 1896 to 3,450 tons in 1906, coupled with a corresponding increase of engine weight of from 118,600 lbs. to 181,400 lbs. This increase occurred during the last half of the period, as no changes had been made up to 1901. During this period the car capacity had also risen so that the length of train did not grow with its weight, having risen from 40 cars in 1896 to 50 in 1906. Summarized, this means a rise of 47 per cent. in train tonnage; of 55 per cent. in the weight of engines, and of but 25 per cent. in the number of cars in a train, while the average speed both while running and including stops remained constant at 16 and 10 miles an hour respectively. This eastbound traffic over the James river division is on favorable grades for nearly the whole length of the run and is in the direction of traffic. Westbound, the empty tonnage rose from 705 to 1,103 during the same period with a length of train of 45 and 56 cars respectively.

On the Richmond division the same maximum tonnage of 3,450 was reached from the 2,280 prevailing in 1896, giving a somewhat greater increase, or a full 51 per cent., while the average speed, including stops, rose from 11 to 12 miles per hour.

The records of another road, the Cleveland, Cincinnati, Chicago & St. Louis, from 1898 to 1906, show a somewhat lower increase, but one that was spread over the eight years instead of being concentrated in the last five. In 1898 the standard freight engine was a ten-wheeler (4-6-0) weighing 136,550 lbs., of which 111,400 lbs. was upon the drivers. In 1901, a consolidation had been adopted, weighing 185,800 lbs., with 170,000 lbs. on the drivers; weights that were increased to 211,500 lbs. and 187,500 lbs. respectively in 1906. The trains hauled by these engines weighed 819,892 and 1,132 tons respectively and consisted of 33, 32 and 39 cars, by which the increase of car capacity or loading is well set forth. Here there was an increase of 38 per cent. in train tonnage while that of the engine weights was but 14 per cent.

In the case of the Chesapeake & Ohio the same average speed was maintained throughout the whole period despite the fact that there was an increase of nearly 50 per cent. in the number of trains, but this average speed was low, and the average of delays in the two terminal years of the decade varied only three minutes. On the other hand, on the C., C., C. & St. L. there was a higher average speed throughout, but it dropped from 14.7 miles per hour in 1898 to 12.2 miles in 1901 and rose again to 13.3 in 1906. This was connected with a regular rise in the amount of traffic from 33 trains per day in 1898 to 36 in 1901 and 43 in 1906, coupled with an increase of passenger traffic from 13 to 15 to 23 trains per day, by which the freight work was delayed.

On the Central of New Jersey there has been an increase of about 5 per cent. in the weight of trains since 1901. If these figures are to be regarded as typical of what has taken place throughout the country, it will appear that the increase of about 50 per cent. in tonnage has been accomplished with an increase of about 25 per cent. in the number of cars per train, due probably to better loading and higher capacities. In each of the cases cited, furthermore, the average weights of trains that were given were somewhat below the maximum that had been hauled by the engine, so that the rating was apparently well within the capacity. Nor are these the highest records that have been made in daily work, but may be taken as good average practice of traffic handling in comparatively level sections of the country, and the maximum tonnage that can be hauled by the modern engine is such that in addition to the tonnage rating as to weight a limitation is also put upon the number of cars that are to be used. It is all well enough to raise engine weights and cylinder capacities to a point where the tractive effort is run up to great heights, but the question arises, how about the cars? The front drawbar of the first car must be capable of sustaining the full pull of the engine, and this link in the chain of the train is frequently too weak to sustain any such stress. There are some engines now at work that are confessedly too powerful for the draft rigging of the cars that they are to haul, and this being the case there arises the natural question of what's the use of going any further.

WHEEL AND RAIL SECTIONS.

It is repeating an old story to say that dissatisfaction has been expressed with more or less vehemence during the past year with the present conditions of rails and rail-making for American railroads. The dissatisfaction has extended not only to the quality of the rail but to the shape of its section as well as that of the wheel that is to roll upon it. The result has been that the Master Car Builders' Association has adopted, as recommended practice, a contour of tread and flange that differs slightly, but in what is considered an important respect, from the old long-established standard, and the Maintenance of Way Association has appointed a committee to look into the matter of rail sections and ascertain whether or not it will be possible to improve on the sections of the American Society of Civil Engineers which are now so extensively used throughout the country.

It is evident that in the redesigning of the wheel and rail contours three objects should be kept in view: the reduction of the wear of the rail, the reduction of the wear of the wheel, and the reduction of the rolling resistance of the wheel on the rail. Between 15 and 20 years ago a great deal of interest was manifested in the subject of the relation of the wheel to the rail; the matter was discussed before the few railroad clubs then in existence, and M. N. Forney read an elaborate paper on the subject before the Master

*See their specifications in parallel columns, *Railroad Gazette*, Sept. 6, page 250.

Car Builders' Association in 1884. This paper gave a careful analysis of the relations of the wheel and rail, it summarized the opinions of railroad men on the subject, as they existed at the time, and contained a number of recommendations that were only partially followed in the standards that were afterwards adopted. No experiments were made and matters were in such an unsettled state at that date as to gage of both wheels and track that it was impossible to do more than express an opinion which could not be verified by facts.

Since that time the weight of cars and rails has been increased and the 100-lb. rail that was looked upon as a dream of Sandberg, who suggested it, has become a reality and common practice. Meanwhile opinions based upon everyday observations have led some to believe in the wide head for the rail while others think a narrower top would do better service. The head of the A. S. C. E. section has a top curvature of 12 in. radius with corners of $^{9}/_{16}$ in. radius and vertical sides. The two weights of 100 lbs. and 85 lbs. which are perhaps typical of current practice have widths of heads of $2^{7}/_{8}$ in. and $2^{1}/_{16}$ in. respectively. Briefly the advocates of a narrower head argue that by so rolling it, the metal will be worked to a finer texture, and cite the fact that when a rail is examined under the microscope there is a very marked difference between the structure at the sides and at the center. On the other hand, the wider head is claimed to offer a greater surface of metal for the support of the wheel and for wear, while neither side seem to pay much attention to what is actually taking place as the wheel rolls over the rail.

This matter has never been thoroughly probed, but certain investigations, the results of which will soon be made public, have led to the conclusion that the determination of the proper contours of the wheel and the rail are of great importance and will have a most decided influence upon the three factors that have been set forth as the aim of the modifications that have been and are likely to be made.

Inquiry among the chief engineers of a large number of railroads has brought out the fact that this relationship of the wheel to the rail is almost universally considered "a matter of very great importance," and one that the "joint committee on wheel and rail section should take up." But no information as to facts was obtained. In one case the writer had "concluded after careful observation on a road where there are many curves, that the vertical side of the rails results, in the case of curves, in a delay of the period when the friction of the wheel against the rail shall not only be that due to the tread but also that due to the flange. In other words, the time when flange friction or resistance takes effect is when the side of the rail at the upper corner has been so worn by the wheel flange that it has approximately reached the shape of the flange itself; that is, when it has a sloping side instead of a vertical side, with a top of considerable radius. Under this condition the rail receives a sort of grinding wear, produced by the wheel flange, and the wearing away of the rail on the outside of curves after the shaping to the flange has been well started is quite rapid. This fact alone has been considered an argument for the vertical sides to rails, especially on roads where there is much curvature. In this there has been no discussion of the radius of the curve at the top of the rail. Possibly that adopted may be a little short, but it is probable that the differences, when compared, are very small. Certainly the radius should not be less than it now is."

On the other hand a few electric roads report that the impression has been formed that the sharp corner and vertical side tend to cut away new wheels quite rapidly and thus form sharp flanges, although one engineer of a large road does not consider that it is a "very important subject," this influence of the contours on rolling resistances.

It is, of course, impossible to so design the wheel and rail that wear and frictional resistance can be done away with for no matter what shapes are used at the outset, wear will alter them to suit surrounding conditions as was brought out in a discussion at the American Society of Civil Engineers. Though this may be true, the question arises whether it will not be worth while to make an investigation in order to ascertain whether shape cannot mitigate wear and thus lessen train resistance.

In the course of the wheel and rail investigations referred to, it was borne in on the observer that the contour of the wheel had much to do with the rolling resistance, though definite figures as to the exact value of the variations used were not obtained. It appeared furthermore that the so-called rolling resistance of the wheel on the rail was, for low speeds at least, the most important factor in train resistance. And it was shown that the area of contact between the wheel and the rail was such that, even with the maximum wheel loads of 100,000-lb. capacity cars, it covered but a small fraction of the width of the head of the rail. This held true when the wheels were worn as well as when they were new. As for the area of the section in contact it was so small on both new and old wheels that the average pressure put upon it, when the wheel load was 20,000 lbs., was such that it far exceeded the limit of elasticity or even the breaking strength of the metal of the rail. The reason, then, why the whole top of the rail appears bright is because of the travel of the point of contact from one side of the head to the other.

The rapid rise in wheel loads on all roads during the past few years has made many subjects of investigation important that in the times of light rolling stock in the past would not have attracted attention. As yet there is no precise data available as to the effect of form of tread and flange on train resistance or even of the difference of new and worn rails on that item of railroad operation, but there seems to be a strong indication that it does have an influence, and, if such is the case, it is certainly deserving of more than a passing notice.

Rock Island Company.

The Rock Island Company is a holding corporation in which is vested the ultimate control of the various railroads included in the Rock Island and the St. Louis & San Francisco systems. The arrangement is unusually complex, because there is an intermediate company between the railroads and the final holding company. This is the Chicago, Rock Island & Pacific *Railroad*, which owns directly $70,067,700 of the $75,000,000 stock of the Chicago, Rock Island & Pacific Railway and all of the $29,000,000 common stock of the St. Louis & San Francisco Railroad. The reason that this intermediate holding company was created was that bonds were to be issued in acquiring the stocks of the railroads which were taken over and bonds issued by a mere holding company would not measure up to the standard either of savings bank or investment requirements that bonds equally well protected issued by a railroad company would reach. Therefore, the Chicago, Rock Island & Pacific Railroad Company issues the bonds which financed the consolidation, while the stock which was given with the bonds in exchange for the stocks of the operating railroads is issued by the Rock Island Company. Control of the whole consolidation, involving 14,270 miles of operated line, is centered and brought to a head in the $54,000,000 preferred stock of the Rock Island Company which, alone of the total $150,000,000 stock of that corporation, has voting power. Thus, actual control of the whole great combination of systems can be held through ownership of $28,000,000 of the preferred stock of the Rock Island Company.

On the face of the returns shown in the Rock Island Company's report, the fiscal year lately closed was not a prosperous one, for the combined income account of the Rock Island Company and of the Chicago, Rock Island & Pacific Railroad shows a surplus of only $155,289 remaining available for dividends on the Rock Island Company's stock. But, as a result of the very complexity of the interrelation between the different companies, this proves nothing at all as to the profitableness of the year's operations. Simply by adjusting the amount of dividends declared on the stock of the Chicago, Rock Island & Pacific Railway so that they will cover the interest payments on the Chicago, Rock Island & Pacific Railroad Company's bonds, the surplus available for the Rock Island Company's stock can be reduced to a nominal sum, the rest of the surplus earnings remaining in the operating railroad company's treasury or being used for its benefit. This is the policy which has been pursued during the last two years, or since the 4 per cent. dividends on Rock Island Company preferred stock were stopped in November, 1905, and the policy of general improvement of the railroad lines begun.

The real ownership of the Rock Island Company's stock, however, is in the surplus earnings of its subsidiary lines. In the case of the Chicago, Rock Island & Pacific Railway, for instance, the Rock Island Company really owns 70.75 of its surplus available for dividends. Last year this amounted to $8,750,000. Similarly the Rock Island Company owns all the St. Louis & San Francisco's surplus after dividends which amounted last year to a little less than $4,000,000. Carrying the process on a step further, the Rock Island Company really owns the surplus after dividends of the Chicago & Eastern Illinois, all of whose stock is owned by the St. Louis & San Francisco. Still further, the Rock Island Company really owns most of the surplus of the Evansville & Terre Haute, nearly all of whose common stock is owned by the Chicago & Eastern Illinois. Fortunately, it is no longer necessary to carry this process still a step further, as the operating results of the Evansville & Indianapolis which has been controlled by the Evansville & Terre Haute, are now merged with the returns of that property.

This is, of course, a somewhat theoretical viewpoint, as in the case of each of the operating railroad companies, part of the sur-

plus for the year would be used by the company which earned it for itself, either for in additions and improvements or for miscellaneous deductions or amounts written off which would properly be charged against the income of the year. Yet the results obtained in this way are of value in estimating the actual earnings' resources behind the stock of the Rock Island Company. Assuming that last year in each case the operating company used half of its surplus for its own purposes, the other half accruing to the Rock Island Company, this remainder would have amounted to 5.6 per cent. on the $49,000,000 outstanding preferred stock of the Rock Island Company. The total of the surpluses of the operating companies, without deductions, amounted to 18.8 per cent. on Rock Island Company preferred stock. It is therefore evident that the dividend on Rock Island preferred stock was earned and might have been paid. That it was not is one of the strongest arguments for the ultimate success of this great experiment in railroad consolidation. As long as the railroads themselves, which are the only earning companies in the complicated scheme, are below standard in roadbed and equipment, the corporate pyramid is not firmly set on its foundations. Once improved to the point of efficiency the system as a whole can stand firm and strong. The work which is being done toward bringing about this result is described in detail in the reviews of the reports of the Chicago, Rock Island & Pacific Railway, and of the St. Louis & San Francisco on the following pages.

The combined income account of the 14,100 average miles operated by the Chicago, Rock Island & Pacific; the St. Louis & San Francisco; the Chicago & Eastern Illinois, and the Evansville & Terre Haute, including subsidiary lines, gives a view in the large of the Rock Island Company's system. Gross earnings were $112,500,000, against $95,400,000 in 1906, an increase of about 18 per cent. Operating expenses rose from $63,300,000 to $74,200,000, leaving net earnings of $38,200,000, against $32,000,000 in 1906. The net income available for dividends was $15,000,000, against $10,700,000 in the previous year, of which $5,600,000 was paid out in dividends and the balance, $9,500,000, carried to profit and loss. The total deductions from profit and loss for the year were $6,600,000, leaving a net increase in surplus just under $4,000,000. The year was a most prosperous one, in which much more than the year before was spent on maintenance of the property, less disbursed in dividends and over twice as much kept as final profit.

In order to complete the view of the Rock Island Company's system, as a whole, the following statement of the combined operated mileage, separated in groups according to the company's custom, is included:

	Miles 1st main track.	Miles 2d & 3d track.	Miles yard trk. and sidings.	Trackage rights included in 1st main track.
Rock Island Lines:				
The Chic., Rock Isl. & Pac. Ry...	7,356	289	1,644	622
Chicago, Rock Isl. & El Paso Ry...	112	...	17	83
The Chic., Rock Isl. & Gulf Ry...	471	...	61	84
Total Rock Island lines..	7,938	289	1,722	705
St. Louis & San Francisco R. R Lines

Minnesota	282	Alabama	128
Kansas	1,842	Mississippi	143
Nebraska	250	Louisiana	92
Colorado	376	Texas	808
		New Mexico Territory	112
Forward	8,918	Total	14,270

The Rock Island Company's System.

Chicago, Rock Island & Pacific Railway.

The Chicago, Rock Island & Pacific has had a year of splendid progress both in earnings and in the general improvement of the property which was begun simultaneously with the suspension of dividend payments late in 1905 on the 4 per cent. preferred stock of the Rock Island Company. In the previous fiscal year ended June 30, 1906, a great deal was done toward raising the physical standards of the track and permanent way. In that year the cost of rail renewals increased 230 per cent. On June 30, 1905, there were less than two miles of rails heavier than 80 lbs. to the yard on the whole of the 6,735 miles owned. In the 1906 year 487 miles of 85-lb. rails were laid. Last year, while the increase in the expense of rail renewals was only 4 per cent., this is to be compared with the tremendously increased figure of the preceding year. There were 140 miles of 85-lb. steel put down during the year, besides 170 miles of 80-lb. rails. On the 7,233 miles of line owned on June 30, 1907, 43 per cent. of the main, second and third track now has 80-lb. or heavier rails. Two years ago 65 per cent. of the main and second track had rails lighter than 80 lbs.

This is one particular instance of roadway improvement. There are other interesting features in the maintenance of way and structures account for the past year. This division of operating expenses as a whole increased 29 per cent. over the previous year, whose expenditures on this account were an increase of 25½ per cent. over the year before. The largest increases, instead of being in the rail and the tie items, were in repairs of roadway, 29 per cent.; repairs and renewals of bridges and culverts, 30 per cent.; repairs and renewals of fences, road crossings, signs and cattle guards, 37½ per cent., and repairs and renewals of telegraph, 56 per cent. The expense of maintenance of way per mile of road was $1,164, against $1,021, in 1906. In 1905 the figure was $823 a mile. The 1907 figures include the 299 miles of the St. Louis, Kansas City & Colorado from St. Louis to Kansas City now included in the general results of the system. There were 1,695,000 ties renewed, of which 915,000 were treated. The seriousness, present and potential, of the tie problem may be judged from the statement that great difficulty was experienced in securing an adequate supply of ties for renewals; this by a railroad whose lines can draw upon both the Northwest and the Southwest for its supply of timber.

There were 233 miles of new ballast put in place and 102 miles of line reballasted. Of the 7,522 miles of track, 1,223 were on June 30 ballasted with rock, 446 with burnt clay, 2,050 with gravel and 524 with cinders, leaving 3,279 miles of sand or dirt, or, in other words, unballasted track. Heavy expenditures were made in replacing light bridges with heavier ones and in strengthening existing bridges to provide for the heavier equipment now in use. In such cases an amount equal to the cost of the original structures

or the estimated cost of renewing them in kind was charged to operating expenses. Over a mile (6,100 lin. ft.) of timber bridges were replaced with steel, against 2,417 ft. in 1906, and nearly 3 miles (14,471 ft.) of bridges and trestles were filled, against 1,208 ft. in 1906. These facts clearly illustrate both the physical weakness of the property when the present campaign of improvement was begun and the effectiveness with which the campaign is being carried out.

The improvement policy was not confined to the roadway department. During the year there were acquired 6 balanced compound Atlantic locomotives, 72 consolidation locomotives, 11 Pacific locomotives and 20 switch engines. The increased use of the Atlantic and Pacific types suggests that the passenger business of the road is growing in quantity and excellence of service, while the addition of over 30 per cent. more new consolidation locomotives than were owned a year previous shows the growth in heavy freight traffic. There were 95 new passenger train cars put in service, including 10 dining cars, 5 observation library cars and 1 passenger motor car. Thirty new passenger train cars and another motor car are to be delivered before the end of 1907. The number of new freight cars was 6,737, a net increase of 3,399, or 13½ per cent. in number, but over 31 per cent. in capacity over the cars previously in service. Nearly 3,000 more freight cars are on order. There also were acquired 1 inspection motor car, 1 derrick, 1 rail saw, 10 caboose cars and 100 Hart convertible ballast cars. Fifty more cabooses are to be delivered shortly. Most of the new equipment was acquired through the Rock Island Improvement Company, which issues the equipment trusts of the road. This list of new equipment does not include 14 consolidation locomotives, 6 passenger train cars, 10 caboose cars, 274 stock cars and 1,000 box cars bought at a cost of $1,500,000 for the Rock Island, Arkansas & Louisiana, which owns the line shown on the map directly south of Little Rock, Ark. As illustrating the method of equipment accounting may be noted the case of one special type consolidation locomotive purchased at a cost of $19,871 to replace an engine lost in the Cimarron river, of whose cost $7,623 was charged to property account to offset the deduction from that account for the value of the lost engine, and the rest charged to operating expenses.

The maintenance cost per unit of equipment was $2,440 per locomotive, against $2,614 in 1906; $861 per passenger car, against $773 in 1906; $60 per freight car, against $55 in 1906, and $71 per work car, against $74 in 1906. The report states that on account of the large number of new locomotives put in service, the lower cost of maintenance per locomotive denotes no reduction in the maintenance standard.

It is evident that the Rock Island has now reached the point where its maintenance expenditures are not only fully taking care of the current depreciation of the property, but making up for insufficient maintenance expenditures in the past. There is still a great deal of work to be done. Every added year of prosperity during which the present liberal maintenance standard can be maintained will mean much in the future history of the company. With its lines once brought up to first-class standard, the Rock Island will be in a very strong position as regards surplus earnings on its railroad property.

Gross earnings last year increased $9,000,000, or 18 per cent., and operating expenses were $6,000,000, or 17 per cent. larger, leaving net earnings of $19,200,000, an increase of $3,000,000, or 19 per cent. The net income after charges was 11.6 per cent. on the $75,000,000 capital stock, on which, however, only 5½ per cent. was paid. There was no special improvement appropriation as in the previous year, but the whole of the surplus after dividends was carried to profit and loss, from which was deducted besides other accounts $1,400,000 for depreciation of equipment (which is responsible for most of this amount), structures and tracks.

Of the increase of $9,000,000 in gross earnings, $3,000,000, as already pointed out, was saved for net earnings. Of the remaining $6,000,000, about $2,000,000 was spent for maintenance and $4,000,000 for increase in cost of movement and administration; that is, for conducting transportation and general expenses. The Rock Island was not as successful as the St. Louis & San Francisco in reducing conducting transportation cost. Conducting transportation was 57.07 per cent. of the total expenses, against 55.98 per cent. in 1906 and 58.25 per cent. in 1905. The still more significant ratio of conducting transportation cost to gross earnings was 38.88 last year, as against 38.31 in 1906, and 41.07 in 1905. Thus the actual cost of moving the traffic in a year when the cost of material, supplies and labor was greatly increasing and when there was likely to be that lack of economy which often comes from handling a great increase in traffic, only 0.57 per cent. more of the gross earnings were spent on conducting transportation than in the previous year. This true, there was naturally an increase in the trainload as one of its prime causes. Including all freight, the trainload now lacks only half a ton of being 300 tons. The revenue trainload was 266 tons last year, against 245 tons in 1906. There was also an increase in the average carload.

A year ago there were some startlingly large increases in the tonnage of various individual commodities. The same thing was true last year. The tonnage of wheat increased 40 per cent., of flour 30 per cent., of hay and straw 50 per cent., of cotton 34 per cent., of fruit and vegetables 27 per cent. and of other agricultural products 55 per cent. But grain and oats tonnage decreased so that the increase in the "products of agriculture" group was only 10 per cent. Other large individual tonnage increases were: in coke 55 per cent.; "other mineral products," 306 per cent.; "other castings and machinery," 112 per cent.; petroleum and other oils, 40 per cent.; wagons, carriages, tools, etc., 45 per cent., and household goods and furniture, 58 per cent. Manufactures, as a whole, increased 19 per cent., and merchandise, which includes all less than carload shipments, 17 per cent. The tremendously rapid growth and expansion of the Southwest are clearly evidenced in these figures of increases. The records of the industrial department emphasize the same fact. There were located along the lines of the road during the year 327 new enterprises at an estimated cost of $8,500,000. These are to employ over 8,000 people.

The balance sheet shows that cash stood at $9,900,000 on June 30. Against this, $7,500,000 of three-year notes fell due and were paid off the next day. This would leave a cash balance of $2,400,000. Current liabilities were $11,000,000, against current assets of $10,600,000, including this cash sum. There were, however, $855,000 in fundable advances for construction and equipment, material and supplies on hand valued at $4,400,000 and $10,000,000 in unpledged bonds in the treasury. The transfer of the St. Louis, Kansas City & Colorado to the property and franchises account added $16,900,000 to that item. There was $2,800,000 added in connection with the completion and equipment of the Rock Island, Arkansas & Louisiana.

The Rock Island is still expanding. The new line of the Trinity & Brazos Valley, the present status of which is described in detail in the review of the Colorado & Southern's report, will serve the Rock Island as well as the Colorado & Southern and the St. Louis & San Francisco as a Gulf outlet. The line which the Colorado Southern, New Orleans & Pacific is building between Houston and New Orleans is described in the review of the St. Louis & San Francisco. The Rock Island is to connect with this new line, not only at Houston, but over the Rock Island, Arkansas & Louisiana, which is to be finished to Eunice, La., on the Houston-New Orleans line, this month. The estimated cost of the last 57 miles of this line from Alexandria south to Eunice is a little more than $1,000,000, of which more than half had been spent on June 30, 1907. The new lines in Arkansas connecting this line with the Choctaw division at Little Rock were finished during the year, the branch from Fordyce to Crossett, 57 miles, having been put in operation on February 1, 1907, and the line from Tinsman to Eldorado, 36 miles, on June 23, 1907. These two lines are laid with 60-lb. rail, gravel ballasted and equipped with Rock Island standard bridges and buildings. Just north of Alexandria a part of the Louisiana & Arkansas is to be used under a trackage contract. Completion of the whole line to Eunice will establish a new through route connecting the Choctaw division, the old Choctaw, Oklahoma & Gulf, with New Orleans.

President Winchell speaks as follows in regard to the railroad legislation of the year. The truth of his statement that every opportunity is being taken to establish better relations between the railroad and its patrons is thoroughly borne out by the facts. There is no railroad in the country which is more alive to the necessity and advantages of publicity and frank dealing than the Chicago, Rock Island & Pacific:

> Legislation by the various states which your lines serve, respecting rates and operating methods of railroads, has been excessive in quantity and severe in character. The legislatures of five such states have passed laws establishing two cents a mile as the maximum rate of passenger fare, and other laws have been passed by the several states calling for serious reductions in freight rates. Doubtless a large part of this legislation has been due to misconception of the actual conditions. At every opportunity it is the policy of the officers of your company to endeavor to establish better relations with the people of the various states, and to impress upon them the fact that the progress of the section of the country traversed by your road, and the continued prosperity thereof, require candid co-operation between the railroads and the other business interests. The aim of all must be to promote the welfare of the country, and it is to be hoped that when the situation is thoroughly understood, a spirit of mutual co-operation will be the result.

The following table summarizes the last two years' results on the Chicago, Rock Island & Pacific:

	1907.	1906.
Mileage worked	7,780	7,128
Passenger earnings	$16,449,765	$13,917,031
Freight earnings	40,663,972	34,695,824
Gross earnings	60,238,420	51,237,858
Maint. way and structures.	8,754,307	7,302,490
Maint. of equipment	7,184,128	6,661,466
Conducting transportation	23,420,948	19,630,076
Operating expenses	41,044,142	35,067,059
Net earnings	19,194,278	16,170,800
Net income	8,750,517	6,785,832
Appropriations for betterments	.....	2,108,280
Year's surplus	4,633,789	.....

St. Louis & San Francisco.

A year ago, in reviewing the results of operation of this road, it was remarked that the St. Louis & San Francisco had two great problems: one, to develop a profitable business on a large mileage of new lines in new country; the other, to reduce the proportionate amount of earnings used up by the unproductive expense of conducting transportation. It could not then be known that the Southwest was during the next year to lead all other parts of the country in the rapidity of its growth, a circumstance which solved the first of the St. Louis & San Francisco's problems with great satisfaction. The second was solved by the officers of the road by reducing the proportion of operating income paid out in conducting the business in a year when the ordinary costs of operation were abnormally high.

The years from 1900 to 1905 were a period during which the St. Louis & San Francisco mileage grew by several hundred miles a year. In 1906 there was an increase of only 38 miles and last year there was an actual decrease of seven miles, due to remeasurements and abandonment of small sections of useless track. But the road stands on the threshold of another period of important expansion. On April 30, 1907, it leased for 999 years the Colorado Southern, New Orleans & Pacific Railroad, all of whose stock and bonds it owns. This company owns the Orange & Northwestern and the Beaumont, Sour Lake & Western, and the three roads are together building a through line from Houston, Tex., to Baton Rouge, La., which will be extended by trackage rights over the Yazoo & Mississippi Valley from Baton Rouge to New Orleans. This line, shown on the map of the Rock Island Company's system on another page, is to be in operation by the end of the year. Besides penetrating a local territory productive in cotton and sugar, it will be a competitor as a through line with the Southern Pacific from New Orleans to Houston. The total mileage under construction by the Colorado Southern, New Orleans & Pacific and its subsidiary companies is 303 miles. Including the trackage rights along the Mississippi river, the total mileage will be nearly 400 miles. This is all the construction which is directly at present under way. There are projected, however, a line from Oklahoma City, Okla., south via Lindsay, Ind. T., to Cornish, which is on another projected line from Ardmore, Ind. T., west via Waurika, Okla., to a point near Wichita Falls, Tex.; and an extension of the old Fort Worth & Rio Grande from Brady, Tex., south to San Antonio. Another through line of even greater importance, though it has not involved any direct construction, is the Trinity & Brazos Valley line from Fort Worth and Dallas, Tex., south to Houston and Galveston, giving the St. Louis & San Francisco as well as the Rock Island for the first time a Gulf connection. The Trinity & Brazos Valley will also be a feeder of the Houston-New Orleans line.

Thus the St. Louis & San Francisco will within the next year again have several considerable increases in mileage, this time by through lines in competitive territory instead of, as most of the additions in the recent past have been, lightly built local lines in undeveloped territory. It will be both interesting and important in judging of the future of the property to observe the effect of the acquisition of these two important through lines, of which the Fort Worth extension changes hitherto mainly local lines from Kansas City and from St. Louis south to Fort Worth, into parts of a new through line, on the earnings and detailed operating results. If the result is to secure a much larger proportion of through traffic, the new lines will furnish an element of great strength in regular traffic not dependent largely on the immediate growth and productiveness of the surrounding territory. More of such through traffic the road has always needed.

Last year's record of operations shows gross earnings 20½ per cent., and net earnings 19½ per cent. larger than in 1906; this as already mentioned, with no increase in the operated mileage. Operating expenses, to be sure, increased 21 per cent., faster proportionately than either gross or net earnings, but, largely owing to the reduction in proportion of conducting transportation cost, the net results were as satisfactory as shown. Conducting transportation amounted to 54.72 per cent. of the total expenses, as against 57.15 per cent. in 1906 and 57.9 per cent. in 1905. Its ratio to gross earnings was 35.25 against 36.64 in 1906 and 37.4 in 1905. This showing is a satisfactory one for any year, remarkably so for a year when the cost of conducting transportation on most roads rose more instead of less than any other operating cost.

The decreased proportion which conducting transportation showed to both operating expenses as a whole and to gross earnings was taken up by maintenance of way and structures which was 21.71 per cent. of total expenses, against 19.71 per cent. in 1906, 18.6 per cent. in 1905, and 17.6 per cent. in 1904; and, of gross earnings, 13.99 per cent., against 12.63 per cent. in 1906 and 12 per cent. in 1905. The same policy of greatly improving the property was carried out as on the Rock Island. The average expenditure for maintenance of way and structures per mile of road operated was $1,068, against $799 in 1906, an increase of $269, or 34 per cent., on each of the more than 5,000 miles operated. This is a striking showing of the improvement policy. The cross-tie renewals during the year amounted to 1,439,000; there were 1,186 ft. of wooden trestles filled; 625 ft. of stone or concrete arch culverts substituted for wooden culverts; 200 ft. of timber bridges replaced by steel structures, and 2,515 ft. of iron and steel bridges replaced with heavier steel bridges. Of new rail there were 21,329 tons of 85-lb., 2,788 tons of 75-lb. and 365 tons of 65-lb. laid in main track during the year. There were also 132 miles of track ballasted and 194 miles reballasted. These figures, which sum up the principal activities of the maintenance of way department, give an idea of how much has been done.

The equipment also was more liberally maintained than in the previous year. This account, as a whole, increased 24 per cent. Repairs cost $2,508 per locomotive, against $2,313 in 1906; $781 per passenger car, against $761 in 1906; $62 per freight car, against $50 in 1906, and $45 per service car, against $49 in 1906. The net increases in rolling stock equipment during the year were 63 locomotives, four passenger cars, 2,416 freight cars and 844 service cars. In addition, there are being delivered during the last half of the calendar year 90 locomotives, 87 train cars and 5,255 freight cars.

Gross earnings were $38,600,000, an increase of $6,600,000. Of this increase, freight earnings, which increased 22 per cent., furnished $4,900,000, and passenger earnings, which increased 16 per cent., $1,300,000. There was an increase of 26 per cent. in mail earnings, partly due to a new mail service operated in connection with the Missouri, Kansas & Texas.

Operating expenses were larger by $4,300,000. Maintenance of way and structures increased $1,400,000, or 33½ per cent.; maintenance of equipment, $900,000, or 24 per cent., and conducting transportation, $1,900,000, or 16 per cent. The increase in general expenses was 22 per cent. The St. Louis & San Francisco is very fortunate to be able to report a decrease of 5 per cent. in tax payments for the year. The net income available for dividends was 80 per cent. larger than in the previous year, and the dividend payments, owing to the passing of the 2 per cent. dividend on the second preferred stock in 1907, 62 per cent. smaller, so that the surplus after dividends was just under $4,000,000, as against a little less than $1,800,000 in 1906, an increase of 121 per cent. There was charged to the general profit and loss account $625,000 as depreciation in the value of buildings torn down, tracks taken up and equipment destroyed and dismantled during the year, the balance of the cost less salvage, being charged to operating expenses.

Freight earnings per mile of road rose from $4,331 to $5,304. The trainload was 224 tons, against 214 tons in 1906, a small increase. This is a road with a great network of branch lines which carry light traffic. The bulk of the business is traffic of this character; therefore an increase in the trainload is much harder to accomplish than on a heavy traffic road with through business, where it is necessary only to cut down the ruling grade or acquire heavier power to raise the number of tons carried per train mile.

There were increases of 21 per cent. in the tonnage of agricultural products, 15 per cent. in mineral products, 14 per cent. in forest products and 24 per cent. in manufactures. Wheat tonnage increased 36 per cent.; hay and straw, 52 per cent.; cotton, 16 per cent.; dressed meats, 69 per cent.; wool, 163 per cent.; bituminous coal, 16 per cent.; "other mineral products," 107 per cent.; petroleum and other oils, 45 per cent.; pig and bloom iron, 44 per cent.; "other castings and machinery," 46 per cent.; bar and sheet metal, 106 per cent.; wagons, carriages, tools, etc., 90 per cent.; household goods and furniture, 21 per cent., and "other manufactures," 29 per cent. The merchandise tonnage increased 11 per cent. and miscellaneous, including all carload shipments of commodities not separately mentioned, 45 per cent. The similarity of some of these individual increases to corresponding ones on the Rock Island will be noticed. The industrial department reports almost the same number of new industrial plants as those that located on the Rock Island lines during the year. The new industries on the St. Louis & San Francisco tracks number 338, cost about $9,000,000 and employ over 12,000 men. These figures are all further testimony to the great prosperity of the Southwest.

The balance sheet shows current liabilities of $13,600,000, against strictly current assets of $12,240,000. There are in addition fundable construction advances amounting to $865,000, supplies on hand amounting to $2,870,000 and unpledged securities in the treasury which cost $1,100,000. This company like the Chicago, Rock Island & Pacific is in no immediate straits for new capital, but if it were is possible to do so on reasonable terms could at once profitably enlarge its working capital.

The following table shows the operating results of the St. Louis & San Francisco, not including the Chicago & Eastern Illinois:

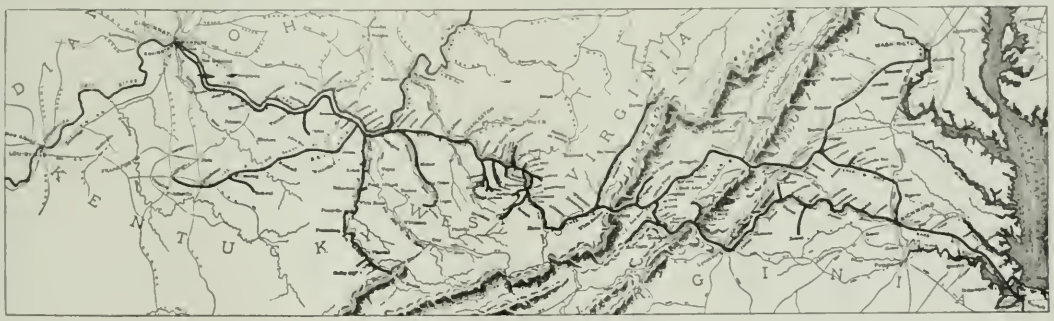
	1907.	1906.
Mileage worked	5,062	5,069
Passenger earnings	$9,169,400	$7,908,841
Freight earnings	26,848,665	21,955,975
Gross earnings	38,621,068	32,046,657
Maint. of way and struct.	5,406,107	4,049,094
Maint. of equipment	4,699,674	3,803,211
Conducting transportation	13,610,703	11,742,742
Operating expenses	24,872,579	20,545,533
Net earnings	13,748,488	11,501,123
Net income	4,158,583	2,309,136
Dividends	199,742	519,742
Year's surplus	3,958,841	1,789,394

Chesapeake & Ohio.

A change has taken place during the last year in the operating results of the Chesapeake & Ohio. The year ended in June, 1906, was far and away the most prosperous in every way in the company's history. Gross earnings increased 19 per cent. and net earnings 26 per cent. over the 1905 year, which in itself was very prosperous. Last year although gross earnings increased 5 per cent., there was a decrease of nearly $600,000 or 5½ per cent. in net earnings. As charges sharply increased, owing largely to an increase of 29 per cent. in taxes and the greater amount of equipment bonds outstanding, the year's final contribution to the profit and loss account was only a nominal one, instead of a surplus of nearly $1,500,000 as in 1906.

Gross earnings were affected unfavorably by the hard winter. Operating expenses were much increased by the rise in cost of materials and a general increase in wages. Furthermore, traffic on the lines in West Virginia and Kentucky was frequently interrupted by land slides and by river floods, the train service on the Cincinnati division having at one time been suspended for a week.

The Chesapeake & Ohio, like the Norfolk & Western, its near neighbor from the Ohio river to tidewater, and, for that matter, many other railroads, is at present in a discouraging situation. Great quantities of traffic are offering. The company has been and is hard put to it to provide enough equipment to meet this traffic. Even with the equipment provided, the necessities of the case are not met, for the existing lines, mostly single-track, are inadequate to promptly and efficiently handle the rush of traffic. More double-track is urgently needed. Gross earnings, to be sure, are increasing, but already the increases are more than eaten up by the rising cost of operation. Locomotives cost more, cars cost more, lumber costs more, general supplies cost more; in particular, labor costs more, while at the same time it is generally less efficient. In this situation the company is met with state laws reducing rates. Furthermore, its main hope of solving its problems—the extension and improvement of its plant through expenditures on capital account—is taken away by the fact that it cannot sell bonds.



Chesapeake & Ohio.

In commenting on this situation President Stevens calls attention to the fact that while the road last year earned more than 5 per cent. on its stock, the shareholders' dividend was only 1 per cent., a rate never exceeded since the formation by reorganization of the present company in 1888. Instead of distributing a fair share of profit to its owners, the company, in order to meet the needs of its shippers, has been compelled to apply its whole surplus income beyond the 1 per cent. dividend payment to buying additional equipment and furnishing more traffic facilities. But even by doing this, all of the vitally needed improvements cannot be carried out. Of 98 miles of new second-track authorized during the previous fiscal year, only 24 miles have been finished. Work on the rest has been stopped because the company cannot borrow the $1,315,000 necessary to finish the suspended work.

President Stevens next contends, and it would seem with justice, that the traffic of the road has not been burdened by excessive rates. An average passenger-mile rate of 2⅛ cents is low for a road most of whose mileage is in Virginia, West Virginia and Kentucky, and which has little or no commutation traffic to bring down the average rate. Still more true is this of the rate received per ton per mile for freight which was only 4⅛ mills last year, one of the lowest ton-mile rates on any railroad in the country. Assuming the further fact, which is confirmed both by a study of the report and a knowledge of the working of the property—that the road has been efficiently and economically managed, he reaches the conclusion that the return to the owners of the property has been entirely inadequate; so small that it would not be justified in any kind of business.

Mr. Stevens continues as follows:

"It would, therefore, seem to be to the interest of the communities and people served by your lines, that your revenues should not be lessened or your credit injured by further reducing rates that are now inadequate to meet the present requirements of the property and [illegible] the reason which you as shareholders may rightfully and reasonably expect. It seems clear that when all the leading railroads in the section served by your lines [illegible] has arrived when the increased volume of traffic offering is being exceptionally large expenditures for improvements, equipment and [illegible] and as the commonwealths through which they pass can only prosper through continued development of the resources and other industries which are served by the railroads, it necessarily follows that any legislation which reduces their credit and prevents the sale of securities at fair prices must work injury at a time to the people as to the railroad itself. It is believed that the communities along the lines of the system must in the end recognize the necessity of this statement."

There was an increase of 5 per cent. in the tonnage of coal and coke which together make up 61 per cent. of the road's traffic. Strangely enough in a year of such very general prosperity all other freight traffic increased almost not at all. There was a small decrease in ton mileage, but as the revenue per ton-mile was slightly larger, the freight earnings increased 3 per cent. There was a decrease of 2 per cent. in the freight density.

The revenue trainload rose from 586 to 596 tons. Including company freight the figure was 628 tons. These figures exceeded only by the Great Northern and short roads like the Bessemer & Lake Erie and the Pittsburgh & Lake Erie, which connect the iron and steel centers of the Pittsburgh district with the ore docks on the Lakes.

There were much larger proportionate increases in the passenger department. Passenger earnings increased 15 per cent. and passenger density 12 per cent., while passenger earnings per mile of road were 13 per cent. larger, rising to $2,675. Passenger earnings per train-mile, however, increased only 1 per cent., while freight earnings per train-mile were 4 per cent. larger.

The total increase in operating expenses was $1,780,000. Of this, $1,050,000 was in conducting transportation, the operating division of which account increased 14 per cent. Maintenance of way and structures increased $440,000 and maintenance of equipment $252,000, thus reversing the experience of many other railroads last year whose maintenance of equipment cost increased far more than maintenance of way. Per mile of line, maintenance of way cost $1,691, against $1,447 last year. It is therefore evident that the road has been well kept up, especially as about $1,000,000 of the extraordinary expenditures for the year was on maintenance of way betterments. The cost of repairs per unit of equipment was $1,973 per locomotive, against $2,114 in 1906; $1,047 per passenger car, against $1,091 in 1906, and $87 per freight car, against $94 in 1906. The passenger car figure for both years is high.

Even including materials and supplies, which stood at $2,240,000 on the balance sheet on June 30, 1907, current assets were $1,700,000 less than current liabilities. Excluding this item, the current assets were $1,700,000 less than the one liability item "unpaid vouchers and pay rolls." Last fall there were reports that the directors were planning to rearrange the company's finances in such a way that a large general bond issue available for improvements and extensions would be created. The Chesapeake & Ohio has been much handicapped by the fact that it had few bonds of uncompleted issues available. Most of its new construction has been financed by means of branch-line bonds. The stock market debacle of last spring probably prevented the formation of such a general and inclusive financial plan. To take care of immediate needs, however, the directors resolved on June 14, 1907 to recommend the creation of $10,000,000 general equipment and improvement 10-year 5 per cent. bonds. This mortgage was unanimously authorized at a special meeting of the stockholders on July 31. As of July 1, $5,000,000 three-year 6 per cent. notes secured by $6,500,000 of these bonds were sold. The proceeds of these notes would, therefore, offset the excess of current liabilities over assets as of June 30, 1907. It is obvious, however, that this note issue does very little toward providing for the general expansion needs of the company and that once

investment conference is re-established, a general and comprehensive finance plan is likely to be adopted.

The following table sums up the last two years' operations:

	1907.	1906.
Mileage worked	1,827	1,793
Passenger earnings	$4,888,139	$4,242,556
Freight earnings	19,974,861	19,395,648
Gross earnings	25,796,861	24,602,988
Maint. way and structures	3,090,037	2,649,557
Maint. of equipment	4,721,346	4,469,590
Conducting transportation:		
Traffic	482,444	434,755
Operation	7,955,064	6,959,355
Operating expenses	16,650,307	14,869,649
Net earnings	9,146,554	9,733,339
Net income	3,392,999	4,607,223
Improvements and equipment	2,684,221	2,532,739
Years' surplus	61,071	1,426,577

Colorado & Southern.

This is a period of great expansion for the Colorado & Southern, which was organized from two branch lines which were lopped off from the old Union Pacific property when the present Union Pacific was formed. These were the Denver, Leadville & Gunnison and the Union Pacific, Denver & Gulf. The latter turned back to the Union Pacific the Julesburg branch by which the Union Pacific now gets its entrance from the east to Denver, on the formation of the Colorado & Southern, which began operations with 1,537 miles of line, including the Fort Worth & Denver City Railway, which it controlled through ownership of a majority of its stock. This brought the system to Fort Worth, Tex. Here it stopped for eight years. The present year has seen, or will see, its extension to Houston and to the Gulf at Galveston, the second largest port of export in the country.

This new construction, which is shown on both the Colorado & Southern and the Rock Island Company maps in this issue, has been carried on through the Trinity & Brazos Valley, a subsidiary corporation, all of whose issued and to be issued stock and issued bonds are owned jointly by the Colorado & Southern and the Rock Island Company, controlling the Rock Island and the St. Louis & San Francisco. Operation of the line from Fort Worth to Houston was begun on February 10, 1907, and on July 1 the Dallas connection with this line was opened. By the close of the year 1907, trains will be operated into Galveston. Construction work is still going on north of Houston in order to prepare the road to handle efficiently the large amount of business which is likely to fall to it. That the business will be large is not a doubtful expectation, for, as mirrored in the joint ownership of the Trinity & Brazos Valley, it is to be used, both from Fort Worth and from Dallas, as a Gulf connection for the Rock Island and the St. Louis & San Francisco, as well as for the Colorado & Southern. Besides, the new lines open up new country and are the shortest railroads between Fort Worth and Galveston and between Dallas and Galveston.

At Fort Worth the Trinity & Brazos Valley uses the terminals of the Fort Worth & Denver Terminal Railway, while at Dallas temporary arrangements have been made with the St. Louis Southwestern. At Houston temporary arrangements have been made for use of the Santa Fe terminals, supplementing the terminal facilities of the Houston Belt & Terminal Railway, now in course of construction. This terminal railway is jointly controlled by the Trinity & Brazos Valley, the Santa Fe, the St. Louis & San Francisco, and the St. Louis, Brownsville & Mexico. At Galveston terminals are being built by the Galveston Terminal Railway, organized and controlled by the Trinity & Brazos Valley. Galveston is reached from Houston by trackage contract over 53 miles of Santa Fe tracks. Operation of this line by the Trinity & Brazos Valley is to be begun this month, while all of the authorized terminal construction at Galveston is to be finished this fall. The total operated mileage of the Trinity & Brazos Valley will then be 422 miles. There had been advanced by the Colorado & Southern up to June 30, 1907, $190,000 for terminals at Fort Worth, $127,000 for terminals at Dallas, $197,000 for terminals at Houston, and $111,000 for terminals at Galveston. In each of the last two cases the same amount had been advanced by the Rock Island Company.

The Trinity & Brazos Valley lines, of which 272 miles were in operation on June 30, are not included in the Colorado & Southern returns. There was, however, a considerable addition to the mileage during the year through completion of the Wichita Valley lines, whose complete operation dates from January 1, 1907. This is a branch line 175 miles long, running from Byers, Tex., on the Red river, across the Fort Worth & Denver City at Wichita Falls, and then southwest and south to Abilene, Tex., on the Texas & Pacific.

The Colorado & Southern has also been expanding in Colorado north of Denver, where 37 miles of branch lines were built during the year, 17 miles by the Fort Collins Development Railway and 20 miles by the Colorado Railroad. In addition, a line 18 miles long, to serve the important territory between Denver and Boulder and the coal mining camps about Boulder, is being built by the Denver & Interurban Railroad. This is to be finished by next spring. It will permit operation of 44 miles of line in all by electricity for frequent passenger service. A map and description of this project was printed in the *Railroad Gazette* of June 21, 1907. The Denver & Interurban is also building an electric passenger line in Fort Collins, Colo., which is to be in operation by December. Advances up to June 30, 1907, to these various companies, were as follows: Fort Collins Development Railway, $50,000; Colorado Railroad, $172,000; Denver & Interurban, $254,000.

Not the only expansion of the year was in mileage. The income account shows large increases in earnings. Gross earnings were $13,500,000, an increase of $1,800,000, or 15 per cent.; operating expenses increased $1,300,000, or 17 per cent., and net earnings were $4,200,000, an increase of $500,000, or 12 per cent. The net income for the year was over $2,000,000, an increase of 18 per cent. over 1906. As was natural with such a showing, dividends were begun on the $8,500,000 second preferred stock. The first payment ever made on this issue—2 per cent.—was paid April 1, 1907. Four per cent. was also paid on the $8,500,000 first preferred, against 2 per cent. in the previous fiscal year and nothing in 1905.

Freight earnings increased 13 per cent. and passenger earnings, as well as express, mail and miscellaneous earnings, each increased 22 per cent. The average ton of freight was carried further and paid more per mile. The increase in the average distance carried, from 134 to 151 miles, is a prophecy of what is likely to happen as soon as the Gulf extension is completed and in smooth working order. It is highly probable that not only will there be a large export traffic by this line, but also that a considerable proportion of the shipments from the East to Colorado will go by steamer to Galveston, thence north over the Colorado & Southern lines. The average passenger was carried 47 miles, against 42 miles in 1906, and paid slightly more per mile than in that year. The gross earnings per mile of road increased from $7,007 to $7,244, while the net earnings per mile of road were about the same as in the previous year, $2,266, against $2,256 in 1906. Taxes per mile of road decreased, which is a more fortunate experience than most railroads can boast of during the year just passed.

Of the increase in operating expenses, maintenance of way and structures furnished $267,000, an increase of 14 per cent.; maintenance of equipment, $250,000, an increase of 15 per cent., and conducting transportation, $788,000, an increase of 20 per cent. Largely on account of this last item, the operating ratio rose from 68 per cent. to 69 per cent. The principal increases under this head were in locomotive fuel, train service, station service and car mileage. There was an increase of 82 per cent. in the item of lost and damaged freight, and of 62 per cent. in the item of injuries to persons. The cost of clearing wrecks rose from $42,000 in 1906 to $59,000, an increase of 42 per cent.

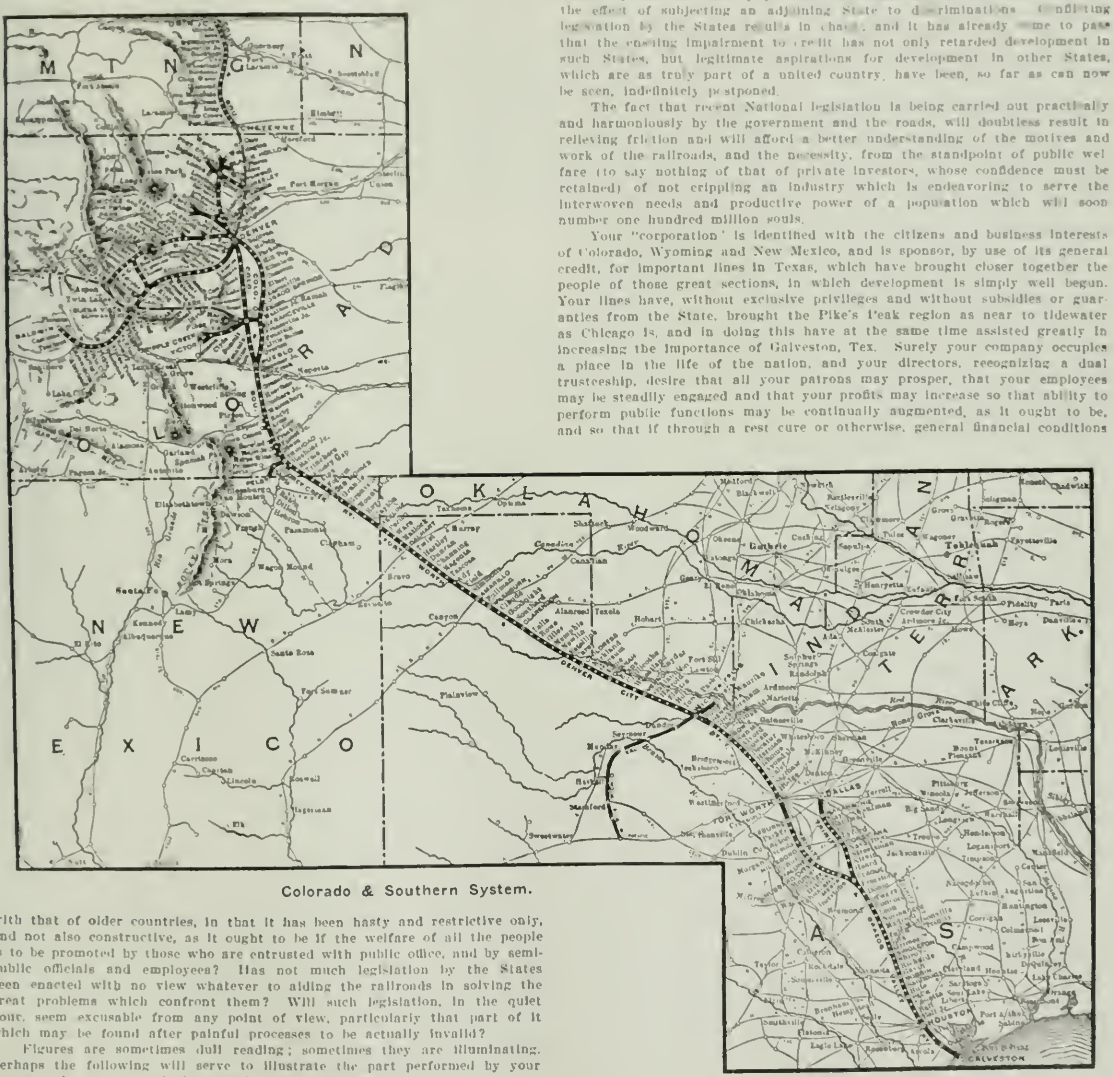
Maintenance expenditures were in general more liberal than in the preceding year. Per mile of road owned, maintenance of way cost $1,238, against $1,178 in 1906. There were 167 miles of new rails laid, against 128 miles laid last year, all of 77-, 80- or 85-lb. steel. Over 800,000 ties were laid, as against 550,600 in 1906. Maintenance of equipment per unit of equipment owned at the beginning of the fiscal year cost $2,725 per locomotive, against $2,509 in 1906; $796 per passenger car, against $832 in 1906, and $79 per freight car, against $66 in 1906. Especially as 386 of the 1,858 miles of the Colorado & Southern are narrow gage line, and a similar proportion of equipment is narrow gage, these are liberal maintenance figures.

The principal item of the Colorado & Southern freight traffic is mineral products, of which 4,440,000 tons were carried last year bringing in a revenue of $4,280,000, being 63 per cent. of the total tonnage and 44 per cent. of the total revenue, as against 67 per cent. and 47 per cent., respectively, in 1906. There was a great increase in lumber traffic during the year. The lumber tonnage rose from 133,000 tons, bringing in a revenue of $609,000 in 1906, to 488,000 tons, with a revenue of $811,000 last year. The 1906 tonnage was 2 per cent. of the total, and the revenue 7 per cent. of the total, while last year, with a tonnage equal to 7 per cent. of the total, the revenue was a little more than 8 per cent. of the whole. The added lumber tonnage must have been carried at much lower rates. Although the agricultural tonnage remained at about the same proportion, there were one or two noticeable increases, in particular in cotton, fruit and vegetables, and potatoes. Fruit and vegetables, which furnished nearly 5 per cent. of the tonnage, yielded only 2 per cent. of the total revenue, while potatoes, with a little over 1 per cent. of the tonnage, brought in nearly 5 per cent. of the total revenue. This apparent anomaly is probably due to the fact that most of the fruit and vegetables were carried only a short distance, while Colorado potatoes were shipped south to Texas. The total tonnage was 7,090,901 tons, against 6,245,948 tons in 1906.

Under the heading "Public Service," President Trumbull gives his views in regard to the relation of railroad companies to the public. His remarks in full are as follows:

> Railroad companies have for years led all corporations in publicity, and in an annual report like this, some allusion to your company's attitude

toward current economic discussions may properly be included. Much has been said, of late, concerning the shortcomings of corporations. It is doubtless true that they have not been infallible, but have they in that respect been in complete isolation? If one looks at the vast field served by railroads, the greatly diversified interests they have to satisfy and contend with, and the army of over one and one-half million employees, which like an army, must have efficient leaders and thorough discipline if safety and success are to be achieved, and if one considers that the development of the country and its business growth have been so rapid that it has been impossible for other industries to keep pace with it, is it not remarkable that the railroads are meeting as well as they are, the demands made upon them without a substantial increase in rates, particularly as the cost of everything which goes into their construction, improvement, maintenance and operation has enormously increased? Within the past year a multitude of laws have been enacted for the regulation of railroad companies. In view of the valuable and far reaching public services that must be performed by them, may it not be true that much of such legislation has been amateurish, in comparison with that of older countries, in that it has been hasty and restrictive only, and not also constructive, as it ought to be if the welfare of all the people is to be promoted by those who are entrusted with public office, and by semi-public officials and employees? Has not much legislation by the States been enacted with no view whatever to aiding the railroads in solving the great problems which confront them? Will such legislation, in the quiet hour, seem excusable from any point of view, particularly that part of it which may be found after painful processes to be actually invalid?



Colorado & Southern System.

Figures are sometimes dull reading; sometimes they are illuminating. Perhaps the following will serve to illustrate the part performed by your company the past year, in its capacity as a public servant:

The number of passengers carried was 2,801,699, at an average rate of 2.44 cents per mile—a trifle more than a two-cent postage stamp—and this partly in a section where physical operations are most difficult and where wages are probably the highest in the world. Compare this, for example, with England and Wales, with an area of 58,000 square miles (about one-half of Colorado or about one-fifth of Texas), where the number of passengers carried is more than in the whole 3,025,000 square miles of the United States. In England, with much lower wages, the regular third-class rate is two cents per mile, and first-class passengers (only 3 per cent. of the total) pay over three cents. The railroad mileage of Great Britain is about one-tenth of that of the United States, but it carries nearly one-half as much capitalization.

The number of tons of freight carried by your company during the year was 7,090,9[illegible], at an average cost to the shipper of 1.[illegible]5 cents per ton—2,000 lbs. carried one mile—for about the equivalent of a one-cent postage stamp. You distributed during the year

For labor and material employed in productive operations, over	$[illegible]	
(An increase over the previous year of more than $1,[illegible],000.)		
For taxes, over	[illegible]	
For improvements and new equipment, over	4,[illegible]	
For new construction, over	6,[illegible]	
		$20,3[illegible]
To investors for interest, a little less than		2,[illegible]
To investors for dividends		510,000

Doubtless two-thirds or more of the payments for material and for improvements, new equipment and construction went to labor in one form or another.

Legislation affecting the vast transportation necessities and interests of a unified country should, like that of older countries, protect, as well as supervise; for duty is reciprocal and is not bounded by State lines. As a Federal Judge has recently pointed out, legislation by one State may have the effect of subjecting an adjoining State to discriminations. Conflicting legislation by the States results in chaos, and it has already come to pass that the ensuing impairment to credit has not only retarded development in such States, but legitimate aspirations for development in other States, which are as truly part of a united country, have been, so far as can now be seen, indefinitely postponed.

The fact that recent National legislation is being carried out practically and harmoniously by the government and the roads, will doubtless result in relieving friction and will afford a better understanding of the motives and work of the railroads, and the necessity, from the standpoint of public welfare (to say nothing of that of private investors, whose confidence must be retained) of not crippling an industry which is endeavoring to serve the interwoven needs and productive power of a population which will soon number one hundred million souls.

Your "corporation" is identified with the citizens and business interests of Colorado, Wyoming and New Mexico, and is sponsor, by use of its general credit, for important lines in Texas, which have brought closer together the people of those great sections, in which development is simply well begun. Your lines have, without exclusive privileges and without subsidies or guaranties from the State, brought the Pike's Peak region as near to tidewater as Chicago is, and in doing this have at the same time assisted greatly in increasing the importance of Galveston, Tex. Surely your company occupies a place in the life of the nation, and your directors, recognizing a dual trusteeship, desire that all your patrons may prosper, that your employees may be steadily engaged and that your profits may increase so that ability to perform public functions may be continually augmented, as it ought to be, and so that if through a rest cure or otherwise, general financial conditions in America again improve, your company's sphere of influence may seem to capital and enterprise an inviting field for further expansion.

The following table sums up the last two years' operations:

	1907.	1906.
Mileage worked	1,858	1,663
Passenger earnings	$3,173,856	$2,603,691
Freight earnings	9,723,962	8,592,527
Gross earnings	13,456,489	11,653,446
Maint. way and structures	2,226,504	1,959,184
Maint. of equipment	1,769,803	1,519,913
Conducting transportation	4,807,630	4,019,982
Operating expenses	9,246,919	7,902,212
Net earnings	4,209,571	3,751,234
Net income	2,216,146	1,766,212
Dividends	510,000	170,000
Year's surplus	1,328,689	1,221,056

NEW PUBLICATIONS.

State Railways: Object Lessons from Other Lands. By Edwin A. Pratt, with a translation of M. Marcel Peschaud's articles on Les Chemins de Fer de l'Etat Belge, in the *Revue Politique et Parlementaire*. London: P. S. King & Son, 1907. Paper; one shilling.

We know of no other publication in which the observer of railroad conditions can get for a shilling as many arguments against government ownership as in this concise little book by Mr. Pratt, already well known for his clear and scholarly studies on transportation topics. Just half the book is devoted to condensed comment—sometimes rather too condensed, it must be admitted—on government ownership in Belgium, Prussia, Denmark, Italy, Australia and New Zealand; the balance is a translation from the French of M. Peschaud, who discusses Belgian railroad conditions in detail. Mr. Pratt, in his general comments, cites examples of the well known objections to government ownership; inflexibility of rates and service; subjection to political influence; high cost of operation; bureaucracy; use of railroad employees to build up a political machine; bad bookkeeping, etc. For example, he quotes Sir Joseph Ward, the New Zealand Premier, as to the fact that goods rates could not be levied until they had been passed upon by the Governor in council, who, also, alone could modify them.

"If you wanted to carry 10,000 tons of cheese for 100 miles," said Sir Joseph, "and if the freight for cheese was 7s. 6d. per mile, you would be charged 7s. 6d. for each ton of the consignment, just as you would for one or two tons; no one could vary the charge." Mr. Pratt rightly comments that if a railroad can afford to carry a single ton of cheese a hundred miles for 7s. 6d., it can well afford to carry a consignment of 10,000 tons the same distance for a lower amount per ton, and that in New Zealand the wholesale man is, in effect, penalized, in order that the retail man shall have no possible excuse for cherishing a grievance against the politicians who control the operation of his state railroads.

Mr. Peschaud shows that of a total of 2,637 miles of railroad in Belgium, all but 344 miles is operated by the state. He criticises the state working on the grounds that train service is bad and speeds are low; the state operation does not economize in the least; it is bureaucratic and involved in much red tape; it is worked neither on commercial nor on industrial lines; the work done by government employees is less efficient, often by one-third, than the work done by private employees; the system has no flexibility, and breaks down in emergencies; the government has gradually made itself less and less amenable to damage claims; it aims to give satisfaction to those without real, but with electoral interests; the number of the staff on the state railroads is 152 per kilometer, as against 107 on the private railroads; the promotion of employees rests on political considerations; the capital accounts have been altered until they are purely fictitious. Further, the government is a poor bargainer, and pays far higher prices for its supplies than the private managements do, and, in 1905, the total proportion of expenditure to receipts was 45 per cent. on the Belgian lines worked by companies and 61.97 per cent. on the lines worked by the government.

Locomotives, Simple, Compound and Electric. By H. C. Reagan. New York: John Wiley & Sons. 932 pages; 5½ in. x 8 in.; 494 illustrations. Cloth. $3.50.

To quote from the preface; "the author, who is a practical engineer, attempts in this book to write a treatise on the locomotive engine, and has tried to describe the manner in which the locomotive is handled while in service." In a way he has succeeded, though to dignify it as a "treatise" is to somewhat stretch the courtesy of the word. It is rather a description of various types of locomotives and certain appliances used thereon, than a book to convey an idea of the construction and working of the locomotive to one who is not familiar with the subject. So much has been published regarding locomotive construction that the author passes lightly over the usual descriptions, using a somewhat original order of treatment and stows away in the first 100 pages all that he has to say of the front end, cylinders, frames, rods, rod accidents and valves and their setting, to each of which a chapter is devoted, and a liberal portion of even this space is given up to examination questions on the subject. He very truly observes that a man "will learn more by watching repairs, etc., * * * than if the method were described in so many words." So the book apparently makes no attempt to show and describe the construction of the various parts, but merely calls attention in many cases to peculiarities of construction, so that it would serve as a good guide if it were to be read in the presence of the locomotive and the several items mentioned were to be studied as they were brought up.

Following these general descriptions, there is a long chapter on compound locomotives. In this no attempt has been made to discuss the subject from the theoretical or practical standpoint of operation. There is not a word of introduction to the chapter, but the reader is plunged at once into a description of the several types of compound locomotives that have been presented for consideration. Some of these have held their own on the basis of the survival of the fittest, others have been withdrawn from the market and converted; while others were almost stillborn. In this respect the chapter will serve as a work of reference for those who wish to study the variations in type without entering into the details of the construction. In these descriptions there are also included a number of foreign locomotives that have never been built in counterpart in the United States, thus making the chapter all the more valuable for the purpose for which it is especially adapted. After this there follows a short chapter on superheaters, very short, in fact, when the importance of the subject and the interest that it is attracting is taken into consideration.

The chapter on air-brakes is one of prominence, but is defective in that it ignores the latest development of the Westinghouse triple-valve with the delayed release and special recharging features. It would be interesting also to learn why the author splits his treatment of the boiler into two chapters separated by hundreds of pages, instead of putting the whole subject together.

The book closes with descriptions of a number of electric locomotives preceded by a sketch of the general features of electric current generation. In this the author does not appear to be thoroughly at home. Not that there are appreciable errors but the language is not that of a man who is a master of the subject. Still this section of the book is worth while as a reference.

Taken as a whole the book may be regarded as a very useful hand-book of the locomotive, to be used for reference and a guide to a more thorough study as pointing out what has been done and the principal appliances that are used on the ordinary American machines.

The Railroad Problem.*

BY ROBERT MATHER.

If the rails of the land should melt over night, the loss tomorrow morning would be less in the falling quotations of railroad bonds and stocks than in the utter destruction of the values on farms and in mines and mills and factories that to-day we count as the nation's wealth. Such sudden and miraculous solution of the problem is, of course, unlikely; at least it has not yet been advocated in Presidential speech or message. But any diminution of the industrial efficiency of our transportation lines would affect in like manner, though in lesser degree, all the varied interests that would go down to destruction with the annihilation of those lines. It is not alone, therefore, the few thousands who own the securities of the railroads, or the million and a half employees engaged in their operations, or the ten millions whom the wages of these employees support, that are directly and peculiarly interested in the proper solution of the railroad problem. The question comes home as well to the pockets of the millions of farmers and miners and millers and manufacturers and merchandisers, with all their added millions of dependents. In short, it is a question that touches us all, not because the charge for transportation is a large element in the cost of what we consume, but because without efficient railroad transportation our commerce could not be profitable. The gross earnings of all our railroads for the fiscal year ending June 30, 1907, were $2,325,765,167. Divided among the population this would be $25 each. A 33⅓ per cent. reduction in freight and passenger rates would mean $8 per annum for each of us, but a reduction by one-third of the capacity of our transportation lines to move the tonnage of the country would mean ruin to us all.

This critical generation would do well to recall how our railroads have been created. Upon the invention of the steam engine the industrial world faced a difficult situation. It had from time immemorial been the practice and the accepted duty of the state to provide and to maintain the highways upon which the citizen might either haul his own freight, or as a common carrier transport the persons and property of others. But the new style of iron highways that the steam engine had introduced was expensive to construct. States were poor, their revenues insignificant and their credit correspondingly bad. Many shrank entirely from the risk that the new task offered; others undertook the work and early became involved in debt, in loss and in shame. In this predicament private enterprise was given the opportunity to undertake the duty which the states themselves were unable to perform. That is, the states employed private capital, on certain terms, to build the highways which the states should have built for the people's use. One of the terms of this employment was that the corporation that built the highways should alone have the right to operate trains over it, and that the public could use the highway for the movement of their goods or persons over it, only under rules and regulations and rates prescribed by the corporation. This worked a restriction upon that free use of the common highways to which the citizens of the state had heretofore been accustomed. For, while any one could carry on the occupation of a common carrier over the ordinary highways of the state, only one common carrier—namely, the corporation that had built it—was permitted to conduct the business of a common carrier on this new kind of a highway. But it had never been the

*From an address before the Chicago Association of Commerce, Oct. 12, 1907.

duty or the function of the state to be a common carrier. The corporation, then, though it exercised a function of the state in *building* the highway, did not exercise a public function in transacting over it the business of a common carrier. That was always has been, and is to-day a private occupation. It is true it is an occupation with respect to which the law has always exercised certain rights of regulation, but it is not on that account a public function any more than the conduct of the business of an innkeeper, a miller, a hackman or an auctioneer, with respect to which the law exercises the same right of regulation, is the exercise of a public function.

To undertake a task too vast and perilous for the state itself to perform, there must have been held out to private enterprise the hope of a far greater reward than a mere interest return on its investment. And such hope was held out. While it was then the law, and therefore a part of the bargain between the state and the corporation that the carrier should charge only a reasonable rate for the service of transportation, it was clearly contemplated by both parties that great values beyond the actual cost of building and equipping the line might flow from the successful carrying out of the scheme. That hope was capitalized by the issuance of shares of stock beyond the face amount of the cash expenditure. If the plan succeeded the hope was realized either in the sale of the shares or in the payment of dividends upon them. If the plan failed, as it often did, the hope was dashed and the certificates that represented it became worthless paper.

Now, let us suppose that the states, in making their bargain with private capital for the building and operation of these public highways, had said to the proposed builders.

"You will not be permitted to issue bonds and stock in face amount greater than your actual expenditures;

"You will never be permitted to make more out of this project than 4 per cent. per annum upon the money actually invested;

"You will, however, be taxed upon the actual value of your property, as ascertained from time to time, and, if your securities find favor in the market and reflect greater than actual values, taxes will be levied upon that basis;

"The state will prescribe the methods of keeping your accounts and will examine them at its will;

"The state will determine the number of trains you shall run and designate the stations at which they shall stop;

"The state will prescribe the number of men you shall employ in operating your trains, and will fix their hours of labor and the conditions of their employment;

"The state will establish rates of fare and of toll from time to time at its arbitrary discretion, without consideration of their reasonableness;

"If any other methods of regulating you occurs to the state hereafter, they will be adopted;

"You will accept without objection all regulations now or hereafter imposed by the state, and if you appeal for the protection of the federal constitution to the federal courts, the state will revoke your charter."

All this and more the states have said to the railroads in recent or in threatened legislation. Had the states been as frank and specific when bargaining with the corporations that were planning to build these public highways, there would have been presented a beautiful exemplification of the principles of the square deal, but it is doubtful if the railroads would have been built.

After completing its compact with the state, the railroad corporation began the construction of its line. With rare exceptions it spent its money not on the faith of things that were, but in the hope of things to be. Our railroads were almost uniformly built, not like those of Europe, from market to market, through industrial communities long established, with tonnage awaiting them at every stage from starting point to terminus, but into the comparatively unsettled and often untracked lands of the future. Their cities were largely unfounded, their factories unbuilt, their mines unopened and their farms unpeopled. Their revenues were not in sight, except to the eye of faith and courage.

They built their lines to suit their situation. They chose the easiest path through the territory they were to serve. Grades and curvature conformed largely to the contour of the country. Highways were crossed at grade and streams on wooden trestles. Light steel was laid in a single track, and ballast dreamed of but forgotten. The cost of terminals in such cities as there were prohibited provision for the future, and only such facilities were acquired as were needed for the traffic immediately in sight. Some light engines and a minimum of cars of small capacity were acquired, and the railroad was "completed"—and put in operation.

The cost, of course, had exceeded the estimates, and a floating debt stood between the stockholder and his dream of dividends. Hardly, too, had the operation of the railroad started before it was realized that the "completed" line was barely begun. As the lands were settled and the cities grew, and the mines and mills began to turn out their product, it was found that the single track, with its light rails, its heavy grades and curves and its inadequate terminals and equipment could not move the traffic it was built to serve. The task of enlargement, improvement and reconstruction was begun. Grades were reduced, curvature cut out, lighter rails in steel, heavy rails laid down, the line double-tracked, the required ballasted grade, crossings eliminated, heavier motive power and rolling stock acquired, and vast terminals, at multiplied cost, bought in the hearts of cities that, when the rails were first laid, were villages or passing tracks.

But the railroads could not rebuild and enlarge their facilities as fast as the traffic grew. In the decade from 1896 to 1906 the railroad mileage of all tracks, including second, third, fourth and yard and siding tracks, had grown from 240,120.12 miles to 317,085.19 miles, an increase of 32.8 per cent. In the process the capitalization of the railroads had increased from $10,566,865,871 to $14,771,421,478, or 26.2 per cent. But the tonnage of the railroads within the same ten years had climbed from 95,328,369,278 ton miles to 215,877,571,241 ton miles, an increase of over 125 per cent.!

Then the railroads confronted a crisis. Unable to handle the traffic that multiplied three or four times as fast as their facilities grew, they turned to further plans for enlarging their capacity, only to find that, in the height of their prosperity and in the stress of the greatest demands upon them, their securities could no longer be sold and money for their improvements was not available. Then, instead of moving with greater speed to provide the tracks and terminals and cars and engines for lack of which less than a year ago grain lay rotting in the fields and communities suffered for want of coal, they slackened perforce their already too slow pace. And to-day, condemned by public opinion, by reports of commissions and by their own consciousness as inadequate to their task, causing daily loss to commerce by the insufficiency of their facilities and equipment, the railroads are impotent to relieve the situation.

This is a national calamity. Its force is felt not only in the falling prices of the stock exchange, but in the falling tide of commercial activity, in the lowered price of the commercial metals and in the slackened demand for human labor. There is not a man, from President to the least of the laborers in this great industrial organization that we call the nation, who is not directly and personally interested in discovering the causes for the inability of the railroads to raise funds for their needs, and in doing his utmost to remove them. This is the railroad problem; this is the national problem.

Three theories are commonly advanced in explanation of the unsalability of our railroad securities. One is that a world-wide money stringency, due to great and general commercial activity, restricts investment in all kinds of securities. I am not a banker and should not presume to have an opinion upon this proposition, but it does not strongly impress me in the face of the fact that three-fourths of the fabulous five billions of dollars that Mr. Hill would have the railroads spend in the next five years in furnishing additional facilities, to-day stands to the credit of depositors in our savings banks alone. I believe the money exists and could be had if our railroad securities appealed to the confidence of our investors.

I count as first among the causes that have made their securities unsalable—the misdeeds of the railroads themselves.

I do not include in this term, for the purpose of this discussion, the payment of rebates. I would not deny under present conditions the perniciousness of the practice, or decry the efforts of government to terminate it. On the contrary, I hold it as much to the interest of the railroads themselves as of the country at large, that violations of the Elkins Act should be made impossible. And I know of no surer way to accomplish that end than for a righteous and determined executive to keep both carrier and shipper for the future in terror of the confiscatory fines which that drastic act imposes for its violation. I see no end to be gained, however, beyond unnecessary further irritation of an already inflamed public feeling, by wholesale and spectacular punishments of past offenses.

I protest further against imputing to the railroads alone the responsibility for these violations of our statutory law. Note my emphasis of this term, *statutory* law. When railroads first became the common carriers of the land, neither law nor custom denounced the giving of a rebate. The only limitation upon a carrier's discretion in the fixing of his rates was that they should not be unreasonable. Subject only to this limitation he could charge as he willed, demanding less from one and more from another and carrying free for whom he pleased. This theory and tradition passed into the railroad business at its inception. It was accentuated by the policy of the states in permitting the free incorporation of railroad companies and encouraging the multiplication of competing lines. The only effective weapon of competition the railroads had was their rates. In passenger traffic, it is true, competition of service counted for something, but it meant nothing in the movement of a car of grain or of hogs that the roadbed was smoother and the scenery more inspiring by one route than by another. It was the rate that moved the traffic. And as it was important both to the shipper who sold his tonnage and to the carrier that bought it, that the transaction should not be known to the competitor of either, the secret rebate came into vogue.

In the beginning this method of competition was not deemed

hurtful, and it was far from being stamped as immoral. The business of the country was more individual and less aggregate than to-day, and the task of getting the best rate that was going was as necessary and legitimate an element of business as were the problems of buying in the cheapest market and keeping down the cost of production. When rebates were general—and time was when no shipper was so poor as not to be able to get them—their only effect was to reduce by so much the general level of rates of the carriers. The railroads were the victims—the commerce of the country the beneficiary, of the practice; for the level of the secret rates tended, eventually and inevitably, to become the level of the open rates.

The railroads anticipated the law in an effort to put an end to the growing practice of rebating. But their pools—formed, it is true, in the hope of conserving their revenues, but well designed to accomplish the laudable end of maintaining stable rates—were denounced as unlawful in the Act to Regulate Commerce, passed in 1887, which also for the first time prohibited discrimination in rates on interstate shipments. Thus the carriers were commanded to resume the policy of open competition which their pools had restricted, and at the same time forbidden to use the only effective instrument of competition at their command—namely, manipulation of their rates. But as this latter prohibition carried no penalties for the shipper who should receive a rebate, and as proof of an offense by the carrier was difficult, the shippers' clamors for secret rates and the carriers' fears for the loss of their tonnage to their competitors overcame the dread of conviction, and the law was regularly and notoriously violated. The Elkins Act in 1903 for the first time made the receiver of a rebate equally liable to punishment with the giver, and made easy the task of proving the offense.

I may justly assume from the name of your association that you fairly represent the great body of shippers of the country. Let us be frank with each other. You know that a rebate was never given that was not also received. You know that the purpose of the railroads in paying rebates has not always, or often, been to enable a great trust to crush its competitors. You know that if the Elkins Act bore date a few years earlier than it does, and if no beneficent statute of limitations could be invoked to your aid, your accumulated fortunes could be wiped out by universal enforcement of that law. You know that whatever of obloquy in the public mind, or of condemnation in the courts, should rightfully be visited upon the participants in the past practice of rebating, should be shared by the shipping class as well as by the carriers.

I will go a step farther. There has never been any difference in morals, and since the passage of the Hepburn Act there is no difference in law, between the giving of a rebate and the giving of free or reduced passenger transportation. In these days when the mask of pretence is being universally lifted, it should not give offense to call the roll of those who have participated with the railroads in this discrimination. Statesmen who regulate the railroads, judges who fine them, preachers who condemn them, and the press that spreads among the people, with no too careful pen, the stories of their misdoings, all decorate the list. The railroads in this respect are in the position before the people of the woman taken in adultery and brought by the scribes and Pharisees before Christ for condemnation. And there is need again for the voice of a Master to say: "He that is without sin among you, let him first cast a stone."

Nor do I include among the misdeeds of the railroads that are responsible for the condition we are now discussing, their past activity in political affairs. I trust that the government of the American people, no matter what form it may assume, will never be so arbitrary that a great property interest, subject to governmental regulation, shall not be privileged to be heard in argument and in protest before the legislative body that determines the nature and extent of that regulation. If, in the past, other and more improper methods have been employed to influence legislative action, I subordinate my zeal to that of no man in demanding that such offenses shall both be punished and made impossible of repetition. Again I protest, however, against fastening upon the railroads alone the shame of these offenses, in the commission of which there must have been at least two offenders. Much of what has been alleged against the corporations in this respect has been but the natural response of the victim to the highwayman. I mention this not in extenuation of the act of the victim, who in the interest of public morals should have lost his life before parting with his money, but to remind a condemnatory people that there *was* a highwayman, and that he was *their* representative. And I think it no more than a square deal that part of the responsibility for this unspeakable shame should willingly be borne by a people that has been so careless of its liberties as to be supinely content to be thus represented in its legislatures.

The misdeeds of the railroads to which, in my judgment, is chargeable the hesitancy of the investing public to take their securities, are acts that more directly affect the securities themselves. There is a prevailing public belief, based on facts publicly shown, that railroad corporations have issued corporate obligations and applied the proceeds to purposes other than for which such obligations may lawfully be issued. Directors are understood to have purchased the securities of corporations, of which they are trustees, and to have sold property of their own to the corporations, making personal profit through their dealings with the trust estate. These and like operations violate certain world-accepted principles of prudence and of honor, and for that reason are condemned by the common mind. The fact that they are understood to have occurred in certain of our corporations suggests the natural inference that they are characteristic of all our corporate managements, and investors are suspicious of the securities of corporations conducted so at variance with the principles of business, of law and of morals.

There can be but one remedy for such a situation, and it should not await governmental action. If the corporations cannot or will not themselves find a way to repudiate these abuses, and to make impossible their repetition, we are in a poor way indeed to regain the confidence which their perpetration has disturbed. I speak impersonally. I describe a condition which I believe is generally realized and which seriously affects the public estimate of our corporation securities.

I place second in the list of causes of the want of confidence in railroad securities the uncertainty as to the kind and extent of governmental supervision and regulation to which the railroads are yet to be subjected.

The regulation that threatens peril to the railroads and the commerce of the country to-day is the regulation of the states. It is in the nature of things that such regulations can be neither logical nor consistent nor comprehensive. The local needs, the local prejudices and the local grievances all find reflection perforce in these local laws. It is the good of the state, not the good of the nation, that they seek to accomplish. Nebraska, Minnesota and Iowa, with population averaging 200 persons per mile of railroad, prescribe the same maximum passenger fare as does Pennsylvania, whose density of population is three times as great. And it is insisted that this rate of fare, already declared confiscatory in Pennsylvania, shall be adjudged compensatory in the states of one-third the population. The great grain-producing states reduce below the point of profit the rates on this tonnage that so vitally affects them, leaving to the carriers to make up, if they can, the reasonable return to which they are theoretically entitled, out of traffic in which the regulating states are not so directly interested. Local situations or influence dictate varying regulations of the hours of work, the rates of pay and other conditions of the employment of labor. Local wisdom decides what kind of headlights locomotives shall carry, what kind of safety signals and appliances shall be employed, and how the accounts of the carriers shall be kept. These conflicting regulations incalculably confuse the conduct of business, while they measurably decrease gross revenues, increase the expenses of operation, diminish the net returns, impair credit and limit the capacity of the carriers to make adequate provision for the growing traffic.

It will benefit us but little to debate the causes that produced the curious wave of animosity toward corporate interests that last winter carried this movement of restrictive legislation to high-water mark. Let us neither abuse the high source from which much of the suggestion proceeded, nor blame too harshly the men who sat in legislative seats and recorded the clamor that filled their ears. Let us rather, as students of our past history and builders of our future prosperity, take note of the fact, measure its significance and prepare to deal with it. There must be some way to bring home to the intelligence of the American people a realization of the truth that no man who has property to conserve or labor to sell can profit in the end by unjust or unwise treatment of our great instruments of transportation. And I cannot help but feel that it would tend greatly to wisdom and justice, and even to moderation in the treatment of this subject, if the people realized that the railroads would willingly submit to a plan of regulation that was wise and just. This point being gained, I believe it would be possible to convince the people that a wise and just regulation of the subject is only possible under a single and centralized authority.

The day is passed for unyielding opposition to all policies of federal control of our carrier corporations. Nay, more, the day has dawned in which to welcome that control. The railroad manager reads without heeding the lessons of the past, if he fails to acknowledge both the right and the power of the federal government to exercise that control; he comprehends but little the spirit of the times if he does not realize the fixed determination of the people to effect that control, and he looks but darkly into the future if he cannot see benefits to flow from it.

We must assume that the President, in preaching regulation of the railroads, has in mind practical regulation, designed to benefit in broadest sense the commerce that constitutes at once the wealth and the greatness of our nation, and through which alone our ninety millions of people live and prosper. It is not to be presumed that his is to be a crusade for mere abstract righteousness, in which business must be forced to the wall if perfection of spirit cannot be attained. Surely we are not to be led by a St. Louis, willing that his country should suffer financial ruin in order that the custody of the Crown of Thorns may be wrested from infidel hands. Nor by a

Marat, eager to prove the equal rights of man by the arbitrary use of the guillotine. And while the President may talk in general terms of more or less terrifying sound to the tumultuous and applauding crowds he meets on his journeys, we have a right to expect that precision and wisdom and conservatism will formulate his final recommendations to Congress. And, if that expectation is realized, the railroads of the country should co-operate with Congress and the Executive in an effort to terminate harmful agitation by securing speedily a plan of federal regulation that shall be sane and effective and final. If, on the other hand, we are cheated of this hope, I believe the country should, and will, turn to a leadership that promises treatment of these vital problems along sound and conservative lines.

There should be great care in experimenting with regulation that offers as warrant of its effectiveness the arguments of theorists rather than the practical proof of experience. Among the proposals thus to be tested is the one for federal limitation of the capitalization of interstate corporations. If the purpose and effect of such action is to invalidate in the courts or to depreciate in the exchanges what are now denounced as watered securities, the blow will fall not on the persons responsible for their creation, but on the victims who parted with money to acquire them. Such an act of vicarious punishment could only be justified by the unquestioned conviction that the continued existence of the assailed securities is a menace to the public welfare. The only ground for such belief is the unfounded fallacy that the amount of securities outstanding against a railroad property determines the rates it charges for transportation. The sufficient answer to this is the fact that the Union Pacific Railroad, with capitalization of $92,000 per mile of road, competes very comfortably, and upon equal rates, with the Atchison, capitalized at $50,298 per mile, and with the Great Northern, whose capitalization is $42,350 per mile. And the same rates between the same points serve for the Illinois Central, whose capital is $56,495 per mile, the Eastern Illinois, with $62,599, and the Alton, with nearly $115,000 per mile.

If the purpose of the proposed new federal power is to limit the future issue of securities by railroad corporations, the people, as is too often the case with hasty legislation designed to benefit them, are likely to be the losers. The issuance of stock beyond the face amount of the actual investment in railroad building has always represented the hope and faith of the builder in the success of his project, and has been the lure that has drawn him into the always uncertain and often desperate undertaking. If the promise of that possible profit be taken away, the independent railroad builder will abandon the field, and railroad extensions into territory now unserved will await the initiative of existing lines. The Hill lines and the Harriman lines each encircle vast empires now without railroad facilities, and other systems are not without their own private pastures. It would admirably serve the interests of these great systems if government limitations of the creation of capitalization should make it impossible for the railroad builder to invade these promising preserves, and thus leave their development to the convenience and selfishness of existing lines.

If, however, the scope of the suggested federal control of corporate capitalization be to insure publicity of their affairs, every honest corporate management should speed its early enactment.

There should be no objection to such federal supervision of the railroads as the national government now exercises over the national banks. It would be a source of strength and of improved credit to the railroads to have it known that the government inspected their accounts and made sure of the existence and value of their assets. It might make impossible, too, such misuse of the funds and credit of the corporations as recent revelations have disclosed. I do not understand, however, that the national government concerns itself with the rates of toll that the banks charge their customers. It may not be so in Chicago, but in New York, I am told, there is no subject on which the ingenuity of lawyers is more regularly taxed than in devising means to evade the usury laws. It seems that the government itself is not quite sure of these carefully regulated institutions, for while it holds them out to the people as a safe place in which to deposit their money without security, the government requires good collateral against its own deposits in the banks. Nor am I informed that, as a result of long-continued supervision by federal authority, there is greater righteousness among the banks and bankers than pervades the railroad business. We read from time to time of bank defalcations and embezzlements. Over $5,000,000 of the people's money was so stolen in the first six months of the calendar year. And the wasting of the assets of the bank and the money of its depositors in private speculation by its officers is not unknown to the history of banking. It is true that these crimes are quite generally punished, and it may well be that the fact that there are more bank presidents than railroad presidents in jail may not have the same significance that it now seems to have, after the railroads shall have been for so long a time under similar governmental control. But we should not delude ourselves with the belief that righteousness will altogether prevail in the railroad world when its operations come under such supervision as the national banks enjoy.

I rode not long ago down the river Ithine. I was not particularly impressed with the beauty of its scenery. The Hudson far passes it in that respect. I saw with interest its storied castles, but the glamour of romance no longer glorified them, and they held my interest only while they could be seen. The fact that did impress me concerning the Ithine was the amazing use that was made of it as a highway of commerce. I trust that the still more wonderful possibilities in that direction of the Mississippi may not longer be neglected by our people.

But the castles of the Ithine took on new interest for me as the vast tonnage floating on the bosom of the stream reminded me that in those strongholds had dwelt the great traffic regulators of the Middle Ages. And the reflection came to me that it was not only by reason of the moderation of their regulations, but also because they protected the traffic from molestation or assault by other powers that they kept the golden stream of commerce flowing past their doors.

I mean to imply by this that the power that regulates should also protect. And I favor an open acceptance of federal regulation because it is only through adequate and effective assertion of the federal power that governmental control can be made uniform or just and the commerce of the country saved from the conflicting regulations of forty-six separate sovereignties.

It is now more than a year since the rate-making power was conferred upon the Interstate Commerce Commission. The wisdom that has moved the Commission to refrain as yet from exercising that power goes far to justify the placing of the power in its hands. Under this power the Commission has intimated that it would require that no through rate should exceed the sum of the locals. From this it results that the states now make the interstate rates. Let us suppose that the rate on grain from Oklahoma points to Galveston is 25 cents. The Texas Commission reduces its local rate to 7 cents; the Oklahoma Commission—soon to be born—does the same. The rate from Oklahoma points to Galveston thus becomes 14 cents instead of 25. If the Kansas Commission should fail to act, and if the railroads should maintain former rates to Galveston from Kansas points, the latter would be subjected to that undue disadvantage to localities that the Interstate Commerce Act prohibits under pain of heavy penalties. But the Kansas Commission would act, and the reduction in its local rate would effect a reduction of the through rates from Kansas to the Gulf. This, in turn, would reduce the rates on grain from the Missouri river to the Atlantic seaboard. And the Interstate Commerce Commission, though convinced of the reasonableness of the former through rate and desirous of preserving to the railroads the revenues accruing therefrom, would be practically powerless to restore it.

This illustration is not peculiar. It could be duplicated without limit and in any locality. The state of Arkansas fixes the passenger fare from St. Louis to the Gulf, over lines of travel that do not touch Arkansas soil, when it enacts that 2 cents shall be the maximum charge for the carriage of passengers from point to point within the state. Missouri prescribes rates of freight from the Mississippi river eastward to the Atlantic, and from the Missouri river westward to Utah, when she fixes the tolls for traffic passing wholly within her borders between the Missouri and the Mississippi rivers. Minnesota, in an act designed to be purely local, has legislated on interstate rates for the Dakotas, and has forced her railroads by state enactment unwillingly to violate the federal laws.

I need not press the argument farther. It is too plain for dispute that a state act prescribing rates of fare and of freight between points wholly within the borders of the state not only may, but in cases now before the courts actually does, so directly affect interstate commerce as to control and displace the rates prescribed under federal law. There can be but one outcome to such a conflict. It has been the law of the land since the famous case of Gibbons v. Ogden, that a state law directly affecting interstate commerce must give way to Congressional action on the same subject. If, in order to apply this principle to the existing situation, there be needed, in addition to the Act of Congress conferring upon the Commission the power to make interstate rates, further federal legislation declaring that the rate-making power thus conferred shall extend to the making of local rates that may control or affect the interstate rate, that is the kind of federal regulation that the next Congress should give us.

There is in this no invasion of state rights, no straining of the Constitution, no assertion of principles that have not long been familiar and often applied. The list of state laws that have been set aside as being in conflict with congressional action on the same subject is a long one. The right of the state to license and regulate navigation on the waters within its borders; to license importers to make sale of their importations; to authorize the damming or bridging of navigable streams; to regulate pilots in its ports—all were powers long exercised by the states, but perpetually denied to them when Congress finally assumed to regulate the subjects. There need, therefore, be no hysteria about the destruction of the rights of sovereign states when the growing needs of our national commerce force this further step forward under the Constitution.

Exhibits at the Railway Signal Association Convention.

The exhibits were shown in a large room on the fourth floor of the Public Service building, in which the convention was held, under the auspices of the Signal Appliance Association. More space was occupied than at any previous convention.

Adams & Westlake Co., Chicago, New York and Philadelphia.—Semaphore and switch lamps; new flat flame long time burner; tower lamp with shade reflector.

American Railway Signal Co., Cleveland.—Automatic signal operating one or two blades in two or three positions; one two-arm mechanism; two motor dwarf signals, one designed specially as a starting signal for side tracks; electric switch lock; switch indicator; switch boxes; track relays, two, three and five point.

American Vulcanized Fibre Co., Wilmington, Del.—Vulcanized fibre for track insulation.

Battery Supplies Co., Inc., Newark, N. J.—"Bsco" primary battery; Gladstone-Lalande battery. The exhibit booth was in the shape of a mammoth battery cell.

Bossert Mfg. Co., Utica, N. Y.—Signal plate clasp, one and two bolts; insulated rail joints, adjustable switch bracket.

Bryant Zinc Company, Chicago and New York.—Gould storage batteries; Waterbury primary batteries; Mock insulated joints; American instruments, D. D.; ammeters and voltmeters; portable and switch board line.

Continental Signal Co., Chicago.—A new electric-motor semaphore mechanism shown in operation; can be used at top or bottom of post, for two or three positions, and for upper or lower quadrant movement; a switch-box; a four lever mechanical interlocking machine of new design.

Dressel Railway Lamp Works, New York.—Semaphore and switch lamps; special lamp, oil and electric, for use in the Washington (D. C.) railroad tunnel.

Duplex Metals Co., New York.—Copper clad signal wire with both weather proof and rubber insulations; spring seats for mechanical purposes.

Electric Storage Battery Co., Philadelphia.—Signal batteries and plates; the "chloride" and the "exide" plates; Missouri Pacific and Harriman lines standard cells.

Fairbanks, Morse & Co., Chicago.—Four h.p. special electric engine with direct-connected generator for electric lighting and battery charging; gasolene-motor velocipede car; gasolene four-wheel car.

Federal Railway Signal Co., New York, Albany and Chicago.—All-electric interlocking machine; switch mechanism; high semaphore signal; motor dwarf signal; switch box; indicator, electrical hand release.

Galena Signal Oil Co., Franklin, Pa.—Perfection signal and railway safety oil.

General Electric Co., Schenectady.—Three-position top mast motor signal of B. & O. standard; similar signal of new B. & O. type with Patenall-Loree upper quadrant spectacle; two-arm home and distant top mast motor signal with independent mechanisms; upper quadrant two or three-position topmast motor signal. All of these were in operation. Mercury-arc rectifier for charging storage batteries from alternating current circuits; signal relays.

General Railway Signal Co., Rochester, N. Y.—A large display of photographs of apparatus used in automatic electric block signaling and all electric interlocking on the New York Central electric zone; similar displays showing apparatus for interurban service, and for the two Hudson River tunnels; views of automatic semaphores as installed on the Great Northern (upward inclination).

General Storage Battery Co., New York.—Different types of Hijur batteries used in signal work.

Gordon Battery Co., New York.—Gordon cells and supplies.

Gould Storage Battery Co., New York and Chicago.—240 A.H., 120 A.H., 40 A.H. batteries; various sizes of couple types; a new type of portable battery for signal service.

Handlan-Buck Mfg. Co., St. Louis.—Non-sweating switch and semaphore lamps; engine and tail lamps; metallic flags; new electric station lamp; long-time burner with flame 7/8 in. wide.

Hall Signal Co., New York and Chicago.—Style E electro-gas signal mechanism; style F electric motor mechanism; various types of relays and lightning arresters.

Hayes Track Appliance Co., Geneva, N. Y.—Hayes derail model A, size 5, with operating stand.

McClintock Mfg. Co., St. Paul.—Mercury-contact polarized relay; mercury contact interlocking relay; lightning arresters.

Northwestern Mfg. Co., Milwaukee.—Standard Browning motors, six sizes; motor generator set furnishing twelve volt circuit for operating the American Railway Signal Co.'s exhibit.

Quincy, Manchester, Sargent Co., Chicago and New York.—Q. & C. American insulated joint of the style in service on the Chicago & Alton for three years; also a new type of Q. & C. insulated joint.

Rail Joint Co., New York and Chicago.—Weber and continuous insulated rail joints; insulating fibre.

Railroad Supply Co., Chicago.—Four styles highway crossing signals; electric lock for outlying switches; the Railroad Supply Co. derailer; track relays; channel pins.

Railway Specialty & Supply Co., Chicago.—Arc lamp lightning arrester; pin and block wire joint; "1908" channel pin; test connectors; P. & M. rail anchor; Smith improved nut.

Stevenson, Arthur E., Buffalo.—A new design of electric mechanism for throwing either switches or signals.

Union Switch & Signal Co., Swissvale, Pa.—Combination outside motion plate detector bar; a new inside, motion-plate, detector bar; two-arm three-position electro-pneumatic signal movement; circuit controller operated by semaphore shaft operated circuit controller; battery charging switches; variable resistance coils; combination relay and indicator.

Westinghouse Machine Co., Pittsburg.—Westinghouse storage battery for block and interlocking signals.

Whall & Co., Boston.—Fibre for insulated rail joints.

A Method of Uniform Signaling.*

In accordance with the instructions of the Executive Committee and the action of the association at the last annual meeting, when the report then presented was referred back for further consideration, the committee submits the following report:

Introduction.—The committee has considered the Standard Code of the American Railway Association in all its discussions and conclusions and has departed from it only when the requirements of a consistent system apparently warranted changes. The intent of the committee is to recommend, not revolution in present practice in signaling, but rather evolution to meet changes that are demanded, and it has been guided in its deliberations by the principle that the object of the work of each and every department is the safe, expeditious and economical movement of traffic.

		REQUISITE INDICATIONS	APPLICATION
STOP	1	Stop here until authorized to proceed	(a Interlocking signals (b Manual block signals
	2	Stop here and then proceed	c Automatic block signals
	3	Stop here and investigate	(d Stop signs (e Home switch signals
	4	Stop within certain limits	f Train order signals
PROCEED Clear	5	Proceed on unlimited speed route; next signal at proceed	a Interlocking signals
	6	Proceed on limited " " " " " "	a Interlocking signals
	7	Proceed	a Interlocking signals b Manual block signals c Automatic block signals
	8	Continue	e Switch signals g Track tank signs
	9	Restriction removed	h Signs (removing slow sign restrictions)
Caution Approaching	10	Proceed prepared to stop at indicated point ahead	m Distant signals for Nos. 1, 2, 3
	11	Proceed on unlimited speed route next signal is at stop	a Interlocking signals
	12	" " limited " " " " " " "	a Interlocking signals
	13	Proceed prepared to pass next signal at limited speed	n Distant signals for No. 6
Here	14	Reduce speed	o Slow signs
	15	Proceed on low speed route next signal at proceed	a Interlocking signals
	16	" at low speed	a Interlocking signals
		SUPPLEMENTARY INDICATIONS	APPLICATION
		"A" Take siding here	b Manual Block signals
		"B" Take siding at next station	b " " "
		"C" Proceed block is occupied	b " " "

NOTE: Manual Block includes Telegraph Block, Staff Block, Controlled Manual Block.
NOTE: Indication No. 8—This indication may also be given at Interlocking Signals which are not Block Signals where Permissive Blocking is used, at Block Signals (Block Station Closed), at Train-order Signals (No orders) and at Flag Station Signals (No Passengers).
NOTE: Indication No. 14—This indication may also be given at a signal to show that "19" orders are to be received.

Exhibit No. 1—Outline of Indications for Method of Uniform Signaling.

Basis of System.—A system of fixed signal indications may be based upon either of two assumptions:

1. That signals should indicate to the engineman what is required of him in the control of his train and also the reason for the required action.

2. That the engineman needs to know only what is required of him in the control of his train.

Since the purpose of signals is to give to the engineman of moving trains information or instructions that must be acted upon without hesitation, it is plain that the indications of the signals and the means of giving them must be such that the meaning can be grasped instantly, without conscious study or effort. It is taken to be self-evident that, as the number of different instructions conveyed by the signal aspects increases, it becomes increasingly difficult for the engineman to remember the meanings of the aspects used, especially any that are not often met with in his daily routine, and the chance of wrong reading increases. In addition, the practical difficulties in the way of displaying a large number of distinct aspects must be taken into account. Tested by these considerations, the first assumption, followed to its conclusion, is found to require too many aspects.

While it is assumed that the engineman must be fully acquainted with the unchanging physical characteristics and the running rules of the road, or portion of the road over which he runs, including locations of fixed signals, it is realized that the engineman's mind should be relieved, as far as possible, from the necessity of remembering what each signal is for; and plainly this can be done only by giving more indications than would be required in a system based strictly upon the second assumption.

*Report of Special Committee on Interlocking and Block Signals before the Railway Signal Association at Milwaukee, Oct. 9.

It is, therefore, the conclusion of the committee that, in a system of signal indications, the aspects should primarily serve to indicate what is required of the engineman in the control of his train, and secondarily should provide for the giving of certain additional useful information, limited by the reasonable practicability of displaying the necessary aspects and the added burden upon the engineman's memory that will result from the use of many aspects.

Indications and Requisites.—Taking this view, the committee has developed the indications deemed requisite, with their applications as shown by Exhibit No. 1, from which it has deduced the necessary requisites of installation and adjuncts (which follow), illustrated by certain typical aspects shown in Exhibit No. 2.

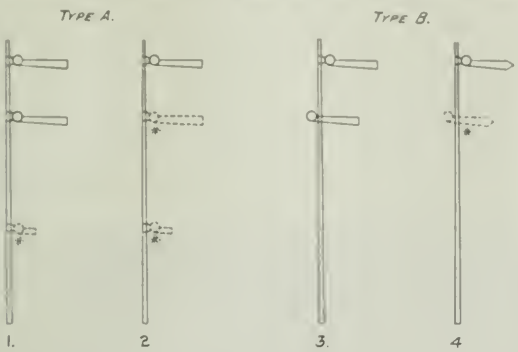


Exhibit No. 2—Typical Aspects for Method of Uniform Signaling.

NOTE.—Type A, "Stop here until authorized to proceed." Type B, "Stop here and then proceed." The aspects here shown are recommended for display of STOP indications Nos. 1 and 2 of Exhibit No. 1, and are typical representations of interlocking and block signals. Arms shown in dotted lines and marked with an asterisk are to be used only when necessary.

REQUISITES OF INSTALLATION.

The numbers in the columns at the left indicate the corresponding Requisites in the Standard Code. Departures from the wording of the Requisites in the Standard Code are indicated by *—new Requisites by X.

Signals affected.				
Interlocking	Manual Block	Auto. Block	Other	
1 *	1 *			Signals of prescribed form, the indications given by not more than three positions and either by three arms, the upper two of which, when horizontal, shall have their ends in a vertical line, or by arm or arms of distinctive form; and, in addition, at night by lights of prescribed color in a vertical line.
		1 *		Signals of prescribed form, the indications given by not more than three positions and either by two arms which, when horizontal, shall have their ends in a diagonal line, or by arm or arms of distinctive form; and, in addition, at night by lights of prescribed color in a diagonal line.
			x	Signals of prescribed form, the indications given by not more than three positions and by arm or target of distinctive form; and, in addition, at night by lights of prescribed color which, when there are two, shall be in a horizontal line.
x	x	x	x	A distinctive position of the arm for the caution (or approach) indication.
2 *	2 *	2 *	x	The apparatus so constructed, that the failure of any part directly controlling a signal will cause it to give its least favorable indication.
3 *			x	Signals, if practicable, either over or upon the right of and adjoining the track to which they refer.
	3 *	3 *		Signals, if practicable, either over or upon the right of and adjoining the track upon which trains are governed by them.
4	4	4	x	Semaphore arms that govern, displayed to the right of the signal mast* as seen from an approaching train.
5	5			The normal indication of Home Signals—Stop.
		5		Switches in the main track so connected with the block signals that the Home Block Signal in the direction of approaching trains will indicate Stop when the switch is not set for the main track.
6 *				The interlocking of signals with switch locks, railroad crossings or draw bridges so that a clear or caution indication at a Home Signal cannot be given unless the route to be used is clear and stop signals displayed for all conflicting routes.
	6 *			The apparatus so constructed that the failure of the block signal instrument or electric circuit will prevent the display of the clear or caution indication at the Home Block Signal.
		6		Signal connections and operating mechanism so arranged that a Home Block Signal will indicate Stop after the ..... of a train shall have passed it.
7				The interlocking of switches, locks, railroad crossings, draw bridges and signals through levers, or their equivalent.
	7			The relative position of the home signal, and track instrument or releasing circuit, such as to make it necessary that the rear of a train shall have passed ..... feet beyond the Home Block Signal before the signal at the preceding block station can be released.
8				Interlocked levers, or their equivalent, by which switches, locks and signals are operated.
9 *				The apparatus so constructed that the failure of any part directly controlling a switch or lock will prevent the display of a clear or caution indication at the Home Signal.
10				Facing point locks, for all facing point switches in main routes.
11				Detector bars, or their equivalent for all facing point switches in main routes.
12				Pipe, or its equivalent, compensated for changes in temperature, for connecting levers, in mechanical interlocking, with switches and locks.
13				Latch locking, or its equivalent.
14				The established order of interlocking such that: A clear or caution indication at a Home Signal cannot be displayed until derails or diverging switches, if any, in conflicting routes are in their normal position, and the switches for the required route are set and locked. The display of a clear or caution indication at the Home Signal shall lock all switches and locks in the route as far as the point to which such signal gives permission to proceed, locking all opposing or conflicting signals and releasing the corresponding Distant Signal, where such signal is used. Where Distant Signals are used, the display of a clear Distant Signal shall effect the same locking as that accomplished by the display of a clear or caution indication at the Home Signal.
15				Interlocking and Block Signals interconnected, where both are operated from the same station.
x				Interlocking signals so arranged that the permissible speeds, in not more than three gradations—unlimited, limited and low speed, shall be indicated.
x				Short arms and short range lights for all low speed indications and dwarf signals.
x	x	x		Adequate approach indications for all high speed signals.
x	x	x		Aspects used for conveying information or specific instructions, combined with the aspect of interlocking or block signals when it is necessary to give information or instruction indications at such signals.

Explanation of Action.—While two lights in horizontal line are recommended for the night aspect of signals which, when in stop position, give indication No. 3, it is the sense of the committee that, in connection with a switch target, one light is sufficient.

The committee, by vote of six to five, included in the outline, Exhibit No. 1, the indication, "Stop within certain limits," because

it conforms to present practice on a great many railroads in respect to Train-order Signals, although such practice is not sanctioned by the Standard Code. On all other points covered by the report the action of the committee was unanimous.*

Recommendation.—The committee concludes that, by accepting certain basic principles as outlined, it has established the number of essential and practicable indications; and it recommends that the indications and requisites submitted be approved and transmitted to the American Railway Association.

Railway Signal Association History.

Recent attempts to write the history of the Railway Signal Association, which was started in 1895, at Chicago, as the Railway Signaling Club, have not been entirely successful, the data required to answer some interesting questions having been lost. In consideration of this fact, and with a view to making the history of the association as complete as possible we give herewith a photograph, recently resurrected by Mr. Rudd, the newly elected president of the association, which was taken at Easton, Pa., about 1895 or 1896. While this picture is, in a sense, ancient history, it will be seen

The Railway Signaling Club in Its Infancy.

that those faces in the group which are still familiar at the meetings of the association, looked about the same then as now. It must be that these men are still young.

Notes from the North-Western Bulletin.

DISTRIBUTING CARS TO SHIPPERS.

No definite rule regarding the tabulation of car orders can be made to work to the best advantage at all stations. But there are some general rules. All orders for cars must be placed on Book Form No. 422 for the purpose of keeping record of car orders furnished. * * * To get on proper footing with your shippers, study their wants, keep track of what they will have to ship, and make them understand that there will be no favors shown. Some years ago one of the patrons at my station offered me my winter fuel at cost, which seemed quite a favor; possibly saved me seven or eight dollars, but as long as this man was in business he was constantly asking favors of me, and seeking preference over other shippers. I promised myself then that I would never sell myself to one of my patrons. Handle your business in such a way that you fear no one, and be just and fair with your patrons, and I think you will have no trouble. * * * Another thing. Sum up the situation each day. Interview your patrons as often as possible. Talk matters over with them. Explain to them the importance of expediting the unloading and reloading. Assist them by suggesting to them some of your ideas. Keep them on the good side of you, and the best of results are sure to follow. Notify them promptly on arrival of all loads, that they may get their men to work immediately as soon as car is placed. During the month of February we handled 86 cars, all loaded, and not an empty box car received during the month. We unloaded our cars and filled the orders for empties from them and kept things moving.—*W. H. Leak.*

FREIGHT HOUSE WORK.

We are closely following the new rules for loading merchandise which have been prepared to insure economical and safe loading and adherence to the rule of loading in station order. It has been found necessary to have the men memorize the loading list, otherwise there is loss of time. To prevent errors I have issued rules to have the loading numbers placed on shipping tickets by some one man; to have each check clerk make a mark on the shipping ticket when goods are received from wagons; to require each check clerk to call the loading number to his caller before the number is marked by the caller on the truck load; requiring the check clerk to see that the caller marks the right number on the truck load, right-side up for the trucker to read; and, under the loading number, the check clerk's initial must be marked. The caller must call off the number in a clear voice to the trucker. The trucker leaves his load on the platform opposite the proper car and picks up and takes the nearest empty truck to the nearest check clerk. The chief check clerk must examine each car before it is closed and make a note of the fact. In April we had occasion to dismiss 134 men and in May 112. With the warehouse force thus constantly changing errors are, of course, inevitable. The rush of business also interferes with accuracy. In one day recently we sent out 2,746 L. C. L. shipments.—*H. S. Jaynes*, Agent at Omaha.

FRANKNESS.

It is absolutely essential to give out no information that may have a tendency to mislead and confuse. It is far better to acknowledge our inability to answer a question where there is any doubt in our minds as to the ultimate outcome. Much harm is being done by endeavoring to answer questions on which we are not conversant. It leads to confusion, invites criticism, and sometimes forms the basis upon which damage claims are made.—*G. D. Brandt.*

Work is progressing with considerable rapidity on the Katanga Railroad, all but a few miles of which will be in Portuguese West Africa, extending westward from the Atlantic at Lobito Bay, near Benguela, about 800 miles to Katanga, in the southeastern part of the Congo State, around which are very valuable mines. The contract for the road has been taken by the English firm of Griffiths & Co. Fifty miles along the coast are in operation, and work is progressing on 200 more with a force of 8,000 men, 1,500 of whom are Hindoos brought from Natal.

*This indication (No. 1) was cut out by the Association.

Railway Signal Association.*

The eleventh annual convention of this association was held at Milwaukee, Wis., October 8, 9 and 10, between 300 and 400 members and guests being present. President J. A. Peabody (C. & N. W.) occupied the chair. The association was welcomed to Milwaukee by the Mayor of the city, who reminded his hearers that the place was renowned not for beer alone. The value of the beer made yearly is about 26 millions, but of iron products and machinery, Milwaukee produces over 87 millions a year.

President Peabody, in his address, spoke of the rapid growth of the association, the membership now being over 900, and reminded the members that this growth is of the right kind, the new acquisitions being largely active members who, under the amended constitution, are likely to be representative members. The amendment providing for representative membership was necessary in order to assure the proper financial support for important committee work. This committee work should result in standards which, when adopted, will effect marked savings to the members. The President referred to the inconvenience which results from having a meeting in September, only one month before the annual meeting, leaving an insufficient time for the preparation of the results of the September meeting for action in October. He congratulated the association on the recognition which is now accorded it by the American Railway Association, and called upon the members to do full justice to the opportunity thereby offered them to make real progress in the art of railroading.

The first business was the consideration of a number of amendments to the constitution, which were adopted unanimously. These provide, in substance, as follows: The membership shall henceforth consist of five classes—active, representative, junior, associate, and honorary. The term "active member" now means the same as was formerly meant by senior active member; and a representative member is a person eligible for active membership and having a practical knowledge of signaling, who is the duly appointed representative of a railway. An applicant for membership must remit the amount of the annual dues as an entrance fee, which will be in lieu of all dues for the year in which he is elected and which will be refunded in case he fails of election. Election is by two-thirds vote of the entire executive committee. No railroad or system under one general manager shall have more than one representative member. Each such member, in voting on the approval of standards or other important questions, shall have one additional vote for each 500 miles of road and one for each 500 working signal arms or disks. Representative members, in addition to personal dues, must pay each year an assessment, to be fixed by the executive committee, which, however, shall for each vote be not more than the amount of the annual dues. The officers of the association must be elected from the active members. Article 8, section 1, of the constitution is amended to read:

> Any proposition looking to the approval or recommendation by the association, of definitions, nomenclature, specifications, standard construction or standard practice, or aimed at defining formally the position of the association on any matter of importance, shall be presented in writing and shall be accompanied by drawings if the latter are necessary for a clear understanding of the subject. No such proposition shall be acted upon by the association unless it has been published in the advance notice, provided for in the constitution, of an annual meeting and has been submitted to the association at such meeting for discussion. After discussion a vote of the active members shall be taken at the same meeting to decide whether the proposition shall be submitted for decision by letter ballot. If the vote is affirmative the secretary-treasurer, within three months from the time when the vote is taken, shall send by mail to each active member a blank ballot and a copy of the proposition with a report, approved by the executive committee, of the discussion thereon. The ballots are to be filled up, signed and remailed to the secretary-treasurer, who shall count all the ballots received within thirty days from the date on which they were sent to the members. He shall then announce the vote in such manner as the executive committee may prescribe. A proposition for which two-thirds of the votes cast are affirmative, provided that ballots properly filled up have been returned by not less than twenty active members, shall be adopted by the association.

All-Electric Interlocking.—After finishing with the constitution the meeting took up the report of committee No. 8, on standard specifications for electric interlocking. This report filled over 25 pages. The meeting spent the rest of the day discussing it in great detail, but only about half of it was gone over, and the next morning, Wednesday, the whole was referred back to the committee. This report was made by a committee of nine prominent members, of which Vice-President L. R. Clausen (C., M. & St. P.) was chairman. It had been prepared with great care and was commended by a number of members as a highly satisfactory code of specifications, but the committee was subjected by individual members to persistent questioning concerning every detail in which there was room for a difference of opinion, and, in consequence of this action, the association spent the whole day in inconclusive committee work. A number of changes in words or sentences were quickly agreed to by the meeting and accepted by the committee; but others on which there was room for a variety of views, were left for the committee to deal with hereafter. For example, the clause requiring the railroad company to blast and remove rock preparatory to the installation of interlocking apparatus was quickly changed to read *solid* rock, and the clause providing that defective material will be returned upon *written* request of the contractor of *his expense* was quickly put into the form here shown, the italicized words having been left out of the original draft. But the clause providing for an endurance test for generators had to be referred back to the committee because, like many other clauses, it was a matter which could be settled in committee, but could not be settled in a large meeting. This was true of the provision concerning the lock-rod and plunger and their respective dimensions, and many other features.

Comprehensive Signaling Scheme.—On Wednesday substantially the whole of the day was taken up with a discussion of the report of the special committee on interlocking and block signals. This is the committee that prepared the "comprehensive signaling scheme" which was presented one year ago and was printed in the *Railroad Gazette* of October 26, 1906; and the present report was in the nature of a supplement to that one. The committee now consists of A. H. Rudd, chairman; L. R. Clausen, vice-chairman, Azel Ames, Jr., C. C. Anthony, H. S. Balliet, Charles A. Dunham, G. E. Ellis, M. H. Hovey, J. C. Mock, F. P. Patenall, J. A. Peabody, Frank Rhea, Thos. S. Stevens and H. H. Temple. With few exceptions these same men constitute the signaling committee of the Railway Engineering and Maintenance of Way Association, and, acting for both associations, an exhaustive discussion of the subject under consideration was recently held at Detroit, occupying 10 days and nearly as many nights.

The action of last year, with what had preceded it, was reported in the *Railroad Gazette* on pages 350 and 368 of the date above mentioned. The chief changes from present general practice were: to approve the upward inclination of the semaphore arm; the use of three-position signals, thus abolishing the distant signal; and the requirement of at least two lights on all high signals at night, those on automatic signals to be staggered instead of being placed vertically one above the other.

The principal feature of the report now presented is Exhibit No. 1, consisting of an outline of the indications requisite in a reasonably complete system of uniform signaling which shall provide for the present needs of American railroad practice (including some features which are unscientific and ought to be abolished), while, at the same time, adhering to a reasonable consistency, and to the principle of employing only the best method for each particular purpose. The report is given in full in another column.

After brief discussion the meeting approved the last paragraph under the head of "Basis of System," that beginning, "It is, therefore, the conclusion of the committee," etc. The different items of Exhibit No. 1 were then explained in detail by Mr. Rudd. Objection was made to the use of the word "requisite" in the heading, on the ground that this use of this word here, meaning things requisite in the scheme prepared by the committee, would be confused with the use of the same word in the standard codes of the American Railway Association, but a motion to strike out the word was lost. At the end of the discussion the items of Exhibit No. 1 were adopted as reported, with the exception of No. 4, which was ordered cut out. This action was based on the view that the common practice, with train-order signals, of permitting a train to stop with its front end at some point beyond the signal is not consistent with good signaling.

The requisites of installation, as arranged in the report, are put into a single code, those for interlocking and those for block signaling together; but it was voted that before sending the report to the American Railway Association these requisites shall be rearranged into five separate chapters, namely, interlocking, manual blocking, controlled manual blocking, automatic blocking, and miscellaneous.

The report was then approved and it will now go to a letter ballot, and, after approval by the association in that way, it will be laid before the proper committee of the American Railway Association.

THIRD DAY.

On Thursday morning the report first taken up was that of Committee No. 5—Specifications for Automatic Semaphore Block Signals, Operated by Direct Current, for Steam Railroads. Most of the time allotted to the meeting having been taken up, this report was not discussed and was accepted as a progress report. The Specifications for Mechanical Interlocking, Committee No. 15, received the same treatment.

The next business was the report of Committee No. 11, on Signal Lamps. This report, which will be given later, deals mainly with the method of fastening the lamp to the post and with sizes of lenses. It was accepted as a progress report, final acceptance being objected to on the ground that there is need of better fitting sockets and brackets. Experiments are going on

*List of exhibits on page 456.

to accomplish this improvement. The report of Committee No. 14, on How to Remedy the Effects of Foreign Current on Automatic Block Signals, was accepted and the committee discharged. The committee was congratulated on its twelfth conclusion. This report is printed in another column.

The report of Committee No. 2, on Maintenance of Automatic Block Signals, was briefly discussed. It deals mostly with conditions on roads of light traffic and is, therefore, silent on some features which are important on roads of heavy traffic; but the criticisms were few and comparatively unimportant. It was pointed out that zincs need not always be taken out as soon as recommended by the committee, it being practicable to use them in high-resistance circuits. Concerning the opening of sealed relays by maintainers, it was declared that the instructions should be the same to all the men, whether experienced or inexperienced, and none should open a relay except when necessary to put a signal in service. Another member called attention to the fact that in many cases it was desirable to use for track batteries four cells instead of two. The report was accepted.

The report of Committee No. 12, on Rubber-covered Wire and Cables, was vigorously discussed, but diversity of view was developed on important points, and the report was referred back to the committee. This committee presented specifications for cables for circuits carrying 600 volts or less, and recommended that the specifications adopted last year for solid conductors be changed in two features: (a) the required degree of insulation resistance, and (b) the time of immersion for the insulation resistance tests. For insulation resistance a new table was presented making less severe requirements, and it was recommended that the 48-hour term for the immersion test be made 12 hours. For the small sizes of wire a period of 12 hours is believed to be ample, and on the larger sizes the committee holds that the manufacturer will, for his own protection, immerse the wire a sufficient time. The reduction of time should reduce the cost of the wire to the consumer. There was a spirited discussion on a proposal to modify paragraph 2, of the specifications adopted last year, so as not to require that 70 per cent. of an insulating compound shall consist of mineral matter only. This proposal, with one for a similar loosening of paragraph 10, relating to acetone extract, was made with a view to admitting, under the specifications, an insulating compound the composition of which is kept secret; but the meeting finally voted unanimously to retain the present strict requirements, the prevailing view being, evidently, that a secret compound should be sold on its reputation, secrecy being radically inconsistent with the theory of detail specifications, which are designed to promote the most complete publicity.

In response to the criticism that the specifications would cause the rejection of the "copper-clad" steel wire recently described before the association, the title of last year's specifications was changed to read, "Specifications for rubber insulated *copper* signal wire."

The report of Committee No. 13, on the Maintenance of Manual Controlled Signals, was accepted for publication.

C. C. Anthony, for the Committee on Definitions, reported the action of the Executive Committee on the "Railway Signal Association Dictionary," which is to be published by the *Railroad Gazette*. This proposed work is to be similar in form and arrangement to the well-known "Master Car Builders' Dictionary" and the "Locomotive Dictionary," issued by the same publisher. The "Signal Dictionary" will be edited by Messrs. Adams and Hitt, Associate Editors of the *Railroad Gazette*. Mr. Adams is author of "The Block System" and Mr. Hitt is editor of the "Master Car Builders' Dictionary." Mr. Anthony briefly described the plan of the work. A committee of the association has been appointed to supervise it. This committee consists of Messrs. Anthony, J. C. Mock and Azel Ames, Jr. On motion of B. H. Mann (Missouri Pacific) it was voted unanimously to approve the scheme for the dictionary and the action of the Executive Committee thereon.

The Secretary's report showed a membership one year ago of 664, and on October 1, 1907, of 897; and it was informally stated that new members since admitted would bring up the total to 925. The Treasurer reported total receipts, including balance at the beginning of the year, of $6,703. The balance on hand October 1, 1907, was $1,718.

The meeting passed an enthusiastic vote of thanks to Vice-President Clausen for the very satisfactory arrangements which had been made for the Milwaukee meeting, and, after selecting Washington, D. C., as the place for the next annual meeting, and electing officers, adjourned. The election resulted in the choice of the following:

President, A. H. Rudd, Pennsylvania Railroad, Philadelphia; Vice-President, H. S. Balliet, Grand Central Station, New York City; Secretary-Treasurer, C. C. Rosenberg, Bethlehem, Pa.; Eastern Member of Executive Committee, F. P. Patenall (B. & O.); Western Member of Executive Committee, C. E. Denny (L. S. & M. S.). Vice-President Clausen holds over and the new Executive Committee will consist of Messrs. Rudd, Clausen, Balliet, Rosenberg, Patenall, Denny, Peabody, Morrison and Mock.

Alexander H. Rudd, the new President of the Association, is Signal Engineer of the Pennsylvania Railroad. He was born in 1867 and graduated from the Sheffield Scientific School of Yale University in 1886. He began railroad work that fall as a draftsman in the real estate department of the Pennsylvania. After a few months he was transferred to the signal department as a draftsman, and in 1892 went to the New York Central & Hudson River as signal inspector of the Hudson division. The next year he was appointed assistant superintendent of signals in charge of that division, and in 1894 went to the New York, New Haven & Hartford as foreman of electric signals and signal engineer of the Hartford division. In 1900 he was appointed signal engineer of the Delaware, Lackawanna & Western. In the spring of 1903 he resigned and returned to the Pennsylvania to take the position of assistant signal engineer, from which he was a few months ago promoted to the place he now holds.

A. H. Rudd.

On Wednesday evening about 300 of the members and guests, including 40 or more ladies, attended a banquet at the Hotel Pfister. The feature of the banquet, aside from the gowns of the women and the decorations of the room, was the address of Colonel H. G. Prout, Vice-President of the Union Switch & Signal Company, who spoke on the relations of the signal manufacturer to the consumer. Speaking of the true ethical basis of a bargain or contract, which, to be right, must be satisfactory and profitable to both sides, and declaring that this must be the cornerstone of the policy of any intelligent manufacturer who desires to establish an enduring business, Colonel Prout continued:

The signal manufacturer nowadays is compelled to assume toward his customers the attitude of the professional man toward his clients, and our customers may, without distortion of the sense of the word, be properly called our clients. The man who is building and selling engines or bridges, or machine tools or signaling and interlocking apparatus, is constantly called upon to take in trust the interests of his customer exactly as the lawyer or the doctor or the engineer takes in trust the interests of his patient or client. That is, we are constantly called upon for professional advice, either directly or indirectly, and very often it is quite directly. We are called upon to assist in scheming the interlocking of the signaling of a given proposition. We are called upon to recommend apparatus and methods. We are called upon to design special apparatus. It would seem that with the greater employment by railroads of higher class and competent engineers, the call upon signaling manufacturers for this professional service must be diminished, but it continues. It is of the utmost importance that the signal maker and the signal user work together, because of the intricate nature of their work. The important work of simplification of standards is still before us. The Union Switch & Signal Company manufactures and sells 156 different semaphore castings, 130 different pipe poles for signals, 95 different front rods, and 140 different lock rods. We carry on our lists and keep manufacturing and storeroom accounts with 37,500 different, separate articles, to say nothing of some unknown thousands that are not listed. With such a multitude of details there are constant chances for mistakes. Even if there were no mistakes, the clerical work and correspondence must be enormous, and a single mistake may lead to $25 worth of correspondence, though perhaps it has to do only with a dollar's worth of material. With more brains and more care the dealings between the maker and the railroad could be greatly smoothed. The saving that could be made if the railroads and manufacturers could get together and abolish about three-quarters of the present patterns, drawings and dies is in some degree indicated by the fact that at the beginning of last month the Union Switch & Signal Company had on hand $1,736,000 worth of material.

Colonel Prout complimented the members on their high ideals, especially as shown in their efforts to establish proper standards of construction and operation, and to secure the approval of the American Railway Association for such standards; but he slyly suggested that the last-named association had not always made lightning speed in its promotion of improved practice.

Electrification of the Rochester Division of the Erie Railroad.

BY W. N. SMITH,
Electrical Engineer Westinghouse Church, Kerr & Co.

(Concluded.)

A very simple type of pull-off was devised for curves in span construction, and it so happens that both the Rochester and Mt. Morris yards have considerable curvature. The pull-off consists simply of a spool type insulator, with a piece of pipe cemented through the center, this pipe being slipped over the hanger spacing rod joining the messenger and trolley clips, thus giving an insulating connection through which an ordinary pull-off cable can be attached to both messenger and trolley wherever required. The division of the horizontal pull between the messenger and trolley wires is easily adjusted to suit the conditions, by shifting the spool type insulator up and down the spacing rod, by inserting longer or shorter nipples of pipe underneath it. In general, when near a span wire, the messenger cable is supported rigidly on its insulator and the trolley wire needs all the side pull; but in the middle of a span the pull must be equally divided between messenger and trolley wire.

The presence of several through truss bridges over streams, and two low bridges over the Erie right of way, necessitated the employment of special construction at these points, particularly at the bridge at Clarissa street on the outskirts of Rochester. The original clearances here were so low that the roadbed had to be excavated out and the track lowered about 2 ft., the minimum clearance between the rails and the trolley wire being finally 18 ft. The messenger is fastened to a horizontal spool type insulator mounted at the center of a substantial piece of turned oak, which is long enough to carry two more similar insulators, one on either side of the center one.

The steel hangers reaching down from the overhead bridge structure carry the two side insulators, so there are always two insulators in series between the 11,000-volt messenger cable and the steel work of the bridge. These insulated supports are suspended at short intervals from the under side of the steel work of the bridge, and are further supplemented by the use of steady strains which prevent any side displacement of the trolley wire. The shortest sizes of hanger spacing rods are used in such places. Where the bridge trusses are high enough to permit it an iron stirrup is employed like that used in span work, which carries the standard form of straight line insulator, and the regular type of catenary suspension is employed.

At either side of these overhead obstructions it was necessary to provide warnings for brakemen upon the tops of freight cars as substitutes for the warnings of hanging pieces of rope previously used. In the accompanying photograph is given a view of the Clarissa street bridge, showing both the old arrangement of ropes and the new one for electrified tracks which supplanted it. It will be noted at this point only one of the two tracks is electrified and freight trains are here obliged by rule to use the unelectrified track; but to insure that the place shall be absolutely safeguarded, the electrified track is fitted with warning signs of the type shown. They consist of a horizontal suspended swinging wooden rod, mounted with its axis at an angle, so that it swings up as it is pushed to one side. The pantagraph trolley is fitted with a set of springs on each side, one of which strikes this warning sign a blow as it passes under and instantly throws it to one side. The blow is struck upon a heavy leather strap held taut by a coil spring of steel wire in tension, the whole contrivance being fastened to the lower half of the pantagraph trolley mechanism so that it is at the right height for striking the warning sign. The swinging rod is mounted upon the pole by means of insulators, effectually preventing any leakage to the ground, even though a car might stand still directly under the sign and make contact with it for an indefinite length of time.

Nearly all the telephone and telegraph wires which cross over the 11,000-volt trolley wire have been put underground, particularly in the case of the leads composed of only a few wires, but where the line is crossed by heavy telephone trunk lines they have been protected by the basket type of construction, so designed as to effectually prevent a broken telephone wire from falling across the messenger or trolley wire. This consists primarily of four galvanized steel cables stretched between opposite ends of two cross arms, one placed above and the other below the wires of the intersecting telephone line, and the four cables are joined by a basket work of light strap iron ribs placed at intervals of 3 ft. to 4 ft. across the whole span, forming the sides and the bottom of the cradle and effectually preventing a broken telephone wire from dropping any further. This construction was also followed in the case of an electric light wire at Avon.

The telegraph department of the railroad, in connection with the signal department, built a private telephone line of two copper wires between Rochester and Avon, with instruments at all signal towers and stations in the despatcher's office, and at the substations, and car shed, and master mechanic's office. This telephone system is run upon the trolley bracket poles, transposed every third pole, and has worked satisfactorily.

Lightning protection for high tension single phase railway line not having as yet been standardized, only a part of the line was equipped with line lightning arresters, which are of a swinging fuse gap type of construction, made by the Westinghouse Electric & Manufacturing Co. This type of lightning arrester consists of a gap one side of which is connected directly to the trolley through a No. 4 copper wire, and the other side being directly connected to the ground rod through a fuse enclosed in a tube which, while the fuse is intact, is maintained in an inclined position like a pendulum held back from its position of rest, but when the fuse is blown a latch is released which allows the fuse tube to swing to a vertical position which shows conspicuously from the ground, and signifies to the patrolman that the fuse should be replaced. The fuse tube can then be lifted off the suspending lugs by a pair of insulating tongs made for the purpose, and the fuse renewed and replaced in a few moments.

On the other half of the line lightning arresters were not installed. During the summer two of the poles were struck by lightning, but the metal work of the brackets and truss rods being entirely grounded, these poles were not damaged below the topmost point of attachment of the truss rods, which is generally not over 18 in. from the top of the pole. In a number of instances the lightning arrester fuses have blown, but it is not known how many of them have blown simultaneously. Although the extent to which this type of arrester is fully protective is hardly established as yet, at no time since regular operation started has any injury to the car equipment resulted from lightning, though there were several severe storms during June and July.

The trolley line is divided into seven sections—one comprising the Rochester terminal, one the Avon yard, three sections in the main line between Rochester and Avon, and two sections south of Avon. The sections are divided by trolley section insulators made by the Westinghouse Electric & Mfg. Co. They are of the overlapping type, made of impregnated wood, and are of sufficient length to insure insulation at 11,000 volts. Each section insulator is carried upon two brackets mounted on poles spaced 10 ft. apart. As the trolley and messenger must both be completely insulated on opposite sides of the breaker, heavy strain insulators are introduced upon which the messenger is dead ended, the two insulators being connected across the gap by a heavy steel rod. This entire combination is supported upon standard insulators mounted upon the regular brackets. One of the breakers, that opposite the substation at Avon, is different from the above mentioned type, in that it is not of the overlapping type, it being necessary to absolutely separate the two halves of the trolley line in order to utilize the separate phases of the trolley current of each half.

The only feeders necessary are those connecting the substation with the trolley on opposite sides of this section break. The principal object of cutting the trolley into additional sections is to facilitate the locating of line trouble. The conditions of electric traction on this line are such that no feeder is necessary besides the trolley wire, and consequently there is no necessity for feeding the sections separately. A jumper is therefore provided at each section insulator in which is placed a hook type knife switch that can be operated in case it is desired to cut that section out. Normally, however, the switches are closed and the effect of the jumpers is to make the trolley wire continuous.

Another detail peculiar to the catenary type of trolley construction is the "deflector"—a sort of mechanical fender placed in the angle formed by the intersecting trolley wires at switches. The type of deflector here used consists of four or five bars of flat steel, ½-in. x ⅛-in., suspended by riveted hangers from crossbars spaced 5 ft. apart which in turn rest on standard trolley clamps fastened to the trolley wire. The particular advantage gained by this construction is that no extra tension is needed to keep the bars from sagging and bending, this type of deflector being of minimum weight and entirely self-contained. They are placed in both angles of each switch. The object of the deflector is to prevent the end of the pantagraph shoe, when traveling under either wire, from becoming hooked over the other.

CARS.

The car equipment fitted with electric apparatus consists of six motor cars which together with their trucks were furnished by the St. Louis Car Company. The electrical apparatus was installed on the cars and trucks by the engineers at the railroad company's car shops in Buffalo, N. Y. The cars are 51 ft. 4 in. over bumpers, 40 ft. over corner posts, 29 ft. 4 in. between truck centers, 8 ft. 9 in. wide over sheathing, and 13 ft. 8⅝ in. in height above the rail. Four of the six have two passenger compartments, the other two having a baggage compartment about 14 ft. long, and a small smoking compartment with six seats, besides the regular passenger compartment.

The underframe of the cars consists of side sills of 5-in. x 8-in. yellow pine, with 6-in. steel channel fillers, intermediate sills of 4½ x 6-in. yellow pine, and center sills of 6-in. I-beams, with fillers. All the cars have upper and lower truss rods and needle beams of 5-in. I beams. End sills are 8-in. x 6-in. oak. The flooring is double, and trap doors are fitted over the motors.

All the lower side windows are equipped with sash balances,

and the interior of the car is finished in mahogany with light green veneering in the ceiling. The seats are of the "Walkover" type, upholstered in dark green plush in the main passenger compartment, and in rattan in the smoking compartment. There is a continuous basket rack on either side over the windows. The end doors are of the double sliding type and the vestibule doors are of the single sliding type, and trap doors are fitted over the steps. Each vestibule is fitted with a double-acting swinging door so arranged as to form the motorman's cab, and when not so used it is folded back to completely enclose the control apparatus and brake gear, and leaves the vestibule unobstructed for passengers.

Each car is fitted with a 50-candle power headlight, at each end, on top of the hood, and it is also fitted with a gong, air whistle, and with a standard train air signal used by the Erie Railroad. The toilet is in the center of the car, adjacent to the partition between compartments. The "Standard" steel type of platform buffer is used, and the regular M. C. B. coupling, air hose connections

Overhead Construction at Mount Morris Terminal; Erie Railroad.

and safety chains are provided, so that the cars can couple up to any of the standard Erie railroad car equipment.

There being an open space between the abutting vestibules when two motor cars are coupled together, due to the rounded and projecting buffer beams of the platforms, this opening being nearly 18-in. wide, which is wide enough to allow a person to fall between the cars, there were provided canvas curtains about 5 ft. high with snaps attached which enable them to be quickly stretched across the space, one on each side of the vestibule end door, so as to insure the safety of trainmen and passengers when walking from one car to another, with the train in motion.

The trucks are both alike, the wheel base being 6 ft. 8 in. The axles are 6½-in. diameter. The trucks are of the standard M. C. B. swing bolster type and inside hung brakes.

The heating equipment consists of 32 Consolidated Car Heating Company's electric heaters of the truss plank type, 450 watts capacity each in the main portion of the car, and two "No. 192 M. S." heaters in each cab.

The electrical equipment of the cars consists of four No. 132-A Westinghouse single-phase railway motors, with a nominal rating of 100 h.p. each, the gear ratio being 20:63. The suspension is of the nose type, and solid gears are pressed upon the axles.

The control system is of the Westinghouse electro-pneumatic type, and includes three distinct circuits, the high potential, the low potential and the control circuit.

The high potential circuit includes the pantagraph trolley, line switch and the transformer. The pantagraph trolley mechanism is operated by a pair of springs and by an air cylinder. The trolley is raised and held against the wire by means of springs against its own weight, and it is lowered by the application of air pressure to pistons working in cylinders that form part of its base. When down it is automatically locked, and the latch of this lock can only be withdrawn by applying air pressure to another small piston which then unlocks the pantagraph allowing the springs to raise it. This trolley mechanism is so connected with the control circuit through the line relay that any interruption in the supply of high-tension current immediately causes the trolley to be lowered by applying the air to the main cylinders in the trolley base.

The line switch is equivalent to a main high-tension circuit breaker. It is opened and closed by air pressure, admitted by electrically-operated valves. In case the supply of air is exhausted, as when the car has stood for some time unused, the line switch must first be held in mechanically by means of a handle provided for the purpose until the air pump, which can then be thrown into operation, has compressed air to about 50 lbs. pressure, which is enough to properly actuate the control system. To raise the trolley when there is no air pressure, there is provided a small automobile tire pump placed underneath one of the car seats, which is connected by a three-way cock into the trolley air piping system, and enables the air-operated trolley latch to be withdrawn and power obtained that will start the air compressor and set going the motor generator set, which is used for charging the storage battery and supplying current to the control circuit.

The transformer is of 200 k.w. capacity, and is of the oil-insulated type. It has three high-potential and eight low-potential

taps, the latter running from 300 down to 110 volts, at which latter pressure current is provided for heating, lighting and auxiliary purposes.

The high tension wiring of the car is done mainly with varnished cambric cable, drawn through loricated iron conduit. A small amount of high grade rubber cable is used, but it is thoroughly protected with varnished cambric tape wherever there is danger of a brush discharge to ground breaking down the insulation.

In the main low potential circuit are the switch group, the preventive coils and the reverser. The switch group is a set of air-operated switches controlled by magnet valves, all mounted in one frame. It is placed athwart the car as near as possible to the low-tension end of the main transformer. The switches of the group are all provided with interlocks, which automatically govern the connections in such a way that each switch of the group acts only when the current in the motors has reached a predetermined value, thus making acceleration automatic. Preventive coils are used across the terminals of some of the switches of the group to prevent excessive current flowing at the instant of closing the switch. Each switch in the group is fitted with its own blow-out coil. There are two reverser switches actuated by air pressure, one for each pair of motors.

Current from the main motor circuit is led through the motor limit switch, which makes effective the functions of the interlocks on the switch group, and renders it impossible for the successive switches to be thrown in unless the limit switch is closed.

The control circuit includes a master controller, in each vestibule, the train line wires and their connections to the valve magnets and interlocks, a storage battery supplying current for these wires, and a motor generator set, which is used either to charge the batteries or to actuate the control system. The master controller makes the proper connections by means of which the 15-volt storage battery actuates the valve magnets which control the action of the air-operated main contactors in the switch group and the reversers. The controller handle is normally held in a vertical central position by springs unless it is moved to one of the running points by the motorman. When released from the grasp of the hand it flies to the vertical position, cutting off the power and enabling the emergency application of the brakes by means of a brake relay valve alongside of it. There are two holes in the face of the master controller directly under the handle, and attached to the handle by means of a chain is a plug which may be inserted into either of these holes. The master controller is not operative unless this plug is pushed all the way into the lower hole, which closes the line switch, connects the generator and battery, and puts the brake relay valve into circuit. This is the ordinary running position of the plug. In case the line switch is opened by an overload, which generally causes the trolley to be lowered, the plug is taken out of the lower hole and placed in the upper, which action immediately closes the line switch, releases the trolley, and allows it to spring up against the wire. As soon as the power is thereby returned to the main circuit the plug is taken out of the upper hole and replaced in the lower one.

There is a push button upon each side of the bottom of the master controller case. That on the right hand side is used for dropping the trolley and opening the line switch. When the button on the left-hand side is pressed, the switch group is stepped up to the last or high-speed notch and remains in that position until the handle of the controller has been returned to the off position.

There are four distinct notches on each side of the controller, the first corresponding to the coasting position, with the power off, the others enabling such gradations of speed as may be desired. Reversal is effected by moving the controller handle to the opposite side of the center or dead point. If the controller stops on the dead point, as it will if released by the hand, it will immediately apply the brakes.

The motor generator set is a compact machine of about ½ k.w., the motor being of the self-starting induction type, wound for 110 volts, the generator being normally of about 23 volts. It is placed under one of the seats in the car, and is covered by a box with removable lid, so that it can easily be reached for such attention as it requires. It is mounted upon rubber bushings, and runs so quietly that its presence in the car can hardly be detected.

The storage battery consists of seven cells contained in a wooden

Overhead Catenary Construction at Clarissa Street Bridge, Rochester, Showing Section Break and Bridge Warning.

box with handles, carried in an enclosed box underneath the car. No other auxiliary lines for any purpose are connected to the control circuit in order to prevent it from being disabled by accidental grounds.

In one vestibule there is located in an asbestos lined compartment enclosed with steel doors, a slate switchboard panel upon which are carried all the switches and fuses for the control of the battery and motor generator set, the lighting circuits and heaters, and also the main connection from the low-tension side of the transformer to the auxiliaries.

The control circuit is fitted with junction boxes, branches running to receptacles at each of the four corners of the car directly under the end sills. The jumpers for connecting the cars and the receptacles are of the 12 point type, there being 12 wires in the main control circuit.

The low-tension wiring between the transformer and switch group and motors is all enclosed in a boxing of Transite, to insure its protection against mechanical injury, as the inductive effect of heavy currents at low potentials renders the use of iron conduits impossible for this part of the wiring.

The air brake and electrical equipment were placed on the cars by the engineers at the Buffalo car shops of the Erie Railroad.

CAR INSPECTION SHED.

Adjacent to the substation is a car inspection shed, a brick building that will accommodate four cars. It is 136 ft. 6 in. long, 30 ft. 5 in. wide and 20 ft. high in the clear, between the track and the bottom of the roof girders, and 24 ft. high from the top of foundation to the top of the parapet. The general style of construction is similar to that of the substation. It is well lighted, there being a window in each bay, 6 ft. 11 in. wide by 13 ft. 6½ in. high. Two tracks run clear through the building, the ends of which are enclosed by rolling steel doors of the Wilson type, about 12 ft. wide and 18 ft. 9 in. high. One of the two tracks is provided with a pit about 110 ft. long and 4 ft. 4 in. wide, in the clear, and 3 ft. deep from the top of the rail to the top of the convex brick floor. The roof is a 4¼-in. reinforced concrete slab, supported by steel girders, slightly pitched in one direction. There are no partitions or separate rooms in the building.

A trolley hoist is provided at the rear end of the building, traveling across it on the bottom flanges of an I-beam attached to one of the roof girders. A third track not connected with the outside tracks runs up and down the middle of the building between the two car tracks. A transfer table is located in a cross pit situated about midway of the building, by means of which a car standing on the floor track may have a truck taken out from under it and shifted over to the center track on which it can be run under the trolley hoist in case repairs are needed. The sides and bottom of this transfer pit are made of concrete. The floor of the car barn other than that taken up by the repair pit and transfer pit is paved with second grade paving brick, laid on sand, which was well packed down with water.

The station is supplied with light by 77 incandescent lamps in pairs and clusters, connected up by a conduit system and steel plate switch cabinet to the auxiliary light transformer in the substation. The pit is also provided with ten incandescent lamp outlets and extension plugs. No electrical means are provided for moving the cars in the station, there being always steam locomotives available for shifting the cars in and out of the building.

The facilities in the inspection shed for making electrical repairs are supplemented by the regular division repair shops, located alongside the steam locomotive roundhouse at Avon, which are equipped with the usual complement of machine tools. At the Rochester terminal a concrete inspection pit 60 ft. long is provided on one of the side tracks close to the passenger station.

OPERATION.

The equipment above described was intended to be sufficient for operating single-car trains with one stop per mile over the entire road, at an average schedule speed of 24 miles an hour, or to haul one trailer making stops about 2½ miles apart, at the same schedule speed. The company has furnished shelters where the public highways cross the line, there being 22 of these flag stations, besides the regular intermediate way stations at which steam trains stop, six in all, or a total of 28 stations at which electric cars may be required to stop. Practically the electric cars stop at all the regular way stations, but at only a portion of the flag stations. A single passenger coach is frequently attached to a motor car, and on some trains baggage, milk or postal cars are regularly hauled. When two trailers are hauled two motor cars are required, making a four-car train, as shown in the accompanying photograph. The service has proved very popular throughout the Genesee valley, through which the line passes, and it is intended to increase the number of motor cars in order to handle the business a little more comfortably next season. It is found that the electric trains on their 31 miles of line can be depended on to keep to their running time rather better than the steam passenger and freight trains operating over the main line.

Four Car Electric Train at Avon; Erie Railroad.

SIGNAL SYSTEM.

The railroad company has installed the manual block system for insuring the safety of trains with the frequent headway at which they are obliged to be run upon the single track road, which must also handle steam passenger and freight traffic at the same time. The blocks extend between the regular way stations, or where such blocks are too long block towers are added, making the blocks average about four miles in length from one end of the line to the other. The siding switches are fitted with electric locks controlled by the block operators, in the towers, or in the way stations. The towers are all connected by the private telephone line, while the way stations retain the usual telegraphic communication with the train despatcher's office at Rochester. All train orders are transmitted by telegraph and written out on Form 31.

TELEGRAPH SYSTEM.

As is well known, the single-phase trolley system causes interference with telegraph lines, along the right of way, and unless both the electrostatic and electromagnetic induction are properly compensated, there is always danger of telegraphic communication being seriously affected. The static effect is particularly annoying, as it is absolutely continuous, as long as the trolley line is charged, whether or not there are any cars moving. Various means were proposed and tried by the Western Union Telegraph Company for the elimination of the static induction, which always causes the telegraphic relays to chatter, but the most successful thus far found was that devised by E. W. Applegate, quadruplex expert for the Western Union Telegraph Co., who has developed a very simple means for overcoming static interference. The Applegate "static pickup," for which a patent has been applied, comprises a back contact relay and a high resistance shunt. The current enters the relay 1 and 2, through a 150-ohm coil or magnet, attracting the armature C. When the line opens by any operator opening his key the armature C falls back and through the back contact connects point C and D by the aid of a spring S. The shunt A consists of 350 ohms of carbon stick and provides a better path for the static current than do the magnets, pacifying the magnets to a certain extent. When the line opens and the armature connects with the back stop C and D, both the A and B shunts are in series with the main line and pick up the static, which escapes through shunt A, relieving the agitation of the armature so that it can respond to the closing of the line. The shunt A robs the relay of main line battery current very materially, so that it responds to the home key sluggishly. Consequently the auxiliary battery F is inserted in shunt B. When the armature C falls back, this battery acts upon the magnets and assists its prompt response to the home key or to any other operator to such an extent that the shunt A does not cause noticeable drag. No matter what the line static may be these shunts "pacify" the instruments and the static is not felt.

The armature spring is adjusted high enough to overcome the wave of static that escapes A and B shunts. The aid of the seven-volt battery overcomes this adjustment and leaves the relay very prompt and satisfactory.

The resistance of the shunt A must be determined by the distance from the ground and battery at each end of the line. The nearer to the ground the less is the resistance of the shunt, as in close proximity to battery and ground the static is more pronounced and the effect of the main battery upon the relay is likely to be correspondingly diminished.

By this arrangement all the telegraph wires are "singled," and metallic circuits, the necessity for which was at one time pending, were discontinued, and the repeater service which they necessitated was also discontinued. There is now a spare wire between Rochester and Mt. Morris through the entire zone of static interruption.

Speech over the telephone line is very clear and distinct, and although the wires and instruments have a heavy static charge, a few simple precautions prevent any trouble. It is intended to carry portable telephones on the cars.

Steady Strain Bracket for Low Bridge Trolley Construction.

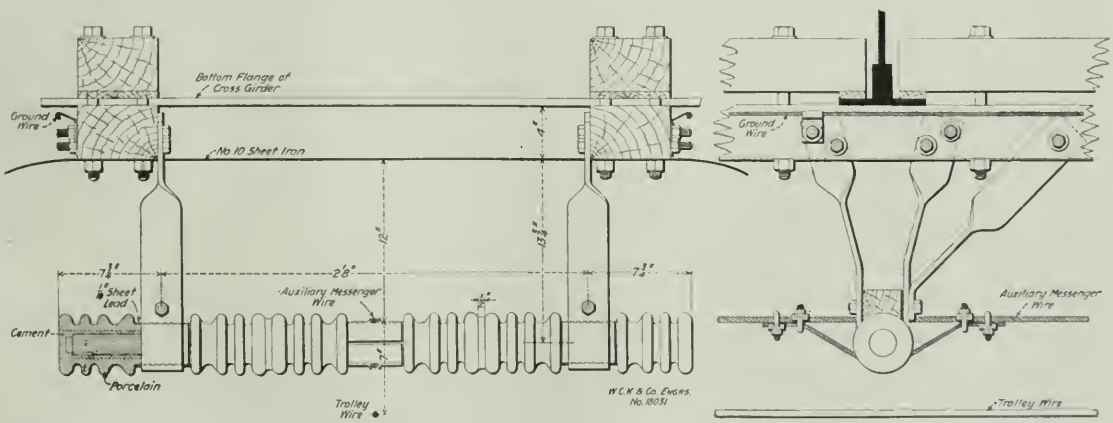
ORGANIZATION.

The single-phase system was recommended for the electrification of this division by the Electric Traction Commission of the Erie Railroad, and after authorization by the company was installed under the general direction of J. M. Graham, Vice-President and head of the construction department of the Erie.

The engineering and the construction work were carried out, and the system brought into operative condition by Westinghouse, Church, Kerr & Co., who designed and erected the buildings and the catenary trolley construction, bonded the track, and installed the electrical apparatus in the substation and on the cars.

The adjustment of the telegraph system was carried out jointly by the Western Union Telegraph Co. and the telegraph department of the railroad company.

The order was given to the engineers on June 6, 1906, and although the activity in construction work all over the country at that time rendered it difficult to secure materials and labor promptly, the work was pushed so rapidly that about 7½ months later, on Jan. 22, 1907, the first official trial trip was run between Avon and Rochester. The severe winter weather thereafter prevailing delayed the completion of the work until spring. During April and



Details of Trolley Construction Under Low Bridge; Erie Railroad.

May the whole equipment of substation apparatus, lines and cars was thoroughly tried out in a course of experimental operation, which also enabled the railroad employees to become familiar with the new system. On the 18th of June commercial operation began and has since continued permanently with marked success.

How to Remedy the Effects of Foreign Current on Automatic Block Signals.*

The present committee has carefully considered the report previously made to the Association and the discussion thereon. As the conclusions recommended by the previous committee were not acted upon by the Association, they are herewith re-submitted for adoption in the form recommended by the present committee. The conclusions now recommended are as follows:

1. For situations where foreign currents follow the track rails, although there may not be a crossing or connection with an electric road, it is recommended that the conditions be carefully studied and exact information obtained as to the course, direction, amount and pressure of foreign current and provision should then be made for removing or blocking out this current.

2. When there is a crossing of an electric road with a steam road, batteries must be placed at each end of steam road track next to crossing and battery current arranged to flow through the relay in direction with foreign current if the foreign current is found to flow in a definite direction. The connections, through block section for control signals, must be made by means of line wire circuits.

3. If there is sufficient foreign current to improperly work the track relay when an insulated joint has broken down, two relays should be used for each track circuit, one being placed at either end and connected in multiple arrangement. However, it should be understood that complete protection is not given by the multiple arrangement of relays, for if there is a broken rail or bond wire, a foreign current may energize the relay at one end of the section before the relay at the other end of the section has been shunted and thus cause the signal to give a clear indication when there was a train in the section.

4. To minimize as far as possible the effects of foreign current on line wire circuits, it is regarded as important that trunking be kept above the top of the ground, the rubber and other insulations be kept in first class condition, and the common wire limited to a length of 10 miles.

5. For multiple arrangement of track circuit relays, a resistance of 16 ohms is suggested for relay at battery end and 4 ohms for the relay at the other end of track circuit.

The resistance of the relay at the battery end of the track circuit that will give the best results is dependent upon the insulation of the track rails, the rail bonding and the voltage and ampere capacity of the battery. The recommended resistance of 16 ohms is deemed the best for those situations where the track circuit conditions may be considered good. For sections where the rail insulation is poor and batteries are not efficiently maintained, a lower resistance may be used to advantage if failures are to be kept within reasonable limits. The greater the resistance of the relay, the higher the voltage required to pick up the armature and the easier it will be to shunt the relay.

6. For track circuits having but one relay, a resistance of 9 ohms is recommended for circuits 500 ft. and under, and a resistance of 4 ohms for circuits of greater length than 500 ft.

While it is recognized that the best results are to be obtained by using a relay having a resistance proportioned to the resistance of the circuit, the benefits do not compensate for the disadvantage from a maintenance standpoint, of having to keep in stock track relays of a number of different resistances.

7. It is advisable to thickly coat with a heavy oil or other insulating compound the parts of an insulated joint before the joint is put in place.

If there is interference from foreign current, it is advisable to put a heavy oil or other insulating compound on the joint and particularly around the exposed ends of the fiber at least every two months.

8. For direct-current track circuit connections run in trunking, a $^{2}/_{32}$ in. rubber insulation wall for No. 8 B. & S. gage wire or larger is recommended.

9. For signal circuit connections run in trunking, a $^{5}/_{64}$ in. rubber insulation wall for No. 12 B. & S. gage wire is recommended.

10. Trunking, when run parallel with the track, should be kept clear of the ground. When run across tracks, trunking should be put in with top clear of the ballast and with top of capping not less than $^{1}/_{2}$ in. below bottom of rail.

11. The standard ground should be made by burying in moist earth an annealed copper plate $^{1}/_{16}$ in. thick, 2 ft. square, to which has been brazed for a length of 12 in. a No. 4 B. & S. gage soft drawn bare copper wire. The plate to be buried in clay or in a 6 in. layer of fine charcoal, and the connecting wire is not to exceed 150 ft. in length. The effectiveness of the ground should be tested by a Wheatstone bridge.

12. If the effects of foreign current on D. C. track circuits cannot be overcome by the methods above outlined, the desired result can be secured by the use of alternating-current track circuits having the proper current frequency.

W. H. Elliott, Chairman; J. M. Waldron, J. D. Phillips, W. F. Follett, C. A. Christofferson, W. M. Post.

*Report of Committee No. 11, presented to the Railway Signal Association at Milwaukee Oct. 9.

Railroad Commissioners' Convention.

The 19th annual meeting of the National Association of Railroad Commissioners was held at Washington, October 8, 9, 10 and 11, Vice-President C. C. McChord, of Kentucky, in the chair. On the call of the roll by states on Tuesday morning, there were represented the following 19 states, together with the Interstate Commerce Commission and representatives of the Railroad Accounting Associations: Connecticut, Georgia, Illinois, Iowa, Kentucky, Maine, Minnesota, Montana, Nebraska, New Jersey, New York (first and second districts), North Carolina, Ohio, Oregon, Pennsylvania, South Carolina, Washington, Wisconsin. As in former years, the Association indulged in a number of long discussions on such subjects as rate making, uniform classification and the valuation of railroads which are not susceptible of profitable treatment in a meeting of this kind, and on which no useful results were accomplished. The most definite action taken was that on the report of the committee on safety appliances. This report, which was made by the Chairman alone, and was avowedly a rambling paper, declared that the block signals now in use have become inadequate, and that the most advanced (?) schemes for keeping trains constantly in communication with stations by electric currents and for providing absolutely perfect automatic provision against collisions should be put in operation on the railroads throughout the country. These over-enthusiastic demands appear, however, to have been discounted by the convention and the meeting finally resolved, unanimously that:

> The Congress of the United States be requested to enact a law to compel railroad companies, both steam and interurban electric roads, to protect tracks by an automatic block system to be approved by the Interstate Commerce Commission, a certain number of miles to be protected each year until all the main track lines shall be so protected.
>
> The members of this association pledge themselves to ask the assistance of the senators and representatives of the several states . . . and to seek the passage of a law by each state to accomplish the same end. . . .

These resolutions, it will be seen, are by no means conservative, though in spirit they are more so than the other declarations of the report. As many of the commissioners represent states in which hundreds of miles of road do not earn $2,000 per mile per year, the use of the word "automatic," in the first paragraph of the resolutions, is doubtless to be explained by the prevailing lack of knowledge as to the meaning of that word in railroad signaling.

A considerable proportion of the 283 pages of the proceedings is filled up with committee reports and essays; 18 pages are taken up with a paper by A. T. Gillette, of New York, on the Valuation of Railroads and the discussion thereon. Mr. Gillette has been employed in a valuation for the state of Washington during the past year. James Peabody, of the Atchison, Topeka & Santa Fe, gave a talk on Uniform Classification, expounding his theory of how to make one. The Committee on Statistics, on which are Prof. Henry C. Adams, Prof. B. H. Meyer and Mr. C. I. Sturgis, made a long report, with copious appendices showing what the different states require in annual reports from railroads, and a paper by S. L. Lupton showing in great detail the features in which uniform action by the different states is desirable. Prof. B. H. Meyer contributed a ten page paper on the analysis of railroad operating expenses.

The Committee on Uniform Classification made a long report and again demanded that Congress authorize the Interstate Commerce Commission to prescribe one. The report of the Committee on Legislation, presented by M. S. Decker, of New York, declares that the time has come when this association, now 18 years old, should carry out its original purpose of securing harmony in railroad legislation. The need of securing greater safety to railroad passengers and employees, and to persons at highway crossings, alone constitutes a pressing demand which should receive the earnest attention of the Association.

The report of the Committee on Rates and Rate Making, presented by Mr. Staples, of Minnesota, fills, with the discussion thereon, about 30 pages, but we cannot discover that any new light is thrown on the subject.

C. C. McChord, of Kentucky, was chosen President of the Association for the ensuing year, and William H. Connolly, of Washington, D. C., Secretary. Mr. Connolly is Chief Clerk of the Interstate Commerce Commission. He takes the place of Mr. Moseley, who is no longer able to give the time necessary to attend to the duties of the secretary of the Association.

GENERAL NEWS SECTION

NOTES.

At Los Angeles, Cal., the Atchison, Topeka & Santa Fe has been found by a jury guilty of paying illegal rebates on freight.

Governor Comer, of Alabama, has issued his call for an extra session of the Legislature November 7, to further regulate the railroads.

The Indiana State Railroad Commission has determined to take upon itself the distribution of coal cars to the mines on the Southern Indiana Railroad.

According to newspaper reports, the Chicago & Alton has had to dismiss seven train auditors for co-operating with ticket scalpers —or, in plainer language, for stealing.

The Wisconsin Central has issued notice that until further notice 90 days' free storage will be given on all carload or L. C. L. shipments, up to the extent of the available space.

It is announced that trains of the Baltimore & Ohio will run to and from the new union station at Washington, D. C., October 26. The Pennsylvania will begin using the station three weeks later.

Near Middletown, N. Y., on Monday last a trestle on the Erie & Jersey Road, a new line under construction, broke down beneath a work train and 20 men were seriously injured, six of them fatally.

It has been informally announced that the tunnel under the East river, New York, from the Battery to Borough Hall, Brooklyn, will be in regular operation by January 1 and to the Long Island Railroad station by May 1.

The Chicago, Rock Island & Pacific Railroad Company has withdrawn its appeal to the Supreme Court of the United States in its controversy with the Territory of Oklahoma over the question of wheat rates.

In Kansas certain railroads have asked permission from the state authorities to collect 3 cents a mile from passengers who board trains without tickets. In Illinois this is permitted by a clause in the 2-cent law passed this year.

At the opening of the present college year, there were 415 freshmen registered in the Sheffield Scientific School of Yale University and 383 in the Academic department. This is the first time that the Sheff. registration has exceeded the Academic.

The Canadian Pacific has made an increase in the pay of telegraph operators of 12½ per cent. The Atchison, Topeka & Santa Fe has increased the pay of telegraph operators an average of 8 per cent., and of apprentices in the shops 20 cents a day.

The Grand Trunk has notified all trainmen that they are to take eight hours rest after 16 hours on the road, under penalty of dismissal. Rather than have trainmen start out without sufficient rest, the company would prefer to omit running that train.

The Lusitania, of the Cunard Line, on her second westbound trip, which was made last week, crossed in 4 days, 19 hrs. and 52 min., having made an average speed of 24 knots per hour. The largest single day's run was 617 knots. Each of these figures beats all previous records.

Conductors of the Chicago, Milwaukee & St. Paul in Wisconsin have received a circular calling attention to the legal liability of conductors who carry passengers, either adults or children, at less than the published rates. Stress is laid on carrying children over 12 years at half-fare rates.

At Jackson, Miss., Judge Potter has fined four railroads $100 each for failing to file with the Railroad Commission reports of the number of passes issued. All of the roads pleaded guilty, though they had not been furnished with blanks by the state; one at least had made a request for blanks but without result.

The State Railroad Commission of Texas has issued to the railroads new rules under which they are to keep their accounts and make their reports to the Commission. The rules, it is said, are so different from those prescribed by the Interstate Commerce Commission that the railroads are going to protest against their enforcement.

In the Federal Court at Kansas City October 11th the Secretary of State of Missouri was enjoined from attempting to forfeit the charter of the Chicago, Milwaukee & St. Paul. The offense of the railroad on which the Secretary proposed to act was that of transferring to the Federal Courts damage suits filed against it in the State Courts.

The telegraph school of the Pennsylvania Railroad at Bedford, Pa., although less than a month old, has already been enlarged to accommodate the increasing number of students. Fifty more instruments have been put in and there is to be a miniature railroad to illustrate the working of the block system. The Erie Railroad has established a telegraph school at Kenton, Ohio, and, according to the newspapers, will continue the practice of clerks now in the employ of the company, who go there to take instruction in telegraphy. The company will also pay their expenses while at school.

Offers of promotion and high wages by the Great Northern and Northern Pacific on new branch lines have led some Burlington firemen and brakemen to seek similar positions with the northwestern roads named. A number of the employees of the Galesburg division have gone west because of a recent change which would compel them to transfer to other divisions.

At Hartford, Conn., Conductor Maroney and Engineman Wilson, who were responsible for the collision near that city June 23, causing the death of ten laborers on a work train, have been convicted on a charge of manslaughter and sentenced each to nine months' imprisonment. At St. Thomas, Ont., October 9, an engineman of the Wabash Railroad was sentenced to six months' imprisonment for causing a fatal accident on that road in August, 1906.

The railroads centering in St. Louis have finally agreed to absorb the bridge toll on the Eads bridge for all freight shipped to St. Louis or East St. Louis from a distance exceeding 100 miles, by whatever conveyance the freight is carried across. That is to say, consignees' or truckmen's wagons hauling freight across the bridge will be relieved of the toll the same as in the case of freight which is carried across in freight cars. The same rule applies to outward freight.

Arthur Hale, Chairman of the American Railway Association Committee on Car Efficiency, has issued Bulletin No. 7, showing surpluses and shortages of freight cars September 18 and October 2. As compared with previous reports, this one shows marked decreases in the surplus and corresponding increases in shortages. The number of roads reporting on October 2 was, however, 23 less than on September 18, so that the difference between these two days is not particularly instructive.

Oren Root, General Manager of the New York City Railway, testifying before the State Public Service Commission concerning the number of cars run on important surface lines in the city, complained of as being insufficient, says it is impossible to get competent motormen. The company is paying higher wages than any other in the East, and yet cannot run all the cars that it desires to. The men are paid overtime and work as long hours as they can. Mr. Root said that he had advertised in the New York and Philadelphia papers for men, with meager results.

An officer of the New York Central, referring to the inquiry now being made by the New York State Public Service Commission concerning freight car service, says that at the New York City Terminals of the New York Central, beginning next month, an increased charge is to be made for the use of cars occupied by produce dealers, who use the cars as distributing depots. Some dealers in vegetables go so far as to live in their cars day and night for a number of days after arrival in New York, peddling out their wares to hucksters who take a small wagon load at a time to sell on the streets of the city. The Central proposes on the fifth and sixth days to charge $3 per car per day; on the seventh and eighth days $4, and thereafter $5.

It developed at the first day of the extended hearing which the Interstate Commerce Commission has begun on the proposed uniform bill of lading that whatever action the Commission may take, the bankers of the country will make a united demand on Congress at its next session to legislate "order" bills of lading into the same class as bills and notes and give them the same legal protection as all negotiable instruments. The long-standing complaint of the banking interests was voiced at the hearing by R. E. L. Marshall and Samuel Williston. They explained with precision to the Commission that the crops of the country are moved each year on loans from the banks on bills of lading which the banks but not the courts regarded as negotiable. The legal uncertainty of such a custom, which has become a commercial necessity, is an evil demanding relief, hence the resolution of the bankers to go to Congress.

Cleveland, Chicago, St. Paul and North Platte, Neb., report serious congestion of freight; and the usual fall rush, in less pronounced form, is reported from many other places. At Cleveland coal dealers and manufacturers are severely hampered in their business because coal cars are so scarce. From Chicago eastward the grain movement is reported so heavy as to greatly interfere with the movement of other commodities. The Union Pacific main line throughout Nebraska is crowded with trains and North Platte merchants had not received a carload of freight for a week. At St.

Paul the congestion is hurting the jobbing interests. The situation is becoming worse than it was a year ago. The building of several hundred miles of branch lines in North Dakota this season, without a corresponding increase in rolling stock, is said to be largely responsible for the present condition. The lines appear to have cars enough, but are deficient in motive power. And to this difficulty is added the strike of machinists from St. Paul to the Pacific coast.

United States Express Company Dividend.

The United States Express Company has declared a semi-annual dividend of 3 per cent. on its $10,000,000 stock, putting it on a 6 per cent. basis. It has heretofore been paying 4 per cent. annually.

Brooklyn Ferry Service to be Abandoned.

The Brooklyn Ferry Company of New York, which went into the hands of a receiver on October 16, 1906, is about to abandon service on its seven lines of ferries across the East river. The property has not yet been sold. The sale under foreclosure was ordered last December and it was then offered to the city for $13,000,000, but the city refused. The company owns five lines, running from the foot of Broadway, Brooklyn, to Roosevelt, 23d, 42d and Grand streets, Manhattan, and from Grand street, Brooklyn, to Grand street, Manhattan. It leases the two lines from Greenpoint avenue, Brooklyn to 10th and 23d streets, Manhattan.

The ferry company at the time of its failure operated 18 boats of its own and leased five, but the competition of the new Williamsburg bridge proved too much for the old ferry service. The company has outstanding $8,500,000 capital stock and $6,500,000 bonds. On August 1, 1906, the company defaulted the interest on the bonds and also certain ferry rentals. A committee of reorganization was formed then, but it now seems that the receiver is convinced that the successful reorganization of the company is impracticable.

Disastrous Derailment at Shrewsbury, England.

A press despatch of Tuesday last reports the derailment of a passenger train while passing over a curve at high speed on the London & North Western, at Shrewsbury, early on the morning of that day, killing ten passengers and six trainmen and mail clerks and injuring a large number of persons. The derailment occurred at a point where the speed limit rule is 10 miles an hour. The engine and all of the cars but one were wrecked.

New Hudson River Steamboat Line.

The New York & Albany Transportation Company has been incorporated to operate a line of freight and passenger steamboats between New York and Albany. The company has bought two boats, one of which is the Saratoga, formerly on the Troy Line. Wharfs have been secured in Albany, and the New York terminal is to be arranged for soon. Both a day and a night service may be started by next April, and perhaps the company will ultimately run lines to Long Island Sound and points on the Atlantic coast.

Short on Theory; Long on Practice.

As a supplement to our report of the convention of railroad commissioners at Washington we copy the following from the *New York Commercial*: "Commissioner Stanton, Montana's representative, sketched the history of Montana, told two or three stories, related thrilling experiences of the early pioneers and toward the conclusion of his speech said a thing or two about railroad regulation. He told the convention frankly that he was a novice at the railroad game.

"'Our board was established seven months ago,' he said. 'We're new at the business out in Montana, but we are doing things; we're short on theory, but long on practice. There was a road out there that refused to run a train. We ordered them to do it. They did. That road,' he continued with a smile, 'won't make any money for years to come.' This statement brought down the house.

"'The pioneers went into Montana in order that their descendants might wear patent leather shoes and ride in automobiles. We intend to see to it that everybody is afforded an opportunity to ride on the steam cars. * * *'"

INTERSTATE COMMERCE COMMISSION RULINGS.

Coal Rates on Burlington Upheld.

The Interstate Commerce Commission, in an opinion by Chairman Knapp, has announced decision in the case of the Albany Produce Co. v. the Chicago, Burlington & Quincy. In their petition complainants alleged that the rate exacted by defendant for transporting coal in carloads from shipping points in the Centerville district, in Iowa, to Albany, Mo., is unreasonable, and is greater than the rate charged for carrying coal in carloads from said shipping points through Albany to St. Joseph, Mo., and that this adjustment of rates subjects complainants and the city of Albany to undue prejudice and gives to the locality of St. Joseph, and coal dealers therein, undue preference.

At the time their complaint was heard defendant's rate on coal from the Centerville district to Albany was $1.25 per net ton, and to St. Joseph 70 cents per net ton, but after the case was submitted defendant voluntarily reduced its rate from the Centerville district to Albany to $1 per ton. The Commission found that so far as shown by the evidence there is no competition between Albany and St. Joseph. St. Joseph ships no coal to Albany, Albany ships no coal to St. Joseph, and neither competes with the other in common territory for the sale of coal. Albany is not in reality interested in the rates to St. Joseph except as they afford a basis of comparison. The Commission declared that there is practically nothing in the record to warrant a finding that the $1.25 rate was unreasonable in itself, or that the present rate of $1 is excessive. It also held that it is equally evident that the charge of unjust discrimination has not been established. The case presented by the record did not indicate the violation of any provision of the law and the complaint was therefore dismissed.

An Unsupported Complaint from Dallas.

The Commission, in an opinion rendered by Commissioner Harlan, has announced its decision in the case of the Dallas Freight Bureau against the Missouri, Kansas & Texas and others. The complaint involved rates on agricultural implements, axes, pig iron, whisky and other commodities from St. Louis to Dallas. Complaint was also made of the rates on sugar, molasses and glucose from New Orleans to Dallas. The Commission held that the record disclosed no sufficient basis for an order, and the complaint was dismissed without prejudice; and it was further decided that: the Commission is authorized under the act to order a reduction in rates only when upon complaint made it is of the opinion that such rates are unjust, or unreasonable, or unjustly discriminatory, or unduly preferential; complainants must therefore prove the issues that they raise or make out a prima facie case sufficiently clear and strong to require the Commission in the public interest to enter upon an investigation of its own motion. Neither of these requirements is satisfied by a comparison, without any other showing, of the rates complained of, from St. Louis to Dallas, with rates between points in other and distant localities where different physical, competitive and traffic conditions exist. Shippers have ample opportunity for personally laying their troubles before the Commission and thus showing the actual results of the rates complained of upon their business. In this case no person interested in such rates appeared as a witness, and the only testimony offered was that of the secretary of a freight bureau having no personal knowledge of the effect of the rates upon the merchants dealing in the commodities involved and whose testimony is limited to a comparison of the rates attacked with rates on the same commodities for equal distances in other parts of the country, where the traffic is much more dense.

Commissioner Clements did not concur in the conclusions of the Commission.

MANUFACTURING AND BUSINESS.

The Fort Pitt Bridge Works, Pittsburgh, Pa., has opened an office in Chicago with A. R. Young, C.E., in charge. He is located in the Fisher building.

The Duff Manufacturing Company, Pittsburgh, Pa., has an order from the South Manchurian Railroad for 450 Duff ball-bearing screw jacks of 35-lbs. capacity.

The Washington Terminal Co. has ordered, for use in its new shops just built in Washington, a large number of double and single swivel vises from The Pittsburgh Automatic Vise & Tool Co., Pittsburgh, Pa.

The Central Inspection Bureau, New York, is inspecting a number of electric double-truck passenger and express cars for the Buffalo, Lockport & Rochester at the works of the Niles Car & Manufacturing Co., Niles, Ohio.

The Cutler-Hammer Manufacturing Co., Milwaukee, Wis., which some months ago bought the Wirt Electric Co. of Philadelphia, has consolidated that business with its New York plant at Park avenue and 130th street, where the manufacture of Wirt apparatus will be continued.

The Central Inspection Bureau, New York, has just finished inspecting a large number of flat bottom gondola cars for the Newburg & South Shore at the works of the Pressed Steel Car Co. The bureau has a contract with the Emlenton Refining Company for inspecting a number of tank cars at this same plant.

The Marion Steam Shovel Company, Marion, Ohio, is now turn-

ing out about 30 shovels a month. A few months ago the company made its first contract with the Isthmian Canal Commission, and it has now submitted to the commission bids for some 100-ton shovels for which contracts have not as yet been awarded.

G. L. L. Davis has resigned as General Sales Agent of the General Castings Co., Verona, Pa., to become General Sales Agent of the U. S. Metal & Manufacturing Co., 25 Broad street, New York City. Mr. Davis has been identified with the railroad supply business for a number of years.

Charles Hansel & Co., 43 Wall street, New York, have been engaged by the North Platte & Encampment Canal Co. to make the surveys, plans and estimates and to take charge of the building of a canal for irrigating 93,000 acres of land extending from Saratoga, Wyo., south to the Colorado state line. The canal is to have a capacity of 1,000 cu. ft. per second. A hydro-electric plant will also be built.

Dr. E. Rosenberg, whose book "Electrical Engineering" was reviewed in the *Railroad Gazette* of September 27, is no longer Chief Electrical Engineer for Körting Bros., Hanover, Germany. He is now an Electrical Consulting Engineer, with an office at Kirchstrasse 5, Berlin, N. W. Dr. Rosenberg has had long experience in large electrical manufacturing works and is particularly well-known for the Rosenberg direct current and train lighting generators, several hundred of which are in operation in Europe and Asiatic Turkey.

S. J. Bowling, Manager of the railroad and steamship department of The Philip Carey Manufacturing Co., Lockland, Cincinnati, Ohio, has moved into new offices at 1327 Majestic building, Detroit, Mich. The company is carrying out its contract for pipe covering at the new Washington Union Station, where it will apply about $75,000 worth of 85 per cent. magnesia covering. It has just finished a contract for the St. Louis & San Francisco for flexible cement roofing and is now applying about 20 carloads of roofing at the National Tube Company's plant at McKeesport, Pa.

The Pilling Air Engine Co., Detroit, Mich., maker of pneumatic hoists, locomotive turntable motors and compressed air hoisting machinery, will change its name to the Detroit Hoist & Machine Co., a new corporation with $50,000 paid up capital stock. The old company will still exist with a nominal capital to protect the name and good will. Both companies will be controlled by the same management. The new plant is in operation. Other improvements will be added in the near future, provision for same having been made by buying three acres of ground on the Grand Trunk at Milwaukee Junction, one of the best shipping points in Detroit.

The More-Jones Brass & Metal Co., St. Louis, Mo., has patented a new process for making bronze and brass bearings. No sand is used in this method, so the danger of grit is avoided. The bearings are cast in composition metallic molds, so made as to avoid cold shot and keep the metal thoroughly mixed. Part of the floating top is drawn off to take away impurities that might be in the metal and to leave the bearing of uniform heat, thus avoiding shrinkage and producing a uniform material. Comparative tests show the material when cast by this process to be 30 to 50 per cent. stronger in both cross-breaking and compression strength, varying with the difference in composition. The specific gravity of the metal is 5 per cent. greater. It is claimed that the bearings cast in the patented process show 40 to 50 per cent. less wear on the metal and the shaft. The cost of manufacture is not larger than formerly.

Iron and Steel.

The Wisconsin & Northern has given an order for 5,000 tons of rails.

The Terminal Railroad Association of St. Louis has ordered 2,500 tons of rails.

The American Bridge Company has an order for 1,000 tons of steel from an electric line for a bridge over the Youghiogeny river.

The Atchison, Topeka & Santa Fe, it is reported, has ordered a large quantity of rails from the Colorado Fuel & Iron Company; also 6,000 tons from the Illinois Steel Company.

OBITUARY NOTICES.

Colonel F. St. J. Lockwood, President of the Danbury & Norwalk, which owns the road operated as the Danbury branch of the New York, New Haven & Hartford, died on October 12 at the age of 82.

Alexander M. Fox, a Director of the Pennsylvania, died at Philadelphia last week. Mr. Fox was 83 years old. He was the oldest Director of the company and was first elected to that office to represent the city of Philadelphia's interest in the road.

Albert C. Murdock, Division Engineer on the Pacific extension of the Chicago, Milwaukee & St. Paul at Ellensburg, Wash., died suddenly on October 6. Mr. Murdock was 37 years old. Before going to the St. Paul a year ago, he was locating engineer on the Northern Pacific at Tacoma, Wash.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

American Society of Civil Engineers.

At the meeting of this society, October 16, a paper was presented on the Bracing of Trenches and Tunnels, with Formulas for Earth Pressures, illustrated with lantern slides, by J. C. Meem. This paper was printed in the *Proceedings* for August, 1907.

American Society of Mechanical Engineers.

At the meeting of this society November 12, the principal address will be made by Charles R. Pratt on the Gearless Traction Electric Elevator, which is being installed in the Singer and Metropolitan Life, New York's two highest buildings. The paper will be discussed by engineers and architects from New York, Philadelphia and Chicago, and members of all professions are invited to attend.

American Railway Association.

A special meeting of this Association will be held at the Waldorf-Astoria Hotel, New York City, October 30, to take the place of the regular session appointed to be held at Norfolk October 23. All business intended to be taken up at the regular fall session will be considered at New York. Reports will be presented by the Executive Committee and the Committees on Train Rules, on Car Service, on Safety Appliances, on Signals, on Statistical Inquiry, on Standard Cipher Code, on Transportation of Explosives, on Standard Rail and Wheel Sections, on Standard Location for Third Rail Working Conductors, and on Car Efficiency. A First Vice-President will be elected.

General Passenger Agents.

The American Association of General Passenger and Ticket Agents held its 52d annual convention at Washington beginning on Tuesday of this week. The feature of the first session was an address by President W. W. Finley, of the Southern Railway. Mr. Finley characterized the demand for increased passenger service at decreased prices as a "hysterical wave of political agitation." The absence of complaints of high passenger rates in specific cases, especially when the public had been provided with federal and state commissions to receive such complaints, Mr. Finley regarded as significant. The convention began its business with a lively discussion of what was universally denounced as the inferior quality of ticket paper now in general use.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Albany & Susquehanna.—Henry E. Cooper has been elected a Director, succeeding J. H. Rhoades, deceased.

Arkansas, Louisiana & Gulf.—Officers of this company, which is building from Monroe, La., to Hamburg, Ark., 57 miles, are as follows: Chief Engineer, E. T. Bond, with office at Bastrop, La.; Superintendent, W. J. Hillyer, with office at Monroe; Auditor, L. E. Smart, with office at Monroe, and Assistant Auditor, V. G. Savage.

Atlanta, Birmingham & Atlantic.—H. M. Atkinson, President, has been appointed also General Manager, succeeding to some of the duties of G. D. Wadley, who remains Second Vice-President in charge of construction.

Boston & Maine.—Henry M. Whitney has resigned from the Board of Directors.

W. T. Roden has been appointed Auditor of Disbursements.

Central of Georgia.—C. E. James, Chattanooga, Tenn., and R. E. Steiner, Montgomery, Ala., have been elected Directors.

Chicago, Indianapolis & Louisville.—The authority of the general officers has been extended over the Indianapolis & Louisville, which is an extension recently opened for traffic from Wallace Junction, Ind., to Shirley Hill, 55 miles.

Delaware & Eastern.—J. L. Greatsinger and J. W. Griggs have been elected Directors, the Board being increased from 12 to 14 members.

Delaware & Hudson.—L. H. Stewart, Comptroller, has resigned on account of ill health. Mr. Stewart has been with the Delaware & Hudson for 33 years. W. H. Davies, Assistant Comptroller, is in charge of Mr. Stewart's duties for the present.

Grand Trunk Western.—W. G. Brownlee, General Transportation Manager of the Grand Trunk, has been elected a Director of the Grand Trunk Western.

Indianapolis & Louisville.—See Chicago, Indianapolis & Louisville.

Panama Railroad.—H. J. Slifer, formerly General Superintendent of the Central district of the Chicago, Rock Island & Pacific, and more recently Consulting Engineer in New York, has been appointed Assistant to the President of the Panama Railroad, with office at Colon.

Union Pacific.—William Mahl, Comptroller, has been elected a Director, succeeding David Willcox, deceased.

Western Maryland.—Edwin Gould has been elected a Director, succeeding James H. Hyde.

Operating Officers.

Arkansas, Louisiana & Gulf.—See this company under Executive, Financial and Legal Officers.

Chicago & North-Western.—L. W. Easterly, Trainmaster at Boone, Iowa, has been appointed Trainmaster at Council Bluffs, Iowa. P. W. Alshton, Trainmaster at Eagle Grove, Iowa, succeeds Mr. Easterly. S. A. Morrison, Trainmaster at Chicago, has been appointed to the new office of Trainmaster at Clinton, Iowa. J. G. Cowan, Trainmaster of the Peoria division, succeeds Mr. Morrison. A. L. Crabbs, chief despatcher of the Galena division, succeeds Mr. Cowan, with office at Chicago.

Cincinnati, New Orleans & Texas Pacific.—Warren S. Andrews, who was recently appointed General Superintendent of Transportation, was born at Salem, Ill., in 1865. After leaving high school in 1882 he began railroad work as a messenger boy on the Illinois Central. The next year he went to the Ohio & Mississippi, now part of the Baltimore & Ohio Southwestern, as an operator, and was later made train despatcher. In 1886 he was made a train despatcher on the Great Northern, and in 1893 returned to the Illinois Central as train despatcher. Six years later he was made Trainmaster on this road at Champaign, Ill., and was then later transferred to Carbondale. In 1902 he went to the Southern, where he served as Trainmaster at Charlotte, N. C., and later as Assistant Superintendent at Alexandria, Va., and at Greensboro, N. C. He was appointed Superintendent of the Washington division of this road in the fall of 1903, and in 1905 was transferred to the Danville division. Last winter he was appointed Assistant to the General Manager of the Cincinnati, New Orleans & Texas Pacific, where he remained until his recent promotion.

W. S. Andrews.

Grand Trunk.—David Crombie, who was recently appointed assistant to the general transportation manager, was born at Hamilton, Ont., in 1864. After a high school education he began railroad work in 1882 as a telegraph operator on the Grand Trunk. He later became train despatcher and in 1890 went to the Flint & Pere Marquette, now part of the Pere Marquette, as train despatcher and car distributor. Four years later he was appointed car service agent and then Superintendent of Car Service on this road. In 1900 he was appointed Superintendent of Transportation of the Pere Marquette and three years later went into private business at Chatham, Ont. In 1907 he returned to railroad work as Master of Transportation of the Grand Trunk at London, Ont., which position he held until his recent promotion.

H. E. Whittenberger, who was recently appointed Superintendent of the Grand Trunk at Montreal, Que., was born in 1864 at Peru, Ind. He began railroad work in 1885 on the Wabash. In 1897 he was made Trainmaster of the Middle division of the Grand Trunk, and in 1902 went to the Denver & Rio Grande as Superintendent. In 1904 he was appointed Superintendent of the Cincinnati, Hamilton & Dayton, and in 1906 went to the Kansas City Southern as Superintendent, where he remained until his recent appointment.

Missouri, Oklahoma & Gulf.—E. B. Fisher has been appointed General Superintendent, with office at Muskogee, Ind. T., succeeding A. N. Leitnaker.

Mobile, Jackson & Kansas City.—A. F. Church has been appointed Superintendent at Laurel, Miss., succeeding J. D. Patterson, resigned to go to the Southern.

New York, New Haven & Hartford.—O. M. Shepard, who was recently appointed Assistant to Vice-President John F. Stevens, was born at Cleveland, Ohio, in 1842. His first railroad work was in the United States government military telegraph and railroad service, which he entered in 1863. After becoming Superintendent of Telegraph he was, in 1870, appointed Master of Transportation and later Assistant Superintendent of the Gilman, Clinton & Springfield, now part of the Illinois Central. In 1874 he was made Assistant General Superintendent of the St. Louis & Southeastern, now part of the Louisville & Nashville, and six years later was made Superintendent of the New York & New England, now part of the New York, New Haven & Hartford. In 1882 he was made Division Superintendent on the New York, New Haven & Hartford, and was later made Assistant to the President. In 1886 he was appointed General Superintendent, and in 1890, the mileage of the system being much greater, was made Superintendent of the New York division and his former office was abolished. In 1903 he was again appointed General Superintendent, where he remained until his recent appointment.

O. M. Shepard.

Philadelphia & Reading.—B. H. Bowman, Assistant Trainmaster at Harrisburg, Pa., has been appointed Assistant Trainmaster at Rutherford, Pa., succeeding G. O. Sarvis, resigned.

Texas & Pacific.—W. G. Mason, Superintendent of the Avoyelles division, has been appointed Superintendent of the Louisiana division, with office at Bunkie, La., having charge also of the line from Eunice to Bunkie, built by the Louisiana, East and West, and which was to be part of the Avoyelles division.

Traffic Officers.

Chicago & North-Western.—H. G. Graves has been appointed General Baggage Agent, succeeding F. D. Taylor, assigned to other duties.

Wheeling & Lake Erie.—S. P. Woodside has been appointed to the new office of Assistant General Freight Agent at Pittsburg, Pa.

Engineering and Rolling Stock Officers.

Arkansas, Louisiana & Gulf.—See this company under Executive, Financial and Legal Officers.

Bangor & Aroostook.—Orlando Stewart, who recently retired as Superintendent of Motive Power and Equipment, is 74 years old. He was born at St. Albans, Me., and after a common school education began railroad work in 1847 as an apprentice on the Boston & Maine. After three years he went to the Erie as a gang boss. In 1853 he went to the Bellefontaine & Indiana, now part of the Cleveland, Cincinnati, Chicago & St. Louis, as shop foreman, and in 1856 returned to the East as a locomotive engineer on the Boston & Lowell, now operated by the Boston & Maine. In 1863 he was appointed general foreman of the United States government shops at Chattanooga, Tenn. He returned to his former position on the Boston & Lowell in 1866. In 1882 he went to the New York, Providence

Orlando Stewart.

& Boston, now a part of the New York, New Haven & Hartford, as Assistant Master Mechanic, and two years later was appointed Superintendent of Motive Power of the Fitchburg. He has been Superintendent of Motive Power and Equipment of the Bangor & Aroostook since 1894. Mr. Stewart is now living at 75 Wallingford Road, Brighton, Mass.

Boston & Albany.—E. E. Stone, Assistant Chief Engineer, has been appointed to the new office of Engineer of Maintenance of Way.

Buffalo, Rochester & Pittsburg.—J. M. Floesch, Chief Engineer, has resigned to go to a construction company at work on the Grand Trunk Pacific.

Union Pacific.—E. F. Fay, general foreman at Omaha, Neb., has been appointed Master Mechanic at Denver, Colo.

LOCOMOTIVE BUILDING.

The Chicago, Milwaukee & St. Paul is said to be figuring on 50 Mikado (4-8-4) locomotives to be built at its West Milwaukee shops.

The Due West Railway, Due West, S. C., which was reported in our advance sheet of October 2 as being in the market for locomotives, has bought second-hand locomotives from Joseph E. Bowen, Norfolk, Va.

The New York Central Lines, as reported in the *Railroad Gazette* of September 27, have ordered 20 ten-wheel locomotives, 99 consolidation locomotives, 60 Pacific locomotives, one 10-wheel switching and 10 six-wheel switching locomotives from the American Locomotive Company. The specifications are as follows:

General Dimensions.

Type of locomotive	10-Wheel.	Consolidation.	Pacific.	10 wheel Switching.	6-wheel Switching.
Weight, total, lbs.	202,000	234,000	261,000	270,000	157,000
On drivers, lbs.	156,000	208,000	171,000	270,000	157,000
Cylinders	22 x 26 in.	23 x 32 in.	22 x 28 in.	24 x 28 in.	21 x 28 in.
Diam. of drivers, in.	69	63	79	52	57
Boiler, type	Rad. stay; Ex. w.-top.	Rad. stay; Strght top	Rad. stay; Ex. w.-top.	Rad. stay; Ex. w.-top.	Rad. stay; Strght top
Workg stm pres	200 lbs.	200 lbs.	200 lbs.	210 lbs.	180 lbs.
Tubes, No.	400	444	379	447	308
Tubes, diameter	2 in.	2 in.	2 in.	2 in.	2 in.
Tubes, length	14 ft. 11 in.	15 ft. ½ in.	20 ft.	19 ft.	11 ft. 6 in.
Firebox, length	105⅛ in.	108$^1/_{16}$ in.	108⅝ in.	109 in.	72⅛ in.
Firebox width	75¼ in.	75¼ in.	75¼ in.	74 in.	65¼ in.
Grate area, sq. ft.	54.93	56.47	56.4	55.4	32.7
Htg. sur., total, sq. ft.	3,327.0	....	4,194.0	4,645.3	2,696.0
Water capacity, gals.	7,000	7,500	8,000	8,000	5,100
Coal capacity	12 tons.	12 tons.	14 tons.	12 tons.	7½ tons.

The San Antonio & Aransas Pass, which was reported as in the market in the *Railroad Gazette* of July 26, has ordered eight simple Pacific oil burning locomotives from the Baldwin Locomotive Works for January, 1908, delivery.

General Dimensions.

Type of locomotive	Pacific
Weight, total	127,000 lbs.
Weight on drivers	96,000 "
Diameter of drivers	62 in.
Cylinders	19 in. x 24 "
Boiler, type	Wagon top
" working steam pressure	180 lbs.
" number of tubes	230
" material of tubes	Charcoal iron
" diameter of tubes	2 in.
" length of tubes	13 ft. 1¾ in.
Firebox, length	71⅝ "
" width	34¼ "
" material	Otis steel
" grate area	17 sq. ft.
Heating surface, total	1,715 "
Tank capacity, for water	5,000 gals.
Oil capacity	1,800 gals.

Special Equipment.

Air brakes	Westinghouse
Axles	Baldwin specifications
Boiler lagging	Keasbey & Mattison
Brake-beams	Carnegie
Couplers	Janney
Headlights	Pyle National electric
Injector	Nathan
Journal bearings	Ajax bronze
Piston rod packings	Jerome metallic
Valve rod packings	Jerome metallic
Safety valve	Crosby
Sanding devices	Leach
Sight-feed lubricators	Nathan
Springs	Standard Steel Works
Tires, driving wheels	Midvale

The Delaware & Hudson has ordered 30 simple consolidation locomotives from the American Locomotive Company.

General Dimensions.

Weight on drivers	220,800 lbs.
Weight, total	250,000 "
Cylinders	23 in. x 30 in.
Diameter of drivers	57 "
Boiler, type	Wooten, wide firebox
" working steam pressure	210 lbs.
" heating surface, total	3,968 sq. ft.
" tubes, number	493
" tubes, material	Spellerized steel
" tubes outside diameter	2 in.
" tubes length	14 ft. 6 "
Firebox, length	126¼ "
" width	114 "
" maker	Worth Bros.
Grate area	99.85 sq. ft.
Tank capacity	7,800 gals.
Coal capacity	14 tons

Special Equipment.

Air brakes	Westinghouse
Axles	Cunningham treated
Bell ringer	Sansom
Boiler lagging	Keasbey & Mattison
Brake beams	Simplex
Brake shoes	Engine, Perfecto
Brake shoes	Tender, Diamond "S"
Couplers	Climax
Headlights	Dressel
Injector	Hancock
Piston rod packings	Trojan
Valve rod packings	Trojan
Safety valve	Consolidated
Sanding devices	Hanlon pneumatic
Sight feed lubricators	Nathan and Ohio triple sight feed
Springs	Railway Steel Spring
Steam gages	Ashcroft
Tires, driving wheels	Midvale
Valve gear	Walschaert
Fire door flange	O'Connor
Draft gear	For 5 engines, tandem radial, Commonwealth Steel Co. For 25 engines, Miner
Side bearings	Miner gravity
Bumper beam front	Commonwealth Steel Co.
End sills, tenders	For 5 engines, Commonwealth Steel Co.
Centering device	For 25 engines, U. S. Metal & Mfg. Co.

CAR BUILDING.

The Tehuantepec National is in the market for cars.

The Harriman Lines have ordered 25 or more passenger cars.

The Pennsylvania is said to be figuring on additional steel cars.

The Manistee & Northeastern will build 20 flat cars at its own shops.

The Wabash, it is said, is contemplating the purchase of new equipment.

The Erie is said to be building 50 cabooses at its Buffalo and Kent shops.

The South & Western, it is said, has ordered 100 cars from the Pressed Steel Car Co.

The Idaho & Washington Northern has ordered four cabooses from the Pullman Co.

The Central of New Jersey has ordered 25 passenger cars from Harlan & Hollingsworth.

The Long Island has ordered 50 passenger cars from the American Car & Foundry Company.

The Wabash denies that it is considering buying new equipment, as reported in our advance sheet of October 9.

The Mexican Central denies that it intends to buy any all-steel passenger coaches, as reported in the *Railroad Gazette* of October 4.

J. S. Clarke, Chairman of the Public Works Committee, Calgary, Alb., is asking bids until November 1 on six semi-convertible street cars.

The Producers Tank Line Company, Louisville, Ky., has ordered 20 tank cars of 80,000 lbs. capacity from the McGuire-Cummings Company.

The Goodwin Manufacturing Company, St. Louis, has ordered 20 tank cars of 80,000 lbs. capacity from the McGuire-Cummings Company.

The Atchison, Topeka & Santa Fe has ordered one hundred 40-ft. refrigerator cars of 60,000 lbs. capacity from the American Car & Foundry Company.

The Due West Railway, Due West, S. C., which was reported in our advance sheet of October 2 as being in the market for cars, has bought second-hand cars from Joseph E. Bowen, Norfolk, Va.

The Louisville & Nashville, as reported in our advance sheet of October 9, will build one hundred 40-ft. refrigerator cars of 50,000 lbs. capacity at its New Decatur, Ala., shops during the first six months of 1908.

The Union Pacific has ordered 250 Hart convertible steel cars of 100,000 lbs. capacity from the Rodger Ballast Car Co. to be built by the American Car & Foundry Co. Delivery to begin December 15. These cars will weigh 43,000 lbs. and will measure 41 ft. 6 in. long, over all. The special equipment includes:

Bolsters	Truck, Simplex; Body, Commonwealth
Brake beams	Damascus
Brake shoes	American Brake-Shoe & Foundry Co.
Brasses	Hewitt
Couplers	Climax
Draft rigging	Miner
Journal boxes	McCord
Springs	Railway Steel-Spring
Trucks	Andrews side truck frames
Wheels	American Car & Foundry Co.

The Sterling Coal Company, Philadelphia, Pa., has ordered 250 steel coal cars of 100,000 lbs. capacity from the Cambria Steel Company. These cars will measure 32 ft. 3 in. long, over end sills; 10 ft.

1⅜ in. wide, over all, and 10 ft. high, over all; 30 ft. 5 in. long, 9 ft. 6 in. wide and 6 ft. 3⅞ in. high, inside measurements. These measurements are in accordance with Pennsylvania Railroad specifications for standard, class "G1a" gondolas, and the special equipment will also be in accordance with these specifications.

The San Antonio & Aransas Pass, as reported in the *Railroad Gazette* of September 20, has ordered six passenger coaches from the Pullman Company for January, 1908, delivery. These coaches will measure 60 ft. long, 9 ft. 8 in. wide and 14 ft. 1½ in. high, inside measurements. The special equipment includes:

Bolsters	Commonwealth
Brake-beams	Carnegie
Brake-shoes	Lappin
Brakes	Westinghouse
Couplers	Janney
Curtain fixtures	Forsyth
Curtain material	Pantasote
Door fastenings	Pullman standard
Journal boxes	Symington
Light	Pintsch
Paint	Murphy Varnish Co.
Platforms	Standard Steel
Roofs	S. A. & A. P. standard
Springs	Standard Steel Works
Trucks	S. A. & A. P. standard

The New York, Ontario & Western, as reported in our advance sheet of October 5, is in the market for 10 passenger cars. These cars will measure 64 ft. long, over end sills; 10 ft. wide, over side sills, and 14 ft. 3½ in. from rail to top of upper deck. Bodies and underframes will be of wood. The special equipment includes:

Bolsters	New York, Ontario & Western standard
Brake-beams	National Hollow or Simplex
Brake-shoes	American Brake Shoe & Foundry Co.
Brakes	Westinghouse
Brasses	Brady
Couplers	Gould
Curtain fixtures	National
Curtain material	Texoderm
Draft rigging	Gould
Heating system	Not yet decided
Light	Safety Car Heating & Lighting, vapor system
Paint	Sherwin-Williams
Platforms	Gould, with Fillon traps
Springs	Railway Steel-Spring
Trucks	New York, Ontario & Western standard
Vestibules	Gould
Wheels	McKee-Fuller

RAILROAD STRUCTURES.

Altoona, Pa.—The Pennsylvania, it is said, has bought 250 acres of land for new shops and for extending its yards in the vicinity of Altoona. Reports say that officials of the company admit that extensions to the shops at Altoona, and at points on the Pitsburgh division are planned, but deny that definite action has been taken.

Amarillo, Tex.—Land, it is said, has been bought by the Pecos Valley & Northeastern as a site for shops, also for a roundhouse.

Chicago, Ill.—The Baltimore & Ohio is said to be buying land as a site for a new freight terminal at Van Buren and Jefferson streets.

Cincinnati, Ohio.—Action will soon be taken by the City Council on the proposition to issue $298,000 of bonds as its share of the cost of a viaduct to be built over the Baltimore & Ohio Southwestern tracks. The railroad to pay $158,000.

Girsland, La.—The Louisiana & North West is planning to put up a two-story freighthouse on the present site of its shops, and to put up a new foundry and machine shop in another location.

Jersey City, N. J.—Contracts are reported let by the Erie to Mullen & McDermott for the sub-structure and to the American Bridge Company for the superstructure of a bridge to be built over the Hackensack river. The work will involve the construction of about four miles of new double-track on the Newark and Greenwood Lake lines, and is expected to be finished by July of next year.

Long Island City, N. Y.—Plans are reported made for the main terminal building of the Belmont tunnel (New York & Long Island). The proposed building is to be six stories high and 150 ft. x 175 ft.

Milwaukee, Wis.—A resolution has been introduced providing for the elimination of 12 grade crossings on the Northern division of the Chicago, Milwaukee & St. Paul. The cost of the work will be between $750,000 and $1,000,000.

New York, N. Y.—The East 14th street car barns were recently damaged by fire; loss about $400,000.

Renfrew, Ont.—Surveyors are at work locating a site for a new freight shed and sidings for the Canadian Pacific here.

Rockport, Ind.—Surveys are being made to locate the site of the proposed bridge to be built over the Ohio river here.

Rossiter Junction, Pa.—Contracts are reported let to James K Long & Son for putting up a passenger station here, and to Adams & Neal for the masonry work. The building is to be used jointly by the Pennsylvania and the New York Central.

Valley Grove, W. Va.—The Baltimore & Ohio has engineers at work on plans to put in concrete walls at various points to protect the tracks from high water. The first part of this work to be carried out will be at Valley Grove, where a wall 600 ft. long is to be built. After completion of this section the work will be continued at other points.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Annapolis, Washington & Baltimore.—See Washington, Baltimore & Annapolis.

Atlanta, Birmingham & Atlantic.—President H. M. Atkinson, of this company, is quoted as saying that the Alabama division will be in operation this month west to Talladega. The Atlanta branch is to be finished about December 1, when trains will be run from Atlanta to Brunswick. By July of next year it is expected to have all the extensions finished and the entire line in operation from Brunswick, Ga., to Birmingham, Ala.

Bartlesville Interurban.—Contracts are reported let for building this proposed line from Bartlesville, Okla., north to Dewey, four miles. J. J. Carl, President, Bartlesville, Ind. T.

Beaumont & Great Northern.—This road, which operates a line from Trinity, Tex., east to Livingston, 30 miles, is said to be planning to build an extension from Livingston southeast to Beaumont, 60 miles.

Boston & Albany.—Assistant General Manager Hustis in a newspaper statement says that about 26 miles of new third main track will be ready for use this winter, and that nine miles more has been authorized. The four-track section will be extended from Lake Crossing, Mass., westward to South Framingham. The sections of the new third track are between East Chatham and Richmond Furnace; Pittsfield and Dalton, and South Spencer and Charlton. Contractors are being engaged for the construction of a section from Rensselaer to Van Hoesen.

Calgary (Alb.) Street Railway.—Bids are wanted November 1 by S. J. Clarke, Chairman of Public Works committee, for building 12 miles of line, also the overhead line work, and a steel bridge with concrete abutments over the Elbow river.

California Northeastern.—See Southern Pacific.

Canadian Pacific.—Application, it is said, will be made by this company to Parliament at its next meeting for authority to build a branch from Killam, Alb., in township 44, ranges 13 and 14, west of the fourth meridian, northwest to Strathcona, about 80 miles.

Carolina & Tennessee Southern.—See Southern.

Colorado Roads.—Funds, it is said, have been secured by H. Larson and associates, of Rawlins, Wyo., to build a line from Steamboat Springs, Colo., north via Rawlins, on the Union Pacific, thence northwest to Lander, on the Chicago & North-Western, 225 miles.

Denver & Rio Grande.—Local reports say that surveys are under way for a line from Chama, N. Mex., southeast to a junction with the present Santa Fe-Antonito line at Servilleta, 60 miles.

Ensley Southern.—See Southern.

Fairmont & Southern.—Bids, it is said, will soon be asked for building this line, projected from Bellington, W. Va., north to Pittsburgh, Pa., 125 miles. (Sept. 20, p. 339.)

Grand Trunk Pacific.—Considerable progress is being made by this company on the main line west of Winnipeg. Treat & Johnston, who have the contract between Winnipeg and Portage la Prairie, 56 miles, will have the greater part of this work under way before winter, and expect to finish the grading about a month after the commencement of work next spring. McDonald & McMillan, who have the contract from Portage la Prairie west to Touchwood Hills, expect to have the work finished this month. Track has been laid from Portage la Prairie west for about 200 miles. It is said that the line will not be finished to Saskatoon this fall as the Canadian White Company will not finish the grading on its contract between Touchwood Hills and Saskatoon, 140 miles, for at least two months after the commencement of work next spring. Foley, Larsen & Co., who have the work from Saskatoon to Edmonton, 350 miles, have grading finished from Saskatoon west for 200 miles, and expect to have all the work finished next fall in time to move the 1908 grain crop from that section. The National-Transcontinental Railway Commission is said to expect that the contractors building the sections from Winnipeg east to Moncton, N. B., 660 miles, will carry on work all winter. It is estimated that 18,000 men are now at work on these contracts, and on the western section between Winnipeg and the Pacific coast and other railroad construction in this section about 20,000 men are at work.

Contracts, it is said, will shortly be let by this company for building 200 miles of main line from Edmonton, Alb., west.

Gulf, Beaumont & Great Northern.—See Gulf, Colorado & Santa Fe.

Gulf, Beaumont & Kansas City.—See Gulf, Colorado & Santa Fe.

Gulf, Colorado & Santa Fe.—This company has filed an amendment to its charter in accordance with the law passed by the last Legislature authorizing it to absorb and operate the Gulf, Beaumont & Kansas City, the Gulf, Beaumont & Great Northern, and the Texas & Gulf railroads, and to build an extension of the Gulf, Beaumont & Kansas City from Center, Tex., its present northern terminus northwest to Timpson, where connection is to be made with the Texas & Gulf. The latter is also to be extended north from Longview to a point on the Red river, about 125 miles. (April 19, p. 565.)

Gulf Short Line.—Incorporated in Oklahoma with $36,000,000 capital to build a line from Kansas City, Mo., southwest via Olathe, Ottawa, Emporia, Marion, McPherson and Hutchinson, Kan., thence through Oklahoma and Texas to Port Lavaca, Tex., on Matagorda bay, 1,500 miles, including branches in Kansas. The incorporators include: C. F. Bridge and T. Ragsdale, of Topeka, Kan.; L. E. Potts and J. P. Byrne, of Oklahoma City, and F. A. Jerran, of La Junta.

Jasper-French Lick Extension.—See Southern.

Memphis & Chattanooga.—See Southern.

Missouri, Kansas & Texas.—Reports are again being revived that this company will extend its Trinity-Colmesnell line from Colmesnell northeast to Shreveport, La., 125 miles.

New York & Long Island.—The south tube of the tunnel under the East river has been finished by the Degnon Construction Company and turned over to the railroad, which will equip it for operation. The north tube was turned over by the builders some time ago.

New York Subways.—The New York State Public Service Commission has approved the project to build the "Fourth avenue subway" in the Borough of Brooklyn, and bids for the work will be asked for shortly. The estimated cost is $25,000,000. (June 7, p. 819.)

North & South Texas.—This company, which is building from Lufkin, Tex., southwest to Groveton, 31 miles, it is said, has plans made for its proposed line south to Houston, about 90 miles. (July 5, p. 27.)

Oklahoma City (Electric).—This company, operating 30 miles of electric lines in Oklahoma City and suburbs, and which is building an extension to connect with the lines it owns at Guthrie, has changed its name to the Oklahoma Railway Company. The capital stock has been increased from $1,000,000 to $3,000,000 and the revised charter provides for operating lines to include Guthrie, Norman, Yukon, Oklahoma and Spencer or Choctaw City. The directors are: A. H. Classen, J. W. Shartel, H. M. Brauer, E. W. Cooke, G. H. Brauer, G. W. Ford and J. M. Owen, all of Oklahoma City.

Oklahoma Railway.—See Oklahoma City.

Okolona-Big Creek.—See Southern.

Opelousas, Gulf & Northeastern.—See Texas & Pacific.

Philadelphia Subway Terminal.—Incorporated in Pennsylvania to build a six-track subway under North Broad street from the city hall to the northern limit of the city near Clearfield street, about four miles. The plans include an extension north for a four-track subway to Olney avenue. George W. Goddard, President; M. Harris and C. Willing are also interested in the project.

St. Louis Southwestern.—Announcement is made that this company has plans ready for freight terminal improvements at Fort Worth, Tex., to cost about $500,000. A new main track is to be laid between Fort Worth and North Fort Worth; yard facilities are to be enlarged and a new steel and concrete bridge built across the Trinity river at that place.

Southern.—The report of this company for the year ended June 30, 1907, shows that double-track work and revision of grades and curvature was finished during the year on 206.81 miles. On the completion of about 85 miles more second-track will be laid from Orange, Va., to Charlotte, N. C.; between Clinton, Tenn., and Knoxville, and between Asheville, N. C., and Morristown, Tenn. During the year second-track has been laid between Pomona and Highpoint, 11.9 miles; between Highpoint and Spencer, 32.3 miles. This provides double-track between Goldsboro, N. C., and Spencer. Work is under way between Winesap, Va., and Sycamore, and grading is about finished between Durmid, Va., and Sycamore, 30 miles. This part of the line is expected to be put in operation about the first of the year. Between Winesap and Durmid, including a line through the city of Lynchburg, 6.9 miles, the work is heavy and includes a tunnel 1,300 ft. long. Grading has been finished on 2.26 miles near Galveston, Va. Second track work between Peyton, Ga., and Austell, 21.6 miles, has been finished with the exception of a bridge over the Chattahoochee river.

On the Knoxville division during the year double track has been laid from Knoxville, Tenn., to Mascot, 12.25 miles, and from Jefferson City, Tenn., to New Line, 10.32 miles. Work is nearing completion on the section between Mascot and Jefferson City, 14.3 miles, this included a new double-track bridge over the Holston river, and it is expected to have the entire line between Knoxville and New Line in operation this year. Grading work is almost finished for a second track between Asheville, N. C., and Craggy, 4.4 miles. A new concrete viaduct has been built over the French Broad river on this section. At the close of the year about half the double-track work between Ooltewah Junction, Tenn., and Cleveland, 13.75 miles, was finished. In addition the company is building under the name of the Carolina & Tennessee Southern, a line from Bushnell, N. C., west along the northern bank of the Little Tennessee river to the North Carolina-Tennessee state line, 26 miles. On this grading is finished from Bushnell for 15.4 miles. From the state line the company is further extending this line under the name of the Tennessee & Carolina Southern to Maryville, Tenn., 38.8 miles, on the latter grading has been finished for 37.4 miles. On the completion of this work, the company will have a continuous line from Bushnell, N. C., west to Maryville, Tenn., 64.8 miles, with maximum grades of half of 1 per cent.

The Ensley Southern is being extended from its present terminus at Short Creek, Ala., northwest to Coal Creek, 3.39 miles; about half of the track has been laid. A spur is also being built to Coal Creek, 1.47 miles.

During the year work has been continued on the Memphis & Chattanooga from Chattanooga, Tenn., crossing the Tennessee river at the Narrows, thence through the valley of the Tennessee to a connection with the Memphis division at Stevenson, Ala., 42 miles. Grading and masonry work on the line from a point on the belt line near Chattanooga to the east portal of Lookout mountain tunnel is about 90 per cent. finished. The double-track tunnel through Lookout mountain, 3,500 ft. long, is about finished, only the arching near the portals remaining to be done. Both approaches for the Raccoon mountain tunnel are finished and tunnel excavation is under way. About 25 per cent. of the grading from Raccoon mountain to the Tennessee river crossing is finished. From this point to the state line all the grading and masonry, including the crossing at Battle creek, Sequatchi river and Tennessee river, are finished and 1.3 miles of track have been laid from South Pittsburgh, Tenn. The bridge over Valley creek is in place and the other structures for Sequatchi river and Tennessee river crossing are on the ground ready for erection.

Construction of the Jasper-French Lick Extension from Jasper, Ind., northeast to French Lick, 24.7 miles, including a tunnel 2,000 ft. long, is nearing completion, and it is expected to put the line in operation next month.

The extension of the Okolona-Big Creek in Mississippi from Vardaman, Miss., to Calhoun, 8.2 miles, was put in operation last December.

Southern Pacific.—It is said that a line will be built from Lake Arthur, La., to Gueydam, 10 miles, which will give the road a shorter line to New Orleans than its present route. A bridge will be built over Nementou river. The shortening of the line is decided on because of the early opening of the Colorado Southern, New Orleans & Pacific's line from Houston, Tex., to New Orleans, which will compete with the Southern Pacific.

The California Northeastern, under construction from Weed, Cal., north to Klamath Falls, is now in operation from Weed north for 40 miles, and about the first of next month will be finished to Dorris, 63 miles. Beyond this point a tunnel which is now being bored will delay the completion of the line to Klamath Falls until next spring.

Tennessee & Carolina Southern.—See Southern.

Texas & Gulf.—See Gulf, Colorado & Santa Fe.

Texas & Pacific.—The Opelousas, Gulf & Northeastern began running passenger trains over its line October 2 from Melville, La., southwest to Crowley, 60 miles. (Sept. 13, p. 368.)

Twin City & Lake Superior (Electric).—This company, which is building a third rail protected line from St. Paul, Minn., to Superior Wis., 125 miles, air line, has graded over 30 miles, and will finish the first section of 49 miles about the first of November. It is expected that the whole line will be in operation by July 1, 1909.

Washington, Baltimore & Annapolis (Electric).—This company, building a high-speed electric line from Washington, D. C., northeast to Baltimore, 33 miles, has grading about finished and track laid for 75 per cent. of the way. The line is double-tracked throughout and has easy grades. The work includes a steel viaduct about half a mile long over the Patapsco river entering Baltimore.

When this work is finished on the main line, the company proposes to electrify the Annapolis, Washington & Baltimore, which it owns, from a junction with its main line at Academy Junction east to Annapolis, 14 miles, and will operate this line as its Annapolis branch. The line extends also west from Academy Junction to Annapolis Junction, on the Baltimore & Ohio, six miles. The Washington, Berwyn & Laurel (Electric), in operation from Washington via Hyattsville to Laurel, Md., 16 miles, also owned by this company, is to be reached by building a connecting line from Annapolis Junction to Laurel, about four miles.

Washington, Berwyn & Laurel (Electric).—See Washington, Baltimore & Annapolis.

Yankton, Wichita & Houston.—Surveys are reported being made by this company from Maple City, Kan., south through Oklahoma for 300 miles. The company proposes to build a line from Yankton, S. Dak., south to the gulf of Mexico. Fremont Hill, President, Cincinnati, Ohio.

RAILROAD CORPORATION NEWS.

Baltimore & Ohio.—See Chicago Terminal Transfer.

Boston & Maine.—See Maine Central.

Chicago & Milwaukee Electric.—A. C. Frost & Co., Chicago, are offering a block of the authorized Wisconsin division first mortgage, 5 per cent. bonds. The division runs from Lake Bluff to Milwaukee, 110 miles, and is to be opened for traffic by November 15.

Chicago, Burlington & Quincy.—See Chicago Terminal Transfer.

Chicago, Milwaukee & St. Paul.—Judge Smith McPherson in the federal court sitting at Kansas City, Mo., has granted a temporary injunction restraining the Secretary of State of Missouri from trying to forfeit the St. Paul's charter, which step was threatened under a recent Missouri law forbidding railroads from transferring to federal courts damage suits filed against them in state courts.

Chicago Terminal Transfer.—The annual meeting has been postponed until January 15. It is understood that the Baltimore & Ohio interests have reached an understanding with the Burlington interests according to which the latter will abandon suits attacking the Baltimore & Ohio ownership of the property, and the Baltimore & Ohio will buy the preferred stock held by minority holders and admit the Burlington as a tenant.

Cincinnati, Hamilton & Dayton.—Gross earnings for the year ended June 30, 1907, were $8,946,000, an increase of $548,000; net earnings, $1,885,000, an increase of $398,000. The deficit after charges was $861,000, which compares with a deficit of $1,148,000 at the end of the previous year.

Coal & Coke.—This company, which has $10,000,000 common stock, has created an issue of $10,000,000 preferred stock. The road runs from Leiter, W. Va., to Charlestown, 198 miles, with branches, and the company also owns 100,000 acres of coal lands. There are $9,268,000 5 per cent. first mortgage bonds of 1919 outstanding, and the increase in capital stock is understood to be in connection with a proposed reduction of the bonded debt to $5,000,000.

Council City & Solomon River.—J. B. Godney has been appointed Receiver of this road, which has built 35 miles of road from Penelope Creek, Alaska, to Dickson, and is projected to Candle, Seward Peninsula, 65 miles farther. There is outstanding $895,460 capital stock and $347,000 6 per cent. bonds due May 1, 1908. The receivership proceedings were brought by officers of the company. It is said that the road can only be operated from the first of June to the middle of October because of heavy snow the rest of the year.

Detroit United Railway.—This company has passed its quarterly dividend of 1¼ per cent. on the $12,500,000 capital stock. A large part of the surplus was used for new equipment and improvements, because in the present money market securities to pay for these could not be advantageously issued. The annual rate has been 5 per cent. since August, 1905, and for four years before that it was 4 per cent.

Great Northern.—Estimated gross earnings of the lines directly operated, for the fiscal year ended June 30, 1907, were $50,018,000, an increase of $3,788,000; net earnings, after taxes, $18,563,000, a decrease of $2,958,000. Other income was $3,415,000, an increase of $1,213,000. Charges decreased slightly and the appropriations for improvements and equipment amounted to $4,935,000, a decrease of $196,000. The balance available for dividends was $12,963,000, equal to 8.6 per cent. on the capital stock. This balance is $1,522,000 less than in the previous year. The balance before the above deduction for improvements, etc., amounts to 11.9 per cent. on the capital stock. The surplus for the year was $2,156,000, a decrease of $3,029,000.

Gulf Line Railway.—This company, which operates a road from Hawkinsville, Ga., to Bridgeboro, 77 miles, of which 14 miles are leased with option of purchase, has asked permission to issue $325,000 5 per cent. first mortgage bonds. (May 31, p. 760.)

Illinois Central.—The annual meeting began on October 17, but it was expected that no business would be transacted for some time, because of the time needed for counting proxies. A committee consisting of L. C. Fritch, Assistant to the President; C. E. Wenman, formerly Assistant Secretary, and E. S. Conway, was appointed to sort the proxies. Stuyvesant Fish has secured an injunction restraining the Harriman interests from voting 286,731 shares owned by the Union Pacific, the Railroad Securities Company and the Mutual Life Insurance Company, on the ground that it is against the law of Illinois to have its roads managed by outside corporations. The injunction only restrains the voting of these shares in case the Harriman interests have not got a majority without them. If they prove necessary to Harriman control, the meeting is to be adjourned to December to give these interests time to show cause for removing the injunction.

Maine Central.—A quarterly dividend of 2 per cent. was paid on October 1 on the $4,918,000 stock. The annual rate has been 7 per cent. for the last four years and before that it was 6 per cent. Over half of the stock is owned by the Boston & Maine.

Mexican Central.—President Diaz of Mexico, in his recent message to Congress, announced that the proposed merger of the Mexican Central with the National Railroad of Mexico is being held up pending an improvement in the money market.

National Railroad of Mexico.—See Mexican Central.

Pacific Traction Company.—This company, which was recently incorporated in Maine and has acquired franchises and street railroads in Tacoma, Wash., has made a first mortgage to the Bankers' Trust Company of New York as trustee, securing an issue of $2,000,000 5 per cent. 20-year bonds of July 1, 1907. It intends to acquire other franchises and to build street railways in Tacoma and Olympia, as well as a connecting line between those cities.

Pennsylvania Company.—Kuhn, Loeb & Co., New York, announce that they will buy at once at par and interest all or any part of $10,000,000 of the $50,000,000 Pennsylvania Company's 4½ per cent. collateral trust improvement notes, due November 1, 1907.

St. Louis & San Francisco.—Francis, Bro. & Co., St. Louis, are offering at a price to yield 6 per cent. $340,000 of an authorized issue of $359,000 5 per cent. equipment notes, dated March 1, 1907, and maturing as follows: $19,000 on March 1, 1908, semi-annual instalment of $18,000 each from September 1, 1908, to September 1, 1915, inclusive, and semi-annual instalments of $17,000 each from that date to and including March 1, 1917. One instalment of $19,000 was paid on September 1, 1907. The notes are secured on 250 gondola cars and 150 Hart convertible cars bought from the American Car & Foundry Company, which endorses the notes.

Southern.—The average mileage operated in the fiscal year ended June 30, 1907, was 7,547 miles, an increase of 173 miles. Gross earnings were $56,657,994, an increase of $3,016,556; net earnings $11,958,712, a decrease of $1,909,587. Interest and rentals increased from $9,853,358 to $11,265,616. Only $1,500,000 out of earnings for the year was paid in dividends on preferred stock, the usual semi-annual dividend due October 1, 1907, having been passed. There was appropriated for improvements, betterments and charges not to be capitalized, $536,334, which is $463,493 less than in the preceding year. The surplus for the year was $253,987, a decrease of $975,252. Out of accumulated surplus a dividend of 1½ per cent., or $900,000, on the preferred stock was declared, payable October 17, 1907.

Stephenville North & South Texas.—This company has registered with the Secretary of State of Texas $322,000 first mortgage, 5 per cent. 40-year bonds secured on 20 miles of completed road in operation from Hamilton, Tex., north. The road is under construction to Stephenville, 24 miles farther.

Toledo Railways & Light.—The President has sent a circular letter to stockholders announcing that the directors favor passing the semi-annual dividend of 1 per cent. on the $12,000,000 capital stock due November 1. The surplus was more than enough to meet this payment, but much has been spent for improvements chargeable to capital account because of the unfavorable market for issuing securities for this purpose.

THE CHICAGO, ROCK ISLAND AND PACIFIC RAILWAY COMPANY—TWENTY-SEVENTH ANNUAL REPORT.

To the Stockholders

The Board of Directors herewith submit their report of the operations and affairs of the Rock Island Lines for the fiscal year ended June 30, 1907.

The results of the operations for the year were as follows:

Gross earnings (increase $9,000,561.86, or 17.6 per cent.)	$60,238,419.01	
Operating expenses (increase $5,977,083.47, or 17.0 per cent.)	41,044,142.00	
Net earnings (increase $3,023,478.39, or 18.7 per cent.)		$19,194,277.01
Other income		745,181.71
Total income		$19,939,459.62
Taxes	$1,676,038.31	
Interest	8,279,300.02	
Rentals	1,233,604.22	11,188,942.55
Net income, after providing for all charges, being 11.6 per cent. on capital stock ($75,000,000.00)		$8,750,517.07
Dividends paid (5½ per cent. on capital stock)		4,116,728.00
Surplus for the year (increase $2,525,509.53)		$4,633,789.07

The increase in gross earnings was disposed of as follows:

Increase in expenditures for maintenance of the property (road and equipment)	$1,974,568.87
Increase in cost of movement and administration	4,002,514.60
Leaving in net earnings (33.5 per cent. of gross increase)	3,023,478.39
Total increase in gross earnings	$9,000,561.86

The property of the St. Louis, Kansas City & Colorado Railroad Company was taken over for operation on October 1, 1906. The greater portion of the cost thereof was carried last year in the general balance sheet as advances for construction and equipment.

The capital stock of the Chicago, Rock Island & Pacific Railway Company outstanding at the close of the previous fiscal year was $74,847,600, and has since been increased by the issue of $6,500 in exchange for a like amount of capital stock of the Burlington, Cedar Rapids & Northern Railway Company.

The amount of capital stock shown on general balance sheet as outstanding June 30, 1907, represents:

Capital stock of the Chicago, Rock Island & Pacific Railway Company, issued and outstanding	$74,854,100.00
Capital stock of the Burlington, Cedar Rapids & Northern Railway Company and Rock Island & Peoria Railway Company outstanding, for the purpose of taking up which there is reserved a like amount of the capital stock of the Chicago, Rock Island & Pacific Railway Company	145,900.00
Total authorized capital stock of the Chicago, Rock Island & Pacific Railway Company	$75,000,000.00

Of the outstanding capital stock of the Burlington, Cedar Rapids & Northern Railway Company, $5,000 is in the treasury of your company.

During the year the funded debt increased $15,880,000.

The cost of property and franchises increased $18,180,162.06. There were also expended $4,375,221.38 for additions and improvements.

The line Fordyce to Crossett, Ark., 56.85 miles, was put in operation February 1, 1907, and the line Tinsman to Eldorado, Ark., 35.81 miles, on June 23, 1907. These two lines compose what was reported a year ago as the uncompleted portion of the Little Rock & Southern Railroad, now a part of the Rock Island, Arkansas & Louisiana Railroad. That road is laid with 60-lb. steel rail and is ballasted with gravel. Standard Rock Island buildings and bridges, including a first-class brick depot at Fordyce, Ark., have been erected.

Trackage rights have been obtained over the rails of the Louisiana & Arkansas Railway Company and the Louisiana Railway & Navigation Company, to carry the line to Alexandria, La., and it is expected that the line from Alexandria to Eunice, La., will be operated in October, 1907. At this latter point connection will be made with the Colorado Southern, New Orleans & Pacific Railroad (Frisco), from Houston, Tex., to New Orleans, La., establishing a new through route of importance to the Rock Island Lines.

The earnings, operating expenses, taxes, interest, etc., of the operated portion of the Rock Island, Arkansas & Louisiana lines were included in the accounts of your company.

GENERAL.

The records of the industrial department show that there have been located along the Rock Island Lines during the year 327 new enterprises, at an estimated cost of about $8,500,000. These new enterprises are scheduled to employ over 8,000 persons.

During the past year your company built or made additions to 58 tracks to private industries, and four side tracks to coal mines.

During the fiscal year 109 locomotives, 95 passenger train cars (including one passenger motor car), 6,847 freight train cars, one derrick car and two other road service cars were received and placed in service.

The work of installing automatic block signals has been pushed, as will be attested by the expenditure of $220,509.58, for new and additional signal and interlocking plants. The greater portion of this amount was for the installation of automatic block signal apparatus.

To meet the growing demands of increased traffic, $4,089,934.18 have been expended for additional and improved terminals at various points.

The new freight depots and yards constructed in St. Louis by the Rock Island-Frisco Terminal Railway Company, were put in operation March 1, 1907. The money was provided jointly by this company and the St. Louis & San Francisco Railroad Company, each company receiving securities of the terminal company in reimbursement of its advances.

$3,000,000 of 5 per cent bonds have been issued by the terminal company and guaranteed jointly by this company and the St. Louis & San Francisco Railroad Company, the unexpended balance of which is reserved for further additions and improvements.

Joint use of these terminals has been granted to the Chicago & Eastern Illinois Railroad Company.

The transfer yard of the Iowa Transfer Railway Company at Des Moines, Ia., referred to in the last annual report, has been completed and is being operated. The total amount advanced by your company as its portion of the cost of this transfer yard was $6,200, for which was received 62 shares, par value $6,200, being one fifth of the capital stock of the Iowa Transfer Railway Company.

The Peoria Railway Terminal Company, a new corporation, with a capital stock of $1,000,000 par value, has acquired all of the property of the Peoria & Pekin Terminal Railway Company, one half of whose capital stock was owned by your company at the date of rendering the last annual report. In exchange for such capital stock your company has received one half of the capital stock of the Peoria Railway Terminal Company, and the latter company is now operating the property.

Trackage rights were acquired and trains of the Chicago, Rock Island & Gulf Railway Company have been operated since July 1, 1906, over the Ft. Worth & Denver City Railway Company from Amarillo, Tex., to Dalhart, Tex., 82.06 miles. Your company has acquired similar rights and has operated its trains since November 25, 1906, over the line of the St. Louis & San Francisco Railroad Company from Wichita, Kan., to Medora, Kan., 48.07 miles.

During the year your company has advanced on account of the Trinity & Brazos Valley Railway Company, for construction and equipment of that line, $97,415.50, and on account of construction of important terminals at Galveston, Tex., $98,016.66.

Legislation by the various states which your lines serve, respecting rates and operating methods of railroads, has been excessive in quantity and severe in character. The legislatures of five such states have passed laws establishing two cents a mile as the maximum rate of passenger fare, and other laws have been passed by the several states calling for serious reductions in freight rates. Doubtless a large part of this legislation has been due to misconception of the actual conditions. At every opportunity it is the policy of the officers of your company to endeavor to establish better relations with the people of the various states, and to impress upon them the fact that the progress of the section of the country traversed by your road, and the continued prosperity thereof, require candid co-operation between the railroads and the other business interests. The aim of all must be to promote the welfare of the country, and it is to be hoped that when the situation is thoroughly understood, a spirit of mutual co-operation will be the result.

A complete inventory of material, fuel and supplies was taken April 30, 1907, and the necessary adjustment of the accounts made.

The accounts of your company at the close of the fiscal year were examined by Mr. Stephen Little.

It is a pleasure to acknowledge the hearty and necessary co-operation of officers and employees.

By order of the Board of Directors,

B. L. WINCHELL,
President.

Grand total liabilities (including provisional accounts)	$298,850,717.54	$277,538,733.68	$21,311,983.86
Profit and loss	$19,123,124.11	$17,202,469.38	$1,920,654.73
Total	$317,973,841.65	$294,741,203.06	$23,232,638.59

NOTE.—In stating the assets and liabilities of the companies forming the Rock Island Lines, the holding of the Chicago, Rock Island & Pacific Railway Company in the bonds and capital stock of the auxiliary lines, together with loans between the various companies, have been eliminated from the liabilities and a like reduction made in the book value of the assets; the figures shown, therefore, represent the book value of the assets and the liabilities without duplication.

The classification of some of the items in the general balance sheet has been changed during the past year. To preserve comparisons the figures for last year have been restated to agree with the classification of the 1907 figures, hence, the 1906 figures do not agree in every detail with those published in the annual report for the previous year.

ST. LOUIS AND SAN FRANCISCO RAILROAD COMPANY—ELEVENTH ANNUAL REPORT.

To the Stockholders:

The Board of Directors herewith submit their report of the operations and affairs of the St. Louis & San Francisco Railroad Company's Lines (exclusive of the Chicago & Eastern Illinois Railroad) for the fiscal year ended June 30, 1907.

The results of operation for the fiscal year were as follows:

Gross earnings	$38,621,067.51	
(Increase, $6,574,410.95, or 20.5 per cent.)		
Operating expenses	24,872,579.36	
(Increase, $4,327,046.24, or 21.1 per cent.)		
Net earnings (Inc. $2,247,364.71, or 19.5 per cent.)		$13,748,488.15
Other income		1,540,866.55
Total income		$15,289,354.70
Taxes	$896,958.13	
Interest, rentals and other fixed charges	10,233,813.28	
		11,130,771.41
Net income after providing for all charges*		$4,158,583.29
Dividends paid: 1 per cent. on first preferred stock		199,742.12
Balance of surplus carried to profit and loss		$3,958,841.17
(Increase, $2,169,447.66.)		

*Being equal to 4 per cent. on the first and second preferred stock ($21,000,000) and 11.41 per cent. on the common stock ($29,000,000).

There was a slight decrease in the mileage operated during the fiscal year, as compared with the previous year, caused by a remeasurement of line and the taking up of small sections of useless track.

The average mileage operated during the year was 5,061.72 miles, as compared with 5,068.92 for the preceding year, being a decrease of 7.20 miles.

The total main track mileage operated at June 30, 1907, was 5,064.16 miles.

The capital stock of the company outstanding at the end of the fiscal year was $50,000,000, being the same as in the preceding year, and is composed of:

$5,000,000 first preferred.
16,000,000 second preferred.
29,000,000 common.

The total funded debt at June 30, 1906, including that of leased and auxiliary lines was		$167,440,148.59
The net increase during the fiscal year was		10,080,153.61
Making the total funded debt at June 30, 1907		$177,520,302.20
The total amount of equipment bonds and notes outstanding at June 30, 1906, was		$8,078,629.97
The net increase during the fiscal year was		4,371,859.82
Making the total amount of equipment bonds and notes outstanding at June 30, 1907		$12,450,489.79

A comparison of the assets and liabilities of the company, and its leased and auxiliary lines, at June 30, 1907, with the figures of the preceding year, is shown on the comparative condensed balance sheet on pages 16 and 17.

The increase in the franchises and property accounts, including those of the leased and auxiliary lines, for the fiscal year was $8,214,792.31.

[illegible] expenditures were made during the fiscal year for additions and improvements to the property and to the equipment.

The various classes of rolling stock acquired are shown on statement, pages 41 and 42, and in addition thereto contracts were placed for 70 freight, 10 passenger and 10 switch locomotives, 87 passenger train cars and 5,255 freight cars, but deliveries of same could not be obtained until the last half of the calendar year 1907.

Contract has been let for the construction of new car and engine shops at Springfield, Mo., to be completed by February 1, 1908, at a cost of approximately $1,[illegible].

A new union passenger station at Birmingham, Ala., was constructed during the year jointly by the lines centering at that point, and this company in conjunction with all the other lines interested has guaranteed the bonds issued covering the cost thereof. The interest charge is to be apportioned between the lines using the terminals on the basis of cars handled.

The station, though not quite completed, was put in operation at July 1, 1907, and 4 per cent. bonds to the amount of $1,190,000 had then been issued in payment of the property, one-sixth thereof, or $198,333.33 being the amount guaranteed by this company.

The new freight depots and yards constructed in North St. Louis by the Rock Island-Frisco Terminal Railway Company were put in operation March 1, 1907. The money was provided jointly by this company and the Chicago, Rock Island & Pacific Railway Company, each company receiving securities of the terminal company in reimbursement of its advances.

$3,000,000 of 5 per cent. bonds have been issued by the terminal company and guaranteed jointly by this company and the Chicago, Rock Island & Pacific Railway Company, the unexpended balance of which is reserved for further additions and improvements.

Joint use of these terminals has been granted to the Chicago & Eastern Illinois Railroad Company.

The company has acquired, through the proceeds of its $7,500,000 five-year, 5 per cent. collateral trust gold notes, dated January 1, 1906, all the capital stock (except Directors' shares), and all the bonds of Colorado Southern, New Orleans & Pacific Railroad Company. The property of the last named company has been leased to this company for the period of 999 years from April 30, 1907. Through the ownership by Colorado Southern, New Orleans & Pacific Railroad Company of all the stock (except Directors' shares), of the Orange & Northwestern Railroad Company and of the Beaumont, Sour Lake & Western Railway Company, a through line will be in operation from Houston to Baton Rouge upon the completion of construction work now in progress (see page 74). From Baton Rouge to New Orleans the trains of your company will be operated into New Orleans under a trackage agreement with the Illinois Central Railroad Company and Yazoo & Mississippi Valley Railroad Company.

The increase in the tonnage carried during the fiscal year was 2,305,162 tons, or 16.64 per cent., and the increase in number of passengers carried was 1,194,353, of 19 per cent.

The earnings from operation per mile of road for the fiscal year were $7,630.03, an increase over the preceding year of $1,307.84, or 17 per cent., and is the largest revenue per mile of road earned by the company in any year.

The percentage of all fixed charges and taxes to net income for the fiscal year was 72.8 per cent., as compared with 82.4 per cent. for the preceding year, and 93.3 per cent. for the year 1905. This shows a healthy growth in the financial strength of the company.

The industrial department has reported that 338 new industrial plants, employing over 12,000 men, and costing approximately $9,000,000, have been located on the tracks of the Frisco lines during the fiscal year.

It is encouraging to note this expansion of industrial development going on in the territory tributary to the company's lines, as it insures, to a large extent, a continued increase in both freight and passenger traffic.

The crops for the current year in the territory tributary to the company's lines are about normal.

The net receipts from land sales and royalties for the fiscal year were:

St. Louis & San Francisco R. R.	$371.46	
Kansas City, Fort Scott & Memphis Ry.	24,929.97	
		$25,301.43

This amount was credited to other income in the income account for the year.

The usual statements showing the income and profit and loss accounts, condensed balance sheet and statistical exhibits, are appended to this report and show the results of the operation of both properties and their financial condition at the end of the fiscal year.

The books and accounts of the company at the close of the fiscal year were examined by Mr. Stephen Little.

Acknowledgment of the faithful and efficient services rendered by officers and employees during the year is here made.

By order of the Board of Directors. A. J. DAVIDSON, *President.*

NOTE.—In stating the assets and liabilities of the companies covered by this report, for the current fiscal year, the holdings of the St. Louis & San Francisco R.R. Co., in the bonds and capital stocks of leased and auxiliary lines have been eliminated, and for the purpose of comparison similar changes have been made in the 1906 figures.

*Decrease.

†$566,304 of this amount was included in "Funded debt" of the K. C., Ft. S. & M. Ry. Co., in the June 30, 1906, report and the remainder, or $2,720,000, in "Equipment notes outstanding."

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

Published Every Friday by The Railroad Gazette at 83 Fulton Street, New York
Branch Offices at 375 Old Colony Building, Chicago, and Queen Anne's Chambers, Westminster, London

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. We give in our editorial columns OUR OWN opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.

CONTENTS

VOL. XLIII., No. 17. FRIDAY, OCTOBER 25, 1907.

The annual report of the Treasurer of Yale University just published repeats the story of the bed-rock value of non-speculative railroad securities in the face of and in contrast with any shrinkage of prices in Wall street. The report is very instructive as showing the nature and results of railroad investments very conservative in nature and, at the same time, very varied as to railroad properties and their location. Out of some 200 separate Yale investments in bonds of all classes 138 are in railroads and street railways; and out of 69 stock investments 38 are in railroads. Of the 174 railroad and street railway investments of the two classes, bonds and stocks, practically none are in default as to either interest or dividends. Other features of the report supply evidence in the same line. Out of 269 stock and bond investments of all kinds 174, or nearly 65 per cent., are in railroad and railway stocks and bonds. The subgroups are not given separately, but the whole group returns 4.82 per cent. income on book value, the bonds, of which 69 per cent. are railroad and railway bonds returning 4.77 per cent. Again the Yale Treasurer refers to his present investment policy as specifically including "railroad bonds and short time notes" and the railroad bonds held rise from $2,118,384 in the fiscal year 1905-6 to $2,658,723 at the end of the past fiscal year, or an increase of more than 25 per cent. Yet again, the shrinkage for the fiscal year ending June 30, 1907, is returned by the Yale Treasurer at about 4½ per cent. on the whole group of 269 investments so largely composed of railroad stocks and bonds. There has, of course, been an added contraction since last June, but it can be reckoned at more than equalling the previous contraction and still leave a good relative showing for the conservative railroad investments of a great educational institution in such a period of great market value shrinkage as the present one. The non-default of interest and dividend payments on the 269 Yale investments certifies another familiar fact in terms of high magnitude. It is anomalous that vast shrinkage of capital nowadays should leave incomes unimpaired just as it is anomalous that so few failures should follow in its wake. But both anomalies are cheering and they can hardly persist much longer without bridging the gap completely between the low ebb of railroad values and the upward turn of the fiscal tide.

The paper on Failures of Steel Tires, by George L. Norris, chemist of the Standard Steel Works, read at the October meeting of the Western Railway Club, which is reprinted with illustrations in this issue, is an interesting and exhaustive study of the causes of failures of steel tires in service. Failures due to inherent defects in the steel from which the tires are made are comparatively few at the present time because of the great advance in the art of special steel making in recent years. Mr. Norris gives in his paper only passing mention of the method of making the blooms from which the tires are rolled, as practiced at the works with which he is connected. As a supplement to the information and photographs contained in his paper as presented, we have incorporated in the article as Figs. 5, 6 and 7, three photographs showing typical fractures obtained in cutting the blooms from the long octagonal ingots into which the molten steel is cast. In order to produce such perfect ingots, the greatest care is exercised in every stage of the process, starting with the melting of the metal in the furnace. Round-end octagonal ingot moulds are used and the ingots are cast from the bottom with the large end up. This allows free escape of the gases. The shape of the ingots and the bottom pouring prevent the formation of fins at the bottom and shrinkage cracks through the body of the metal. These cracks if present would open up during the process of upsetting the bloom under the press preparatory to rolling the tires. In addition to these precautions the ingot moulds are thoroughly heated before pouring to prevent sudden chilling of the molten metal. This assists greatly in getting rid of the usual honey-combing around the edges of the ingot. The ingots, when cold, are made into blooms by cutting partially through with a tool in a lathe and then breaking the remaining metal by driving a wedge in the tool groove. The top is discarded and the remaining portion of the ingot is cut up into from four to six blooms, depending on the size of tire. The three photographs show the uniformly perfect fractures obtained. The metal is free from honey-combing around the edge or blow holes scattered through the interior of the metal. The central pipe shown in the two left-hand sections of Fig. 6 and any excessive segregation is usually entirely cut off with the top discard. Where a small pipe extends into the center of the second piece it is got rid of by punching out the center during the process of manufacture of the tires.

The annual meeting of the Railway Signal Association, reported last week, marks real progress, though the discussions at the convention brought out very little that was new. The principal feature of the meeting, "Exhibit No. 1," of the report made by the special committee, is itself anything but new in its substance; but it is important in what it represents. In deciding to reduce the

number of essential signal indications to sixteen (Numbers 1—3; 5—16, and "C") the committee has done a valuable service; and this service has been done by such competent men, by means of such a thorough discussion in committee, that the report will stand as a permanent landmark. Opposers may succeed in delaying the adoption of the improved practice called for by the report, but the reasonableness of the committee's scheme cannot be controverted. Railroad signaling in America has suffered greatly from a diversity in appliances (and, to a lesser degree, in practice), which probably is inevitable in so large a country; and it is the existence of this diversity, with the need of reducing it, that gives importance to this report. Without resolute action, by a united association, in support of this committee, the notion that there ought to be 30 or 40 signal indications is likely to spread, and to receive support. We do not discuss Exhibit No. 1, for to do so would require several columns of space. The adoption of each item was the result of the most thorough sifting of all possible considerations, and all this will be explained in the circular accompanying the letter ballot. Indeed, the success of the committee's action will depend in large measure on the letter ballot; for to secure the triumph which the report deserves there should be a large, intelligent and enthusiastic vote in both the Railway Signal Association and the American Railway Association; and this will not be possible without a full, detailed and clear explanation of the committee's action, so well prepared that no lukewarm or ill-informed member can miss the point. This point is the necessity of simplifying and making uniform American railroad signaling, and of abolishing all its bad practices. The present report tells definitely what service the railroads want (or should want) their signals to perform. If all or a good majority will promptly agree on this matter, the committee will then proceed to tell how to arrange the signals so as best to fill the want. This was tentatively done in the report made a year ago, but the railroad public was not then educated to the point either of accepting the report or intelligently rejecting it. Now, with the present report, the subject can be taken up again, with more promise of progress.

In its statement of the "Basis of System," on the first page of the report, this committee has distinctly cleared the air. Every signal engineer should study every line of these half dozen paragraphs, if not for the correction of errors in his own mind, for the strengthening of his power to denounce error in others. For the reason given above, we do not here discuss the whole of the report; but this point, and the recognition of the single switch light, under "Explanation of Action," deserve special mention. Having set out to prescribe a perfectly consistent system, the members of the committee were under strong temptation, no doubt, to contrive something new, or at least, different, for the indication at an isolated switch; but they dared to be (superficially) inconsistent, thus promoting simplicity and economy. It is to be hoped that next year, in their recommendations, they will go further and prescribe for such switches a simple and rational target—say one of the simplest and most old-fashioned of those described in the *Railroad Gazette*, January 12, 1906—and also a limit for the height of both target and light. Switch lights can be sufficiently differentiated from semaphore lights by height alone.—The action of the Milwaukee meeting in spending a whole day on a code of specifications has once more shown how profitless it is to try to do committee work in such a large meeting. If a committee makes a poor report on such a subject—detailed specifications—the only remedy is to get a better committee, and wait another year. But in this case it was not a poor report. Many items were unacceptable to some of the members, and very likely justly so; but it is not the function of a new set of specifications to prescribe exactly what a certain engineer will desire to say in a certain place or on a certain branch of his subject. The most that a committee can do is to prescribe a form, taking care to mention every point that any user is liable to desire to insert in a contract, and in disputed or doubtful matters to draft such a paragraph as a majority will want. If the committee cannot make a satisfactory guess concerning the wishes of the majority it can give alternative readings, or it can leave blanks. To use blank spaces would be the only way to satisfy some of the critics who spoke at Milwaukee; and probably that is the method that the committee will adopt in making some of its corrections; but it is to be borne in mind that a blank but poorly fulfils its function unless the committee tells very fully just what it believes ought to be put into the blank space. A main object in this work is uniformity, and every blank space offers a chance for unnecessary (as well as necessary) diversity. The true course with new specifications which are accused of being crude is that which has been taken by this Association with the insulated wire code—use temporarily the best that can be had, and keep a committee on the watch to introduce improvements when practicable.

RAIL CORRUGATIONS.

For a number of years a great deal of trouble has been experienced by street railway companies, from the corrugating of the upper face of the rail head. Innumerable theories have been advanced to account for this peculiarity, but very little in the way of real investigation has been done. Corrugating is not a peculiarity of street roads, for it is to be found on some steam lines, and has been particularly troublesome in India, but it is upon these street roads that it occurs to the greatest extent and has attracted the most attention. In fact, it has become, in some cases, a very serious item of expense. Much of the trouble has been attributed to the condition of the metal forming the rail, but there does not seem to be one atom of evidence to prove that the metal of the rail itself, or the method of its manipulation at the mill, has anything whatever to do with it. At the recent meeting of the American Street & Interurban Railway Engineering Association, held at Atlantic City, a report was rendered by a committee appointed to look into the subject of rail corrugations, in which the trouble is attributed to a vibration set up by the loading of the rail, and remedies are suggested which are claimed to have been effective. The report gives, in detail, the answers to the questions that were issued as a circular, and then the conclusions are drawn on the basis that the primary cause of corrugations is vibration, either in the rails or in the entire track structure. So that they may arise from any one of four causes: the vibration or lateral bending of the web of the rail itself; the rails being loose on their supports; the ties being loose on their foundations and the vibration or movement of the foundations immediately under the track structure. Which one of these defects or conditions caused the corrugations, can be ascertained by an inspection of the head of the rail. Each condition produces corrugations of a different character, not only in length and form, but also with certain other peculiarities difficult of explanation without referring to a case in point.

The reason given why these corrugations do not appear on steam roads, if they are due to vibrations, is that the comparatively loose rail is forced ahead by the great weight of the locomotive in the well-known long wave, and that there is very little slipping of the wheels of the trailer cars. In cases where trouble has been experienced on foreign roads, it has been found that, in almost every case, the rails have been held in chairs or were provided with some form of a cushion, and the probability is that there is a slight movement between the rail and its supports.

In the cases of street rails that were reported to be free from corrugations and yet were very loose, it has been found that the corrugations really existed, but the distances between crowns, or the pitch was so great that they were not perceptible under the conditions of ordinary inspection.

By measuring the amount of bending or buckling in the web of the rail it has been found, in some cases, to be as much as $^3/_{32}$ in.

It has been noted by some roads that corrugations were appearing on rails laid on a concrete base, but in every case that has come to notice the rails had been temporarily supported by wooden ties, concrete being tamped under the base of the rail between the ties with no provision made for taking up the shrinkage, which always takes place during the settling and drying of the concrete.

In many cases where track is constructed in this manner the rails seldom have a continuous or uniform support, by reason of their not having anchorages or holding-down devices other than spikes in the ties, spaced at long intervals. This results in a slight movement of the rail on its foundation, and soon causes corrugations to appear, although quite frequently where light rail is used the trouble comes from the bending or buckling of the web of the rail, as noted above.

In concrete road-bed construction, it seems absolutely necessary to provide some means of drawing the rail down on its bed, thereby taking up the shrinkage and preventing any liability of the rail moving on its foundation. In this class of construction, vibration can be prevented only by providing a rail of the proper design and an absolutely uniform and continuous support.

When the trouble in tie construction is found to have been

caused by loose rails or ties, the only remedy is to grind or file the head of the rails, and to immediately follow this work by firmly securing the rails to the ties and by tamping, using a coarse gravel wherever the foundation is found to consist of soft or spongy material.

Corrugations in light rails, due to the bending of the thin web, are difficult to remedy without considerable expense, but after the heads have been filed to a comparatively smooth surface, it has been found that setting the track to a slightly wide gage will sometimes prevent a recurrence of the defect.

That there is something in this bending of the web of the rail to account for this corrugation is shown by the fact that about two years ago steps were taken to obviate the trouble by increasing the thickness of the web of the rails on one road to $\frac{9}{16}$ in. By this means the corrugation has been reduced on a system of 600 miles to a very small percentage. It is added in conclusion, that the price of this immunity is eternal vigilance, and the expenditure of considerable sums of money when any form of wooden support is used.

STILL BETTER BRAKES

A third terrible fatal derailment within a recent period, and caused by failure to check the speed of the train on a curving approach to a dangerous curve, has happened in England under circumstances which suggest some general lessons, both there and here, in the value of the quickest acting brakes.

In July, 1906, at Salisbury, a train at high speed was derailed on a sharp curve where the speed limit was 15 miles per hour, killing 28 persons. In September, 1906, at Grantham, a train at high speed was derailed on a sharp curve where the speed limit was 15 miles per hour, killing 14 persons. On October 15, 1907, at Shrewsbury, a train at high speed was derailed on a sharp curve where the speed limit was 10 miles per hour, killing 16 persons. In each case, either the vacuum brake failed to work at the critical time, or three persons, the driver, fireman and guard, failed to do their duty. One physical condition is alike in the three cases, namely: In nearing each of these three dangerous curves the driver normally begins to check from high speed while the train is passing through a curve.

It has been demonstrated and published that the older forms of vacuum brake ball-valve, still largely in use, are liable to erratic action. This is, in brief, the discovery that the ball can, under certain circumstances, be so displaced as to allow the air to be slowly admitted to the vacuum chamber above the piston, and thereby impair or lose the efficiency of the brake. The governing circumstances are that the train needs to be moving at high speed, and that the brakes be applied, and released, to slightly check speed while on a curve with sufficiently short radius so that centrifugal force prevents the return of the ball to its valve seat, and causes the brake to be temporarily inoperative. At Salisbury and Grantham the drivers and firemen were instantly killed and, lacking their evidence, we can only incline to the belief that these accidents were due to a dangerous form of brake valve. If no other explanation is found for the similar derailment at Shrewsbury it will be cumulative evidence of mechanical defect.

It seems to be clear that the original failure of the British companies, in the seventies, to adopt a standard, either compressed air or vacuum, for braking trains has so divided the business that there has been a lack of incentive to invention and application of improved brakes. In the vacuum brake, with the exception of an automatic feature, the improvements have been comparatively slight.

The history of the air brake in this country has been marked by four epochs, and we are now apparently entering on a fifth stage. There has been a successive adoption for passenger service of four distinct forms, each better than the other, and made standard as rapidly as the efficiency of the later form over that of its predecessor was adequately demonstrated. The fifth and the latest improvement gives an increased emergency efficiency of from 15 to 20 per cent. In connection with a supplemental air supply and a graduated release feature, it reduces to a minimum the existing small chance of brake failure due to incompetent handling. While this is not yet in the "adequately demonstrated" group to the extent that demands its wholesale adoption, nevertheless it has been applied to the electric equipment of the New York Central, Pennsylvania, Long Island and other roads and made standard on the Atchison. Judging by the past, it is sure to receive such consideration as its merits warrant, and this ready attitude is fully justified by a study of the results of accidents. In all the 159 principal accidents reported on by the Interstate Commerce Commission for the last year, brake efficiency was a marked factor, and in so far as the percentage of that efficiency can be increased there will be a lessening of the serious results.

Train Accidents in September.[1]

Our record of train accidents occurring on the railroads of the United States in September includes 18 collisions, 24 derailments and two boiler explosions, 44 accidents in all. This record is not published in full except in the cases of the few accidents which are especially prominent in the present instance six collisions and four derailments. The record of "ordinary" accidents—which term includes, for our present purpose, only those which result in fatal injury to a passenger or an employee or which are of special interest to operating officers—is given at the end in the shape of a one-line item for each accident, showing date, location, class, and number of deaths and injuries. In this tabular statement the italics indicate items which are explained in detail. This record is based on accounts published in local daily newspapers, except in the cases of accidents of such magnitude that it seems proper to send a letter of inquiry to the railroad manager.

The month of September had four train accidents which may be called of first magnitude: the collision at West Canaan, N. H., on the 16th; the derailment at Norris, Iowa, on the 6th; the collision near Bellaire, Ohio, on the 28th, and one at Tehachapi, Cal., on the 26th. The New Hampshire collision, due to an error in the train number in a despatcher's order, was reported in the *Railroad Gazette* of the 20th. The railroad commissioners of the state have investigated the case and they think that the weight of evidence is against the despatcher who, it is believed, put the cipher into the order, in place of the figure 4, which should have been put there, because a previous order relating to train No. 30 was before him when he was carrying out this operation. It does not appear that the commissioners unequivocally condemn the despatcher, though they exonerate Greeley, the station operator, from all blame. The only recommendation in the report is that the despatcher at Concord should not be required to go downstairs to deliver train orders, as he is liable to have to do during a few hours on Sunday morning.

The derailment at Norris, Iowa, on the 6th occurred nearly opposite the station. It caused the death of 13 passengers and the injury of six; one employee was killed and five injured. The passengers killed and injured were all in the smoker, which is said to have been a strong car, in first class condition. The passenger train was running at regular speed. A freight train was standing on the side track, and the trucks of the tender of the passenger engine, supposedly derailed several hundred feet west of the switch, when they struck the switch caused the passenger engine to turn over against the freight engine, badly damaging both. The mail car, baggage car and smoker were demolished. No defect was discovered in cars, engine or track, which would have caused the derailment.

In the collision near Bellaire, Ohio, on the 28th, six passengers, three employees and one other person were killed and 20 passengers and two employees were injured. In this collision, occurring at 2.40 p.m., an eastbound express train ran over a misplaced switch and collided with a freight train which was moving on the westbound main track. The engines of both trains were wrecked, and the smoking car was telescoped by the baggage car so that every seat was demolished. Every person in this car was either killed or injured. The collision is charged to the forgetfulness of a telegraph operator who had neglected to change the switch.

The collision near Tehachapi, Cal., on the 26th, caused the death of eight Greek laborers and the injury of 20, a work train being run into by a freight near the entrance to a tunnel. It is said that the comrades of the victims attacked the trainmen after the collision, so that a force of armed men was sent to protect the trainmen.

The collision at Dillard, Ore., on the night of the 12th was a case of a freight train entering a side track not under proper control. It collided with and damaged five work train cars occupied

[1] Abbreviations and marks used in Accident List:

rc.....Rear collision.
bc.....Butting collision.
xc.....Other collisions; as at crossings or in yards. Where only one train is mentioned, it is usually a case of a train running into a standing car or cars, or a collision due to a train breaking in two on a descending grade.
b.....Broken.
d.....Defective.
dr.....Defect of roadway.
eq.....Defect in car or engine.
n.....Negligence.
unf.....Unforeseen obstruction.
unx.....Unexplained.
derail.....Open derailing switch (negligence of engineman or signalman).
ms.....Misplaced switch.
acc. obst..Accidental obstruction.
malice....Malicious obstruction of track or misplacement of switch.
boiler.....Explosion of boiler of locomotive on road.
fire.....Cars burned while running.
Pass.....Passenger train.
Ft.....Freight train (includes empty, engines, work trains, etc.).
*Wreck wholly or partly destroyed by fire.
†One or more passengers killed.

by laborers, standing on the side track. Five laborers were killed and five seriously injured. Of the killed, three were burned to death, the wreck having taken fire immediately from stoves in the outfit cars upset by the collision.

The collision at Allington, Conn., on the 15th, resembles that which occurred at Pittsford, N. Y., in June, in that the engineman is said to have forgotten a regular train which runs only once a week. In this case it was a Sunday train; in the Pittsford case it was a train scheduled to run only two days in the week.

The collision at Devore, Cal., on the 21st, was due to a long freight train becoming uncontrollable while on a steep descending grade. It collided with an empty engine at the foot of the grade and the wreck was mostly destroyed by a fire which broke out immediately.

The derailment near Kanawha Falls, W. Va., on the 2d, causing five deaths, was due to a broken rail. Three cars were overturned and fell down a bank. The rail was one weighing 100 lbs. per yard, made in 1898, but it had an interior defect which could not have been discovered by a surface inspection.

The derailments near New Florence, Pa., on the 15th, which were on the West Penn division of the Pennsylvania, are remarkable only because they were both caused by the same wheel failure; that of the flange of a wheel in one of the trains. The two trains were running in the same direction on parallel tracks, and the second derailment, which is classed as due to accidental obstruction, was caused by parts of the wreck of the first train which fell under the cars of the second.

In three derailments in this month the first vehicle to jump the track was the tender, and in two of these cases the engine was running backward. These three are in addition to those mentioned above, but in one of the above (Norris) it is thought that the tender was the first to leave the track.

Of the 12 serious electric car accidents reported in the newspapers in September, five resulted in one or more fatalities, namely, Schenectady, Chicago (South Side Elevated), Nazareth, Pa.; Toledo, Ohio; Elmore, Ohio.

The Interstate Commerce Commission has issued an interesting decision concerning the collection of demurrage for the detention of freight cars while on private side tracks. The opinion, by Commissioner Prouty, is in the case of the Cudahy Packing Company against the Chicago & North-Western. The complainant owns a warehouse at Deadwood, S. Dak., situated on a spur track built and maintained at the expense of the railroad. Demurrage at one dollar a day is charged if cars are not unloaded within 48 hours. The complainant desires to retain its cars upon this spur track both before and after they are unloaded for an indefinite time without payment of demurrage charges. The Commission holds that the fact that the defendant had constructed and maintained entirely at its own expense the spur track for the exclusive use of the complainant, would be no reason why the complainant should be relieved from the payment of these charges which are imposed upon the rest of the public. The construction and maintenance of this track is rather in the nature of a gift to the complainant and certainly could not be made the basis of any exception in its favor; and the question is in no way affected by the fact that the cars are owned by the complainant. This is as it should be, of course. The Commission, indeed, might justly have gone farther and have declared that the same rule would apply even if Cudahy had owned the track. The North-Western has the usual rule that if the consignee owns both car and track no demurrage shall be charged; but that rule is justified rather by expediency than by economy and justice. In this case the packer evidently desired to treat the side track as though he owned it. And well he might; for the company had about the same as given it to him. The owner of private cars may take them out of service whenever he pleases, unless he has agreed to keep them in service; but it is not a strained construction of the arrangement between the owner and the railroad to hold that such cars shall share with other similar cars the burden of keeping the general traffic moving; even perhaps to the extent of being used for some other shipper's goods if the owner has no immediate need of the cars. More important than this consideration, however, is the convenient use of the track. Demurrage is not charged solely as rent on cars, nor for rent and track room combined; but also for the purpose of facilitating switching and the promotion of prompt movement of freight generally. If a packing company desires to hold its cars out of service it should at least provide for them a track where they would not inconvenience the railroad switching crews in their handling of other cars. Demurrage collections must be managed under rather loose rules, at best; but this decision ought to suggest to the railroads that they abandon, so far as abandonment may be in the interest of economy, their rule exempting owners' cars on owners' tracks. If a railroad hires a car and pays for its use it should have the right to use it as its own car.

Erie Railroad.

The Erie is a railroad company on which the depression in the security market has fallen with particular severity. A year ago plans were authorized and work begun on making over the property into an efficient trunk line railroad. A new through line was to take the place of 70 of the first 89 miles westward out of Jersey City and new cut-offs were to be built further west. As a result of these improvements and others by which they were to be followed, grades and curvature, now severe, were to be greatly reduced all the way between New York and Chicago, with the intention of eventually getting a maximum grade of 0.3 of 1 per cent. both east- and westbound between Chicago and Port Jervis, and with the exception of one pusher grade, a ruling gradient of 0.2 of 1 per cent. east- and 0.6 of 1 per cent. westbound between Port Jervis and Jersey City. The Jersey City terminals were to be rearranged, enlarged and electrified, this improvement including an open cut four tracks wide through Bergen Hill, the narrow throat which lies just west of the passenger and fast freight terminal, whose double-track tunnel had for some time been insufficient. Work had been actively begun on several of these projects and it looked as though the time was within measurable distance when the Erie, freed from the handicaps of the mistakes of the past as reflected in the physical needs of the property, would be able, through greatly increased earnings, to overcome even the great financial mistakes of its past history—a result which was almost absolutely certain to come about if a thorough improvement policy could be carried out.

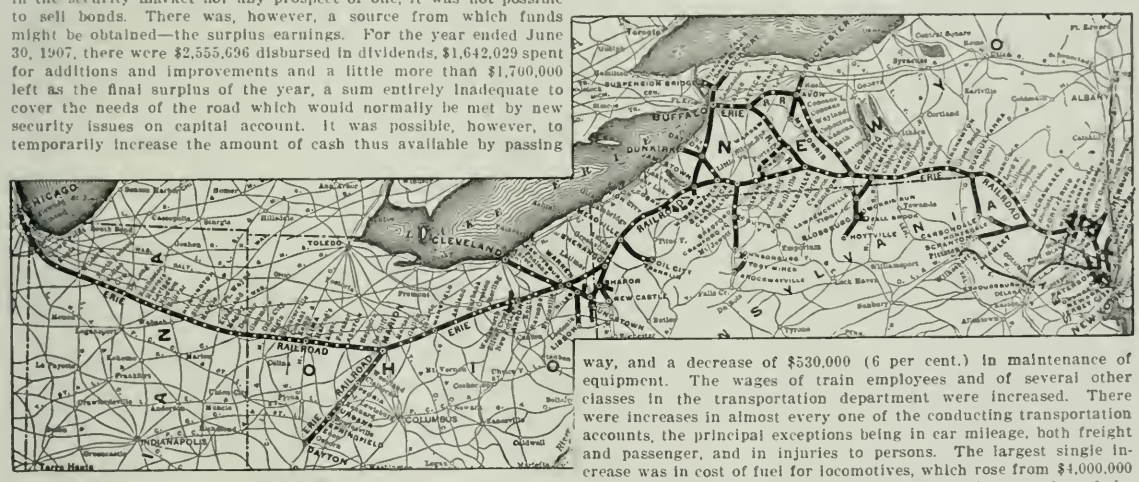
The Erie has had to depend on issues of bonds convertible into common stock, to finance the cost of its improvements. Up to June 30, 1906, $22,000,000 of these bonds were sold, while Erie common stock was selling around 45. With Erie common selling at below 20, as it does to-day, the convertible feature of such bonds is of small value and there is no market for them. Even before the stock market crash of last March the company, in the fall of 1906, with work actively under way on at least three of the new construction projects, found itself in need of ready money. Short term notes were issued. The report gives no facts about the note issues of the year and the information made public at the time was not always definite or final, so that it is not possible to give with certainty the exact amounts put out. According to the *Railroad Gazette's* record, however, between October 1, 1906, and January 3, 1907, $7,000,000 six-months 6 per cent. notes were sold at prices near par.

Then came the great decline in security prices. There fell due on April 8 $3,000,000 notes, and the Erie was for the moment in a tight place. These were refunded by $5,500,000 one-year credit notes which instead of being interest-bearing were discounted by the bankers like commercial paper. This is a more expensive process for the seller. At the price of about 90, at which the notes were reported to have been sold, the cost of the money to the Erie was 10 or 11 per cent., a prohibitive rate for railroad borrowings. The funds

thus obtained were all needed to meet notes which were falling due. Improvement work had been stopped in March. The most important of this was what is known as the Guymard cut-off, from Highland Mills, N. Y., west via Campbell Hall to Guymard, which is the station east of Port Jervis. This new 40-mile line was to take the place of a stretch of road with heavy grades and curvature. There was also a cut-off between Hunts, on the Hornell-Buffalo line, and Cuba, on the main line west of Hornell, on which work was suspended. These were the two pieces of work on which most had been done.

Before many weeks the situation brightened. Late in May the Erie borrowed $5,000,000 more on one-year notes, but on better terms than received for the notes sold in April. The two new cut-offs on which work had been stopped had been incorporated as separate railroads, the Guymard cut-off being the Erie & Jersey Railroad and the cut-off from the Buffalo division to the main line being the Genesee River Railroad. The Erie & Jersey issued first mortgage bonds and in June the Erie sold $3,000,000 three-year 6 per cent. notes secured by $4,000,000 Erie & Jersey bonds. In the same month the Genesee River was authorized to issue $6,000,000 first mortgage bonds and the Erie negotiated a loan of $2,000,000 secured by part of these bonds. Thus funds were provided for the immediate needs of the Erie and for carrying on the most important of the construction work which had already been begun.

Then came the question, how, looking toward the future, to further finance the improvements? The short term notes had been issued at high cost to provide funds immediately and absolutely necessary. This form of financing was too expensive to be followed except under compulsion. As there was no general improvement in the security market nor any prospect of one, it was not possible to sell bonds. There was, however, a source from which funds might be obtained—the surplus earnings. For the year ended June 30, 1907, there were $2,555,696 disbursed in dividends, $1,642,029 spent for additions and improvements and a little more than $1,700,000 left as the final surplus of the year, a sum entirely inadequate to cover the needs of the road which would normally be met by new security issues on capital account. It was possible, however, to temporarily increase the amount of cash thus available by passing



Erie Railroad.

the dividend payments. This, however, was a more extreme step than the directors thought necessary to take.

The expedient was adopted, as announced last August, of paying the dividends in scrip payable in 10 years with interest meanwhile at 4 per cent. This operation has been described as a forced loan from stockholders at 4 per cent., at a time when the Erie was paying 6 per cent. and over for money borrowed from other sources. In a sense this is true but it does not tell the whole story. It was within the power of the directors to pass the dividends altogether; in which case the stockholders would have had nothing at all for their dividend payments. There is special justification of scrip dividends in the present situation of the Erie. The road has great quantities of traffic, is well managed and needs only a series of improvements to put it in a strong position financially. Once established as a cheaply operated through line between New York and Chicago it should be able to make returns on all of its very large capitalization. Even now, preferred dividends are being earned and the stockholders for that reason should get returns. On the other hand, money cannot be borrowed at reasonable rates and without funds work will have to be stopped on important improvements and part of the money already spent wasted. Therefore scrip dividends are a reasonable compromise between passing out money to stockholders which is greatly needed for the eventual betterment of their property, and paying nothing at all. Through the funds thus temporarily obtained it is probable that part at least of the note issues maturing in 1908 can be paid without going to the security market for new funds.

From the earnings' standpoint the past year was a prosperous one, particularly because operating expenses were kept in hand and did not increase as fast as might have been feared. Gross earnings from railroad and other operations, not including coal companies were $53,900,000 against $50,000,000 in 1906, an increase of $3,900,000, or 8 per cent. Railroad gross earnings increased $3,700,000, which is in the same proportion. Railroad operating expenses were $1,900,000, or 6 per cent. larger than in the previous year, while net railroad earnings were $16,171,357, an increase of 12 per cent. over the previous year. The expenses of "other operations" were larger than the earnings, so that the net earnings from all operations were $15,747,788, against $14,129,797 in 1906. The railroad operating ratio was 68.12 per cent., against 69.71 per cent. in 1906.

This reduction in the operating ratio is a fortunate and unusual result in a year when the expenses of operation generally greatly increased. It was brought about partly by a reduction of 6 per cent. in the cost of maintaining the equipment. This decrease came mostly in locomotive repairs, where such a showing was not unnatural following a year in which 173 new locomotives, of which 118 were additions, were added to the equipment. In 1907 with four new locomotives received there was a decrease of 26 in the number of locomotives. The retiring of these 30 old locomotives from the equipment also helps to explain the decrease in the cost of locomotive repairs. Repairs and renewals cost $2,291 per locomotive, against $2,954 in 1906; $612 per passenger car, against $618 in 1906, and $69 per freight car, against $60 in 1906. Maintenance of way cost $2,346 per mile of line operated, against $2,139 in 1906. It therefore appears that the reduction in the Erie's operating ratio was not gained at the expense of maintenance.

Conducting transportation increased $1,530,000, or 9 per cent., against an increase of $179,000, or 11 per cent., in maintenance of way, and a decrease of $530,000 (6 per cent.) in maintenance of equipment. The wages of train employees and of several other classes in the transportation department were increased. There were increases in almost every one of the conducting transportation accounts, the principal exceptions being in car mileage, both freight and passenger, and in injuries to persons. The largest single increase was in cost of fuel for locomotives, which rose from $4,000,000 to $4,330,000. The good results of the year in the operation of the road are shown in the cost per locomotive-mile which, in the final analysis, is probably the most accurate single unit by which to judge railroad operating expenses. In spite of the increase in cost of fuel, supplies and wages, the total cost per locomotive-mile was reduced from 36 to 34 cents. The principal decrease was in the cost of repairs and renewals—a concrete illustration of the saving due to acquisition of new and modern motive power. There was an increase of 6 per cent. in the number of ton-miles, against an increase of 2 per cent. in the freight-train and freight-car mileage. The trainload rose from 455 to 472 tons and the carload from 19 to 20 tons. Although the average haul was slightly shorter, the ton-mile rate was 0.614 cents, against 0.598 cents in 1906, so that the freight earnings increased nearly $3,000,000, or over 8 per cent.

Passenger earnings, with a small decrease in the passenger-mile rate, increased 5 per cent. Of the 24,200,000 passengers carried, 23,500,000 were local passengers and 683,000 through passengers. There was a larger increase in through passenger travel than in the previous year. The increase of 7 per cent. in passenger miles was handled with an increase of 4 per cent. in passenger-train mileage but of 8 per cent. in passenger-car mileage.

The Erie does what few other railroad companies do in showing its freight traffic by commodities. A table is given showing the tonnage of the year and of the preceding year with the percentage which each class was of the total traffic, and, in addition, the increase or decrease in each class of tonnage both in amount and per cent. Only by including all these figures can an accurate idea of the business of the road be quickly gained, yet many roads give merely the tonnage by classes during the year, sometimes without even giving the percentage which each class is of the total tonnage.

This table shows that anthracite coal is the largest single item of the Erie's tonnage; 22 per cent. of the total last year, against 20 per cent. in 1906, this with an increase of 16 per cent. in anthracite tonnage. Bituminous coal was 19 per cent. last year, against 20 per cent. in 1906. The principal proportionate increases in tonnage during the year were in grain, flour and other mill products, 18 per cent.; cotton, 55 per cent.; fruit and vegetables, 46 per cent.; dressed meats, 13 per cent.; petroleum and other oils, 17 per cent.; sugar, 24 per cent.; bar and sheet metal, 55 per cent.; forest products other than lumber, 27 per cent.; anthracite coal, 16 per cent.; iron and other ores, 28 per cent.; salt, 12 per cent. Live stock tonnage decreased 22 per cent.; "other packing house products," 37 per cent., and agricultural implements, 33 per cent.

President Underwood speaks of the present status of the construction work. The contemplated improvements to the line between Passaic Junction, N. J., and Highland Mills, N. Y., the eastern terminus of the Guymard cut-off, have been postponed. They will have to be carried out before the maximum benefits will be secured from the Guymard cut-off. As part of the plan for improvements east of Port Jervis, the Erie Terminals Railroad has been organized in New Jersey to build from a point on the New York and New Jersey state line, near Suffern, to the Hudson river; and the Suffern Railroad has been organized in New York to build from Suffern, on the present main line, to a connection with the line of the Erie Terminals company. These two companies will take care of the improvements south of Suffern.

Similarly in western New York, although the new cut-off from Hunts to Cuba is to be finished, its related line improvements between Hornell and Hunts and between Salamanca and Cuba have been postponed. The cut-off from Columbus, Pa., to Niobe, 13 miles, which is being built by the Columbus & Erie Railroad, has progressed satisfactorily during the year.

There are several interesting events not yet mentioned. The electrified line between Rochester, N. Y., and Mt. Morris, 35 miles, was put in operation in June and has already resulted in an increase of over 33⅓ per cent. in passenger earnings. This electrification was described in the *Railroad Gazette* of October 11 and October 18, 1907, with editorial comment in the earlier number. The American Locomotive Company in June delivered to the Erie the first of the three Mallet articulated compounds which are to be used as pushers over one of the worst summits on the road. These engines, which will push more than two consolidation locomotives of the heaviest type, represent the latest step in concentrated locomotive power. If they prove to be as successful in practice as there is reason to believe, they will probably eventually be adopted as a permanent type to strengthen the few points at which the regenerated Erie will have steep grades. A third feature of the year's operations which, though small proportionately, is of serious import to the company, is the increase of over 40 per cent. in taxes. This is almost entirely due to new laws in New Jersey whose legality is now being tested before the courts. During the year the contract with Wells, Fargo & Company for handling the express business on the Erie, which expired in 1916, was extended for a further period of 16 years.

One of the Erie's great problems has long been its suburban business. As will be seen even on the small scale of the map of the whole road, Erie lines are thickly clustered in the territory on the west side of the Hudson river between Newark, N. J., and Haverstraw, N. Y. The Erie has a tremendous commutation business which it is handicapped in serving. Betterment of the suburban service awaits the general terminal improvements at Jersey City, in particular the completion of the new four-track cut which is to be used entirely for passenger service. Eventually the ferry trip will be eliminated. A contract was made during the year with the Hudson & Manhattan, which is building two tunnels under the Hudson river, by which the Erie is granted the use of the tunnels now building, together with valuable terminal facilities in New York. This contract will become partially effective as soon as the first tunnel of the Hudson & Manhattan is put in operation, which will be within a few months. Once the Jersey City improvements are finished, the Hudson & Manhattan is to build additional facilities at that point and the contract can be carried out in full. Then the Erie should be able to offer a particularly attractive suburban service.

The last two years' operations, not including the New Jersey & New York Railroad, 37 miles, or the coal companies, are summarized below:

	1907.	1906.
Mileage worked	2,169	2,151
Passenger earnings	$9,158,282	$8,982,814
Coal freight earnings	13,135,409	12,649,493
Other freight earnings	25,114,683	23,506,444
Gross railroad earnings	51,194,113	47,161,102
Maint. way and structures	5,087,975	4,500,230
Maint. of equipment	8,117,536	8,677,901
Conducting transportation		
Traffic	907,923	901,771
Operation	18,107,485	16,641,723
Railroad operating expenses	33,579,959	32,059,130
Net railroad earnings	17,614,155	15,102,272
Net income	5,903,658	5,916,844
Additions and improvements	1,642,029	1,926,978
Year's surplus	1,705,933	933,975

St. Louis Southwestern.

The St. Louis Southwestern is one of the smaller Gould railroad properties. It lies directly in the territory of the St. Louis, Iron Mountain & Southern and probably on this account is managed quite independently of the other Gould railroads. It is not a great system, but a small compact railroad leading from various points in northeastern Texas, north through Arkansas and parallel to the Mississippi river to St. Louis. From the Mississippi river crossing at Illmo, Mo., to St. Louis, 138 miles, it runs over track used jointly with the St. Louis, Iron Mountain & Southern. The lines in Texas are owned by the St. Louis Southwestern Railway of Texas. The longest through line of the road, from Gatesville, Tex., to St. Louis, does not pass through the most important cities in the intervening territory, such as Fort Worth, Dallas and Sherman, Tex.; Shreveport, La.; Little Rock, Ark.; Memphis, Tenn., and Cairo, Ill., which are all reached by branches. The road is therefore largely dependent on the traffic which is produced along its own lines, a good deal of which gets the long haul from Texas to the Mississippi river gateways, as is shown by the average distance haul of the freight, which is 240 miles. The passenger travel is largely local, the average haul being 40 miles.

The St. Louis Southwestern is not and never has been a dividend paying road. The 1907 report is the sixteenth annual statement of the company's position. The railroad lines which were taken over in 1891 were of the lightest standard. The next few trying years gave no opportunity for making improvements, so that by the time that railroad prosperity returned in 1898 and 1899, the road was in need of almost everything. On June 30, 1897, there were only 24 miles of rail heavier than 56 lbs. to the yard in the whole mileage of 1,223 miles and all of this 24 miles of 75-lb. steel had been put in the track since June 30, 1894. There were only 94 miles of rock ballasted track and 347 miles of track ballasted with gravel and sand. Of the total of 1,223 miles, 736 miles were unballasted and 595 miles were unfenced. In the 1897 annual report the President urged the importance of continuing the work of fencing the track as the reduction in the amount paid for claims for stock killed and injured would make the expenditure a very profitable investment. These features of the condition of the property 11 years ago are suggestive in comparison with the road as it stands to-day.

On June 30, 1907, the total mileage of track with 85-, 75-, 70- or 60-lb. rails, mostly 75-lb., was 870 miles of the total of 1,310 miles owned. Of the same total, 859 miles were ballasted, leaving 451 miles of track, mostly in Texas, unballasted. At the same time all but about 300 miles of line were fenced. These figures deal with conditions on the lines owned and do not, as nearly as can be judged from the facts given in the report, include the lines over which the St. Louis Southwestern has trackage rights.

In the 1897 year gross earnings were $4,800,000, or $3,879 per mile of road and net earnings $888,000, or $726 per mile of road. Fixed charges and taxes, not including any payments on the second mortgage income bonds, were $954,000, leaving a deficit from the year's operations of $64,000. Last year gross earnings for the first time in the company's history were more than ten million dollars, or $7,267 per mile of road. Net earnings were $3,400,000, or $2,312 per mile of road; fixed charges and taxes, including $751,000 on the consolidated mortgage bonds which absorbed two-thirds of the second mortgage incomes, were $1,850,000, leaving, instead of a deficit as in 1897, a net income after charges of $1,700,000. This is a record of tremendous progress. It is due both to the growth and development of the Southwest and to the application of surplus earnings to the improvement of the property so that it has been in a position to handle the continually increasing traffic which has been offered to it.

Last year's record is the best in the history of the road. The increase in gross earnings was $1,600,000, or 17 per cent. Operating expenses increased $500,000, or 7 per cent., leaving net earnings of $3,360,000, against $2,290,000 in 1906, an increase of over $1,000,000, or 47 per cent. The operating ratio was reduced from 75 to 68 per cent. These are remarkable gains. No railroad outside of the Southwest can show any such favorable results for the past year. The St. Louis Southwestern shared the fortunate experience of the other Southwestern roads in not only getting a large increase in gross earnings, but in being able to save most of this increase for net, while most railroads in other sections of the country had to see their increased earnings being used up in operating expenses.

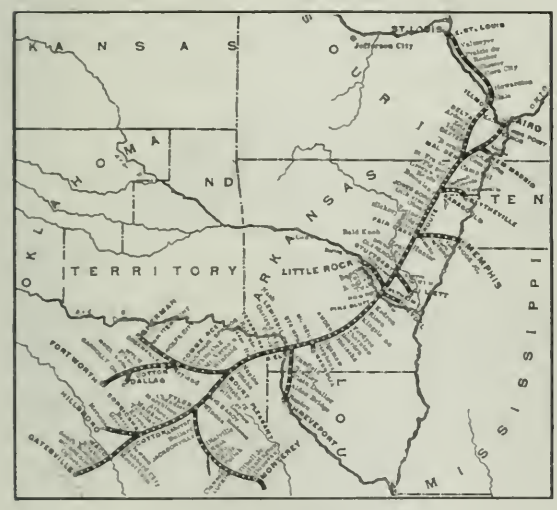
Whether this rate of progress or one anywhere nearly so large can be maintained during the present year is a question. Vice-President and General Manager Britton states, under date of September 16, that general business throughout the Southwest is in a healthy condition and an improved traffic movement may be expected. Indications point to a fair cotton crop in spite of the fact that its lateness makes it peculiarly liable to harm from early killing frosts. The demand for lumber and forest products continues good and the movement is limited only by the available equipment. Especially is there increased traffic in hard woods, oak, hickory,

gum and cypress. Many new hard wood lumber mills have been located along the line to use hard woods from lands from which the yellow pine has been cut off. Completion of this lumbering will leave the land ready for agriculture. A great deal of such land is constantly being cleared and put under cultivation, so that the acreage along the line devoted to agriculture is each year increasing. Besides this, immigration has continued and many new commercial enterprises have been located whose result will be reflected in the traffic of future years.

On the other hand, Mr. Britton has a less cheerful story to tell under the head of adverse state legislation. Of this much has been encountered during the past year, such as requiring additional train service, additional station buildings and viaducts where not needed, equipping locomotives with electric headlights, many reductions in freight rates and "harassments encountered through orders from the several state railroad commissions." In Texas, for instance, orders have been issued establishing accounting methods widely at variance with the Interstate Commerce Commission standard, resulting in duplication of records and accounts and a corresponding increase in expenses. A number of the laws and the orders of the commissions have been appealed to the courts.

In regard to the reduction of passenger fares by law, Mr. Britton speaks as follows:

During the past year, in obedience to public clamor, the legislatures of the states of Arkansas, Missouri and Illinois enacted 2-cent passenger fare laws which went in effect on April 10, June 19 and July 1, 1907, respectively, in the states named. While these laws apply only to intrastate business, their effect has been to compel this company and other railroad companies similarly situated to reduce their interstate passenger rates as well. Up



St. Louis Southwestern.

to the time the first of these laws became effective, the increase in the volume of passenger traffic and the revenues derived therefrom, in the states named, was about 15 per cent. over the corresponding period of the preceding year, attributable to the very satisfactory business and crop conditions prevailing and to the development and colonization of the territory tributary to this line. While this increase was most gratifying, the volume or density of the passenger traffic by no means warranted or justified the large decrease, nor in fact, any decrease whatever, in the passenger rates. Since these laws became effective, the passenger revenues of the company, in the territory affected thereby, have shown a decrease, instead of an increase, compared with the same period of the preceding year. While it is hoped that the volume of passenger traffic will continue to increase in proportion to the natural growth of the country and its population, the passenger business, which has always been more or less unprofitable in the Southwest on account of the sparsely settled condition of the country will continue to be so for some time to come, unless some relief from these confiscatory rates can be obtained through legal process. With this object in view, the Missouri law is now being tested in the Federal courts on constitutional grounds."

The trainload in 1897 was 160 tons and the carload 11 tons, both including company freight. Only six years ago, the trainload was 236 tons and the carload 15 tons. Last year the trainload was 323 tons and the carload 18 tons. These figures are for the entire system. The Texas lines for the first time had a trainload of over 200 tons, while the average trainload on the lines north of the Red river was 426 tons, a satisfactory figure for a Southwestern road even though most of its mileage is through line. One strong point in the operation of the road is the fact that there is almost an equal amount of tonnage in each direction. The northbound tonnage is 54 per cent., and the southbound tonnage 46 per cent. of the total. Last year the southbound tonnage increased more than the northbound. This is shown in the reduction of percentage of empty car mileage to total car mileage from 28 to 25 per cent.

The total freight revenue increased $1,2[illegible], or 18 per cent. This was due both to an increase of 8 per cent. in the number of revenue ton miles and of 9 per cent. in the ton mile rate. The number of passenger miles increased 16 per cent., and the total passenger revenue 18 per cent., while the average revenue per passenger mile increased 2½ per cent., which was possible because the passenger-rate deductions did not take effect until nearly the end of the fiscal year. There was a decrease of three miles, or 7 per cent., in the average passenger trip end, as a result, a decrease of 5 cents, or 5 per cent., in the average revenue per passenger.

There were some very large proportionate increases and decreases in the individual articles of tonnage. Wheat decreased 27 per cent., oats, 52 per cent.; corn, 44 per cent., and "other grain and mill products," 15 per cent., while the rice tonnage increased 122 per cent.; fruits and vegetables, 30 per cent.; cotton, 84 per cent., and cotton products, 110 per cent. In justification of its title, "Cotton Belt Route," these last two classifications made up over 11 per cent. of the total tonnage. This as against 6 per cent. in the previous year. As most of this is through traffic, it is easy to see that the fine cotton crop of last year, more than any other one thing, was responsible for the road's prosperity. Under the head of manufactures and miscellaneous there were decreases of 11 per cent. in tonnage of sugar and molasses, 27 per cent. in petroleum and other oils and 57 per cent. in rails. On the other hand, castings and machinery increased 30 per cent.; wines, liquors and beers, 41 per cent.; agricultural implements and carriages, 41 per cent., and general merchandise, 21 per cent. The total of this group was 19 per cent. of the total tonnage, an increase of 10 per cent. over the previous year. The tonnage, as a whole, increased 8 per cent. over 1906 and was slightly over 3,000,000 tons, of which a little more than 2,000,000 tons originated on the road.

Nearly $1,500,000 was spent on additions and betterments during the year. For these expenditures, however, the treasury was reimbursed by consolidated mortgage bonds which are being held subject to future sale. There was over $321,000 advanced from the treasury for the same purpose, against which no bonds have yet been issued. The principal items among the additions and improvements were: Roadway and track, $500,000; new side tracks, $150,000; new roundhouses and shops, $163,000; rails, $109,000, and new buildings, $104,000. At Pine Bluff, Ark., a modern steel and concrete car shop equipped with the latest machinery and a new power house have been built. The company now hopes not only to repair and replace all of its existing car equipment, but to build new cars from time to time. There were 115 miles of track laid with 75-lb. rails replacing 56-lb. rails. Work is now in progress ballasting the line between Mt. Pleasant, Tex., and Fort Worth, 154 miles. The bridges of the road have been improved, the two most important new bridges being one over the Brazos river at Waco, Tex., the other over the Red river at Shreveport, La., giving the St. Louis Southwestern its own line into Shreveport. At the same time the maintenance expenditures included in operating expenses were larger than in the previous year. Maintenance of way cost $1,308 per mile of line owned, against $1,257 in 1906. Repairs of equipment cost $2,071 per locomotive, against $2,040 in 1906; $706 per passenger car, against $636 in 1906, and $71 per freight and work car, against $53 in 1906—this last a noticeable increase to place the freight car maintenance on a proper level. There was a slight decrease in cost of repairs per locomotive mile, showing greater efficiency in power. There was an increase of 10 per cent. in number of locomotives and of 16 per cent. in total tractive power during the year. On the other hand, there was a decrease in the number of freight cars, a result which probably would not have come about if investment conditions had been more favorable. If its traffic continues to increase in the way it has during recent months, the St. Louis Southwestern will soon need to order new freight cars.

The St. Louis Southwestern has $20,000,000 preferred and $16,500,000 common stock outstanding. These are now selling at about 35 and 15 respectively. The surplus of $1,571,497 earned last year after interest on the still remaining income bonds and after miscellaneous deductions, is equal to 5 per cent. on the preferred stock and 3½ per cent. on the common. The stockholders have had a long time to wait for any return on their holdings, but at the present rate of progress a dividend on the preferred stock would seem to be inevitable within a year or two. However, if the business reaction which is freely predicted, affects the Southwest, dividend payments will probably have to be postponed for a number of years longer. The railroad lies in territory which has a most hopeful immediate future so far as natural conditions are concerned, but which may, by severity in railroad legislation, cripple

its own growth and the growth of its railroads for several years. The last two years' results are summarized below:

	1907.	1906.
Mileage worked	1,454	1,452
Passenger earnings	$2,028,881	$1,713,474
Freight earnings	7,899,937	6,698,723
Gross earnings	10,553,135	8,989,564
Maint. of way and struct.	1,713,653	1,650,466
Maint. of equipment	1,383,417	1,189,334
Conducting transportation	3,707,592	3,433,387
Operating expenses	7,196,103	6,699,444
Net earnings	3,357,032	2,290,120
Net income	1,712,542	697,055
Income bond interest	130,420	130,420
Year's surplus	1,571,497	586,778

Pere Marquette.

The Pere Marquette, with over 2,000 miles of line, is the largest railroad now or for some time past in the hands of a receiver. The only other large road in such case is the Cincinnati, Hamilton & Dayton. The two went into receivership together on December 4, 1905, but their operations are kept separate. The annual report of the Pere Marquette just issued covers the first full year during which the road has been managed by the receiver, Judson Harmon; a year of successful progress in restoring a wrecked railroad property to independence.

As almost inevitably happens when a railroad company is forced into financial default, the road itself had been allowed to run down and wear out physically. The following table of the amounts spent during the last four years on maintenance per mile of line and per unit of equipment proves this concisely:

	1907	1906	1905	1904
Maintenance of way, per mile	686	679	720	533
Repairs of locomotives, per locomotive	1,975	1,890	1,940	1,333
Repairs of passenger cars, per car	426	427	441	409
Repairs of freight cars, per car	41	39	25	21

With the exception of the locomotive item, none, even of the present charges, are sufficient to permanently preserve the line or the car equipment. The record of the earlier years shows how inefficient were the tools with which the receiver was to work out the salvation of the property.

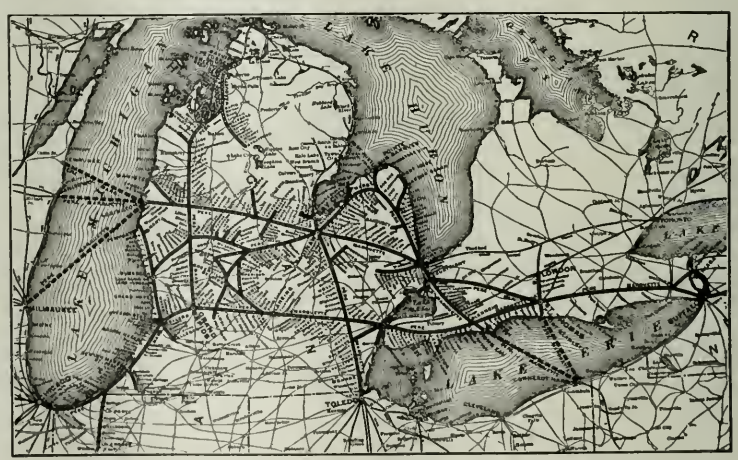
That, nevertheless, he has done this, is shown by the success, at a time when it was most difficult to raise railroad funds, of an offering of $5,000,000 five-year 6 per cent. notes. These were offered to the stockholders in June and the issue was considerably oversubscribed at par. Yet the preferred stock, instead of being a guaranteed 4 per cent. stock, as the Cincinnati, Hamilton & Dayton agreed to make it, is quoted at about 30, while Pere Marquette common, on which the C., H. & D. guaranteed 5 per cent., is quoted at 8. The proceeds of this issue are to be used to pay off the outstanding receiver's certificates and take the road out of the hands of the court and return it to the management of its stockholders.

At the same time the present preferred stock is to be exchanged at 115 for 4 per cent. first preferred stock, cumulative after 1910. Present preferred shareholders, however, who did not subscribe to the note issue are to receive new second preferred stock in exchange for their present holdings. Common stockholders are to exchange their holdings for an equal amount of new common stock, plus an additional amount of new common stock equal to the par value of any notes for which they may have subscribed.

This reorganization plan is to be voted on at a special meeting of the stockholders next Monday, October 28. It is likely to be carried and by the end of the year the Pere Marquette, entirely separated from the Cincinnati, Hamilton & Dayton, will probably begin a new period of its history as a solvent, independent railroad. That it will long remain independent, however, is doubtful, though the fact that it has parallel lines with both the Michigan Central and the Grand Rapids & Indiana may prevent it from falling, as it naturally would otherwise, to either the New York Central or the Pennsylvania. As it stands, it is a fairly compact group of lines in central Michigan, some of them of light traffic. Besides this central group of local lines, it has a through line with connections by trackage rights at each end with Buffalo and with Chicago, and car ferry connections across Lake Erie and Lake Michigan.

The property has fared well during the year just past. Gross earnings were $11,200,000, an increase of $784,000, or 6 per cent. over 1906. Operating expenses were kept down so that they required only $11,000 of this increase, and net earnings were $1,200,000, an increase of $710,000, or 21 per cent. There was a decrease, which amounted to almost as much as this gain in net earnings, in payments for taxes. Taxes rose from $414,663 in 1905 to $1,196,918 in 1906, owing to the final decision, against the railroads, in April, 1906, by the United States Supreme Court of the Michigan railroad tax case. The contested part of the taxes for 1902, 1903 and 1904, and the entire taxes under the new law for 1905, with a penalty of 1 per cent. a month on the deferred payments immediately fell due and were paid. Last year there were no such back payments and there was a corresponding reduction in taxes. Other fixed charges, however, increased by $143,000, leaving a net reduction in fixed charges of $576,000. The net income after charges was $432,000, against a deficit of $861,000 in 1906, an increase of $1,300,000 over the previous year's showing. This very favorable result is what makes it possible, fundamentally, to carry out a speedy termination of the receivership.

It will be observed that the satisfactory operating results were obtained not so much through increase in gross earnings as by keeping down operating expenses. As shown by the maintenance figures per mile of track and per unit of equipment, this was not done by spending less on the property. It was brought about by reducing the cost of the non-productive payments, conducting transportation and general expenses. In 1905, with 1,312,000,000 revenue ton-miles, conducting transportation cost $6,272,000. It was reduced $271,000 in 1906 and last year $31,000 more, so that in a year when there were 1,715,000,000 revenue ton-miles and when wages and supplies cost more than in the previous years, conducting transportation cost only $5,970,000. General expenses were $381,000 in 1905, $408,000 in 1906, and last year were reduced to $365,000, less than the 1905 figure. The largest decrease under this head was in law expenses, which were $26,000 against $48,000 in 1906. Salaries of general officers were $69,000, against $76,000 in 1906. The principal changes in the conducting transportation account were increases in wage payments, fuel, loss and damage and advertising; and decreases in cost of handling fuel, injuries to persons, operating marine equipment (this a decrease of 25 per cent.), and outside agencies. Such a saving as the one in the cost of handling fuel is noteworthy, because it is a saving which represents increased efficiency and nothing else. Another economy of the same kind is mentioned incidentally in connection with one of the smaller improvements made during the year. New freight platforms and transfer sheds were built at Michigan City and at Detroit at a cost of less than $5,000. Through them a saving of $10,000 a year will be made in cost of transferring and switching freight at Chicago, Detroit and Suspension Bridge. Incidents like these prove that the present operating officers are taking advantage of chances for real economies.



Pere Marquette.

The better operation of the road is shown in a decrease in the number of empty freight car miles. The empty mileage was reduced from 36,500,000 to 31,000,000. The revenue trainload was increased from 312 tons to 322 tons, and the average carload by half a ton. There were only six instead of seven empty freight cars in the average train, while the larger loading was carried in the same number of loaded cars as in the previous year. In spite, therefore, of a small reduction in the ton-mile rate, the average revenue per freight-train mile increased from $1.86 to $1.90.

The Pere Marquette's tonnage is made up 16 per cent. of agricultural products, 38 per cent. of mineral products, 20 per cent. of forest products, 12 per cent. of manufactures, and 12 per cent. of less than carload shipments and commodities not otherwise classified. There was an increase of 60 per cent. in the tonnage of fruits

and vegetables carried, which rose from 1.6 per cent to 2.5 per cent of the total tonnage. The tonnage of sugar beets increased 36 per cent and now furnishes 2 per cent., against 1.5 per cent. in 1906, of the total tonnage. There was an increase of 63 per cent. in anthracite tonnage, which rose from 3.6 to 5.7 of the total; but the amount of bituminous coal carried decreased. There were decreases in every classification of forest products, the total decrease being 12 per cent. In 1906 forest products made up 24 per cent. of the total tonnage, against 20.5 last year.

There are entries which hint at previous bad bookkeeping and insufficient maintenance. For instance, the receiver has charged over $1,000,000 during the year to profit and loss on account of depreciation of equipment. When the road was put in his charge there were on hand about 2,800 low-capacity, non-air freight cars and a number of old small locomotives. No provision had been made by previous managements for renewing this equipment, or for charging off the depreciation from year to year while in service. In order to preserve what value remained, it was decided to dispose of these cars and engines for their scrap value. All of them have been condemned and charged off, and nearly all of them have been scrapped or sold for scrap value. Their original cost has been credited to equipment renewal account, and their estimated depreciation, amounting as already mentioned to over $1,000,000, charged to profit and loss.

The equipment was increased during the year by 4,000 36-ft. box cars of 8,000 lbs. capacity bought from the Pullman Company, delivered between October and March. In payment, $4,346,753 receiver's equipment notes were issued, of which $3,661,200 was for the cost of the cars and $685,553 for accrued interest to maturity. These notes, issued in two series, are payable monthly, the final maturity of one series being 1913 and of the other 1914. To-day, according to the receiver, 70 per cent. of the freight cars have been bought within the last four years, while the rest are in good repair and will be available for heavy service for many years. The breaking up of the old cars and the purchase of a large number of new cars, puts the Pere Marquette equipment in position to compare favorably with that of any railroad in the United States.

The receiver was able to provide funds to put down heavier rails on over 80 miles of track. There were 35½ miles of 85-lb. rail laid on the main line, principally on the Toledo division. This released 75, 70, 67 and 60-lb. rail which, with 10 miles of 70-lb. rail released during 1906, was relaid at various points on 45½ miles of line of lighter traffic. This 45½ miles had been laid with 56, 40 and 35-lb. rails, most of which was scrapped and sold, the rest used for side tracks and repairs. New steel bridges on concrete abutments replacing wooden bridges and pile trestles were built at seven points up to the close of the fiscal year and work was then in progress on seven more bridges of the same sort. General repairs were made to 28 bridges. There were 25 concrete culverts built replacing wooden bridges, wooden culverts and pile trestles; five more are under construction. During the year there was a net charge of $134,000 to additions and improvements.

The suit brought early in 1906 to annul $3,500,000 Pere Marquette bonds issued in July, 1904, to pay for stock of the Chicago, Cincinnati & Louisville, which was then taken into the "Great Central System," was settled in April, 1907. In consideration of $400,000 receiver's certificates and the abandonment of all claims of the Pere Marquette for advances to the Chicago, Cincinnati & Louisville, or for ownership of its stock, the $3,500,000 Pere Marquette bonds were surrendered and canceled. This settlement was approved by the court in the receivership cause and the certificates forming part of the consideration were issued by its authority.

During the year the amount of receiver's certificates outstanding was increased $619,180, as shown in detail by the following statement:

Amount outstanding June 30, 1906		$1,619,180
Issued during the year on the dates and for the purposes shown below:		
July 2, 1906, to provide funds to pay interest due July 1, 1906, on the following bonds:		
Pere Marquette R. R. Co., collateral trust indenture 4 per cent. bonds	$57,400	
Pere Marquette R. R. Co., consolidated mortgage 4 per cent. bonds	167,640	
Pere Marquette R. R. Co., refunding mortgage 4 per cent. bonds	181,140	
Flint & Pere Marquette R. R., Toledo division, first mortgage 5 per cent. bonds	10,000	
	419,180	
March 1, 1907, issued as the consideration, among other things, for the surrender of certain bonds of the P. M. R. R. Co., amounting to $3,500,000, with the unpaid interest notes or coupons issued therewith, and in settlement of certain litigation between the P. M. R. R. Co. and Wm. A. Bradford, Jr., and others	100,000	819,180
		$2,438,360
Less tax certificates issued May 5, 1906, paid and canceled Feb. 1, 1907		200,000
Total receiver's certificates outstanding June 30, 1907		$2,238,360

On April 15, 1907, the South Haven branch from Lawton, Mich., to South Haven, on Lake Michigan, 34 miles, was leased to the Kalamazoo, Lake Shore & Chicago Railway for 25 years. Accordingly this branch is not shown on the map. Steamer No. 5 was sold to the Barry Steamship Company. The proceeds of the sale are to be used to buy 59 new stock cars.

Receiver Harmon mentions the creation in Michigan of a railroad commission of three members which took office in September, and also the 2-cent passenger fare law of that state which took effect September 28. It appears that the commissioner of railroads made inquiry as to whether any contest of this law would be made by the Pere Marquette or by the receiver. He was informed that no contest would be made. On this point the receiver speaks as follows:

> This course was determined upon after mature consideration, and is due to the desire of the receiver and of all concerned to accept as controlling the public sentiment in Michigan on that subject, a desire which outweighs the well-grounded belief that such a rate is unreasonably low in Michigan when applied without reference to passenger earnings per mile of road. It is hoped that increased patronage by the people of the state will make good the substantial loss inevitably resulting from such a large reduction of passenger rates. If a maximum rate of 2 cents per mile shall prove insufficient to meet the expenses of the passenger service and to allow a fair return on the value of the property used in the passenger service it is expected that the people of Michigan will, on being shown that fact, modify the law and allow a reasonable rate to be charged.

This is a tone which might well long ago have been adopted by most railroad officers.

The closing statement of the report before being signed by the receiver is a sincere acknowledgement of the co-operation of the officers and employees in helping him work out the salvation of the property. While he is the executive head, it must not be forgotten that he can be only indirectly responsible for the successful operating results, which must be due to General-Manager Cotter and his assistants. Mr. Harmon's acknowledgment of the help which he has received, though brief, has a different tone from the generally rather perfunctory acknowledgments of this sort in a railroad report. It is as follows:

> The excellent showing for the year which the receiver is able to make, notwithstanding many adverse conditions, has been mainly due to the spirit and intelligence which the officers and employees have shown in the discharge of their several duties. This report would be incomplete without this acknowledgment of their intelligent devotion to the property and business of the road.

The principal results of the last two years' operations for the years ended June 30 are summarized as follows:

	1907.	1906.
Mileage worked	2,390	2,398
Passenger earnings	$3,431,021	$3,239,447
Freight earnings	9,902,158	9,665,899
Gross earnings	14,214,195	13,430,170
Maint. of way and struct.	1,639,447	1,627,307
Maint. of equipment	1,975,221	1,873,321
Conducting transportation	5,640,323	5,563,684
Operating expenses	9,977,351	9,933,994
Net earnings	4,236,843	3,497,076
Taxes	477,817	1,196,918
Interest and rentals	3,465,792	3,322,455
Fixed charges	3,943,609	4,519,373
Net income	432,222	$60,947*

*Deficit.

Baltimore & Ohio.

The year 1907 might easily have been a very striking one in the history of the oldest railroad company in the United States. The eighty-first annual report might have recorded the transformation of the Baltimore & Ohio from being the Pennsylvania's second line of defence, to be, in fact, as well as in potentiality, the eastern end and principal trunk line outlet of the Harriman lines in the West. But Mr. Harriman has had his hands full since the Union Pacific acquired 18½ per cent. of its stock in the latter part of 1906, and plans for uniting the Baltimore & Ohio with the Pacific roads, whether or not seriously planned, have not been carried out. The only closer connection which has been made between the Baltimore & Ohio and the Harriman lines has been the establishment of a new steamship line by the Southern Pacific from Baltimore to New Orleans.

Although most briefly mentioned in the report, probably the most important special event of the year was the aggressive action of the Baltimore & Ohio in connection with the foreclosure of the Chicago Terminal Transfer Railroad. The Chicago Terminal Transfer owns the Grand Central Station in Chicago, the terminal tracks used in connection with it, and a belt line around the city. The Baltimore & Ohio, with the Pere Marquette and the Chicago Great Western, uses the Grand Central Station and terminals. Interest on the bonds of the Chicago Terminal Transfer was defaulted January 1, 1905, and on April 16, 1906, a receiver was appointed. A decree of foreclosure on February 20, 1907, advertised the sale of the property on May 3, 1907. In order to protect its lease of its passenger terminal in Chicago, which seemed likely to be bought by the Hill interests and turned over to the Burlington for its exclusive use, the Baltimore & Ohio, under its rights as lessee, came forward with an offer to redeem the Chicago Terminal Transfer bonds at par, which was generally accepted by the bondholders. By this

action it appears to have safeguarded its right to occupy the Chicago Terminal Transfer property, in spite of the fact that the Hill interests held control of a majority of the Terminal stock. After extended negotiations an agreement is reported to have been reached under which it is believed that the Burlington and the Baltimore & Ohio will use the Grand Central terminal jointly. What will happen to the other roads is not known. The effect of this somewhat unexpected event on the Baltimore & Ohio's finances for the year was that $17,000,000 of the $27,000,000 raised by the new stock issue of September, 1906, was tied up temporarily, yet apparently for some time. In consequence, the road at June 30, 1907, was left with very little surplus working capital. Aside from this, the year has been one of no special developments. The road has carried more business than in the record year 1906 and at a slightly higher average rate for freight, in spite of which its net earnings are smaller. There is no such extensive campaign of improvement under way as there was in the summer of 1906. In general, the year has been a comparatively uneventful one.

The Baltimore & Ohio is a heavy traffic road. Most of its tonnage is low-grade heavy freight. These are the items in their order which make up the largest proportion of the tonnage:

	Per Cent.
Bituminous coal	39.33
Coke	10.05
"Other castings and machinery"	7.51
Stone, sand and like articles	7.07
Miscellaneous	5.91
Ores	5.70
Lumber, bark, etc.	5.28
Cement, brick and lime	3.95
Grain	2.52
Iron, pig and bloom	2.45
Anthracite coal	1.85
Merchandise	1.13
	92.75

No other classification furnished as much as three-quarters of 1 per cent. of the total tonnage. Of the groups mentioned almost every one is made up of heavy or bulky articles. The traffic center of the road is in the West Virginia, Pittsburgh and Cleveland districts, from which it carries bituminous coal and iron and steel products both eastbound to Baltimore, Philadelphia and New York and westbound to Chicago, Cincinnati and St. Louis.

Gross earnings were $82,200,000, against $77,400,000 in 1906, but this increase of $1,800,000 was all and more spent in paying for the handling of the increased traffic. Operating expenses were $5,400,000 larger than in 1906, so that there was a decrease of over $500,000 in net earnings. At the same time the operating ratio rose from 64 to 67 per cent.

Maintenance of way and structures increased $1,200,000, maintenance of equipment $934,000 and conducting transportation $3,200,000. The payments for wages were about $1,154,000 larger than in 1906, fuel and other supplies cost more and, on account of the accidents at Woodville, Ind., on November 12, 1906, and at Terra Cotta, D. C., on December 30, 1906, the item of injuries to persons rose from $276,000 to $773,000, an increase of nearly 200 per cent.

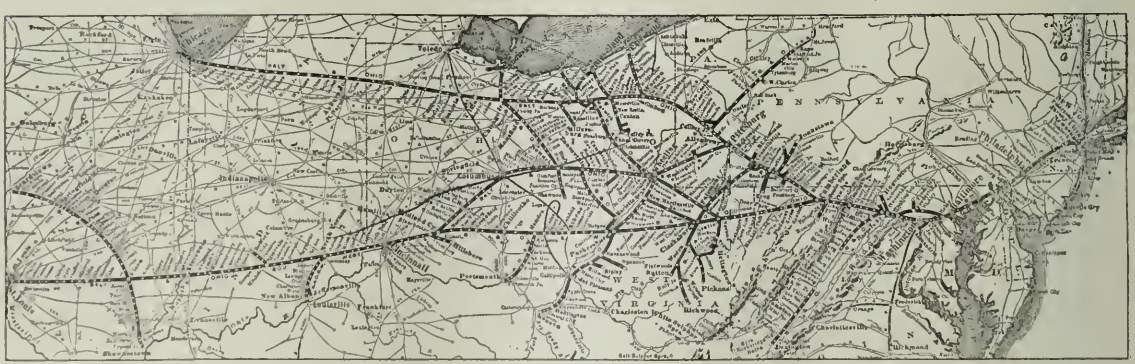
Maintenance of way cost $2,632 per mile, against $2,315 in 1906, this including no part of the more than $4,000,000 appropriated directly or indirectly for improvements, and $6,000,000 more charged to capital account. Equipment repairs cost $2,486 per locomotive, against $2,415 in 1906, $851 per passenger car, against $755 in 1906, and $84 per freight car, against $70 in 1906. The locomotive figures cover only the lines directly operated. The car figures are for the whole system, including nearly 500 miles of affiliated lines. Although the big increases in operating expenses were in the conducting transportation accounts, these figures make it evident that maintenance of both way and equipment was somewhat more liberal than in the previous year.

There is published an instructive table showing the principal facts of the freight and passenger movement for the last twenty years. In 1888, with 1,774 miles operated, there were 11,200,000 tons carried at an average rate of 0.656 cents per ton per mile. In 1899, with 2,042 miles of line and 25,000,000 tons carried, the average rate was 0.390 cents, the bottom figure. The next year the ton-mile rate rose to 0.455 cents, and in 1907 it was 0.570 cents. This is the highest figure since 1896, with the exception of 1904, when 0.582 cents was the average rate. Last year, with over 4,000 miles operated, there were 58,400,000 tons of freight carried. The average haul was 191 miles, against 195 miles in 1888. This table gives an idea of the steadiness of the road's traffic and the importance to the Baltimore & Ohio of the average rate received. With satisfactory rates it can make large profits; without them it has more to fear than most large railroads, for it must depend largely on its regular sources of heavy traffic.

In 1888 there were 7,100,000 passengers carried an average distance of 32 miles at an average rate of 1.861 cents per mile. This rate dropped to 1.540 cents in 1894. Last year it was 1.956 cents, against 2.006 cents in 1906. In 1907 there were 17,500,000 passengers carried an average distance of 41 miles.

The trainload was 433 tons, against 420 tons in 1906. The average carload was 23 tons last year. The average earnings per ton of all commodities, including soft coal, were 1.11 cents; the average earnings per ton of soft coal were 79 cents. The average distance haul of soft coal and of all commodities was almost exactly the same.

Among the principal improvements carried on during the year were the new passenger and freight terminals at Wheeling, W. Va., where a new line substitutes a 1.3 per cent. grade (the ruling grade between Wheeling and Pittsburgh) for a 3 per cent. uncompensated grade on a curve of 17 degrees, equivalent to a grade of 3.5 per cent.



Baltimore & Ohio.

This work, which is well advanced and should be completed by 1908, includes new masonry abutments, pier and retaining walls, excavation for street depression, changes of tracks and of street car tracks, steel work for elevated tracks, a new power plant and a new passenger station 90 ft. x 250 ft., with two umbrella sheds, each 620 ft. long.

At Washington, D. C., grading for the joint coach and engine yards north of New York avenue extended, between Florida avenue and Langdon, has been about 95 per cent. finished; about 70 per cent. of the tracks have been laid; two 25-stall engine houses, machine and blacksmith shop, oilhouse, storehouse, signal tower, battery charging station, boiler houses, two-story enginemen's building, car repair shop, locker and washroom building, sandhouse and steel coal tipple are about 98 per cent. finished. There are under construction a four-story storehouse, power plant, a brick chimney 150 ft. high, oilhouse and three sheds for airing bedding and cleaning carpets. The Rhode Island avenue bridge has been built and the New York avenue bridge is 90 per cent. finished. The operations of the Washington Terminal Company, controlled jointly by the Baltimore & Ohio and the Pennsylvania, which is building the Washington terminal station, had been $12,200,000 to June 30, 1907. The outside of the building, except cleaning down, pointing and putting on dome roof, is finished. The interior of the east wing is 96 per cent. advanced, the central section 90 per cent., the west wing 60 per cent., the concourse 96 per cent., the train sheds and platforms 90 per cent., the express building 95 per cent., the power house 98 per cent., the tracks 92 per cent., the interlocking and signal apparatus at K street 80 per cent. and at Massachusetts avenue 60 per cent. and the filling for the plaza 95 per cent. All masonry bridge work and filling, tunnel and girder work on both the north and south ap-

proaches has been finished. It is expected that train service will be begun next Sunday.

President Murray speaks as follows in regard to the state railroad legislation of the year:

There has been legislation on the part of a number of states which threatens most serious consequences to the carriers affected thereby. This action has been mainly confined to a reduction of the charge for the transportation of passengers to a maximum rate of 2 cents per passenger per mile. The state which action affects your lines, and the date such action became effective, are: Virginia, July 1, 1907, with an exception as to B. & O. lines fixing the maximum at 3 cents per passenger mile; West Virginia, May 21, 1907; Ohio, March 15, 1907; Pennsylvania, October 1, 1907; Indiana, April 10, 1907; Illinois, July 1, 1907. Compliance with the above legislation required a revision of passenger tariffs and rates, and it cannot be said at this time with any positiveness to what extent your passenger earnings will be affected; that the reduction will be considerable admits of no reasonable doubt. In some sections the incentive to travel may afford some possible compensation, but in others nothing of this character can be looked for, and the result as a whole is problematical.

The following table shows in brief form the operations of the last two years, rearranged where necessary, according to our usual practice. The figures cover the lines directly operated and do not include the results of the Valley Railroad of Virginia; the Ravenswood, Spencer & Glenville; the Ohio & Little Kanawha; the Cleveland Terminal & Valley, and the Cleveland, Loraln & Wheeling, which have a combined mileage of 456 miles and gross earnings of $4,151,936. The figures for the Baltimore & Ohio system excluding these controlled or affiliated lines, are as follows:

	1907	1906
Mileage worked	1,066	4,030
Passenger earnings	$14,117,117	$13,701,098
Freight earnings	64,625,946	60,002,204
Gross earnings	82,243,922	77,292,056
Maint. of way and struct.	10,542,499	9,330,859
Maint. of equipment	13,148,502	12,514,981
Conducting transportation	29,330,156	26,198,469
Operating expenses	51,880,091	49,515,221
Net earnings	27,363,831	27,870,835
Net income	18,561,302	19,142,275
Dividends	11,500,190	9,251,478
Improvement appropriation	1,115,672	4,077,973
Year's surplus	2,915,499	5,812,821

Nashville, Chattanooga & St. Louis.

The Nashville, Chattanooga & St. Louis is controlled by the Louisville & Nashville and forms the most direct connection between the Louisville & Nashville's line from St. Louis and Georgia railroads in which the L. & N. is interested—namely, the Georgia Railroad and the Atlanta & West Point. The territory in Tennessee served by the Nashville, Chattanooga & St. Louis embraces two of the three iron ore producing districts in the state, the bituminous coal fields on the Cumberland plateau northwest of Chattanooga and the phosphate beds southwest of Nashville. These beds are the largest known deposits in the world. Grain and lumber also contribute largely to the traffic of the road. A great variety of timber is native to Tennessee, and much of it is valuable hardwood. During the fiscal year ended June 30, 1907, the total tonnage carried amounted to 5,930,000 tons, of which 3,830,000 tons originated on the lines of the road. Of this total tonnage 16 per cent. was coal, 4 per cent. coke, 5 per cent. ores, 6 per cent. stone, sand and similar material and 2 per cent. phosphate rock. The bulk of the traffic in these classes originated on the lines of the road. Grain took up 16 per cent., flour 4 per cent., other mill products 3 per cent. and hay 3 per cent.; lumber amounted to 10 per cent. and logs, posts, wood, etc., to 3 per cent. Products of animals amounted to 2 per cent. Among manufactures the most important articles are brick, cement and lime, which aggregated 3 per cent. of the total tonnage, and bar and sheet metal, iron and rails, 4 per cent. Among the above products the more noticeable changes, as compared with the figures of the preceding year, were an increase of 13 per cent. in coal and coke, an increase of 29 per cent. in ores and an increase of 15 per cent. in phosphate rock. Lumber increased 59 per cent., while logs, etc., decreased 51 per cent. Grain increased 15 per cent. and flour 15 per cent., while other products of agriculture remained about the same. There was a falling off of 16 per cent. in live stock. Pig iron and bloom, bar and sheet metal decreased slightly. It is interesting to notice that although there were big increases in the amount of building materials, machinery, tools and household goods originating on the lines of the company, much of this seems to have been shipped to other territory. The amount of merchandise originating on its own lines decreased from 217,000 tons to 169,000 tons, while if the building materials, etc., had been for home consumption there would have been, presumably, a corresponding increase in the output of merchandise.

The history of the road dates back to 1854, when the Nashville & Chattanooga was built from Chattanooga to Nashville. The Nashville & Northwestern, from Nashville to Hickman, Ky., was built in 1869, and the two roads were consolidated under the name of the present operating company in 1877 and now form the main line, 229 miles long. There are about 300 miles of branches, which have been built or acquired from time to time from the early 'eighties up to 1890. Three of them run to the coal fields and others run to the phosphate fields and south to a connection with the Louisville & Nashville at Gadsden, Ala. The Western & Atlantic runs from Chattanooga to Atlanta, Ga., and was leased from the state of Georgia in 1890. The story of this state-owned road was published in the *Railroad Gazette* of August 2, 1907. In 1896 the Paducah & Memphis division of the Louisville & Nashville was leased, but its operations have been included in the accounts of the rest of the company only since 1900, when the lease was finally ratified. It runs from Paducah, Ky., south to a connection with the Nashville, Chattanooga & St. Louis at Hollow Rock, Tenn., about half way between Nashville and Hickman, and thence southwest to Memphis. The weights of rails on the Nashville, Chattanooga & St. Louis run all the way from 38 lbs. to 80 lbs., but, beginning with 1899, some 80-lb. steel has been laid each year, until now there are 278 miles thus equipped. Old trestles and bridges are being gradually replaced with steel girder and I-beam structures.

Gross earnings in 1907 were $12,240,000, an increase of $1,120,000; net earnings, $4,040,000, a decrease of $20,000. The operating ratio was 67.0 per cent. in 1907, 63.5 per cent. in 1906, 66.6 per cent. in 1905 and 63.5 per cent. in 1904. Large amounts for additions to property and equipment have been charged against income each year. The extent to which the company is turning earnings back into the road is still more noticeable in the maintenance charges during the last few years. Maintenance of way cost $1,413 per mile in 1907, as against $1,306 per mile in 1906, and $1,257 per mile in 1905. Maintenance of locomotives per locomotive cost $2,824 in 1907, $2,313 in 1906 and $2,470 in 1905. Maintenance of passenger cars per car cost $677 in 1907, $630 in 1906 and $552 in 1905. Maintenance of freight cars per car cost $74 in 1907, $63 in 1906 and $58 in 1905.

The company has $10,000,000 capital stock and $16,000,000 bonds, of which $6,300,000 are first mortgage bonds secured on the main line and maturing in 1913; $7,608,000 are first consolidated mortgage bonds of 1928, secured on the main line and branches; the rest are branch line bonds. The interest on these bonds amounted to $947,640 in 1907. Rentals were $626,460. These charges have been about the same for several years. The stock is now on a 6 per cent. basis, this being the annual rate of the last two semi-annual dividend distributions. In 1905 and 1906 5 per cent. annually was paid and in 1904, 4 per cent.

Nashville, Chattanooga & St. Louis.

The principal results of operation were as follows:

	1907.	1906.
Mileage worked	1,230	1,226
Passenger earnings	$2,407,401	$2,207,804
Freight earnings	8,967,426	8,104,876
Gross earnings	12,238,472	11,120,082
Maint. of way and struct.	1,737,619	1,601,666
Maint. of equipment	1,696,448	1,338,283
Conducting transportation	4,501,038	3,874,606
Operating expenses	8,203,003	7,035,492
Net earnings	4,035,469	4,055,490
Net income	2,233,528	2,243,413
Income appropriations	1,527,158	1,289,421
Year's surplus	106,380	453,992

NEW PUBLICATIONS.

*Railroad Operation in Italy.**

This is a lecture delivered at its request before a meeting of the engineers of Milan last June during the railroad exhibition held there—not a simple half-hour address, but a plump pamphlet of 166 octavo pages in its printed form. The subject was timely, for the first year of the operation of the railroads by the state had been distinguished by a confusion and blockade of traffic, perhaps greater than has ever existed elsewhere since the first days of railroads—a natural consequence of the transfer of a system by operating companies which had long known that they would no longer have to provide for the needs of traffic, to a government which had done very little to equip itself for the work until the railroads actually fell into its hands. And the selection of Signor Spera to discuss the subject was natural; for he had given a good part of his life to the study of it. As early as 1895 he published a volume on possible reforms and economies in the working of the Italian railroads, which had been chiefly in the hands of three great operating companies since 1885; followed it by a second volume on the same subject in 1897, and by a third in 1904, just before the state took over the railroads (mostly its own property before 1885) from the companies. These volumes had been interspersed with many other pamphlets and lectures on Italian transportation questions, and the author as delegate of the Minister of Public Works reported on the International Railroad Congress in Paris, to the Minister of Agriculture on the Chicago Labor Congress in 1893, and studied our railroads at the time of the International Railroad Congress in Washington. Thus we may assume that his opinions were mature and based on long observation and reflection and wide knowledge.

The circumstances affecting railroad transportation in Italy are peculiar. A long and narrow peninsula stretching out between two seas, cut off from the rest of Europe by the Alps, and divided longitudinally by the Appenines, it would have been difficult to plan an efficient railroad system to serve the whole country; and as when railroad construction begun it was divided among a number of independent governments, there can scarcely be said to have been any plan at that time. It is a country lacking the bulky freights which burden the railroads of such countries as Great Britain, Belgium, Prussia, Saxony and large parts of this country; lacking coal, and therefore the primary iron industries. The population per square mile is less than in several other European countries; but per square mile of cultivable land it is excessive. The great valley of the Po is one of the most fertile agricultural districts in the world, and one of the best cultivated; on the other hand the Appenines cover a wide belt where there is little cultivable land; and in South Italy, with few exceptions, farming is deplorably backward. The nearness of the sea to all parts of the country has had less effect on railroad transportation than might have been expected. There are comparatively few deep harbors; Geneva and Naples, on the main land, are really great ports, and Sicily is so well provided that it exports and imports chiefly by sea. On the other hand, the country is full of towns, especially small ones; and where these have industries the raw materials have to be brought in large part from the ports or from beyond the Alps.

No one unless intimately acquainted with the circumstances of a country and of its different parts is qualified to criticise its system of railroad operation. But it is certainly true, as Signor Spera says, that such system ought to be planned to suit the circumstances; and that while road and rolling stock should be specially designed for the peculiarities of the traffic, the best machinery for transportation will be effective only when a high degree of ability is engaged in working it; that the operating engineer is as indispensable as the constructing engineer. Here our author finds the weak point of Italian railroad management. Methods of operation developed in other and very different countries were imitated at first and have been adhered to after they had been proved inefficient. The country has many small cities or large towns, each of which is the traffic center of a limited district. Four-fifths of the journeys are for distances less than 62 miles; not one-eighth of the freight is carried as far as 186 miles, and 53 per cent. of it less than 62 miles. Now these short hauls in Italy are effected only by three classes of slow trains—omnibus, mixed and "accelerated," usually infrequent, and for many places leaving or arriving at inconvenient hours. The delays are such that local freight in a very large proportion of cases can be delivered more quickly when hauled by horses than when shipped by rail. The 7,200 miles of railroad in Italy had in a recent year 1,558 millions of ton-miles of freight traffic, or 209,000 ton-miles per mile of road. In this country in 1906 the freight movement was 970,900 ton-miles per mile of road, or nearly five times as great, though we had less than 400 inhabitants per mile, and Italy more than 1,000. Per inhabitant there were 47 ton-miles in Italy and 2,510 in the United States. The American railroad man evidently should be modest in applying his knowledge to Italian circumstances.

Without going into particulars of the reform proposed by Signor Spera, we may say that a chief feature of it is a strict separation of passenger and freight, light and frequent trains for the local traffic, running between local traffic centers 40 or 50 miles apart, the freight trains carrying a crew large enough to do all the loading and unloading at stations; and provision for the long distance and heavy traffic in the way of double-track, yards and stations, and some new lines, not so much unlike the work we are engaged in here.

The Chemistry of Commerce. By Robert K. Duncan, Professor of Industrial Chemistry at the University of Kansas. 263 pages; 5½ in. x 8½ in.; 59 illustrations. Published by Harper & Brothers.

Professor Duncan's theme is the applicability of science to modern industry. This does not seem to need proof, familiar as we are with the glowing articles in Sunday supplements hailing new discoveries and heralding revolutions in trade or transportation because of them. But it seems that manufacturers in this country do not read the Sunday papers; at least, there is a lack of what Professor Duncan calls the sympathy between learning and manufacture. The new processes described by him are almost entirely confined to Germany, although France and Italy are also ahead of us in using the investigations of chemists in improving their products, and, as the author says, "even in England there is abroad in the land the spirit of applied science." The function of the manufacturer is two-fold; it is to make as efficient an article as possible and to make money out of it. His success in the one should naturally depend on his success in the other, but in America, especially during the last few decades, he has been able through control of the market, to maintain or increase his earnings in spite of waste in production and comparative inferiority of his product. The problems of manufacture have been marked by the tariff, the abundance of raw material and the enormous demand that made competition mild. But now overproduction is in sight, the supply of raw material is to a great extent controlled by a few men and even the tariff is not eternal. In the last chapter of the book, the author describes a plan looking to the solution of these manufacturing problems whose solution is now becoming necessary. Industrial Fellowships may be established at the University of Kansas by manufacturing companies. The endowment, all of which goes to the holder of the fellowships, extends over a period during which the Fellow has the university's laboratory facilities in seeking to improve the manufacture of a specific product. His contract with the endower is broad and gives great advantages to both, while the university has the right, three years after the Fellow has finished his investigations, to publish a thesis embodying the results of his work, this, of course, having nothing to do with any patents that may be taken out. Professor Duncan's book is most readable; it is general, rather than specific, knowledge that he presents and so clearly that the reader absorbs it without conscious effort.

Explanation of Switch and Signal Circuits. By John T. Doran. New York: Doran & Kasner. Cloth, 137 pages. Price, $1.50.

This book describes the electric block and interlocking signal system installed in the Electric Zone of the New York Central. No statement is made to this effect although the language used assumes that the reader is well acquainted with the installation mentioned. The book is useful for the circuit plans contained, these being typical of an A. C. signal system applied to a road which is electrically operated. But the descriptions are incomplete and far from clear, and the reader gains no satisfactory idea of the signal system. The following announcement on the title page is unique: "A Handbook of Diagrams and Information for Electrical Signal Constructors and Maintainers at a Glance, all that ordinary Signal Men Need and Nothing They do Not Need." That a relay must be used with a track circuit, and that when more contacts are required than one relay will provide a second or repeater relay must be used are facts well known; but signal maintainers cannot be expected to realize this when told that "A track circuit governs the polyphase relay, which, when operated, completes the S. T." The author is much in need of the new signal dictionary, to learn that a signal having two or more home arms is not called a "root," as is stated on the circuit diagram shown, but is a route signal.

Seth Wilmarth and His Locomotives.

Yeadon, Pa., Oct. 5, 1907.

To the Editor of the Railroad Gazette:

Will you permit me to call your attention to two errors in my article on "Seth Wilmarth's Locomotives" in your issue of Sept. 27th? Beneath illustration of engine "Pioneer" your printers have named the date of building as 1871, and 1949 as the year in which the

*L'Esercizio Ferroviario in Italia, nei suoi rapporti con l'economia del paese e la scienza del transporti. Im l'ingegnere Giuseppe Spera, Roma, 1907.

"Fury" first appeared. These should be 1851 and 1849 respectively, and as the drawings show these latter dates distinctly we will in this case have to lay the blame on the shoulders of the long-suffering printers. C. H. CARTLEDGE.

Convention of the American Street and Interurban Railway Association, and Affiliated Associations.

The twenty-sixth annual convention of the American Street and Interurban Railway Association and its affiliated associations, the American Street and Interurban Railway Engineering Association, the American Street and Interurban Railway Accountants' Association and the American Street and Interurban Railway Claim Agents' Association was held at Atlantic City, N. J., Oct. 14 to 18 inclusive.

ENGINEERING ASSOCIATION.

The Engineering Association, which includes the mechanical, electrical and maintenance of way departments, held its meetings in the sun parlor on the Steel Pier from Oct 14 to 16, President H. H. Adams (Baltimore) in the chair. President Adams in his opening address laid particular stress on the work of the committee on "Standards," and strongly recommended the adoption of the committee's report. He acknowledged the hearty co-operation and assistance given this committee by the manufacturers and extended an invitation to them to take part freely in the discussions. Referring to one of the questions in the "Question Box" relating to the number of men employed in maintenance in the various engineering departments, he pointed out the value of comparative data in determining whether this work was being done as economically and efficiently as it might be with the facilities at hand.

Other addresses were delivered by John I. Beggs (Minneapolis), president of the "American" Association; Past President Olds (Milwaukee), who reviewed briefly the progress in electric railway engineering since its beginning, and C. L. S. Tingley, President of the Accountants' Association.

The following reports and papers were presented at the meetings: Control Apparatus, paper by F. E. Case, General Electric Co.; Maintenance and Inspection of Electrical Equipment, J. Lindall (Boston Elevated), chairman; Care of Electric Railway Tracks, paper by L. Wilson (Minneapolis); Rail and Rail Matters, Julian Griggs (Scioto Valley Traction Co.), chairman; Rail Corrugation, F. G. Simmons (Milwaukee), chairman; Standards, W. H. Evans (Buffalo), chairman; Open Versus Closed Terminals for Car Storage, E. W. Olds (Milwaukee), chairman; A Year's Experience with Gas Engines, paper by Paul Winsor (Boston Elevated); the Parsons Steam Turbine, paper by St. John Chilton (Allis-Chalmers Co.); Operation of Curtis Turbines in Railway Service, paper by A. H. Kreusi (General Electric Co.); Recent Developments in Steam Turbine Power Station Work, paper by J. R. Bibbins (Westinghouse Mach. Co.); "Question Box" of 55 questions. Some of these papers with the discussion on them will be reprinted in subsequent issues.

The officers elected for the coming year were: F. G. Simmons (Milwaukee Electric Railway & Light Co.), President; Paul Winsor (Boston Elevated), First Vice-President; F. H. Lincoln (Philadelphia Rapid Transit Co.), Second Vice-President; W. H. Evans (International Railway Co., Buffalo), Third Vice-President; J. W. Corning (Boston Elevated), Secretary and Treasurer; Members of Executive Committee, W. J. Harvie (Utica & Mohawk Valley), Wm. Roberts (Northern Ohio Traction & Light Co., Akron), E. O. Ackerman (Columbus Railway & Light Co.), John J. Murphy (Chicago Union Traction Co.).

"AMERICAN" ASSOCIATION.

The American Street & Interurban Railway Association met in the sun parlor on the Steel Pier, Oct. 16 to 18, with President John I. Beggs (Twin City Rapid Transit Co., Minneapolis) in the chair. President Beggs in his annual address first called attention to the fact that the Secretary of the Association now has permanent offices in the new United Engineering Societies Building, 29 W. 39th street, New York. He proposed a plan for the establishment of paid secretaries for all four of the affiliated associations and the maintenance of a statistician and other clerks to carry on the fast growing work of the associations. He regretted that the past year had been marked by very unsatisfactory relations existing between many of the companies, members of the American Association, and the municipalities in which they operated. He believed, however, that the wave of unreasoning prejudice, denunciation and unwise legislation was at its crest and is already beginning to recede. He ventured to predict that until a radical change is worked in the minds of the public it will be almost impossible to obtain additional capital necessary to make the extensions and improvements necessary to give to the cities and towns the transportation facilities which their increasing growth demands. He looked forward to the time when the several states would appoint intelligent and impartial commissions to investigate and regulate the conditions of operation and remove the company's property from the exploitation of grafting local politicians. The continued development of single-phase alternating-current machinery was gratifying but it should not be lost sight of that equally important developments were constantly being made in direct-current machinery. The matter of depreciation accounts was important particularly in view of the present agitation in favor of municipal ownership and valuation of public service properties.

The presidents of the three affiliated associations also spoke at the opening meeting and gave a brief report of the year's progress to the parent association.

The following committee reports and papers were presented at the meetings, some of which will be reprinted in subsequent issues with the discussion thereon: Car Wiring, J. W. Corning (Boston Elevated), chairman; Standardization of Equipment, H. C. Page (Springfield, Mass.), chairman; The Technically Trained Man and the Electric Railway Profession, paper by Prof. H. H. Norris (Cornell University); The National Fire Protection Association, paper by Ralph Sweetland (Boston, Mass.); Influence of the Design of Railway Structures on Economy of Operation, paper by H. T. Campion and William McClellan (Consulting Engineers, New York); Rules for Government of Motormen and Conductors, E. G. Connette (Worcester), chairman; Light Freight Handling by Electric Lines, paper by P. P. Crafts (Iowa & Illinois Ry. Co.); Freight Service on Electric Railroads, paper by H. H. Polk (Interurban Railway Co., Des Moines); A Department of Publicity, paper by J. H. White (Boston Elevated); Advertising from the Street Railway Standpoint, paper by A. W. Warnock (Twin City Rapid Transit Co., Minneapolis); Problems of a Small Road, paper by H. S. Cooper (Galveston Electric Co.); Insurance, H. J. Davies, chairman; Rules for the Construction of Car Houses; Municipal Ownership, C. D. Wyman (Boston), chairman; Heavy Electric Traction, Calvert Townley (N. Y., N. H. & H.), chairman; Compensation for Carrying Mail, G. H. Harries (Washington), chairman; Use of T-Rail in Cities, paper by C. Gordon Reel (Kingston, N. Y.); Public Policy of the Past and Future, paper by C. L. Allen (Utica & Mohawk Valley); Interurban Railway Fares, paper by Theodore Stebbins (New York); Municipal Ownership in Great Britain and the United States, paper by William J. Clark (New York); Public Relations, W. Caryl Ely (Buffalo), chairman.

The officers elected for the coming year were: President, C. G. Goodrich (Minneapolis); First Vice-President, J. F. Shaw (Boston); Second Vice-President, A. W. Brady (Anderson, Ind.); Third Vice-President, T. N. McCarter (Public Service Corporation of N. J.); Secretary and Treasurer, B. V. Swenson (New York).

CLAIM AGENTS' ASSOCIATION.

Meetings of the American Street and Interurban Railway Claim Agents' Association were held at the St. Charles Hotel, Oct. 14 to 16, with H. C. Bradley, Acting President, in the chair. The following papers were presented: Policy of the Claim Department to the Injured Employee, by R. H. Schoenen (Lehigh Valley Traction Co., Allentown, Pa.); The Claim Agent of To-day and His Work, by H. K. Bennett (Fitchburg, Mass.); How I Manage Bad Cases, by H. P. Vories (Pueblo, Colo.); Selecting and Training Investigators and Adjusters for the Claim Department, by E. C. Carpenter (Indiana Union Traction Co.); Making the Claim Department Effective, by C. B. Hardin (United Railways Co., St. Louis); Instruction of Employees in Accident Work, by F. W. Johnson (Philadelphia Rapid Transit Co.).

The following officers were elected for the coming year: President, H. R. Goshorn (Philadelphia Rapid Transit Co.); First Vice-President, A. J. Farrell (International Ry. Co., Buffalo, N. Y.); Second Vice-President, W. F. Weh (Cleveland); Third Vice-President, J. S. Harrison (Jacksonville, Fla.); Secretary and Treasurer, B. B. Davis (Columbus, Ohio).

ACCOUNTANTS ASSOCIATION.

The American Street and Interurban Railway Accountants Association met at the Chalfonte Hotel, Oct. 15 to 17, with President C. L. S. Tingley in the chair. The programme included the following papers and committee reports, some of which will be reprinted in subsequent issues: Amusement Park Accounts, paper by F. J. Pryor (American Railways Co., Philadelphia); Mechanical Devices and other Office Appliances, paper by F. E. Smith (Chicago Union Traction Co.); Where Maintenance Ends and Depreciation Begins, paper by J. H. Neal (Boston Elevated); committee reports on "Standard Classification of Accounts" and "International Standard Form of Report."

The officers elected for the coming year were: President, F. R. Henry (St. Louis, Mo.); First Vice-President, R. N. Wallis (Fitchburg, Mass.); Second Vice-President, W. H. Forse (Indiana Union Traction Co.); Third Vice-President, S. C. Rogers (Newcastle, Pa.); Secretary and Treasurer, E. M. White (Birmingham, Ala.).

Exhibits at the Street Railway Conventions.

The following were among the exhibitors at the American Street and Interurban Railway Association convention at Atlantic City, Oct. 14 to 19. The exhibits were arranged on the Steel Pier and all the booths and decorations were the same as used for the exhibits at

the M. C. B. and M. M. Association conventions last June. The exhibit was larger than in any previous year.

Adams & Westlake Co., Chicago.—Gravity ratchet brake handles; street car hardware; street and interurban railway signal lamps of all kinds; arc and incandescent electric headlights.

Allis Chalmers Co., Milwaukee, Wis.—Three car train (two motor and one trail car) air brake equipment with Allis-Chalmers OB governor and type J emergency valve; single car straight-air brake equipment; sectional models of governor and emergency valve; exhibit of essential parts of Allis-Chalmers improved Parsons steam turbine and large revolving racks containing pages from company's publications.

American Blower Co., Detroit, Mich.—One 80-in. steel plate fan, belt driven; one No. 5, type P, blower with nozzle outlet; one 5-in. x 5-in. type A, vertical engine, driven by direct connected generator run as motor; steam coil heater section; model of dry kiln; one 24-in. "A. B. C." disk ventilating fan.

American Brake Shoe & Foundry Co., Mahwah, N. J.—Exhibit of M. C. B. standard brake heads and shoes; proposed standard brake head and shoe, interchangeable with M. C. B. standards, for electric trucks having wheels of 3-in. tread or wider; proposed standard brake heads and shoes for electric trucks with wheels having treads less than 3 in. wide; standard brake heads and shoes adopted by the Central Electric Railway Association. Brake shoes include "Diamond S," Streeter, "U," and "Special" shoes, plain and flanged, with and without steel back reinforcement.

American Locomotive Co., New York.—Electric motor trucks for medium and high-speed service.

American Mason Safety Tread Co., Boston, Mass.—Samples of American Mason safety treads; Empire safety treads; Karbolith car flooring.

American Railway Supply Co., New York.—Employees' hat and coat badges.

Athu Steel Casting Co., Newark, N. J.—Cast-steel body and truck bolsters; Titan manganese cast steel motor gears for electric trucks.

Baldwin Locomotive Works, Philadelphia, Pa.—Class 90-40 electric motor trucks under W., B. & A. car exhibited on track by Niles Car & Mfg. Co., and equipped with G. E. 125 h.p., A. C. motors on each axle, 5½in. x 10-in. journals, steel tired wheels.

Carey Manufacturing Co., Phillip, Cincinnati, Ohio.—Samples of asbestos paper and millboard, all weights; asbestos wick, rope and sheet packing; 85 per cent. magnesia coverings; cork and wool felt coverings for low temperature insulation; magnesia flexible cement rooting.

Chicago Pneumatic Tool Co., Chicago.—Full line of electric and pneumatic tools; electric drills for A. C. and D. C. current, sizes from ¾-in. to 3-in.; grinders, tool post, pedestal and portable types; electric hoists, 250 lbs. to 2,000 lbs. capacity; electric track drill for bonding; electric drill for driving screw spikes.

Consolidated Car Heating Co., New York.—Electric car heaters, longitudinal and cross-seat types; portable vestibule heater; car heater and headlight switches; automatic cab heater switch; 600-volt signal system to replace dry batteries, to enable passengers to signal motorman or conductor; air motor system for operating doors of electric cars.

Cook's Standard Tool Co., Kalamazoo, Mich.—Standard car and track jacks; Standard and Climax track drills; track tool grinders and high speed drill bits; cattle guards.

Crocker Wheeler Co., Ampere, N. J.—Photographs of large power-generating stations.

Curtain Supply Co., The, Chicago.—Curtains of Pantasote, Oakette and Crown materials, equipped with Forsyth No. 86, Ring No. 88 adjustable and self-righting fixtures; Keeler eccentric fixtures for closed cars; Acme, Climax and Forsyth cable fixtures; Ring closed groove fixtures for open cars and for Brill semi-convertible cars.

Dearborn Drug & Chemical Works, Chicago.—Boiler compounds and methods of water treatment; samples of oils and greases.

Dixon Crucible Co., Jos., Jersey City, N. J.—Structural steel building painted with Dixon's silica-graphite paint; samples of graphite pencils, crucibles, lubricants; graphite gear grease; motor brushes; graphite products particularly adapted to street railway use.

Duff Manufacturing Co., The, Allegheny, Pa.—Duff ball-bearing jacks; Barrett trip jacks, Barrett automatic lowering jacks; Barrett armature lifts.

Edwards Co., The O. M., Syracuse, N. Y.—Exhibit of 26 designs of window fixtures; four designs of vestibule trap doors; shade rollers and roller sash balances; window fixtures for drop sash.

Electric Storage Battery Co., Philadelphia, Pa.—Type R 83 chloride accumulator cell of 5,000 amperes capacity; smaller cells for signal work, spark coils, etc.; carbon regulator; recording and regulating hydrometers; automatic cell filling apparatus; apparatus for regulating A. C. loads.

Evans, Almirall & Co., New York.—Photographs and plans of installations of the Evans Almirall system of water heating by forced circulation with exhaust steam.

Galena Signal Oil Co., Franklin, Pa.—Reception booth.

Garlock Packing Co., Palmyra, N. Y.—Samples of fibrous and metallic packing.

General Electric Co., Schenectady, N. Y.—Parts of 1,000 k.w. Curtis turbo-generator; G. E. railway motors; air-brakes; control apparatus; full line of electric specialities.

Gold Car Heating & Lighting Co., New York.—Exhibit of electric heaters and switches.

Goldschmidt Thermit Co., New York.—Specimens of work done with thermit, including welded motor cases, pipe joints, rails; specimens of metals free from carbon, including metallic manganese, chromium, molybdenum, ferro-vanadium, manganese-zinc, manganese-copper, manganese-tin, ferro-titanium, ferro-tin, etc.; crucibles, mold boxes and other apparatus used in the thermit process. Demonstrations out of doors of thermit welding of rail bonds, gear cases, etc.

Gould Storage Battery Co., New York.—Types S, U and O storage batteries in lead lined tanks; type O battery in Appert glass jar; sets of types WS and X storage couples; samples showing development of plates and photographs of storage battery installations.

Grip Nut Co., Chicago.—Square and hexagon grip nuts in all sizes.

Howe Sand Dryer, C. F. Towne, Sales Agent, Binghamton, N. Y.—A 10-ton capacity Howe sand dryer in operation; model of 20-ton capacity dryer, showing arrangement of vapor boxes and steam coil pipes.

Johns Manville Co., H. W., New York.—Victor combination meters, both portable and switchboard types; overhead line material; Noark fuses; Transite asbestos fireproof lumber; rail bonds; asbestos pipe covering, roofing and packing; J. M. friction tape and other insulating and fireproof materials.

Kalamazoo Railway Supply Co., Kalamazoo, Mich.—Root snow scraper and flanger; Improved Moore track drills; track drill chuck; high-speed track drill bits; Kalamazoo reinforced pressed steel wheels.

Kinnear Mfg. Co., Columbus, Ohio.—Full-size rolling steel doors for car barns, operated by chain and combined crank and motor hoists.

Lackawanna Steel Co., New York.—Abbott rail joint plates; Abbott composite steel and concrete tie; Abbott track gage plate.

McConway & Torley Co., The, Pittsburgh, Pa.—Pair of model cars fitted with Janney M. C. B. coupler and radial draft gear as designed for electric interurban and street cars, sample of Cox rail joint.

Maryland Railway Supply Co., Baltimore, Md.—Section of track showing the "Spike Strut" rail fastener as applied to standard T-rail and ties; a longitudinal section through a tie, exhibiting the action of the "Spike Strut" on the wood fiber and position assumed when driven home; Witherbee storage battery. Monarch metal polish.

Mummert, Wolf & Dixon Co., Hanover, Pa.—The "Plurality Die" bolt cutter; samples of bolt cutting dies.

National Lock Washer Co., Newark, N. J.—Models of car windows fitted with National cam curtain fixture; balance protected groove curtain fixture, sash lock and sash balance; samples of lock washers in different sizes and styles.

Norton Grinding Co., Worcester, Mass.—Pair of ground car wheels mounted on axle and revolving against indicators to show accuracy of wheels; standard street car axle finished by grinding; photographs of car wheel grinder; two panels showing samples of alundum grinding wheels and India oil stones.

Pantasote Co., New York.—Samples of Pantasote car curtains and seats upholstered in Pantasote.

Pittsburgh Pole & Forge Co., Pittsburgh, Pa.—Sections of tubular iron poles with hot process joints; rail bender.

Quincy-Manchester-Sargent Co., Chicago.—Q. & C. Bonzano rail joints for T and girder rails; Q. & C.-Stanwood car steps; anti-creepers; compromise joints; Samson rail bender.

Rail Joint Co., The, New York.—Exhibit of "Continuous," Weber and Wolhaupter types of rail joints for T and girder rails and compromise joints.

Ramapo Iron Works, Hillburn, N. Y.—Automatic switch stands; switches and frogs; tie plates.

Ridgway Dynamo & Engine Co., Ridgway, Pa.—Booth in concert hall with catalogues and photographs of power plant installations.

Riverside Metal Co., Riverside, N. J.—Reception booth in ballroom.

Samson Cordage Works, Boston, Mass.—Waterproof trolley cord; colored bell and register cord; wire center armature cord; solid braided rope.

Schoen Steel Wheel Co., Pittsburgh, Pa.—Two sets of motor truck wheels mounted on axles taken from service, one freight and one passenger, showing wearing qualities of Schoen rolled steel wheels; full line of sample rolled steel wheels for all classes of electric service.

Sherwin-Williams Co., The, Cleveland, Ohio.—Samples of all kinds of car, locomotive and structural paints and varnishes; pole paint; Insulating varnish and impregnating compounds.

Standard Paint Co., New York.—Samples of Ruberoid roofing, colored roofing and flooring; S. P. C. flexible iron fender paint; P. & B. baking varnishes; clear and black finishing varnish; air-drying and core-plate varnishes; S. P. C. armature and field coil varnish; electrical compounds; insulating tape.

Standard Steel Works, Philadelphia, Pa.—Rolled and forged steel wheels mounted on axles, taken from service; steel-tired wheels with various tire fastenings; pressed steel gears; cast steel gears and forged gear rim; helical and double elliptic truck springs.

Symington Co., The T. H., Baltimore, Md.—Proposed standard journal boxes for electric motor equipment; special journal boxes for third-rail shoe supports, etc.; Symington machine pivot journal box lid; Symington M. C. B. type lid; special journal boxes for street cars with limited clearance; Baltimore ball-bearing center plates and side bearings; Gilebrist rail chairs.

Underwood & Co., H. B., Philadelphia, Pa.—Samples of St. John self-adjusting cylinder packing; portable boring bar in operation; portable nulling machine in operation; portable crank pin turning machine; two-cylinder air motor in operation; portable Corliss valve seat boring bar; vacuum dash pots for Corliss engines.

U. S. Metal & Mfg. Co., New York.—Columbia lock nuts; Victor and Perfect car replacers.

Walworth Manufacturing Co., Boston, Mass.—High and low-pressure valves, steam specialties and tools; Walmanco high-pressure steam joint; safety water column; Neverstick blow-off cock.

Washburn Steel Castings & Coupler Co., Minneapolis, Minn.—M. C. B. type coupler for interurban cars applied with radial draft gear; box pilot coupler for electric locomotives; type K radial traction coupler; couplers for dump and ballast cars.

Western Electric Co., Chicago.—Electrose line insulation; Shelby trolley poles; Kalamazoo trolley wheels and hasps; deltabeston wire; Amazon and Dryfield tapes, and a full line of other electric specialties.

Westinghouse Companies, Pittsburgh, Pa.—The Westinghouse Electric & Manufacturing Company exhibited a full line of single-phase and direct current motors for electric traction; span of catenary construction with pantagraph trolley in operation; arc lamps; 500 k.w. Westinghouse-Parsons steam turbine open for inspection (joint exhibit with Westinghouse Machine Company); Union switch system of multiple control; single-phase electric locomotive (on track space). The Westinghouse Traction Brake Company exhibited AML equipment, electro-pneumatic brake system, portable blowing outfit, AMM and SME equipments, EL electric locomotive equipment, Westinghouse automatic car and air coupler.

Wharton, Jr., & Co., Inc., Wm., Philadelphia, Pa.—Exhibit of manganese steel special track work for steam and electric railways; spring switch throws, anti-kickers, tongue locks and other switch constructions.

Wilson Manufacturing Co., Jas. G., New York.—Sliding swing door with chain hoist; rolling wood door with glass panels for roundhouses; interlocking slat rolling steel door; solid sheet type rolling steel door; also drawings and photographs showing rolling doors electrically operated.

Yale & Towne Mfg. Co., The, New York. Duplex and triplex chain hoists of various sizes; electric trolley hoists; chain blocks; photographs of shop hoists.

Gas Engines in Street Railway Service.*

The Boston Elevated Railway Co. has now been operating gas engine plants for electric generating purposes for more than a year with very satisfactory results. At the Somerville power station there is a pair of gas producers, two gas engines of 600 h.p. and two 350 k.w. generators.

This plant was started in May, 1906, and since then has given continuous, reliable and satisfactory service. There have been no shutdowns, no accidents and no failures. The fuel has been soft coal, the same as used in our steam stations, mostly run-of-mine Pocahontas.

A great deal of water is used for scrubbing the gas and for cooling purposes. The average amount has been 281 lbs. per k.w.-hour. When this water was bought, as it was for a few months, it cost about twice as much as the coal. Since November, 1906, it has been pumped from a very dirty brook by means of two-stage centrifugal pumps, electric driven; and filtering through a pressure sand filter. This outfit has been entirely satisfactory and has given us no trouble. The suction lift is 12-ft. and the pressure at the pumps 30-lb.

The discharge of water from the gas scrubbers is very dirty,

*Abstract of paper presented to the American Street and Interurban Railway Engineering Association, in convention at Atlantic City, by Paul Winsor, Chief Engineer of M. P. & B. S., of the Boston Elevated Ry.

being full of floating lampblack, and is altogether too black to put back into our dirty brook. A sand filter basin 246 sq. ft. in area and tile under-drained, removes all of the lampblack, so that water is being turned back into the brook in a cleaner condition than when it was taken out.

During the first months, back fires and pre-ignitions were much too frequent, occurring almost every day. Lowering the compression on one of the cylinders changes in the igniters, and experience have reduced these troubles so that now two or three weeks are passed without a single one. This plant has proved absolutely reliable. It can be put into service any time in less than five minutes—much quicker than can our steam plants. It can carry good loads and do it continuously. Each unit has carried 450 kilowatts (652 brake horse-power) for an hour with swings to 495 kilowatts (717 brake horse-power).

For the first seven months of this year this plant used 2.034 lb. coal per k.w.-hour, while the steam plants averaged 3.477-lb. per k.w.-hour—a saving of 41.5 per cent. One of the smaller steam plants, containing three 200-k.w. compound condensing engines, used 4.414-lb. per k.w.-hour; this gas station used only 46.1 per cent. as much.

There is good evidence to show that a gas engine plant, making its own producer gas, will operate at least as reliably as a steam plant and will use from 30 to 60 per cent. less fuel, depending somewhat on the size of the gas plant, but principally upon the size of the steam plant. The drawbacks to the gas plant are the high first cost and the smallness of the size of the units, the largest gas engine now built, being of but about 3,000 kilowatt capacity.

Convention of the Superintendents of Bridges and Buildings.

The Association of Railway Superintendents of Bridges and Buildings held its seventeenth annual convention in the Republican Hotel, Milwaukee, Wis., October 15, 16 and 17. President J. H. Markley (T., P. & W.) was in the chair. The convention was welcomed by Mayor Becker, of Milwaukee. R. H. Aishton, General Manager of the Chicago & North-Western, delivered an address, in which he spoke of the importance of the work of this association, and suggested the adoption by it of standard methods and designs covering much of its work and thereby aiding the American Railway Association. The address of President Markley had for its chief theme self-reliance, and the members were urged to cultivate and exhibit this quality in the discharge of their official duties.

The present membership of the association, including nine new members taken in during the convention, is 374. The balance in the treasury is $1,370. H. P. Morrill (C. & N.-W.), C. W. Vandegrift (C. & O.), and J. H. Cummin (L. I.) were elected life members. Suggestions to change the name of the organization to The Railway Bridges and Buildings Association, also to change the time of meeting, were discussed, but both were rejected. The officers for the ensuing year are: President, R. H. Reid (L. S. & M. S.); First Vice-President, J. P. Canty (B. & M.); Second Vice-President, H. Rettinghouse (W. C.); Third Vice-President, F. E. Schall (L. V.); Fourth Vice-President, W. O. Eggleston (Erie); Secretary, S. F. Patterson (B. & M.), (re-elected); Treasurer, C. P. Austin (B. & M.), (re-elected); Members Executive Committee, A. E. Killam (I. C.), J. S. Lemond (Sou.), C. W. Richey (Penna.), T. S. Leake (Mo. P.), W. H. Finley (C. & N.-W.), J. N. Penwell (L. E. & W.). Washington, D. C., was selected as the next place of meeting.

There were two addresses delivered during the convention, the first being by W. H. Finley, Assistant Chief Engineer of the Chicago & North-Western, on the Quebec bridge and the failure of same. It was a discussion of the design of the structure as compared with other notable long-span bridges, particularly the Firth of Forth bridge in Scotland, and of the American type of structure as compared with other types; a denial of the assertion, made in many non-technical quarters, that the attempted span was too great for the present state of the art, and some comment regarding the possible cause or causes of the failure. The second address was by Prof. W. K. Hatt, of Purdue University, on the work of the Forest Service of the United States Department of Agriculture in investigating the strength of structural timber. He explained the elements influencing the strength of such timbers, exhibiting specimens sawed from different kinds of woods, such as long-leaf yellow pine, short-leaf pine, Douglas fir, etc.

Following its peculiar custom, the convention devoted the remainder of the first day and a part of the second to the discussion of last year's reports. Little new information of importance was developed; in fact, this customary threshing over of old straw seems of exceedingly doubtful value, since not only of itself is it of little if any profit, but it curtails seriously the time which ought to be devoted to the new reports. If the association will persist in this practice it should reverse its present procedure, disposing of its new reports first, and then devoting what time may remain to the reports of the previous year.

The standing-committee subject of water supply was the first of the new reports taken up. The report was merely the [illegible] results of some pumping tests made on the Illinois Central railroad. A member asked about the practice at some stations of turning the pump exhaust into the discharge line in order to raise the temperature of the water for locomotive use. No one had any information to offer on this subject, however. The matter of using kerosene in gasolene pumping engines received the next attention. One member reported using this oil after getting the pump started and heated up with the gasolene, saving considerable in the cost of operation. It was stated that gasolene engine makers would equip the engines for the oil, the change for a 10 or 12 h.p. engine, for example, costing about $50. Methods for using the kerosene engine were described. One member complained that in his use of the two fuels he had had trouble with the exhaust, which emitted smoke in variable, indicating imperfect combustion.

On "Fire Protection," standing subject No. 3, there was no report, but the subject was discussed. P. Swenson (Sou.) protects the bridge stringers with galvanized iron and reported that some which had been so covered for 17 years were still in good condition. President Markley allows his timbers to season for a year before covering with metal, which insures longer life through greater freedom from decay. But while the use of the galvanized iron unquestionably prolongs life, it prevents inspection, and is objectionable on this account, as has been brought out before in similar discussions of the subject. Mr. Killam (Int. of Can.) keeps all rotten spots adzed off the tops of the ties and bridge timbers, which has proved an excellent preventive of fires.

Mr. Sibley (N. Y., N. H. & H.) asked if water barrels were effective in proportion to the cost and trouble of keeping them constantly in condition for instant use. Mr. Canty (B. & M.) thought them undesirable and the continual loss of the pails a great bother as well as a continual expense. J. F. Parker said that on the Coast Lines of the Santa Fe they use metal barrels. Those on the bridge or trestle have a piece of burlap convenient for soaking in the water and dashing it on an incipient fire. The barrels at the ends of the bridge have hinged tops that are closed and locked with a switch lock. Queries about avoidance of freezing of the contents of protective barrels in cold weather brought statements that the use of a strong brine prevents this.

There was no discussion or other action on the report on "Fences, Road Crossings and Cattle Guards."

"Preservatives for Wood and Metal" brought out the usual queries and testimony concerning the life of creosoted timber, the amount of penetration obtained, etc. The advantages of crude oil as a preservative were spoken of by some members, but the greatly increased inflammability was a serious objection to its use. However, J. F. Parker reported that the Santa Fe has been using it for 10 years, soaking the timbers for entire bridges, and they give no thought to any augmented fire risk and have no trouble in that respect either.

On the matter of preservatives for metal, Mr. Penwell (L. E. & W.) thought there was nothing that comes up to red lead. Mr. Reid (L. S. & M. S.) told of a tar compound that is being applied to their track elevation bridge floors in Chicago. The workmen call it "dope" and it is highly effective, taking off mill scale when it is removed and leaving the steel surface bright and clean. The great problem, in connection with a suitable and effective preservative, is in getting the steel work properly cleaned for repainting, this being a vital point.

It was decided to make this subject of preservatives for wood and metal a standing committee subject.

In presenting the report on smoke-jacks, Mr. Lichty (C. & N.-W.) spoke of the maintenance troubles that the building department has with these very necessary and usually more or less unsatisfactory features of engine houses. The committee report, which is printed in part on another page, and the discussion in the convention, indicate a general preference for wooden jacks. In reference to the Chicago & Eastern Illinois' wooden jacks, A. S. Markley said they have had the design in use for 10 years or more and all of their houses are so equipped, except one built this year on which they are trying one of the patented materials. He asserted that weather conditions have far more effect on the action of a jack than its form. The drawing of the C. & E. I. jack reproduced in the report shows a cap on the top. This has been dispensed with as being a detriment to the free action of the jack. The amount of rain which the exposed top will admit is unobjectionable. Very few of these jacks, even of the first applied, have had to be removed on account of decay; there has been no trouble whatever from fire, since there is no place for soot and other fire-causing materials to lodge, and they do not have to paint them, relying instead on the soot and moisture to form a coating on the inside, which protects them effectually. Their cost, at present lumber prices, is from $20 to $25.

Mr. Penwell explained that the Lake Erie & Western jack shown in the report is newly adopted by them. It is square in section, costs about $60, and its life, based on past experience, is estimated at seven years.

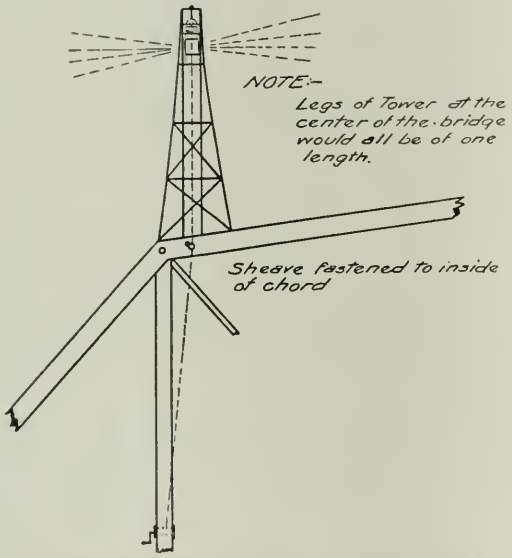
P. J. Onell (L. S. & M. S.) thought the weight of cast-iron jacks a very objectionable feature, 1½ or 2 tons in each panel of the engine house roof being sure to cause trouble unless the roof is specially designed or reinforced to sustain such a load.

Because of its interest it was agreed to continue the subject for another year.

The report on fastenings for freight house and other doors was not discussed.

"Towers and Guides for Drawbridge Lights" likewise received little discussion. The chairman of the committee stated that in investigating the subject he was surprised to discover that 68 per cent. of the railroads of the country have no drawbridges. This matter of character and location of lights for these bridges is controlled by the Government's lighthouse board, of course, the application being the point which each road determines for itself. Ease of placing and removing is the important feature, and the scheme of the Toledo, Peoria & Western shown herewith was considered the best of any reproduced in the report. Concerning it J. H. Markley said: "The one great advantage is that no guide for the lamps is needed until the bottom of the tower is reached; at that point the bale of the cage containing the lamp enters the guide head and is raised to the top of the tower. It matters not how much the lamp swings or in what direction, it cannot enter the guide head but one way, which is the right way. There is no climbing whatever to do; the operator stands on the deck of the bridge and with a ½-in. rope that passes over a pulley at the top of the tower, raises everything into position."

On the subject of protecting steel bridges against the action of



Toledo, Peoria & Western Railway's Method of Hanging Light on Drawbridge.

brine from refrigerator cars, while it was evident that the members are extremely anxious to have this evil corrected in some effective way, but realized their impotence to have the private car line owners respond to any demands they might make, or already have made. J. P. Snow (B. & M.), in a written communication, thought that Government aid should be invoked to compel the private car owners to act in the matter. A. S. Markley said that while the use of concrete decks on bridges eliminated the trouble so far as floors were concerned, that still left the rails unprotected and Government aid could be asked on the grounds of endangering traffic.

The subject of concrete building construction received no discussion. Also the subject of the action of sea water on concrete was only briefly discussed. Mr. Parker (A., T. & S. F.) said they had tried all kinds of imported and domestic cements for this use, and had found only one that is satisfactory, giving the name of the brand.

On "Expansion and Contraction of Concrete Walls," the discussion consisted almost entirely of citations by different members of observations and experiences in regard to the effect of temperature changes on such structures.

The following are the standing committee subjects for 1908.

1. Pile and frame trestle bridges.
2. Fire protection.
3. Fences, road crossings and cattle guards.
4. Construction of cofferdams.
5. Preservation of timber.
6. Coaling stations and cinder pits.

The special subjects for committee investigation and report are:

1. Waterproofing of concrete-covered steel floors and subways.
2. Modern equipment and tools for the erection of steel bridges.
3. Protection of structures against the effects of electric currents.
4. Protection of embankments from the effects of high water by riprap or otherwise.
5. Experience in the use of gasolene and kerosene engines, or combination of same, for water supply, drawbridges, etc.
6. Modern dwelling houses for section foremen and section men in outlying districts.
7. Reinforced concrete culverts and short span bridges.
8. Methods of erecting truss bridges, (a) under traffic, (b) free of traffic.

Bridge and Buildings Supply Men's Association.

At the Milwaukee convention of the Superintendents of Bridges and Buildings the exhibitors held a meeting and formed a permanent organization bearing the name given above. The officers are: President, Charles Ernshaw, Manager Standard Paint Co., New York; Vice-President, W. W. Johnson, Franklin Manufacturing Co., Chicago; Secretary, T. R. Wyles, Vice-President Detroit Graphite Co., Detroit, Mich.; Treasurer, S. Reid Holland, Eastern Granite Roofing Co., Chicago; Executive Committee: For one year, F. J. Johnston, American Hoist & Derrick Co., St. Paul, Minn., and H. A. Neally, Jos. Dixon Crucible Co., Boston, Mass.; for two years, J. T. McGary, American Valve & Meter Co., Cincinnati, Ohio, and C. C. Lazenby, Otto Gas Engine Works, Chicago; for three years, N. C. Durie, N. C. Durie Co., St. Louis, Mo., and J. H. Eames, Sherwin-Williams Paint Co., Chicago.

Following is the list of exhibitors at the convention:

Allith Mfg. Co., Chicago.—"Reliable" round-track door-hangers; fire underwriters' approved automatic door equipment; continuous parallel door equipment for freight stations, warehouses, etc.

American Hoist & Derrick Co., St. Paul, Minn.—Photographs of the "American" ditcher, hoisting engines, etc.

American Valve & Meter Co., Cincinnati, Ohio.—Catalogues, blue-prints, etc., of stand-pipe float valves, tank fixtures, switchstands, etc.

Barrett Mfg. Co., New York and Chicago.—General line of the Barrett specifications for roofing and water proofing; tar-rock sub-floors for machine shops and storehouses.

J. A. & W. Bird Co., Boston, Mass.—"Rex Flintkote" roofing, Ibex insulating and building paper, Bird's bull's-eye belting, Ripolin enamel paint and Rex red roof paint.

Buda Foundry & Mfg. Co., Chicago.—Carborundum tool grinders, ball-bearing bridge jacks, Buda reinforced lever scales and street crossing gates.

Carbolineum Wood Preseeving Co., Milwaukee, Wis.—Photographs of structures using "Carbolineum" wood preserver; testimonials, etc.

Philip Carey Mfg. Co., Cincinnati, Ohio.—Full line of "Carey" roofing for buildings.

Detroit Graphite Co., Detroit, Mich.—Samples of "Detroit" graphite paint, literature, etc.

Paul Dickinson, Inc., Chicago.—Dickinson cast-iron smokejacks and cast-iron chimneys and ventilators for roundhouses; photographs of roundhouses containing the Dickinson devices.

Jos. Dixon Crucible Co., Jersey City, N. J.—Dixon's silica graphite paint for steel bridges.

N. C. Durie Co., St. Louis, Mo., and Chicago.—Malleable iron washers for bridge and building construction.

Eastern Granite Roofing Co., New York. Granite roofing for buildings.

Fairbanks, Morse & Co., Chicago.—Literature descriptive of pumping plants, coaling stations, motor cars, etc.

Franklin Mfg. Co., Franklin, Pa.—Samples of asbestos lumber and shingles.

E. F. Houghton & Co., Chicago.—"Vim" leather packings for deep-well pumps; new "Vim" leather air-brake packings of steer hide, treated by new process.

H. W. Johns-Manville Co., New York and Milwaukee, Wis.—"Maguasite" smokejack, "vitribestos" smokejack, asbestos roofing and pipe covering, "keystone" hair insulator, asbestos building lumber, building papers, etc.; the "Exceloid" roofing.

Chas. R. Long, Jr., Co., Louisville, Ky.—Station and bridge paints.

J. C. McFarland & Co., Chicago.—"Alpha" double-hung hollow metal window frames for office, mercantile and factory buildings; photographs of buildings containing "Alpha" frames.

National Roofing Co., Tonawanda, N. Y.—General roofings, "Hydroclad" double-faced roofing for cement work, "Security" brand of asphalt roofing, and "Permanere" mineral asphalt paint.

Natural Carbon Paint Co., Freeport, Ill.—Samples of metals protected with "Mindura," showing effect of several years' wear under railroad bridges. Samples of pigment and ore from which pigment is prepared.

Otto Gas Engine Works, Chicago.—Photographs and drawings of coaling stations, water-softening plants, etc.

Arthur E. Rendle, New York and Western Paradigm Co., Chicago.—Full-sized models of "Paradigm" skylights and fireproof windows glazed with ribbed glass and wire glass, supplemented with full-sized details of all parts of the structures.

Standard Asphalt & Rubber Co., Chicago.—Waterproofing for concrete structures, bridge floors, etc., damp-proofing for buildings and protection against electrolysis, mastic flooring and brick paving with asphalt filler.

Standard Paint Co., New York.—"Ruberoid" roofing, "Flexlte" colored paints, and "S. P. C." iron paints.

Stover Motor Car Co., Freeport, Ill.—Six passenger gasolene motor inspection car.

Stowell Mfg. & Foundry Co., Milwaukee, Wis.—"Wilbern" adjustable hangers for freight house doors, latches for roundhouse and depot doors, and hangers and fixtures for fireproof doors.

U. S. Wind Engine & Pump Co., Batavia, Ill.—"Mansfield" and U. S. water columns, and U. S. hydraulic valve.

Gifford Wood Co., Hudson, N. Y.—Pamphlets showing ice elevators, conveying machinery and ice tools.

Causes of Defects and Failures of Steel Tires.*

BY GEORGE L. NORRIS, M.E.,
Chemist, Standard Steel Works.

With few exceptions, the tires used in the United States are all made from (acid) open-hearth steel, which, because of its uniformity in quality and cheapness, as compared to crucible steel, has practically driven the crucible steel out of the market. In Europe most tire steel is made by the open-hearth process, and some by the crucible process, but tires of (basic) Bessemer steel are also commonly used. The conditions of service, especially as to wheel loads, are not, however, as severe as in America.

The grade of steel used for tires in Europe is much softer than that used in America, as shown by some of the typical analyses in the table in the next column.

Up to 1890 it was the general practice to make tires from short ingots, each ingot being sufficient to make only one tire. As it is practically impossible to cast an ingot of steel, no matter how small, without pipe and segregation in the upper end, tires made from the short or single tire ingot are liable to contain defects from this cause. In manufacturing from a short ingot no cropping is discarded from the top of the ingot, the only discard being the small disc of metal punched from the center of the bloom.

About 1890 the Standard Steel Works conducted a series of tests comparing the tires made from short or single tire ingots and long ingots from which several tires could be cut, and in which the top portion of the ingot containing the piping and segregation was discarded. A paper on the results of these tests was contributed to the American Institute of Mining Engineers by A. A. Stevenson, M.E. As a result of these investigations the Standard Steel Works adopted the practice of making all tires from bottom poured long ingots, as the only way to reduce to a minimum the number of tires failing in service on account of casting defects in the ingot.

Both the long and short ingots are usually bottom-cast in groups, fed from a central runner. The long ingots are octagonal in section, about 72 in. long, and vary from 13 in. to 20 in. across. The short ingots are usually cylindrical, though conical ingots are common abroad, and generally have a dome shape top. They vary in diameter and height according to the size of tire to be made. Unlike the long ingot which remains fluid for some time and gives an opportunity for the steel to teem, and the gases and impurities to rise to the top, the short ingots set quickly and the piping, gas cavities and other defects, as compared with the long ingot, occupy relatively a larger portion.

Typical Analyses of Tire Steels.

Even with the minimum amount of piping possible, the punching does not always entirely remove the defects, and consequently the tires made from short ingots more frequently contain these defects. The illustrations, Figs. 1 to 12, plainly show the superiority of the long ingot over the short for manufacturing tires of homogeneous structure. Fig. 1 is a full length section of a long ingot, from which the piped portion above the line *a-b* is discarded, while Fig. 2 is a section of the ordinary short or single tire ingot from which nothing is discarded but a small thin disc in punching the bloom. Fig. 3 is a section of a tire bloom from a long ingot. The contrast between it and the short ingot is very marked. Fig. 4 shows the manner of cutting an ingot into tire blooms. Figs. 5 and 6 show the fractures of a long ingot cut up into blooms, and Fig. 7 is an enlarged view of a typical fracture. The central pipe shown in the left-hand blooms of Fig. 6 is punched out in forming the tire. Fig. 8 is an etched section of a tire made from a long ingot bloom, and shows the homogeneity of structure obtained by this method of manufacture. Figs. 9, 10 and 11 show etched sections of tires made from short ingots, illustrating the presence of the original casting defects. Fig. 12 is a section through a conical ingot such as is used to some extent in Europe. For soundness this possesses no advantage over the ordinary cylindrical, short ingot.

Tire Tire Tire. Discard.

Fig. 4.

During the past few years, owing to increased speeds, wheel loads and severity of service, steel tires have more frequently developed that condition on the tread, commonly termed "shelly" or "flaky" spots. This condition is also often referred to as "soft spots."

Fig. 5.

*A paper read at the October meeting of the Western Railway Club.

"porous," or "honey-combed metal," "sand holes" and "unwelded metal." It is in the nature of a breaking down of the tread into flakes or scales by numerous cracks which penetrate into the tire, principally in the area of rail contact. A tire developing such a condition is not considered dangerous, and consequently is not always promptly removed. Hence the shells or flakes rapidly spread over a greater length of the tread, and the cracks penetrate so deeply into the tire that a large amount of steel is wasted in turning up the tire to remove all traces of the shelliness. Fig. 13 shows the appearance of the tread of a typical shelly tire.

The causes which produce this condition of shelly or flaky treads may be inherent defects in the steel, such as pipe, gas cavities, slag and segregation, but are more commonly the conditions of service.

Inherent defects in the steel are confined almost exclusively to tires made from short ingots and rarely occur in tires from long ingots, for the reason that the top portion of the ingot containing the pipe, slag, segregation and gas cavities is discarded. The relation between the piping and casting defects of the ingot and the shelliness of the tire is plainly shown in Fig. 9. Usually the appearance of the tread of a shelly tire, due to inherent defects in the steel, is different from the ordinary shelliness, due to service conditions. Instead of the tread showing spots with numerous thin flakes, as in Fig. 13, there is apt to be only a single spot from which a large shallow piece has spalled out (see Fig. 14), or there may be several spots where pieces have broken out of the tread, leaving distinctly granular fractures, as in Fig. 15. An etched transverse section of this tire (see Fig. 16), shows that these defects are due to entrapped slag.

As has been stated, by far the greater number of shelly tires are

Fig. 7.

Fig. 6.

produced by conditions of service, and in the case of tires from long ingots this is practically the sole cause of this trouble. The conditions of service most prominent in causing shelliness are: Brake burns, unequal diameters of wheels upon the same axle, which may result in causing the wheel to become eccentric through slipping; eccentricity of the wheel, in its turn causing pounding. These conditions are all intensified by speed and load, but more especially by speed. It is probable that what is commonly termed "brake burn" is the chief cause producing shelliness. When the brakeshoe retards the revolution of the wheel to the extent that the distance traversed by the car exceeds that rolled by the wheel, a high degree of heat is generated locally on the tread, due to the slipping of the wheel on the rail. This results in the production of several small, hard slip spots, or brake burns on the tread within the limits of the rail contact. These small hard spots are usually covered with irregular heat cracks, which through the pounding of the wheel on the rail and joints, and under the influence of various stresses to which the tires are subjected, tend to penetrate into the tire along the line of the resultant forces, causing the steel to break up into shells or flakes. In the case of chilled wheels the brake burns produce what is termed comby tread, and the penetration of the cracks is along the cleavage planes of the white iron crystals forming the chill and perpendicular to the tread.

Many of the hard slip spots developed disappear through the friction of the tire on the rail, or under the scouring or tooling effect of the brakeshoe, without breaking up into shelly or flaky spots. In those cases, eccentricity of the wheel results, and long, rolling flats are produced, sometimes 30 in. to 40 in. long and as much as $\frac{1}{2}$ in. deep at the lowest point. Frequently such wheels will have two rolling flat spots. The severe punishment through pounding and slipping which eccentric wheels undergo, produces excessive and deep shelling. That the wheels become eccentric or out of round through the hard, slip spots has often been tested, by putting a pair of wheels showing such spots, but not shelled, into the lathe. It is not infrequent to find that the tool will skip for a space of 2 to 3 ft. while cutting to a depth of $\frac{1}{16}$ in.

It is conspicuous that some of the roads having the greatest

Fig. 8.

Fig. 9.

Fig. 11.

Fig 12.

Fig. 10.

Fig. 14.

Fig. 13.

Fig. 16.

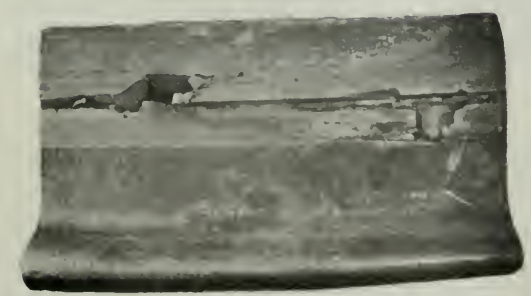

Fig. 15.

amount of trouble from shelly tread tires find the trouble most serious on low-grade divisions with infrequent brake applications, and on the heavy grade or mountainous divisions of these same roads the trouble is only slightly developed. This indicates that the long continued brake application on the heavy grades is effective in grinding off the small hard spots, or in other words the tread is worn down faster than the rate of penetration of the heat cracks in the burned or slip spot area.

The formation of the shelliness from the hard, slip spots, or brake-burned areas is very well shown by the illustrations. Fig. 17 is a view of a tire showing several of the brake-burn spots, one of which has started to form a shelly spot. Fig. 18 is a section through this spot on line *a-b* polished and magnified two diameters. The white area *a-b* is very hard and might be likened to a case-hardened spot. Fig. 19 is a section through another spot on the same tire, polished and slightly etched to emphasize the contrast. It is the breaking up of these hard areas that originates the detailed cracks which penetrate into the tire and cause shelliness. Fig. 20 is an etched section of a shelly tire, and shows no inherent defects. Fig. 21 is a view of the tread of the same tire which shows an advanced stage of shelliness. Fig. 22 is a section cut from the tire as indicated on Fig. 20, and polished and magnified 40 diameters. It corresponds to the hard area shown on Fig. 18, the letters *a-b* on Fig. 22 marking the limit of depth of the hard spot. The metal between *a-b* and the tread shows a badly cracked condition, and it is through the penetration and extension of these cracks that shelliness is caused and spreads as long as the tire remains in service after this condition originates. Figs. 23 and 24 are etched sections to show the microstructure of Fig. 22 magnified 50 diameters. In both Figs. 23 and 24 the line *a-b* corresponds to *a-b* in Fig. 22. In the case of Fig. 23, which is located outside of the cracked or shattered area, cleavage has not taken place along this line as is the case in Fig. 24. The microstructure of the metal between the line *a-b* and the tread is distorted, but there is no tendency indicated toward separation of the micrograins along the lines of ferrite. This would be the case if the shelliness was due to microscopical particles or filaments of entrapped slag, as these usually occur in the ferrite. The microstructure below the line *a-b* is entirely unaltered and the line of demarkation is very sharp, cutting as it often does through the micrograins and separating them into distorted and undistorted portions. Figs. 25 and 26 illustrate clearly how these cracks extend and multiply. Fig. 25 is a polished but unetched specimen from a

Fig. 17.

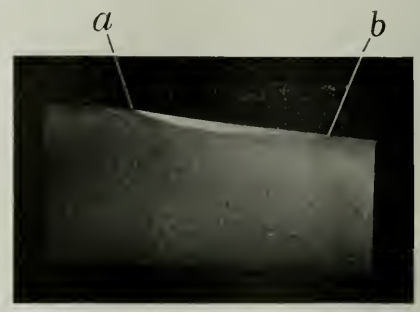

Fig. 18.

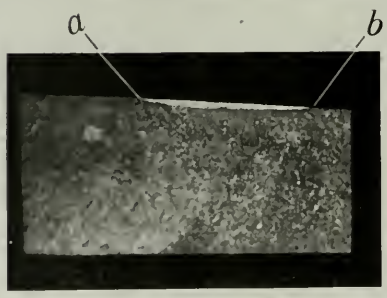

Fig. 19.

Fig. 20.

Fig. 21.

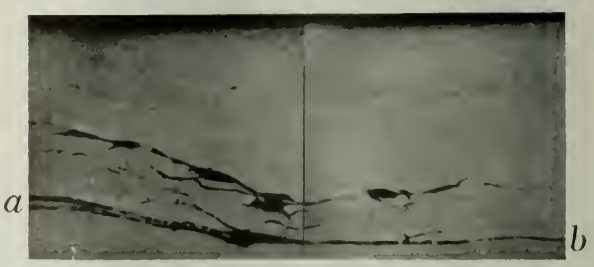

Fig. 22.

tire in the initial stages of shelling, magnified 35 diameters. Fig. 26 is a portion of the same specimen, etched and magnified 50 diameters. There is no evidence of any inherent defects. Fig. 27 is a longitudinal section of a shelly tire and gives a good idea of the manner in which the shell cracks penetrate into and break up the steel. Neither this section nor the transverse section, Fig. 28, shows any inherent defects.

It is notable that driving tires are practically free from shelling, which certainly would not be the case if the shelliness was largely the result of inherent defects in the steel, improper treatment during manufacture, or defects of workmanship. The few cases of driving tires which have been examined were due to inherent defects in the steel. Brake burns and slip spots are apparent on the tread of driving tires, but the rate of penetration of the cracks, owing to their greater diameter and flatness of arc, is slow, and consequently their removal by brake wear is quite certain. Furthermore, the service conditions of driving tires are less severe than those of tender, trailer and coach wheels. The number of revolutions is less, the area presented to the rail is greater, and the brake application is more effective. The static wheel load for driving wheels of modern high-class passenger locomotives averages about 22,000 lbs. per wheel, while in the case of many trailing wheels and wheels under large capacity tenders, the wheel load is far great and is carried on a smaller area of rail surface.

The liability to shell is far greater in the case of tender wheels under heavy tanks in through passenger service than any other class of equipment. The service conditions of the tender wheels are the hardest of all the wheels, owing to the constantly shifting and varying load carried. The varying load not only affects the percentage of brake application, giving a variation in the retarding effect of the brakeshoe on the wheels, and increases the liability to

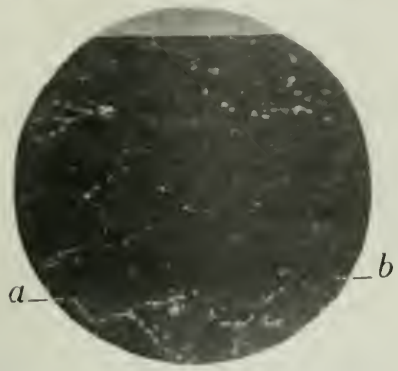

Fig. 23.

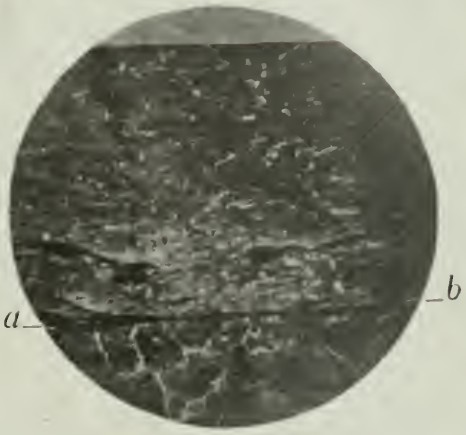

Fig. 24.

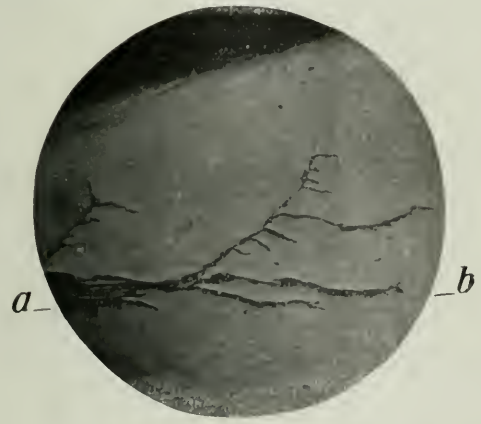

Fig. 25.

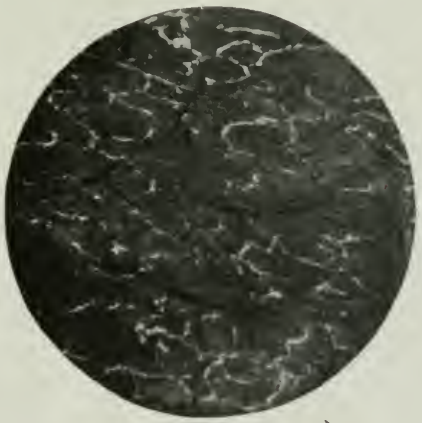

Fig. 26.

Fig. 27.

Fig. 28.

brake burn spots, but also causes the tender to ride rough and to pound the wheels. This is on account of the stiffness of the springs, which are designed for full load, but carry a light load much of the time in service. There is a marked increase in the number of shelly tires during the winter season, which is natural, as all conditions of operation are more severe. In general the wheels under tenders do not receive the same attention as wheels under coaches. The inspection may be as close, but it has been observed that those roads having the most trouble from shelly wheels keep tender wheels in service that they would not tolerate under coaches. This observation is confined by the records of the wheel lathes which show an average of about twice as much metal turned off the tender wheels as from the coach wheels.

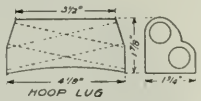
Trailer wheels probably rank next to tender wheels in tendency to develop shelliness. Most of the cases of shelly trailer wheels observed have been under engines in through passenger service, and this wheel load has averaged 20,000 lbs. and upward per wheel. This great load, with the tendency of the trailer wheels to "pick up" on the application of the brakes and develop brake burn spots is doubtless the reason why they have given so much trouble from shelliness.

Coach and engine truck wheels come next in order. Most of the shelly coach wheels have been under heavy cars in through passenger service. The majority of cases have been distinctly traceable to brake burns.

(To be concluded.)

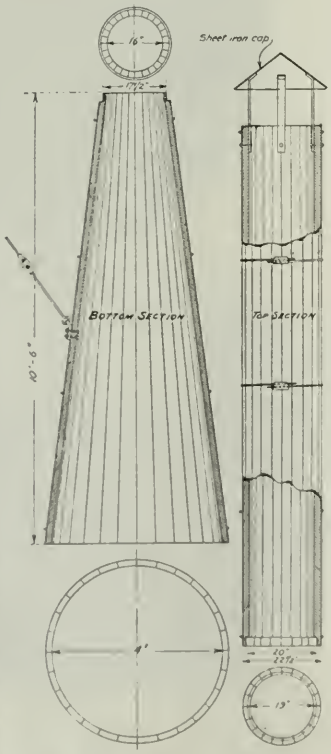
Smoke-Jacks for Engine Houses.*

The committee is as unable, after nine years have elapsed, as was the committee which reported in 1898, to say which is the best form and best material for engine house jacks. It is safe to say, however, that some of the compositions of asbestos that were new at that time have proved to be failures, and railroad men are as eager as ever at the present time to find a substitute for the many kinds of cumbersome and expensive jacks now in use, which will be reasonably cheap in first cost and easy to maintain in service.



Jacks are made in all conceivable shapes, sizes and forms to meet certain requirements and conditions in the different kinds of engine houses, but generally they are classed as two distinctive types, the one having the telescopic drop section fitting down closely over the stack of the locomotive after it has been placed, and the other having a large flaring section which is stationary, under which the engine may be placed without accuracy, and is larger proportioned in every way than the first-named type. The latter-named style answers to a greater extent for ventilation on account of its larger dimensions and must necessarily allow the escape of more heat in cold weather unless special arrangements are made to avoid it.

It is well known that the various forms of iron and steel when used for this purpose decompose very rapidly, cast iron being bet-



Chicago & Eastern Illinois Wooden Smoke-Jack. Cost in Place, $20 to $25.

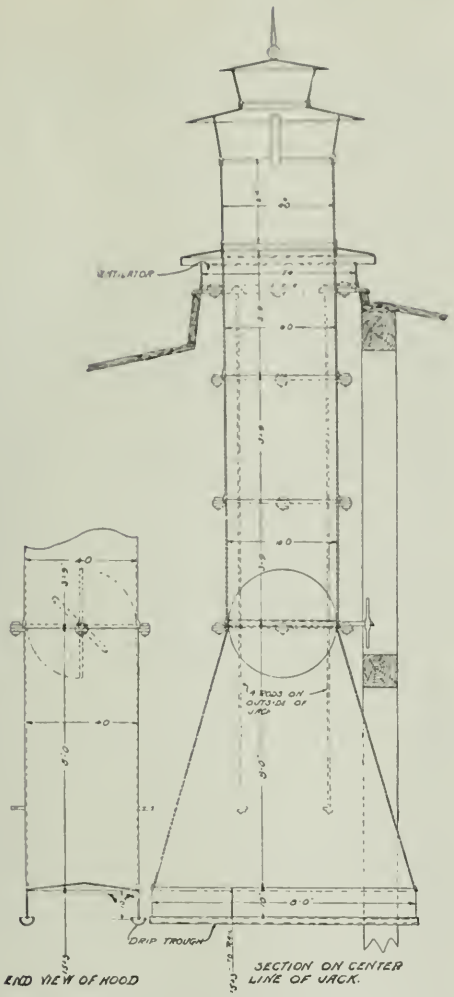
Erie Wooden Smoke-Jack. Cost About $100.

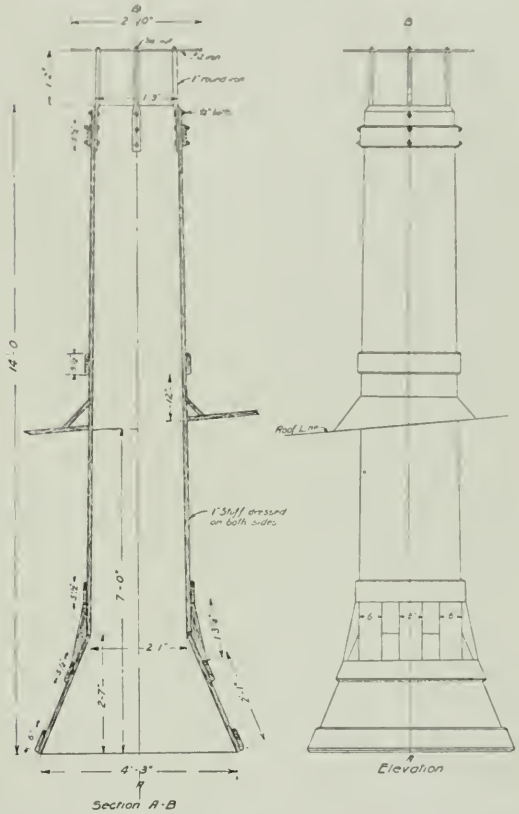
*From a committee report to the Milwaukee convention of the Superintendents of Bridges and Buildings.

ter adapted than wrought iron or steel, but these when made thick enough to last any considerable length of time are cumbersome and expensive and often crack during the first season owing to contraction and expansion. The sheet iron jacks last ordinarily only two to five years.

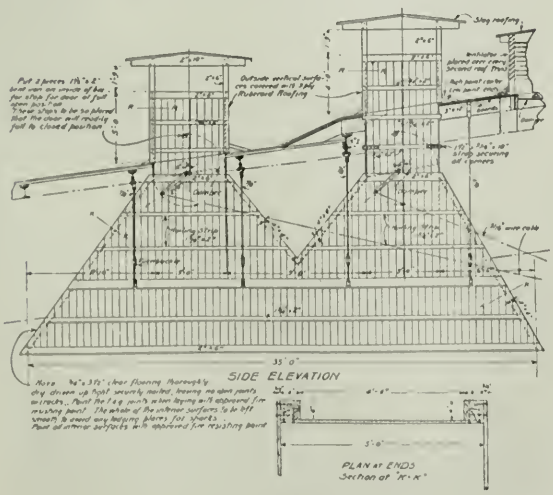
Stoneware or earthenware, commonly designated as tile, has been extensively used for jacks, and a considerable number of such jacks are still in use, but in northern climates they are being gradually abandoned and replaced with other kinds on account of being cumbersome and cracking when subjected to extreme heat and cold. This form of jack usually consists of several joints of tile mounted

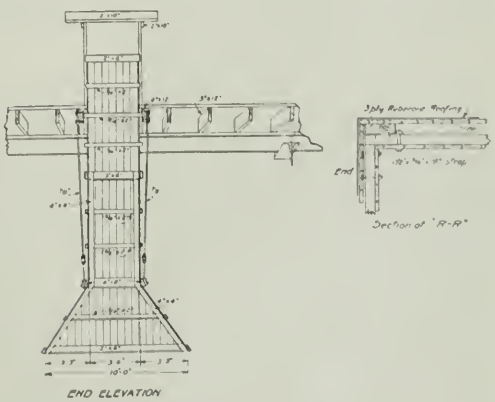


Dickinson Cast Iron Smoke-Jack; Pennsylvania Railroad.



Lake Erie & Western Wooden Smoke-Jack. Cost in Place About $60.





Pittsburg & Lake Erie Wooden Smoke-Jack. Cost About $300.

upon a roof casting and surmounted by a sheet metal cap and having either a telescopic section or a stationary hood under the roof, made in either case of iron. This lower section and the cap are subjected to rapid disintegration and have to be renewed frequently.

Wood seems to withstand the action of the gases better than metal and it has been successfully used by some roads for many years without any trouble whatever, while other roads experienced loss from fire and many do not use them for fear of similar results.

Attention is directed to a statement made on page 184 of the Eighth Annual Proceedings, wherein a member stated that they had been using wooden jacks for 20 years on every engine house but one (which was equipped with cast-iron), and he was sorry that the one exception did not have wooden jacks. He further stated that they use the stationary style (without drop section), and that they did not use any sort of protection against fire in the way of sanding or fireproof paints, being careful in the use of them until they became saturated or coated inside from natural use. Others have used the wooden jacks successfully for years. The committee would therefore earnestly recommend a careful investigation of wooden jacks to ascertain if possible whether the fault has not been in the style or methods of construction, and misuse where failures have occurred, rather than in the kind of material. It is quite certain that a wooden jack fitting closely over the mouth of the stack, or nearly so, would be more likely to cause trouble than a large-mouthed jack, where plenty of air passes through with the smoke and gases.

Various compositions of asbestos, cement, etc., have been extensively experimented with in recent years for this purpose, many of which proved to be short lived, and none to date have stood the test sufficiently long to prove that they are worth the price which is charged for them, regardless of the fact that they may be guaranteed by the manufacturers for a specified term of years.

The report is signed by M. J. Flynn, C. A. Lichty, D. L. McKee and A. F. Miller.

Efficient Operation on the New York Central.

The possibilities in handling dense traffic with the aid of block signals are well shown by the following record at three block stations on the Hudson division of the New York Central for the 24 hours from midnight to midnight, October 18 and 19:

Sixty-eight westbound and 71 eastbound trains passed block station 58, which is just south of Poughkeepsie—a train movement for each 21 minutes of the 24 hours.

At block station 31, just south of Croton, there were 96 westbound and 98 eastbound trains—one movement every 15 minutes of the 24 hours.

At block station 9, between Spuyten Duyvil and Yonkers, there were 107 eastbound and 104 westbound trains—a train movement every 13 minutes of the 24 hours.

Of these trains there were 22 eastbound and 20 westbound through freights, which handled 2,028 cars; in addition to this there were six work trains in service south of Poughkeepsie.

As a particular indication of the density of the traffic: At one period of the day seven trains passed block station 9 westbound in 24 minutes and eight trains eastbound passed in 33 minutes; a train an average of each 4⅛ minutes eastbound and 3¼ minutes westbound.

The efficiency is reflected in that two through eastbound passenger trains were delayed a total of 12 minutes; two eastbound locals a total of 39 minutes; one westbound local 12 minutes, and two westbound through passenger trains a total of 28 minutes, one of which overcame the delay and arrived at Albany on time.

Report on Signal Lamps—Railway Signal Association.*

Your committee concurs in the reports made at the annual meetings of 1905 and 1906. It would be desirable to arrive at definite standards of dimensions, so that the present confusion of lamps and brackets could be eliminated. There are many variations in the vital measurements, which affect their fitting properly, which are just enough off to prevent interchangeability, and yet are not so radical but that they might be modified to a common standard. With very few exceptions, 5 in. and 5⅝ in. are the sizes of lenses everywhere.

Experience seems to show that the white bullseye, which was formerly used so generally as a back-light, is not now deemed satisfactory, and we find its use is being rapidly dispensed with; in its place plain ground glass is used, which serves every purpose, and eliminates the possibility of a confusion of signals.

In previous annual reports the Lamp Committee has spoken of the prism glass reflector. It is meeting with considerable favor, due to its ability for increasing the intensity of the light, and there being no deterioration in its reflecting powers from continuous service, as is found in metal reflectors. This reflector is, of course, applicable only to the one-lens lamps.

It would be advisable to continue this committee for another year, to study the question of proper maintenance of signal lamps. By a more thorough education in this direction, general efficiency will be improved. Some roads have drawn up rules for the care and handling of signal lamps, and their experience would be of material assistance in compiling a complete set of rules.

Harry Hobson, chairman; C. S. Stephens, C. J. Cannon, F. E. Wass, Chas. Geary.

*Condensed

The 1907 Grain Crop.

The following estimates are taken from the *Journal of Commerce*:

Indicated Harvest for 1907.

	October, 1907. Bushels.	Acres.	Harvest of 1906. Bushels.	Acres.
Winter wheat*	409,500,000	28,132,000	492,888,000	29,599,961
Spring wheat	216,067,000	16,464,000	242,372,966	17,705,868
Total wheat	625,567,000	44,506,000	735,260,966	47,283,829
Total corn	2,491,715,000	98,099,000	2,927,416,091	96,737,581
Total oats	741,521,000	31,491,000	964,904,522	30,958,768
Total barley	147,192,000	6,152,000	178,916,484	6,323,757

The official preliminary estimates of yields per acre compare as follows:

	Oct., 1907	Oct., 1906	Oct., 1905	Oct., 1904
Winter wheat	*14.6	16.7	14.3	12.3
Spring wheat	13.1	13.7	14.7	12.7
Oats	23.5	31.2	33.9	32.1
Barley	23.9	28.3	26.7	27.2
Rye	16.4	17.0	16.6	15.2

*August report; nothing later.

The condition of corn on October 1 was 78, as compared with 80.2 last month, 90.1 on October 1, 1906, 89.2 at the corresponding day in 1905 and a 10-year average of 79.6.

The following table shows for each of the 25 principal corn states the condition on October 1 in each of the last three years and that on Sept. 1, 1907, with the 10-year averages:

States.	Oct. 1, 1907.	Sept. 1, 1907.	Oct. 1, 1906.	Oct. 1, 1905.	Ten-year average.
Illinois	86	86	87	96	84
Iowa	76	76	97	90	82
Nebraska	69	75	90	95	67
Missouri	84	86	90	94	80
Texas	78	80	76	76	73

Foreign Railroad Notes.

In Munich there has been a strike of teamsters, including those of the firms which have contracts with the State Railroads to deliver freight to consignees from the stations. The authorities gathered as many employees as possible, chiefly trackmen, to drive the teams, disclaiming any intention to affect the result of the strike, but claiming that the railroads must make every possible effort to fulfil their contract to deliver freight to consignees.

The length of the completed railroads in French Indo-China, which have for years been reported to be 1,491 miles in the statistics of the railroads of the world, was really at the close of 1906 only 940 miles, according to the French Colonial Minister. All lines but one earn more than their expenses. They have cost about $25,000,000. The Yunnan Railroad in China, which is a French enterprise connecting with a colonial railroad, has so far cost $18,900,000 for 292 miles completed, and has met with serious obstacles.

GENERAL NEWS SECTION

NOTES.

Los Angeles papers report the establishment in that city of schools of telegraphy by both the Atchison and the Southern Pacific companies.

The Western Union Telegraph Co., which has been paying operators more than double pay since the strike of a few weeks ago, on October 19 restored the former conditions, but announced that increased rates of regular pay would soon be promulgated.

The Texas Railroad Commission has modified its order, recently issued, requiring railroads to report accidents by telegraph, and now directs that the reports be sent by mail. This change, it is said, is due to the fact that the railroads have sent the telegrams collect. The commission had no appropriation for making the payments.

The Wabash and the Chicago & Alton have arranged to jointly operate as double track their single-track lines from Mexico, Mo., to Clark, 26 miles. The Alton tracks will be used for all eastbound trains of both roads, while the trains going west will go over the Wabash. Automobiles will be run between the two stations at Sturgeon.

In competing for eastbound steamship business, the Erie, it is said, has filed a rate of $10 for second class tickets from Chicago to New York. This rate, which is a cut of $6.75, will become effective November 20 and will be in effect at least 30 days. A special meeting of the Central Passenger Association has been called for October 25 to decide what action other trunk lines will take.

The Railroad Commission of Canada has sent to all the railroads a circular reminding them that 30 per cent. of their engines and cars have defective safety appliances, the inspectors of the Commission having lately made extensive examinations of cars. The Commission expresses the hope that the railroads will correct these defects and thus obviate the necessity of further action by the Board.

At New Durham, N. J., this week 10 freight conductors and brakemen of the New York Central (West Shore) were arrested and held in $1,000 bail each, on charges of larceny. Detectives of the road, disguised as tramps, hid in the yard where considerable quantities of silks and other valuable freight had been stolen from cars, and, after watching three or four nights, found the evidence for which they had been looking.

The Union Pacific road is going to resume the practice of allowing the extension of the limits of round-trip tickets in case of the sickness of the holder, on the presentation of a physician's certificate to that effect. The Interstate Commerce Commission has ruled against the practice, but the U. P. holds that where the privilege is extended to all alike under similar circumstances, and the practice is set forth in the tariffs, it is perfectly legal.

Prof. Henry C. Adams, who is preparing the regulations under which the Interstate Commerce Commission is to keep its records of railroad operations and accounts, has invited to advise him in his work President F. A. Delano, of the Wabash; Vice-President Julius Kruttschnitt, of the Southern Pacific, and Theodore Hinchman, a Consulting Engineer, of Detroit. These gentlemen will give their attention more particularly to the question of depreciation of property and other subjects on which Professor Adams desires the results of railroad experience.

On the occasion of the convention of the American Association of General Passenger and Ticket Agents, in Washington last week, a committee conferred with the Interstate Commerce Commission, with a view to a possible complaint to test the legality of the practice of employing ticket agents on commission. It is said that some railroads now employ doctors, dentists, hotel clerks and liquor men to sell tickets; and that in these cases the purchaser and the agent often divide the commission allowed by the roads on such sales, which, of course, constitutes a discrimination in passenger rates.

No bill of lading can be drafted which will meet the approval of the shipper, the railroad and the banker, but the Interstate Commerce Commission, following its hearings on the subject, intimates that it will undertake the task of formulating and promulgating a uniform bill in the not distant future. As the basis of its work in this direction it will take the bill prepared by the special committee representing the three interests involved. The criticisms passed on this bill during the hearings will be taken into consideration, and the Commission has invited suggestions in writing, such suggestions to be in before November 1. From the position taken by some of the railroads at the hearing, it is a foregone conclusion that the Commission's bill of lading will be assailed at many points. The authority of the Commission to promulgate the bill will be questioned, and its character as a negotiable instrument will be tested in the courts. The bankers, moreover, declare that no matter what the Commission may say as to the negotiability of a bill of lading, that quality cannot be given to the instrument without authority of law.

The extensive installation of block signals on the Union Pacific and Southern Pacific within the past three years is well known. At the present time and with the completion of additional installations already authorized the two systems will have a total of 5,7[illegible]. The Union Pacific has in operation, equipped with automatic signals, 459 miles of single track and 244 miles of double track. An additional 176 miles of double track and 197 miles of single track will soon be put into service. More than 500 distant switch signals, protecting the movement of trains approaching 158 stations and sidings on the main line of the Kansas and Colorado divisions, have also been put in place.

In consequence of the reduced rates now prevailing in the state of Pennsylvania the Baltimore & Ohio has withdrawn the Washington stop-over privilege on tickets sold from Pittsburgh to Philadelphia. The rate between the cities named has had to be reduced to $6.98, which is a dollar less than the regular fare from Pittsburgh to Washington. Passengers for Washington are buying Philadelphia tickets and throwing away the Washington-Philadelphia portion. Those with baggage cannot take advantage of this, as the baggage has to be checked through to Philadelphia. On through tickets to Baltimore, New York and other places not in the state of Pennsylvania the Washington stop-over is continued.

Press despatches from Montgomery, Ala., say that, following a conference between the President of the Southern Railway and the Governor of Alabama, that road is to adopt, on December 1, throughout Alabama, a general passenger rate of $2\frac{3}{4}$ cents a mile, and freight tariffs based on the rates charged in Georgia; and that the lawsuits now pending to test the constitutionality of the 2-cent fares and other low rates ordered by the Alabama legislature, are to be withdrawn. In North Carolina it is reported that a somewhat similar compromise will soon be agreed upon between the Governor and the officers of the principal railroads. The lawsuits are to be dismissed and the railroads are to adopt and use, until the next session of the legislature, the low rates ordered by the state.

Sunday Law in Massachusetts.

The following law, providing for one day's rest in seven, is now in force in Massachusetts:

Section 1.—Except in cases of emergency or except at the request of the employee, it shall not be lawful for any person, partnership, association or corporation to require an employee engaged in any commercial occupation, or in the work of any industrial process, or in the work of transportation or communication, to do on the Lord's day the usual work of his occupation, unless such employee is allowed during the six days next ensuing 24 consecutive hours without labor.

Section 2.—This act shall not be construed as authorizing any work on the Lord's day not now authorized by law; nor as applying to farm or personal service, to druggists, to watchmen, to superintendents or managers, to janitors, or to persons engaged in the transportation, sale or delivery of milk, food or newspapers. * * * Penalty $50.

Economical Loading of Cotton.

"The economic necessity which demanded cars of increased carrying capacity, demands that the increased capacity be utilized. The car shortage is not due so much to a real deficiency in the number of cars as it is to the fact that the cars in service are not being used to the best advantage. With careful loading 51 uniform bales of uncompressed cotton can be loaded in a standard box car, and an average of 42 bales can probably be obtained. If, in loading uncompressed cotton for its initial movement to the compress this can be accomplished, the efficiency of equipment will be increased approximately 70 per cent. over present average practice (25 bales).

"For many years the unit of loading compressed cotton has been 50 bales to the car, because of the practice in selling cotton to use a unit of 100 bales, and because the standard car when this unit was adopted was 34 ft. in length. The present standard car is 36 ft. long, and it is easy to load 60 bales, as now compressed, on the floor. Fifteen additional bales can be placed on top so that it is now easy to load 75 bales of compressed cotton in a box car of the present standard, and the railroads are trying to secure such loading.

"Some of the compresses have contracted to make 75 bales the minimum load. We hope to make contracts with all of them on this basis. Many of the southern spinners have agreed to co-operate

by ordering their shipments in units of 75 bales. We are anxious that the New England spinners should adopt the same plan. This matter is of too large importance to be subservient to the unit rule of the New York Cotton Exchange."—*L. Green*, Freight Traffic Manager, Southern Railway.
