With high priced labor it becomes all the more necessary to keep tools in good repair, and in the case of axes, adzes, scythes, shovels and hoes that they be kept sharp. A tool grinder should be kept on the car at all times so that tools may be sharpened as soon as they become dulled.

There are several types of mowing machines made that can be attached to a motor car or hand-car; there are disc weed cleaners; tie tamping machines are in use on many roads, and experiments have been made in the use of a caterpillar tractor for mowing right of way, plowing fire guards and ditching cuts.

With the class of men that we can get for the wages paid at this time, we can operate any of these machines. Much good work is being done at present in the use of the oxy-acetylene torch in repairing worn frogs and switches, and study should be made to see how any class of work can be done the cheapest, and if some mechanical arrangement will cheapen the work it should be used.

Treated ties should be used to reduce maintenance expense. While a roadmaster may not have the authority to get them on his particular road, he can help to get the people on his road to thinking about the matter. The railroads that began using treated ties 10 years ago are reaping the benefit of the investment today in big figures; they are averaging about 200 ties to the mile of all tracks, while the average number of ties used on a road where treatment has not been used is over 300 per mile of all tracks.

Large sums are spent in squaring up ties where track has run and this has to be done at least once a year. By the use of rail anchors this can be avoided, and the labor of squaring up the ties and retamping them and of getting the track back in shape will be saved.

It would be a great thing for all concerned, including the men employed on the sections, if the work could be arranged so as to keep practically the same number of men on the section the year 'round. When one can provide steady work for men, they will make homes and be able to live much better and be more contented and dependable. Much work, such as relaying of rail, can be done in the winter by doubling up section gangs.

The heavy sections of rail now in general use make it necessary to use track laying machines, and by their use the number of men necessary in a gang employed in relaying rail has been cut down fully one-half. In a similar way on ballast work, by the use of convertible side and center dump cars, the amount of shoveling to be done in getting ballast in its proper location has been very much reduced. The steam shovel and the ditching machine, together with a modern spreader, have reduced hand labor to a minimum in widening cuts and embankments. There should be a steam ditcher on every operating division, and in many places on every roadmaster's division.

The roadmaster should also revise his methods to coincide with the new order of things, so as to keep in closer touch with the methods employed by the foremen to get the best work. The days of the roadmaster riding on the back of a passenger train and throwing off "butterflies" has about gone. While he should ride a passenger train over his territory in daylight about once a week to keep in touch with the riding of the track, he should get over his territory the balance of the time on a motor car or *on foot*. A roadmaster should plan to walk over every foot of his track twice a year. He should plan to walk over *one* section each week, having the section foreman with him, if possible.

The "eight-hour" day has reflected a greater hardship on railroad maintenance of way than on probably any other class of work, for the reason that the section gang's work is scattered over from 4 to 10 or 12 miles, and the men go to and from the work on the company's time. The result is that where hand-cars are used the effective time on track is only about 6½ hours, and even with motor cars it is only about 7 hours per day.

There is bound to be an adjustment of wages downward when things get settled in this country, but everyone should try and save something out of the present high wages. There is no class of people that find it harder to save money than railroad employees, owing to their being transferred from place to place, and thus being discouraged from purchasing real estate. Building and loan associations are today regulated by the states, the same as banks, and are safe places to invest money, and they have the advantages of taking monthly payments.

I want to suggest that you talk to your section foremen about saving some of their money in this way, and they may induce some of their men to do the same thing. The man who is saving money is more apt to want to work steadily and he is also more apt to be saving for the company that he works for.

Labor Saving Devices

By J. B. Baker

Supervisor on General Manager's Staff, Pennsylvania Railroad, Philadelphia, Pa.

The weight of the rail now in use makes it imperative that a power rail loader be used. Those in common use consist of a derrick and boom, with rail hook, and obtain the air from the train line. A crew of six men is customarily employed to operate them. Small steam derricks are being used successfully to unload rail and work faster than air unloaders, but are more expensive to operate and maintain. Where rail is unloaded in reclamation yards, the magnet crane is the most economical equipment.

Where it is possible to obtain the use of the track for the major portion of the day, a power-operated rail laying machine is economical. A machine of this sort will lift the new rail into track and travel over the newly laid rail at slow speed. The splices are placed on the rail and bolted up by a close-quarter air motor using an air supply from the locomotive operating the rail derrick. Under heavy traffic, such as obtains on many eastern roads, it is possible to obtain the use of track for periods aggregating not more than from two to three hours per day. The gang must be organized, with a view to starting at once after the passing of the last train and make every minute count. In this operation a small hand-operated rail layer, consisting of a carriage and boom traveling on the opposite rail from that being installed, and lifting the rail by means of hand winches, is a real labor saving device. On rail weighing as high as 125 lb. per yard, this machine, operated with 5 men, will replace 20 men on the tongs. The old rail is thrown out several rail lengths ahead of the operation and the new rail set in by machine at the rate of a little better than one rail per minute. This operation is usually no faster than that done by a competent gang of tong men, but a speed can be maintained equal to that of the tong men by using less men and the operation by machine is undoubtedly easier on the men. In many localities it is frequently difficult for the men to accustom themselves to the use of this device, but where it has been in use for some time the men would object strenuously to going back to the old method. Sixty-foot rail weighing 125 lb. per yard, has been laid successfully with this device.

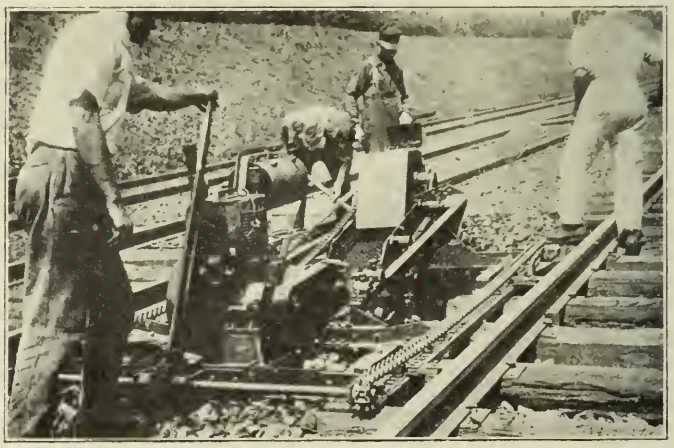
Unloading Ties—The unloading of ties is usually done by hand. Where ties are distributed by work train and a rail loader is on the train, a hook should be carried in the equipment which will unload from an open top car and release in mid air. Where unloading in yard is done with a view to piling ties, davits placed in the stake pockets, with hooks and chains, either power or air operated, designed to raise one or more ties at a lift, can be used to advantage. The possibility of clamping a light I-beam to the roof of a box car, extending through one door and supported on an A frame, with a view to assisting in the unloading of ties from such cars, should be given careful consideration in the light of existing local conditions.

It is not uncommon to receive ballast in flat bottomed gondola cars, making necessary the shoveling of this ballast over the side or end of the car. This is an extremely slow operation, and should be avoided wherever possible. In localities where steel mills are accessible, such cars have been turned over to the mills to transfer loading by a car dump to hopper cars. The usual charge for this work is one dollar per car. A drag scoop can be used to advantage on gondola cars, especially those with drop ends.

A ballast leveler which will remove the ballast to very close to the top of tie is an extremely economical machine, particularly where applying ballast in long stretches. It is perfectly practicable to reinforce a spreader or snow flanger so that this equipment can be used to advantage in leveling either stone or cinder ballast.

Cleaning Ballast

The cleaning of ballast in the center ditch and in the cribs is a job that until recently was conceded to be strictly a hand operation. The Trench-Zepp ballast cleaner provides a screen which is in many cases a help to the workman, especially in cleaning the border, but some difficulty has been experienced in the operation of these screens in the inter-track space, due to the necessity of lowering them for passing trains. It is frequently necessary for the workman to throw the ballast over his shoulder onto the screen, in which case the scattering of the dirt by the wind is objectionable. A machine designed to clean ballast in the inter-track space was recently built by the Link-Belt Company of Philadelphia, and is now in operation on the Pennsylvania Railroad. The machine is designed with conveyors or buckets which scoop up the ballast from the ditch and throw it onto a shaking screen. The dirt goes through the screen and is shoveled out by hand from a tray while the clean ballast passes over the screen and falls again into the ditch. The entire machine is operated by a gasoline engine mounted directly on the mechanism and is built with such compactness that it will clear traffic on both of the adjoining tracks. The method of disposing of the dirt was a problem in the design of this machine. An attempt was made to blow it to the rear of the cleaner through pipes, and collect it into bags, but this was not successful, as the pipes clogged easily if the dirt was slightly damp.



Ballast Cleaning Machine

The ballast cleaner moves forward on caterpillar travelers, resting on the ends of the ties, and operated by a hand ratchet at the rear. It is intended in future machines to connect this ratchet to the engine, enabling the ballast cleaner to move forward under its own power. A crew of five men is required to operate the machine, but this will be reduced to four when the device is self propelling.

The first attempts resulted in the cleaning of three rail lengths in five hours. As the men became accustomed to the machine this speed gradually increased and with the help of slight changes in the design, a speed of one rail length (33 ft.) in 45 minutes, is now being maintained.

A great deal of ballast cleaning would be eliminated if the front-end cinders and other dirt could be removed from the top of the ballast before they are allowed to find their way into the body of the ballast. This is in many places done by sweeping, and is at times neglected until the cinders lying on top of the ballast cause signal failures.

Although sweeping removes a large portion of this dirt, it also is the means of pushing some of the dirt into the crevices of the stone. Steps are now being taken to build a vacuum suction machine which will lift this loose dirt from the top of the ballast faster, more easily and more thoroughly than can be done by hand. In addition to this, plans have been drawn for a large vacuum ballast cleaner to be mounted on a flat car, with a view to picking up the ballast to a depth of 4 in. below bottom of tie in both cribs and inter-track space. The ballast would be screened and the dirt deposited in a gondola car, while clean ballast would be replaced in the track. It is estimated that a machine of this type should clean ballast at the rate of one-half mile of single track per day.

Applying Bolts and Spikes

The application of bolts by the common trackmen's wrench is being replaced, where possible, by faster and easier methods. Around interlockings, where it is possible to obtain a supply of air, a close-quarter air motor with a proper chuck and socket will be found to save time and labor during any track changes. The same close-quarter air motor with an extra chuck can be used to drill bolt and bonding holes. Where air is not available, the use of a ratchet wrench has been resorted to economically, the nut being tightened to a certain point with a ratchet wrench and tightened finally by about two pulls on a standard track wrench.

About two years ago a pneumatic spike driver was developed and placed on the market. It consisted of an air hammer mounted rather heavily with a cross arm handle at the top and a button at the bottom fitting over the head of the spike, with a view to driving the spike into the tie by placing the machine immediately on the head of the spike. While operating, the machine was about as efficient as two spike drivers, but the necessity of changing hose every 500 ft. and the newness of the machine in general, contributed to showing the operation unsuccessful. If the machine could be made to start its own spikes it would be a decided improvement, but any additional mechanissm would increase the weight, and the tool is cumbersome as it is.

Surfacing

Hand surfacing is being replaced on many roads by the pneumatic tie tamper. This operation has been largely limited to stone ballast, but with larger faced bitts there seems to be no reason why it should not be used to advantage in cinder and gravel ballast. One of the problems in the use of these tampers has been to train the men in handling the tool. When put in the hands of an inexperienced man these tampers are hard on the workmen and the men at first shun their use, but when taught how to properly hold the tool and after becoming accustomed to its working in general, very satisfactory results are being obtained. Experience has shown that best results can be obtained from the tampers by assigning a definite gang to their operation and allowing this gang to go from place to place over one supervisor's territory, rather than by passing the tampers from one section to the next, in which case they would be continuously in the hands of inexperienced men.

A comparison of the costs of machine tamping versus hand tamping, based upon the performance of these machines for several months showed, on the basis of 11,520 tie parts per mile of track (four parts per tie) a cost of $.038 per part for machine tamping as against $.050 per part for hand tamping, representing a saving per mile of track of $138.24 in favor of the machine tamping; and in another instance a cost of $0.027 per part for machine tamping as against $.050 per part for hand tamping, a saving of 2.3 cents per part, or $264.96 per mile of track, air being available from existing air lines in the latter instance.

Discussion

This paper brought out considerable discussion, particularly regarding special applications of standard equipment to local problems. Interesting ways were described in which difficult work normally requiring a considerable force of men was handled by use of special equipment.

Report on Drainage

No matter how good the rail, ballast and ties may be, if tracks do not have the proper drainage they will soon become out of line and surface. Drainage has been neglected on many roads in the last few years on account of the scarcity of labor. At the present time, with the high cost of labor, we must seek mechanical devices for proper ditching and draining. In the past, hand work and a work train were thought to be essential to the clearing of ditches. Today we have ditching machinery that will clear out ditches, shape and slope them. One ditching machine will do as much as 50 men.

Where water lies on the surface or in ditches in the fall and during the winter, we find the track heaving. It is just as expensive to shim tracks and keep constant watch over them when shimmed as to do the proper ditching to carry away the water so the road-bed will be dry and the track not heave.

Through cuts where silica sand, quicksand or alkali clay are encountered that slide quickly, the time to install drainage is in very dry weather; sheet piling should be used in opening the ditches. Great care should be taken to lay the tile to the proper fall from the beginning to the outlet of the tile. At the mouth of the tile a mattress of good heavy rip-rap or a bottom of old ties should be placed to prevent the dirt from washing away from under the tile.

Where there are soft spots in the track, either in cuts or on fills where track slides on account of improper drainage or softening, a ditch four or five feet deep and three or four feet wide, filled with rip-rap or stone, with laterals under the track, will be found to be very beneficial. Laterals should be placed wherever necessary to draw the water from under the tracks. Embankments extended along existing tracks on earth or clay and having during rainy seasons insufficient bond with the existing fill, slide frequently on account of this leakage of water between the old and new grades. In many cases an auger can be used to bore the side of the bank and a pipe placed therein to afford an outlet for the water.

Below are figures of the cost of ditching by different methods for 1917 and 1918.

	Per cu yard
American Steam Ditcher	$0.4131
Mahoney Ditcher	0.4034
Push Cars, two	0.5862
Car Barrows	0.7670
Wheelbarrows	0.7142
Casting	0.3525

These cost data were collected on work actually performed on a single track, having an average of six tonnage trains during working hours; of soft clay road-bed where the standard ditches are such as are ordinarily known or described as shoulder ditches.

J. P. Corcoran, C. & A. (Chairman).

Discussion

A number of roadmasters described their experience with the use of various types of ditching machines in the construction of side ditches. One speaker went into detail concerning the use of three ditchers in one train and reported considerable economy from this method since the charge for work train service was distributed over the output of the three machines. In answer to a question he stated that this method was used for rather heavy work and slides. The

depth of drains was the source of considerable discussion, it being pointed out that in northern latitudes it was impossible to cut the ditches deep enough to go below the frost line. Several men from northern railroads stated that they did not do much tiling on this account since a tile deep enough to avoid frost is too deep to be of value. This was questioned in one case where the speaker stated that he found it necessary to go four or five feet with a drain to get any results. There was also some discussion of sub-drainage. An officer of an eastern line described in considerable detail the methods which had been necessary to restore drainage on multiple track lines where the roadbed had been allowed to become saturated and mucky.

Equation of Track Values

A progress report was presnted by W. P. Wiltsee, principal assistant engineer, N. & W., Chairman, who stated that the committee has in view the possible establishment of the hours of labor required for each of the different kinds of work necessary in the upkeep of a section of railroad under different conditions, both as to traffic and as to physical characteristics.

Other Business

At the annual dinner on Wednesday evening the principal speaker was Charles H. Piez, president, Link Belt Company, and formerly vice-president of the Emergency Fleet Corporation; he told of his experience with handling of labor by an independent board not responsible to the corporation. Based on the failure of this plan he believed a return of the railroads to their owners must provide for negotiation with labor by a body responsible to the rate making authority.

W. G. Arn, assistant engineer of maintenance of way, Illinois Central, and formerly lieutenant-colonel, Thirteenth Engineers, and F. A. Preston, formerly major in the Aircraft Corps, also spoke.

St. Louis was decided upon as the place for holding the next convention.

The Track Supply Exhibit

The Track Supply Association presented its eighth annual exhibit in a room adjoining the convention hall. This exhibit was the largest which has ever been made by this organization, over 60 firms being represented. Special attention was given this year to the attractive presentation of the exhibits and to the display of full-size equipment rather than models or photographs.

The officers of the Track Supply Association for the past year are: President, Edward Coleman, American Hoist & Derrick Company, St. Paul, Minn.; vice-president, Wm. H. Armstrong, Ingersoll-Rand Company, New York; secretary-treasurer, W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y.; directors, E. T. Howson, *Railway Age,* Chicago; J. V. Westcott, Q. & C. Co., Chicago; D. T. Hallberg, P. & M. Co., Chicago; and R. A. Van Houten, Sellers Manufacturing Co., Chicago.

The list of exhibitors together with the devices or materials on display and the names of their representatives is as follows:

An Reduction Sales Company, New York City. Oxygen, acetylene, welding and cutting apparatus. Represented by Ellsworth Mills, B. N. Law, R. T. Peabody, E. S. Brewer and B. A. Eliason.

Ajax Forge Company, Chicago.

Alexander Crossing Company, Chicago. Exhibiting continuous rail crossing. Represented by J. Eggleton and W. W. Rasser.

American Hoist & Derrick Company, St. Paul, Minn. Transparencies and photographs of "American" railroad ditcher. Represented by Edward Coleman, J. L. Hickey and C. T. Hook.

American Steel & Wire Company, Chicago. Railroad fence, woven wire fence and American steel fence posts. Represented by L. B. Shanahan, P. J. Hindmarsh, J. W. Collins, A. N. Frouds, M. E. Evans and W. E. Mackley.

American Valve & Meter Company, Cincinnati, Ohio. Anderson economy switch stands, interlocking switch stands and safety switch locks. Represented by J. T. McGarry and F. C. Anderson.

Anchor Company, Milwaukee, Wis. Anti-rail creepers. Represented by Orlando Metcalf and George H. Chadwell.

Balkwill Manganese Crossing Company, Cleveland, Ohio. Models of Balkwill articulated cast manganese railway crossing. Represented by S. Balkwill.

Bethlehem Steel Company, Bethlehem, Pa. New Century switch stand model 51-A, switch stand model 1217, Steelton positive switch stand model 52 A; switch stand model 1222 with and without target, double tongue for steam roads. Represented by R. E. Belknap, R. W. Gillispie, Neul E. Salsich, J. F. Hennessy and E. H. Gumbart.

Blaw-Knox Company, Pittsburgh, Pa. Clam shell buckets, culvert forms. Represented by R. D. Allrich and L. R. Grannis.

Buda Company, Chicago. Section car, jacks, No. 9 "C" switch stand, Hyduty Paulus track drill, new Liberty tool grinder. Represented by M. A. Evans, H. C. Beebe, E. A. Thiele and A. L. Bliss.

Carbic Manufacturing Company, Duluth, Minn. Carbic flare lights and cases, and oxy-acetylene cutting and welding equipments. Represented by G. B. Van Buren and C. H. Bolinder.

Carnegie Steel Company, Pittsburgh, Pa.

Chicago Malleable Castings Company, Chicago. Thomas rail anchor tie plates. Represented by L. Lewellyn, W. M. Osborn and Herbert MacDonnell.

Cleveland Frog & Crossing Company, Cleveland.

Crerar, Adams & Co., Chicago. Eureka bonding drills, Calumet track drills, jacks, shovels, brooms and die starters. Represented by Russell Wallace, G. D. Bassett, J. A. Martin, C. W. Gregory, W. I. Clock and R. M. Bullard.

Deeming-Endsley Company, Chicago.

Dressel Railway Lamp Works, New York.

Duff Manufacturing Company, Pittsburgh, Pa. Barrett track jacks, automatic lowering geared ratchet and ball-bearing jacks. Represented by C. N. Hulin and E. A. Johnson.

Elliott Frog & Switch Company, St. Louis, Mo.

Fairbanks, Morse & Co., Chicago. Light inspection car equipped with two cylinder kerosene engine and heavy section and extra gang car. Represented by E. C. Golladay, Benjamin S. Spaulding, A. A. Taylor, F. J. Lee, C. B. Skelton, F. M. Condit, E. Lang, Charles Wilson, G. Howard, D. K. Lee, E. J. Coverdale, Stephen Smith, H. E. Vergosen and Mr. Daggett.

Fairmont Gas Engine & Railroad Motor Car Company, Fairmont, Minn. Roadmaster's inspection car, hand car exhibition engine. Represented by W. F. Kasper and H. M. Starrett.

Frog, Switch & Manufacturing Company, Carlisle, Pa.

Hauck Manufacturing Company, Brooklyn, N. Y. Kerosene burner thawing outfits. Represented by Willis C. Squire and G. A. Nelson.

Hayes Track Appliance Company, Richmond, Ind. Derails and stands. Represented by S. W. Hayes and R. W. Slautterback.

Ingersoll-Rand Company, New York. Tie tamping equipment and air-operated track tools. Represented by William H. Armstrong, C. S. Kulp, J. N. Thorp, Jr., and C. W. Melcher.

Kalamazoo Railway Supply Company, Kalamazoo, Mich. Inspection car with step starter, kerosene or gasoline engine, level gage and master gage. Represented by J. B. McKinnon, D. A. Stewart, F. E. McAllister, M. C. Study and H. R. Miller.

Lackawanna Steel Company, Lackawanna, N. Y. Rail joints, safety head angle bar, Abbott joint plates, hook shoulder tie plates, rail anti-creepers, track bolts and spikes, deseamed rails, steel sheet piling. Represented by Jay L. Hench, F. E. Abbott, G. O. Benson and E. J. Wetter.

Lidseen, Gustave, Chicago. The Lidseen force feed oilers. Represented by E. W. Koon.

Lundie Engineering Corporation, New York. Lundie tie plate. Represented by C. Z. Moore, Eugene Brandies and W. Brooke Moore.

Luther Grinder Manufacturing Company, Milwaukee, Wis. Grinders to grind twist or flat drills and miscellaneous tools. Represented by C. R. Pfeifer, F. S. Hyland and H. T. Hardy.

Madden Company, Chicago. Illustrations of the three-man rail layer, model of Veerac motor, photographs derrick truck car, Harris-Muff ballast screen, models of the Wagner switch point straightener, Richter blue flag derail, Red Top fence posts, Blair tie spacer, model Clough unloading hook, and model perfect rail base. Represented by H. C. Holloway, W. W. Glosser and R. W. Dawney.

Miliburn, Alexander Company, Baltimore, Md. Portable carbide lamps, oxy-acetylene and cutting apparatus. Represented by John A. Schreiber and David Bartlett.

Mudge & Co., Chicago. Kerosene inspection motor car. Represented by Burton W. Mudge, Robert D. Sinclair, Karl J. Eklund, Albert C. Force, Fay E. Posson and L. O. Stretton.

National Lock Washer Company, Newark, N. J. Nut locks. Represented by R. L. Cairncross and A. T. Thompson.

National Malleable Castings Company, Cleveland, Ohio. Rail anchors, rail braces and tie plates. Represented by T. W. Aishton, J. J. Byers, L. S. Wright and J. A. Faitz.

North American Engine Company, Algona, Iowa. Inspection car. Represented by J. Edward Murphy, Dr. C. H. Cretzmeyer and E. A. Adams.

Oxweld Railroad Service Company, Chicago. Oxy-acetylene welding and cutting apparatus. Represented by F. C. Hasse, W. H. Kofmehl, L. C. Ryan, C. M. Marshall, I. Allison, R. C. Kohn, F. C. Tichen and H. N. Real.

P. & M. Company, Chicago. P. M. Henggi, Vaughan and Ajax anti-creepers and bond wire protectors. Represented by D. T. Hallberg, John Ritchie, John Reagan, George E. Johnson, J. E. Mahoney, F. W. Reeve and P. V. Samuelson.

Pocket List of Railroad Officials, New York. Copies of pocket list. Represented by J. Alexander Brown, Charles L. Dinsmore and Harold A. Brown.

Positive Rail Anchor Company, Marion, Ind. Rail anchors, Fallon girder

type guard rail brace and plate, Busse guard rail. Represented by Arnold H. Told, L. C. Ferguson and E. A. LeBeau.

Q. & C. Company, New York. Bonzano Thompson rail joint, guard rail clamps, Q. & C. snow melting track device, Q. & C. adjustable rail brace, rolled steel step or compromise joint, Q. & C. Freeland derails and Sampson rail bender; Fewings car replacers. Represented by L. T. Burwell, J. L. Terry, R. J. McComb, E. M. Smith, A. R. Horn and J. V. Westcott.

Rail Joint Company, New York. Standard, compromise, frog and switch-joint insulated rail joints. Represented by W. S. Boyce, Alex Chapman, Charles Jenkinson, J. H. Larson, R. W. Tayne, V. C. Armstrong, E. A. Condit, Jr., W. P. Thompson, McLeod Thompson, G. T. Williard, H. C. Hickey, E. F. Schermerhorn, J. N. Mead and C. B. Griffin.

Railroad Supply Company, Chicago. Tie plates and derailers. Represented by A. H. Smith, Hiram Buck, H. G. Van Nostrand, George Nibbe and E. H. Bell.

Railway Review, Chicago. Copies of paper. Represented by Harold A. Smith, Charles L. Bates and W. M. Camp.

Railway Safety Tie Company, Milwaukee, Wis. McSafety tie plate and steel concrete ties. Represented by E. M. McVicker and A. W. Tabert.

Ramapo Iron Works, Hillburn, N. Y. Manganese switch point, rolled steel double-shoulder switch slide plate, special switch slide plate, machined heel plate, switch stands, guard rail clamps. Represented by Thomas E. Akers, Arthur Germunder, J. B. Strong, J. Edgar Davidson, Robert J. Davidson, Jr., W. W. Snow and W. C. Kidd.

Reading Specialties Company, Reading, Pa. Guard rail clamps, rail benders, rerailers wtih clamps, trolley rerailers, compromise joints and derails, guard rail, car shed shoes, car chocks, tie spacers, clamps for broken rails. Represented by B. John Buell and W. J. Zimmerman.

Rodger Ballast Car Company, Chicago.

Simmons-Boardman Publishing Company, Chicago. Copies of Railway Maintenance Engineer and *Railway Age*. Represented by L. B. Sherman, E. T. Howson, W. S. Lacher and B. J. Wilson.

Sellers Manufacturing Company, Chicago. Sellers anchor bottom wrought iron tie plates. Represented by J. M. Sellers, G. M. Hogan, R. A. Van Houten, T. D. Crowley and R. J. Platt.

Southern Railway Supply & Equipment Company, St. Louis, Mo. Saunders car stopper. Represented by L. Boswell.

Templeton, Kenly & Co., Ltd., Chicago. Track jacks. Represented by W. B. Templeton and J. A. Cervenka.

Track Specialties Company, New York. Guard rail clamp, compromise rail joints, derails, rail benders, tie plates and rail braces, guard rail brace adjustable track shim, slide plate and switch brace, rail joints, anchor plate and foot guard. Represented by J. A. Bodkin.

Union Switch & Signal Company, Swissvale, Pa. Insulated rail joint. Represented by J. D. Roett and J. J. Cozzens.

Verona Tool Works, Pittsburgh, Pa. Track tools, track jacks, levels, gages, nut locks, Palmer rail joint spring and bonding strips, and Hillard portable milling machine. Represented by H. C. Mull, E. L. Ruby, E. Woodings, W. B. Lewis and A. T. Palmer.

Wharton & Co., Inc., William Jr., Easton, Pa. Guard clamps, Wharton O'Brien insulated switch rod and seamless steel cylinders for oxygen and hydrogen gas. Represented by H. F. McDermott, Charles M. Griffith and V. Angerer.

Wyoming Shovel Works, Wyoming, Pa. Red Edge track shovels. Represented by H. T. Potter, H. C. Emery, G. E. Geer and William Ziegler.

At the annual meeting on Wednesday morning the following officers were elected for the ensuing year: President, Wm. H. Armstrong, Ingersoll-Rand Company, New York; vice-president, David T. Halberg, P. & M. Company, Chicago; secretary-treasurer, W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Directors, Alexander Chapman, Rail Joint Company, Chicago; F. M. Condit, Fairbanks, Morse & Company, Chicago; Herbert Potter, Wyoming Shovel Works, Chicago.

The Southern Railway announces that its line between Washington, D. C., and Atlanta, Ga., 649 miles, is now double track throughout, the last section of second track, about three miles long, having just been finished. After the completion of work which is now going on between Charlotte, N. C., and Spartanburg, S. C., this line will be equipped with automatic block signals throughout.

The Railway Fire Protection Association will hold its sixth annual meeting at the Hotel La Salle, Chicago, on November 18, 19 and 20, instead of on October 21, 22 and 23, as was originally planned and announced. This postponement was authorized by the executive committee of the Association in order that railroad representatives serving in the dual capacity of accident prevention and fire prevention officers would be free during the month of October to devote all their time to conducting the "National Railroad Accident Prevention Drive."

Train Accidents in July[1]

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of July, 1919:

Collisions

Date	Road	Place	Kind of accident	Kind of train	Kil'd	Inj'd
†1.	New York Central	Dunkirk	rc	P. & P.	12	17
17.	C. C. & O.	Erwin	xc	F. & F.	0	0
17.	D. L. & W.	Ackermanville	bc	F. & F.	1	2
19.	Lehigh V.	Upton	rc	F. & F.	2	0
23.	Penn.	Tyrone	xc	F. & F.	1	3
*31.	N. Y. N. H. & H.	Portchester	rc	F. & F.	2	0

Derailments

Date	Road	Place	Cause of derailment	Kind of train	Kil'd	Inj'd
2.	Rich'd F. & P.	Milford	d. truck	P.	0	9

The trains in collision on the New York Central at Dunkirk, N. Y., on the first of July, at 2:20 a. m., were westbound passenger No. 7 and westbound passenger No. 41, No. 7, consisting of a locomotive and 12 heavy cars, running into No. 41, which was standing at the station. Eight passengers, three trainmen and one trespasser were killed, and 17 passengers were injured. The presence of the standing train was indicated by a home and a distant signal, and also a flagman; and the engineman (killed) applied the brakes; but an angle cock behind the tender was closed, making the brakes ineffective on the cars. A trespasser, riding between the tender and the baggage car had evidently closed the cock, ignorantly assuming that thereby he could stop the train, Dunkirk being his home. This collision was reported in the *Railway Age* of July 4, page 40.

The trains in collision on the Carolina, Clinchfield & Ohio at Erwin, Tenn., on the 17th, were a southbound freight, and a locomotive without train. The freight, consisting of 90 cars became uncontrollable on a descending grade and ran into the yard, striking the standing locomotive. Thirty-two cars were thrown off the track and damaged, and 25 of these, containing coal, were overturned. Estimated loss $23,000.

The trains in collision on the Delaware, Lackawanna & Western at Ackermanville, Pa., on the 17th were local freights. One engineman was killed, and one engineman and one fireman were injured. The collision was due to oversight of a conductor and an engineman, who disobeyed a despatcher's order.

The trains in collision at Upton, N. Y., on the 19th were eastbound freights. The leading train had been stopped because of failure of the locomotive, and the following train wrecked the standing caboose; and the conductor, inside of the caboose, was killed. A brakeman of the second train was also killed.

The trains in collision on the Pennsylvania Railroad near Tyrone, Pa., on the morning of the 23rd about 12:16 o'clock, were an eastbound through freight and a switching freight. The latter, coming out of an industry track, ran into the side of the train on the main line. One engineman and three other employees were injured, the engineman fatally. The yard-

rc, Rear collision——bc, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch ——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.) ——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

train had run past a signal set against it (an interlocked position-light dwarf). Three main tracks were blocked and 31 passenger trains were delayed from nine minutes to two hours. Thirteen freight trains were delayed from 20 minutes to nine hours.

The trains in collision on the New York, New Haven & Hartford, near Portchester, N. Y. (in the township of Greenwich, Conn.) on the 31st, were westbound through freights. The leading train extra 098 was just coming to a stop, because of a block signal set against it, and the following train, M. H. 3, drawn by a heavy electric locomotive, ran into it at about 20 miles an hour. The caboose and eight cars were wrecked. The two men in the front end of the electric locomotive (the engineman and another engineman riding as instructor) were killed. The wreck took fire from an electric wire and these two men were burned. The collision occurred at 5:25 a. m., in clear weather. The conductor of another westbound freight, running on track No. 3 (to the right of track No. 1, on which the collision occurred) noticed that the engineman of M. H. 3 was apparently asleep and while passing called to him, but was not answered. The engineman at fault was 40 years old, and had been on duty 10 hours, 35 minutes. The point of collision is seven miles west of Stanford, Conn. All four main tracks were blocked 5½ hours. Investigation shewed that the colliding train had passed both cautionary and stop signals set against it, and that both of the men had been asleep probably several minutes prior to the collision.

The train derailed on the Richmond, Fredericksburg & Potomac at Milford, Va., on the evening of the 2nd was northbound passenger No. 66. Three express cars, two mail cars and two coaches went off the track and one mail car was overturned. Nine persons were injured, none seriously. The derailment was due to failure of an equalizer bar of front tender truck.

The train derailed at Crystal Run, N. Y., on the fourth was westbound passenger No. 25. Five coaches were overturned and ditched. The train was well filled but the injuries to passengers were all classed as slight. The train was running at 40 miles an hour when a wheel of the tender jumped the track.

The train derailed on the Monongahela Connecting Railroad near Pittsburgh, Pa., on the 9th was a local freight. The locomotive was thrown off the track at a switch and was overturned, demolishing two dwelling houses. The engineman, the conductor, and a child in one of the houses were killed. The houses took fire from the locomotive firebox.

The train derailed on the Pennsylvania Lines near Kentland, Ind., on the 14th, was eastbound passenger No. 902. The train ran upon a burning trestle and the last two coaches fell through. Three trainmen, one mail clerk, and an express messenger were injured.

The train derailed near Lake Katrine, N. Y., on the 14th, was an eastbound freight. The locomotive was wrecked by the explosion of its boiler, and was overturned. The engineman and fireman were killed, and a brakeman was injured. The explosion was caused by low water.

The train derailed on the Delaware & Hudson near Colonie, N. Y., on the 18th, was one consisting of a locomotive and two coaches carrying workmen to the company's shops. One coach was thrown off the track and overturned and 15 employees were injured.

The train derailed at Katy, Tex., on the 23rd of July, was Gulf, Colorado & Santa Fe passenger train No. 17, running over the Missouri, Kansas & Texas. Seven cars ran off the track and 32 passengers and 4 employees were slightly injured; estimated total damage to cars $28,000. The cause of the derailment was not determined.

The train derailed at Long Run, W. Va., on the 25th was westbound freight No. 97. The locomotive was thrown off the track in a tunnel and the resulting wreck took fire. Seven cars of oil and merchandise were burnt up. The wreck blocked the tunnel for three days and trains between Clarksburg and Parkersburg had to be run by way of New Martinsville.

The train derailed at Linfield, Pa., on the 30th of July, was a southbound passenger. The baggage car was overturned. The engineman and fireman were killed and two passengers were slightly injured. The cause of the derailment was not determined.

The train involved in the accident near Charleston, S. C., on the 5th, was northbound passenger No. 82. The locomotive was wrecked by the explosion of its boiler, and the engineman and fireman were injured, the fireman fatally.

The train involved in the accident on the Union Pacific near Castle Rock, Utah, on the 21st was an extra freight. The locomotive was wrecked by the explosion of its boiler and the engineman, fireman and one brakeman were killed. Explosion due to low water.

Electric Car Accidents.—In a butting collision of electric cars near Punxsutawney, Pa., on the night of the 16th of July one passenger was killed and another was injured. Both of the motormen jumped off in time to save themselves. It is said that a defective block signal was the cause of the collision. The half dozen other electric car accidents reported in the newspapers in July caused injuries numbering from 3 to 20 each; but no fatal injuries, so far as reported. One of these accidents, at Pittsburgh, Pa., on the 15th, was a case of a street car being struck by lightning. The motorman was stunned; but the other injuries appear to have been due to panic rather than to electricity.

Canada.—At Stonecliff, Ont., on the sixth, the Imperial Limited express, of the Canadian Pacific, was derailed by a malicious obstruction and the fireman was fatally scalded. On the Canadian National near La Duramtaye, Que., on the 11th the eastbound Maritime express was derailed and the engineman and fireman were killed. Four other derailments of passenger trains in Canada resulted in a few injuries each, all being reported as not serious.

"Well, Well, We'd Better Go Slow About This"

Convention of Traveling Engineers' Association

Economical Speed for Slow Freight Trains and Methods of Handling Air Brakes Discussed

The Traveling Engineers' Association met for its twenty-seventh convention at the Hotel Sherman, Chicago, on September 16, with H. F. Henson, road foreman of engines of the Norfolk & Western presiding. After the opening prayer President Henson addressed the convention.

President's Address

Mr. Henson spoke in part as follows: Our last convention met during the great world struggle and at that time all our attention was devoted to bringing the conflict to a successful conclusion. We have met the challenge of war. Now let us meet the challenge of peace and securely re-establish justice, loyalty and freedom. In these trying times labor cannot afford to put itself in the position of obstructing the wheels of progress. The workers must see that not only loyalty to their country but also loyalty to its industries is essential. The conservatism and loyalty of the traveling engineers has never been questioned and they can help to influence opinion among the many employees with whom they come in contact.

After referring to the present industrial unrest, Mr. Henson made a plea for rigid economy in the use of fuel and supplies on the railroads. In discussing the affairs of the association he mentioned that the American Railroad Association has invited the Traveling Engineers' Association to amalgamate with it and asked the members to give the matter consideration.

A report an handling air brakes was then submitted by the committee on that subject.

Handling Air Brakes on Passenger Trains

Before coupling to the train, the compressor steam valve should be opened wide, the steam end lubricator feed increased to about two drops per minute for each compressor having two steam cylinders, or one drop per minute for each compressor having one steam cylinder; then, to assist in charging the train quickly, the brake valve should be placed on tap and maximum main reservoir pressure accumulated.

Charging Train.—To charge the train quickly, release position should be used until, on use of running position, five pounds less than standard brake pressure is shown. The application for the terminal test of the brakes may then be made if those who will inspect the train are ready; otherwise the charging should be completed in running position.

Standing Brake Test.—After receiving the proper air whistle signal to apply brakes, a 20-lb. continuous reduction should be made and the brakes held applied until the inspector or trainman who is responsible for the proper operation of the brakes leaving any particular terminal has examined the brake on each car to see whether it is applied and has correct piston travel. Then, on receiving the proper train air signal, which should be given by the car discharge valve on the last car, the brakes should be released. When the rear brake releases, the one or more inspecting should examine each brake to ascertain whether all have released.

Brake Pipe Test.—If, for any reason, an angle cock or double-heading cock have been closed at any time, it should be finally insured that all such have been reopened by making an application, getting a signal that the rear brake has applied, then releasing and receiving a signal that the rear brake has released.

Running Brake Tests.—A running test is made by the engineman making an application that will satisfiy him that the brakes can be operated from the brake valve, and if he finds that they cannot be, he must at once signal for brakes. This must be made when engines have been changed or at other times after parted hose has been recoupled; also a sufficient distance (so that the train can be stopped by hand brakes) from draw-bridges, railroad crossings and other hazardous places and before going down heavy grades.

Incoming Brake Inspection

On completing a stop at a terminal, the brakes should be left applied with a reduction of 20 lb. If the brakes were held applied to the stop with a light application, enough should be added to make a total of 20 lb.

Starting and Slacking

Starting quickly, slipping drivers, taking slack harshly, or starting quickly after slacking, will cause shocks that are disagreeable to passengers and damaging to equipment. To avoid these the throttle should not be opened until the brakes are released. It should be opened gradually then, and the cylinder cocks should be open when starting conditions will permit, particularly during short movements, as at water cranes and when taking slack. Even after a slow-down and release, care should be taken not to open the throttle before all the car brakes are full released, and then it should be opened gradually. The sanders should be kept in good condition, and sand used when necessary to prevent the drivers from slipping. Where failure to start requires taking the slack, the throttle should be closed, the independent or straight air brake applied, the locomotive reversed, then the engine brake should be graduated off. Steam should be used if necessary, to close in all train slack. If the train must be backed to a more favorable place for starting, before reaching the point where the stop is to be made, and while still working steam, a brake pipe reduction of six or eight pounds should be made The engineer should continue to work steam moderately until the stop is completed so as to have all slack closed in. The engine should be reversed, the release of the brakes started, and, at the time when experience indicates that the holding power of the rear brakes is ending, steam should be used but as carefully as consistent with starting the train and avoiding damaging shocks.

Independent Brake Use

The independent brake should not be used in making passenger train stops. It should be applied and left in application position to prevent the locomotive from moving while taking coal or water, when oiling or doing work on the engine, during other than a short stop on a grade, and as explained, for taking slack. When releasing the independent brake, the valve handle should be moved to running position only. If the engine brake does not release, a "kick-off" with the automatic brake valve should be made.

Train Slack Control

Smooth handling of passenger trains requires that slack must never be changed suddenly. The action of the brakes in changing the slack will be most severe at low speeds. Therefore, any heavy reduction should be avoided when speed is low. As the heavier the reduction the rougher will be the slack action, the split-reduction should be used

when commencing other than light applications. To help avoid objectionable slack action while applying the brakes on trains of more than eight cars, and where conditions will permit, the use of steam should be continued to hold the slack while the brakes are being applied.

Use of Sand While Stopping

Sand should not be used while braking on good rails, except in an emergency. Sand should be used to prevent wheels sliding on slippery rails. It should be started flowing before the brakes are applied in service braking, and immediately after the brakes are applied in emergency braking, continuing its use throughout the stop.

Complete Release

To completely release passenger train brakes (this does not include partial release with graduated release equipment), the automatic brake valve handle should be moved to release position, back to running position, and then, after waiting about seven seconds, "kick-off" should be made. How long to stay in release the first time depends mainly on the length of the train, but to an extent also on the main reservoir pressure. The proper length of time in release position is indicated when the brake pipe hand shows at least five or six pounds more after returning to running position than before moving from lap to release, and will vary from a second with a very short train to not more than 15 sec. with the longest train. If, after returning to running position, the brake pipe hand shows a pressure higher than the feed valve adjustment, release position was used too long. A release should not be attempted unless the pressure has been reduced at least seven pounds below the standard carried if the train has less than eight cars, and ten pounds for longer trains.

Stopping Without Graduated Release

Stopping without graduated release from usual speeds requires the two-application stop. The reasons for the two-application stop are the same as for the graduated release stop, and its method is to come as near to the graduated release stop as possible. The application should be made from usual speeds, as with a graduated release braked train; that is, while working steam, and using the "split-reduction," a reduction of about 15 or 18 lb. should be made, depending on the speed and grade. Then steam should be gradually shut off or reduced to a drifting throttle as required. This application should have been made at a point that will have reduced the speed to 12 or 15 m. p. h. when about 500 ft. from the stopping point. To release the train brakes, release position should be used for a time to suit the length of train, then move to running position until the brakes are released. For the second application, a reduction of about seven pounds should be made and followed with a little more when necessary, but endeavoring to avoid a total of over ten pounds. At the proper time, depending on whether the train consists of less than eight cars, the brakes should be released by using release position, then running position, followed by the kick-off. A heavy second application indicates too high speed at the first release or being too near the stopping point when the second application is started.

One-Application Method for Stops From Low Speeds

When making stops from low speeds, sufficient time should be allowed between shutting off steam and starting the brake application to permit the drawbar springs to re-act and start the slack in. An application has the same effect, due to the head brakes applying first. The effect on the slack is stronger at slow speeds. Therefore, the two acting together will produce very disagreeable shocks. Where the one-application method is being used, a split-reduction should be made, the first reduction not over six or seven pounds, which may be followed by further reductions if needed, but the first reduction should be made early enough to avoid making a total application of more than ten pounds when the stop is completed.

Emergency Stops

In an emergency, the brake valve handle should be moved quickly to emergency position and left there until the train stops. As an emergency application produces the quickest and highest braking force, it may cause shocks and slid flat wheels; hence may be used only to avoid injury to persons or damage to property.

Mountain Grade Braking

Retaining valves should be used when descending mountain grades whenever the brakes cannot be re-charged to within ten pounds of standard pressure. When operating with retaining valves, the application should be sufficient to insure a release, so that the train is retarded by the retaining valves, and not by sticking brakes. Graduated release must not be used when retaining valves are cut in, and when retaining valves are not cut in, not more than one release graduation may be used between complete re-charges. Release position of the brake valve should be used when re-charging, followed with the kick-off. Limiting the maximum speed to 30 m. p. h. on grades of 3 per cent to 3½ per cent, and 45 m. p. h. on grades of 2 per cent to 2½ per cent, provides for avoiding much of the trouble and annoyance from burned brake shoes, and an average margin of safety compared to level grade work.

Double Headers and Pushers

With more than one locomotive, the brakes should be controlled from the head locomotive and the air signal should be connected to and operate on it. On each other locomotive, the brake pipe should be cut into the train brakes, unless specifically excepted for certain pusher engines used for a short distance only, keep the automatic brake valve cut out, and its handle in running position, the compressor operating as usual, and, if had, the independent brake valve in running position. When a train is to have a helper locomotive coupled on ahead, the regular engineman will apply the train brakes with a 20 lb. brake pipe reduction before the helper couples on, leave them applied, and close the double-heading cock. The helper engineman will, after coupling, release the brakes and then make the brake pipe test. When a helper locomotive is to be cut off, its engineman will apply the brakes with a 20 lb. reduction and leave them applied. The regular engineman, then in charge, will release them and make the brake pipe test. The automatic brake valve on other than the head locomotive must not be cut in at any time or for any reason except for a plainly needed emergency application of which the head engineman is unaware or unable to make.

In starting a train with two locomotives ahead, commencing to use steam at the same time will cause severe shocks and damage, therefore the second engineman must not use steam until the head engineman has started the train or done all he can to this end. Braking with two locomotives ahead must be done with more than usual care, to avoid rough handling. This is due to the additional weight and slack at the head end, and, usually, the extra length of train.

With a pusher locomotive on the train, the head engineman will, when the train is to be started, allow the pusher engineman to endeavor to start it. When he has done so, or, being unable to, is using full power, the head engineman will carefully assist. When the train is being stopped, the pusher engineman will continue to use steam lightly until the stop is completed, so as to hold in the slack.

Backing Train Movement

When ready to make a backing train movement in which the back-up hose may or will have to be depended on for

more or less control, and on receiving the signal to back, the engineman will lap the automatic brake valve. The man at the rear end will, when the back-up signal is given, at once make a sufficient discharge from the back-up hose cock to insure a substantial application of the brakes. On the engineman noting by the air gage and by the brakes applying that this required reduction has been made, he will make the usual release and proceed to back up.

When making such backing movement, the automatic brake valve should be carried in running position so that, while permitting brakes to be applied, they will release and re-charge. The only exceptions are that the engineman will apply the automatic brake whenever necessary to insure the safety of the train, and will release the brakes in the usual manner, to guard against stuck brakes, as soon as any stop is completed.

Slow Downs

While still working steam, a first brake pipe reduction of about seven pounds should be made. After the exhaust closes, it should be followed by further reductions as required to obtain the desired low speed. To insure a prompt and certain release of all brakes, the reduction must total at least ten pounds before attempting to release. If less, the needed amount should be added just before releasing. At this and other similar times when releasing, release should not be made before the service exhaust ceases, and steam should not be used quickly, as either one or a combination of both will cause a severe jerk.

Brakes Sticking

One cause for brakes "sticking" or failing to release is attempting to release a lighter application than is here recommended. Another cause is some brakes re-applying on the locomotive or near the head end after releasing, and a failure to make the kick-off. Another cause for stuck brakes is a defective feed valve that allows the brake pipe pressure to vary from time to time, or a good feed valve that cannot regulate the pressure uniformly because of too little excess pressure, as a result of too low governor adjustment or a governor defect, or having less actual excess pressure than indicated, due to an error in the gage

If stuck brakes are noted on a running train that is fully charged, the surest way to release it is to make a reduction of ten pounds, wait until the service exhaust ceases, then make the regular release, followed by the "kick-off." If an application is impracticable, they should be kicked off carefully—not long in release.

Overcharged Brakes

If a train of the older or P-M equipment is overcharged while running, the pressure can be reduced to the standard by applying and releasing the brakes one or more times without much re-charging. With the L-N equipment an overcharge of 5 lb. may be got rid of by reducing the brake pipe pressure to 60 lb. and releasing. If there is a heavier overcharge while running, the high pressure should be maintained until the next stop is completed, then the brake pipe pressure should be reduced to 60 lb., and after the brake pipe exhaust ceases, the brake pipe should be recharged as indicated on the brake pipe gage to 5 lb. below the original pressure to which the train was overcharged. This should be repeated until the re-charge pressure is the pressure to be carried.

Brakes Apply From Unknown Cause

Should the brakes apply from an unknown cause, it indicates that a conductor's valve has been opened, a hose burst, other serious leaks have occurred in the train, or the train has parted. In such cases the throttle should be closed immediately, the automatic brake valve lapped and left on lap until the train is stopped and the signal to release has been given.

The report is signed by T. F. Lyons, (N. Y. C.), chairman; Eugene Hartenstein, (C. & A.); Fredric Kerby, (B. & O.); L. S. Ayers, and W. R. Garber, (K. & M.).

Discussion

M. O. Davis (A. T. & S. F.) advocated the use of the drifting throttle on long descending grades. He also recommended keeping the engine brakes released when making the running test starting out of terminals. Mention was made of the use of gas engine oil for lubricating the air cylinders of locomotive air compressors, and L. P. Streeter (I. C.) stated that while good results had been secured with automatic lubricators on regularly assigned engines, some difficulty had been experienced in securing successful operation where locomotives were pooled. F. B. Farmer (Westinghouse Air Brake Company) expressed the opinion that a maximum speed of 45 miles an hour on descending grades was too high. In reply G. H. Wood (A. T. & S. F.) stated that trains could be brought to a stop on descending grades from a speed of 45 miles an hour in the same distance that they could be stopped on level track from 65 or 70 miles an hour, and for that reason there was no more danger involved. Where cast iron wheels were used the high rate of speed might result in extensive heating of the wheels and in that case it would be necessary to limit the speed. In closing the discussion the chairman stated that the committee realized the speeds given were not applicable in all cases. They were intended rather to establish a maximum limit which could be deviated from according to the judgment of the traveling engineer.

Adjusting Tonnage of Slow Freight Trains for Average Speed of Twelve Miles an Hour

A railroad is most efficient when it produces the maximum ton miles per hour at the least expense consistent therewith. Engine efficiency should not be measured only by the percentage of possible tonnage handled per train, but preferably by the percentage of the maximum ton miles which can satisfactorily be handled per engine per month. Prof. W. J. Cunningham has well said:

"The time element has not generally been given the recognition it deserves. Ton miles per train hour as a unit is analogous to the horsepower unit, but instead of foot pounds per minute we use train ton miles per hour.

"The unit is the resultant of the train load multiplied by the speed in miles per hour. It is influenced favorably by an increase in load or in speed or in both, or by an increase in one factor proportionately more than a decrease in the other factor. . . . A large part of the expenses vary with the hours, hence it is important that the ton miles per hour shall increase. The capacity of the road in periods of peak-loads of traffic will vary with the ton mile production per train hour.

"The ultimate unit of freight car efficiency is: 'Net ton miles per car day.' Cars produce ton miles only when in motion. . . . We are all familiar with the reasons which make it difficult to get a larger daily mileage, but sometimes it may appear that we have become too complacent in accepting these reasons as a complete explanation. In times of car shortage, an increase of one car mile per day throughout the country would be equivalent to adding about 100,000 cars to those available for service."

Apparently this condition can be but slightly improved by increasing the speed of freight trains, because of the small percentage of the time that a car is in movement. But in this we may be deceived to a considerable extent, for in hundreds of instances which have come under the observation of every experienced railroad man, a small increase in the running

time of a train has resulted in the loss of a car day for each car in the train at destination, and frequently an aggregate loss of many car days, as well as per diem charges (which may again interest us soon) at intermediate stations, terminals and junctions. An increase in the time on road also means less time at terminals for repairs, or fewer trips per locomotive. Continued exhaustive strain on locomotive parts is expensive, as such usage invariably results in failure or excessive repair work and time out of service, which, in addition to the direct expense, necessitates an increase in locomotives owned or under lease.

Generally the fuel consumed per ton mile is reduced as the engine load is increased within a reasonable limit, but the wages per train crew per trip are increased in most instances, and frequently it has been found expedient to reduce train tonnage much below the possible maximum in order to clean up blockaded divisions and thus to best serve the public as well as the stockholders. Solely on a ton mile per hour basis a gradual gain in locomotive efficiency can be shown as speed increases to thirty or thirty-five miles per hour; but when the speed of freight trains averages more than fifteen miles per hour, many factors other than ton miles per hour affect the net economy.

During the period between 1890 and 1900 many railroads recognized the inadequacy of old methods of tonnage rating, and began the application of scientific and more logical methods, including the use of dynamometer cars, and adjusted tonnage. The real improvement thus brought about was so alluring that many operating officials lost balance, and failing to consider the immediate ill effects of overloading, went to an unprofitable extreme which still exists too frequently.

The probability of costly delays and accidents increases very rapidly as the length of train approaches the present maximum. The modern locomotive usually can keep a train moving which it cannot start without running out the slack with such force as to overstrain even the best draft gears and couplers. These parts are thus often subjected to destructive forces when long trains are handled over track with sharp variations in grade and while the slack in such trains is run in or out rapidly by air brake operations.

The probability of failure of trains to make expected movement, with consequent expensive road and yard congestion, increases rapidly as train tonnage closely approaches the possible maximum, even though there is no breakage or accident.

The modern locomotive attains its maximum fuel and thermal efficiency at speeds of not less than twelve miles per hour while working at approximately 25 to 30 per cent cut-off. As the cut-off is increased, the thermal efficiency decreases rapidly. At lower speeds, high degree superheated steam is not obtained, and the possible economy from this source is not realized. Superheater locomotives are capable of higher sustained speeds than saturated steam engines capable of dragging the same load, and full advantage should be taken of this superiority. On low grade divisions where it is necessary to half stroke or in many instances to nearly full stroke the engine most of the way between terminals, these features are worthy of careful consideration.

Fully as important as any of these considerations is the psychological effect on the train and engine crews. The present-day appeal is for co-operation, and we feel safe in saying that the extent to which co-operation will be forthcoming from the engine and train crews will be most gratifying if these employees are permitted and encouraged to "get over the railroad." Delays or depressingly slow movement exhaust patience and interest, and without interest and initiative on the part of engine and train crews the best performance cannot be obtained.

Aside from the psychological effect on employees, the time element in calculation of wages of train crews, at one time negligible, has become of great and increasing importance during the past few years. Let us not forget that an equitable relation between this item and the distance between terminals must be maintained. Speaking generally, shortening the distance between terminals, with the cost of consequent new terminals and abandonment or lessening in productiveness of many present terminal facilities, would increase charges to capital account and operating expenses excessively.

Adjusting tonnage properly is one big factor in good railroading. On a railroad handling many high-speed and important passenger, express and mail trains on the same tracks used by freight trains, the maximum possible tonnage per train will result disastrously; while on roads having four tracks, for example, a closer approximation to maximum possible tonnage may be satisfactorily maintained. Often on single-track roads where sidings are five or six miles apart, it is with difficulty that trains can make one hundred miles within the sixteen hours unless the average speed exceeds twelve miles per hour, excluding delays.

The committee is of the opinion that the volume and character of traffic, the physical characteristics of the roadway, and the locomotive equipment vary so greatly on the several roads and in many instances on the various divisions or sections of the same system, that the problem of determining the most suitable average speed and tonnage for freight trains generally must be solved for each division or district. Numerous carefully conducted road tests and expert analysis of performance and cost records should be made to determine the most economical operation.

In the table are shown records of the average freight train speeds for 23 different roads.

AVERAGE FREIGHT TRAIN SPEEDS
As Reported to the Operating Statistics Section in Item 10 (c) of Form C. S. I.

Railroads	Average freight train speeds, M. P. H. 1918 Aug.	Sept.	Oct.	Nov.	Dec.	1919 Jan.	Feb.	Mar.	Apr.	May
A. T. & S. F.	12.4	12.4	12.6	12.5	12.6	12.4	12.9	13.1	13.0	13.2

Arithmetical average	10.5	10.2	10.8	10.3	10.5	10.9	11.0	11.0	11.0	11.1

Arithmetical average of averages, 10.8 miles per hour.

The above table will be supplemented by figures showing speeds for the months of June, July and August, and also by figures showing the average train load on various roads, in the proceedings to be published.

The report is signed by H. C. Woodbridge, chairman, E. F. Boyle, J. S. Meidroth and F. R. McShane.

The dynamometer car or testing plant should be used to determine whether the locomotive is properly designed and constructed, but tonnage rating should not be determined solely by the use of data thus obtained. Allowance must be made for slight defects in the locomotive, slightly inferior fuel, variation in efficiency of engine crews, and the multitude of variables in car and track construction and maintenance, all of which affect movement. For example—the movement of cars with wheels having worn treads requires much more power on curves than would be necessary if the original con-

tour of the wheel treads obtained. Cars with sufficient coupler side-play, anti-friction side bearings, well-lubricated center plates and journal bearings, also can be moved with less power than others of the same capacity not so prepared. The extent that the outside rail is elevated on curves, materially affects the movement of tonnage trains, etc.

We believe that with very rare exceptions an average speed of more than twelve miles per hour for tonnage freight trains can be attained and maintained without reduction in the properly determined maximum allowable tonnage, and that this tonnage will exceed the present rating in some instances, if the transportation and mechanical departments co-operate effectively in determining the proper rating, and if the officers of these departments, as well as those in the maintenance of way department, put into regular use every possible means for the elimination of delays.

Some of those furnishing information to the committee, assumed that the average freight train speed was at present considerably in excess of twelve miles per hour, and were fearful that the committee would advocate the reduction of the present average speed.

Discussion

F. P. Roesch (U. S. R. A.) discussed the comparative cost of handling tonnage with light and heavy engine loading giving statistics for stated conditions which showed that the heavier loading was the more economical. S. Kerby (B. & O.) expressed the opinion that locomotives are often overloaded and better results would be secured by reducing the tonnage and increasing the speed. L. R. Pyle (U. S. R. A.) brought out that enginemen in general do not like to haul heavy tonnage trains and are prone to state that the motive power is overloaded even though the loading is adjusted so that trains can be moved at reasonably good speed. Curves showing the variation of cost with varying tonnage prove conclusively that the net revenue increases with heavier loading. Mr. Pyle expressed the opinin that on many roads operating results could be greatly improved by eliminating delays and by keeping motive power in condition to perform economically. J. H. DeSalis (N. Y. C.) called attention to the fact that the cost of locomotive repairs, considered on a mileage basis, often exceeded the wages of the train crew and for that reason the effects of varying tonnage on the unit cost of repairs must be considered. Several members spoke on the necessity for co-operation between the traveling engineer, trainmaster and despatcher in order to reduce delays and increase the average speed of trains between terminals. The prevailing opinion was that there is little danger of overloading locomotives if the main journal bearings are kept in good condition.

An account of the latter part of the convention will be published in next week's issue of the *Railway Age*.

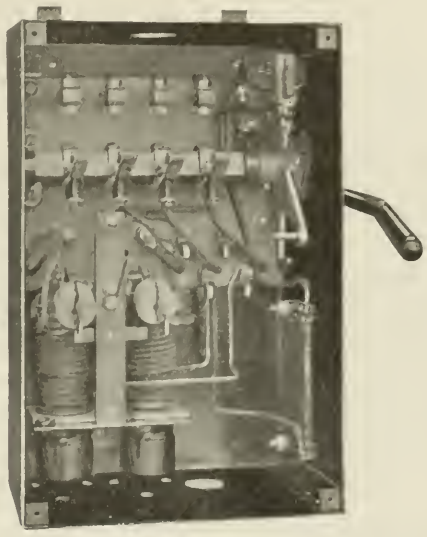
Enclosed Starters for Squirrel Cage Motors

Protection for both the motor and the operator is the principal feature of design in two new enclosed starting switches manufactured by the Cutler-Hammer Mfg. Co., Milwaukee, Wis.

One switch contains an overload protection unit, which is so designed that the circuit is not interrupted by a high initial starting current or by momentary overloads, yet gives protection against the continuance of harmful overloads. This inverse time element action is obtained by the retardation of a plunger in an oil dashpot. The time required for the relay to operate on any given overload condition may be varied by turning an adjusting screw.

The other switch is a three-pole fused starting switch, especially adapted for those motors which cannot be connected directly across the line when starting. A resistor with two sets of terminals allows the motor to be started on either 60 per cent or 75 per cent line voltage. When the motor has reached normal speed, the resistor is cut out of the circuit and the fuses inserted, which is accomplished without breaking the motor circuit. Therefore, the fuses do not carry the heavy starting current, and need be of no greater capacity than to insure proper motor protection.

Both types of starters are completely enclosed and are so designed that it is impossible to touch any live parts either while operating or while renewing fuses and making adjustments. The enclosing cases, which are arranged for conduit



Switch with Overload Protection. Cover Is Removed, Showing Contactors, Duplex Relay and Low-voltage Coil

wiring, prevent the accumulation of dust and grease on the contacts besides protecting the workmen from live parts. All contact posts and fingers are of standard *C-H* drum construction, easily inspected and renewed. Both types of switches are provided with low voltage protection coils.

Lowering the Panel of the Three-pole Starting Switch Deadens the Fuses and Makes Them Accessible for Renewal

To operate either type of starter, it is only necessary to raise and lower the handle, which can be locked to prevent unauthorized operation. The starters are made in various capacities for operating squirrel cage motors on potentials not exceeding 550 volts.

General News Department

The Division of Valuation of the Interstate Commerce Commission has served tentative valuations of the Chicago, Terre Haute & Southeastern, the Hawkinsville & Florida Southern and the Wadley Southern.

Pleasure travel has been very heavy in Western Canada this season, swarms of people coming from the United States. The hotel at Banff, Alberta, reports that it has refused sleeping quarters to 15,000 tourists this season.

The American Society for Testing Materials, which has hitherto had offices at the University of Pennsylvania, has now established society headquarters at the Engineers' Club Building 1316 Spruce street, Philadelphia.

The safety officers of the Northwestern region met at the Hotel Morrison, Chicago, on September 16 for the purpose of discussing plans for the "National Railway Accident Prevention Drive," to be held October 18-31, inclusive.

The American Association of Engineers has removed its national headquarters from 29 South La Salle street to 63 East Adams street, Chicago. The Chicago chapter of the association will retain its offices at 29 South La Salle street.

Indications of valuable oil deposits have been found adjacent to the line of the Chicago, Milwaukee & St. Paul in Montana and Washington. President R. M. Calkins states that boring for oil has been started in several spots near the road in Callam County, Wash., and in Musselshell County, Mont.

A plan for preventing strikes, similar to that embodied in the Canadian law, is provided in a bill, H. R. 9062, introduced in Congress by Representative Wood of Indiana. It provides for the appointment by the President of commissions to investigate labor controversies and would prohibit a strike or lock-out pending the conclusion of any investigation by a commission.

A tropical hurricane and tidal wave practically destroyed Corpus Christi, Tex., Port Aransas and Portland, and other nearby towns, on September 14, killing and injuring hundreds of persons; the railroads were not seriously affected. Relief trains sent from San Antonio, Brownsville and other points have already reached the affected districts with food and medical supplies.

The St. Louis, (Mo.) municipal bridge across the Mississippi river is leased (as regards its railway dock) to produce revenue, and so the city of St. Louis will have to pay taxes on the Illinois half of the bridge. This is a decision recently rendered in the County Court of St. Clair County, Ill. The Illinois half of the bridge has been valued at $600,000, and the 1918 taxes on this amount, which were in suit, are about $17,000.

A campaign for increased production in all industries has been started by the Chicago Association of Commerce in the shape of an appeal to workmen for intelligent co-operation in meeting the present industrial crisis. Statements of the problem and the necessity for increased production have been prepared by the Association of Commerce in such form as to be suitable for inserting in pay envelopes and others for display upon bulletin boards.

The Greenville & Western Railway, extending from Greenville, S. C., northward, 23 miles, to River Falls, evidently out of commission because of unsafe road bed, will resume business as soon as the new ties can be laid and certain trestles have been repaired, so as to make the track passable. This is the substance of a letter received by the South Carolina Railroad Commission and given out at Columbia. The road has been bought by W. H. Cook, of Duluth, Minn.

Representative McKeown has introduced in Congress a joint resolution providing that no railroad shall declare a dividend out of funds received from the government as compensation for the use of its property during federal control until the company shall have settled all valid final judgments rendered prior to federal control, including judgments from which appeals were pending at the time and became final subsequent to the taking over of the railroads by the government.

The United Mine Workers, in session at Cleveland, Ohio, on September 13, following an address by Glenn E. Plumb on government ownership of the railways and their operation by railway employees, adopted a resolution endorsing the Plumb Plan and pledging the support of the miners' organizations to obtain its enactment. The mine workers also invited the railroad brotherhoods to join them in an alliance for joint action, to be extended later into an economic alliance with labor organizations in other basic industries.

The executive council of the Federated Railway Shopmen of the Chicago district has called a national convention to be held at Chicago on September 25, to act upon the new wage scale granted to shopmen recently. According to statements made by officers of the executive council, steps will be taken at the convention to oust the grand lodge officers now conducting the wage negotiations with Railroad Administration officers at Washington. The convention was called by John D. Sanders and M. L. Hawver, who were the leaders of the recent unauthorized strike of shopmen in the Chicago district. So far as can be learned it has not been sanctioned by the international officers of the shopmen's brotherhood and was called without their knowledge.

Oil as fuel has long since supplanted coal on the lines of the Southern Pacific in Southern California; nevertheless the removal of the old coal handling facilities has not been entirely consummated. An instance of this recently was brought to light in the application of the Pacific Electric Railway Company to the Railroad Commission of the State of California for authority to dismantle and remove its long wharf at Port Los Angeles, Cal., and to take up the railroad tracks adjacent. This wharf was originally used by the Southern Pacific for a coal wharf. With the advent of oil as fuel the Southern Pacific transferred the principal part of its fuel handling in Southern Californa to the port of San Pedro and allowed the wharf to fall into disuse. A large part of the wharf was destroyed by a storm several years ago and the application says that the need for it no longer exists, and that it constitutes a menace to other wharves.

National Transportation Conference Plan Introduced as a Bill in Senate

Senator Frelinghuysen of New Jersey has introduced in the Senate a bill, S. 2998, embodying the plan for railroad regulation proposed by the National Transportation Conference, which was called by the railroad committee of the Chamber of Commerce of the United States.

Canadian Regulations for Train Markers

In order to standardize both equipment and operating practices, the Board of Railway Commissioners for Canada recently ordered that all passenger cars and cabooses hereafter constructed shall be equipped with marker sockets fixed at such elevation as will permit lamps and flags to be placed therein from the platform or floor of the car without the use of steps. Furthermore, according to the order, all passenger cars and cabooses now in use and not equipped with marker sockets in this position must be so equipped on or before

May 1, 1920. The action was taken because of the placing of marker sockets at the corners of the roofs in addition to the lower position on some of the passenger cars of the Grand Trunk.

Pyle National Exhibit

Through an oversight the report of the exhibit of railway supplies held in connection with the convention of the Railway General Foremen's Association, published in last week's issue, failed to mention the display of the Pyle National Company. This exhibit consisted of an 18 in. headlight case, an 18 in. special with glass reflector, an 18 in. special with wing side number doors, a K.2-generator, E.2-generator, E.-generator, 14 in. standard case, 1,450 lamp stand, Young valve gear, 32 U. and 33 E. connectors, 402 B. wheel, 1,602, 602 B wheels. This company was represented by J. Will Johnson, W. Miller, O. W. Young, W. Smith and T. P. McGinnis.

The M. W. Brotherhood

The United Brotherhood of Maintenance of Way Employees and RailwayShop Laborers is holding a convention at Detroit, Mich., with approximately 2,000 delegates from the United States, Canada and the Panama Canal Zone present. The convention will last two weeks (September 8-20). The discussions are to be on the wage question, including its relation to living costs, and the probability of calling a strike unless wage demands and working agreements are not granted. The membership has already voted power to the executive committee to call a strike of the 600,000 men employed in maintenance of way and railway shop work. The latest reports from the convention indicate that the organization will abide by President Wilson's plea to postpone action on wages until the conclusion of the government's eorts to bring living costs to normal.

Signal Division A. R. A.—Annual Meeting

The first annual meeting of the Signal Division of the American Railroad Association, and the twenty-fourth annual meeting of the former Railway Signal Association, was held at the Congress Hotel, Chicago, on September 17-19, with 311 members, representing the railways of the United States and Canada, in attendance. An address of welcome was delivered by Harry B. Miller, prosecuting attorney for the City of Chicago, after which the regular business of the Division was taken up, and the committee reports were presented for discussion and action. The committees reporting and the subjects of their reports appeared on page 526 of the *Railway Age* for September 12. The entertainment provided consisted of luncheons on Wednesday and Thursday, a theater party on Wednesday night and an informal roundtable dinner on Thursday evening.

New Locomotives for Canadian Pacific

The Angus shops of the Canadian Pacific at Montreal, Quebec, recently completed 16 new locomotives which were used to draw the royal train carrying the Prince of Wales across Canada. Locomotives of this type, which are said to be the heaviest in service in the Dominion, are being turned out at a rate of one every five and a half working days. The total weight of each engine and tender in working order is 480,000 lbs., the cylinders are 25 in. by 30 in., the diameter of the driving wheels is 75 in. and the boiler carries 200 lb. steam pressure, giving the locomotive a tractive effort of 42,000 lb. The tender holds 8,000 imperial gallons of water and 12 tons of coal. The new locomotives are to be used in the passenger service of the Canadian Pacific between Fort William, Ont., and Winnipeg, Man., and between Smith Falls, Que., Trenton and Havelock.

McAdoo's Passes Discussed in Senate

The issuance of railroad and Pullman passes to W. G. McAdoo and to members of his family on the strength of his appointment as special counsel for the Railroad Administration for the state of New York was criticised in the Senate on September 15 by Senator Sherman of Illinois and defended by Senator Robinson of Arkansas, who said that Mr. McAdoo was serving without compensation and had served as director general without compensation during the war. "It is small business to make an attack on Mr. McAdoo under the circumstances," he said. In reply to a question by Senator Kellogg as to what services Mr. McAdoo performs as special counsel Senator Robinson said that according to his information they are largely advisory but far in excess of the value of the passes. Senator Kellogg said he doubted if there has been a time in years when so many people have been traveling on railroad passes "as in a time when no one should have a pass" and he declared that Congress ought to prohibit the issuance of passes at all.

Arbitration Rules

The Arbitration committee of the Mechanical Section of the American Railroad Association, calling attention to requests for interpretations and for arbitrations that are not prepared in accordance with the rules, promulgates the following general rules:

1. Requests for interpretation of the Rules of Interchange must be signed personally by the chief mechanical officer of the railroad or company. Questions received from car foremen, bill clerks, inspectors and others in a minor capacity, will not be considered. Many of the questions raised by these minor officers could and would be settled by the chief mechanical officer without being referred to the arbitration committee.
2. In presenting requests for interpretation, all facts in the case should be clearly stated, and, wherever possible, repair cards and other records involved should accompany the letter.
3. Where the question for interpretation is the result of a controversy with another company, the name of the other company should be given in order that the committee may, if necessary, request additional information from both parties to the dispute. Several requests for interpretation of the rules have been presented recently that were in reality disputes that should have been prepared as arbitration cases.
4. All cases presented for arbitration should be prepared in accordance with provisions of Interchange Rule 123. Both parties to the dispute should join in presenting the case. The entire file, including original repair cards, joint evidence certificates, etc., should accompany the prepared statements.

Lumber Men Consider Railroad Problem

Lumber men and the lumber industry generally have always taken interest in railroad problems; however, with the present complex situation, the railroad question has occupied even more of their convention time than formerly. The governmental relations committee of the National Lumber Manufacturers' Association, sitting recently in Chicago, adopted resolutions vigorously denouncing government ownership or operation of railroads, and proposed rigid long-and-short-haul provisions. At the summer meeting of the Northern Wholesale Hardwood Lumber Association held recently at Minneapolis, Minn., resolutions were adopted advocating the return of the railroads to their corporate owners not later than January 1, 1920, under proper regulation of the power of the Interstate Commerce Commission and also opposing any rigid long and short haul provision. The Northern Pine Manufacturers' Association, at Minneapolis, Minn., adopted resolutions opposing government ownership of railroads and government guarantees of railroad income, but favoring government loans to roads which are in financial distress.

Eastern Oregon Supports Senate Bill 360

The passing of laws which will assure the people of Eastern Oregon railroad rates now in effect under federal control and prevent transcontinental lines from being returned to pre-war schedules under private management has been urged in letters recently sent by H. H. Corey, a member of the Public Service Commission of Oregon to Senators Cummins, Poindexter, Kellogg, Pomerene and Robinson, who are the committee appointed to draft a law for the solution of the railroad problem. Mr. Corey's letter said in part:

"We of the eastern portion of this state are very much interested in Senate Bill 360, known as the "long-and-short-haul legislation." In view of the arbitrary manner in which the carriers in the past have discriminated against intermountain points, we feel that there can be no compromise on this measure. We hope that you may see the justice of granting at least equal railroad rates when the long-and-short-haul distances are disregarded because of competitive conditions. We think this is a large concession, for, as we view it, there is little justification for a carrier to haul several hundred miles further over mountain ranges at the same rate as for the shorter haul."

Mr. Corey has also urged financial, industrial and commercial organizations throughout eastern Oregon to prepare

and present strong endorsements of Senate Bill 360. He tells them that the practice of allowing lower rates from the east to the Pacific Coast, than for the shorter haul to intermediate points, not only denies to Eastern Oregon an equal opportunity in the manufacturing and jobbing business but has practically put out of business Oregon's coast ports. "Portland has suffered more from lack of water transportation than any other port of the Pacific Coast. There five transcontinental lines meet the potential boat rates, this making it impossible for them to operate; while the roads make up any deficits that may occur from this practice by assessing higher rates in the back haul territory. . . ."

The Heavy Hand and Its Lesson

Written under the imprint of a red hand and the caption above is the August accident record of the Pere Marquette and other roads under the jurisdiction of Federal Manager Frank H. Alfred. The first paragraph of the August bulletin, prepared by George Bradshaw, supervisor of safety, tells the cause of the red hand: "Well, boys, we have been hard hit this month. Seven of our men have made their last runs and entered the great terminal. William Ryan, a brakeman on the Canadian division fell from a car, was run over and killed; William Young, a laborer in Sarnia roundhouse was fatally injured in falling from the running board of an engine on which he was working and five employees of the Chicago-Petoskey division were killed in a collision between an extra freight and a regular passenger train. The cause of the collision was clear and undisputed—the entire crew of the freight simply forgot about the (opposing) passenger train and they came together at full speed on a sharp curve between stations."

The bulletin, with its moral, ends as follows:

"In the midst of life there is death, and in the best devised system of safety there is ever lurking the germ of a serious mishap. It has always been and always will be so long as men measure short of perfection. Our sacred duty is to so conduct and govern ourselves that this germ will be least likely to develop and multiply within us. A man in train service is never off duty and the book of rules is only one short paragraph in the great volume of his guiding principles."

Standard Steel Car Company Strikes Riot

A permanent committee has been appointed to represent the manufacturers of 36 states who attended the "Our Country First Conference" held in Chicago September 8 and 9, a report of which appeared in the *Railway Age* of September 12. This committee was announced recently by John M. Glenn, secretary of the Illinois Manufacturers' Association, under the auspices of which organization the conference was held. The committee, which consists of 16 men, among whom are four prominent railway and railway supply men, was selected to obtain a country-wide ratification of anti-red resolutions which are to be presented to Congress. Among these resolutions is one asking that the Interstate Commerce Commission be empowered to decide the wages of railway employees, as well as the rates for transporting freight and passengers. Following the performance of this duty, the committee will function as the agency of the manufacturers of the nation in propaganda work. The committee consists of: Charles Piez, president, Link-Belt Company, Chicago, chairman; E. B. Leigh, president, Chicago Railway Equipment Company, Chicago, and representing the National Association of Manufacturers, New York; Alba B. Johnson, president, Railway Business Association, New York; Samuel O. Dunn, editor, *Railway Age*, Chicago; George M. Gillette, Minnesota Employers' Association, Minneapolis, Minn.; Milo D. Campbell, National Milk Producers' Federation, Coldwater, Mich.; Thomas Creigh, American Institute of Meat Packers, Chicago; R. H. Rice, National Conference of State Manufacturers' Associations, West Lynn, Mass.; Charles S. Keith, National Lumber Manufacturers' Association, Kansas City, Mo.; W. H. Stackhouse, National Implement and Vehicle Association, Springfield, Ohio; H. H. Merrick, Mississippi Valley Association, Chicago; Dwight T. Farnum, American Institute of Industrial Engineers, St. Louis, Mo.; J. J. Phoenix, National Association of Hosiery & Underwear Manufacturers, Delavan, Wis.; S. Edward Davis, Butter and Egg Board, Chicago; George M. Verity, Ohio Manufacturers' Association, Columbus, Ohio, and John M. Glenn, secretary, Illinois Manufacturers' Association, Chicago.

Standard Steel Car Company Strikers Riot

The strike of workmen at the Hammond, Ind., plant of the Standard Steel Car Company, which has been in progress for approximately two months and which necessitated the calling out of eleven companies of the Indiana state militia several weeks ago, again assumed a serious aspect on September 9, when five strikers were killed and 15 wounded in a battle between 1,000 former employees of the company and the police. About two months ago the workmen at the plant went on a strike for increased wages and improved working conditions. The strike did not cause serious trouble until about three weeks ago, when rioting broke out between the strikers and the police and a number of persons were injured, as a result of which the Indiana state militia was ordered to Hammond to restore order. These troops were withdrawn about two weeks ago and since that time the strikers have been returning to their work in small numbers, thereby creating bad feeling among the men who refused to return. On September 9, about 200 men on their way to work were attacked by a crowd of 1,000 strikers, who in turn were ordered to disperse by police and special guards employed by the company. The rioting which ensued as a result of the attempts of the police to arrest the leaders of the mob resulted in the death of five of the strikers and the wounding of 15. Since this latter outbreak there has been no serious trouble reported and the strikers continue to return to their work in small groups.

Safety Committees' Work in June

The Safety Section, Division of Operation, of the United States Railroad Administration, has issued bulletin No. 7, showing that in the month of June, on the class 1 railroads, 158 employees were killed, and 10,000 were injured, as compared with 210 killed and 12,624 injured in the corresponding period of 1918. In June of this year the number of meetings held by general and local safety committees was 1,958, with an attendance of 32,020. The magazines, pamphlets and other printed matter distributed, numbered 1,095,808 pieces.

This bulletin contains detailed suggestions to supervisors of safety, on the government operated railroads, for making effective the "National Railroad Accident Prevention Drive" which is to be conducted from October 18 to October 31.

Committee meetings should be generally held during the ensuing four weeks and the drive definitely presented; there should be general inspections of tools, shops, buildings, and all railroad property; clean-up periods, short or long, and meetings early in October, to be managed by foremen and gang bosses; and pledge cards should be circulated. It is desired also that the co-operation of ministers, schools, public officers, etc., shall be secured and, in general, that all the methods heretofore proved useful in no-accident drives be employed now with the utmost possible efficiency. Men should be drilled, and every individual who can do anything in this direction should be assigned to a position for action.

The records of the results of the drive are to be made up on the basis of casualties per 100 persons in the service, comparison being made with the casualty records for the period October 1-15; and also with last year's October record. Reports will include all deaths or bodily injuries which are to be reported to the Interstate Commerce Commission.

The bulletin ends with an appeal to everyone to take personal pride in making the drive a success. The net decrease in casualties in the first half of 1919 was 19,110 employees (or 21,390, if all cases are included). Special care should be taken with new men in the service, who must be watched, advised and instructed.

Western Railway Club Opening Meeting

On Monday evening, September 15, the Western Railway Club, Chicago, held its opening meeting of the season at the Hotel Sherman, Chicago. R. M. Calkins, president of the Chicago, Milwaukee & St. Paul Railway Company, discussed the railroad situation from the standpoint of the corporation. He said in part that the railroad companies were willing to accept government regulation, fair and just wages to em-

ployees, pooling of cars when necessary and unification of terminals if the service rendered would be more efficient and economical, but in return it would be only just that the owners of railroad securities should be allowed a fair return on their investments. The problem is to ascertain where the money is to come from to finance the railroads, to extend their facilities and to give adequate service to the public if these securities do not offer a fair return, for insurance companies, banks and other financial institutions which have been purchasers of large quantities of railroad stocks and bonds, are now looking elsewhere for investments.

In regard to rates and the Cummins plan now before the Senate committee, Mr. Calkins said that it did not seem fair to allow a certain rate and then ask that all over and above a certain margin of profit be returned to the government, because it would certainly kill initiative on the part of those in charge of railroad properties and discourage the employees from attempting to save any thing over and above the fixed margin of profit. When a rate is fixed it stays fixed until changed by the rate making bodies, in contrast with the prices of a great many commodities which are shipped over the railroads at a fixed rate. For instance, beef, pork or mutton may vary five or six cents per lb. up or down even within a week's time, while the rate per lb. for shipping such meat remains the same. He stated that it was his belief that this high cost of living would adjust itself rapidly if the railroads were turned back to their owners as soon as possible, providing legislation was enacted which was fair and just to all.

Following Mr. Calkins' address, a paper on "Railway Train Lighting" was presented by E. Wanamaker, electrical engineer, Chicago, Rock Island & Pacific. This paper outlined the history, development and progress of train lighting since its early beginning in England in 1825.

National Association of Railroad Commissioners

The call for the thirty-first annual convention of the National Association of Railway and Utilities Commissioners, to be held at Indianapolis, Ind., on October 14, was given in the *Railway Age* last week, page 527. President Charles E. Elmquist expects that the committee reports to be presented at this convention will be unusually interesting and important. They will be taken up, so far as practicable and convenient, in the order in which the subjects are given below. Members are called upon to make special effort to be present, and to attend the session of the first day, when the opening address will be delivered by Hon. C. B. Aitchison. It is not safe, says the circular, to infer that the propaganda against state regulation is dead. "Congress must be thoroughly informed of the facts concerning our dual system of regulation and the necessity for its continuance. Justifiable pride in the accomplishments of the state commissions, a proper consciousness of our responsibilities to the public, and a clear appreciation of the complex problems of reconstruction, vitally relating transportation and utility services to our industrial fabric, make it imperative that every member of the association attend."

The twenty subjects to come before the convention, as indicated by the titles of the committees, together with the name of the chairman of each committee, are as follows:

Standardizing annual and special reports of companies; U. G. Powell, Nebraska.
Railroad rates in inter-mountain states; H. H. Williams, New Mexico.
Terminals and Warehouses; O. P. B. Jacobson, Minnesota.
Special war committee.
Public ownership and operation; J. S. Allen, Wisconsin.
Safety of railroad operation; C. C. McChord.
Safety of operation of public utility companies; W. D. B. Ainey, Pennsylvania.
Railroad service, accommodations and claims; C. C. Marshall, Ohio.
Service of public utility companies; C. B. Hill, New York
Railroad rates; E. J. Bean, Missouri.
Public utility rates; T. W. D. Worthen, New Hampshire.
Car service and demurrage; O. P. B. Jacobson, Minnesota
Express and other contract carriers by rail; E. O. Edgerton, California.
Statistics and accounts of railroad companies; U. G. Powell, Nebraska.
Statistics and accounts of public utility companies; C. E. Schreiber, Wisconsin.
Grade crossings and trespassing on railroads; H. H. Williams, New Mexico.
Valuation committee; W. A. Shaw, Illinois.
Capitalization and inter-corporate relations; H. P. Long, Louisiana.
State and federal legislation; V. E. Wilson, Nebraska.
Publication of commissions' decisions; A. R. Weed, Massachusetts.

Exhibitions at Traveling Engineers' Convention

The following is a list of the companies exhibiting at the convention of the Traveling Engineers' Association, Hotel Sherman, Chicago, September 16 to 19:

Air Reduction Sales Company, New York—Oxy-acetylene welding apparatus and gases. Represented by E. L. Mills, R. T. Peabody, S. H. Shaykin, M. M. Weist and B. A. Eliason.

American Flexible Bolt Co., Pittsburgh, Pa.—American flexible bolt, American reduced body staybolt, American marine hollow bolt, American hollow staybolt iron, American rivet. Represented by R. W. Benson, W. F. Heacock, L. W. Widmeier and W. W. McAllister.

American Locomotive Company, New York—Locomotives, Alco reverse gear, flexible staybolts, Alco throttle lever, Alco trailing truck, Alco lateral motion box, Alco rotary snowplow. Represented by W. J. Murray, G. G. Jones and G. P. Robinson.

American Steel Foundries, Chicago—Simplex clasp brake, Simplex couplers, Simplex shelf coupler pocket, Ecluse coupler yoke, Economy draft arm, steel side frames. Represented by W. G. Wallace, W. C. Walsh and J. H. Tinker.

Anchor Packing Co., Philadelphia, Pa.—Packings of all kinds for railroads and power plants. Represented by J. P. Landreth and J. C. Weedon.

Ashton Valve Company, Boston, Mass.—Ashton safety valves, pressure recording gages, locomotive steam and air gages, test gages, dead weight and gage tester, wheel press recording gage and whistles, protected dial gages. Represented by J. W. Motherwell, H. O. Fettinger and J. F. Getzrust.

American Arch Co., New York—Security brick arch and new double tube supported arch. Represented by J. P. Neff, A. W. Clokey, R. J. Hunmeright, W. L. Allison, F. G. Boomer, J. D. Brandon, E. H. Cook, T. M. Ferguson, E. T. Mulcahy and W. W. Neale.

Baldwin Locomotive Co., Philadelphia, Pa.—Locomotives. Represented by W. T. Sample and C. H. Gaskill.

Barco Manufacturing Company, Chicago—Engine tender connections, car steam heat connections, coach yard steam heat connections, freight train departure yard air connections, air reservior joints, Barco crosshead and slide, Barco automatic smoke box blower fitting, Barco roundhouse blower and blow off connections. Represented by F. N. Bard, C. L. Mehoe and C. Thomas.

Bird-Archer Company, New York—Harter circulating boiler plate, boiler compound. Represented by F. B. Bird, C. W. Bird, L. F. Wilson, L. D. Bush and C. W. McGurn.

Boss Nut Company, Chicago—Boss lock nuts, bolts and rivets. Represented by J. A. MacLain, J. W. Fogg and W. G. Willcoxen.

Broschart Threadless Pipe Coupling Company, Trenton, Mo.—Train line couplings and accessories. Represented by J. L. Broschart.

Buda Company, Chicago—Model G. W. headlight equipment. Represented by H. Bayley, M. A. Ross and W. F. Davis.

Chamber Valve Company, New York City—Throttle valves. Represented by F. H. Clark.

Chicago Pneumatic Tool Company, Chicago—Pneumatic tools. Represented by L. C. Sprague, A. C. Andresen and C. W. Cress.

Commonwealth Supply Company, Richmond, Va.—Lewis power reverse gear. Represented by S. H. Lewis.

Crane Company, Chicago—Valves and fittings. Represented by F. D. Fenn.

Dearborn Chemical Company, Chicago—Water treatment for locomotive boilers. Represented by G. R. Carr, J. D. Purcell, W. S. Reid, L. L. Beele, O. H. Rehmeyer, L. H. Bowen, I. P. Bowen, C. H. Everett, C. S. Murray, J. E. Roddy, H. Ross and T. H. Price.

Joseph Dixon Crucible Company, Jersey City, N. J.—Brake cylinder greases, front end finish, rub liner lubricant, general graphite lubricants. Represented by H. L. Hewson, I. R. Brandon and J. E. Simpson.

D & M Cleaning Process, Chicago—D & M cleaning process. Represented by D. L. Lewis and F. M. Hilgerink.

Detroit Lubricator Company, Detroit, Mich.—Three feed Detroit standard lubricator, with transfer filler attachment, one U. S. standard three-feed lubricator and Detroit automatic flange oiler. Represented by A. G. Machesney and A. D. Howard.

Electric Pneumatic Seal Company, Centralia, Ill.—Car stopping device for use in hump yards. Represented by L. W. Wiley.

Elda Brass Mfg. Company, Cincinnati, Ohio—Lubricators, injectors, water glasses, coal sprinklers, boiler checks, line checks, locomotive appliances. Represented by E. O. Corey and H. V. Glenn.

Flannery Bolt Company, Pittsburgh, Pa.—F. B. C. flexible staybolt, universal sleeve, Tate flexible staybolt. Represented by W. M. Wilson.

Franklin Railway Supply Company, New York—Franklin butterfly

fire door, Franklin lateral preventer, Franklin buffer, Economy engine truck McLaughlin flexible joints, unit safety bar, Universal valve chest, Franklin automatic driving box wedge. Represented by J. L. Randolph, C. W. F. Coffin, S. G. Allen, J. L. Bacon, H. F. Ball, J. G. Berger, L. Brooks, R. G. Coburn, W. T. Comley, W. H. Coyle, R. F. D. Mott, H. M. Evans, P. Gillespie, C. H. Godfrey, W. T. Lane, F. W. Martin, C. F. Owens, J. A. Partington, F. R. Peters, C. F. Prescott, F. L. Reed, S. D. Rosenfelt, J. Sinkler, H. R. Stafford, R. H. Stickney, P. Weiler, P. Willis and C. L. Winey.

Galena Signal Oil Company, Franklin, Pa. Represented by C. McNair, H. Hale, F. J. Walsh, W. F. Walsh, D. L. Eubanks, A. J. Poole, W. J. Watsn, W. E. Auger, C. B. Royal, I. P. Ferguson, J. F. Linahen, W. H. Foster, J. A. Graham, B. P. Corey, W. L. Trout, F. Smith, R. Webb, J. J. Dyer, I. Farmer, P. Stack, W. O. Taylor, M. Meehan, J. A. Roosevelt and J. S. Brown.

Garlock Packing Company, Palmyra, N. Y.—Packings. Represented by G. W. Sullivan and W. H. Cook.

Garrett-Callahan Company, Chicago—Magic boiler preservative. Represented by A. H. Hawkinson, W. Rollinson, O. A. Leath and E. V. Sackett.

A. W. Gillespie & Company, Chicago—Economy locomotive fire door. Represented by A. W. Gillespie and J. S. Seeley.

Hunt Spiller Manufacturing Corporation, Boston, Mass.—Piston valve bushings, piston valve packing, piston valve bull rings, cylinder packing, crosshead shoes, driving box shoes and wedges, knuckle pin bushings, side rod bushings. Represented by J. G. Platt, V. W. Ellet, E. J. Fuller, C. Galloway and F. Hartman.

H. G. Hammett, Troy, N. Y.—Staytite metallic piston rod and valve stem packing.

Hanna Locomotive Stoker Company, Cincinnati, O.—Locomotive stokers. Represented by W. T. Hanna, F. E. Cornwell, L. J. McConnell and J. R. Gallagher.

Henry Manufacturing & Grease Cup Company, Terre Haute, Ind.—Henry automatic grease cup. Represented by M. Henry.

International Correspondence Schools, Scranton, Pa.—Correspondence courses. Represented by E. M. Sawyer, H. T. Pettinger, C. Z. Meyers and J. W. Harding.

H. W. Johns-Manville & Company, New York—Air pump and throttle packing industrial and brake cylinder packing sets, insulation for pipes, boiler and locomotive lagging, brake slack adjuster. Represented by J. E. Meek, J. C. Younglove, P. C. Jacobs, P. R. Austin, E. H. Willard, D. L. Hennings, L. S. Wilbur, H. M. Butters, G. Christenson, J. H. Trent and H. Flannagin.

Lewis Valve Company, New York—Lewis automatic drifting valve. Represented by F. M. Patterson.

Locomotive Firebox Company, Chicago—Nicholson thermic syphons for locomotive fireboxes. Represented by J. L. Nicholson, S. Hawley and J. T. Anthony.

Chas. R. Long, Jr., Company, Louisville, Ky.—Railway paints, locomotive black varnish, Staybrite front end paint, Lo-kost front end paint, Lovico process freight car paints, passenger car and locomotive enamels. Represented by Harry Vissering, G. S. Turner, W. H. Heckman and J. M. Monroe.

The Leslie Company, Lyndhurst, N. J.—Pressure regulators and removable coupling nuts. Represented by S. I. Leslie and J. J. Cizek.

Locomotive Feed Water Heater Company, New York—Model of feedwater heater and pump. Represented by W. L. Allison, E. A. Averill and W. T. Bennison.

Locomotive Lubricator Company, Chicago—Schlacks' system of force feed lubrication for locomotive valves and cylinders. Represented by C. W. Rudolph, O. H. Neal and W. J. Schlacks.

Locomotive Stoker Company, Pittsburgh, Pa.—Duplex stokers. Represented by C. D. Barrett, W. S. Bartholomew, J. J. Byrne, O. B. Capps, W. G. Clark, D. F. Crawford, J. J. Hannahan, E. Prouty, L. V. Stevens, O. W. Deitrich, H. C. Cale, A. N. Willsie, D. T. Carlisle, E. Ryan, R. C. Jordan, E. G. Haskin and F. H. Tryon.

Locomotive Superheater Company, New York City—Pyrometer for superheater locomotives. Represented by G. E. Ryder, R. R. Porterfield, R. M. Osterman, K. E. Stillwell, G. Fogg, G. E. Crisp, B. R. Bristol, B. G. Lynch, H. Spicer, J. E. Monroe, H. B. Oatley, R. J. Van Meter, F. Schaff, W. Boughton, A. C. Louden, W. A. Buckbee, B. Browne, A. C. McLaughlin, S. MacDonald, C. Wickham, W. Tawse, J. Bell and H. C. Bell.

Lovejoy Tool Works, Chicago—Cone bearing journal jacks. Represented by W. H. Dangel.

Manning, Maxwell & Moore, New York—Ashcroft Manufacturing Co., gages, Hancock inspirator, Hancock boiler tester, boiler checks, appliances. Consolidated safety valve. Represented by C. L. Brown.

Metal & Thermit Corporation, New York—Thermit and alloys, compounded with chromium, nickel, iron, titanium and manganese; thermit process for pipe welding, thermit welding equipment. Represented by W. H. Moore, H. S. Mann and C. D. Young.

W. H. Miner, Chicago—Draft gears, side bearings. Represented by J. R. Mitchell and B. S. Johnson.

Mudge & Company, Chicago—Mudge-Slater spark arrester. Represented by J. K. Vanatta and G. W. Bender.

Nathan Manufacturing Company, New York—Injectors, lubricators, boiler checks, gage cocks, water gages, boiler washer and tester. Represented by O. Best, W. R. Walsh, W. Brumble, J. Arn, H. Gettys, J. Lemley, F. C. Davern and R. Welsh.

National Railway Devices Company, Chicago—Shoemaker vertical fire doors. Represented by J. G. Robinson, E. J. Gunnison and F. Lind.

National Boiler Washing Co., Chicago—National hot water locomotive boiler washing system. Represented by D. Anderson.

National Tube Co., Pittsburgh, Pa.—National pipe and tubes.

National Waste Co., Chicago—Packing and wiping waste. Represented by G. Green.

New York Air Brake Co., New York City—Forsyth automatic air and steam connector, air pump strainer, type L, automatic brake valve, leather and rubber gaskets for air brake equipment, pipe fittings for railroad air brake service. Represented by G. Kleifges, W. J. Elliot, H. Yohn, W. Owens and L. W. Sawyer.

Ohio Injector Company, Chicago—Chicago lubricator, Chicago flange oiler, Chicago non-lifting injector, Chicago U. S. Standard special II injector, Ohio water glass protector, Ohio lifting injector, Chicago automatic drifting valve. Represented by A. C. Beckwith, F. W. Edwards, W. S. Furry and F. B. Farnsworth.

Okadee Company, Chicago—Okadee front end hinge, locomotive blow-off valves, tender hose couplers, Okadee water gage, glass and round-house washout valves. Represented by A. G. Hollingshead, G. S. Turner and W. H. Heckman.

O'Malley-Beare Valve Company, Chicago—Multiplate valves, Perfection self-grinding gage cocks, water glass drains, special locomotive valves. Represented by T. O'Malley, E. O'Malley, J. E. Brown, J. N. Gallagher, J. Pigott, F. Hitesman and W. Morris.

Paxton-Mitchell Company, Omaha, Neb—Paxton-Mitchell piston rod packing and Leighton cylinder packing rings. Represented by J. L. Paxton and F. J. Myers.

Pyle-National Company, Chicago—Headlight cases, with glass reflector and wing side number doors, K.2-generator, E.2-generator, E.-generator, 14-inch standard case 1450 lampstand, Young valve gear, 32 U. and 33 E. connectors. Represented by J. W. Johnson, W. Miller, O. W. Young, W. Smith, J. Reese, C. LeFevre, R. L. Kilker, T. P. McGinnis, C. P. McGinnis and G. Haas.

Pilliod Company, Swanton, O.—Baker valve gear. Represented by E. J. Barnett, W. H. Bellmain, K. J. Eklund and R. H. Weatherly.

Pocket List of Railroad Officials, New York City—The Pocket List. Represented by C. L. Dinsmore and J. Alexander Brown.

Railway Review, Chicago.

Schroeder Headlight & Generator Company, Evansville, Ind.—Headlight with switch lens and special lens for diffusing light on yard and switch engines. Represented by J. H. Schroeder, A. H. Varney, E. B. Barris, C. E. Kinnaw and F. Edmunds.

Wm. Sellers & Company, Inc., Philadelphia, Pa.—Feed water equipment and special devices. Represented by J. D. McClintock and J. R. New.

Simmons-Boardman Publishing Company, New York City—*Railway Age*, Railway Mechanical Engineer, Locomotive Dictionary, Car Builders' Dictionary. Represented by A. F. Stuebing, J. M. Rutherford and F. H. Thompson.

Sargent Company, Chicago—Ironclad water glass protector, Sargent safety water gage, E. S. E. Reflex gage, E. S. E. water glass cocks, Renn gage cock, Loodige quick acting blower valves, E. S. E. automatic feed grease cup, Martins self-locking grease plug. Represented by G. S. Garren and K. C. Robbins.

Southern Locomotive Valve Gear Company, Knoxville, Tenn.—Southern valve gear. Represented by E. L. Challman.

Smith Adjustable Hub Plate Company, Chicago—Smith adjustable hub plate. Represented by A. J. Sams and R. G. Long.

Standard Stoker Company, New York—Locomotive stokers. Represented by J. A. Carey, H. L. Walker and F. M. Morley.

W. S. Tyler Company, Cleveland, O.—Draftac spark arrester. Represented by J. H. Jackson and A. D. Busch.

Universal Equipment Company, Toledo, O.—National Gregory automatic fire door.

Universal Packing & Service Company, Chicago—Spring journal box packing. Represented by L. Rowe.

United States Metallic Packing Company, Philadelphia, Pa.—King type single and tandem piston packing, King type air pump packing. Represented by M. B. Brewster, H. E. Hyslop, L. B. Miller and J. Luscombe.

Vapor Car Heating Company, Chicago—Locomotive cab heating arrangement; pressure reducing valves, steam gages, traps and metallic straight pert steam joints. Represented by E. C. Post.

Harry Vissering & Co. Chicago—Viloco fire door, Crescent metallic piston rod and valve stem packing, sanders, duplex sander valves, bell ringers and Viloco steam compressor governors. Represented by G. S. Turner, J. M. Monroe and W. H. Heckman.

J. H. Watters, Anniston, Ala.—Locomotive track sanders, feed water strainer valves. Represented by J. H. Watters.

Western Railway Equipment Company, St. Louis, Mo.—Linstrom syphon, Western M. C. B. malleable iron journal wedge and security dust guard. Represented by R. M. Hoerr, R. L. Langtim and S. H. Campbell.

Westinghouse Air Brake Company, Pittsburgh, Pa.—H.-6 brake valve with collapsible equalizing piston, No. 4 brake pipe vent valve, M. C. B. hose couple gage, hose coupling packing ring gages, triple valve shipping caps, auxiliary devices governor, freight brake cleaners and testing outfit, brake cleaning tools, air compressor strainer. Represented by W. S. Bartholomew, C. J. Ohlmstead, J. S. Y. Fralich, J. B. Wright, L. Wilcox, L. M. Carleton, A. K. Hohmyer, F. H. Parke, A. L. Berghane, W. Sleet, A. G. Houston, F. B. Farmer, J. A. O'Malley, H. H. Burns and F. B. Johnson.

At a meeting of the Railway Equipment Manufacturers' Association, held on Tuesday, the following officers were elected: President, C. W. Floyd Coffin, Franklin Railway Supply Company; Vice-President, David L. Eubank, Galena Signal Oil Company; Secretary, Fred W. Venton, Crane Company; Treasurer, Charles L. Brown, Manning Maxwell & Moore.

Checking Percentages by Chart

An article and chart by William Wyer was published in our issue of June 27, on page 1826. The caption to this chart was through an error placed at the side of the chart instead of at the bottom of the chart. Thus, in other words, to read the chart according to the directions of the caption, the page should be turned horizontally instead of held vertically

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JULY, 1919

Name of road.	Average mileage operated during period.	Operating revenues: Freight.	Passenger.	Total (inc. misc.)	Operating expenses: Maintenance of Way and structures.	Maintenance of Equipment.	Traffic.	Transportation.	General.	Total	Operating ratio.	Net from railway operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.
Alabama & Vicksburg	141	$151,094	$69,004	$234,610	$38,412	$49,589	$1,728	$86,281	$9,797	$188,117	80.18	$46,117	$46,492	$12,229	$34,237

Traffic News

The Chamber of Commerce of Houston, Tex., on behalf of the Houston Car Wheel & Machinery Company, has petitioned the Dallas (Tex.) District Freight Traffic Committee for a revision of rates on old and new car wheels and axles to points in Arkansas and Oklahoma. Changes are requested in the rates on scrap iron and steel, old wheels on or off axles and new wheels and axles. The proposed rates would allow Houston car wheel manufacturers to compete with those in St. Louis and Kansas City.

The Canadian Railway War Board has recently issued an order allowing regularly organized railway and steamship ticket agencies to continue the sale of railway tickets under such arrangements as the individual railway companies believe best suited to protect their interests. This action is taken, according to the board, because of the character of service rendered by these organizations to the public and to the railways in the handling of railway transportation.

The grain elevators at Fort William and Port Arthur, Ont., number 36, and in the near future, following the completion of certain additions, the total capacity of these elevators will be 55,560,000 bushels of grain. This is the largest elevator storage capacity of any port in the world, exceeding Chicago and Minneapolis. A large proportion of these elevators are fireproof. The Port Arthur elevator has a capacity of 9,500,000 bushels. The elevators in this port can unload 2,360 cars in ten hours, and the 23 elevators on the water front can in that time load into steamers 9,350,000 bushels. On one day, November 30, 1915, they actually did load 7,350,000 bushels. —*Canadian Pacific Bulletin.*

Traffic conditions for the week ended September 8 show some improvement in the movement of freight throughout several of the regions, compared with the same period in 1918. In the Southern region, according to the figures issued at Washington, revenue freight loaded showed an increase of 3,807 cars over the corresponding week of last year, and 10,973 cars over the week ended September 1, 1919. In the Central Western region lumber loaded showed an increase of 16 per cent and grain 8 per cent over the same week in 1918. In the Southwestern region 37,881 cars of wheat were loaded during the period July 1 to September 3, being an increase of 8,850 cars over the same period last year.

The Pacific Coast Shipbuilders' Traffic Association, with headquarters at San Francisco, Cal., has been organized recently to obtain reductions, if possible, on the present freight rates on ship steel. The association is composed of 18 Pacific Coast shipbuilding companies, and its officers are as follows: L. R. Bishop, chairman, representing the Southwestern Shipbuilding Company, the Long Beach Shipbuilding Company and the Schaw-Batcher Shipbuilding Company; H. C. Reed, secretary, representing the Bethlehem Shipbuilding Corporation, Ltd.; C. E. Robinson, treasurer, representing the Pacific Coast Shipbuilding Company. Soon after the organization of the association it began an active campaign to have the existing transcontinental freight rates on steel reduced in order that Pacific Coast shipbuilders would be enabled to continue the fabrication of steel ships. Letters outlining the present situation on the Pacific Coast and its relation to transcontinental steel rates have been sent to Max Thelen, director of public service, and Edward Chambers, director of traffic, of the Railroad Administration

The necessity for loading cars to full capacity and releasing them promptly in order to avoid a car shortage has been called to the attention of shippers, consumers and officers of the Railroad Administration in a letter recently made public by the Public Service Commission of Oregon. The letter says in part: "Grain is now moving and very shortly the maximum shipments may reasonably be expected, followed by the transportation of apples, potatoes and perishables, with demand for refrigerating equipment. Our lumber shipments must be adequately cared for, and this Commission, mindful of the past, requests that the Administration give such attention to Oregon's needs as will prevent any recurrence of adverse conditions heretofore encountered by our shippers. We suggest again directing the attention of shippers both by circular and placard, to the necessity of loading to full capacity, and promptly releasing cars, with such other advice as will tend to assist in conserving the supply, and speeding up the movement. We further suggest the advisability of carriers moving traffic to destination by the most direct route available."

According to a report on overseas traffic for the week ended Sept. 10, 5,842 cars of commercial export freight were received at North Atlantic ports for this period, compared with 869 cars for the same week in 1918, an increase of 4,973 cars, or 572 per cent, for the first ten days of September, 1919, over the corresponding period for 1918. The report shows that there were 14,186,237 bushels of grain stored in elevators at North Atlantic ports for the period mentioned. There were received during the week 6,549,358 bushels of grain, while 6,587,037 bushels were cleared. The total amount of grain in elevators as of Sept. 10 represents 72 per cent of the total elevator capacity at these ports. At South Atlantic and Gulf ports there were 10,366,191 bushels of grain in elevators, the elevators at Port Arthur being the only ones reported empty. At North Atlantic ports there were 20,321 cars of export freight on hand on September 10, 1919, compared with 20,593 cars for the same day of the preceding week. The report shows that there were 8,621 cars of export freight on hand at South Atlantic and Gulf ports as of September 9, 1919, as against 8,958 cars on September 3, a decrease of 337 cars.

Freight Situation on the New Haven

E. J. Pearson, federal manager of the New York, New Haven & Hartford, has issued an appeal to shippers and consignees to release cars more rapidly in order to avoid an embargo. Loaded cars are accumulating and the co-operation of the shippers, which brought relief in July and August, is still urgently necessary. He says further:

"Since the recent strike the number of cars placed at destination for unloading has rapidly increased from an average of about 8,000 a day to between 11,300 and 12,000, and, in addition, there are a considerable number of cars at destination awaiting space on unloading tracks. Unloading is progressing at the average rate of 2.4 days per car placed. Previous record has been at the rate of less than two days per car placed, which, on account of the necessities of the present situation, should be improved upon if possible.

"At the present time there are about 50,000 cars on the system, whereas the record volume of traffic formerly was handled with 5,000 to 7,000 less. The present increase is congesting transportation facilities, restricting the inbound movement, the current performance of terminal switching, prompt removal of empties, the receipt and forwarding of trains, and is decreasing capacity for maximum performance. The demand for empty cars is extremely urgent."

"The work of construction needed for the completion of extensive terminal improvements, including also a transfer station at Cedar Hill (New Haven), has been recently resumed through the assistance of the United States Railroad Administration, so that within a few months capacity will be still further increased.

Coal Production

Bituminous coal production in the United States for the week ended September 6 is estimated by the Geological Survey at 9,660,000 net tons, a decrease of 7.6 per cent as compared with the week before, apparently due to the observance of Labor Day as a holiday in some districts. However, the rate of production, the report says, appears to have risen, and at least maintained that set up in late August. For the week ending August 30, the percentage of full time output lost on account of car shortage was 24.1, as compared with 16.8 per cent the week before. In part, however, the report says, the change was more apparent than real because, without any change in the number of cars, an adequate car sup-

ply one week when the demand is dull and men are on strike may become an inadequate supply the next week when demand is brisk and men are back at work. Such an apparent change seems to have occurred in Illinois; but taking the country as a whole the less adequate car supply was real and the number of empties available for loading was smaller than the week before. Car supply, instead of improving, during the week of August 30 became somewhat less satisfactory and just now the principal obstacle in the way of increased production is shortage of cars.

National Industrial Traffic League Meeting

The National Industrial Traffic League's summer session was held at Pittsburgh, Pa., on September 4 and 5. The reports of the various committees of the league were presented, however, much of the time was taken up with the discussion of action taken by the executive committee regarding legislative recommendations for the solution of the railroad problem and discussion of the car shortage situation. Among the legislative recommendations made by President G. M. Freer of the league, in reporting for the executive committee, are suggestions that Congress be asked to provide a time limit within which carriers must present bills for charges on shipments, opposing the extension of the jurisdiction of the Interstate Commerce Commission over port-to-port water rates, and endorsing the suggestion made to the House Committee for a provision in the law that interstate rates will not automatically revert to their pre-war status when the roads are restored to private ownership, but will continue until June 30, 1921, unless changed by action of the properly constituted authorities. With the exception of the latter recommendation the league approved of the executive committee's recommendations. The latter recommendation created considerable debate as to its probable effect and the question was postponed for further discussion.

A report of an investigation conducted by the league as to the car shortage situation was also presented. The answers to a circular sent by the league to its members asking for information as to the reasons for the car shortage stated briefly that poor switching, slow movements in transit, failure to repair bad order cars, accumulation of administration cars because they were not allotted, freight schedules lengthened, bad condition of motive power and labor disturbances, both industrial and railroad were contributing factors. Max Thelen, director of the Division of Public Service, who was present at the meeting, replied to each of the assigned reasons for the car shortage, outlining the administration's side of the problem. The action taken by the league on this matter was expressed in a telegram prepared by a sub-committee and forwarded to Director General Hines assuring the continued cooperation of the shippers but demanding further efforts by the Railroad Administration to avoid a car shortage.

Among the resolutions adopted by the league at the meeting are the following:

A resolution offered by the executive committee providing that the directors of public service and traffic be requested to require that application for the cancellation of rates alleged to be obsolete should be accompanied in all cases by a showing that interested parties have been consulted as to the actual or prospective use of such rates and whether or not these parties consented to the withdrawal of the rate, also that all tariffs carrying such cancellations shall contain in connection therewith a provision to the effect that such rates shall be re-instated on one day's notice on proper showing that the rates will be actually used.

A resolution, also offered by the executive committee, recommending that legislation be enacted that will continue the rates, fares, etc., existing, with intra and interstate, at the time the carriers are returned to private operation until same be later changed either by the act of the carrier or carriers as provided by law or by properly constituted authority having jurisdiction.

A resolution recommending that the law provide for a board of conciliation and arbitration to hear labor railroad disputes whose decision should be subject to revision only by the authority to whom it would report. Railroad employees would waive their right to strike and would be guilty of conspiracy, punishable by proper remedy, if they did strike though they might resign. The Board would be composed of eight members—two from carrier employees, two from carrier officers and four from the general public—and would be appointed by the Interstate Commerce Commission and report to it.

President Freer was instructed by the league to oppose the rigid long-and-short-haul clause section of the Cummins Bill, the provision for a transportation board, the provision for rate zones and in his discretion such other portions of the bill as are opposed to the provisions of the Esch-Pomerene bill, in his appearance before the House Committee. The league also voted that the Senate Committee be asked to have hearings on the Cummins bill.

Anthracite Shipments for August

The production of anthracite continues to increase, according to the statement of the Anthracite Bureau of Information, Philadelphia. The shipments for August amounted to 6,144,144 gross tons, as compared with 6,052,334 tons in July, which in turn had the record for largest shipments since October, 1918. Compared with August, 1916, the latest normal year in the anthracite trade, the shipments last month showed an increase of a little over 600,000 tons or about 11 per cent.

For the first five months of this coal year the shipments have amounted to 28,752,699 tons, as compared with 26,678,333 tons for the corresponding period of 1916, an increase of 2,074,366 tons.

The shipments by railroads were as follows (gross tons):

	August, 1919	August, 1916	Five Mo., 1919-1920	Five Mo., 1916-1917
P. & R.	1,142,713	1,000,667	5,559,110	4,904,976

Commission and Court News

Interstate Commerce Commission

Discrimination Against Western Pacific Ordered Removed

The Interstate Commerce Commission in a decision by Commissioner McChord, finds unlawful and in violation of the second paragraph of Section 3 of the commerce act a lower basis of divisions of joint through passenger fares between points in California and Salt Lake City and points north and east thereof accorded to the Western Pacific by the Southern Pacific and the Atchison, Topeka & Santa Fe than they allow each other of similar joint fares. The decision also holds that the Western Pacific is entitled to reparation, although the amount has not yet been determined. Commissioner McChord says the expression of rates and charges in the form of divisions makes them none the less rates and charges which may be discriminatory. The effort to relieve a discrimination does not necessarily involve the power to describe, the order of removal normally operating in the alternative, and that as the commission has found that the division fixed upon was discriminatory that statement of the fact establishes the damage. The amount of the damage is demonstrable and does not depend upon any contingency. The plaintiff, because of the unlawful practices of the defendants was placed in an unfavorable and unjust situation with respect to passengers transported by it between points in California and Salt Lake City as compared with its competitors. If it had been placed in the same situation as its competitors it would have received more money for each passenger transported, but as the exact amount of damage cannot be determined upon the record, the plaintiff should prepare a statement showing the details of the transportation of passengers, upon which the commission will consider the entry of an award of reparation.

Commissioner Clark dissented to the award of reparation, but concurred in the remainder of the report. Commissioner Eastman filed a concurring opinion and Commissioners Daniels and Hall filed dissenting opinions. Commissioner Daniels said he was unable to agree that reparation should be awarded and that he was inclined to doubt whether the evidence disclosed a violation of Section 3. By continuing its participation in through routes and joint fares with the Western Pacific, he says, the Southern Pacific voluntarily short hauls itself, and the joint fares must therefore be regarded as a distinct concession on the part of the Southern Pacific. A different basis of divisions resulting from such an inequality of mutual conditions generally is not necessarily unlawfully discriminatory. Mr. Daniels also says that the record may be searched in vain for evidence showing that the plaintiff sustained actual damage. If the Santa Fe and the Southern Pacific had demanded of each other the same minimum divisions as they demanded of the Western Pacific the latter would not have derived any benefit therefrom. Commissioner Hall agreed substantially with Commissioner Daniels, pointing out that while the Southern Pacific and the Santa Fe competed with each other, their lines are so located as to supplement each other and in many instances each is a necessary and important connection of the other; while the Western Pacific supplements neither in any practical sense and affords to neither any traffic possibilities of consequence.

State Commissions

The New York State Public Service Commission, Second District, has ordered the installation of "audible-visible" warning signals at highway grade crossings on the New York Central and the Delaware & Hudson, as follows: At Elsmere; between Elsmere and Delmar; at Guilderland Center and at the Guilderland road two miles from South Schenectady.

The Public Service Commission of New York, Second District, acting on a complaint of the Brotherhood of Railroad Trainmen, decides that the full-crew law, of New York, prescribing the number of men to be employed on freight trains of over 25 cars, but excepting trains on roads less than 50 miles long, does not apply to the Wallkill Valley Railroad, 32 miles, a branch of the New York Central extending from Kingston, southwestward to Montgomery. Although the branch is operated under lease, as a part of the New York Central system, which is much more than 50 miles long, the commission holds that as the branch trains never run on to the main line, the Wallkill Valley is to be treated, so far as this law is concerned, as a separate railroad. Either as to its ownership, or as to its method of operation it is not "a railroad of more than 50 miles in length."

The New York State Public Service Commission, Second District, acting on a complaint of the Brotherhood of Locomotive Engineers, decides that locomotives should not be towed under steam except under the control of an engineman or of a fireman with at least one year's actual experience; and not in charge of a fireman until he shall have established his ability by satisfactory examinations and tests. The complaint was against the Boston & Maine for permitting engines to be towed under steam when manned only by a fireman. On this road steam locomotives, with their trains, are hauled through the Hoosac Tunnel, about 5 miles, by electric locomotives. Evidence was presented to the effect that engines have been thus run while manned by stupid or careless firemen. As a fireman is, presumably, in training for the position of engineman, the commission holds that, after one year, he ought to be able to attend to such elemental duties of the engineman as are required when the engine is being towed. The decision requires, therefore, that such firemen shall have had one year's experience and that this fact, with his qualifications, shall be made a matter of record, which record shall be accessible to the commission.

The New York State Public Service Commission, Second District, considering a complaint against the American Railway Express Company, in Buffalo, decides that the rule of that company limiting its pickup service to the hours before 5 p. m., and providing for no pick-up service in Buffalo on Sunday, is reasonable. Certain bakers, fish dealers, makers of ice cream, and motion picture exchanges, have been accommodated in former years by evening and Sunday wagon service; but the commission holds that these branches of traffic should not be considered as such serious necessities as to warrant the Sunday (or evening) wagon service; these shippers, in these irregular hours, must do their own carting. The express company's offices are kept open for the receipt of shipments during the entire 24 hours every day, including Sundays.

Court News

Taxation of Automatic Block Signals

The Montana Supreme Court holds that the block-signal system of a railroad located on the roadbed and attached to the track, and operated automatically by passing trains, is assessable by the state board of equalization and not the county assessor. Judgment for the railroad in an action against a county treasurer was affirmed.—N. P. v Dixson (Mont.), 174 Pac. 706.

Limitation of Liability—"Character of the Shipment"

In an action by a shipper against a railroad for the full value of a shipment of oriental rugs, destroyed en route by a fire of unknown origin, it appeared that the shipper had undervalued the rugs and thus obtained a lesser freight rate. The New York Appellate Division holds that the railroad was not liable for more than the declared value of the rugs, as it had no knowledge of the "character of the shipment" within the meaning of the Carmack and Cummins amendments. The shipment was described as rugs but this gave the railroad no knowledge that it consisted of valuable oriental rugs.—Haddad v. Southern Pacific, 185 App. Div. 500.

Foreign Railway News

German Railway Rates Raised.—From October 1 all railway passenger and baggage rates in Germany will be raised 50 per cent.

I. T. Williams, general manager of the London & North Western Railway of England recently had conferred upon him the honor of knighthood.

Sunday Traffic on German Railways.—Suspension of Sunday traffic on Baden, Wurtemburg, Bavarian and other German railways for all purposes except transport of essential foodstuffs, is said to be contemplated, owing to coal shortage.

The Colonial Government of the Dutch East Indies, says the Far Eastern Division of the Bureau of Foreign and Domestic Commerce, proposes to build 10,000 miles of railway during the next 15 or 20 years. This is only possible, colonial officials say, by the investment of American capital with the assistance of American engineers.

Representing a Real Service

LONDON.

The Engineer (London) states that during the year 1918, 1,029,000 men passed through the Soldiers' & Sailors' Free Buffet provided by the London & North Western Railway Company at Euston.

Ambulance Trains Over Great Western

LONDON.

The Great Western Railway Magazine states that from the outbreak of war until the end of June this year, 5,895 loaded ambulance trains passed over the Great Western railway, 2,989 of which were loaded to stations on this company's system.

Railway and Port Concessions in Russia

According to Danish authority England is asking for a railway concession through Esthonia to Russia, in order to open up a road to the Russian market. It is also stated that negotiations are being carried on with a view to leasing the islands of Dagos and Oesel to England for the construction of a large commercial port there.

A New Electric Railway in Switzerland

A concession has been granted to the Berne Power Works for an electric narrow gage railway between Meiringen and Guttanen. This line will be used at first for the transport of goods in bulk for the erection of the projected water-power works at Oberhasli, and afterwards will doubtless attract a fair amount of tourist traffic.

Japanese Railway Reform

Reforms on the Japanese Government railways have been instituted (says the Japan Chronicle). Till recently all locomotives made very short runs to the great inconvenience of the traveling public. A new type of locomotive, which made a run between Tokyo and Hamamatsu, a distance of 167 miles, without changing, is to be used in time on all the government railways.

Railway Development in Queensland

The Queensland Acting Minister for Railways has been inspecting the Burnett district of Queensland in connection with the scheme of railways for opening lands to settlement by soldiers. It is proposed to construct four spur lines in conjunction with the proposed Many Peaks to New Cannindah line, including junctions with the line at Mundubbera and the Dawson Valley line. The area of land to be developed is 2,500,000 acres, and it is estimated that it will provide land for 15,800 settlers. The estimated cost of the railways is £1,420,000, while the provision will have to be made for roads and water supply.

Rapid Reconstruction of Belgian Railways

Reuter's Agency learns from a Belgian official source, says the Railway Gazette (London), that when the armistice was signed 1,500 kilometers of Belgian railways had been destroyed. So rapid has been the work of repair that today only 300 kilometers are out of order. On the principal railway from Ostend to Brussels marvelous work has been accomplished, and the normal service is being run on the embankment line which was constructed at the time of the Ghent Exhibition, and all work has been more or less restored to its pre-war condition. The bridges on the Lys and Scheldt are in a fair way towards completion, and meantime the service is maintained over temporary bridges.

Exports of Cars in July

Exports of freight cars in July totaled 1,986 valued at $4,146,923, as compared with 5,055 valued at $13,675,186 in June and 3,008 valued at $6,268,078 in May. No passenger cars were exported in July. The detailed figures as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

	Passenger Cars		Freight and Other Cars	
COUNTRIES—	Number	Dollars	Number	Dollars
France	.....	.....	1,417	3,117,436
Italy	.....	.....	300	514,800
Canada	.....	.....	30	21,650
Honduras	.....	.....	4	590
Mexico	.....	.....	12	3,450
Cuba	.....	.....	18	15,257
Dominican Republic	.....	.....	1	2,150
Brazil	.....	.....	150	294,750
Chile	.....	.....	1	14,340
China	.....	.....	50	162,500
Total	.....	.....	1,986	4,146,923

Railway Construction in Mexico

Satisfactory progress is being made, writes a correspondent in the construction of the extension of the Llano Grande branch of the National Railways of Mexico. The road is being built by E. E. Shaw, an American contractor. He has about 1,800 men employed in the grading and track laying work. The first 28 miles out of Llano Grande will be finished in a few more weeks. It will penetrate a dense forest of commercial timber. The rails for the new line are being manufactured by the Monterey Iron & Steel Company. The proposed terminus is the Pacific port of Mazatlan. The surveyed route is over the heights of the Sierra Madre range, with a drop from about 10,000 feet altitude to sea level within a distance of about 30 miles. At Llano Grande large lumber mills were established several years ago. It is planned by owners of timber tracts reached by the road to install other lumber mills. From Llano Grande the branch line runs to Durango, 75 miles, where it connects with the old Mexican International Railroad that runs to Piedras Negras, opposite Eagle Pass, Tex.

British Trade with Germany

In commenting on trade with Germany the London Times Trade Supplement says:

There is an old adage about the folly of cutting off one's nose to spite one's face, and logically this saying applies to the question of future trade relations between Britain and Germany. Other countries, with the possible exception of Belgium, whose experience of Hun methods has been burned in too deeply to be quickly forgotten, are making strenuous efforts to secure a commanding position in the German market. Distasteful as the idea of doing business with Germans is to large numbers of people, we are afraid that the exigencies of the situation will compel us to bid for our share of the German market.

The decision of the Federation of British Industries to

open a branch in Cologne is a recognition of an unwelcome necessity. The facilities which will be afforded thereby will no doubt be very valuable, particularly in the direction of investigating the financial standing of German firms desiring to do business with this country. This extremely necessary work will certainly prevent a good deal of loss to British exporters.

Belgian Railroad Receipts

Belgian railroads are now said to be working with 60 per cent of pre-war efficiency, writes Trade Commissioner Harry T. Collings from Brussels, under date of August 13. That the railroads are fast returning to normal conditions is shown by the following figures giving the receipts of Belgian railroads for the first five months of 1919, as compared with the corresponding months in 1914. (All conversions have been made at the normal rate of exchange, $0.193 per franc.)

	Receipts			
	From Passengers and Baggage		From Freight and Other Merchandise	
Month—	1914	1919	1914	1919
January	$1,464,677	$885,677	$3,537,497	$929,102
February	1,304,101	1,025,023	3,626,084	1,261,834
March	1,485,907	1,469,309	3,887,599	1,993,304
April	1,752,826	1,940,229	3,673,176	2,321,404
May	1,834,272	2,161,986	3,625,891	2,773,410

These figures should not be taken to indicate equivalent numbers of passengers or quantities of freight in the two years compared, Mr. Collings says. Previous to the war, railroad fares and freight rates were exceedingly low in Belgium. In general, one may say that the railroad fare in 1914 was 3 cents a mile first class, 2 cents second class, and 1 cent third class. Fares have now been increased from 40 to 50 per cent. Previous to the war, tickets good for travel on all lines in Belgium for 15 days from date cost about $12 first class, $8 second class, and $4.75 third class. These are not issued at present. Cheap workmen's tickets permitted workmen in 1914 to go to and from work up to a distance of 3 miles for about one-half cent a mile, for longer distances the cost per mile was much lower—tickets permitting a journey of 25 miles each way costing as low as one-seventh of a cent a mile. Many of these tickets have not been issued since the war; those issued are at much higher cost per mile than before the war. Proposals have recently been made to increase still further railroad fares to enhance government receipts.

In 1914 freight rates in Belgium were exceedingly low and were uniform throughout the country, except that a special rate was granted for large quantities of merchandise destined for export (tarifs des ports de mer). The present freight rates in Belgium are 40 per cent higher than before the war and may be increased soon.

Aldington Becomes General Manager of Great Western

Charles Aldington recently was elected general manager of the Great Western Railway of England, succeeding Frank Potter, deceased. Mr. Aldington has many acquaintances among the railway officers of the United States, having traveled over and studied the railways of the United States extensively. Mr. Aldington, like most American railway executives, has risen from the ranks. He entered the service of the Great Western as a junior clerk when 14 years old. In 1894 he became chief clerk to the superintendent of the London division. Five years later he became traffic superintendent of the Central London Railway, but returned to the Great Western in 1902 and for a time was attached to the staff of the general manager. In 1909 he became assistant to the superintendent of the line and later was made assistant superintendent of the line. On January 1, 1911, he was appointed superintendent of the line and held this position until March, 1919, when he was made assistant general manager. In 1905 he was a delegate to the International Railway Congress at Washington. He familiarized himself with railway practice in France, Germany and Italy and elsewhere on the Continent, as well as in America. While superintendent of the line Mr. Aldington inaugurated a fine system of express freight trains, which for some years prior to the war were a distinct feature of the service of the Great Western Railway. He introduced the system of telephone train control and he also fostered the extension of road motor car service to and from country districts not served by a railroad.

Exports of Railway Track Material in July

Exports of track material in July were considerably less than those of any previous month this year. Rails exported amounted to 32,707 tons valued at $1,870,583, as compared with 67,028 tons valued at $4,208,872 in June. The totals for July as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

	Spikes		Steel Rails		Switches, Frogs, Splice Bars, etc.
	Pounds	Dollars	Tons	Dollars	Dollars
Belgium	527,871	37,117	1,163	67,279	27,586

Effect of French Railway Nationalization

In a manifesto published on June 2, the French Federation of Railway Employees protested against the proposed rise in rates, and suggested as an alternative the nationalization of all the French railways. Commenting upon this, the Journal des Débats of June 7, points out that a rise in rates is inevitable in view of the huge deficits on working—5,500,000,000 francs in 1914-19, and 3,000,000,000 francs for 1919 alone. But would nationalization benefit the users of the railways or the Exchequer? asks the Journal. It is easy to answer the question by comparing the working co-efficient (operating ratio) of the State system, which was 120 per cent in 1918, with 87 per cent for the Midi, 85 per cent for the Paris-Orléans, and 90 per cent for the Paris-Lyons-Méditerranean. The State figure exceeds even those of the companies serving the liberated districts: 96 per cent for the Est, and 112 per cent for the Nord. A comparison has been made between the Ouest system purchased by the State and the Orléans system, which have a very similar traffic both in kind and length of haulage. The Orléans deficit for the last 10 years (1909-1918) reached 241,000,000 francs. If, instead of being worked at a working co-efficient ranging from 52-85 per cent, the co-efficient of the Ouest had been employed (68-120 per cent) the deficit would have exceeded 1,200,000,000 francs. From these figures the cost of complete nationalization to the taxpayers may be guessed. The Federation, moreover, the Journal continues, omits to mention that not the least of the causes of the actual deficits of the lines is the rise in wages of the personnel. Before the war the employees of the great railways earned about 800,000,000 francs. In 1919 they will share nearly 4,000,000,000 francs, or an increase of 400 per cent. A rise in rates is unavoidable, and the increased revenue thus gained will be accompanied by the reduction of work owing to the general adoption of the eight-hour day.

Recent Damages to Mexican National Railroads

The National Railroads, says a recent issue of Excelsior, quoted in commerce Reports, have suffered serious losses in the recent storms, and it is officially estimated that an additional expenditure of 200,000 pesos will be necessary for ties alone, without counting the value of the material which the railroads have at present on hand for the purpose. It is said that even greater expenditures will be necessary for rails and other supplies. The materials which were stored in Torreon, Durango, Monterey, and other cities of the north have been used already for the repair of the lines in the State of Chihauahua, which have been more seriously damaged than in any other section. Paulino Fontes, Director of the Railroads, states that the President of the Republic, in view of the absolute necessity of immediately repairing damages which have been done, has decided upon the immediate appropriation of money for these purposes, in addition to that which is taken in from freight and passenger transportation.

More than 50 bridges, large and small, have been destroyed by the storms in the division from Jimenez to Chihuahua. Almost as many more have been destroyed from Chihuahua to Ciudad Juarez and in the branch from Jimanez to Chihuahua. The repairing of the bridges will be very expensive and it will be necessary to make an even greater outlay in the construction of enbankments to support the roadbed, which has been completely obliterated in many places for miles.

It is stated that the large Ortiz bridge, in the State of Chihuahua, will have to be completely rebuilt. It is planned to construct a new bridge entirely of concrete, in order that it may more successfully resist the repeated overflows of the River Concha. Eng. Angel Pembert has been delegated by the President to make a thorough investigation of the probable cost of the work and of the conditions under which it may be carried out.

England's Exports and Imports

LONDON, England.

The following table, taken from the English Board of Trade statistics, gives the exports and imports of railway material of the United Kingdom for the seven months ended July, 1919, as against the same period for the two previous years:

EXPORTS	1919	1918	1917
Locomotives	5,946 tons	12,318 tons	13,584 tons
Steel rails	65,621 tons	18,088 tons	24,403 tons
Railway wheels and axles	7,683 tons	5,829 tons	2,980 tons
Tires and axles	14,321 tons	11,205 tons	12,238 tons
Chairs and sleepers	8,938 tons	4,076 tons	4,250 tons
Railway carriages for passengers	£249,882	£418,782	£109,557
Railway trucks, wagons, etc	£646,913	£175,875	£276,552
Machine tools	£1,024,408	£858,533	£1,324,772

IMPORTS	1919	1918	1917
Locomotives	29 tons	178 tons	112 tons
Steel rails	3,748 tons	278 tons	219 tons
Tires and axles	2 tons	368 tons	1 ton
Machine tools	£2,660,041	£2,211,516	£1,456,812

The following tables show the distribution of steel rails exported from the United Kingdom:

	1919	1918	1917
To Russia	49 tons	.....	.....
Sweden	3,901 tons	.....	.....
Portuguese East Africa	1,030 tons	5 tons	1 ton
Chile	160 tons	.....	124 tons
Argentine Republic	127 tons	.....	.....
British South Africa	1,992 tons	13 tons	100 tons
British India	25,151 tons	2 tons	104 tons
*Straits Settlements	8,091 tons	.....	38 tons
Ceylon	3 tons	.....	.....
Australia	21 tons	.....	10 tons
New Zealand	7,291 tons	21 tons	132 tons
Other countries	17,805 tons	18,047 tons	23,894 tons

The following table shows the distribution of locomotives exported from the United Kingdom:

	1919	1918	1917
To Spain and Canaries	605 tons	150 tons	74 tons
Other countries in Europe	1,608 tons	8,189 tons	9,593 tons
Argentine Republic	529 tons	193 tons	138 tons
Other countries in South America	289 tons	183 tons	79 tons
	1919	1918	1917
To British South Africa	277 tons	441 tons	1,943 tons
British India	1,672 tons	2,386 tons	857 tons
*Straits Settlements	65 tons	39 tons	253 tons
Ceylon	73 tons	35 tons	10 tons
Australia	427 tons	57 tons	178 tons
Other countries	401 tons	645 tons	459 tons

*Including Federated Malay States and Labuan.

Equipment and Supplies

Locomotive Deliveries in July

The Railroad Administration has issued the following:

For period July 1 to July 5

Works	Road	No.	Type
American	Vgn.	3	USRA Mallet
		3	
Baldwin	B&LE	5	USRA S. F.
	B&O	2	USRA Pac.
	Erie	6	USRA Pac.
	C&O	1	USRA Mount.
	P&R	1	Mallet
	P.L.W.	1	Mallet
	SP	1	S. F.
	T&P	1	S. F.
	UP	—	
		18	

For week July 6 to July 12

Works	Road	No.	Type
American	C&NW	6	USRA 6W. Sw
	Vgn.	3	USRA Mallet
		9

Grand total 112

In addition to the above, the American Locomotive Company completed 53 foreign and shipped 2 miscellaneous domestic locomotives, and the Baldwin Locomotive Works completed 20 foreign and shipped 7 miscellaneous domestic locomotives.

Locomotives

THE BELGIAN GOVERNMENT.—The American Locomotive Company is figuring on 400 locomotives for the Belgian government.

THE CUBA RAILROAD COMPANY has ordered from the American Locomotive Company one 4-6-0 type locomotive, with 20 in. by 26 in. cylinders, and a total weight in working order of 152,000 lb.

THE AMERICAN TRADING COMPANY, Cuba, has ordered from the American Locomotive Company one 2-8-0 Consolidation type locomotive, with 14 in. by 20 in. cylinders and a total weight in working order of 72,000 lb.

THE IMPERIAL KARAFUTO GOVERNMENT has ordered from the American Locomotive Company one 2-6-2 tank locomotive with 14 in. by 22 in. cylinders, and a total weight in working order of 90,000 lb.

THE MOGYANA RAILWAY OF BRAZIL has ordered from the American Locomotive Company four 2-6-6-2 Mallet type locomotives with 16½ in. and 26½ in. by 24 in. cylinders, and a total weight in working order of 160,000 lb.

THE CENTRAL OF BRAZIL has ordered from the American Locomotive Company six 4-6-2 type locomotives with 21½ in. by 28 in. cylinders, and a total weight in working order of 205,000 lb.; also seven Consolidation type locomotives with 21½ in. by 26 in. cylinders, and a total weight in working order of 165,000 lb.

Freight Cars

THE UNION TANK CAR COMPANY is inquiring for prices on 1,000 tank cars.

THE UNION TANK CAR COMPANY is inquiring for prices on 1,000 tank cars.

THE BUFFALO BOLT COMPANY, Buffalo, N. Y., is inquiring for two 50-ton flat cars.

NEW YORK CENTRAL.—The Ryan Car Company is making repairs on 300 freight cars.

W. R. GRACE & Co., New York, is inquiring for 40-ton coal cars, number not stated, for export.

O. B. CINTAS, Havana, Cuba, has ordered 150 flat cars from the American Car & Foundry Company.

THE SOUTH AFRICAN GOVERNMENT RAILWAYS have ordered 300 drop-side and 200 high-side gondola cars from the Pressed Steel Car Company.

THE MAGNOLIA PETROLEUM COMPANY, Dallas, Tex., has ordered 25 40-ton, 8,000-gal. tank cars from the American Car & Foundry Company.

Iron and Steel

THE CHICAGO, ROCK ISLAND & PACIFIC has ordered 231 tons of deck plate girder spans from the American Bridge Company, Chicago, to rebuild its bridge over the Platte river, near Ashland, Neb.

Miscellaneous

THE HASKELL & BARKER CAR COMPANY, Chicago, has placed an order for 400 tons of repair material, largely plates, to be used for repairs on 300 hopper cars of the Pennsylvania Railroad.

British Locomotives for Central and South America

LONDON.

An article in "Modern Transport" states that the North British Locomotive Co., Limited, Glasgow, have received an order for 38 4-8-0 two-cylinder compound locomotives for the Central Argentina railway.

Sir W. G. Armstrong Whitworth & Co., Ltd., has now in hand ten 4-6-0 type locomotives for the Leopoldina Railway (Brazil).

The Colombian National Railway has ordered six Kitson-Meyer type locomotives from Kitson & Co., Ltd., Leeds, three of which have already been delivered. All of these locomotives are fitted with the Robinson type of superheater.

Supply Trade News

R. S. Hunter has been appointed Chicago manager of the **Warren Oil Company of Pennsylvania**, Warren, Pa.

The **American Locomotive Company** is planning to carry out improvements to double the capacity of its plant at Chester, Pa. The work will cost about $1,000,000.

E. M. Cutting, Pacific Coast manager for the **Edison Storage Battery Company** with office at San Francisco, Cal., has been appointed manager of the railroad department with office at Orange, N. J. Mr. Cutting entered railway work in 1888 in the signal department of the Southern Pacific. In 1898 he was appointed supervisor of signals for the Western division and in 1902, in addition to his duties in the signal department, he was given charge of all electric train lighting. In 1908 he became engineer of train lighting, heating and ventilation, resigning in 1912 to become Pacific Coast manager for the Edison Storage Battery Company, which position he held until his recent promotion. Mr. Cutting was instrumental in initiating the movement which culminated in the formation of the Association of Railway Electrical Engineers of which he was elected president in 1909.

E. M. Cutting

Work has begun on an extension of the rail mill at the plant of the **Algoma Steel Company**, Sault Ste. Marie, Ont. The improvement will cost several hundred thousand dollars and is part of development plans made by officers of the company which involve an expenditure of from $5,000,000 to $7,000,000.

The **Western Electric Company**, New York, has recently added a lighting department to its general sales organization. This new department is under the direction of **E. Cantelo White.** Mr. White has served in the electric lighting field for almost 15 years, both in the United States and Canada, as a salesman and designer of lighting equipment.

Charles Riddell has resumed his duties as manager of the Chicago office of the **Baldwin Locomotive Works** and the **Standard Steel Works Company.** Mr. Riddell, who was formerly manager of the Chicago office, has been serving as assistant secretary and treasurer in the financial department at the Philadelphia, Pa., office for the past year and a half. **Arthur S. Goble**, manager of the Chicago office, has been transferred to the St. Louis, Mo., office.

C. H. Norwood, contracting electrical and mechanical engineer, has moved his offices from 417 South Dearborn street, Chicago, to 116 West Illinois street, where increased shop facilities will permit the manufacture of electrical and mechanical specialties pertaining to moving bridges. The business will be incorporated about October 15 under the name of the C. H. Norwood Company. James B. Noonan, office manager, will then become a member of the firm.

The **Dunbar Manufacturing Company**, Chicago, manufacturers of railway and automobile supplies, has appointed **W. C. Irwin** district sales representative in St. Louis and the Southwest, with office in the Frisco building, St. Louis. Mr.

Irwin has been in the railway supply business for several years and at present is district representative for the Doss Nut Company, Chicago, the Railroad Supply Company, Chicago, and the Woven Steel Hose & Rubber Company, Trenton, N. J. During the war Mr. Irwin was a captain in the Engineers' Corps of the United States Army.

The Baldwin Locomotive Works and the **Standard Steel Works Company,** both of Philadelphia, Pa., have opened a branch office in the Merchants National Bank building, St. Paul, Minn. **Henry Blanchard,** sales representative in the Chicago office of the concerns, has been appointed manager of the new branch offices. Mr. Blanchard entered the service of the Baldwin Locomotive Works and the Standard Steel Works Company in the latter part of 1915, in the Philadelphia office. In April, 1919, he resigned as assistant to the vice-president in the Philadelphia office and was transferred to the Chicago office as sales representative. Prior to entering the service of these companies he served as sales engineer of the American Steel Foundries, with office in Chicago.

Lieutenant-Colonel L. P. Winby, whose appointment as managing director of the P. & M. Company (England), Ltd., with offices at 31 Budge Row, London, E. C., was announced in the *Railway Age* of June 27, page 1842, is now in this country on a six weeks' business trip for the purpose of undertaking the accounts of a few companies manufacturing railroad and engineering appliances and who desire foreign business which can be reached by the selling organization of the P. & M. Company (England), Ltd., in the British Empire and in the East. This company controls the sale of rail anti-creepers in all countries outside of the United States, Canada, Mexico and Cuba, under the patents of the P. & M. Company, Chicago.

L. P. Winby

Lieutenant-Colonel Winby was born in Glamorganshire, England, and educated at Brighton College and Cambridge University. He entered the Royal Engineers (British Army) in 1900 and served under Lord Roberts in the South African war. Leaving the army in 1902 he joined the firm of L. P. Winby & Co., Queen Anne's Chambers, Westminster, London, S. W., engaged in engineering work, including the construction of railways in South Africa. At the outbreak of war he rejoined the army and served continuously in France and Belgium as a lieutenant-colonel in the Westminster Dragoons, resuming his former work after the signing of the armistice. In June of this year he was appointed managing director of the P. M. Company (England), Ltd.

Trade Publications

Automatic Ore Unloaders.—The Wellman-Seaver-Morgan Company, Cleveland, Ohio, in a recent bulletin, presents an extended article on the W-S-M automatic ore unloader built by that company at a number of points on the Great Lakes for the unloading of cargo ships into railway cars or storage piles. The special feature of this equipment is a grab bucket of enormous capacity.

Machine Tool Equipment.—A number of two-page bulletins have been issued by the Bilton Machine Tool Company, Bridgeport, Conn. These bulletins are bound in a cover with punched holes to which others may be added from time to time and each briefly describes and illustrates a machine made by this company. These include gear milling and hobbing machines, automatic milling machines, automatic cam feed drill presses, drilling and riveting machines, etc.

Railway Financial News

Boston & Maine.—The bill in equity by Edmond F. Brown et al, owners respectively of 55 and 52 shares of Boston & Maine stock, seeking to have the court review, annul, modify or amend the order of the Massachusetts Public Service Commission approving the plan to reorganize the Boston & Maine under the act of 1915, has been dismissed by the Supreme Court of Massachusetts. The 1915 statute gives the Boston & Maine the right to acquire ownership of all leased lines and issue bonds and stock to the amount of $13,306,090 to refund the floating debt.

Chicago & Western Indiana.—This company has given notice that interest which fell due September 1 on its $15,000,000 6 per cent collateral trust gold notes, will be paid on and after September 15, at the office of J. P. Morgan & Co. The principal of these notes also matured the first of this month, but no provision for paying it has been made, except the invitation to the holders to extend the notes at 7 per cent. More than 75 per cent of the notes have been deposited under the extension agreement with the Bankers Trust Company, which will pay the September coupon on the deposited notes by check. The offer to extend the notes is still open. The notes first matured September 1, 1918, and were extended for a year, with an extra compensation of 1¼ per cent.

New York Central.—J. P. Morgan & Co. are forming a syndicate to offer $15,000,000 New York Central one-year 6 per cent notes. These notes are to be secured by pledge of $20,000,000 New York Central refunding 4½s and 75,000 shares of Reading Company first preferred stock, the collateral having a value of over 120 per cent of the amount of notes issued. The new notes are being offered at 99⅝, to yield about 6.40 per cent. The state bank commissioner of Massachusetts has declared the issue legal investment for Massachusetts savings banks.

New York, New Haven & Hartford.—Federal Judge Mack has set October 28 for the hearing of arguments on motions made by Harold Norris and more than 1,300 other stockholders of the New Haven for permission to intervene in the suit of Edwin Adams and others for the recovery of more than $150,000,000 alleged to have been wasted by William Rockefeller and other former directors of the company. Judge Mack will also hear on the same day argument on a motion for the appointment of a limited receiver to prosecute the Adams suit at the expense of the company.

Seaboard Air Line.—This company is offering an extension privilege of one year on a 7 per cent basis to holders of the $4,000,000 6 per cent notes which were due September 15. The September 15 coupon, plus a cash compensation for extension of $9.50 per $1,000 bond, is being paid at the Guaranty Trust Company, New York. The collateral behind the notes will be increased from $5,334,000 first and consolidated 6 per cent bonds to $6,000,000. The extension has been approved by the Railroad Administration. The company's gross income for 1918 and 1919 will be about $7,099,857, the agreement arrived at between the Railroad Administration and the Seaboard Air Line calling for an annual compensation of $6,920,025. Estimating corporate expense at $50,000, and taking charges as of 1917, the company should have a net income of $941,452, against $854,067 in 1917.

St. Louis-San Francisco.—The Missouri Public Service Commission has authorized this company to issue $1,283,000 of its prior lien mortgage 6 per cent bonds to reimburse the company for money actually expended for its income and to sell the same at not less than 90 cents on the dollar. The money expended represents the acquisition of additional property.

Meal Stations, on the time-tables of railroads in Sweden, are indicated by the simple but suggestive picture of a crossed knife and fork opposite to the name of the station.

Railway Officers

Railroad Administration

Central Administration

W. J. Cunningham has resigned as assistant director of the Division of Operation, effective on September 15, to return to his work at Harvard as James J. Hill professor of transportation. Mr. Cunningham organized and was appointed manager of the Operating Statistics Section early in 1918 and was appointed assistant director of the Division of Operation, and also chairman of a special committee on maintenance expenditures, on June 1, this year.

Regional

C. T. Beven has been appointed acting terminal manager at New Orleans, La., vice **E. A. Kelley**, deceased.

Federal and General Managers

E. R. Richardson, assistant to the federal manager, has been appointed federal manager of the Coastwise Steamship Lines succeeding **H. B. Walker**, who has resigned to reassume direction of the Old Dominion Line. Mr. Richardson was freight traffic manager of the Ocean Steamship Company before the steamships were taken over by the Railroad Administration.

Financial, Legal and Accounting

R. D. Anderson, assistant engineer on the Minnesota and Dakota division of the Chicago & North Western, has been appointed special engineer in the accounting department, a position recently created, with office in Chicago.

Operating

J. S. Spelman, general superintendent of the Western Pacific at San Francisco, Cal., has also been appointed division superintendent, Western Division of the Western Pacific only, with headquarters at Sacramento, Cal.

Subsequent to the separation of the Southern Pacific from the Western Pacific, the Deep Creek and the Tide Water & Southern, and the appointment of **E. W. Mason** as general manager of the latter lines, as announced in *Railway Age* of September 5, the following appointments have been made by General Manager Mason, the officers to have jurisdiction over the Western Pacific, the Deep Creek and the Tide Water & Southern: **H. K. Faye,** general freight and passenger agent of the Western Pacific, to be traffic manager; **J. P. Quigley,** superintendent Western Division, Western Pacific, with headquarters at Sacramento, to be superintendent of transportation and telegraph, with headquarters at San Francisco; **W. R. Groom** to be chief special agent and **W. T. Jacobs** to be purchasing agent. H. K. Faye in turn has appointed **B. K. Smith,** assistant general freight and passenger agent of the Western Pacific, general passenger agent, and **W. J. Shotwell,** assistant freight agent. Unless otherwise stated the headquarters of these officers are to be at San Francisco.

Traffic

O. O. Ogden, has been appointed general agent of the Natchez & Southern and the Natchez & Louisiana Railroad Transfer with offices at Natchez, Miss.

J. H. Wingfield has been appointed manager of dining cars of the Southern Railway, Lines East, with office at Washington, D. C., succeeding **W. Netherland,** deceased. **E. H. Rosecrans** has been appointed superintendent of dining cars, Lines East, with office at Charlotte, S. C., succeeding Mr. Wingfield.

Samuel L. Seymour, assistant to George D. Ogden, freight traffic manager of the Pennsylvania, Eastern Lines, with office at Pittsburgh, has been retired under the pension rules of the company after 51 years of continuous service. Mr. Seymour will engage in general insurance brokerage business with Edwards, George & Co., Pittsburgh.

Augustus E. Ruffer, general superintendent of the Erie, eastern division, with office at New York City, has been furloughed for service with **A. T. Hardin,** regional director of the Eastern region. **Herman J. Klein,** assistant general superintendent of the Erie, Lines East, has been appointed acting general superintendent to serve during Mr. Ruffer's absence.

Obituary

George S. Leavenworth, mining engineer of the Tennessee Copper Co., engaged a great part of his life in railroad location and construction work, died August 8 at Ducktown, Tenn. Mr. Leavenworth was a graduate of the University of Vermont. At the time of his death he was engaged in mining operations in the South.

Charles M. Jacobs, member of a district board of production of munitions for the British Ministry of Munitions during the war; noted authority on tunnel construction in many parts of the world and particularly in New York, London and Paris where he had practised; superintendent of construction of six tunnels in New York City, among them the Pennsylvania tunnels and the Hudson Tubes, died Sept. 14, in London. In 1907 Mr. Jacobs was appointed consulting engineer to advise the French government on a proposed tunnel under the Seine river near Harve. Although he submitted plans and estimates the work was never done, probably because of the war. He was also consulting engineer to the contracting firm of Dade & Pelle for the tunnel under the Seine at Paris, part of the rapid transit system of Paris, completed in 1908. Until 1915 when he retired from active engineering work, he was a member of the firm of Jacobs & Davies. He visited his New York office each year until 1913.

C. M. Jacobs

Mr. Jacobs was born and educated in England, receiving a mechanical training in the workshops and drafting offices of the firm of **Charles and William Earle,** engineers and shipbuilders, Hull, England, and was finally appointed superintendent engineer in the construction of marine works; practised as consulting engineer in South Wales and London and came to the United States in 1889 by invitation of the late **Austin Corbin,** then president of the Philadelphia & Reading, to advise on various schemes in which that gentleman was interested, and more especially with reference to designing deep tunnels for rapid transit between Brooklyn, New York and Jersey City. During the period from 1890 to 1896 he was consulting engineer of the New York & New England Railroad; Elmira, Cortland & Northern; Long Island Railroad, and also chief engineer of the Blackwells Island bridge. In 1892-4, as chief engineer of the East River Gas Co., he designed and constructed a tunnel between Ravenswood, L. I., and Seventy-first St., New York City. There are laid through this tunnel two large gas mains with a 3-ft. gage railway track alongside. This tunnel was driven simultaneously from both sides of the East River. The headings met at midnight July 11, and were joined up, thus completing the pioneer tunnel under the East river. From 1902 until about 1909, Mr. Jacobs served as chief engineer of the North River division of the tunnel lines of the Pennsylvania.

Another Strike!

FOLLOWING IN THE TRACKS of the "Reds" who are now trying to throttle the country by tying up the steel industry, the radical leaders of two printing trades' unions in New York have demanded that the employing printers shall, in effect, turn their respective businesses over to their employees. The vehicle is an unreasonable demand for a minimum wage of $50 a week of 44 hours and a threat to strike if not granted.

On its face, the issue is local. In fact, it is the kindling of a nation-wide conflagration with far-reaching possibilities. Under the circumstances it is our plain duty as American citizens to fight until the last vestige of fire shall have been stamped out.

At this writing it is impossible to predict when we shall again be able to get out another issue of the *Railway Age;* but we ask the indulgence of subscribers and advertisers alike until we can resume. In the interim, our editorial staff will continue to function to the end that our readers shall not fail to have a connected story of happenings in the railway world. Should it be necessary, a way will be found to get out special bulletins covering matters vital to the operation of our railways and the welfare of those who make what the railways buy.

The Steel Strike

Entirely irrespective of the pros and cons of the strike in the steel industry, it is clear that the struggle has resolved itself into a contest between Americanism and alienism. This is shown not only by the fact that it is the foreign element—mostly Slavs—who are on strike, but by the character of the leader of the strikers—in reality, William Z. Foster, secretary of the Steel Workers' National Committee. Mr. Foster is an out-and-out radical. He was at one time an organizer of the I. W. W., and in 1911 was sent by that organization to Europe, where he spent much time with the radical leaders in France, Germany and Austria-Hungary. He later left the I. W. W., and is working in the A. F. of L. on the basis that the way to work out his radical ideas is through the medium of the established labor organizations. In short, he has adopted a policy of boring his way in, or of getting into the stronger organization, of inoculating it with his theories, and of carrying them out by means of a militant minority. Further than that, he is the joint author of a book, "Syndicalism," published in Budapest in 1911, in which among other things he favors the revolution by general strike. The *Iron Age* in its latest issue has done the people a service by reproducing passages from this book, such as "The syndicalist knows that capitalism is organized robbery and he consistently considers and treats capitalists as thieves plying their trade. He knows they have no more right to their wealth they have amassed than a burglar has to his loot." Or, "In his choice of weapons to fight his capitalist enemies, the syndicalist is no more careful to select those that are 'fair,' 'just' or 'civilized' than is a householder attacked in the night by a burglar. He knows he is engaged in a life and death struggle with an absolutely lawless and unscrupulous enemy . . . With him the end justifies the means." Speaking of the general strike, he says, "The general strike is the first stage of the revolution proper." With a leader capable of preaching such doctrines as these to a mass of more or less uneducated and un-Americanized foreigners, all kinds of trouble may be expected. It is fortunate, however, that the issue is so clear. This country is American, and a question of Americanism can be decided only one way.

Working for the Public

The Plumb plan "makes him (the workman) the true servant of the public and of the country, which rewards his efficient service with an interest in the dividends of the enterprise. . . . . For a man will work for the public more unstintingly than he will work for that impersonal thing called Capital. . . ." These are the words of Grand Chief Warren S. Stone of the Brotherhood of Locomotive Engineers in an article entitled "The Labor Campaign Is On," in the September number of the Locomotive Engineers' Journal. Observation of the actions of men in government service, and particularly under the civil service rules, does not bear this statement out. Moreover the employees in railroad service are now working for the public—a public which has treated most of them handsomely, both as to wages, and working conditions. The employees generally do not seem to be at all appreciative of this; indeed they are treating the public with much the same contempt as are the profiteers. A group of railway mechanics was discussing one of their number and criticising him because of his close attention to his work. "He forgets that he is working for the government and acts as if he were still working for a private corporation," said one of them. Thoughtless words; and yet reflecting an attitude which unfortunately is all too general. Inefficiency means decreased production and higher cost of living. Democracies are slow to anger, but once aroused exert an irresistible force in righting wrongs. America has high ideals—the question is whether those who are abusing them will awaken in time to see the handwriting on the wall and profit by it.

Effects of Safety Campaigns

The "no accident" campaigns recently conducted by the United States Railroad Administration have been highly successful from the standpoint of both the railroads and the employees. Even if their effects were confined to the railroad field, they would be worth the efforts and time expended on them, but their influence is beginning to be felt much farther than their authors anticipated. The Chicago Association of Commerce has designated October 9 as "Fire and Accident Prevention Day." In its announcement of this one-day drive for the prevention of fires and accidents, the association has given credit to the Railroad Administration for what it has accomplished in drives of a similar nature, and the publicity

matter prepared for the drive refers to the experience of the Railroad Administration as proving that 75 per cent of accidents are due to carelessness on the part of individuals, and can be prevented by inspiring individuals to be careful. Safety work has long been carried on by railroad companies, industrial concerns, and municipal, state and governmental agencies, but the Railroad Administration has had an especially good opportunity for carrying it on effectively, because it could make its influence felt on such a large mileage of railroads and throughout the entire country. Habits of carefulness may be formed in short, intensive no-accident drives, which will outlast the actual campaigns.

Government Ownership of Coal Mines

The *Railway Age* often has pointed out that the application of radical policies to the railways was sure to be followed by the advocacy of radical policies in other fields of industry. The Plumb plan provides for government ownership and employees' management of the railroads. The coal miners have not waited for the adoption of the Plum plan to begin an agitation for the application of a similar policy to the coal mines. The United Mine Workers of America has commenced a propaganda for nationalization of the coal mines and participation of the employees in their management. It also has decided to demand a 30-hour week and a large advance in wages. The railways are the largest purchasers of coal, and their owners and officers are interested in the new program of the miners because of the very large increase in railroad expenses which its adoption would cause. But the demands the miners have decided to make have a much broader significance. They are a striking illustration, in addition to many others the country recently has been afforded, of the extent to which radical counsels are coming to prevail in organized labor. We now have both the labor brotherhoods and the United Mine Workers engaged in propaganda for the acquisition of the industries in which they are employed at the expense of the general public and their management partly or wholly by the employees. The adoption of such plans would result in the overthrow of existing American industrial and political institutions, and evidently the support of many large labor organizations is being won for plans which their leaders know would involve an industrial and political revolution. It is daily becoming clearer that we have entered a great struggle between those who wish to preserve the existing institutions of America and those who wish to establish socialism and sovietism in their place. The first great fight will be over the future ownership and management of the railways. If private ownership and management wins in this field it will probably win in others. If private property in railroads is destroyed private ownership of other kinds of property also probably will be destroyed. The issue is clear-cut, and we have no doubt as to the side on which a great majority of the people finally will array themselves.

A Superintendent's Nights and Days

A superintendent manages the work of his division through three principal assistants, the engineer, the master mechanic and the trainmaster. Which of the three is the most important is not a practical question, for each one is absolutely essential; but which of the three should engage the most of the superintendent's time and attention is a question which all competent observers will in most cases answer alike; it is the trainmaster. Director General Hines has sent out a letter intimating that operating officers are not giving sufficient attention to roadway and mechanics, particularly roadway, which evidently has enlivened a good many staff meetings; and some of these officers have a feeling that they are being unfairly criticised. This feeling would seem to be due to abnormal sensitiveness. If the roadway of a division is neglected the division engineer is the man immediately responsible. It may be that the division superintendent, rather than the chief engineer or the general manager, was responsible for the selection of the division engineer, but this is not usually the case. A chief in Washington must, indeed, work through the chief division officer to find out what is going on from day to day on the division, but the latter ought not to need a great deal of time to fix the manager's attention on the essential issues. The reasons why the superintendent must live with the trainmaster more than with the other two are to be found in the nature of the case. The trainmaster may be likened to the stage manager of a theatre; the division engineer to the painter of the scenery. While the show is going on—which, on a railroad, means all of the time—the stage manager's office is the critical place. Or, to adopt a simile used by George M. Basford in one of his addresses, we may compare the superintendent to the conductor of an orchestra; he must concentrate attention on the players, not on the men who made the instruments. Again, the science of keeping up track and that of maintaining locomotives are comparatively settled; the young officer has, or should have, a good mental equipment of clearly defined principles; whereas the trainmaster must learn efficiency from a multitude of teachers. Much of his knowledge must come from experience; he cannot get it from books or at school. Even at his best he, much oftener than the other two, has problems which he cannot settle; and the man who (having been duly diligent) has the largest number of unsolved puzzles, is the one who is entitled to the first call on the superior's time and attention.

The Annual Convention of the Signal Division

THE FIRST ANNUAL CONVENTION of the Signal division of the American Railroad Association, which was held in Chicago on September 17-19, resembled previous conventions of the old Railway Signal Association in that there appeared to be a determination to forward constructive measures that will conform to or improve upon the best present practice.

During the past few years the annual convention of the Railway Signal Association has been held in September. It is now recommended that the annual meeting be held in July in order that the executive committee of the American Railroad Association can dispose of each year's work of all its sections and divisions at its annual convention, which is to be held each year in November. Such an arrangement would necessarily require a change in the time of holding at least one of the two stated meetings of the Signal division. These stated meetings have heretofore been held in March and June, and it is proposed now to hold them in March and December. It is probable that some objections may be raised to July as the annual convention month. In normal times that is a busy time for the signal department. Construction work, seasonal repairs, and inspections are usually going at full speed. Then, also, July is about the middle of the vacation period, when the department is short handed. Under such circumstances, it may mean that some roads cannot send representatives to the annual convention. Besides, passenger business is especially heavy at that time of the year. So far as the stated meetings are concerned, there probably can be no objection to holding one in March, since has always at least one day been set aside during that month for one of the stated meetings. December,

however, may prove to be a poor time to hold such a meeting. At that time of the year, at least in some parts of the country, storms are prevalent and it may, therefore, be out of the question for some members to attend. There is one feature, however, that may relieve the situation somewhat, and that is that at any meeting, committee reports may be submitted to the members for action by letter ballot.

The subject of automatic train control was brought up again by Committee 10—Signaling Practice, in the form of recommended requisites for the design and construction of such devices. It is the opinion of some of those who have made a detailed study of train control devices that the time has come when service tests should be made on a larger scale and that the railroads should lend all the assistance practicable to those who are conscientiously engaged in the development of such devices.

Another problem confronting the association is illustrated by a remark made during the meeting that only five per cent of the total signal business of one signal supply company conformed to Railway Signal Association standards. This might at first seem surprising; for it would appear that the railroads should use material approved by the Railway Signal Association and the Signal division of the American Railroad Association. It would seem that, inasmuch as a great deal of time and much conscientious constructive work have been devoted to the development of standard materials, the amounts of such materials used by the railroads should represent more than five per cent of the total signal supplies purchased. It is true, however, that the Railway Signal Association has not yet prepared standards for all signal materials, but it is certain that they have been prepared for more than five per cent of such materials. It is understood that when the executive committee of the American Railroad Association approves the work of any section or division of the association and it is also approved by the Railroad Administration, the use of such materials or specifications becomes mandatory. In such a case it might be possible for the executive committee of the American Railroad Association and the Railroad Administration to approve many of the standards already adopted by the Railway Signal Association, in which case the total signal business of a signal material manufacturer would soon show a much larger percentage of R. S. A. standard supplies than indicated by the statement referred to.

The Plight of a Short Line Railroad

One of the witnesses on Monday before the House committee on interstate commerce is the builder and owner of an 88-mile railroad running out of Savannah, Ga. George M. Brinson appeared before the committee and testified that he had put over $700,000 of his own money into his road, the Midland, which runs back from Savannah through a timber and agricultural country, crossing two or three other railroads and running through no large towns excepting Statesboro. Not only had Mr. Brinson built the road largely with his own money, but he was president and, as he remarked in answer to a question of one of the committee, was about all the officers there were. He had previously built other small roads in the south and had made a fair amount of money out of them. The Midland runs through what Mr. Brinson characterized as the richest county in Georgia. Building the road afforded transportation facilities to villages and rural communities heretofore without a railroad outlet. The road had been in operation only a very few years when the United States went into the war.

Mr. Brinson testified that the road cost about $1,200,000, which presumably included equipment. There are outstanding $360,000 of bonds which are now in default of interest. The bonds are held by quite a number of different people and as yet no foreclosure suit has been begun. Mr. Brinson, because there seemed no better way out of a hopeless position, signed one of the standard short line contracts with the government, but what he had to tell the committee was in substance that he could not go on operating the road under present conditions and make it pay even its expenses and the interest on the bonds, disregarding any return on his own investment of $700,000. Neither did he think any one else could take the road and operate it in such a way as to pay expenses and interest on the bonds even if his own interests were wiped out completely. The bonds are only at the rate of $4,000 a mile.

Is this a plain case of a man making a bad business venture and now coming before Congress and asking to be helped out? It is not; if Mr. Brinson's testimony may be taken at its face value, and the testimony was remarkably convincing and apparently made a considerable impression on the members of the House committee. In Mr. Brinson's opinion, this was a clear case where the government through its action, necessary as that action might be to meet war conditions, had wiped out his investment of $700,000 and had created conditions which made the many other short lines situated somewhat as the Midland is, unprofitable, if not actually a source of expense instead of revenue to their owners.

The owner of this little road, since the roadbed was entirely unseasoned, had bought five old, "rattle-trap"—the word is his—locomotives, with the intention of running them until the roadbed had been seasoned enough to justify putting on heavy new locomotives. The Midland did not have cars enough of its own to do its local business, but, as Mr. Brinson expressed it, it was a family affair between him and his connections; he could give them traffic and they were willing to let him use their cars. But government operation changed all that.

Fully as disastrous, however, to the Midland and like-situated roads, in Mr. Brinson's opinion, as the shutting off of car supply after the government took over its trunk line connections and the routing of freight by a government line rather than over an indepepdent line, was the situation created by the government's railroad labor policy. Before government control a short line such as the Midland could hire men through individual bargaining with them, could, in effect, make a strictly local, rural industry of operating a local line through an agricultural country. Now, Mr. Brinson testified, his local labor demanded the same rate of wages as the government was paying. He could no longer get a boilermaker to speed up when one of the "rattle-traps" broke down. Now this boilermaker must have not only the same wages, but the same restricted output as the boilermaker on the Central of Georgia, United States Railroad Administration.

We see in this testimony of Mr. Brinson some confusion of economic causes which might have been effective whether or not the government had taken over the operation of the trunk lines and causes which are directly traceable to the policy of former Director General McAdoo, but the one thing that stands out clear and seemingly irrefutable and the thing that visibly impressed the House committee was the fact that unless the American people are willing to forego expansion of railroad facilities through the building of such roads as this independent 88-mile line, some specific provisions will have to be made in the bill for the reorganization of the American railroad systems for the encouragement of the short line railroad builder. Mr. Brinson thought that the Cummins bill, if he understood it correctly, would possibly help him out of some of his difficulties, but he did not go so far as to express the opinion that it would encourage other optimistic would-be railroad builders to put $700,000 into a new railroad anywhere in the south.

It is true that the aggregate mileage of all the short lines is not large when compared with even a few of the largest

systems, but the short lines play a part in the economic life of the country that should not be overlooked, and while the short line problem is a small one compared to the great problems which face Congress in regard to the American transportation question as a whole, it is one that deserves study and, it would appear, has the sympathetic interest of Congress.

What Is a Strike?

THE PROVISIONS in the Cummins bill designed to bring about the settlement of labor controversies by an impartial tribunal instead of by the use of, or, more frequently, by the threat of force, and to prohibit "any combination or agreement with the intent *substantially* to hinder, restrain or prevent the movement of commodities or persons in interstate commerce," has called forth a lot of impassioned rhetoric about interference with the inalienable right of a free-born American citizen, or of two such citizens, to quit his or their employment peaceably, when they have regretfully arrived at the conclusion that they can no longer maintain or improve the "American standard of living" on the wages offered them. This notwithstanding the fact that the bill says specifically that "nothing herein shall be taken to deny to any individual the right to quit his employment for any reason."

The constant repetition of the presumption that a strike consists of a peaceful folding of the hands or that it is properly described by the euphemistic language used by Mr. Plumb recently when he said that men would "cease to serve" is becoming tiresome. It is true that we have no basis in experience for a proper conception of the kind of nation-wide strike that has been occasionally threatened by the train service brotherhoods and other large organizations of railroad employees but we have had plenty of experience of the kind of strikes that includes such practices as throwing emery dust into machinery, soap into locomotive boilers and bricks at the heads of men who are not only willing but anxious to take the places of the strikers and to try to maintain a standard of living on the wages that they scorn and by hours of labor that they find irksome.

We have also had recent experience of the fact that a strike does not necessarily mean a termination of employment, because when Mr. Hines announced that such an interpretation would be placed upon the action of the Pacific coast train employees and of the shop men on a number of eastern roads if they failed to report for work by a specified time the men returned to their jobs.

It even seems somewhat problematical whether the provisions of the Cummins bill would apply to the individual employees under the present form of strike ballot on which an employee signs his name to an authorization to the officers of the union to "use the protective features of the organization if necessary," knowing that if he does not so sign his name will be recorded in a little notebook carried by the walking delegate for future reference. It would seem that the conspiracy in such cases would be on the part of the labor leaders. The latter like to have it appear that they are "sitting on the lid," in anxious endeavor to restrain their restive followers from a too rash eagerness to burst the bonds of serfdom, but their bluffs have been so successful in the past that it is a little difficult to predict with assurance what would be the result if they were brought to a showdown.

There are ways to find out, however. One way would be to force the labor leaders to play their strike card and show to what extent their claims represent the real feeling of the men. This might also tend to show how many of the easier jobs at higher pay which the labor organizations point out in their arguments they might be able to fill. For example, the shop employees last year got a raise on the ground that it was necessary to keep them from migrating to the shipyards, but although they were allowed less than the shipyard scale, the increase in wages for the shopmen was followed by a large increase in the number of them applying for railroad service. The mere taking of a strike vote is so easy and usually has been so successful, and the methods of labor organizations include so many ways of making it unpleasant for a man to vote against a strike, that it is time to find out what a strike vote means.

Another way would be to enact into law some such provision as that contained in the Cummins bill and let a class of employees submit its grievances to arbitration by a board on which they would have equal representation. Then if the board should award them, say, only 25 per cent instead of 50 per cent and the men should still feel so dissatisfied and so disgusted with their employment that they would feel justified in "ceasing to serve" we imagine that the law could be repealed before enough new jails could be built in which to house the martyrs, because the jails now in existence might be needed for the leaders, whose interest in their own jobs is causing most of the trouble. If, on the other hand, a large percentage of the men should even grumblingly accept such a trifling increase in their emolument until they could think up a new excuse for reopening the case, or if the peaceable strikers motoring homeward to await their summons to court should find their passage obstructed by the pedestrians in search of employment, they might be led to join with the public in a conclusion that the law was a good one.

Public Sentiment and the Steel Strike

E. H. GARY, chairman of the United States Steel Corporation, has declined on behalf of the corporation to deal with organized labor, and the long-threatened great strike in the steel mills has begun, in spite of the plea of President Wilson that it should be postponed until after the industrial conference which he has called.

There is a circumstance relative to the attitude of the Steel Corporation which is highly significant. Although its refusal to recognize or deal with organized labor has resulted in a great strike, its course has received little criticism from the press, except the labor and socialist papers; and the sentiment of the public seems to be in its favor. If the Steel Corporation had assumed a few years ago the same attitude it would have been criticised by a large part of the press, and public sentiment would have been against it.

One of the reasons why, in this crisis, the Steel Corporation has fewer critics and enemies than it would have had a few years ago is that it has voluntarily given its employees large advances in wages and the opportunity to acquire its stock and share in its profits. Another is that it promptly and patriotically placed all of its vast resources at the disposal of the government during the war. There is another reason, however, which probably is much more important and influential. This is the tendencies which large labor organizations recently have been manifesting.

Until some years ago employers generally held the whip hand in dealing with their employees. The public knew this resulted in much injustice and not a little oppression and accepted the view that labor must be organized to secure its rights and protect its interests, and that employers should recognize organized labor. Until recently the public has looked with sympathy and approval upon the increase in the number of labor organizations and the growth of their memberships. A great impetus to the growth of the labor organizations was given during the war by the government's attitude of friendliness to them.

But simultaneously with the recent acceleration of the

growth of labor unions there has been occurring a change in the purposes which many of them avow and in the methods they use. When labor organizations were weak they demanded that employers should submit controversies with them to arbitration. Recently, however, there has been a growing tendency on the part of strong unions to decline arbitration, and to insist that all their demands must be granted under penalty of a strike. The first conspicuous illustration of this change in the attitude was afforded in the controversy regarding the basic eight-hour day on railroads in 1916, which resulted in an order for a general railroad strike and the hasty enactment of the Adamson law. Formerly the labor unions confined themselves to seeking better working conditions, shorter hours and higher wages for their members. Recently their demands in respect to working conditions and hours have been rapidly growing more extreme until finally the coal miners have asked a 30-hour week accompanied by a large increase in wages; but the unions are no longer confining their activities to such matters as working hours and wages. For years the socialists tried without success to secure control of the American Federation of Labor. Recently, however, large labor organizations affiliated with the Federation have begun to advocate measures which would be even worse than socialism. The railroad labor organizations are carrying on a propaganda for government ownership of the railroads and their management by the employees. The coal miners have begun a propaganda for government ownership of the coal mines and the division of their management between the government and the miners. Under these schemes, while the public is to buy the industries in question, it is not to be allowed, as it would be under socialism, to manage its own industries, but is to turn them over largely or wholly to the irresponsible management of the persons on the pay roll.

At the very time when big unions are demanding that the government shall nationalize vast properties and practically turn them over to the unions to manage, the unions have begun to lose control of their own members. The advocates and spokesmen of organized labor used to contend that collective bargaining between employers and employees was necessary to secure not only justice but continuous orderly operation of industries. Recently, however, the members of labor unions in all parts of the country have begun to strike in violation of their contracts with their employers and contrary to the orders of their own organizations. These "outlaw" strikes have even occurred in shipbuilding plants and on railroads which at the time were under the control or actual management of the government. These have been strikes against the government itself.

Developments such as those mentioned are making a very unfavorable impression upon all classes who do not belong to labor unions and even on many members of labor unions. When members of labor unions strike in violation of their contracts and contrary to the orders of their own officers, the question naturally is raised as to what good it does to carry on negotiations and make contracts with labor organizations. When they demand a 30-hour week, as the United Mine Workers are demanding, the question arises as to whether continued increase in the strength of labor unions will not result in a curtailment of the production of coal and of other commodities which will be destructive of the welfare of the working and all other classes. When labor unions commit themselves to such schemes as the Plumb Plan and nationalization of the coal mines, the question naturally arises as to whether the continued growth of unionism will not strengthen the movement for extreme radicalism and push the country finally into socialism or bolshevism. Many of the labor leaders disavow socialism; but socialism is merely the public ownership and *public management* of all the facilities of production, distribution and exchange, while the present labor leaders seem disposed to force upon the country public ownership and *labor class* management of all large industries, which would be worse than socialism. The extreme demands which have been made, the "outlaw" strikes which have occurred and the radical measures which have been proposed have been supported by the spokesmen of labor in words which themselves have been alarming. They have used the familiar language of the socialist and the anarchist in denouncing property owners, and the word "revolution" frequently has been on their lips.

There undoubtedly is a connection between recent developments in the labor world and the attitude of the press and the public toward the controversy between the United States Steel Corporation and organized labor. The general press and public are inclined to think that the Steel Corporation in refusing to recognize organized labor may be fighting the public's battle. If the public believed that recognition by the Steel Corporation of organized labor was all that was involved its attitude might be different. But naturally the public is beginning to wonder whether the further recognition of organized labor by employers and its further growth in membership and power means that there are to be disastrous curtailments of production in the United States; that contracts made by organized labor are not to be observed by it; that organized labor is going to refuse to submit its demands to arbitration; and that it is going to become a giant agency for the promotion of socialism, or even bolshevism. The public naturally reasons that if these are to be the results of the development of labor organizations, their recognition by employers is not so desirable as it formerly seemed to be. Knowledge of the fact that John Fitzpatrick and W. Z. Foster, the principal leaders of organized labor in the steel strike, are extreme radicals, Foster being an avowed advocate of the overthrow of the present industrial system, and of the use of "direct action" to bring this about, is not adapted to make the public look with less suspicion and apprehension upon the steel strike.

Only time will tell what is to be the outcome of the strike. The patent fact, however, that the attitude of the general press and public is far less friendly to organized labor in this struggle than it would have been a few years ago may well cause the leaders and members of labor organizations to pause and reflect. The people of the United States are just as determined not to be ruled by an autocracy of the proletariat as they ever were not to be ruled by an autocracy of the plutocrats. A vast majority of them are not in favor of socialistic or bolshevistic measures, but believe in private ownership and individual initiative. A large part, and perhaps even a majority, of the members of labor organizations are not in sympathy with the extreme radicalism being manifested by their present leaders. In other words, while the tendency of the labor organizations is to become more radical, the general trend of American sentiment is conservative, and there is a growing belief among the people that the labor organizations are trying to use the power they believe they possess to exploit the general public. Many very strong men and organizations, just when they have thought their power had reached its maximum and was ready to be used with the maximum effect, have suddenly found themselves rendered powerless and even crushed by the overwhelming reaction of an aroused and exasperated public.

The proposed alliance between the railroad brotherhoods and the unions of coal miners is expected by the officers of the United Mine Workers to result in joint action in wage demands. A committee has been appointed by the United Mine Workers to meet a similar committee from the railroad brotherhoods on October 1, to prepare a plan of co-operation in presenting wage and working condition demands.

Letters to the Editor

National Department of Public Works Versus the Corps of Engineers, U. S. A.

Chicago.

To the Editor:

The United States Engineer Corps is a body of men justly proud of its record, but hostile to any movement which threatens its authority or reduces its field of action. It has on its roster the names of many men who deserve credit for high attainments. Their country had educated them and made them a class apart, invested with authority and clothed with dignity. They have been entrusted with vast responsibilities and for the most part have discharged those responsibilities worthily, but not without the advice and help of untitled civilian engineers, who have paid for their education and gotten their experience without the aid of a paternal Government. It is these men who have done the vast proportion of the work for which men who wear insignia of military rank have been accorded, and have graciously accepted, the credit.

A statement of the vast area of the field of operation of the Corps of Engineers is a fitting preface to what I am about to say. Continental United States has an area of 3,742,583 square miles, within which are 26,410 miles of navigable rivers, 1,200,000 square miles of arid lands, and 75,000 square miles of swamp lands. Our continental and insular coast line is 48,881 miles long, not including our water front on the Great Lakes. We have between 35 and 40 continental ports, besides all those in our insular possessions. There are 517 West Point engineers to care for this vast array of work, as shown by the "Statement showing rank, duties, and addresses of the officers of the Corps of Engineers," issued by the War Department on January 1, 1919. A large proportion of the 375 captains and lieutenants were rushed through West Point without completing the course of study. We have then, old and young, experienced, and novices, 517 officers to do the vast work suggested by the citation previously made.

There are in the United States over 100,000 engineers in the various lines coming within the term engineering. Thousands of these men responded to war's compelling need; the American Society of Civil Engineers supplied more than 1,500. The American Society of Mechanical Engineers sent 1,497. The American Institute of Mining Engineers, 739. The American Society of Electrical Engineers supplied 1,412. The American Society for Testing Materials supplied 575. The architects sent hundreds. These were not novices, but men who, when the need was presented, were able to meet it, and their record of achievement is a proud one. They know that they have earned recognition from the government. They are so self-respecting that they are not willing, now that the piping days of peace have returned, to do the planning and the work which must be done along their several lines, and submit their work to a military engineer who, as a matter of form, will attach his name to the plans and as a matter of course, accept the credit which goes with the work.

Military engineers are educated to meet the constructive and destructive needs of war, and war has demonstrated to the United States its need for them. They do not fit into the every day life of a democracy. Their training makes them autocratic. Most of them, however, have the instincts of gentlemen and they deport themselves as such, but the officer is a rare exception who can wholly divest himself of a superior attitude toward the civilian. The feeling may be successfully camouflaged but it is only in concealment.

We think that no record will disclose a structure designed for the uses of peace and erected under military direction which has been designed, supervised, and completed wholly by the military engineer without aid or counsel from some civilian engineer. In support of this statement the Sault Ste. Marie locks and the Panama Canal are in evidence. Are not the skill and brains of Alfred Noble, Joseph Ripley, L. C. Sabin, David Molitor, Isaac De Young, and many other civilians built into the Sault structures? Then take the Panama Canal. It is to the glory of the Corps of Engineers, U. S. A., that they were in charge of that tremendous project, and the names of Goethals, Sibert, Gaillard and Hodges will always flash upon the screen of memory when that work is thought of, and *they* have had recognition and reward; but we who know, will also remember Williamson, Goldmark, Schildhaur, Cornish, Zinn, Nichols and their civil associates. Alfred Noble, too, left his impress upon that great work. The Pacific division had as its Chief, S. B. Williamson, civilian, all of whose aids were civilian engineers.

An examination of the Chief Engineer's report for 1913 (Vol. 6, Statement of Construction Expenditures to June 30, 1913) shows that the military on the Atlantic division built 2,265,415 cubic yards of masonry for $16,993,254.33, or an average of $7.50111 per cubic yard; and that the civilians on the Pacific division built 2,453,320 cubic yards for $13,646,-113.96, or an average of $5.5627 per cubic yard; showing a civil economy of $1.9384 per cubic yard over the cost of the Military division, or a saving of $4,745,515.49 on the job. Did Williamson ever receive any recognition from Congress? He did receive it from a business organization to which his achievement recommended him. Did any one of his civil associates receive commendation or reward from Congress? If so, when, and what was it? And furthermore, we know that these engineer officers did not plan the Panama canal. The type and salient features of that canal were worked out by a minority of the International Commission for the Isthmian Canal. To the project thus prepared the army engineers fell heir,—a project changed, except as to dimensions, in only one particular. The lake which the minority planned on the Panama side of the Culebra cut, with dam across the Rio Grande and locks between Sosa and Ancon, was abandoned because locks in that location would be within range of gunfire from warships. The locks were moved back to Miraflores and a large item of cost was added to the work. The wisdom of this move from the military standpoint could not be questioned then, but the World War has shown such advance in the power of modern artillery, and indirect fire has reached such precision of aim that the interposition of a hill and the withdrawal for a few miles count for but little as a means of defense.

I have grown old in engineering service and I have been in touch with military engineers for 40 odd years. I have admired, valued and still value the friendship of many of them. But I have not learned to admire the system which environs them, and I believe that the injection of that system into the activities of our civil life is a harm so great that it needs to be abated, as it will be by the passage of the bills supported by the Engineers, Architects and Constructors Conference on National Public Works and introduced on June 25, in the Senate by Wesley L. Jones and in the House by Frank G. Reavis, and the 100,000 or more engineers of our country should use every honorable influence and means to secure that legislation.

Isham Randolph,
Consulting Engineer.

Eight-Cent Street Car Fare in St. Louis.—The Public Service Commission of Missouri has authorized an increase in street car fares in St. Louis to 8 cents, the advance to continue for six months.

Raising a Large Train Shed Under Traffic

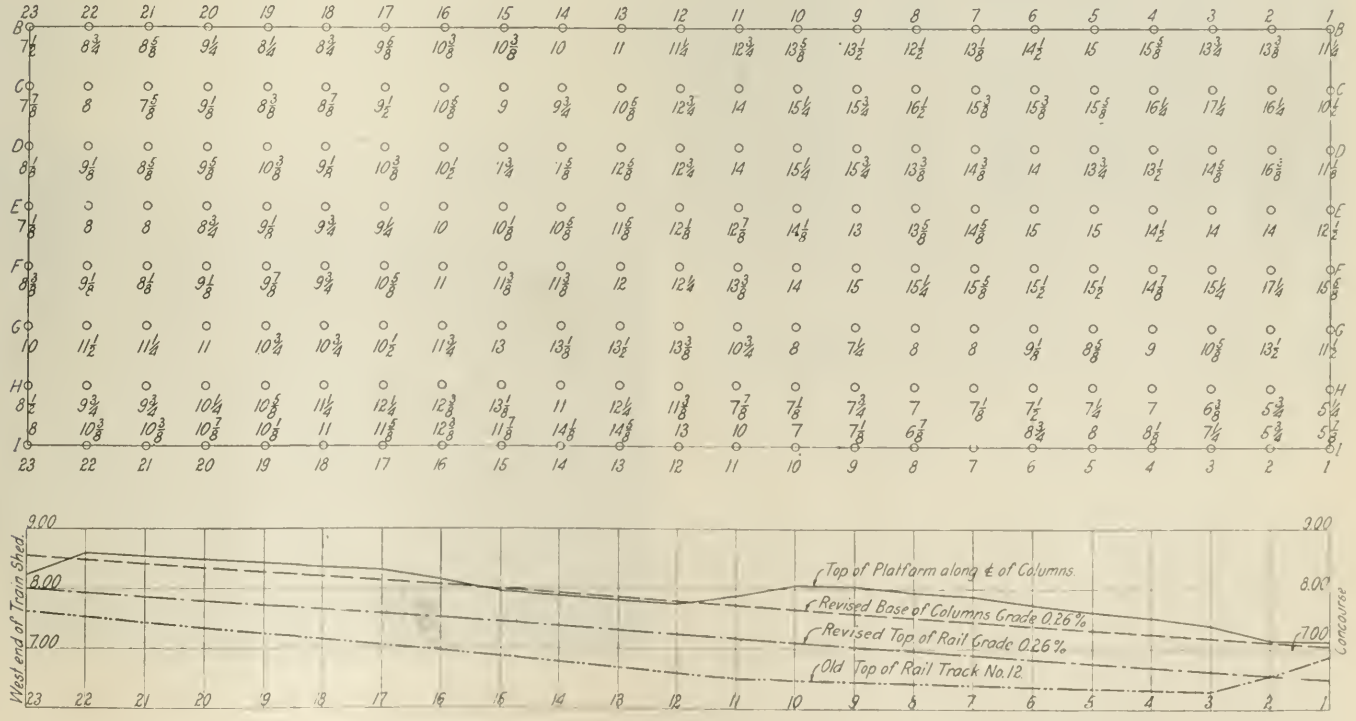
Lackawanna Lifts Entire Structure at Hoboken to Overcome Settlement and Restore Original Clearance

Looking Over the Train Shed Toward the Station

RAISING A TRAIN SHED having an area of approximately five acres and weighing about 18,000,000 lb., from 4 to 17 in. above the level to which many of its supporting columns had sunk, is the unusual engineering project which has just been completed by the Delaware, Lackawanna & Western at its Hoboken (N. J.) terminal. The work was done under the necessity of interfering as little as possible with the 1,500,000 passengers passing through the terminal each month and the operation of the 225 trains which arrive at and depart from the terminal daily. The project involves an expenditure of more than $250,000 and, in addition to raising the shed, includes the complete reconstruction of the skylighting facilities.

The Shed

The trainshed at Hoboken was erected in 1907. It is of the Bush type with columns set in rows along the center of each platform, supporting a series of arches which extend laterally from center to center of platforms. The roof of the shed is formed of reinforced concrete slabs resting on purlins which are 6 in. bulb angles. The concrete roof slabs are 2 in. thick, reinforced with expanded metal and

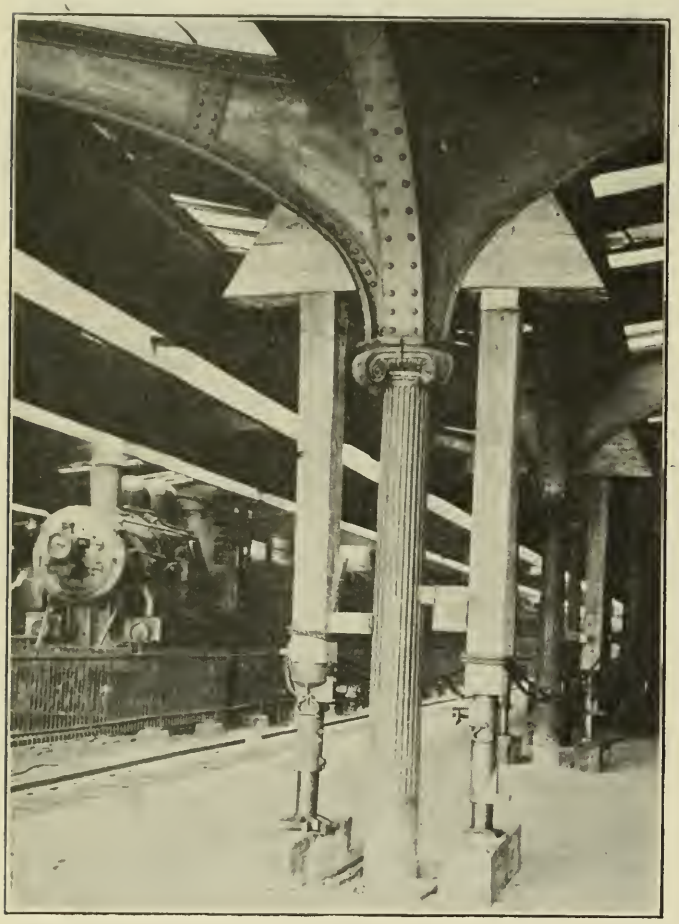


Plan of Shed Showing Amount of Raise. A Typical Profile

covered with a composition roofing. Smoke ducts are provided over the center of each track, and daylight is admitted to the shed through continuous skylights over each platform 7 ft. 10 in. in width of ⅜-in. wire glass.

The shed is 360 ft. wide by 630 ft. long. It covers 14 tracks and has an area of approximately five acres. It weighs approximately 18,000,000 lb. and is supported by 207 cast iron columns which rest on concrete foundations and which, in turn, are supported on wood piles averaging 80 ft. in length. The site is on made ground over the old bed of the Hudson river, and the supporting piles are driven into the mud underlying it.

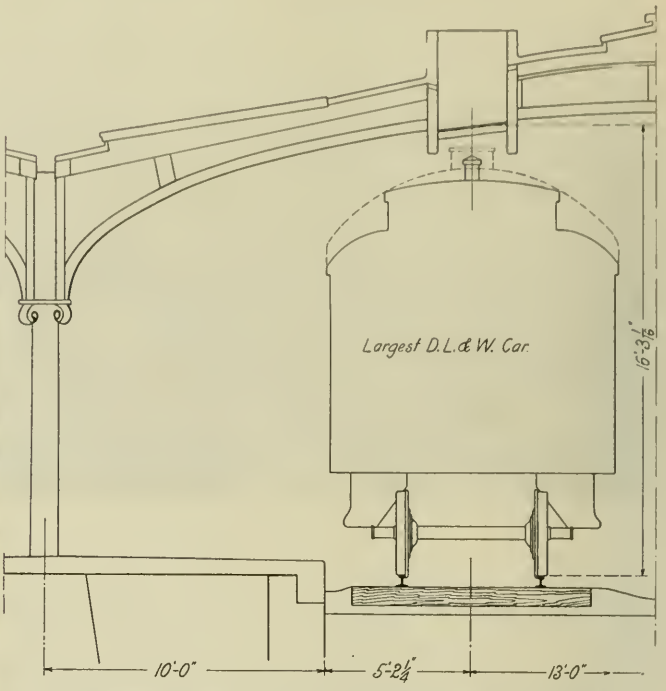
Shortly after the completion of the shed settlement was noted in the pile foundations. The settlement was irregular in extent, ranging from a minimum of 5¼ in. to a maximum of 17¼ in. As a result of this subsidence it became necessary to raise the tracks to a temporary grade, reducing the clearance under the roof from that originally provided, and the lifting of the shed was undertaken to restore ample clearance as well as to provide for the continually increasing size and height of motive power and equipment. The wire glass skylights originally provided had been found difficult to maintain in good repair owing to the vibration set up in the structure by trains and the exhaust from locomotives. Consequently, when it became necessary to raise the shed it was decided to replace the original skylights with others of the vault type.



A View of the Jacking Apparatus. The Extent of the Raise Is Indicated on the Column

At the time of its erection four expansion joints were provided in the length of the shed, dividing it into five sections which were tied together with structural steel connection members. The roof was made weather tight by flashings of copper over the joints. As built, the bases of the supporting columns were embedded in concrete foundations, and before lifting could be begun it was necessary to cut away this concrete from around the column bases.

In planning the work it was decided to raise an entire section at one time, providing jacks at each column in a section. The first lifting operations were confined to the section adjoining the concourse after it had been cut free from the adjoining section. The connection members between the sections were cut by means of acetylene torches.



Clearance of Train Shed After Completion of Work

The lifting was accomplished by hand jacks resting on wooden blocks placed on the concrete platforms and jacking shores working against blocks of wood, triangular in shape, firmly secured to the flanges forming the section of roof support next to the columns, by bolts passed through the rivet holes. The arrangement of the jacking apparatus is shown in one of the photographs, and with the jacks installed at all the columns the weight was first taken at the columns where the settlement was greatest. After this

A View of the Old Type Skylights

all the jacks were started and the entire section brought up to the proper grade.

In the lifting of this section the jacks were supplemented by levers of 12-in. by 12-in. timbers mounted on the smoke ducts at the expansion joints, the ducts acting as fulcrums and furnishing the means for attaching the chains and hooks to the section to be lifted. On the opposite side of the joint the ducts acted as the resistance against which the levers worked through the blocks and falls.

During the lifting of the first section the possibility

The Completed Roof in a Panel of the Train Shed Consists of Two Sections of Concrete Slab and One Section of Glass

of jacking continuously from one end of the structure to the other suggested itself, and on experiment was found to be practical. Consequently the remainder of the work was done in that manner, thus obviating the necessity and expense of cutting the expansion joints between sections and the use of levers.

The continuous jacking was begun by lifting the first line of columns in the second section approximately 2 in. in the first lift. This was followed by a similar lift of the No. 2

The Forms, the Glass and the Copper Expansion Joints

columns in the section after which a lift could be made either in the No. 1 or No. 3 columns, and so on to the end of the structure.

When the lifting was begun it was feared that the jacking operations might cause further settlement in the foundations, but this did not prove to be the case, and the raising progressed without any serious trouble. Owing to the settlement of the foundation, however, certain of the steel members had taken a permanent set, and in lifting the north line of columns where the settlement had been comparatively slight it was found that in raising the adjoining line of columns to the permanent level it was necessary to raise the north line above the grade. On completion of the lifting these columns were jacked down to the proper grade with little trouble.

A force of approximately 20 men was employed in making the preparations for the jacking operations, this being increased to 40 men during the actual operation of the jacks. With all in readiness the work of lifting the first section was accomplished in one day. In lifting the shed the lift in many cases was sufficient to bring the column bases above the level of the platforms, which were then raised in accordance with the new grade of the shed.

The Skylights

Under the old skylighting arrangement ⅜-in. wire glass was used in both the trainshed and concourse roofs, the skylights in both cases being of the continuous type. In the trainshed a skylight was provided over each platform. Under the new plan the wire glass is replaced by skylights of the vault type furnished and erected by the Keppler Glass Constructions, Inc., of New York. In the roofs of both

A Concrete Curtain Wall on the North of the Shed Complicated the Jacking Operations

the concourse and the trainshed the area of glass will be reduced approximately 67 per cent, the photographs of the old and new conditions showing clearly the manner in which this reduction is accomplished. In a trainshed bay the new glass is installed in the center of the three panels and reinforced concrete slabs are inserted in the end panels. In the concourse roof the new skylights are continuous, the reduction in glass area being made in the transverse section, concrete slabs replacing every other row of the old skylights.

The new skylights are made up of vault lights 7-in. square supported by reinforced concrete beams, the reinforcement consisting of ¼-in. steel rods placed between the rows of glass in both directions. In placing the glass, separators of cardboard strips are used which may be stripped out by hand from underneath the roof when the forms are taken down.

Throughout the roof, copper expansion joints, as shown in one of the photographs, are used every 9 ft. When placed the joints provide also for drainage, being made continuous in the concourse roof by means of lapping. In the skylights, themselves, each glass is free to expand and contract, each unit being given a coat of white along its corrugated edges

in order that there will be no interference with the light rays. Over this is placed a preparation of asphalt which permits expansion in each glass.

The concrete slabs are reinforced with expanded metal, the concrete mix being 1:2:4. The mix of the concrete surrounding the glass in the skylights is 1:2½. The concrete plant is located at the track level, all materials being brought in by train. The outfit consists of the mixer and an elevator. The materials are wheeled to the mixer which discharges into push buggies which are elevated to the roof where timber runways are provided.

The lifting of the shed was begun in June of this year and completed in August. It was done by company forces under the direction of L. L. Talynn, acting chief engineer of the Lackawanna; A. E. Deal, bridge engineer, and M. H. Doughty, division engineer.

Work is now under way on the new roof and skylights, and it is estimated that this portion of the project will be completed early in November.

Convention of the Associated Business Papers

THE FOURTEENTH ANNUAL CONVENTION of the Associated Business Papers, Inc., was held at the Congress hotel in Chicago on September 18, 19 and 20. This organization is composed of companies publishing over one hundred of the largest technical and trade papers in the United States.

In addition to transacting business affecting primarily the interests of the publications belonging to the Association, the convention heard addresses and adopted resolutions touching upon the present industrial unrest, the large reconstruction problems confronting the country, and took action intended to make the business press a potent factor in the education of public opinion regarding these matters.

Resolutions which were drafted by a committee headed by H. G. Lord, president of the Technical World Journal, of Boston and New York, called attention to the present labor unrest and current radical labor movements, and instructed the Executive Committee of the Association to take whatever steps were necessary to bring about such co-operation between the editorial departments of the different publications of the Association and between the Association and other organizations as will enable the business press to exert the maximum influence for sound industrial and governmental policies.

The resolutions set forth that while an increase of government activities during the war were necessary, it is now desirable that government activities in relation to business shall be reduced to the lowest practicable minimum. Adverse reference was made to such projects as the Plumb Plan and the nationalization of the coal mines. Congress was commended because it evidently is determined not to give serious consideration to any scheme for government ownership of railroads and their management by the employees, but to adopt measures for the return of the roads to private operation.

The enactment of legislation which will cause railway rates to be so made as to encourage adequate development of railroad facilities was advocated.

The following officers of the Association for the ensuing year were elected: President, Samuel O. Dunn, Chicago, Editor, *Railway Age*, and vice-president, Simmons-Boardman Publishing Co.; vice-president, M. C. Robbins, New York, president, The Gas Age; treasurer, H. L. Aldrich, New York, president, Marine Engineering; members of the Executive Committee, A. J. Baldwin, vice-president, McGraw-Hill Company, New York; R. Marshall, president, Concrete, Detroit, Mich.; F. P. Porter, president, Building and Buildings Management; A. O. Backert, vice-president and manager, Penton Publishing Co., Cleveland, Ohio; Roger W. Allen, president, Allen-Nugent Company, New York; A. C. Pearson, president, Dry Goods Economist, New York.

At the session of the Association on Thursday morning papers were presented by H. G. Lord and H. M. Swetland, president of the United Publishers Corporation, on the business press as "the partners of business." These papers outlined and emphasized the ways in which the business papers can best serve the industries with which they are connected.

Charles Piez, president of the Link Belt Company, and formerly vice-president of the Emergency Fleet Corporation, delivered "An Appreciation by Business." Mr. Piez discussed the industrial situation now confronting the country, and especially the phases of it due to the present radical labor movement. He pointed out that this unrest is largely due to an exaggerated idea on the part of labor as to the amount of the products of industry which goes to capital, and emphasized the necessity of business concerns and business papers frankly and clearly presenting to labor the facts regarding the amount of return derived by labor on the one side and capital on the other from their joint efforts in production. He also emphasized the good that the business press can accomplish by actively engaging in the work of educating business men as well as workingmen regarding the economic principles of efficient production and the advantages of the present American system of industry and government over the socialistic system which organized labor is now disposed to advocate.

An address on "The Significance of the Plumb Plan" was delivered by Samuel O. Dunn, editor of the *Railway Age*. He pointed out that one of the most significant features of the Plumb Plan is that it is the first formal demand made by any large body of American workingmen to have the management of a great industry transferred from the brains in that industry to the hands in it. Since the Plumb Plan was announced the coal miners have proposed a somewhat similar plan regarding the coal mines. Both schemes contemplate the purchase of great industries by the government at the expense of the public, after which they are to be turned over to the employees to manage. It is claimed that great increases of efficiency would be obtained under employees' management, but, Mr. Dunn contended, the great increases in industrial efficiency in the past have been due to the ability and initiative of able men to whom the existing industrial system has afforded the opportunity to rise to positions where they could exert an influence over industrial operations in proportion to their ability. Government ownership and employees' management of industry would interpose insuperable obstacles to the rise of able men to the most important positions in industry, and would put the power of management in the hands of those who would not own the industries and who would therefore have no sense of responsibility for the results of their management. Under the Soviet scheme of ownership and management the individual disappears as a factor in industry, and is replaced by committees of the proletariat.

The sessions of the Association on Friday and Saturday were devoted chiefly to consideration of problems relating primarily to the editing and publishing of business papers.

At the annual dinner on Friday evening A. C. Pearson, president of the Association, acted as toastmaster, and the speakers were Prof. Sorres, of the University of Chicago; Prof. John A. Scott, of Northwestern University, and Major-Gen. Leonard A. Wood. General Wood urged the business papers to oppose the current radical movements and defend the political and industrial institutions which have been established by and under the federal Constitution.

Signal Division Holds its First Annual Convention

Automatic Train Control Considered; Switch Lamp Standards Submitted and Other Details Discussed

THE FIRST ANNUAL MEETING of the Signal division of the Engineering section of the American Railroad Association and the twenty-fourth annual meeting of the former Railway Signal Association was held at the Congress Hotel, Chicago, September 17, 18 and 19, inclusive, with a total registration of 254. R. E. Trout (St. L. & S. F.), chairman of the division, occupied the chair, and H. S. Balliet (N. Y. C.), secretary of the division, acted as secretary of the meeting.

President's Opening Address

The president, in his opening address, dwelt mainly upon the character of the work being carried on by the division and its importance to present day railroad operation. He said, in part:

"A recent typical example of the division's work is the ballast, rail and bonding resistance formula which provides an approved and recognized reference sheet for use not only for a poorly maintained ballast section for track circuits, but also for sections containing zinc treated ties. I personally was unable to convince my own railroad that the annual installation of zinc treated ties should not exceed 12.5 per cent in any track section until I used this division's recommendations. Their adoption resulted in the avoiding of many signal interruptions and saved money by making unnecessary the shortening of track sections.

"The railroads may be led to adopt the division's standards and specifications more freely if a larger number of the field construction and maintenance forces attend the stated and annual meetings so that all standard plans and specifications submitted may be criticised fully. The committee chairmen will thus get the benefit of these men's actual field experience covering years of work. As to new standards, I wish to urge the preparation of standard switch layouts with fittings and that consideration be given the locking feature so that the switch point will be locked with reference to the stock rail instead of to the locking or plunger stand. With the present arrangement it would be possible to remove the stock rail and still complete the locking.

"A well signaled single track division is certainly a step in the right direction, as the signals will increase the capacity of that division, and with the added safety to be derived through the track circuit the signals will, as is being done today, practically eliminate the '31' train orders. The '19' order can be delivered with safety and little reduction in speed. These features, with the addition of insuring the observance of signal indications, in the opinion of your chairman, come very near the goal. The observance of signal indications may be brought about by automatic train control or more severe disciplinary measures for improper observance during surprise or efficiency checks. With this end in view I suggest that the checks and the required discipline be made under the supervision of competent Interstate Commerce Commission inspectors. We all know how thorough these inspectors are after an accident. No manner of protection will entirely eliminate the human equation.

"The automatic train control would have eliminated a large number of our recent serious accidents. The division, through the Railway Signal Association, can well lay claim to the present automatic train control requirements which have been the means of holding the design and consideration of such devices to those that will pass signal requirements. There are today one or more completed serviceable train control devices for steam railroads that should facilitate the handling of trains to a greater extent than will the automatic signal alone due to the continuous control. That is, these devices assume control of the train instantly whenever a dangerous condition occurs which can be detected by the track circuit. With train control in sight, it is advisable to consider whether automatic block signals should be installed first, getting nearly 100 per cent protection from them with the increased capacity they afford, which later could be followed with installations of train controls, or whether it would be advisable to make complete installations of both.

"The educational features derived through the work of the regional committees have increased the efficiency of the signal departments as the meetings permitted an exchange of experiences and methods that are of great value to our railroads.

Automatic Train Control

"The use of some form of automatic train control has been recommended by the Interstate Commerce Commission for some time in connection with reports covering investigations of serious railroad accidents. This subject was brought more prominently before the railroad officers through the establishment of an automatic train control committee by the United States Railroad Administration on January 14 by Director General Hines. This committee was instructed "to make a study of and report upon automatic train control devices now undergoing tests upon various lines of railroads, or available for test, with their recommendations for installation, and for the practical suggestion of any device now or during its investigation, made available for that purpose, which it may consider practicable and reasonably conforming to the purposes to be accomplished." In this connection the views presented by two members of the division on automatic train control are of particular interest to the operating officers."

The speaker then proceeded to quote from Messrs. Anthony and Shaver, as follows:

C. C. Anthony, formerly assistant signal engineer of the Pennsylvania Railroad, said: "I should like to bring before you at this time a few thoughts in connection with automatic stops or automatic train control. It is my belief that the time has come when trial on a larger scale than usually has been undertaken so far is desirable. A number of years ago, when I was more closely associated with the work of the Railway Signal Association, I made a statement somewhat as follows: 'If a railroad should insist that an automatic stop must be installed on its lines, a practical and workable one would soon be in service.' Possibly I was wrong at that time, but several years have elapsed since and development has gone on to such a point that I feel sure devices are available which will meet the requirements and work successfully in regular service.

"I think we know pretty well that not all the work done in this field has arrived at the development of one or more good automatic stops; at least in some cases, it has seemed that this was a mere incident and that selling stock was the main thing. But in several cases conscientious efforts have been made by individuals, not often by the railroads, on development work in connection with automatic train

control apparatus. I believe we have reached the point where one or more such devices may be expected to give satisfactory service and should be tried and proved on a fairly large scale. A great deal of money has been spent on development work which cannot go much further without much more extensive trials than have usually been given so far. Requisites of automatic train control have been formulated and revised several times; but requisites alone will not bring results. Those who are working conscientiously in this field need the help and encouragement of extensive operation in service. An engine division commonly is accepted as the proper unit for a trial installation of a train control device.

"Possibly this is not the time to make such a suggestion, but an expression of the conviction of the signal division that large scale trials of train control devices are desirable—that the time for further development by that means is here and no longer in the future—would certainly give enough impetus to the work; this, of course, provided the division has reached that conclusion.

"It seems to be the thought of many that all sorts of difficulties are in the way of practical applications of a system of automatic train control. I think few of us have gone into that part of the problem in detail. We simply have thrown up our hands at the prospect, and have been more than willing to put off the effort until it should be forced upon us. I recently have had occasion, however, to give the matter some study in possibly its most difficult phase—the application of automatic stops on single track—and I think I may say that the difficulties are not so great as we have imagined. Some changes in the signal controls when they also become automatic stop controls are, of course, necessary to secure full protection between opposing trains without interfering with their approach at meeting points. But the problem does not seem so monumental, after all, when one gets down to the details.

"I wish to leave with you these two thoughts; that the next step in the development of automatic train control—a step that the art is now ready for, and that ought to be taken in the very near future—is trial on a large scale, with hearty co-operation on the part of you who are on the railroad 'side of the fence'; and that there is no need to shrink from the difficulties to be overcome in dealing with practical operating conditions."

A. G. Shaver, consulting signal and electrical engineer, speaking on the same subject, said in part:

"The railroads have not given heretofore much attention and money to the development of new ideas and new schemes for their own use. This development has been carried on mostly by the inventors and the manufacturers, sometimes at heavy expense. The time has arrived when the railroads must interest themselves in such matters, at least to the extent of lending a helping hand.

"Automatic train control development requires much experimentation and costs considerable money. Thus far the railroads have not shown great enthusiasm regarding it. Many operating officers favor it; I have an idea a majority of them do. Of course, the railroads look to their signal engineers as experts in such matters, and they depend on their reports and opinions. The signal engineer is naturally conservative, and especially in a subject so important as train control he does not want to make any mistakes.

"His duties are numerous, and he is a very busy man. He does not have time to study and analyze highly technical subjects of such broad scope and difficult detail as train control is supposed to be, and for the same reasons also it is difficult for him to keep up with progress in the art as fully as he would like to do. Therefore, he considers train control cumbersome and complicated—although Mr. Anthony says it is not, and I agree with him. Hence, generally speaking, the signal engineer is not enthusiastic and encouraging regarding it.

"Because of general sentiment favoring automatic train control, we signal engineers must set ourselves to the task of becoming familiar with it and of being charitable in our consideration and criticisms, which I am sure we shall be when we are fully informed. And we should use our influence with the railroads that train control systems of merit shall be given an opportunity and a fair show in demonstrating what can be done by installations being made of sufficient size and extent to be considered worth while; for example, equipping an engine division as Mr. Anthony suggests. Signal engineers can be of much help and it is due them that they should have credit for their part in such an important undertaking."

First Day's Committee Reports

Thirteen of the 17 committees of the Signal division submitted reports for discussion and action. At the first day's session reports were made by Committee No. 16—Standard Clauses and Sections; Committee No. 2—Mechanical Interlocking, and Committee No. 3—Power Interlocking.

Committee No. 16, F. B. Wiegand (N. Y. C.), chairman, in connection with the standardizing of various clauses and sections in the different specifications as adopted by the Signal division reported on general provisions; standard sections; general electrical requirements and on phrases and words. A brief discussion took place on the information submitted. It was voted that the report as revised be approved and submitted to letter ballot for inclusion in the manual.

Committee No. 2, C. J. Kelloway (A. C. L.), chairman, reported on specifications for a mechanical interlocking machine, having approved Saxby & Farmer locking; on a compensation chart and a specification for machine locking with a view of establishing uniformity and sequence. A compensation chart revised to meet the suggestions made by members at the annual meeting in New York in 1918 was presented as a part of the report.

There was some discussion on the question of using a greater lever length for interlocking machines to permit greater ease of operation. Some members said that the Saxby & Farmer machines used in Canada, England and France have longer levers, thus increasing the ease of operation. It was pointed out, however, that it was necessary to have a specification for the machines of the Saxby & Farmer type now manufactured in this country, and if special machines were desired another specification would have to be drawn up to cover the conditions.

It was suggested that the committee, in preparing a specification for mechanical locking, provide for clearing opposing signals on the same route when no traffic is handled on the crossing line, so as to dispense with the need of operating the plant at certain periods, thus reducing the expense of operation. The compensation chart submitted will enable construction forces properly to set compensators for temperature changes. After revision the report was approved and will be submitted to letter ballot for inclusion in the manual.

Considerable discussion occurred on the specification for machine locking, establishing uniformity and sequence with reference to the locking of lifting type derails in both the normal and the reverse positions. Some changes in phraseology were proposed, and it was decided that the report be accepted as progress and referred back to the committee.

Committee No. 3, F. B. Wiegand (N. Y. C.) chairman, submitted specifications for electric locks for interlocking machines; for power interlocking machines; for universal first and second range voltage electric lock for hand operated switches; and for universal electric motor switch operating and locking mechanism, first and second range voltage.

The specification for electric locks for power interlocking

machines developed some discussion with reference to the phraseology used in various parts of the report. The report was received as information. It was felt that better provision should be made in the specification to cover the wiring between terminal boards and electric locks, light levers, etc., on the machine. A number of revisions were suggested and the committee recommended that the specification as revised be adopted for submission to letter ballot and inclusion in the manual, which motion was carried.

Little discussion was brought out on the specification for universal first and second range voltage electric locks for hand operated switches, and it was moved that this specification be received as information. Motion carried.

Considerable discussion occurred in connection with the specification for universal electric motor switch operating and locking mechanism, first and second range voltage, with reference to the average operating thrust of 700 lb., and the time of operation. It was the feeling of the manufacturers that the present low voltage switch machines could not be operated in the time specified with a thrust of 700 lb. on the throw rod. It was moved that the specification for universal electric motor switch operating and locking mechanism, first and second range voltage, be referred back to the committee for further action and consideration; which motion was carried.

The Second Day's Session

On September 18, the committees submitting reports were Committee No. 11—Batteries and Switchboards; Committee No.5—Rules for Maintenance and Operation; Committee No. 4—Direct Current Automatic Block Signaling; Committee No. 8—Alternating Current Automatic Block Signaling, and Committee No. 10—Signaling Practice.

Committee 11, R. B. Elsworth (N. Y. C.), chairman, submitted a specification for primary battery jars, which after a little discussion was accepted and submitted to letter ballot for inclusion in the manual.

Committee No. 5, L. R. Mann (Mo. Pac.), chairman, submitted instructions for the installation and handling of caustic soda batteries. The discussion brought out slight changes in wording for certain paragraphs, which were accepted by the committee, after which the report as revised was adopted and submitted to letter ballot for inclusion in the manual.

Committee No. 4, C. F. Stoltz (C. C. C. & St. L.), chairman, presented unit specifications for direct-current motor-operated signal mechanism, 10 to 30 volts. Considerable discussion was offered on the various sub-paragraphs and many minor changes in phraseology, and additions were suggested for the committee's consideration. This specification was referred back to the committee.

A report was also submitted on the use of zinc treated ties in track circuits, which, in part, follows: "As the electrical conductivity of zinc treated ties decreases with age during the first year better results may be had by allowing the ties to season for a period of from two to six months before using in a circuited track, thus avoiding the use of the tie while its conductivity is greatest.

"For good results the number of zinc treated ties installed per year in any track circuit should not be greater than 15 per cent of the total number of ties in that circuit."

In the discussion of this subject, C. A. Dunham (G. N.), said that after 15 years' experience with zinc treated ties he had found that the ordinary tie renewals in track circuits did not affect the operation of the circuit if it did not exceed 3,000 ft. in length. F. W. Pfleging (U. P.), said that in his experience with zinc treated ties when not more than 0.3 or 0.4 lb. of zinc chloride per cu. ft. was used he had experienced no trouble in connection with track circuits with ordinary tie renewals. Some zinc treated ties having as much as 0.5 lb. of zinc chloride per cu. ft., however, had caused trouble and made it necessary to shorten up track circuits where these ties were used. The report on the zinc treated ties was submitted as information.

Committee No. 8, C. H. Morrison(N. Y., N. H. & H.), chairman, reported revisions suggested at the June meeting covering material included in various specifications for A. C. automatic block signaling. It was ordered that the specifications presented at Atlantic City in June, and as revised, be submitted to letter ballot for inclusion in the manual.

The committee recommended that the specification for alternating current electric generators be cancelled and eliminated from the manual as the revised specification for alternators covers the subject; and this was agreed to. The specification for single-phase track transformers, 250-volts or less, was recommended by the committee to be eliminated from the manual as the specification for single phase line transformer, oil-immersed, self-cooled and the specification for single phase track transformer cover the above subject It was moved that this recommendation be adopted and the motion was carried.

Committee No. 10, J. A. Peabody (C. & N. W.), chairman, in presenting the report on the problem of signaling railroads with reference to the effect of signaling and the proper location of passing sidings on the capacity of the line, decided that the work on this subject is complete insofar as it relates to the proper location of passing sidings on the capacity of the line, and that the problem of signaling can more properly be handled by the sub-committee which is assigned to report on requisites of signal locations for automatic block signals for single track roads. The recommendation of the committee that this subject be considered closed was adopted.

The committee reporting on automatic train control submitted for the information of the members of the division the definitions and requisites adopted by the Automatic Train Control Committee of the United States Railroad Administration on February 4, 1919. It was recommended that these requisites be accepted as information. The discussion with reference to the automatic train control following the presentation of the requisites is given above.

The Third Day's Session

Reports were presented on September 19 by Committee No. 9—Wires and Cables; Committee No. 15—Valuation; Committee No. 17—Specifications for Oils; Committee 13—Electric Testing, and Committee 6—Standard Designs. After the submission of the last report the results of the election were announced and other unfinished business presented.

Committee No. 9, W. H. Elliott (N. Y. C.), chairman, submitted for consideration a specification for wire joints, accompanied by drawings, Nos. 1403 to 1407 inclusive, and also submitted a specification for friction tape. It was the sense of the meeting that not enough construction details in the form of instructions were contained on the drawings, inasmuch as they represented the only information furnished the men in the field. The various drawings were criticised from a construction standpoint, and numerous suggestions made; after which the report was referred back to the committee for further consideration. The specification for friction tape was discussed to some extent, and it was voted that this be approved for submission to letter ballot for inclusion in the manual.

Committee 13, P. M. Gault (I. C.), chairman, presented a specification for portable direct current volt-ammeters. During the discussion the committee accepted several minor changes which were suggested, after which these specifications as revised were approved for submission to letter ballot for inclusion in the manual.

Committee 15, J. M. Carley (B. & A.), chairman, submitted a progress report in part as follows: "We have

concentrated our work on: the average life in years of the important units of the different types of signal installations, considering depreciation and obsolescence separately; tables for the different types of signal installations which will show the percentage of material to be added to cover waste, contour, sag, loss, breakage, etc., and on the extension of the study made of labor costs by a joint signal committee of the Interstate Commerce Commission and the President's Conference Committee, to establish a percentage to be added to material, to arrive at the total cost. Studies are being made to establish a percentage to be added to the cost of material to cover labor and other costs in the installation of highway crossing signals, bells and gates. The committee has prepared a list of about 100 major items of signal material which is to be mailed out to signal engineers for obtaining information as to the average service life of the various units. The report was accepted.

Committee No. 17, I. S. Raymer (P. & L. E.), chairman, submitted a specification for mechanism, lubricating oil and an historical sketch on oils. The specification for the oil was discussed at considerable length, and some felt that it should include two grades of oil, one for use in the northern section of the country and the other for use in the southern section.

A representative of one of the signal manufacturers stated that it was necessary to have two grades of oil because of the climatic conditions, that is, one grade for certain sections where the temperatures were high and one for the sections where they were low. It was claimed that if one grade of oil only was provided for the entire country it would necessarily have to be for use in that part where low temperatures prevailed, and when this oil was used in hot climates evaporation would make it necessary for the mechanisms to be oiled more frequently. The report was turned back to the committee for further consideration. The historical sketch on oils was accepted as information.

Committee No. 6, F. P. Patenall (B. & O.), chairman, submitted for adoption at the meeting one revised drawing and three new ones. In addition, four new drawings were presented as information and for discussion. The drawings presented for adoption were R. S. A. drawing 1014, one-way horizontal type compensator, revised; drawing 1459, staff tip adapter, new; drawings 1460, switch lamp (cylindrical type), new, and drawing 1461, switch lamp base socket, new. These were accepted for submission to letter ballot for inclusion in the manual. The four new drawings submitted as information were: Drawing 1440, switch lamp (spherical type); drawing 1470, train marker lamp; drawing 1480, engine signal lamp, four lens, and drawing 1490, engine signal lamp, two lens. These were accepted as information.

During the discussion objections were raised to the use of the same size lens in switch lamps when they contain more than one because, even though it is the practice to have damaged lamps repaired at a central point by experienced men, it sometimes happens that roadmasters and others have been successful in getting through requisitions for new lenses and have made repairs in the field which have resulted in not getting the lenses in the proper place. It was the thought of the committee, however, that all such lenses should be the same size as this is a matter which has been thoroughly discussed at previous committee meetings. It was also felt that one type of lamp bracket socket should be used on all cars, because of the interchange of cars.

Officers Elected

The officers of the division chosen for the ensuing year are as follows: Chairman, C. J. Kelloway (A. C. L.); first vice-chairman, F. W. Pfleging (U. P.); second vice-chairman, F. B. Wiegand (N. Y. C.); secretary, H. S. Balliet (Grand Central Terminal). The following were elected to the Committee of Direction to serve for a period of three years: W. H. Elliott (N. Y. C.); C. H. Morrison (N. Y., N. H. & H.); J. A. Peabody (C. & N. W.); F. P. Patenall (B. & O.), and K. E. Trout (St. L. & S. F.). Those elected to serve for a period of two years are: C. A. Dunham (G. N.); G. E. Ellis (I. C. C.); H. K. Lowery (C. R. I. & P.), and E. E. Worthing (So. Pac. Lines, Atlantic System). Those elected to serve for one year are: J. H. Cormick (Can. Nat'l.); W. J. Eck (Southern); A. H. Rice (D. & H.) and E. G. Stradling (C. I. & L.).

Change in Schedule of Meetings

It was announced that because of the necessity of having all reports in the hands of the Executive Committee of the American Railroad Association not later than October 15, in order that this committee might act upon them at its November meeting, it would be advisable to change the present schedule of meetings. In this connection it was the sense of the Committee of Direction that the first stated meeting should be held at New York the first week in December, the second stated meeting to be at Chicago in March, and the annual meeting should be held in July. This arrangement would give the various committees opportunity to round out their work and report to the Executive Committee of the American Railroad Association. The time between the July and the December meetings would also give all committees a long period to prepare reports for presentation in December. The proposed change was given as information, and will be presented to the division for approval by letter ballot later.

Signal Appliance Association

The officers of the Signal Appliance Association, chosen for the ensuing year at a meeting held in Chicago, on September 17, are: Chairman, A. S. Anderson (Adams & Westlake Company); vice-chairman, J. Warren Young (Kerite Insulated Wire & Cable Company); secretary and treasurer, F. W. Edmunds (Schroeder Headlight & Generator Company). Those elected to the Executive Committee are: W. J. Gillingham (Hall Switch & Signal Co.); M. R. Briney (Federal Signal Company); C. S. Pflasterer (National Carbon Company); W. P. Allen (Union Switch & Signal Company); J. W. Hackett (Okonite Company); H. G. Thompson (Transportation Engineering Company); S. G. Johnson (General Railway Signal Company). The chairman of the Arrangements Committee for the ensuing year is Henry Lee (Simmons-Boardman Publishing Company), and the chairman of the Place Committee is George A. Blackmore (Union Switch & Signal Company).

Organization for Purchasing and Stores*

Executive Officer Should Supervise Purchasing, Selling, Storing, Handling, Protecting and Disbursing

By Henry B. Spencer
Director, Division of Purchases, United States Railway Administration

When the Railroad Administration was being organized, the function of purchasing the larger items of material, the use of which was more or less common to all railroads, such as rolling stock, rail and ties, as well as general supervision of the purchasing of all other supplies, was combined with the function of providing the finances for the operation of the railroads under the Division of Finance and Purchases. The director of this division was assisted in his duties by two committees, each composed of three members, one known as the Advisory Committee on Finance and the other as the Central Advisory Purchasing Committee.

It was determined later that the relation between the financing of the railroads and the purchasing of their necessary supplies was not so intimate as might be supposed, and this finally led to a separation of the functions of finance and purchasing and the creation of two distinct divisions, known as the Division of Finance and the Division of Purchases, each in charge of a director with assistant directors replacing the original Advisory Committees.

The work of the Central Advisory Purchasing Committee, which was subsequently absorbed in the Division of Purchases, has been very largely carried on through the local purchasing organizations of the various railroads, supervised as to detail by regional purchasing committees, which form a part of the staff of each regional director, and through him report to the director of the division.

The railroads under federal control annually purchase material and supplies of all kinds to the value of approximately $1,700,000,000. Since the organization of the Division of Purchases, it has expended directly $400,000,000 for rolling stock and $9,000,000 for rails, and has quite directly supervised the production and distribution of 120,000,000 cross ties which have cost $90,000,000. From the inception of the work it has been the policy of the director in disbursing these large amounts to obtain the widest possible distribution of the business among all of those manufacturers who were able to supply any portion of the railroad requirements and to encourage as much as possible individual initiative on the part of those supplying the materials for the railroads, and to give all of the various devices which have been presented for attention, careful and impartial scrutiny with the object of adopting for use as many of them as could be shown to offer results that were satisfactory from both mechanical and economical standpoints.

Cross Tie Situation

The cross tie situation has presented one of the most difficult problems with which the division has had to deal. A great many interesting facts have been developed by the concentrated survey which the division has been enabled to make of the entire field of tie production, and one of the lessons we have learned in that respect has been that in a great many cases the local production has not been developed or conserved to the best advantage, so that in a large number of cases individual railroads have drawn on foreign territories for a larger portion of their supply than was economically necessary and to that extent have increased their own cost of operation and have influenced higher costs on other railroads through competition established in the territories from which they procured certain portions of their supply.

I believe that if when the railroads return to private management the executive officers will give serious thought to some co-ordination of action with respect to the development and economical distribution of the tie supply of the country considered as a whole, most beneficial results can be obtained in their costs of maintenance, in which the cross tie plays such an important part.

One step towards a permanent improvement which, in my judgment, is vital to the best interests of the railroads as well as of the tie-producing industry, would be the adoption by the railroads of a standard specification for controlling the purchase of cross ties and a uniform and universal application of the requirements of such a specification by a standardized inspection. The efforts which the Railroad Administration has made to bring about such a condition have not only met with the unqualified endorsement of the more reputable tie producers, but have acted to improve the average quality of the ties being used by the railroads, as well as to conserve the timber from which they are produced. I believe that concerted action in this direction on the part of the railroads, taken perhaps through the medium of the American Railroad Association, would prove to be of incalculable benefit.

Due to the abnormal conditions existing in the manufacturing world during the year 1918, the difficulty of obtaining supplies for the operation of the railroads became increasingly great and the Division of Purchases was directly represented in every section of the War Industries Board which had to do with the allocation and control of manufactured products used by the railroads, and was in constant touch with the Priorities Board and the Price Fixing Committee.

In the original organization of the Railroad Administration, no definite provision was made for any distinct supervision of the cars and distribution of the material bought under the jurisdiction of the Division of Purchases, the work of this character being left to the discretion of the regional directors and the local federal managers.

Railroads Carry Too Much Stock

At the beginning of federal control the railroads had reserve stocks of material in their possession aggregating in value $495,680,000. The difficulty of obtaining deliveries of material within any reasonable time and the higher prices paid for such as was obtainable, resulted in greatly increasing the value of these stocks, which on July 1 of this year had reached the enormous total of $642,192,000, an amount, by the way, which is much larger than necessary. It is gratifying to be able to report that through the co-operative effort of the federal managers and their respective organizations these large balances are being reduced. (Since January 1, $14,000,000 worth has been transferred.)

The constantly increasing investment in material did not fail to attract attention and led to an investigation of the causes. It soon became evident that there was no uniformity of practice among the railroads with respect to the

*From an address at the September meeting of the New York Railway Club. Mr. Spencer was prevented from attending the meeting because of the death of his mother. He was represented by Assistant Director George G. Yeomans.

purchase, conservation and distribution of their material. This lack of uniformity in the handling of such a large investment led to an examination of the methods and the results which were being obtained by the different railroads. It became apparent that the best results were being obtained by those railroads which had entrusted this work to a department created exclusively for that purpose, and to which was given the sole responsibility for the proper care and distribution of the material and the accounting for its receipt and disbursement. These organizations were found to be working with various degrees of success on different railroads but, generally speaking, were obtaining better results than were found on those railroads where the work of this nature was wholly or partially under the jurisdiction of other operating departments which used the material.

The amount of material in stock on July 1, 1919, represented an average supply sufficient for six months' operations, based on the average monthly consumption during the first six months of the year. Those railroads which have maintained for some years well organized and effective stores departments have been able to so control their investment in material that it did not exceed an average of four months' supply. If all of the railroads had been equally well managed in this respect they would have expended approximately $215,000,000 less for their material than they actually did expend in the last 18 months.

Relation Between Purchasing and Stores Departments

It further became apparent that the relation which existed between the work of the purchasing department and the stores department was so intimate and their activities so vitally interwoven, and that the results which were being obtained on railroads which had recognized the affinity of these departments in their form of organization, were so much better as a rule than those obtained on roads where this relationship was not recognized, that it was determined to combine the operations of the stores department with those of the purchasing department, under the jurisdiction of the Division of Purchases, and joint instructions to that effect were issued by the directors of the Division of Operations and the Division of Finance and Purchases in October, 1918, the general tenor of which was that an independent stores department reporting to the purchasing agent should be organized on each railroad under federal control.

The necessity for a strong organization working along well systematized and effective lines to properly care for the vast amount of materials in which the railroads have so large an investment, may be illustrated by the following approximate figures, comparing the amount of money spent for material by the railroads under federal control with their operating revenues and expenses:

Approximate average daily operating revenues	$12,600,000
Approximate average daily operating expenses	11,300,000
Approximate average daily purchases	4,600,000

(These purchases do not include any rolling stock.)

It will be seen that out of every dollar earned 36½ cents is expended for material.

Operating Officers at Fault

One of the fallacies indulged in by the average railroad operating officer seems to be that he does not regard money expended for material as being money spent until it appears in and affects his operating expenses. To this fallacy I attribute much of the apparent lack of interest on the part of railroad executives to bestow the same careful attention on the stocks of material which are accumulated by their subordinates that they give to the other details of their business. As soon as money has been transformed into material, it has apparently lost all value until it reappears in the shape of an operating expense, and some of us have not yet learned that it requires even more diligent attention to prevent serious losses through improper care in the purchase, distribution and accounting for material than for the money itself which it represents.

For a great many years it was one of the accepted theories that the users of material were the men best qualified to determine the amount which it was desirable to provide for future use, to care for the material which had been provided, and to account for its ultimate disposition.

To this theory is due the unnecessarily large accumulation of material found on many railroads. It is still being acted upon in some cases, although its validity has been disproved by the advance which has been made during the past 15 or 20 years in the methods of handling this important branch of railroad operation.

It has been effectively demonstrated that this work can be more economically and efficiently performed by an organization devoting its entire attention exclusively to that feature of the business and working independently, but in co-ordination with those departments whose functions include the using of the material. The sole function of the stores department is to provide materials and supplies suitable for the service for which they are required, when and where they are needed and at the lowest net cost, which involves the work of properly storing and protecting the property until it is used and accounting for it accurately.

Concentrate the Management of the Service of Supply

The receipt and distribution of material is so intimately involved with its procurement that they cannot be successfully disassociated, and experience points directly to a combination of the purchasing and stores department under a single authority as the ideal form of organization for the service of supply.

For the stores organization to be effective and efficient and produce the economy which it should, it is important that adequate and convenient facilities shall be provided for the handling and storing and issuance of materials. The storerooms and yards should be planned so that the materials can be readily inventoried and the storekeeper and his assistants can at all times readily see and know the amount of stock on hand.

It is, of course, advantageous to have modern storerooms, but it is not necessary in order to obtain results that these facilities are immediately built. With intelligent planning and co-operation between the engineering department the present facilities can generally be modernized and made efficient at comparatively small costs, but it is important that in locating and designing any new facilities of this nature, or in remodeling those which already exist, the final decision as to details should be made by those who are directly responsible for the handling of the material. For handling scrap and heavy materials, it is desirable that cranes and other modern facilities for reducing the cost of labor shall be provided. Reclamation machinery should be installed wherever it is found that it will result in economy, and for various reasons this work should be entirely under the supervision of the stores department.

In order to obtain the best results which such an organization should be capable of producing, the importance of its work must receive recognition. It should be immediately apparent that the officers who are entrusted with the investment of 35 per cent of the gross earnings of a railroad should be men of character, ability and experience. Responsibility of this magnitude cannot be successfully placed upon shoulders of incompetent or inexperienced men without resulting disastrously, but with the proper personnel results can be and are being procured which seem almost incredible to those who still adhere to the theories and practices of the past.

Illustrating the possibilities of the case, I quote from the performance records of two typical railroads, one above the average with an efficient organization such as I have

attempted to describe and one below the average which has not as yet fully developed its stores department along the lines indicated.

Road *A* at the beginning of federal control had $11,840,000 invested in the ordinary run of material, exclusive of rail, ties and fuel. This represented 5.6 months' supply, based on the average monthly consumption for the first six months of this year, and was abnormally high due to large purchases made at the low prices prevailing prior to the entry of this country into the war.

During the 18 months ending June 30, last, this railroad has reduced this investment 17.5 per cent, or $2,079,000, and is currently using 21.5 per cent of its stock every month, or turning it over more than two and one-half times per year.

Road *B*, a smaller road, which should therefore be more easily controlled in such matters, had an investment in similar material of $6,955,999 at the beginning of federal control, which represented 5.1 months' supply on the same basis. During the same 18 months' period this railroad increased its stock $4,731,000, or 68 per cent, and on June 30, 1919, had an investment of $11,686,000, of which it is currently using only 11.5 per cent monthly and has enough money tied up in material to last it for approximately nine months.

If the supply department of the latter railroad had been as effectively organized and managed as the former, it would have expended $5,951,000 less for material than it actually spent during the last 18 months, or $330,000 per month. It would have had that amount free for other uses and would also have avoided the expense of handling and caring for this large amount of stock as well as the inevitable losses incident to depreciation and obsolescence which accompany such unnecessarily large accumulations of material.

These are extreme cases, but they show conclusively that executive officers can well afford to devote considerable attention to this department of the service and to expend sufficient money to secure the supervision of trained experts in this particular field and to adopt the methods which have been successful in producing such economical results.

After carefully studying the practical results which have been obtained by the various railroads under federal control, it is my conclusion that the best means of enabling executive officers to obtain effective supervision and control of these large expenditures is to concentrate the exclusive management of the service of supply in the hands of a single organization created for that particular purpose and to which should be entrusted every detail of the work of procuring, storing, distributing and accounting for all supplies of every description that are required for the maintenance and operation of the property. Under such a system there is no division of authority, and there can be no shirking of responsibility. The records of performance present a complete and comprehensive view of the entire situation with respect to the total investment of the railroad in materials, and render that investment more responsive to the current needs of operation and easier of effective control.

It is not possible to accomplish this where the authority and responsibility for the amount of the expenditure and the custody of the material is divided among several different departments and where the accounts are distributed among numerous independent units, which renders the work so intricate that the combined results cannot be presented in a manner that permits the details to be clearly grasped without laborious research.

The money spent for material is the same kind of money and must be obtained in the same way as the money that is spent for labor, and the requisitions for material purchases should be scrutinized with the same care and attention that is given to the pay rolls. It too frequently happens that our gaze is focused so persistently upon the pennies in the payroll that we fail to see the dollars in their converted form which are being lost through inadequate supervision and imperfect methods in the purchase and handling of material. There is a natural tendency to shun the expense involved in any work which does not of itself produce a direct and tangible income, but from the figures I have quoted no one can doubt that Road *B* would have been fully justified in adding $100,000 or even $500,000 a year to the payroll of its supply department if by so doing they would have created an organization which would have functioned as effectively as the one which Road *A* has built up. It is these concealed losses which are most difficult to bring to light and which sometimes seem incredible when exposed, but I know of no way of exposing them more clearly than in the manner I have endeavored to outline, and until they are exposed the proper remedy cannot be applied.

Recapitulation

To recapitulate: On a large system or railroad the organization for the purchasing, selling, storing, handling, protecting and disbursing of all materials and supplies should be under the jurisdiction of an executive officer of sound business judgment who must at all times be posted on commercial and market conditions. He should be assisted—

(1) By purchasing officer or officers with necessary forces, etc., who will procure the material from the manufacturers and producers with efficiency and economy;

(2) By managers of the stores department with clerks, laborers, etc., who will make requisitions and supervise the caring, storing, accounting and issuing of all supplies. He should keep the supply of material on hand to the lowest practical amount consistent with market conditions.

There should be the fullest co-operation betwen this department and the departments which control the use and consumption of materials, such as the department of maintenance of way and structures, maintenance of equipment, transportation and construction and improvements.

Railroad Hearings Before House Committee

WASHINGTON, D. C.

SEVERAL DAYS of the hearings on proposed railroad legislation before the House committee on interstate commerce were devoted last week to the representatives of steamship lines, who vigorously opposed the provisions of the Esch bill designed to give the Interstate Commerce Commission jurisdiction over port to port rates. W. E. Clark of Seattle, Wash., representing the Pacific Steamship Company, told the committee that such legislation might result in "regulating American shipping into the bone yard." Legislation to benefit water lines, he urged, should permit a free hand in competitive foreign commerce, including Alaska, and provision for export and import rates on American railway lines applying only to water freight moved by American ships.

A Question as to What Farmers Think

Benjamin F. Marsh, director of legislation and executive secretary of the Committee on Transportation of the Farmers' National Council, told the committee that it is a waste of time for Congress to consider any plan for the return of the railroads to private management. He advocated government ownership and "democratic operation" of the railroads, although he did not define his idea of democratic operation. He said, however, he was not in favor of the Plumb plan unless it were amended in some particulars. When Mr.

Marsh said the farmers are almost unanimous for government ownership Chairman Esch said he had a letter from Thomas C. Atkeson, representing the National Grange, saying the farmers are opposed to government ownership. Mr. Marsh said that would make it necessary for him to expose the "fraudulent claims" of the National Grange. He declared that instead of having 1,000,000 members it has only 620,000 and that many of them are not farmers; that its membership has never adopted a resolution against government ownership, and that its method of voting is not representative of the members of the state organizations, but represents merely the votes of the masters of the state granges and their wives. He then proceeded to read a number of letters from masters of state granges and presidents of state farmers' unions declaring that the farmers of their states were almost unanimously for government ownership.

Representative Rayburn of Texas remarked that his district is almost entirely an agricultural one, and that the farmers are the most violent opponents of government ownership he knows of. When the letter from the president of the Illinois farmers' union was read, Representative Denison of that state inquired as to whether any referendum of the Illinois farmers had been taken, because, while there might be a farmer in Illinois for government ownership, he had never heard of one. Mr. Marsh said that no referendum had been taken, but that the writer of the letter had given his judgment of the opinions of the farmers. Mr. Denison suggested that he find out more about those opinions before expressing his judgment of them.

Other members of the committee asked similar questions, but Mr. Marsh did not know just how the opinion that the farmers were for government ownership was arrived at except by general knowledge. Chairman Esch asked him if he did not have any letters from opponents of government ownership, because the epistles that Mr. Marsh had put in the record were in reply to a questionnaire he had sent out. Mr. Marsh said he had a few from New England, but that they did not discourage him. Mr. Esch suggested that it would be fair to file both kinds of letters. When the letter from the president of the Washington State Grange was reached Representative Webster asked if that man were not under indictment for sedition. Mr. Marsh said he had been indicted as a result of a Wall Street conspiracy because he had said that the war was a "rich man's war," but that the indictment had been quashed. When Mr. Marsh challenged the committee to investigate Mr. Plumb's charges, Representative Rayburn said they merely represent an effort to "re-open old sores that have been agitated in the newspapers for 50 years with a view to reviving the prejudice against private management."

Automatic Train Control Devices

A number of witnesses interested in automatic train control devices appeared before the committee at the request of Chairman Esch, who has long been especially interested in railroad safety legislation and who recently made a personal inspection of the train control device on the Chesapeake & Ohio near Charlottesville, Va.

J. W. Williams of Spokane, Wash., representing the General Safety Appliance Company, discussed the need for automatic train stops at considerable length and urged legislation providing for the appointment by the President of a committee of five members, only two of whom should be railroad men, to investigate the subject of automatic train control.

On September 20 George W. Stevens, federal manager of the Chesapeake & Ohio, and Charles Stephens, signal engineer of the road, described the installation of the American Train Control Company's system on their line from Gordonsville to Charlottesville, Va. In reply to questions by Chairman Esch, Mr. Stevens admitted that railroad men and engineers were inclined to be slow to approve of new devices, but the Chesapeake & Ohio had been sufficiently convinced of the practicability of automatic train control, to adopt it. Mr. Esch referred to the objection often made that automatic devices tend to cause inattention or carelessness on the part of the engineer. Mr. Stevens did not think this objection had much force because he said the device made it possible for the officers to check up on the enginemen and to hold them to an accounting. He estimated the cost of the device as about $400 to $500 a mile for the track equipment and $600 to $700 a mile for the engine equipment. Mr. Esch asked whether the saving resulting from freedom from accidents would offset the cost. Mr. Stevens replied that train control devices would not prevent all classes of accidents, but that they would prevent collisions, and that the Chesapeake & Ohio had had no collisions on its line where the device is installed since its installation. During the first winter, he said, some trouble was experienced as a result of ice and snow, but during the second winter the difficulty had been remedied. The forthcoming winter would constitute a more conclusive test.

Charles Stephens went more particularly into the description of the device, which was described in the *Railway Age* of March 28 and was enthusiastic regarding its practicability; but he said that legislation would be necessary to compel railroads to adopt automatic stops.

Mr. Esch put into the record a letter from Calvin W. Hendrick, president of the American Train Control Company, in which he gave a list from the Interstate Commerce Commission reports of accidents which he said could be prevented by the use of automatic train stops and also described his device in glowing terms. The letter included the following statement: "It is as marketable as it is remarkable; it is elastic in its adjustability; provides absolute and permissive block movements; affords entire protection; it has been extensively tried and is now declared a perfect system and stands unchallenged in the field of safety and economical operation.

"Unsolicited approval of these experts in the science of railway transportation who have written editorially in the Railway Review, *Railway Age* and the Railway Signal Engineer of what they saw demonstrated on the Chesapeake & Ohio is convincing and leads me to believe that the public is forcefully getting behind a movement exacting just such protection to passengers and freight as the American Train Control System affords."

Mr. Hendrick also submitted a letter from Federal Manager Stevens to him, saying in part: "After testing the system out under service conditions nearly a year, working under weather conditions when the stop shoe was entirely encased in ice, the signal engineer has reported that trains have been stopped when the following dangerous conditions prevailed—open switches—block occupied by train—cars fouling the main line—broken rails—on three occasions. This would seem to justify the cost of installation."

D. P. Moore, a patent attorney who said he had long been interested in automatic stops and had examined many installations, told the committee that the time is now about ripe for legislation to compel their adoption by the railroads. There are several devices that have proved their practicability, he said, and are in a more advanced stage than automatic signals were when they were first adopted. He said that officers of the Chicago, Rock Island & Pacific were enthusiastic about a device he was interested in that has been installed on that line and that can be used without roadside signals; and that enginemen are anxious to have their engines equipped. He said that automatic stops are not yet 100 per cent perfect, but thought that railroad officers are gradually getting more interested in their practicability.

Theodore Perry Shonts

THEODORE P. SHONTS, president of the Interborough Rapid Transit Company, died at his home in New York city on the morning of September 21, at the age of 63.

Mr. Shonts had been a leading figure in the railroad and engineering world for nearly 40 years. He was best known as superintendent, general manager, and president of the Indiana, Illinois & Iowa, where his service extended from 1882 to 1902, and as head of the subway and elevated lines in New York city, which position he had held for the last 12 years; but he had figured in many other important enterprises. His character embodied a combination of progressiveness and conservatism which made him a leader in any line which he entered; and his abounding physical and mental energy gave him a remarkable command of details.

He was born in Crawford country, Pa., May 5, 1856, son of Dr. Henry D. Shonts. In his boyhood the family moved to Iowa, and there he was brought up; and in 1876 he was graduated from Monmouth College, Monmouth, Ill. He received his degree of M.A. three years later, and then studied law for two years. While still young he became a partner in the law office of Drake & Baker; through this firm he became interested in railroad building. Having given some attention to civil engineering while in college he soon made his mark in railroad construction, his first railroad work being that of superintendent of the Iowa Construction Company.

T. P. Shonts

In 1882 he was appointed general superintendent of the Indiana, Illinois & Iowa; in 1886 general manager, and in 1898, president. In conjunction with Paul Morton, second vice-president of the Atchison, Topeka & Santa Fe, he acquired control of this road. Later, this was sold to the Vanderbilt interests; and in 1904 Shonts was elected president and general manager of the Toledo, St. Louis & Western.

Having been recommended by Paul Morton to President Roosevelt, Shonts was, in 1905, appointed chairman of the Isthmian Canal Commission, in which position he became president of the Panama Railroad. He spent two years on the Isthmus where he cleansed the cities of Panama and Colon, organized a sanitary force, and did much other preparatory work.

Mr. Shonts was made president of the Interborough-Metropolitan Company in February, 1907, being at the same time president of the Chicago & Alton and of the Toledo, St. Louis & Western; but his New York work gradually absorbed the whole of his energies.

The management of the New York city railways during these dozen years has been a unique task. Mr. Shonts came to it with a fund of general experience and a reputation as an organizer; but the specific problems encountered were in many respects new. With the growth of the city the subway lines have been greatly extended, both above and below ground, and express tracks have been built on the earlier elevated structures. These improvements have cost hundreds of millions. The enormous train movement has had to be kept going constantly, while the changes were being made, with scarcely an hour's intermission on any track, day or night. The financial burden of these improvements has been borne mainly by the city; but the negotiations between the operating company and the officers of the city and of the state have demanded constantly the talents of an astute diplomat. The newspapers, day in and day out, have furnished the general criticism, (sometimes aided by the city officials); and the state, through the legislature and the Public Service Commission, has criticised details of management and operation. Through all this, the cars have had to carry a traffic constantly over-taxing their capacity; yet the trains have been run with a speed and punctuality really wonderful; and this has been done with a degree of safety which affords quite reasonable justification for the Interborough's claim to be the safest railroad in the world.

Mr. Shonts continued as a director in a number of railroads including the Chesapeake & Ohio, the Iowa Central, the Kansas City, Mexico & Orient, the Minneapolis & St. Louis, the Pittsburgh & Shawmut and the Toledo, St. Louis & Western; and in numerous other corporations.

The strike of commercial coal dock workers at the coal docks at the head of the Great Lakes has for some time tied up coal traffic at that point and has resulted in increased demand being made from many points in the northwest, which is practically dependent upon the coal passing through the head of the lakes for its winter supply, for cars with which to move coal from this point to distributing centers and smaller towns. The Northwestern Regional Director, in response to these complaints, has been moving from 800 to 900 cars daily from the coal storage docks at the head of the lakes to northwestern points and loading these cars for the return trip with grain. In addition to complaints made concerning the lack of coal cars in the Northwestern Region, lumber interests in the Puget Sound district and grain shippers in the northwestern states have been requesting more cars. Insofar as the lumber loading is concerned the car shortage is more the result of a heavier production of lumber due to the resumption of building throughout the United States rather than to an actual car shortage for the loading of this commodity. Insofar as the grain car shortage situation is concerned, it is cited that in 1918 at the opening of the grain shipping season, 38,000 cars were stored, inspected and ready for the grain traffic in the grain producing states, whereas this year there were only approximately 3,000 cars for this seasonal movement. In addition, the general car shortage in the Northwestern Region is ascribed to the heavy increase in the miscellaneous freight loading, due probably to the resumption of activity in many of the smaller industries.

Labor Makes Protest Against the Cummins Bill

Plumb Hints at a French Revolution Unless His Plan is Adopted. Samuel Gompers and Warren S. Stone Testify

GLENN E. PLUMB, author of the Plumb plan for turning the railroads over to the railroad employees at government expense, Warren S. Stone, and other labor leaders, appeared before the Senate committee on interstate commerce on Tuesday and Wednesday of this week to protest against the Cummins bill and especially against that part of it which makes it a misdemeanor for railroad employees to strike pending the settlement of their disputes with railroad managements by arbitration. Mr. Plumb was the first witness called and began his testimony with a general economic discussion of the usefulness, significance, etc., of strikes, discussing the question, as he expressed it, from the point of view of the student of economics and not as a representative of organized labor. Following the general discussion of the constitutional right of any man to quit employment which he found distasteful, Mr. Plumb expressed the opinion that it was not within the power—constitutional power—of the legislature to take away by law this inherent constitutional right, and later in his testimony he expressed unqualifiedly the belief that what an individual had a constitutional right to do, individual employees had a constitutional right to do collectively.

He said that strikes had, up to within the last year, been caused by one or both of two reasons, a desire on the part of working men for higher wages or a demand for the recognition of the union. Now, however, conditions have changed. Whenever the strike for higher wages had been successful the capitalists had merely added the wage increase to the cost of the product of labor and thus passed along to the consumer, which included labor, this additional cost. Thus an apparent increase in wages gained by means of a strike did not reduce profits of capitalists, but was taken out of the pockets of all consumers, including labor, through the higher cost of living. Labor, according to Mr. Plumb, now realized that it must attack and cut down the profits of capitalists, that wages, if advanced, must not be passed along as a burden on the consumer, that the laboring class could increase railway wages most effectively by cutting down the high cost of living and, to do this, profiteering on the part of capital must be stopped. Now, therefore, according to Mr. Plumb, we may expect a new type of strike, a strike which shall benefit all consumers. Labor heretofore had struck only to benefit itself as a worker, not as a consumer, but now labor might be expected to, and, in his opinion, would strike against the profiteering of capital.

As an illustration and purely as a hypothetical case, Mr. Plumb suggested the possibility of a strike on the part of railroad labor against the paying of the "exorbitant" rental for the railroads. He was asked whether the contracts which the government had entered into with the owners of the railroads were valid contracts and could be repudiated. This question he did not answer directly, although acknowledging in general that it would not be legitimate for a minority to force upon the government a relinquishment of actual responsibilities. Yet he pointed out that only about 80 of the contracts with the railroad companies had been signed and that more than 100 still remained to be signed. Again and again he returned to the point that the strike could, and, in his opinion, would, in the future be used as a means of cutting down illegitimate profits of capitalists and that, therefore, were Congress to pass a law which would make it a misdemeanor for railroad men to strike, it would not only be unconstitutional, but would tend to continue indefinitely the increased cost of living.

He pointed out that the transportation was the one essential element which entered into the cost of every product bought by the consumer whether or not such product was transported "a single yard" by railroad. He was asked: "Does not a strike limit production?" and answered: "There would be a temporary loss in so far as production for the time was curtailed on account of strike, but if the strike was successful this loss would more than be made up to the consumer by the gain which would result from the reduction in profit of capitalists." In answer to another question along the same lines, Mr. Plumb said that, in his opinion, labor now, if never before, realized its interests as a consumer. This realization is part of the progress of economic life. To take away, therefore, the power of railroad employees to strike would be a direct interference with progress and a step backward in economic and industrial life.

Mr. Plumb was asked whether or not, while fighting the causes of a contagious disease, the patients suffering the disease were not quite properly quarantined. He acknowledged that they were, but he said that the Cummins bill quarantined labor, whereas it should have quarantined capital; that it was not quarantining a patient to jail 2,000,000 railroad employees because they would not work under the conditions prescribed by capital. He said the Cummins bill made no provision to compel capital and railroad managements to meet the demands of labor under penalty of a jail sentence pending the finding of a tribunal, whereas it imposed a jail sentence on labor for its refusal to work until its demands had been satisfied.

Mr. Plumb was asked whether a strike to enforce the adoption of the Plumb plan would be justified. He was most emphatic in his denial and denied equally emphatically that he or other representatives of labor had ever claimed a strike for such a purpose to be legitimate.

He was asked whether or not labor had threatened to strike unless the legislature passed the Adamson law. He denied again emphatically that this was the case and said that the Adamson law had been urged by the administration. One member of the committee told Mr. Plumb that in this contention he was entirely wrong, that he and other members of the committee at present were members of the committee when the Adamson law was under discussion and that he and other members of the committee understood plainly that the brotherhoods threatened to strike unless this passing of legislation was enacted immediately.

The Use of Force a Possibility

Mr. Plumb was asked whether there was no legal way to prevent strikes. He said that he would not go so far as that. He intimated that the way to avoid strikes was to go to the root of the trouble and to enact into legislation the Plumb plan. He likened himself and other leaders of organized labor to the conservatives just prior to the outbreak of the French Revolution. If the progress of evolution was blocked by legislation which would make a strike of railroad employees illegal, revolution would follow. Mr. Plumb talked vaguely and rather guardedly about the seething unrest in the masses, which for the time being labor leaders were generally able to control, although recently, as in the case of a strike of the machinists, the power of the leaders might be overthrown. Asked whether he thought there would be a revolution or not, he said that an industrial revolution was a possibility, although he firmly believed in the ability of

the conservatives, meaning himself and other labor leaders, to control and prevent such a catastrophe by preventing the government from adopting a policy which would further oppress the laboring man. He acknowledged, however, under cross-questioning, that an industrial revolution might be the worst sort of revolution and that he thought the use of force was a possibility.

Asked again whether he deemed it legitimate for railroad employees to strike against the enactment of the Cummins bill into law, he said that it would be illegitimate, but he did not believe it was possible for a law to be enacted and to become effective which would take away the constitutional rights of employees to strike. He acknowledged that the law might legally be passed but he expressed the opinion that it could not and would not be made effective. Pressed to say whether or not a strike would be legitimate if the law were enacted and actually made effective, he said that he did not believe that it could be made effective, but that if it were made effective then his reasoning was wrong. He was asked what he considered a fair return to capital. He said that he thought 6 per cent on the money actually invested and employed in the private operation of railroads was fair and that 4 per cent was ample under a government guarantee. One of the Senators pointed out that the government itself had had to pay 4¾ per cent on the last issue of government securities, notwithstanding the fact that these securities were exempt from many classes of taxation, especially state taxation. He answered this question by remarking that the bonds he had bought only bore 4¼ per cent interest or less and when pressed for direct answer as to whether railroads should be made exempt from state taxation he said that, of course, if railroad securities were free from taxation they ought to bear a lower interest rate.

Deficit Due to Exorbitant Rental

Mr. Plumb was asked whether in the face of the present large deficit from government operation freight rates would not have to be increased. Senator Cummins was appealed to to express an opinion as to what the deficit would be and said that he thought it would be about $650,000,000 for the two years. Mr. Plumb said that he thought that the rental was too high by $300,000,000 to $400,000,000, although he did not make it perfectly clear whether he meant $300,000,000 to $400,000,000 per year or $300,000,000 to $400,000,000 for the two years. He thought, however, that the way to increase revenues and thus wipe out the deficit was to lower freight rates, not to increase them. He expressed the belief that if freight rates were to be increased now it would increase, not decrease, the deficit.

Again he returned to the Plumb plan. He said that no one had questioned the constitutionality of his plan; that what he and the other labor leaders proposed to do was to get at the cause of the present labor difficulty by constitutional means, but that if such means were not adopted, it was possible that some other means, unconstitutional, would be adopted by a radical minority.

Testimony of Samuel Gompers

On Tuesday afternoon Samuel Gompers appeared before the committee and protested against Section 29 of the Cummins bill, which provides that "if two or more persons enter into any combination or agreement with the intent substantially to hinder, restrain or prevent the movement of commodities or persons in interstate commerce; or enter into any combination or agreement which substantially hinders, restrains or prevents movement of commodities or persons in interstate commerce such persons so combining and agreeing shall be guilty of a conspiracy and shall be punished by a fine not exceeding $500 or by imprisonment not exceeding six months."

Mr. Gompers said that this took away the right of railroad labor to strike, to collectively quit its job. The essential difference between a freeman and a slave is the right which the freeman has and which the slave lacks of refusing to work under conditions which are distasteful. Mr. Gompers pointed out that any law, whether called compulsory arbitration act or something else, which took away the right of labor to collectively quit its job made a slave of the laboring man. He said he had had broad experience with the working of various laws to compel arbitration. He cited the New Zealand compulsory arbitration act, which when it was first proposed was hailed as the remedy which would do away with the bitterness of war between labor and capital. But even in New Zealand, where it would seem that conditions were especially favorable for the carrying out of such a law as this, the law proved a failure, Mr. Gompers said. He cited the case of a dispute in the boot and shoe trade. The dispute went to arbitration and was decided in favor of the working men. Whereupon, the manufacture of boots and shoes in New Zealand was stopped and shoes were imported from England. Nor was there anything in the law which could reach this situation. This was only one of many proofs of the unsatisfactoriness of the law and its enforcement virtually had to be abandoned. Mr. Gompers said the Canadian arbitration law had proved entirely unworkable. It exists, but it does not prevent strikes.

"Would labor have entered so full-heartedly into the war if such a law as Section 29 of the Cummins bill had been in effect at that time?" asked Mr. Gompers. "Why should labor, which proved itself unqualifiedly loyal during the war, now be driven into slavery?"

Mr. Gompers pointed out that Congress, if it should enact this Cummins law, would go against all its own precedents, that Congress had reversed the decision of the Supreme Court of the United States in passing the seamen's law, and in passing Section 6 of the Clayton bill Congress had specifically given railroad employees the right to strike.

"Have the railroad men proved traitors?" asked Mr. Gompers. He said that three weeks before the war the American Federation of Labor had unreservedly pledged itself and its members to the support of this country. He said that once a meeting of inter-allied labor leaders was held in London without the attendance of representatives of the American Federation of Labor, a resolution was passed petitioning the Allies to seek a negotiated peace, but later, in September, when another meeting of the same delegates, with the exception of the addition of five American delegates, was held in London, the petition was withdrawn and a new resolution was passed urging the Allies to fight until the soldiers of the Central Empires had been driven from the countries that they had invaded and until the governments of the Central Empires had been overthrown. The American delegates numbered five out of the total of 87 inter-allied labor representatives, but it was the work of these delegates alone, Mr. Gompers implied, which so rapidly changed the attitude of this labor conference before the war.

"Is it a fair reward for labor to now be confronted with this law?"

"You propose to turn the railroads back to private owners, but the railroad workers are to be hand-cuffed."

Again Mr. Gompers returned to the impossibility of enacting any compulsory arbitration act. He said that Carranza of Mexico had issued an order making people who aided a strike liable to the death penalty, but no one was put to death.

"I have done my share to prevent unnecessary strikes, but Americans will never surrender the right to quit work. I don't want to live a minute after this right has been taken away from them," said Mr. Gompers. "There are no strikes in China or in India," said Mr. Gompers, "but in every free country the strike is a necessary part of the freedom of labor.

Labor must have the right to quit work just as Congress must hold the purse-strings of the nation.

"The effect of this bill would not be to prevent strikes. I would strike if necessary even if this law were enacted," said Mr. Gompers. "There is nothing in the law," he said, "to prevent the president or the directors of a railroad corporation from resigning."

At this point the chairman, Senator Cummins, interrupted to tell Mr. Gompers that on this point he was mistaken, that the bill provided that any two persons, officers or directors or anybody else, who combined in the manner prescribed in the bill, were liable to imprisonment. Mr. Gompers brushed this aside as theoretical. The president and the directors and the executive officers could act behind closed doors. The law could not reach them. On the other hand, labor had to act in the open. They were at the mercy of the law.

Mr. Gompers was then excused because of an engagement which he had made earlier, but promised to answer questions of the committee later.

Warren S. Stone Testifies

Warren S. Stone, chief of the Brotherhood of Locomotive Engineers, then appeared before the committee. He disclaimed any intention of being offensive, but he said he believed in straight from the shoulder talk. He said first that he wanted to correct a statement that had been made in the morning session by one of the committee in the cross-examination of Mr. Plumb. Mr. Stone said that it was not true that the Adamson law was forced through Congress by representatives of labor. It was forced through Congress, if forced at all, by the President of the United States; that neither he, Stone, nor any other labor leaders had approached any member of Congress in order to urge the passage of the Adamson law. He said that he and the other representatives of the Big Four had approached the President of the United States and laid before him the demands of the Big Four for an eight-hour day and time and a half for overtime and that finally, at the request of the President, they had withdrawn the request for time and a half for overtime. Mr. Stone was asked whether or not this withdrawal was conditional on the passage of the Adamson law. He acknowledged that it was. He was asked by Senator Robinson whether or not there would have been a strike if the Adamson law had not been passed. He said that there would have been a strike had the law not been passed. Senator Robinson pointed out that the statement made earlier that the Adamson law was passed under compulsion was not a mistake but was a statement of fact. This point was then dropped.

Mr. Stone said that he was a chief executive officer of the Brotherhood of Locomotive Engineers, but he had no power to call a strike, but that he had absolute power to veto a strike and absolute power to call off a strike. He was then asked whether, if a strike was called because of the passage of the Cummins bill or a similar bill, he would veto such a strike. He virtually refused to answer this question on the ground that he did not believe such a strike would be called.

He then took up the Cummins bill, section by section, and found it vicious and impossible. He characterized it as the most retroactive step which had ever been proposed and wound up by saying that he had only had six hours to study the bill so that the specific objections to it which he made were probably not all the objections which he could with more study make. He said the proposed Cummins bill limited the power of the Interstate Commerce Commission; it repealed the Adamson law; it made the transportation board a court of last resort which could deny the granting of wages to labor and from the decision of which there was no appeal but on which board labor had no representation. He said the law throttled the short lines. He said that the section which provides: "Any other indebtedness of any such carrier to the United States which may exist after settlement of accounts between the United States and the carrier shall be evidenced by notes payable on demand, with interest at the rate of 6 per centum per annum," is simply an excuse for higher rates. He characterized Section 10, which provides for the consolidation of roads, as a great gap full of possibilities for graft. He said that the sections dealing with the issue of securities were full of jokers; that the ability of roads to issue short term notes without the consent of any government body opened the door wide to over-capitalization and resulting higher rates; that Section 24, which prescribed the methods under which new securities could be issued, was a joker. Section 25, which provides for sharing excess earnings with employees, he characterized as vicious and a sham; Section 26, which creates a committee of wages and working conditions as a mere bluff; and Section 29, which is the one making conspiracy to interfere with interstate commerce punishable by imprisonment, as "frankly vicious."

In cross-questioning Mr. Stone was asked again and again to say whether or not any tribunal could be created which could arbitrate the differences between capital and labor, and again and again he evaded the direct question or said it was "doubtful." Asked whether it was defensible to tie up the entire transportation system of the country and so bring about conditions of starvation in the cities, he answered that it was wrong for all the railroads of the country to be controlled by a little group of about 12 men on one short block in Wall Street.

He said that, in his opinion, the representation of labor on the board of directors of the railroads, as provided for in the Cummins bill, was of no advantage at all to labor. He was asked whether he wanted a majority representation, then, on the board. He said "No," but reiterated the statement that the representation provided for by the bill was useless.

In the course of the discussion, one of the committee remarked that the government was now operating the railroads.

"Oh, no, it isn't," replied Mr. Stone. "The government is only paying the bill."

Mr. Gompers, continuing his testimony Wednesday afternoon, said that he would rather see his country put to the inconvenience of a general strike than see the workmen made slaves by the Cummins bill becoming a law. He said that there was nothing that Congress could do to prevent the possibility of a general strike of railroad labor, but that in his opinion, no such strike would ever occur. He said that if the Adamson law had not been passed there would have been no strike because the railroad managements were prepared to give in to the brotherhoods.

He thought that a labor representative on the railroad board of directors would be helpful to all concerned. He wound up by saying that the labor leaders could now control the radical elements in the ranks, but that he could not answer for labor if Congress passed such a law as this.

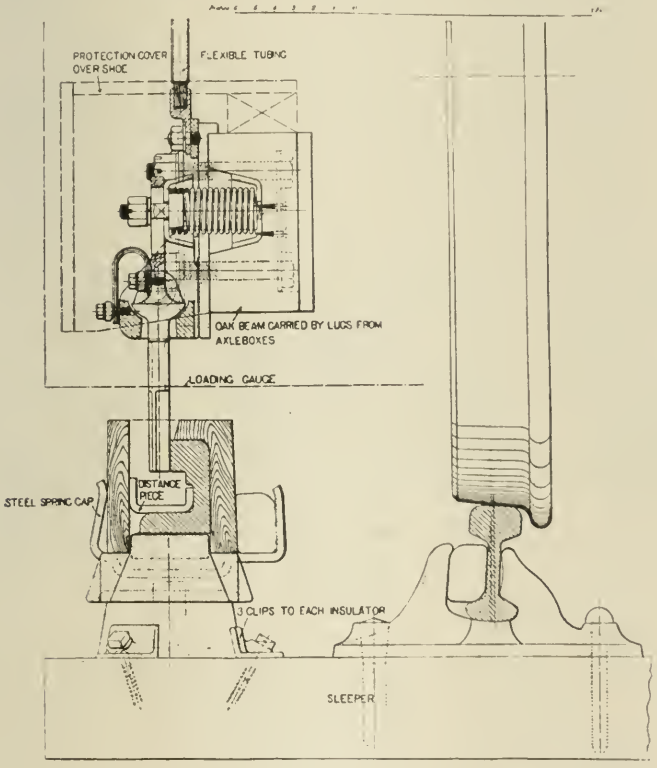
Charles O. Roberts, former ticket agent at the La Salle street station, Chicago, through his attorney, has filed three suits in the Circuit and Superior courts, seeking redress for malicious prosecution and libel against the American Surety Company of New York and officers and agents for the Chicago, Rock Island & Pacific Railroad Company, who caused his arrest recently charged with embezzlement. The suits aggregate $75,000. Mr. Roberts was accused of taking $500 of government railway money on August 31. When arraigned before United States Commissioner Mark A. Foote, he testified that, being called home suddenly, he carried the money with him because the relieving agent refused to accept responsibility for it and that on his way to his home he was held up by robbers who stole the money. Witnesses of the robbery testified to the fact and Roberts was discharged by Commissioner Foote on September 23.

Multiple Unit Equipment for English Railway *

Description of All-Metal Cars Offers Opportunity for Interesting Comparison with Similar American Rolling Stock

THE PROBLEM of the designers of multiple unit equipment for the Manchester-Bury section of the Lancashire & Yorkshire Railway was that of designing all-steel electric cars for operation from a 1,200-volt third rail. The maximum grade on the line is 2.04 per cent, and the result of tests made with a train consisting of one motor coach and one dynamometer car weighing 54 and 32.6 tons respectively showed a maximum speed of 40 miles an hour and a maximum acceleration of 2.52 ft. per second.

The contact shoes, which collect the 1,200-volt current from the live rail are directly connected to the main trolley cables running along each side of the car. These trolley



Cross Section Through Conductor Rail Showing Contact Shoe

cables are paralleled, and connections are taken through the main knife switches and fuses, then through the circuit breakers to the contactors, resistances, motor cut-outs, reverses, brushes, and finally to the motors, returning to the earth by a connection on the field frame. Another connection from the trolley cable through a knife switch and fuse to the starting switch of the rotary transformer supplies an auxiliary current at 100 volts for the operation of the contactor, pump-motor, lighting and auxiliary apparatus on the car, with the exception of the heating, the latter being taken direct from the trolley-cable. The heating units are protected by grounded metal covers.

Contact-Shoes and Protective Devices

Each contact shoe is secured to a beam fixed between the axle-boxes of the motor trucks. The kind adopted, which is illustrated, bears upon a rail known as the Aspinall full protected side-contact live rail. The shoe is pivoted horizontally and parallel to the center line of the cars and is allowed to move freely between stops. A pressure of 25 lb. is maintained on the rail by a spring placed between the top of the shoe and the shoe beam.

An effort was made to find suitable means for isolating the main trolley cable from the contact shoe, either by a fuse in the connecting cable between the shoe and the trolley cable, or a switch of the circuit breaker type. After a thorough investigation it was decided that any such method would be useless, because if fuses were used, four would be required on each car, and at some period it would be possible for the whole of the current for the train to be carried by one shoe, which would necessitate each fuse being capable of withstanding the whole of the current for the train without fusing.

Owing to the fact that the current at starting is about 2,000 amp. it would be more than likely that the substation circuit breaker would open before the shoe fuse was blown. In addition to this, the blowing of a fuse at 1,200 volts is attended by an explosion which, unless the fuse is well protected, might set up an arc between the shoe or its connecting leads and some grounded portion of the truck. Similar reasons apply to the use of the circuit breaker and in addition the housing for the circuit breaker would require a compartment 3 ft. by 3 ft. by 2 ft. in size, which, to be satisfactory, would have to be quite close to the contact shoe.

Trolley-Cable

In order that the car be "all metal" in every sense of the term the question of housing the trolley cable gave rise to considerable investigation, and much effort was made to find a substitute for Jarrah† timber, which has been used for some years quite successfully on the Liverpool-Southport 600-volt section of the Lancashire & Yorkshire Railway.

Exhaustive tests were made with various kinds of housing materials, but it was found that Jarrah fulfilled all of the conditions most successfully. It is an additional insulation, it will not burn with a flame and it smothers an arc when formed.

Couplers

The electrical connectors used between cars are of the plug and socket type and are so located that when a train is made up the plug of one car is directly opposite the socket of the car next to it. The high-tension couplers are connected directly to the 1,200-volt cable running along each side of the car. A cross-sectional diagram of one of these couplers is shown in one of the drawings. The plug portion is fixed to the car and the contact consists of a copper rod which is split by four saw cuts. Tension is maintained by the small springs B; C is the socket which is a part of the loose portion of the coupler; D and E are the connectors to the main trolley cable; F and G are fiber insulating tubes, and H is a mica insulation wrapped around the block forming the socket C.

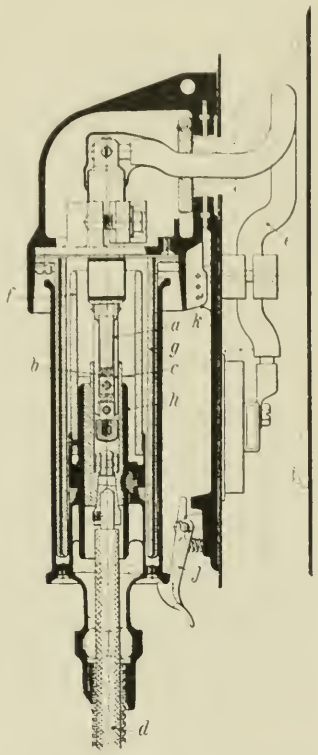
When the plug and socket are in position, as shown in the drawing a spring catch, J, comes into operation, which makes it impossible for vibration to cause the plug to fall

*The substance of this description was taken from a paper presented by George Hughes before the Institution of Civil Engineers.

†The mahogany gum tree of Southwestern Australia.

out of the socket. The plug portion fixed to the car is hinged and held in a vertical position by a small pin, *K*.

There are two low-tension couplers similar in construction to the high-tension couplers except that they are smaller and each coupler contains a number of contacts. One set of the low-tension couplers is connected with the 100-volt cable from the rotary transformer and the other low-tension set is connected with a multicore cable which controls the con-



Arrangement of High Tension 1200-Volt Coupler

tactors. When the loose portion is not in position it is held up by a dummy holder. The low-tension connecting cables between cars are covered with rubber tubes as a protection from weather.

In connection with the bell-circuits, which are worked from a battery of accumulators, there is also a small coupler in the center of the car.

The rotary transformer is located under the car and is attached to the underframe. It is a compound-wound machine of 10-kw. capacity and has a single armature with two commutators, one at each end. There are two windings on the armature, a high-tension winding being placed in the same slot with and above the low-tension winding. This machine is operated on the high-tension motor side by an automatic control-switch and is protected by a knife switch and fuse.

It has been found necessary to equip the rotary transformer with an automatic starting device because when short trains are in use there may be gaps in the live rail at junctions and cross-over roads. In such cases the current will be cut off for a short period and would cause the motor portion of the rotary transformer to flash over and give trouble if it were not so equipped.

A compartment, which is on the opposite side to that of the motorman, contains all of the 1,200-volt portion of the control equipment. It completely isolates the whole of the high-tension equipment from the remainder of the car by sheet-metal walls and door. All apparatus in this compartment can be operated manually from outside, and the door of the compartment is interlocked with the main isolating switch so that it is impossible to open the door when current is on.

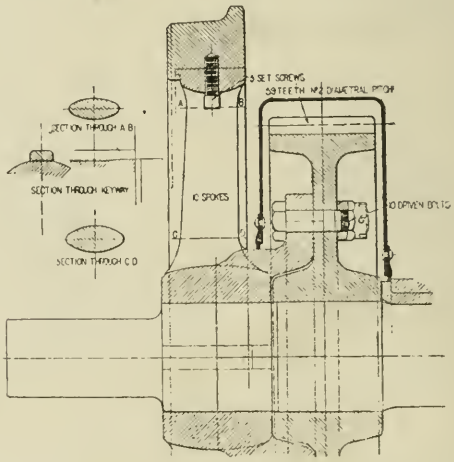
There are two main circuit-breakers on each car. They are of the magnetic shield type, insulated for 1,200 volts, and are so designed that they can be set or reset from the motorman's compartment.

Electrical Control Equipment

The control equipment is of the shunt multiple-unit type, the contactors being operated from a 100-volt circuit supplied by the rotary transformer. Either automatic or manual operation may be used at will in the forward position, and manual only in the reverse. A supplementary field control is used for higher speeds.

When the controller handle is placed in the series or parallel notch the main contactors operate automatically in sequence until the series or parallel running positions are reached. The automatic operation is controlled by means of relays which are governed by the main motor circuit and so arranged that no succeeding contactors come into operation until the motor current has dropped to a predetermined value. The current sequence of operation of the contactors is controlled by electrical interlocks.

Automatic control is installed to prevent the motorman from exceeding the normal acceleration current by operating the controller handle too quickly. It is not a unit saver. Its adoption makes necessary the use of relays and a large number of interlocking secondary contacts. Experience has shown that much attention is required to keep these in effective working order, and the maintenance of relays and extra



Section of Wheel and Gear

contacts tends to exceed that of the main contacts. The question of additional motor maintenance, however, due to overloading, is minimized in motors of modern design, especially when the motormen become efficient.

Each motor and each trailer car is provided with two master controllers. There are nine positions of the controller handle, four series notches, four parallel notches, and one for supplementary field control.

There are four positions of the reverser handle: ahead manual control, ahead automatic control, off, and reverse control. Two reverses are fitted in each motor car and each reverser controls two motors.

Each motor car is fitted with two motor cut-outs. Each cut-out controls two motors and is manually operated. It consists of two fixed mica-insulated bars supporting contact-fingers, with a movable contact-barrel between them. Connections from the contactors and motors are made through the contact fingers, and when the contact-barrel is in the normal position both motors are in circuit. When the barrel

is moved to the right, one motor is cut out, and when it is moved to the left, the other motor is cut out.

Motor Trucks

A side elevation of one of the motor trucks is shown. The frames are built of 12-in. by 4-in. by 0.6-in. angle for sole bars (side frame) and transoms.

The greatest advantage claimed for the built-up frame is low maintenance cost. The truck is stiffly gusseted at the top, and horn-plate ties take the place of any necessary trussing. The design is the result of the development of the built-up frame truck, and is calculated to withstand vibration and inertia stresses due to starting and stopping and centrifugal forces at curves.

The gear wheels are pressed on to the axles and also bolted to flanges cast on the running wheels, as shown in one of the drawings. This relieves the axle of a considerable portion of the torsional stress. The wheels are of the standard locomotive spoke pattern, having 10 spokes designed of sufficient strength to withstand the pressure due to tire shrinkage and the shock caused from the fact that a considerable portion of the weight of the motor is carried directly on the axle. The wheels are 3 ft. 7 in. in diameter.

The bolster rests on two sets of four helical springs, and is of the box-girder form, being built of 8-in. by 3-in. channels and ½-in. plates; the rubbing-blocks are fitted with detachable case-hardened plates for renewal purposes. The bolster has a lateral movement of 1½ in. each way. The swing links are of forged steel and of ample proportion. The upper ends are bushed with case-hardened steel ferrules.

Laminated type of bearing springs are used which have auxiliary helical and rubber springs at the ends. The helical springs have an entire absence of friction, and are very responsive in their movement, while the laminated springs are slow moving; hence a combination of these two gives good riding qualities and minimizes oscillation.

The wheel base is 9 ft., which allows room for the large motor and for a long spring base. A double brake-block arrangement is fitted, thus eliminating unequal stresses in the axle. The outside brake hangers are cranked, so as to leave free access to the adjusting turn-buckles. The standard English practice of attaching the brake block direct to the hangers is adopted. The mechanical advantage of the brake is 8 to 1, giving a total block pressure of 65 per cent of the total weight of the car.

Each truck is equipped with two 200-hp. motors, mounted and geared to the axle through spur gearings, the ratio being 59 to 25. The usual type of nose suspension of the motor has been adopted so that half of the weight of each motor is supported by three sets of concentric rubber springs, and the other half is borne directly on the axles. Thus half of the weight of the motors is spring-borne. This method of suspension was adopted because of its simplicity. The motors are built with solid steel frames and interpoles. The field coils and interpole coils are enclosed in brass cases and solid mica insulation is used in the armature coils.

The vacuum type of brake equipment is used, and the vacuum is maintained by a pump having a swept volume of 90.8 cu. ft. per minute, capable of releasing the brake in 12 seconds. There is a brake valve in each motorman's compartment, which is connected to the trainpipe. The brake valve includes vacuum-pump control switch and "dead-man's handle."

The motorman is compelled to retain his hold on the handle when running; should he release it, the handle rises, the vacuum brake is applied, current is cut off from the main motors by a tripping switch below the valve body, and the pump motors are stopped should they happen to be running. The handle has a range of movement without tripping actually occurring, which enables the motorman to move his wrist slightly from time to time and thereby rest his hand without danger of setting the brakes.

Wiring

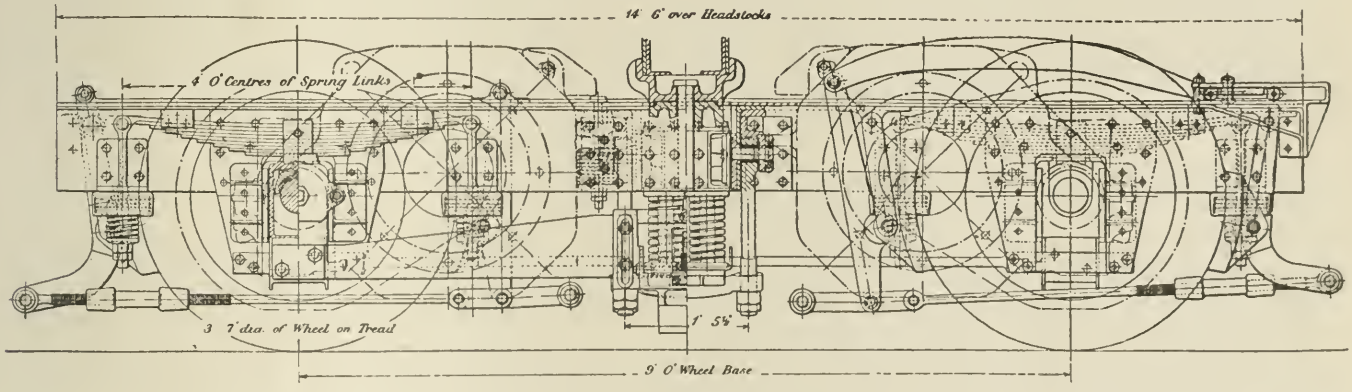
The high tension 1,200-volt cables are kept separate and distinct from the low-tension 100-volt cables, the former being placed in Jarrah troughing well below the car floor and the low-tension cables immediately under the car floor.

Code signals between the guard of the train and the motorman are communicated by means of bells, one of which is in each motorman's compartment, with pushes suitably placed for easy access by either the guard or motorman. Current for these bells is supplied by batteries of accumulators, 14 motor cars being fitted with "Ironclad-Exide" cells, and 14 with Edison cells. There are 6 "Exide" cells to a battery, having a discharge capacity of 150 amp. in 5 hours. They are built up in lead-lined wooden boxes and supplied in two crates with three cells in each crate, the crate being fitted with outside terminals. There are 10 Edison cells to a battery, and these also have a discharge capacity of 150 amp. in 5 hours. These cells are supplied in two crates with five cells in each crate, the two crates of cells being placed in a sheet-iron case, which is suspended from the underframe of the car. This case is also pivoted on one of the suspending arms, so that when the cells require recharging they can be removed quite easily.

Six spare batteries of each type are kept fully charged or on charge, so that exchange of batteries can be effected in a very short time whenever a car is in the repair shop. A battery can also be used for emergency lighting in case of failure of the lighting circuit.

The lighting is taken from the 100-volt circuit supplied by the rotary transformer. Each motor car is lighted by thirty-three 35-watt lamps.

Power for heating is taken directly from the 1,200-volt trolley cable, and there are 20 heaters arranged in series in



Side Elevation of Motor Truck

each car. Each heater has a voltage drop of 60, and the current consumed is 7 amp. per heater. Each heater contains 77 ft. of No. 17 S. W. G. high-resistance wire, enclosed in a perforated metal cover. The heaters are arranged along the side of the car between the seats.

Maintenance of Equipment

The operation of the train is so arranged that the vital parts of the electrical equipment, motors and motor trucks are looked over twice a week. During this inspection, the rotary starting switch, contacts, circuit breakers and contact fingers are cleaned if necessary. A weekly examination is made of the controller, reversers, motor cut-outs, motor brushes and the commutator. The brake rod, springs and oil arrangements on the motor trucks are also examined.

The cars are given a general overhauling every six months, at which time the car bodies are removed from the motor trucks, the motors taken out, the armature removed, the commutators examined, turned up and the mica undercut if necessary, the brush gear overhauled, the armature windings cleaned, blown out and varnished, the steel frame cleaned and connections examined, the motor trucks inspected, the wheels turned up if required, and the bearings adjusted. The electrical equipment is thoroughly overhauled, every individual piece of apparatus being inspected and the necessary parts repaired or adjusted and the wiring of the car inspected and put in order.

Once every twelve months the equipment is overhauled, the contactors are taken down, the fingers being taken off and renewed where necessary, and the controller and all other equipment is dismantled and renewed, cleaned and adjusted. According to the author, this periodical examination has contributed materially to efficient service.

Doings of the Railroad Administration

WASHINGTON, D. C.

DIRECTOR GENERAL HINES has authorized the following statement, asking the further co-operation of shippers and receivers of freight in promoting freight car efficiency to avoid a serious shortage of transportation facilities:

"During the war no one was more patriotically helpful than the American shipper. With zeal and efficiency he did his part in the common cause. The Railroad Administration had excellent opportunity to observe this attitude during the war, and has appreciated heartily the subsequent continued co-operation of the great majority of the shippers.

"The time has now come for renewed efforts by both the Railroad Administration and the shippers and receivers of freight so that the nation's transportation service may be rendered with the greatest satisfaction possible under the circumstances. An unusually heavy grain and coal movement, deferred repair and the construction of public highways in all sections of the country and the concentrated requirements of suddenly reviving business, combined with the usual transportation requirements at this time of the year, threaten a serious lack of transportation facilities unless all parties interested co-operate in securing the greatest possible utility from the existing limited transportation facilities.

"In this connection attention is invited to the following extract from a recent public statement of the President:

" 'We have now got to do nothing less than bring our industries and our labor of every kind back to a normal basis after the greatest upheaval known to history, and the winter just ahead of us may bring suffering infinitely greater than the war brought upon us if we blunder or fail in the process. An admirable spirit of self-sacrifice, of patriotic devotion and of community action guided and inspired us while the fighting was on. We shall need all these now, and need them in a heightened degree, if we are to accomplish the first tasks of peace.'

"The Railroad Administration will do its full part. The Car Service Section in Washington and the various regional organizations are striving earnestly to secure a fair and just distribution of the existing equipment as well as to meet the requirements of individual shippers. Of the 100,000 new freight cars which the Railroad Administration ordered constructed, 59,409 had been completed on September 13 and are now in service, and this number is being increased at the rate of over 900 each working day. Instructions have been issued to all regional directors to bend every effort to speed up road and yard movements, to secure heavier loading of equipment, to establish and maintain complete and accurate yard checks, to reduce the number of bad order cars, to make prompt delivery to connections, to effect early deliveries at freight houses and team tracks, to reduce the number of freight cars used in the transportation of company material and to expedite the movement of grain cars in terminals. The hours of labor of car shop employees have been increased and every effort is being made, both in railroad shops and in the shops of private concerns to whom the work is being let out, to reduce the number of bad order cars.

"I earnestly urge all shippers and receivers of freight to redouble their efforts to promote freight car efficiency.

"Shippers of freight can assist—

"1. By loading all cars to full visible or carrying capacity.

"2. By prompt loading and release to the carrier.

"3. By ordering cars only when actually required.

"4. By eliminating the use of railway equipment in trap or transfer service when tonnage can be handled by motor truck or wagon.

"5. By reducing the diversion and reconsignment of cars to a minimum.

"Receivers of freight can assist

"1. By prompt unloading of cars and notice thereof to the carrier.

"2. By ordering goods in quantities representing the full safe carrying capacity of cars and disregarding trade units.

"3. By ordering from the nearest available source.

"4. By pooling orders so as to secure full car loads.

"A resumption of intensive loading will not merely reduce the number of cars under load, but will also relieve congested terminals where it is a question of track room.

"With a strong concerted effort on the part of the Railroad Administration and the shippers and receivers of freight, it is hoped that during the period of abnormally heavy traffic with which we are now confronted the nation's transportation needs may be met with reasonable satisfaction to all parties.

"I earnestly ask the continued and even more effective co-operation of all shippers and receivers of freight."

Director General Hines also authorized a statement that the new cars ordered constructed by the Railroad Administration continue to be placed in service in increasing numbers. During the week ended on September 13, 5,341 of these cars, being at the rate of 890 per working day, were placed in service.

The total number of these cars in service on September 13 had increased to 59,409. The next week, he said, should show still further progress in the number of cars placed in service.

An Imperial Mineral Resources Bureau has been established in London, charged with the duties of collecting information regarding the mineral resources and metal requirements of the British Empire. The bureau is to be directed by a board of governors, comprising one appointed by the home government, one by each of the five self-governing dominions, one each by the government of India and the secretary of state for the colonies, and six representatives of the mineral, mining and metal industries.

Unrest Growing Among Maintenance Men

Survey Shows Increased Wages, Eight-Hour Day, Exodus of Foreigners and Shortage of Labor Complicates Situation

WHAT HAS BEEN the net effect of all of the revolutionary changes in the labor situation during the past 18 months? Has the coming of peace relieved the labor shortage? Is the present supply of men adequate? Have the eight-hour day, the increase in the pay check, and union working conditions made any marked change, for better or for worse, in the efficiency of the employee? These are all-important questions which every supervisory officer has asked himself again and again in the last six months. The signing of the armistice on November 11 was taken by many people to mark the end of most of our war-wrought ills. With the transition from war to peace activities, the return of soldiers and the closing of munition plants, many expected a marked relief from the labor shortage, if not an actual labor surplus. Others, however, maintained that the shortage would continue and even become more aggravated as time went on. Which idea was correct?

With a view to gaining some first-hand, authentic information on this subject a questionnaire was addressed to a number of maintenance of way officers in various parts of the country, soliciting replies to eight questions listed below, covering matters of actual fact and expressions of personal opinion regarding labor problems.

(1) The number of men employed now as compared with a year ago and normal pre-war times.

(2) The effect of the higher wage rate in increasing the efficiency of the existing forces, in attracting a better supply of labor, etc.

(3) The effect of the eight-hour day on increased efficiency, the ability to secure and hold men, etc.

(4) The effect of the reported exodus of foreign labor.

(5) The adequacy of supply of skilled and unskilled labor.

(6) The dissatisfaction with wage scales for men and foremen in the various branches of work.

(7) The general unrest among laborers.

(8) General comments regarding other influences.

The information thus obtained which may be taken as representing conditions on August 1, has been analyzed from the standpoint of the number of men employed, the available supply, the reasons for an appreciable shortage, and the relation of this shortage to the increased wages, the eight-hour day and the exodus of the foreign laborer. The subject of efficiency was studied with respect to the effect of the increased wages, the eight-hour day, organized labor and the matter of general unrest. The results of this analysis are submitted below.

Shorter Hours Reduced Output of Work

The number of men now employed in maintenance of way work is about the same or somewhat less than in years past. Some roads reported more men than were at work last year, but not as many as in normal times. Several roads are suffering a real shortage of men. One has only 40 per cent of the normal number; another lacks 13 per cent. One northern road has a normal track force but is short 20 per cent in its bridge carpenter gangs. The foregoing figures supplied by one of the granger roads for the years 1913 to 1919, inclusive, are probably typical of conditions the country over.

Year	No. of men
1913	17,422
1914	15,321
1915	16,402
1916	14,497
1917	15,389
1918	15,254
1919	16,569

However, figures such as these must be considered with one point clearly in mind, namely, that this year's figures are for men generally on an eight-hour day, while the totals for the other years are in nearly all cases for a ten-hour day. Thus, while the total number of men employed this year may not vary to an appreciable extent from previous records, the number of hours worked is at least 20 per cent less. In taking this into account, it must be noted that the dead time spent in getting out the gang car, riding to and from work, unloading and loading tools, etc., is practically the same under an 8-hour day as with a 10-hour day. Consequently the reduction of working time is more than 20 per cent. Some roads have made a definite effort to compensate for this deficiency in working time by employing a larger number of men.

Another factor closely related to this, is the new rule that traveling to and from work should be done during the regular working hours, in contrast to the old rule under which the men should travel in one direction on their own time. One railway officer estimates that this accounts for an additional loss of effective working time of at least one-half hour per day per man.

As a matter of fact, this deficiency in the actual hours of work is compensated for in part by the fact that the roads are doing much less improvement work this year than normally. This, of course, affects also the labor charge for maintenance. As one railway officer expresses it. "Were we able to do the same amount of work done in pre-war times, we would have to have at least 1,000 more men, due to the reduction in working hours per day for the same period." The policy of the Railroad Administration to restrict maintenance of way expenditures has also had an influence, and there is no question but that the large cut in forces made by some of the railroads in June had a pronounced effect on the number of men at work and the relation of the demand to the supply.

A Shortage of Labor Exists

On the general question of labor supply the consensus of opinion seems to be that there is a shortage, especially in the industrial districts. One man refers to it as "normal summer shortage." The dearth of men would seem to be more serious with regard to skilled labor than for unskilled forces, but one report indicates the reverse of this. Territories depending on negro and Mexican labor seem to fare much better than those depending entirely on white men. One peculiar manifestation is the reluctance of the hobo to go outside of the large labor centers where he is now in demand as a strike breaker at attractive wages.

The exodus of the alien is beginning to have a pronounced effect in most districts where he has been a chief factor of the supply. As is now well known, a large number of men of foreign birth, most of them Italians and Greeks and a large number of Poles, have returned to their native lands and many others have applied for passports. Just what their motives are is not well known, although it is assumed to concern the restoration of family ties broken by the war and it is not clear whether these men expect to return to this country or not. However, if this movement continues

unabated without such a compensating return, it will soon be a serious matter. One of the replies received does not take this so seriously and for a rather novel reason, it says "The effect of the absence of foreign labor is not serious, as the efficiency of this class has dropped to a point where, generally speaking, it is the least desirable."

Opinions on the efficiency of wage advances in holding the supply of labor or attracting a better class of men seem to be divided. The question reduces to one of competition. Where the railroad rate is better than that offered by other employers the effect has been good, but in large industrial centers where the men have opportunity to get better paying jobs, the railroad work reverts to the old status in which it attracts only the least desirable class. In rural districts, on the other hand, the class of men now employed is better than it has been for several years. Thus, in the Middle West in particular, the railroads have been able to employ local native help to the almost entire exclusion of the foreigner. This return to old-time conditions has been very welcome, for it not only serves as a compensation for the increasing scarcity of the alien class, but gives the roads a more intelligent and agreeable type of workman to deal with and largely removes the need for camps and commissary facilities.

Eight-Hour Day Not Favored

No discussion of the influence of the increased compensation in attracting men is complete without adequate consideration of the eight-hour day. What a man can earn in his day's work depends not only upon the rate of pay per hour but also upon the number of hours he works. This simple problem in arithmetic is not overlooked by even the most thick-headed workmen in comparing the relative merits of two jobs, and it is the experience of most railway officers replying to the questionnaire that the *net daily rate* of pay as well as the *hourly rate* has an influence where competition for labor prevails. Thus, one report states, "We are paying 40 cents per hour and are getting no better men than we formerly obtained at the old rate. Our men claim that they cannot maintain their families at the rate we are now paying, namely—$3.20 per day for 8 hours work. If we could work our men 10 hours per day straight time at 40 cents per hour, I am sure we could secure a large increase in our forces." Another says, "The majority of the men prefer to work 10 hours and many of them are insistent on doing so. It requires careful watching to avoid the practice of working overtime, especially among extra gangs." Still another says, "The men would prefer to work 9 or 10 hours a day instead of 8. This would give them more money for their day's toil." The chief engineer of a western line states, "Practically all gangs have made numerous requests for the privilege of working 10 hours, and on portions of the line where industrial competition is keen, it has been necessary to increase the working hours to 10 hours in order to hold the men." Only a few instances were reported where the men indicated a preference for the 8-hour day."

Changes Have Not Increased Efficiency

Considering the changes that have taken place in the status of the maintenance of way employee, during the past year, it is of particular interest to ascertain whether he is any more efficient than formerly. In other words, whether the employer has benefited by the advantages accruing to the workman. Chief among the changes were the large increase in the wage rate and the eight-hour day, but these two factors cannot be discussed intelligently without taking other considerations into account, namely, the advance accorded to other railway employees and those in outside industries, the circumstances under which the advances were granted, the relation of supply and demand in the labor market, and most of all—the growth of the union labor idea.

Only one road reported a definite improvement in the class of men employed together with some advance in the standard of efficiency. In all other cases the reports indicate a feeling that no such increase in efficiency has taken place, and while the higher rate has attracted a better class of men in some cases, the general observation is that the efficiency has been lessened. One railway officer reports an improvement which he believes has resulted from the shorter working period, but the remaining statements report no improvement if not a definite retrogression. Several replies give good reasons for this. One states, "Regular track men now have longer hours for leisure, for cultivation or for other occupations and for pleasure. In consequence, they are less fit to give a full day's work by the physical exhaustion of these additional occupations." Another says of the Mexicans that the shorter working day gives them more time to get into trouble.

Present Influences Are Detrimental

To obtain increased output from any man it is necessary to provide an incentive, therefore in a study of the present labor situation it is necessary to determine what agencies influencing the workmen in maintenance of way service would tend to produce such an incentive or have the reverse effect. There are two prime motives that will tend to make a man work harder. First, the desire to hold his job and, second, eagerness for better pay. The first of these motives is entirely ineffective during any labor shortage, for as soon as a man knows there is no one to take his place, he is not going to worry much about his job. Labor has been scarce so long in this country that the indifference of the laborer as to the opinion of his boss has become almost insolence.

The second motive can be utilized to get more effort out of the men only when there is some relation between the increased effort and the rate of pay and this fact must be clear to the men. There has been no recognition of this in the entire history of the wage advances by the Railroad Administration. Arrangements for increased rates to experienced or leading workmen as provided for in the wage schedules are totally inadequate to provide such an incentive. The wage schedules also automatically suspended the only attempts at bonus systems in use on American railways. The feeling of the men based on their experience is that the force and effectiveness of their representations before the Board of Wages and Working Conditions are infinitely more important in obtaining a raise than any extra effort which they put into their work.

Influences tending to destroy efficiency are much more in evidence than those designed to promote it, but these in general have to do with the feeling of unrest noted in nearly all classes of labor, and are discussed under that heading.

So much has been said about labor unrest in the last six months that it is, in a sense, a trite subject. However, the character of the replies received to the questionnaire is such as to supply much information on which to base a definite analysis of the matter as relating to maintenance of way employees. This current unrest has been ascribed to several agencies, chief among which has been mentioned (1) dissatisfaction with wage increases as affected by the high cost of living, (2) the organized labor movement and (3) the spread of anarchistic doctrine. From the information obtained the importance of these influences, at least insofar as they concern maintenance of way employees, is about in the order named with the third of minor or very slight importance in most cases.

The most natural expression of unrest is manifested by a dissatisfaction with the wages, a subject closely allied to the cost of living. Six of the reports received point to the increased cost of living, or the decreased value of the dollar, as the most serious cause of trouble. As one officer expresses it, "The men feel the effects of high prices charged

for living expenses, and the large increases granted them last year do not improve their actual living conditions as much as might be thought when comparing their present rate with what they received in 1917."

Another evidence of unrest is traced to the feeling among maintenance of way employees that they have not been treated fairly as compared to the men in other branches of the service. In other words, they feel that Supplement No. 4 was more generous in its provisions than Supplement No. 8. This is explained in one report as follows: "This has been due mostly to the fact that every order or supplement issued gives a different effective date and the various interpretations and instructions as between the different classes of employees and supplements were more or less conflicting with a natural tendency to cause dissatisfaction." As is well known, this constituted the principal grievance of the recent agitation for an increase in the wage scale.

The Effect of General Organization

Necessary as any organization of workingmen may be to secure recognition of their contentions and grievances, it is an unfortunate fact that the formation is not conducive to increased effort on the part of the individual. In the case of the maintenance of way employee, this has not been caused so much by agitation on the part of the organizer as by the policy of the Railroad Administration in dealing with the men. For instance, one report states that the foremen "have been more or less dissatisfied for the reason that the men know that their immediate superiors have little or nothing to do with the increases and there has been a natural tendency not to respect the foreman or officers."

One officer describes the condition as follows: "I believe that well over 50 per cent of the men are decidedly against any wage trouble, but on account of the Administration policy of forcing all men to organize and deal only with organized units many of the more stable classes of men have been forced into the organization and are now dominated by force and fear of the radical element."

There has been but limited evidence of agitation of the anarchistic type. Only one report refers to this condition, which is undoubtedly a local manifestation. "This in my opinion is due to the radical teachings and writings of irresponsible men, in a large proportion foreigners, who have no property of their own, many of them without families, and who personally prefer troubled conditions to peaceful conditions. * * * At the present time the country is dominated, both in the skilled and unskilled branches of labor, by the irresponsible, traveling-about younger class of men, who are comparatively a small proportion of the total men employed in this district. Many of our better class of men, married and with families, are unable to do much toward stabilizing conditions, although with assistance by business management, I believe they would soon improve conditions."

Among minor sources of disquiet mentioned in the reports is prohibition. The hobo has not yet adapted himself to the new era and it takes him longer to spend his money. This hobo tendency to lay off because of surplus money has also been noted in other classes.

While the supply of labor is more nearly adequate than during last year, it is not large enough to afford a sufficient force of good workmen. Conditions would be much worse if the railways were employing enough men to compensate for the short working day, or if they were doing as much work as in normal years. The present wage rates, coupled with the eight-hour day, do not afford a daily wage sufficient to attract the best men, while the conditions of employment and the plan of compensation do not encourage efficiency. Unrest is largely the result of the high cost of living influenced to an appreciable extent by the development of labor organizations under government sponsorship. Owing to the great increase in wages, the cost of maintenance work per unit of work done has increased enormously so that money spent is no measure of the work done. At the same time, a decrease in the percentage of effective working time per hour of time paid for and the decreased efficiency of the men, as compared to the "test period," makes it apparent that the man-hour unit can not be considered a true measure of the work accomplished.

Orders of the Regional Directors

EXPORT BILLS OF LADING.—Supplement 7 to Circular 240 of the Southwestern regional director states that through export bills of lading should not be issued for freight via North Atlantic ports destined to Central and South America, Africa, the East Indies, Straits Settlements, Australia and New Zealand.

Protection of Cotton from Fire.—Order 237 canceling Order 73 of the Southwestern regional director calls attention to the necessity for taking measures to protect cotton from loss and damage by fire and to certain rules already promulgated to prevent fires of this nature. The Central Western regional director issued a similar order September 10.

Grain Embargo—Primary Markets.—Supplement 13 to Circular 83 of the Northwestern regional director states that permit regulations have now been modified to include maize, kaffir corn, and feteria, and they should be handled the same as other grain insofar as permits are concerned. The Southwestern regional director issues similar instructions in Supplement 1 to Circular 247.

Export Bills of Lading via Pacific Ports.—Circular 248 canceling Circular 241 of the Southwestern regional director contains revised instructions for the issuance of through export bills of lading via Pacific ports.

Car Loading—Company Material.—Circular 249 of the Southwestern regional director states that the maximum loading of cars in the transportation of material is particularly important now. Cars containing ties are reaching destination not loaded even to minimum capacity. The circular calls particular attention to shipments of lumber.

Apprentices in Car Shops.—Order 238 of the Southwestern regional director requests that, effective at once, an apprenticeship system be established in the passenger car and freight car departments for both regular and helper carmen apprentices, making the ratio of apprentices to mechanics in the car department the same as that for machinists, boilermakers and other craftsmen.

National Safety Council.—The Northwestern regional director, file 8-1-89, recommends that the chief safety officer of each line attend the annual session of the National Safety Council at Cleveland, Ohio, October 1 to 4 inclusive.

Employees Holding Two Positions and Working 16 Hours.—The Northwestern regional director, file 42-1-99, calls attention to several cases where employees are working an eight hour trick on one railroad and an eight hour trick either in a similar capacity or some other position on another railroad. The rule prohibiting employees from filling two jobs on the same railroad or upon two different railroads must be made universal in the Northwestern region.

Interchange Records.—Circular 250 of the Southwestern regional director contains suggestions for the improvement of car records. Since per diem settlements were discontinued apparently the feeling has prevailed on some railroads that interchange reports are not of the same importance as before; and some inaccuracy is complained of.

Freight Car Distribution.—Freight Car Distribution Notice 15 of the Northwestern regional director orders that all shippers of newsprint paper be given full car supply for shipments of that class of paper.

The Steel Strike

The strike of the organized steel mill workers which began Monday, September 22, has succeeded to the extent that it has tied up steel plants in the Chicago district, in the Mahoning Valley district of Ohio, at Cleveland, in the upper Monongahela Valley (Monessen and Donora) and in various other places, but it has failed in that it has not interfered seriously with operation of the mills in the Pittsburgh district which is held to be the strategic center in the situation. Conflicting reports have made it difficult to determine how many men are on strike or to how great an extent the steel industry has been tied up. It early became evident, however, that the strikers were composed largely of the unamericanized and uneducated foreign element and that even those plants whose operation was impeded most severely were handicapped principally by the walk out of their unskilled labor. Many of the workers, apparently, have not reported for work because they were intimidated and feared violence on the part of the strikers, rather than because they were on strike themselves. It is notable in the situation that in those districts, such as Pittsburgh in particular, where the protection on the part of the state constabulary has been at its best, the strike has proved the least effective.

There has been violence and shooting in a number of places, notably at New Castle, Pa., Buffalo, N. Y., Farrell, Pa., and McKeesport, Pa., but here and at other places where the constabulary was on hand the situation was quickly put under control.

The reports on Wednesday did not show any decided change in the degree in which the various districts were tied up or otherwise, except that in such places where the mills were operating the men were gradually beginning to return to work.

The district that seems to be tied up the worst is the Mahoning Valley district of Ohio. At Youngstown, three plants were compelled to suspend operations Monday and on Tuesday practically all the Mahoning Valley plants were idle. The secretary of the strikers' committee for the district claimed that there were 30,000 men idle in the city and 60,000 idle in the district.

In the upper Monongahela Valley, the plants at Donora and Monessen are closed and some 15,000 men are idle.

Reports Tuesday night showed that some 8,000 workmen in the Sharon-Farrell district of the Shenango valley were idle but officers of the steel plants expressed their opinion that only 1,000 were strikers, the rest being out of work through the shortage of unskilled labor and the resulting cessation of work. The Farrell works of the Carnegie Steel Steel Company, however, are reported as running 100 per cent. There has been rioting in both Farrell and Sharon.

Cleveland is another district that has ceased operation to a large extent. Only two independent steel manufacturing concerns were reported in operation Wednesday, these being protected by contracts with the Amalgamated Association of Sheet and Tin Workers. The last of the Steel Corporation plants closed Thursday.

At Buffalo, it was reported that four plants affected by the strike had closed. The Lackawanna Steel plant closed Tuesday morning and the Donner Steel Company, Tuesday afternoon.

At Johnstown, some 15,000 men were reported out of work. The Cambria Steel plant is entirely idle, but the Loraine Steel Company is operating at about 85 per cent.

The mills at Coatesville are reported to be showing improvement as the men who were originally intimidated are returning to work. Operations in the open hearth departments of the Midvale Steel Company and the Lukens Steel Company were impeded at first but each company reported Tuesday night that it had succeeded in putting three additional open-hearth furnaces in operation.

The redeeming feature in the entire situation, however, is the Pittsburgh district. That center thus far has not been nearly as seriously affected by the strike as the other sections. Some men were out from the various plants, but not enough to impede operations seriously and there has been some disorder. By Wednesday, moreover, the situation had begun to improve and many of the plants reported that their men were gradually returning to work. The Edgar Thomson works of the Carnegie Steel Company at Braddock was able to blow in one blast furnace which had been banked and was operating at nearly 100 per cent although there was a shortage of unskilled labor. The Homestead works was also operating all its departments, although 25 per cent of the men were absent, these being mostly foreigners. The Duquesne plant and the Carrie furnaces at Rankin were also operating nearly at normal. The American Steel and Wire Company mills at Braddock, however, were idle and some 10,000 men out of work. At McKeesport, the National Tube and other plants were operating in part and some reported a gradually increasing personnel.

The Chicago District

Practically all of the big steel mills in the Chicago steel producing district, with the exception of those in Hammond, Indiana, have been closed down as a result of the strike. According to estimates prepared by officers of the steel workers' unions, between 75,000 and 80,000 men in this district are on strike and the walk-out has completely tied up the steel industry in the Chicago district. At the Gary, Ind., mills, the strikers, on leaving the plant banked the furnace fires but left some of the fluid steel in the furnaces which if the fires are allowed to go out will completely ruin them and may cost the steel companies one million dollars or more for repairs. The steam and operating engineers who have not been directly involved in the strike have declared their intention of remaining out as individuals although the international organization of their union has declared their strike unauthorized and has threatened to take away the charter of the local organization.

In South Chicago practically all mills have been closed and only small crews have appeared at the mills and at Joliet, Ill., it is reported that 95 per cent of the men have left their work.

Newspaper reports compiled from various steel producing points in the western territory indicate that plants have been closed at Anderson, Ind.; De Kalb, Ill.; Cleveland, Ohio; Columbus, Ohio; Canton, Ohio; Steubenville, Ohio; Denver, Colo.; Pueblo, Colo. In practically all of these places, however, the cessation of work was not general, some plants remaining in full blast and others operating in part.

The strike, being but a few days old, has not as yet affected the railroads to any extent. It is believed by many railroad officials that enough steel is on hand at the present time to fill the requirements of the railroads until the end of the strike and that no serious difficulty will be encountered because of the curtailment of the production of rails. Although officials of the railroad brotherhoods have given no indication of their attitude toward the strike, it is possible, according to some reports, that sympathetic action may be taken, insofar as handling supplies to mills affected by the strike is concerned. The car building plants and railway supply companies engaged in the manufacture of steel materials for the railroads have been variously affected by the strike, the Hammond plants of the Standard Steel Car Company, the American Steel Foundry Company, the Illinois Car & Equipment Company, the Keith Railway Equipment Company and others reporting that all of their men are at work and that production has not been curtailed. On the other hand the South Chicago plant of the American Brake Shoe & Foundry Company and the Indiana Harbor, Ind., plant of the American Steel Foundry Company has been closed.

Report on Railway Mail Pay in Canada

The Commissioners Recommend a Payment of 34.7 Cents Per Car Per Mile for Mail Car Service

By J. L. Payne

THE BOARD OF RAILWAY COMMISSIONERS has just handed down a report in the appeal of Canadian railways for an increased allowance for the carriage of mails. The matter had been at issue for seven years. In 1912 the primary demand was made, and in the year following a general adjustment was made by the post office department. This was not satisfactory to the railways, and, while accepted for the time being, the government was asked, if better terms could not be offered, to have the whole case referred to the railway commission for investigation and report. The outbreak of war occurred in 1914, and because of the resulting disturbance, as well as for other reasons, a hearing was not arranged until March last. In order that the case may be understood in all its bearings, it is necessary to pause for a moment or two and get the situation clearly in mind as it existed at that time.

In 1912 the railways appealed to the post office department for an advance of rates. At that date a somewhat mixed schedule was in operation. To the trunk lines was paid an allowance of from $130 to $160 per mile per annum. The branch lines were paid at the rate of 8 cents per car mile. In 1913 the post master general put the whole service on a uniform basis of 16 cents per car mile for full postal cars. Half cars were allowed 9 cents. For baggage car service, when over 30 feet of space was used, the maximum rate of 16 cents was granted; for from 15 to 30 feet 9 cents, and for less than 15 feet 4 cents. While accepting these new rates ad interim the railways, as I have said, put in a vigorous plea for increases on the broad ground of inadequacy. This was done by the Canadian Pacific and Grand Trunk specifically; but, of course, it was clearly understood that all railways were as directly concerned. In February last, on the recommendation of the post master general, the privy council referred the appeal to the railway commission "to determine as to the accuracy of the claims made by the railway companies, and, if it is found that the present rates are inadequate, to determine, as the result of evidence to be submitted by both parties, what would be fair rates of payment for the service." Those were the terms of the reference.

In order that a fair comparison may be made as between the rates in dispute in Canada and the rates which prevail in the United States, it is necessary to make clear the character of the service rendered by Canadian railways in return for the payments to which allusion has been made. This can be done in few words. Speaking broadly, and omitting only minor and relatively unimportant details, the railways provide the cars and keep them clean and in repair. The post office department does everything else, including practically all of the transfer work at terminals. The receiving of mails at depots and their carriage to post offices, and so on, are responsibilities which rest wholly on the department.

The Canadian Pacific led in the attack at the hearing, and W. J. Moule, assistant comptroller of that company, was the principal witness. He was effective. His command of data was excellent, and to this he added a modest and moderate attitude. There is a good deal in the character and bearing of witnesses, as I can say from a considerable experience as stenographer and reporter in court practice. The railways rested their case on the advanced cost of operation since 1912, and submitted an arbitrary segregation of operating expenses as between passenger and freight service. At the bottom of this course was the contention that, inasmuch as the postal car was a part of passenger trains, it should earn its full ratio of operating cost per car mile. In support of this argument a considerable mass of data was presented, based on operating results for the preceding year. A summary of the facts thus introduced will be interesting, and must suffice for the purposes of this judicial statement of what took place.

For the statistical year 1918 the operating expenses of the Canadian Pacific were segregated as between passenger and freight service, and to each account a definite percentage was assigned. These ratios were moneyed out and reduced to a car mile basis. It would take up a good deal of space to give the statement in its entirety, and that is perhaps unnecessary. Mr. Moule, however, brought it down in the final analysis to 33.10 cents per passenger car mile. From this he made certain deductions, as for example in the case of maintenance, train supplies and so on, amounting in all to 2.52 cents, leaving the sum at 30.58. It was argued that to this should be added a certain percentage for taxes, fixed charges, dividends and common stock, having a total of 8.93 cents. The final sum would thus be 39.51 cents per car mile, or 38.25 in case the allowance of 2 per cent for common stock should be eliminated. It was the broad contention of Mr. Moule—and this constituted the essence of the case for the railways—that all the services in connection with passenger business should be considered as in effect, since advantage of the whole passenger service was taken by the mail service.

Mr. Moule did not, however, stop there. He showed that the cost of passenger service had been materially increased for that part of the statistical year 1919 for which definite information was then available. His calculations on the 1919 basis carried the operating cost per car mile to a figure well beyond 40 cents, and he maintained that heed should be given to the facts in that regard in the ultimate reckoning of a fair allowance for postal service, looking to the future.

In rebuttal, the department relied in large degree on the testimony of the writer. [Mr. Payne is comptroller of statistics for the government railway department.] Here again the practical aspects of the case do not call for an attempt to present even an epitome of the mass of statistical data which was introduced. He suggested that all calculations based on a segregation of operating expenses, as between passenger and freight services, should be received with reserve. They contained an obvious element of purely arbitrary assignment, as to which expert railway accountants were far from being agreed. The Association of Railway Accounting Officers, he pointed out, had definitely declared that an accurate separation of accounts on such a basis was impracticable. If, however, Mr. Moule's formula and deductions should be accepted, there still remained large ground for debate as to what subtractions should properly be made because of the manifestly special character of the service given by mail cars. For example, the outlay under the divisional head of traffic had no bearing whatever on postal service. A large number of other items attaching quite clearly to passenger train service had no connection with the mail car. Other accounts applied only in degree. No one knew or could know what volume or per-

centage of total operating expenses should be legitimately assigned to the postal service rendered by railways. He made a hypothetical summary of all accounts as to which doubt might exist and showed that they reduced Mr. Moule's calculation by 18.50 cents per car mile.

The witness went further. He showed that the postal car made large earnings at the prevailing allowance; that it was actually more profitable than some other passenger train cars, and that relatively it gave a higher net return than any car. He did not assent to the loose contention sometimes heard that earnings from mails were largely in the nature of velvet to the railways; but he did insist that it would be a mistake to charge postal cars with the measure of operating cost which might properly be assigned to some other passenger train cars. He could not say what deduction should be made on that account, but he argued that it was quite material.

The board, in deciding as between Mr. Moule and the comptroller of statistics, put a higher appraisement on the calculations and arguments of the former; for their report and finding followed pretty closely his estimate of what the allowance for postal service should be. The commissioners were unanimous in suggesting that 34.7 cents per car mile should be paid by the post office department. "Giving due consideration to the averages involved," they say in their report, "and the element of judgment concerned in dealing with the question as to the proper participation of the mail service in general cost, it would appear not unreasonable that the rate accepted by the board for the kindred express service in the general express judgment should be adopted; that is, a rate of 34.7 cents for a full mail car mile. It would appear also not unreasonable that the charges for the other services set out in the order-in-council, as contained in the references to the board, should be increased in each case by the same percentage as the 34.7 cents rate represents over the 16 cent rate."

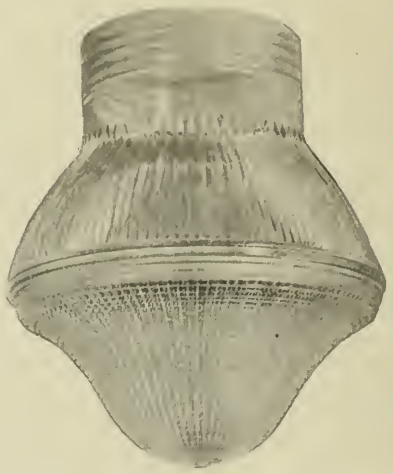
To this was added a memo to the effect that 34.7 cents per car mile should be regarded as the maximum rate, "subject to all bonus or statutory deductions." This latter qualification calls for a word or two of explanation. Practically all railways in Canada, except the Hill roads in the West, have received government aid in some form. In a number of instances the subsidy paid was made subject to certain services "if required by government," and to reservations for the carriage of mails. The matter is not clear, at all events not to me, and it may be that the railway commission will be asked for an interpretation.

What does this report by the railway commission mean? In the first place, it does not necessarily mean that this is the end of the matter. The board was asked to make a report and not to give a judgment; and that report is not binding on the post office department. I have, from a sense of what would be proper, refrained from offering a single syllable of comment on the merits of the case as I have here presented it in this brief form, and I shall not presume to indulge in surmise as to what should or may be done; but I may at least state one or two facts relating to the effect of the recommendation made by the commission. If it is accepted, it, in the first place, means an increase of 117 per cent in the allowance now paid by government for the transportation of mails. In the second place, the monetary aspect of that increase carries with it an additional outlay by the post office department of several millions of dollars per annum. The railways of Canada earned $3,288,734 from mails in 1918, and this sum would be more than doubled if the new rate of 34.7 cents per full car mile is given effect. To that extent the railways would add to the volume of their earnings. The significance of these figures is accentuated when it is pointed out that the revenues of the post office department from all sources for the last fiscal year were $21,602,712, as against an operating cost of $19,273,583. An addition of $3,800,000 on railway postal service account would create a deficit under present conditions.

Reflector Globes for Vapor-proof Lighting Fixtures

MANY LIGHTING FIXTURES in railroad buildings are subjected to gas and moisture conditions that call for the use of moisture and vapor-proof fittings. It has been standard practice in the past to equip vapor-proof lighting fittings with clear glass globes and in order properly to direct the light, it has been necessary to place a reflector over the glass globe. This procedure, however, did not produce a highly efficient lighting unit.

A combined vapor-proof globe and reflector has been designed by the Holophane Company, New York, in which



Globe Can Be Used with Any Standard Vapor Proof Fitting

it has used the well-known prismatic construction. Reflecting prisms are on the upper portion of the globe to redirect the light in downward directions and refracting and diffusing prisms are on the lower surface to distribute the light in different directions in the desired proportions, so that the resulting illumination of the work will be uniform. Tests show that the illumination is increased by 75 per cent over that given by an ordinary clear vapor-proof globe.

The globes are for use in connection with the standard vapor-proof fittings now on the market, including the standard Navy thread, and are made for the 40 and 60-watt type *B* lamps and for the 75, 100 and 150-watt type *C* nitrogen lamps.

Engineer Casualties Third Highest.—Only the infantry and the Signal Corps suffered heavier battle casualties in the war than the Engineer Corps, according to recent figures compiled by the War Department. Among each 1,000 enlisted men in the infantry reaching France there were 270 killed or wounded. Among each 1,000 in the Signal Corps the casualties were 50, and in the Engineer Corps 43.

Want Canal Service Restored.—Upon the opening of the Panama Canal regular steamer service was established between Atlantic and Pacific ports. This service was interrupted by slides, and has not since been regularly resumed. The California Manufacturers' Association now demands the resumption of this important service which, it claims, would tend to reduce rail rates on raw material.

Economic Span Lengths for Simple-truss Bridges*

Showing the Fallacy of the Old Criterion of Equal Superstructure and Substructure Costs

By Dr. J. A. L. Waddell
Consulting Engineer, Kansas City, Mo.

UP TO THE PRESENT TIME the general knowledge possessed by the engineering profession concerning economic span lengths for bridges has been rather crude and unsatisfactory. Until three decades ago the only data available on this subject were covered by the broad statement that the greatest economy in a bridge layout exists when the cost of a span is equal to the cost of a pier. In his pamphlet on "General Specifications for Highway Bridges of Iron and Steel," issued in 1888, the author pointed out the fact that the then popular impression concerning this question was incorrect, because the cost of the floor is constant, and hence the adjustment is one between cost of substructure and cost of metal in trusses and laterals. Three years later he gave, in a paper published by "Indian Engineering," a mathematical demonstration of the theory of the economics of bridge layouts, showing that the greatest economy will exist when the cost of a pier is equal to one-half of that of the trusses and laterals of the two spans which it helps to support. This demonstration was based upon the assumption that the piers rest on hard material and that, in most cases being of minimum size, they would not vary in dimensions or total cost for small changes in the span lengths.

This principle, though, is not applicable to the case of piers resting on sand or on piles, because the cost per lineal foot for substructure is often nearly constant for all moderate span lengths, while that for the superstructure augments; and this fact is not at all generally recognized by bridge designers. It has become evident of late to the author that there is needed by the profession a systematic investigation to determine in an authentic manner the economic span lengths for simple truss bridges to support the different kinds of live loads by piers resting on various types of foundation at all practicable depths, and to conform to changing market prices for materials in place.

The author has computed the actual costs of both substructure and superstructure for over two hundred cases of bridge layouts covering the following combinations: Railway, highway, and combined railway and highway bridges on concrete pier shafts overlying caissons or cribs resting on sand, bed-rock, or piles, and reaching to depths below low water of 50, 100, 150, 200, and 250 ft.; also for low, medium, and high conditions of the material market.

The following are some of the assumptions and conditions precedent adopted for the series of calculations:

Character of Structures

The different classes of bridges covered are double-track railway, single-track railway, standard highway, and combined double-track railway and highway, all metal being carbon steel (excepting in one set of estimates where nickel steel was employed), the railway floors being open, the highway floors being paved with creosoted blocks resting on a reinforced concrete base, the footwalks being slabs of reinforced granitoid, and the handrails being of steel.

All pier-shafts are of plain concrete. All caissons founded on sand are of timber with concrete filling having steel bases and cutting edges. In the pile piers the piles are 75 ft. long and project 60 ft. below the bases, which are assumed to be 20 ft. high, the piles being spaced three feet center to center. The character of the materials passed through during the sinking is assumed to be the ordinary mixture of silt, quicksand, soft gumbo, and other river deposits, overlying either coarse sand, suitable for foundations, or bed-rock. The methods assumed for sinking the caissons are those of open dredging and the pneumatic process, the former being employed when the bases are to rest on sand and the latter when they are to reach bed-rock. In the case of pile piers, the open box is first to be sunk by dredging to the required depth, then the piles are to be driven inside of it, and finally the remaining space is to be filled with concrete.

The specifications for the designing of superstructure are those given in Chapter 78 of the author's "Bridge Engineering," and those for the designing of substructure are to be found in Chapters 39 to 43, inclusive of that treatise.

Unit Prices of Materials in Place

The following table gives the unit prices for materials in place assumed for the purpose of this investigation:

Materials	Condition of Market Low	Medium	High
Structural steel, per lb.	4 cents	6 cents	8 cents
Concrete shafts of 20 ft. average thickness, per cubic yard	$9.00	$12.00	$15.00
Mass of caissons, including all materials, for a width of 30 ft. and a height of 150 ft., sunk by open-dredging, per cubic yard	15.00	20.00	25.00
Mass of cribs, including enclosed pile-heads, per cu. yd.	15.00	20.00	25.00
Portion of long piles projecting below base of crib, per lin. ft.	0.75	1.00	1.25

For the "Medium Condition of Market," the price per cubic yard of the shafts and for mass of caissons was modified by addition or subtraction from the price, depending on the width of the structure and the price of caissons was modified slightly for increases in height. Without these modifications of unit prices for substructure, the investigation would be not only illogical, but incorrect.

The prices per cubic yard for caissons sunk by the pneumatic process under medium market conditions, have been made two dollars greater than those for caissons sunk by open-dredging. This is due primarily to the more rapid sinking by open dredging, but also to the fact that the pneumatic caissons are generally filled solid, while the open dredging caissons often have their excavating wells only partially filled.

The price used for nickel steel superstructure in place for medium market conditions has been taken as 8½ cents per pound; for the reason that the last ante-bellum figures on structures, designed partially with that alloy, quoted to the author made the price of the nickel steel portion 2½ cents per pound higher than that of the carbon-steel portion.

Method of Determining the Economic Span Lengths

In making each of the cost estimates there was assumed a structure of indefinitely great length and unvarying profile, so that the sum of the cost of the steel work in a span and

* Abstracted from a paper presented before the Western Society of Engineers at Chicago on September 15, 1919.

the cost of a complete pier divided by the horizontal distance between adjacent pier centers gives the comparing cost per lineal foot of structure, although, as before indicated, not the *complete* cost thereof.

In the following table is given a résumé of the results of nearly all the cost computations that were prepared:

RÉSUMÉ OF RESULTS OF COMPUTATIONS

Character of structure	Character of Foundations	Depth of caisson footings, ft.	Economic span lengths, ft.	Remarks
Low-level Combined	sand	100	275	
Low-level Combined	sand	150	300	Shaft batter 1 in. to 1 ft.
Low-level Combined	sand	200	325	
Low-level Combined	sand	250	350	
Low-level D. T. R. R....	sand	100	275	
Low-level D. T. R. R....	sand	150	310	Shaft batter 1 in. to 1 ft.
Low-level D. T. R. R....	sand	200	360	
Low-level D. T. R. R....	sand	250	430	
High-level Combined	sand	100	275	
High-level Combined	sand	150	300	Shaft batter ¾ in. to 1 ft.
High-level Combined	sand	200	325	
High-level Combined	sand	250	350	
Low-level Combined	rock	50	250	
Low-level Combined	rock	100	300	Pneumatic caissons.
Low-level D. T. R. R....	rock	50	275	
Low-level D. T. R. R....	rock	100	325	Pneumatic caissons.
High-level Combined	rock	50	300	
High-level Combined	rock	100	350	Pneumatic caissons.
Low level S. T. R. R....	rock	50	250	
Low-level S. T. R. R....	rock	100	300	Pneumatic caissons.
High-level Combined	piles	20	175	Pile piers.
Low-level Highway	sand	100	300	
Low-level Highway	sand	150	350	Shaft batter ½ in. to 1 ft.
Low-level Highway	sand	200	400	
Low-level Highway	sand	250	450	
High-level Highway	sand	100	325	
High-level Highway	sand	150	350	Shaft batter ½ in. to 1 ft.
High-level Highway	sand	200	375	
High-level Highway	sand	250	400	
Low-level D. T. R. R....	sand	100	350	
Low-level D. T. R. R....	sand	150	385	Nickel-steel superstructure.
Low-level D. T. R. R....	sand	200	425	
Low-level D. T. R. R....	sand	250	470	
Low-level Highway	sand	100	275	
Low-level Highway	sand	150	350	Shaft batter 1 in. to 1 ft.
Low-level Highway	sand	200	425	
Low-level Highway	sand	250	500	
Low-level D. T. R. R....	sand	100	290	
Low-level D. T. R. R....	sand	150	330	Low-market unit-prices.
Low-level D. T. R. R....	sand	200	375	
Low-level D. T. R. R....	sand	250	425	
Low-level D. T. R. R....	sand	100	275	
Low-level D. T. R. R....	sand	150	325	High-market unit-prices.
Low-level D. T. R. R....	sand	200	375	
Low-level D. T. R. R....	sand	250	425	

From a study of the preceding table there can be drawn the following deductions:

For all types of bridges the economic span length increases with the depth of foundation, though not necessarily in the same proportion.

The lighter the superstructure and the live load it carries, the greater generally is the economic span length, and the greater the variation of the latter with the depth of foundation.

For sand foundations there is not much difference in the economic span lengths for low level and high level bridges of the same type.

Structures with piers founded on bed rock generally have economic span lengths somewhat greater than those of the corresponding structures founded upon sand.

Single-track railroad bridges have economic span lengths a little less than those of the corresponding double-track structures.

Pile piers for high-level bridges involve, for economic considerations, rather short spans; and for low-level structures they usually necessitate such short ones as to require the adoption of plate girder superstructures.

In highway bridges having very deep foundations on sand, increasing the batter of the shaft augments the economic span length.

Using nickel steel instead of carbon steel in the superstructure increases materially the economic span length.

The assumed variations in unit prices with changing market conditions make very little difference in the economic span lengths. There would have been no difference at all had the prices of all the materials used been assumed to vary in the same proportion; but the superstructure steel, erected, ordinarily changes in value somewhat more rapidly than does the substructure of the bridge.

There are not many irregularities to be found in comparing the diagrams or the tabulated results of the calculations; and what few exist are small. They are generally due to the adoption of a minimum weight limit for sinking to great depths instead of figuring upon employing temporary loading, as shown, for instance, by the substructure curve of Fig. 15.

The costs on which this table is based provide a check on the correctness of the old methods of determining economic span lengths, and from the variations between cost per foot of superstructure and cost per foot of substructure thus obtained, it is evident that the former rule for determining the economic span length is not reliable, especially for foundations at great depths; hence its use should be discontinued.

International Railway Association

UNDER THIS NAME the International Railway Congress is to be reorganized. The executive committee of the American Railroad Association has approved the plans for the new association, so far as these have been defined, and has voted to continue the membership of the A. R. A. in the international association. Mr. L. Weissenbruch, of Brussels, Belgium, the long-time secretary of the organization, has sent letters to the members throughout the world, in which he expresses the expectation that a date and place for a general congress will soon be settled upon by the Permanent Commission.

The International Railway Congress had its headquarters in Brussels. It is of many years' standing, but its life was in some degree dependent on a Royal Decree of September 22, 1911, under the terms of which the Belgian Government now holds that the organization must be dissolved. German occupation of Belgium forced the complete suspension of the activities of the officers, and suppressed the publication of the Bulletin of the Congress.

The property of the old association will be distributed among the members pro rata, according to their respective contributions during the last six years of the life of the Congress.

With the approval of a large proportion of the members of the Permanent Commission, an outline of the proposed new constitution, signed by V. Tondelier, president, and L. Weissenbruch, general secretary, has recently been sent to all members.

At the time of the suspension of activities the association included railroads in the following countries: Argentina, Belgium and Colony, Brazil, Bolivia, Chili, China, Costa Rica, Cuba, Denmark, Dominican Republic, Egypt, Ecuador, Spain, United States of America, France, Algeria, Tunis and Colonies, Great Britain and Ireland, India, Protectorates and Colonies, Greece, Haiti, Italy, Japan, Luxemburg, Mexico, Nicaragua, Norway, Paraguay, Netherlands and Colonies, Rumania, San Salvador, Serbia, Siam, Sweden, Switzerland, and Uruguay.

In many of the countries the railroads belonging to the association are wholly or largely government-operated, but the membership includes non-government companies in France, Great Britain, Italy and the United States; in France about 25 companies; Great Britain, 43; Italy, 19 (including tramways); United States, 56. There are also independent companies in Canada, India, Spain and Sweden.

The last list of officers shows 37 members of the Permanent Congress. Among the names are Stuyvesant Fish, E. J. Chamberlin, F. A. Delano, Theodore N. Ely (deceased), Fairfax Harrison, L. F. Loree, E. P. Ripley, Sir Guy Granet and Sir Frederick Harrison.

Hugh M. Wilson

Hugh M. Wilson, formerly associated with *The Railway Age*, and for several years its owner, and from 1910 to the early part of 1917 first vice-president of the McGraw Publishing Company, died Sept. 19.

Hugh M. Wilson

Mr. Wilson was in journalistic work during practically his entire business life. He was born at Jacksonville, Ill., and his first experience was as city editor of the Jacksonville Daily Journal, after which he was a reporter on the Minneapolis Evening Star. In 1889 he entered the technical paper field on the staff of the Mississippi Valley Lumberman. From that beginning and with but one brief interruption he devoted his energy and abilities to the object of developing trade and technical papers. He soon entered the railway field and became an associate editor of the Northwestern Railroader. When that publication was shortly after consolidated with *The Railway Age*, at Chicago, he was made secretary-treasurer of the new organization. He subsequently became manager of *The Railway Age*, meanwhile continuing as secretary-treasurer, and was elected president of the company in 1899.

In these years, although busily engaged in the business department of the paper, he found much time for editorial work, particularly on news matters relating to the purchase of equipment and supplies. His familiarity with this branch of railroad work soon made him an authority and fitted him for the work he did as secretary of the Railway Supply Manufacturers' Association from 1897 to 1902.

His energy was perhaps best displayed by the publication during the International Railway Congress at Washington, in 1905, of a daily edition of *The Railway Age*, which was designated as the official journal of the congress. Supplementing the praise showered on him by both American and foreign delegates for the success of this enterprise he was created a chevalier of the Order of Leopold by the King of the Belgians.

In 1906 the Wilson Company, with Mr. Wilson as the controlling owner, was organized, taking over *The Railway Age* and the Street Railway Review, which had just then been purchased and which was changed shortly to the Electric Railway Review and from a monthly to a weekly publication.

Two years later Mr. Wilson sold both papers. *The Railway Age* was consolidated with the Railroad Gazette to make the present *Railway Age Gazette*, while the McGraw Publishing Company purchased the Electric Railway Review and consolidated it with the Street Railway Journal under the name of the Electric Railway Journal.

Mr. Wilson immediately went abroad for an extended trip, and on his return in June, 1909, was elected vice-president and a director of the Barney & Smith Car Company, Dayton, Ohio. He continued with the Barney & Smith Car Company until 1910, when he was elected first vice-president of the McGraw Publishing Company, which position he retained until January, 1917.

News of the death of Hugh M. Wilson will shock and sadden many persons in the railway and railway supply fields. While Mr. Wilson had not been identified with the steam railroad and railroad supply field for over eleven years, he had a very wide circle of acquaintances and many warm friends in it who still remember favorably the work that he did in it.

He was distinctly a man among men. He was always bubbling with enthusiasm and overflowing with energy. It was impossible for anybody to come in contact with his bluff and magnetic personality without liking him. He was primarily a publisher, but as a publisher he was always interested in, and exercised a great influence over, the work of the editorial department. He always encouraged his editors courageously and outspokenly to advocate honest and public spirited policies, regardless of whether this course seemed adapted to increase or to diminish the prosperity of his papers. He advocated a vigorous policy of government regulation of railroads at a time when the desirability, and even necessity, of government regulation was by no means as generally recognized in the railroad field as it is now. As a publisher he was distinctly a builder, always being in favor of issuing the best papers practicable from an editorial and typographical point of view, even though this involved expenditures which might yield no immediate return, and, indeed, might never yield any return at all. He was in all respects one of the highest grade men who have ever entered the business paper publishing field in the United States. Both as president of the Wilson Company, and later as vice-president of the McGraw-Hill Publishing Company, he exerted an influence which has tended to raise permanently the ideals and improve the policies followed in the business paper field.

Mr. Wilson had a bad breakdown while he was connected with the McGraw-Hill Company. He went abroad and took a long rest and seemed to have largely recovered when he was struck by an automobile and seriously injured. While his breakdown and the automobile accident occurred some years ago, they undoubtedly produced the condition which ultimately resulted in his sudden death.

Efficient Maintenance and Operation of Locomotives

Traveling Engineers Consider Methods of Handling Power on the Road and Care at Terminals

An account of the early sessions of the Traveling Engineers' Association convention was published in the *Railway Age* of September 19, pages 581-585. The papers presented at the later meetings are given in part below:

The Advantages of Stokers on Modern Locomotives

Heretofore, in considering the application of mechanical stokers to locomotives we have thought in terms of the present only. In our opinion, however, the time is now at hand when we must consider future needs. Man power and wage costs are the dominating factors, and for economical operation we must use machinery to do the work that at one time could profitably be performed by hand. The economical rating of a locomotive is no longer the greatest tonnage it can drag over a division regardless of time, but the greatest tonnage it can haul over a given distance in a given time. This time has been fixed at eight hours for one hundred miles in freight service, which on account of delays en route may call for a speed considerably in excess of 12½ miles per hour.

The ever-increasing cost of wages makes it necessary to get more work out of the machines, and we can therefore no longer limit the capacity of the modern locomotive to the capacity of the fireman to shovel coal, but must by mechanical means overcome the physical limitations of the man.

In the first place, the advantage to be gained by the application of stokers is the realization of maximum boiler capacity, not only through sustained periods, but at any time when needed. The necessity for using mechanical devices wherever possible arises, not only from a humanitarian standpoint, but more particularly where it is necessary to develop 100 per cent efficiency in each individual, and as this factor enters into the effectiveness of the locomotive more than any other part of railroad operation, it would seem that the human element with which we have to contend, if for no other reason, would be the strongest recommendation for the installation of mechanical stokers on all power that is kept in road service.

Years ago the capacity of the firemen at times governed the amount of work performed and not the capacity of the locomotive. There were two reasons for this: First, it is impossible to educate any two men up to a point where they will fire a locomotive exactly the same under all conditions and look ahead to be prepared for any emergency; second, the physical capacity of men to perform the work. The stoker makes it possible to have every engine 100 per cent effective. Of course the stoker is not automatic and it takes a certain amount of intelligence to operate it properly, but there can be no question but that there is a much larger field for fuel economy in its use than there has ever been in hand firing, regardless of what our method has been in educating our firemen in the past or how careful our supervision has been.

Every railroad officer has had practically the same experience in the work of firemen; namely, that in some instances it is possible to get full capacity out of the locomotive, while in other instances, even with experienced men, it is not. Therefore it is only fair to assume that the amount of work performed by any given number of locomotives in any given territory will be based on the average poorest firemen on that division rather than on the average best firemen. With the engines equipped with mechanical stokers, receiving proper attention at terminals and by the men on the road, each will give identically the same service.

Steam chest temperatures in connection with superheated engines should receive much more attention than they have had in the past and there is no question but that a scientific job of firing largely affects steam chest temperatures when using superheated engines. On some tests conducted on a superheated engine it was demonstrated that it was possible to increase the steam chest temperatures from 20 to 50 deg. by expert firing, as compared with the work of the regular fireman on the job. Uniform temperatures in the fire-box, together with perfect combustion, will give the highest steam-chest temperatures possible to obtain, and as it takes a given amount of air to produce perfect combustion from a given amount of coal, and as the admission of air to the fire-box can only be regulated by the depth of the fire on the grate, it can readily be seen that in firing an engine by hand where the fire-door has to be opened to admit of the fuel charges, that the admission of air to the fuel bed through the grate must be intermittent, either too much when the door is closed or not enough when the door is open.

The stoker also makes it possible to carry the water at a lower uniform level than is possible with a hand-fired engine, for the reason that the steam pressure can be maintained at any time even though the engine is being worked to its maximum capacity through any sustained period.

In all the comparative tests that have been made between the stoker and hand-fired engines no one seems to have come to the same definite conclusion regarding fuel consumption, but from our experience we have found that in using the same grade of coal with the stoker and hand-fired engines, the boiler capacity of the engine not only is increased to a great extent as far as handling tonnage is concerned, but that it makes it possible materially to reduce the running time between terminals; therefore, with the present stoker in its perfected form, it should not only show much greater efficiency than a hand-fired engine, but also effect a very material reduction in fuel consumption, based on the consumption per ton mile per hour.

There seems to be considerable stress placed on the stack losses of some stoker-fired engines due to the extremely fine quality of coal necessary to use on them. While it is true that in the past considerable loss occurred from this source, with the present perfected stoker and the brick arch extending well back to the door sheet, the stack losses can be reduced to a point nearly as low as is done by using run of mine coal hand fired. In some large Mikado type engines, where originally they used six bricks in the arch, the arch was extended two bricks further back, bringing it up to within about seventeen inches of the crown-sheet. This not only has made a saving in stack losses, but has almost entirely eliminated the smoke, and we believe that with an arch of this kind and a large combustion chamber it would be possible with careful manipulation to burn 98 per cent of all fuel in the fire-box.

Today the firemen are presenting a demand for another increase, and in addition to this are requesting that all engines above a certain limit be equipped with mechanical stokers, and all under that limit be equipped with mechanical coal passers and grate shakers. Considering the cost of the mechanical coal passer and grate shaker, it would seem that

it would be much better to take the money expended in this way, apply it to the stoker and equip all engines kept in road service with a stoker.

While committees reporting on this subject in the past have never been able to secure reliable information in regard to stoker maintenance cost, records for the past five years show our maintenance cost to have been a little under $10 per thousand miles. As to the miles per engine failure due to stoker trouble, the record of the El Paso & South Western show an average of 61,556 miles per stoker failure. The application of stokers on this line has entirely eliminated the stereotyped engineers' report of "engine not steaming." While as a rule the size of nozzles has not been increased, it has been possible to adopt a standard front end and make all engines give a uniform service as far as steaming is concerned without any complaint from engine crews. It was never possible to get any class of engines to steam alike when hand fired. One fireman will want a bridge in the nozzle, while another wants it out; one would want the draft-sheet 15 in. from the bottom of the arch, while another wanted it 21 in.; one would want the petticoat adjusted one inch above the nozzle, while another man would want it six inches. With the stoker, however, practically no work on front ends is necessary by the roundhouse force except to make regular inspections.

Let us not forget that the fireman of today is the engineer of tomorrow, and owing to the constantly increased coal burning capacity of the locomotive, the application of a mechanical means of supplying the fuel is the only thing that will make the work sufficiently attractive to enable us to get and keep the right kind of men on our engines.

The report was signed by E. Gordon, chairman, J. A. Cooper, A. N. Willsie, J. O. Clendenen and J. R. Bissett.

Handling Locomotives to Secure Efficiency and Fuel Economy

The essential requisites to locomotive efficiency are proper design, proper operation and proper maintenance of power, the matter of fuel economy always being closely related to any of the three. The matter of proper design should start with having the boiler and grate area designed of ample proportion to furnish enough steam to develop the maximum cylinder horsepower of the cylinders at all times. Some of the older boilers are of rather low capacity for the cylinders of the engine, but in late years there has been a decided tendency toward having 100 per cent boilers. Every modern locomotive should be equipped with superheater, brick arch and power fire-door; all of which are fuel-saving and capacity-increasing devices. The combustion chamber also makes for fuel economy and is now in successful use on most large locomotives. The mechanical stoker should be applied to all large engines, and although the conditions under which the engine is to operate would govern, generally speaking, engines with over 50,000 lb. tractive power ought to be stoker fired.

Air compressors and headlight turbines of modern and most economical design should be used on new power, and on some old power it will be found in the interest of economy to replace existing auxiliaries with the more economical outfits. There are some as yet undeveloped sources of fuel economy for locomotives, one of which, the feed water heater, while still in the experimental stage, will undoubtedly soon be perfected and put in more or less general use.

In designing the engine, front end, grates and ash-pan should be given plenty of attention. It is necessary to keep the air out of the front end, and yet admit it in plenty to the ash-pan, which means ample ash-pan air openings and all joints tight around the front end. The effect of front end leaks and also insufficient ash-pan air opening has been made the subject of circulars recently issued by the United States Fuel Section, which have brought out very plainly the losses due to these two causes. The exhaust nozzle should be made as large in diameter as possible, so as to reduce back pressure and yet furnish the draft required to produce proper action on the fire. The grates should have ample air opening and the grate rigging should be such as to permit shaking freely by the fireman, which cannot be done if too many sections of grate are carried on one shaker.

Essentials for Proper Operation

The proper operation of locomotives covers many phases and only a few of them will be touched on here. It is recognized that where locomotives are pooled they are not so well maintained, as the engine crew does not take the same interest in an engine that they may not see again for a month; and they do not make the lighter repairs, nor the thorough inspection and report of defects occurring en route which they do in a case of the regularly assigned engine. Although it may be more economical in general to use pooled engines, particularly when business is heavy, there are instances where regularly assigned engines could be used, and it is preferable to do so when consistent.

Locomotive performance is affected to a considerable extent by the terminal facilities. Terminal facilities may often include various fuel or labor-saving appliances, but these are not always installed in co-ordination with other appliances at the same terminal. Proper terminal layout should be such as to get the quickest movement into and out of the engine-house of engines arriving at and departing from terminals. Considerable fuel is lost, the expense of handling the engine is increased, and there are many delays due to improper design of terminals. In the past we have been rather short-sighted as regards designing locomotive terminals with a view of handling increasing sizes of power.

One question in the operation of trains and locomotives that is very important and is not as a rule given much attention is the matter of proper water supply. Wherever it is possible to change an existing water supply for one of better quality, it should be done, providing the cost of the change is not prohibitive, and then, having obtained the best available water, every water should be given the necessary treatment to prevent scale formation and corrosion within the boiler. We are all familiar with the many troubles that result from using hard waters. Fuel lost from having scaled heating surfaces is a large expense; boilers operate at reduced efficiency when scaled up; engines fail and give up trains on account of flues leaking, and the cost of boiler maintenance is much higher on account of frequent flue, stay-bolt and fire-box renewals. Most all this can be avoided. Engine failures due to leaking can be reduced to practically nothing; stay-bolt trouble can be reduced to a minimum, and considerable fuel will be saved with the proper treatment of all waters. This should be done on every railroad, and the steam user who does not adopt some method of water treatment to avoid incrustation is unprogressive and is losing money.

Maintenance of Machinery and Boiler

Proper maintenance depends first on proper inspection and then on getting the defects corrected which are brought out by this inspection. The pooled locomotive can be run successfully and efficiently if there is adequate terminal inspection and repair. Not infrequently the officer in charge of the terminal is under the impression that the only inspection necessary is searching for loose nuts, missing parts of machinery, cracks, hot bearings, etc., and consequently uses rather low-grade men for this purpose. The best man on the job is none too good for inspection, as a locomotive ought to be tested for steam blows, pounds and such defects as

cannot be observed by the eye alone. Steam blows, such as are caused by defective cylinder packing, valves and valve rings, go further toward reducing the efficiency of the locomotive, and waste a great deal more coal than is generally realized.

If the inspection and repair of locomotives were carried out in accordance with federal inspection laws, pretty good results would be secured; but even though the spirit is to comply fully with these laws, it is unfortunate that there is still at times considerable neglect or rather inefficient inspection and repairs. All repairs found by the inspector ought to be made, and when possible a check should be made before the engine leaves to see that all work has been done.

A few items of maintenance, or shop practice, that might be mentioned are care in laying out shoes and wedges, and proper maintenance of binders, tramming of engine trucks, drivers and tender trucks, and the fastening of valve bushings so that they cannot move, making it possible to use standard rings for all engines of a class. It will frequently be found that the steam distribution is not correct for engines of the same class, due to slight differences in the position of the valve bushing and size of valve rings used.

Perhaps one of the most important items of maintenance is the proper care of superheaters and superheater flues. The superheater is the greatest fuel-saving device, and as the saving in fuel depends on the amount of superheat, it follows that any obstruction which prevents free passage of the hot gases around the superheating units will result in a reduction in superheat and a corresponding reduction in the efficiency. It does not take many trips for superheater flues to become stopped up and unless constant attention in the way of blowing them out in roundhouses is given superheaters will be found only saving perhaps 50 per cent of what they should when properly maintained.

Fuel Department Organization

Although fuel economy depends on proper design, proper operation and proper maintenance of power, it is necessary in order to get real results to have a separate fuel organization. This should consist of a general staff officer, in charge of fuel conservation, who should devote his entire attention to the conservation of fuel on locomotives, in shops, at terminals, water stations and for all miscellaneous purposes. He should also have jurisdiction over the quality, preparation and uniformity of coal furnished. It is important that the cleanest grade of coal should be obtained from each mine in the district from which the fuel supply comes, and a vigorous inspection should be maintained to see that the railroad gets what it is paying for in this respect. Mine weights should, of course, be checked at certain prescribed intervals to know that accurate weights are being obtained.

To carry out his plans, the general fuel officer should have divisional fuel supervisors, who should be assigned a certain territory for all the various details of fuel economy, but whose principal duty should be the education of firemen in the economical firing of engines. The fuel organization should have enough clerical assistants to keep up-to-date records of fuel performances by individual engine, by engineer and by fireman, so that performances on any division can be known and examined at any time. These records give means of locating the cases where an engine or an engine crew is operating wastefully, and they also show what progress is made in saving fuel.

Co-operation with the operating department is, of course, very important. Monthly divisional fuel meetings should be held with the superintendent, master mechanic, divisional officials and such employees as can consistently attend. At these meetings progress reports are made, conditions are analyzed and suggestions invited from all present as to where improvements in engine or train operation can be obtained. General fuel officials should attend these division fuel meetings as often as possible, but the superintendent should be the chairman of the divisional fuel committee and conduct the meetings, as this brings about a more thorough and more uniform understanding of the importance of various matters effecting fuel economy by operating officials who otherwise might overlook some of the details and leave it up to the mechanical department. The minutes of these fuel meetings should be furnished to the general manager, general superintendent, superintendent of motive power, general fuel official, division superintendent, and master mechanic.

Any progressive movement must be backed by educational efforts and great stress is laid on the necessity of constant education of enginemen particularly, as they, of all employees, are most responsible for the coal pile, and also of all others who in any way may be concerned in the use or waste of fuel.

The report is signed by J. B. Hurley (Wabash), chairman; Robert Collett (U. S. R. A.); F. P. Roesch (U. S. R. A.); B. J. Feeny (U. S. R. A.); and G. E. Anderson (Gt. Nor.).

Discussion

W. G. Wallace (American Steel Foundries) emphasized the importance of having a record of the coal consumption immediately available at the end of each trip. If this information is given to the train dispatcher at the end of the run, it makes it possible to check up the coal consumption, taking into account all the conditions surrounding the trip. This helps greatly in fixing the responsibility for excessive fuel consumption, whether it is due to the operating conditions, the mechanical condition of the power or the quality of the coal. E. Hartenstein (C. & A.) mentioned the losses due to slow orders and unnecessary stops. He also touched on the qualifications of locomotive inspectors and stated that men who had received their training in road work were often better qualified than men from the shop. V. C. Randolph (U. S. R. A.) called attention to the important part which the locomotive engineer must play in securing economy in the use of fuel, and advocated that these men should be taught how to operate the engines at the greatest efficiency. Among the common wasteful practices he mentioned especially working the locomotive harder than is necessary. H. C. Woodbridge (U. S. R. A.) stated that irregular action of reverse gears was often responsible for excessive fuel consumption and expressed the opinion that it is necessary to make improvements in these devices. A. G. Kinyon (Fuller Engineering Company) advocated a fuel department organization reporting to the chief executive officer. He brought out that instruction must be supplemented by adequate supervision to get the best results. B. J. Feeny (U. S. R. A.) stated that too much attention is given to accounting for oil and far too little attention to fuel records. He also emphasized the fact that the responsibility for saving fuel extends to all departments.

Caring for Locomotives at Terminals to Secure Efficiency and Increased Mileage

Assuming that the locomotives come from the shops in a condition to readily develop the state of efficiency for which they are rated, the efficiency that can thereafter be maintained and the mileage obtained, will depend largely upon the thoroughness of the work done upon the locomotive during general overhauling periods. The limited facilities of the average terminal plant should neither be required nor expected to make good the shortcomings of the general repair shops.

Increased mileage is but another term for maintenance of a high efficiency, as it pre-supposes less delay along the line due to locomotive troubles, quicker turning at terminals for

service and a greater number of trips between shoppings. The efficiency of the practices in use at terminals, the extent of the facilities available for doing work and the excellence of the work done will in a general sense determine the measure of efficiency that can be expected to be maintained at such places. It follows that a constant striving for the betterment of practices, of facilities and of workmanship, are the essential needs at terminals to maintain locomotives in an efficient state and to increase the mileage obtainable. The traveling engineer should be of valuable assistance to those in charge of terminals in bringing these betterments about.

The question as to what are the best methods of caring for locomotives at terminals is synonymous with, what constitutes good roundhouse practice?

Studied from any angle, these two questions constantly intermingle and seemingly resolve themselves in every case into the same identical set of fundamental requirements which, in turn, constitute equally the basic principles of good roundhouse practice and the essential necessities of locomotive maintenance.

These requirements are: Caretaking inspection of the locomotive by competent locomotive inspectors as soon as possible after arrival at terminal; the obtaining of an intelligent report from the incoming engineer as to the conditions noted during his trip which were detrimental to the efficient operation of his locomotive; the proper cleaning of the fire, ash-pan and front end, and attention to the fire and water while lying at the terminal; a careful inspection by competent workmen of the troubles and defects as reported by the engineer and locomotive inspectors and the making of the necessary repairs and changes in an efficient manner; the furnishing of the proper engine tools and the necessary supplies for the outgoing trip, which will include filling of lubricators and rod cups; frequent riding of the locomotives by the traveling engineer, especially in cases of trouble, the cause of which is in doubt and usually due to a combination of adverse conditions.

With the exception of the last mentioned point, these requirements are incidental to every trip in either direction where inspection and repair facilities are provided for at each terminal. The maintaining of the least reasonable condition of efficiency demands that these requirements must be provided for and carried out at least at the end of each day's work, and is required by the Interstate Commerce Commission rules.

In addition to the points already mentioned, provision should be made for periodical inspections not usually covered in work reports, which will include boiler washing, boiler inspections and inspections of the operating parts enumerated later on; for the carrying in stock of needed supplies of all kinds for making the repairs and for renewals, and for shop equipment and tools necessary for reasonable running repair maintenance.

Engineer's Reports

Inasmuch as there are certain troubles and defects which may have an important bearing on the efficient operation of the locomotive, such as steam blows, pounds, and conditions affecting the steaming properties, which are only discernable when the locomotive is working, an intelligent report from the engineer as to the detrimental conditions noted while running, is of the greatest importance in connection with good maintenance.

There is scarcely a way in which the traveling engineer can be of more use to the mechanical department and be of greater aid in assisting to keep locomotives in an efficient condition than in seeing that engineers' work reports are made out in such a manner as to clearly indicate the part complained of, the nature of the defect to be corrected, the cause of trouble experienced, and in cases where a definite cause cannot be given that the report describes just what takes place.

Locomotive Inspection

The Locomotive Inspection Bureau of the Interstate Commerce Commission has issued rules governing the inspection of locomotives which embrace practically every feature of importance requiring either daily or periodical attention, and including limitations of wear permissible for certain parts. These rules are based upon the practical experience of both the Federal Inspectors and representatives of the most important railroads of the country, and failure to live up to them constitutes a violation of the law.

Carried out in the spirit intended, they stand for good maintenance. Where observed, however, only within the letter of the law, a high state of efficiency is not necessarily indicated, as many of the rules do not cover the best conditions obtainable, but rather the poorest allowable, and the limitations below which it is not permissible to go. The efficiency obtained will therefore depend upon the spirit in which these rules are followed out. The inspection should be thorough and painstaking, inasmuch as defects that result in delays, breakages and failures, are frequently discernable only under the closest scrutiny.

In addition to those parts to which attention is called by the rules referred to, every part subject to wear that would interfere in any way with the efficient working of the locomotive and all parts subject to severe strains, breakages, or loosening effects, including nuts, keys and cotter pins, as well as the condition of all safety appliances, should receive attention. It is a good plan to have an outgoing inspection, covering conditions of air brakes, injectors, electric headlight, and power reverse gear, and for the examination of such parts of the locomotive as were reported for shop attention.

Where for any reason the fire is dumped at the terminal, suitable provision should be made for the inspection and testing of steam and air-operated devices, such as the air brakes, injectors, electric headlight, power reverse gear and similar devices, while still under sufficient steam pressure to operate such parts. This guards against defective conditions in such parts, gives opportunity for repair if any defects are found, and in the case of air brakes, provides for the testing and adjusting of piston travel within proper limits.

All locomotives should be cleaned in order to facilitate the work of inspectors and shop men.

Shop Facilities and Tools

Where the facilities of a general or so-called back shop are not readily accessible, adequate means for doing light repair work of a reasonable nature should be provided in the way of a small machine and blacksmith shop. This should contain at least a lathe, a small shaper, a drill press, a press for pushing bushing in and out, a blacksmith forge and a grind-stone. Such a plant is almost invaluable, providing, as it does, for both quicker and better work as well as assisting in cutting down the cost of maintenance. Arrangements should also be made for a liberal supply of tools in everyday demand, such as drills, taps, reamers, dies, files, wrenches, pipe fitters' and boilermakers' tools and others of like nature not usually provided by the workmen themselves.

The building of larger and heavier locomotives and the increased weight of various parts which have to be handled, demand the more or less constant use of portable cranes, jacks and block and fall, and the same should be provided for quick and safe work. An electric or other type of welding machine has also become practically a necessity in terminals of any size.

Supervision, Qualification and Methods

Competent supervision over mechanical activities at terminals is a most important factor in efficient locomotive

maintenance. Men for these positions should be chosen with particular regard for their general fitness in reference to experience, good judgment, foresight and resourcefulness, as well as for their ability to handle men. Frequently located at points distant from any large terminal through which immediate assistance could be procured, often with poor facilities for doing work and none too competent help, their success or failure depends largely upon their own capabilities and they find a constant demand for the exercise of each of the qualifications mentioned.

Resourcefulness is constantly in more or less demand in devising ways and means to meet the varying conditions incidental to running repair work and in overcoming the unexpected requirements and emergencies that are constantly arising. It may well be added that the interest taken in the work by the supervision will be a dominating feature in the results achieved. Not only should the methods of the workmen be generally watched to prevent loose methods and bad practices creeping in, but the completed work should be frequently examined as a guard against poor work and carelessness.

Turning Power

It must not be overlooked that features other than the maintaining of an efficient locomotive enter into the matter of increased mileage and that insofar as they have to do with the care of the locomotive while at terminals, they must be given due consideration in connection with terminal work.

Increased mileage necessarily implies a greater number of trips to be made between shoppings than previously averaged.

Conditions at terminals which interfere with the promptness with which locomotives may be reached for the purpose of making needed repairs and for being otherwise prepared for a quick return to service, tend to prevent increased mileage.

It is usual to consider the cleaning of fires, the obtaining of coal and water and the turning of the locomotive as adjuncts to the maintenance and care of power. The extent of the provisions made for doing this work and the ease with which the locomotive can reach the points where the work is to be done, is most important in the quick turning of locomotives, and as a means of bringing about increased mileage. Lack of adequate provisions in this respect slows up terminal movements, hinders getting at the locomotive promptly to make the needed repairs, tends to hurried repairs and to work being left undone. If frequently leads to badly congested conditions and serious delays, and fosters carelessness in the various stages of preparing the locomotives for return to service on account of the necessity of crowding them through the terminal in order to turn them with any degree of promptitude, and in general results in poor conditions and delays, neither of which is conducive to increased mileage.

Poor facilities in this respect are especially troublesome at terminal points where more or less severe winter weather is experienced and where during such periods they may be the cause of power conditions becoming very serious.

In this connection it may, therefore, be pointed out that the trackage about terminal plants insofar as it provides for prompt and free movement of the locomotive in conjunction with cleaning fires, obtaining coal and water, getting to and from the turntable and in reaching and departing from the shop, is important in giving more time for the making of repairs and lessening the time required for preparing the locomotive for despatching. In a like manner the adequacy of the provisions made for cleaning the fires, for inspection purposes and for coaling, have an important bearing on the time required in doing such work and on that necessary in getting the locomotive otherwise ready for service.

Responsibility of the Traveling Engineer

The duties of the Traveling Engineer are of such nature as to place upon him a considerable share of the responsibility for the maintenance of the locomotive over which he has nominal control. Being in constant touch with all the conditions that enter into their handling both at the terminals and on the road, he cannot well evade such responsibility.

In various ways as through casual inspection of methods used and work being done when he is around terminals, through riding the locomotive, through investigation of delays and failures and through his contact with the locomotive crews, it is within his power to know just what conditions are prevailing with reference to maintenance. He has the means of knowing whether his engineers are making intelligent reports or not by occasionally looking over their work reports. He has the means of knowing by personal observation and by information gained from delay and failure reports whether inspectors are competent and painstaking in their work or not. Being around terminals for a time at least, daily, he should know whether or not fire, ash-pan and front end cleaning is being done properly, and the locomotive cared for in a proper manner while laying over. He should know by the results obtained as well as by the complaints of the locomotive crew, by his personal experience in riding and by results of investigation of delays and failures whether the work being reported is being properly done or neglected. He can easily ascertain what is done in reference to boiler inspection during boiler washing periods and to other parts during periodical inspection.

In the extent to which he avails himself of this information which is always at his command, and the use to which he applies it in assisting to maintain efficient conditions, or in aiding to bring them about, where such are not of the best, will lie the measure of his share of the responsibility for the conditions which exist. It is scarcely sufficient that he is able to say in explanation of poor conditions, delays and failures, that the work required to better conditions was reported. To be relieved of his share in the responsibility for poor conditions he must be able to show that he made use of all the means within his power to bring about a betterment of conditions. It comes well within the scope of his authority to take up, consult and advise with those in charge of terminals as to conditions which come within his observation that are detrimental to maintenance and efficiency and in regard to which improvement may seem possible.

He will almost invariably find that the information and advice that he can offer as the result of his observations and experience will be most gladly received. As a rule the terminal authorities are more given to complaining of the lack of assistance given them by the traveling engineer than in regard to his insistence on better conditions. He who offers friendly advice and assistance is ever more welcome than he who criticises without offering a remedy.

The traveling engineer should take particular interest in the prevention of operative practices which tend to decrease locomotive efficiency, such as moving engines without opening the cylinder cocks, with its ill effects on cylinder and piston rod packings and the slipping of locomotives in starting them, with its general racking strains.

The report is signed by T. F. Howley, chairman, Joseph Keller, B. J. Feeny, C. W. Corning and J. W. Burrows.

Discussion

W. H. Gallagher (M. K. & T.) advocated a method of adjusted tonnage rating as a means of securing greater efficiency from locomotives. E. R. Boa (N. Y. C.) brought out the necessity for co-operation between the traveling engineer and the roundhouse foreman. F. L. Pierce (C. & A.) described a method of inspection of outgoing engines by traveling engineers which had brought good

results. E. F. Boyle (Sou. Pac.) spoke of the damage to locomotives resulting from improper operation by hostlers, who often moved the engines when the cylinders were filled with water. B. J. Feeny (U. S. R. A.) stated that while good facilities were necessary to secure the best results, a fair degree of efficiency could be secured by giving attention to simple matters which required no elaborate equipment, such as blowing tubes and cleaning grates, as these matters have a great influence on the operating results secured with the engines. W. L. Robinson (B. & O.) mentioned the abuse of locomotives by incompetent hostlers, and stated that traveling engineers should have authority over these men and should instruct them in the proper method of handling engines.

E. S. Boyle (Sou. Pac.) stated that, as a rule, if all the work reported by the enginemen is done, the motive power will be kept in fairly good condition. It is, however, necessary for the traveling engineer to see that the men do not fail to report necessary work. He advocated occasional joint inspection by the traveling engineers, general foremen and master mechanics to check up the engineers' reports.

A resolution was passed stating that it was the opinion of the association there should be responsible engine inspectors and night roundhouse foremen at all engine terminals.

Other Business

At the session held on Friday, the report of the committee on amalgamation with the American Railroad Association was received and discussed. The committee stated that in view of the fact that the duties of the traveling engineer were not strictly mechanical work nor transportation work, but a combination of the two, it believed that the best results would not follow from amalgamation as a division of either the operating section or the mechanical section, but by the creation of a separate section to take over the activities of the Traveling Engineers' Association. This course had been suggested to the officers of the American Railroad Association, but no answer had been received, and in view of this situation the committee was continued.

The by-laws of the association were amended to leave the selection of the place of meeting entirely in the hands of the executive committee.

The following officers were elected: President, G. A. Kell, Grand Trunk; first vice-president, W. E. Preston, Southern; second vice-president, L. R. Pyle, Railroad Administration; third vice-president, E. Hartenstein, Chicago & Alton; fourth vice-president, J. H. DeSalis, New York Central; fifth vice-president, E. F. Boyle, Southern Pacific; secretary, W. O. Thompson, New York Central; treasurer, David Meadows, Michigan Central; members of executive committee, F. P. Roesch, Railroad Administration; B. J. Feeny, Railroad Administration; J. Keller, Lehigh Valley.

One-Piece Cast Steel Frames for Electric Locomotives

A NOTABLE EXAMPLE of the large and intricate parts which are successfully made of cast steel is the bed casting for the latest order of electric locomotives built for the New York, New Haven & Hartford. In designing this locomotive, the weight of the built-up frame was found to be so great that the total weight would exceed the allowable limit. For that reason the Commonwealth Steel Company, St. Louis, Mo., was asked to submit a design. The general plan for such a casting had been worked out by the company's engineering department, but the 10 beds for the New Haven locomotives were the first to be made.

The locomotive bed is 32 ft. 4 in. long, weighs 17,000 lb. and is probably the most difficult casting of its kind ever attempted. This single unit replaces a very large number of parts, greatly reducing the weight and increasing the strength. Numerous bolts and nuts have been eliminated that become loose and allow play, especially at the pedestals. This will result in a considerable saving in the cost of maintenance and repairs. This locomotive bed strikingly illustrates the adaptability of cast steel to certain types of construction. It not only provides an irregular contour of members for clearance without sacrificing strength, but also facilitates securing various cross sections of all members, correctly proportioned in size to correspond with various stresses, at the same time providing the required flexibility in the structure.

I. C. C. Recommends Consolidated Classification

Decision Follows an Extensive Investigation. Dissenting Opinion by Commissioner Woolley

IN A REPORT signed "by the commission," the Interstate Commerce Commission recommends to the director general of railroads a consolidated classification to be adopted in place of the present official southern and western classifications by railroads under federal control. The commission finds that this consolidated classification is also reasonable for application by roads not under federal control. The commission says in part:

In our annual reports to Congress we have from time to time mentioned our efforts to stimulate work in the direction of greater uniformity in freight classifications. Early in 1918 it was apparent, in view of the progress already made, that a complete unification of the rules and descriptions of articles in the official, southern, and western classifications was possible at a not distant date, and we accordingly inquired of the carriers why they could not by January 1, 1919, or sooner, effect a consolidation of the three general classifications into one volume containing one set of uniform commodity descriptions with three rating columns, one for each territory, subtended, and with one set of general rules. Shortly thereafter the director of traffic of the railroad administration, after conference with us, appointed a special committee of experienced classification men to carry out the work he had in mind. This committee prepared and submitted a volume entitled "Proposed Consolidated Freight Classification No. 1," which accomplishes the consolidation and uniformity sought, and, in addition thereto, proposes many increases and reductions in ratings, most of which, however, have no necesary connection with the work assigned to the committee. The volume was not filed with us as a tariff schedule.

The director general requested that we make an investigation and give him our recommendations relative to the advisability of adopting it for application by carriers under federal control. We accordingly instituted this proceeding of inquiry and investigation into the reasonableness and propriety of its provisions. We made respondents all of the carriers subject to the act and which were not under federal control, in order that the same classification might, if that course were found advisable, be prescribed for their use also. The special committee distributed about 14,000 copies of the volume among carriers, state commissions, interested shippers and shippers' organizations throughout the country, each copy accompanied by a notice of this proceeding. Hearings were held at Boston, Mass.; New York, N. Y.; Chicago, Ill.; Omaha, Neb.; Portland, Ore.; San Francisco, Cal.; Denver, Colo.; Fort Worth, Tex.; New Orleans, La.; Atlanta, Ga., and Washington, D. C. Nearly 15,000 pages of testimony were taken and over 800 exhibits were filed. The evidence of objectors or protestants was generally confined to the proposed increases, changes in the nature of increases, and new items. In other words, objections to a particular item were not heard unless the item proposed to put some new or added burden upon shippers. Most of the evidence relates to the increased ratings. The consolidation of the classifications and the unification of the rules and descriptions, generally speaking, were received with favor.

As we understand it, the consolidated classification was proposed as a general standard classification to supersede not only the existing issues of the official, southern, and western classifications, but also all state classifications, and at the request of the director of traffic we have received evidence as to the general effect of canceling the various state classifications. That evidence will be referred to later in the report. We were advised by the director of traffic that he had under consideration also the advisability of canceling the exceptions to all classifications, but that commodity rates might be established in lieu thereof in proper cases. That matter, however, has not been referred to us for investigation and recommendation.

The consolidated classification is not a uniform classification in the full sense of the term, because all the ratings are not uniform. In a majority of the items, the ratings are the same as now. The consolidated classification would preserve the identity of the official, southern, and western classifications, and, as finally amended, is intended to be filed with the Commission, with a separate I. C. C. number for each territory. In other words, from a legal or technical standpoint, it is to be three classifications in one volume. It is not much larger and is no more complicated than any one of the three general classifications now in use.

The consolidated classification is the result of effort toward uniformity extending over a long term of years, and since uniform rules and descriptions are necessary before uniformity in ratings is possible, it marks an important step toward a uniform classification. Definite action in the direction of uniformity was taken about 10 years ago, when the carriers created their committee on uniform classification, to which was assigned the duty of working out a common set of rules and descriptions for the three general classifications. This committee made disappointingly slow progress, largely because of technical considerations and the disposition of the carriers in each territory to force their views and measures of expediency upon the carriers in the other territories. It was abolished shortly after the proposed consolidated classification was prepared.

The special committee which prepared the consolidated classification consisted of the chairman of the committee on uniform classification, the chairman of the Official and Western Classification committees, a member of the Southern Classification Committee, now its chairman, and our classification agent. In consolidating the classifications and unifying the rules and descriptions the members of the special committee are understood to have been guided largely by their own ideas. They were not of one mind in respect to some of the changes they have proposed in the rules and descriptions. Numerous concessions were made and some long standing and deep rooted controversies growing out of territorial or local traffic policies were cast aside. There are instances in which the existing rules as to a given situation and the descriptions, even of like articles, differ widely in the three classifications, and in respect of certain items some radical changes were necessary in order to accomplish the desired uniformity.

As stated, the consolidated classification also proposes many changes in ratings. The special committee was not directed, however, to change ratings where that was not necessarily or reasonably incident to changes in descriptions. The task assigned to the special committee was merely the completion of the work begun years ago by the committee on uniform classification, which committee had nothing whatever to do with ratings. The changes in ratings were proposed, not by the special committee as a body, but by the representatives of the respective territorial committees, individually and on their own initiative. The representative of each classification committee undertook a realignment of the ratings in his

own classification, in accordance with what he conceived to be proper principles and considerations. Our representative on the special committee had no voice in fixing any of the proposed ratings. There was no concerted effort to make the ratings uniform, but the desirability of uniformity seems to have been kept in mind, and as to a number of items where there were considerable differences in the existing ratings in the three classifications, changes were proposed which effected a greater degree of uniformity, particularly in the higher classes. Changes proposed for the purpose of attaining a greater degree of uniformity have more of an upward than a downward trend.

The table below, showing the nature and number of changes and new items proposed, was prepared by the special committee and submitted with its report to the director of traffic:

Nature of changes	Number of changes in the classifications			
	Official	Southern	Western	Total
Increase in ratings	890	2,574	393	3,857
Reduction in ratings	478	898	464	1,840
Carload ratings eliminated*	136	1	4	141
Increases in minimum weights	342	599	194	1,135
Reductions in minimum weights	229	73	61	363
Carload minimum weights to which rule 34 is added, subjecting them to the graduate scale	39	49	132	220
Additions or new items	1,144	1,665	425	3,234
Total	3,258	5,859	1,673	10,790

*The number of carload ratings established does not appear, but they are included in the reductions.

A Uniform Classification

We have stated that the consolidated classification marks an important step toward a uniform classification. Our hitherto most important case in which the matter of classification uniformity was considered was the *Western Classification Case,* 25 I. C. C., 442, decided December 9, 1912. In that proceeding the lines parties to the western classification sought to establish a large number of changes, including revised rules and descriptions which had been recommended by the committee on uniform classification. We there discussed classification matters rather fully and stated that in our opinion a uniform classification was practicable, but that there were great difficulties to be overcome, particularly in so far as uniform ratings are concerned. In the instant case several traffic organizations, one or two state commissions, and a number of the shippers who would be adversely affected by the changes proposed in the consolidated classification as a result of efforts toward uniformity went on record as being opposed to, or at least not advocating, a uniform classification, contending that there are such wide differences in conditions in the various parts of the country as to make a uniform classification impracticable and undesirable. We are now, as formerly, fully convinced that a uniform classification, with such exceptions or commodity rates as may be necessary in special cases, is practicable and desirable, and practical uniformity should not be unnecessarily delayed. Naturally there must be both increases and reductions, which may adversely or advantageously affect individual shippers and carriers, but a broad view of the situation justifies the statement that carriers and shippers alike will be amply repaid in the end by the benefits which will accrue from uniformity. The fact that a uniform classification would be of convenience is a consideration of relatively minor importance; we have advocated uniformity because it is an essential part of the general scheme which contemplates greater consistency in rate making and elimination of discriminations and inequalities.

Placing the ratings in juxtaposition in three parallel columns opposite the descriptions impresses us as never before with the great lack of consistency that exists among the three classification territories. Many of the inconsistencies are due to considerations of minor importance and could be removed without changes in rate scales and, in our view, without serious effect upon any one, particularly in so far as less-than-carload ratings are concerned. In large part different ratings in the three territories are not due to actual or substantial differences in circumstances and conditions, but are the result of mere differences of opinion and the natural inclination of traffic officials to give expression to their respective theories of classification. For instance, on furniture in less than carloads, the chairman of the official committee, following a practice of long standing in his territory, proposes the same rating for the articles wrapped as for the articles boxed or crated. The chairmen of the southern and western committees in some instances do the same thing; in others they do not, but propose ratings one or two classes higher for articles wrapped than if boxed or crated. Moreover, the proposals of the three chairmen, even as to one and the same article of furniture, are in some cases directly opposed to each other.

General Observations

As we have pointed out, most of the increases proposed have no necessary connection with the work of consolidating the rules and descriptions. None of them, except such as were necessarily or reasonably incident thereto, were contemplated by us when we suggested a unification of the rules and descriptions, and, as we understand it, were not in the mind of the director of traffic when he appointed the special committee. When the case was assigned for hearing we did not realize that there was such a vast number of changes that had no necessary connection with the work required of the special committee.

The director general did not intend that the consolidated classification should be a revenue measure, and the chairmen of the classification committees disclaim any purpose on their part to make it such. While in fact it would yield the carriers some additional revenue, the record is convincing that, in the main, the proposed increases reflect conscientious efforts to bring about a proper relationship of ratings and to fairly distribute transportation expenses over the various articles of traffic.

A study of the changes in ratings proposed by the classification chairmen disclosed inconsistencies in each territory which apparently we could not endorse. We therefore made a comprehensive analysis of the existing and proposed ratings to ascertain whether or not we could properly recommend, with modifications, the somewhat general revision of ratings proposed, or an amplification of those proposals. We find that we can not properly recommend either for the reason that many and important changes as to which interested shippers have had no notice or opportunity to be heard would be included.

Our analysis of existing and proposed ratings was made with a view of also ascertaining what changes in existing ratings other than those proposed would, in the judgment of our classification and general traffic experts, formed without fully hearing shippers or carriers that would be affected thereby, be proper to propose in any general revision of ratings having for its principal purpose attainment of a higher degree of uniformity. The results of this analysis appear in Appendix No. 6, and constitute practically a uniform classification so far as the first four classes are concerned. The results of this laborious work are thus preserved. They will be available and valuable in the future as efforts in the direction of uniformity progress. They must be understood to be the tentative views of our expert assistants who heard the case and in no sense as findings or conclusive suggestions by us. However, the suggestions in this appendix, so far as they affect descriptions, packing specifications, and minimum and estimated weights are adopted as recommendations by us without prejudice.

We can not recommend the increased ratings as proposed,

nor can we recommend, with modifications, those proposed unaccompanied by many others that have not been proposed and as to which no opportunity for hearing affected parties has been afforded. We shall not recommend any changed ratings except as the establishment of new items may indirectly effect changes, and such changes as may be a necessary part of the establishment of uniform descriptions of articles, uniform minimum weights, or uniform packing requirements. Our recommendations as to such changes will not prejudice any complaint that may be filed as to individual changes that are believed by complainant to result in unreasonable rates or in undue prejudice.

Commissioner Woolley, dissenting in part, said:

At the close of the majority report, 54 I. C. C., 1, 72, I reserved the privilege of announcing separately my views on this subject. The course this proceeding has taken and the conclusions announced by the majority lead me to the conviction that our administrative functions have been pressed into the background by a seemingly nice, yet in my judgment a wholly unwarranted, judicial finding, which unhappily prevents expedient and effective progress toward a result urgently sought by the commission itself for more than a score of years.

The Congress was first apprised by the commission in 1897 of the desirability of a uniform classification, and 10 years later, 1907, was informed that the carriers then had taken definite steps to establish it. Also in this latter year the National Association of Railway Commissioners unanimously adopted a resolution requesting the Congress to "enact a law requiring the Interstate Commerce Commission at once to proceed to make a uniform classification * * *." Since then in nearly every annual report for the past 10 years the commission has informed the Congress of the progress—rather lack of progress I would say—made by the carriers toward the end sought. Apparently the theory was that the task should primarily be left to the carriers to work out, and that course was followed. After at least 10 years' endeavor real results were still in the promising stage, and it was not until the properties and operations of the carriers fell under federal control that the commission finally succeeded in having brought forward suggestions for greater uniformity in the concrete form of a consolidated classification. Judging from previous progress this was possible only because the railroads of the country were being operated as a unit under a single directing head.

The director general did not seek by independent action to give effect to the proposed classification; he did not assume the responsibility of filing the classification pursuant to the regulating statute, but simply sought our recommendations as he was authorized to do under section 8 of the federal control act, and we so reported the situation to the Congress. I mention these facts merely to emphasize the status in which the classification reached us and to make it plain that the recommendations sought could be given as a matter of course without adversely affecting the legal rights of shippers. Their day in court could not be taken from them in that way.

Presumably, in the light of the commission's inquiry as to the possibility for complete uniformity of "rules and description" by January 1, 1919, and the fact that the consolidated classification contemplated an even greater and more important degree of uniformity in the sense that it proposed greater uniformity in ratings and numerous other changes, the director general was disinclined to file it as a classification without first obtaining the recommendations of the commission. Be that as it may, the form of presentation left us free to bring into play our administrative functions unhampered by technical legal strictures. There was no issue presented for trial and no judicial finding to be reached under the act to regulate commerce, unless, technically, the commission itself raised such an issue by making respondents the comparatively few short lines not under federal control, which are sustained largely by their share of trunk line rates governed by the three principal classifications now in force. As I view the situation, however, we were asked only for recommendations, and were free to give them, in an administrative sense, both as to the carriers under federal control and the remaining few that had been relinquished, without prejudicing the rights or interests of either shippers or carriers.

Based upon the same deep study followed by the experts on the several classification committees and the special committee created by the Railroad Administration, and after a wide field of inquiry and hearing, the combined judgment of our attorney-examiner and classification agent was not only to sustain in a large measure the suggested changes in ratings but to advocate the immediate adoption, as shown in Appendix No. 6 of the majority report, of almost complete uniformity with respect to the first four classes as well as the partial uniformity suggested in the remaining classes. With commendable prudence they worked over the mass of detail and out of it marshalled a real approach toward the result the commission has sought for more than a score of years. The parts of the work which proposed substantial uniformity in ratings, and likewise the parts of the work of the several committees which proposed desirable changes —I refer to the proposals and suggestions that reach beyond uniformity of "rules and description"—are passed to the director general by the commission, not with recommendations, but, as I read the majority report, with the suggestions that these parts be merely laid upon the shelf labeled "preserved for future reference." In course of a few years we may again hear of this work, but is it not likely then to be labeled "obsolete"?

There has thus been another move in what may be likened to a game of chess commenced in 1897; the director general passed to the commission the question of changed ratings and the commission passed it back. The reason assigned for declining to make recommendations in respect of ratings is "that many important changes as to which interested shippers have had no notice or opportunity to be heard would be included." To my mind this means about the same as sustaining a demurrer to a dilatory plea in an ordinary lawsuit, rather than the exercise of an administrative function. We have ample authority under section 15 of the act to prescribe reasonable classification ratings and rates, and in my judgment the commission will not accomplish the uniformity in classification which for years it has been seeking, and which it evidently believes would be reasonable, until we affirmatively exercise our administrative functions in that direction.

In the recommendations made I concur only because they are a step in the right direction; but I am unwilling to acquiesce in declining recommendations in respect to uniform ratings upon the ground that changes are suggested of which shippers have had no notice or have not been heard, when the rights of such shipper are amply protected by the statute.

In expressing this view I do not wish to convey the impression that I favor, either in the form of uniform classification ratings or otherwise, substantial increases in rates for revenue purposes. I am opposed to that course and have been since the beginning of this proceeding; moreover, the presentation of the proposed classification was accompanied by an express disavowal that it was intended as a revenue measure. The point I wish to emphasize is that recommendations looking toward uniform ratings and the prompt establishment of a uniform classification could have been made without, in a legal sense, approving or authorizing increased rates. If any unwarranted and unjustifiable rate increases resulted such shippers as found themselves adversely affected promptly could seek and secure relief under the provisions of the regulating statute.

General News Department

The Seaboard Air Line has decided to use oil fuel in the locomotives on its lines south of Hamlet, N. C., and has contracted for a supply of oil from Mexico.

The Mechanical Section of the American Railroad Association has given notice that the Rules of Interchange as revised in June, 1918, will be continued in effect until November 1, 1919.

The House of Representatives has passed a bill taking away from the President the power to change rates without the approval of the Interstate Commerce Commission. The House bill amends a bill already passed in the Senate and now goes to conference.

The Brotherhood of Railway and Steamship Clerks, Freight Handlers', Express and Station Employees has been ordered to take a strike vote to enforce demands made to the Railroad Administration by the Brotherhood on August 18, according to statement accredited to J. J. Forrester, president of the brotherhood.

W. Merrifield, lately sergeant in the British army, but now a fireman on the Algoma Central & Hudson Bay, was invited to board the royal train when the Prince of Wales passed over that line, and was invested by the prince with the Victoria Cross. Sergeant Merrifield won this decoration at Cambrai in October, 1918.

The Sandusky (Ohio) Chamber of Commerce has instituted a campaign for the early realization of the project to build a bridge across Sandusky Bay with available tracks for the Northwestern Ohio, thereby giving it an entrance to Sandusky. A general committee of bankers, manufacturers and merchants has been appointed to push the project to completion.

The city of Youngstown, Ohio, has applied for a writ of mandamus to force the Erie to proceed at once with grade separation work in that city. The application claims that the road has not proceeded with due diligence to acquire land needed for the elimination of a number of crossings and in the meantime property values have advanced, which will mean a loss to the city, as it is responsible for 35 per cent of the expenses.

Several hundred claims against the American Railway Express Company, for goods lost, were the subject of a conference of merchants in Philadelphia last week, the claims being for packages which were collected from shippers by a thief, disguised as a truck driver for the express company. Whether or not the claims have been presented to the company is not stated. The merchants are going to demand payment for their losses on the ground that the express company is responsible for failure to prevent the unauthorized use of its drivers' uniform.

"Fire-Prevention Day," October 9, is to be converted, this year, in Chicago, into a "fire and accident prevention day." The Chicago Association of Commerce has promulgated this title, and has urged all residents of the city to co-operate in the reduction of accidents and in the prevention of fires. October 9 is the anniversary of the Chicago fire, and public exercises are to be held. The circulars issued in this campaign refer repeatedly to the success of the Railroad Administration in conducting its "no-accident week" and similar campaigns.

Sir Alfred W. Smithers, chairman of the board of directors of the Grand Trunk Railway of Canada, has agreed to submit to arbitration the question of the terms on which the Grand Trunk System shall be transferred to the Dominion Government, the decision of the arbitration tribunal to be accepted as final by both sides. The Government has offered the directors an annual rental of $3,600,000, this amount being based on the average earnings of the last ten years. The directors asked $5,800,000, basing their demand on the net receipts in 1913.

At the threshold of bankruptcy, is the present position of the railroads of America, according to Robert F. Maddox of Atlanta, Ga., president of the American Bankers' Association. The statement was made in the course of an address before the Illinois State Convention of the American Bankers' Association, held recently at La Salle, Ill. The cause, Mr. Maddox declared, was that the nation's roads never had been able to convince the federal rate making body of their financial need. His address also included a plea for a solution of the present railroad problem that would be free of all political consideration.

Six and a half miles is the latest airplane altitude record; made near New York on September 18, by Roland Rohlf. The exact indicated height was 34,610 ft., and it is officially reported. This is 5,610 ft. higher than the highest peak of the Himalayas, the highest mountain in the world. At about 17,000 ft. the airplane became invisible from the earth and was out of sight for an hour. The aviator wore an oxygen mask, and began inhaling oxygen when he was at a height of 20,000 ft. For twenty minutes he was in a temperature of 43 degrees below zero. The management of the machine in the rarefied air above 31,000 ft., was very difficult. On the following day Rohlf rose from the ground to a height of 2,000 ft. in ten minutes.

A train robbery on the Canadian National, near Harlaka, a short distance from Quebec, on the morning of September 18, is said to have netted the robbers $100,000. The train was the Ocean Limited, eastbound. Five masked robbers appeared in the mail car, while the train was in motion, having smashed in the rear door of the car; and after intimidating the mail clerks, and taking the money, which was in coin, in bags, they jumped off the train while it was approaching the next station, St. Thomas; the robbery was not discovered, however, until the train had run about 25 miles farther, to Cap St. Ignace, where the conductor became suspicious at the silence in the mail car. He went in, and found the five clerks bound with ropes.

Dr. John D. Robertson, health commissioner of the City of Chicago and head of the Smoke Prevention Bureau, recently declared, in connection with a smoke prevention drive he is now conducting, that smoke from locomotives in the city of Chicago must be eliminated. Just how this can be accomplished Dr. Robertson is not quoted as saying. A recent newspaper statement quotes him as saying: "I don't care how the railroads end the smoke nuisance. They can use smokeless coal, change their boilers or do anything they desire, but the smoking engines must stop. No excuses will go." Railway executives, master mechanics, and locomotive firemen and engineers were called into conference in Dr. Robertson's office and plans were formulated for reducing the smoke nuisance insofar as the railroads entering Chicago are concerned.

The United Mine Workers of America, in convention at Cleveland, Ohio, in addition to advocating an alliance with the railroad brotherhoods, have further co-operated with the latter in opposition to the clauses in the Cummins bill, now pending in the Senate, prohibiting strikes in the railroad industry. In addition, they have formulated a demand for a 60 per cent increase in wages, a limit of six hours upon the lay's labor underground, a five-day week with time and a half for overtime and double time for work on Sundays and holidays. A joint wage scale conference is to be held with

the operators of the central competitive district at Buffalo, N. Y., at which a new agreement will be discussed. Should no agreement be reached at this conference in time to be ratified by the convention, which will be reconvened at Indianapolis for that purpose, a general strike of all bituminous coal miners in the United States will automatically ensue on November 1.

A shortage of labor, housing and storage facilities has led to a congestion of freight at the Detroit (Mich.) terminals and as a result an embargo on less than carload freight has been considered as a means of eliminating this congestion. The terminal warehouses are full of household goods, in addition to which there is a large accumulation at the present time in cars on the terminal tracks that is unable to reach the terminal warehouses. In addition many families arriving in Detroit with their household effects have been forced to reship them to their former homes because of the congestion. Efforts are being made to force consignees to remove their shipments at the end of the three-day storage period allowed them and it is hoped by this means to eliminate the congestion to a certain extent. It is believed by railroad operating officers at Detroit that if freight can be moved from the terminal warehouses within the three-day time limit, much of the present trouble will be eliminated and the railroads will be able to handle the situation without placing an embargo in effect.

Florida is the latest state to be advertised by the Railroad Administration. Its advantages as an agricultural state are presented in an illustrated booklet issued by the Division of Traffic, Agricultural Section. P. H. Rolfs, dean of the Florida Agricultural College, who extends a welcome to homeseekers, says that the opportunities offered by Florida are unsurpassed in any part of America; and America is the best of the world. "Florida is a land of undeveloped opportunity, as well as a land of almost unlimited agricultural possibility. It is a land in which agriculture is new, giving an opportunity for the largest range of imagination and constructive ability. . . . Nature has done almost everything to make this an ideal land for agricultural development. The cold is rarely severe, even in northern Florida, and the hottest summer days are comparatively mild, sunstroke being unknown. The educational advantages of the state are second to none. . . ." Ralph N. Greene, State Health Officer, writes about health conditions. Dependable information is given regarding the state's farm production, transportation facilities, markets, roads, schools, churches and living conditions.

Meeting of Western Chief Special Agents

Chief special agents and heads of special service departments of all roads in the Central Western Region attended a meeting at Chicago on September 12, called by Hale Holden, regional director of the Central Western Region, at the request of R. S. Mitchell, chief of the Secret Service and Police Section of the United States Railroad Administration, to form a permanent regional organization of chief special agents and heads of special service departments for co-operative work of material benefit for the protection of property. Emmett Gregg, chief special agent of the Atchison, Topeka, & Santa Fe, with office at Topeka, Kans., was elected president of the new organization; H. A. Koach, inspector in the Secret Service and Police Section of the Railroad Administration, was appointed inspector at Chicago, and James Dahlman, also an inspector in the Secret Service and Police Section, was appointed inspector at Omaha, Nebr. The new association will appoint a committee having among its members representatives from railroad centers throughout the region. It will be the duty of this committee to appoint other committees at the smaller terminals or junction points. The chief special agent of the line having the most business at these points will designate his special agent as chairman of these subcommittees. Mr. Mitchell has also appointed an advisory committee of chief special agents, one from each region in the United States, who will meet with him to further direct the work. T. E. Pratt, chief special agent of the Chicago, Burlington & Quincy, with office at Chicago, will represent the Central Western Region on this committee.

Pullman Conductor's Pay Further Increased

A readjustment of the wages of sleeping and parlor car conductors has been made by the Railroad Administration which gives these men, numbering about 24,000, a further increase of from $10 to $15 a month, retroactive to May 1, 1919. This increase is in addition to the general raise of $25 which was granted under general order No. 27 (April 14, 1919). That increase was based on incorrect data concerning working conditions, and the Pullman conductors did not receive an increase on a par with other railroad employees. The Railroad Administration calls attention to the fact that the present is not a further increase resulting from the demands of employees, but merely a readjustment to correct an error.

Safety on the Southern Pacific

In announcing the National Railroad Accident Prevention Drive, R. J. Clancy, in charge of this work for the Southern Pacific, Lines South of Ashland, calls attention to the fact that during the last 12 years the Southern Pacific has transported approximately half a billion revenue passengers (19,000,000,000 revenue passenger miles) with such a high degree of safety that, relatively, a passenger may travel on the Southern Pacific the equivalent of seven hundred and sixty thousand times around the world without danger of loss of life in a train accident. One of the safest places in the world is on a Southern Pacific train. "We have demonstrated ability to safeguard the traveling public, but what about safeguarding each other? Are we manifesting the same degree of interest and care in safeguarding ourselves? Our record in this respect is good, but we can make it better."

American Legion on the Pennsylvania

Employees of the Pennsylvania Railroad, at the general office in Philadelphia, who have been in the military or naval service, number over 1,400, and "Pennsylvania Railroad Post, No. 204," of the American Legion has just been formed. Over 500 men attended the first meeting, and were enrolled as charter members. Twelve such posts have been started on the lines of the Pennsylvania, east of Pittsburgh, and it is expected that the national body will approve of the wish of the employees to call these, permanently, Pennsylvania Railroad Posts. Altogether, on the eastern lines of the Pennsylvania, over 18,000 employees entered the military or naval service in the World War. Among those who have joined Post No. 204, are Brigadier General W. W. Atterbury, Colonel H. C. Booz, Colonel C. M. Bunting, Lieutenant-Colonel J. W. Study and Lieutenant-Colonel I. A. Miller. The president of Post No. 204 is Claude Liddy and the Secretary, J. M. O'Brien.

The President's Labor Conference

President Wilson has announced a list of 22 men whom he has invited to represent the general public at the conference to be held at Washington, October 6, to discuss relations between capital and labor. Twenty-two representatives of labor and an equal number of employers are also to be selected. The President's list is as follows:

Bernard M. Baruch of New York, former chairman of the War Industry Board; Robert S. Brookings of St. Louis, former chairman of the Price Fixing Committee of the War Industries Board; John D. Rockefeller, Jr.; Elbert H. Gary, chairman, United States Steel Corporation; Dr. Charles W. Eliot, president Emeritus of Harvard; Charles Edward Russell, of New York; John Spargo, of Vermont; O. E. Bradfute, Xenia, Ohio, president Ohio Farm Bureau Federation; Ward Burgess, Nebraska; Fuller R. Callaway, La Grange, Ga., cotton manufacturer; Thomas L. Chadbourne, New York; Charles G. Dawes, president Central Trust Company, Chicago; H. B. Endicott, Milton, Mass.; Edwin F. Gay, dean graduate School of Business Administration, Harvard University; George R. James, Memphis, Tenn.; Thomas D. Jones, Chicago; A. A. Landon, Buffalo; E. T. Meredith, Des Moines, Iowa, editor Successful Farming; Gavin McNab, San Francisco; L. D. Sweet, Carbondale, Col.; Louis Titus, San Francisco.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JULY, 1919

Name of road.	Average mileage operated during period.	Operating revenues: Freight.	Passenger.	Total (inc. misc.)	Operating expenses: Maintenance of Way and structures.	Maintenance of Equipment.	Traffic.	Transportation.	General.	Total.	Operating ratio.	Net from railway operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.

The Condition of the Cotton Belt

The tracks of the St. Louis Southwestern, in Texas, are unsafe for normal operation, according to a telegram given out at Austin by the chairman of Texas Railroad Commission, the telegram being signed by J. M. Herbert, president of the railway company. The telegram, as printed in Texas papers, reads:

"Undoubtedly portions of the St. Louis Southwestern tracks in Texas have reached a point through failure and neglect of maintenance by Railroad Administration of unsafe condition for normal operation, as evidenced by accidents killing and injuring employees and others, traceable directly to inadequate inspection and maintenance. In my opinion it is the duty of your commission to make an immediate inspection with view of having conditions improved. If you desire any assistance or further information from me shall be glad to respond."

The commission replied to Mr. Herbert with a request for detailed information, promising to make inspections where necessary.

The St. Louis Southwestern is in the Southwestern Region, B. F. Bush, regional director, and the federal manager is William N. Neff.

Public Ownership Conference

With the railroad question and the Plumb Plan solution of the railroad problem "the first and most important subject on the program," a public ownership conference will be held under the auspices of the Public Ownership League of America in Chicago on November 15, 16 and 17. The general purpose of the conference, as stated in the announcement "is to study the problems of public ownership, to get the ideas of the most careful and competent utility experts in America, to hear the methods and plans of those who have made a success of public ownership in this and other countries and to devise ways and means for the advancement of the public ownership, efficient operation and democratic control of public utilities." Glenn E. Plumb, author of the Plumb Plan for government ownership of the railways and their operation by the railway employees, will speak, and may, according to the announcement, enter into a debate on the subject, the negative side of which will be taken by a representative selected by the United States Chamber of Commerce, provided, of course, this organization accepts the invitation which has been extended to it. Lawrence B. Finn, chairman of the Kentucky State Railroad Commission, W. L. McKenzie King, leader of the Liberal Party in Canada and Frank P. Walsh, formerly of the War Labor Board will also speak on the railway problem.

National Agreement with Shop Unions

Heretofore the shopmen have had local agreements with the railroads being operated under the United States Railroad Administration. For some time the representatives of the shopmen and of the Railroad Administration at Washington have been working on a national agreement which should supersede the local agreements. Such an agreement has now been worked out and, in general, agreed on between the representatives of the Administration and the shopmen. It is expected that this agreement will be signed in the near future. In general, it does not change existing agreements materially, but simply incorporates the provisions of these agreements into a comprehensive national agreement. The scale of wages is not raised, it is understood, but the shopmen are left free to apply for higher wages on account of the increased cost of living and, in general, the form of agreement is like that entered into between the four brotherhoods and the Railroad Administration.

Pennsylvania's Relief to Soldiers; $257,454

E. B. Hunt, superintendent of the Pennsylvania Railroad Voluntary Relief Department reports that from the time of the outbreak of the trouble on the Mexican border in 1916, to August 1 of this year, he has paid to the beneficiaries of those employees who were members of the Relief Fund and who were killed or died from other causes, while in military or naval service, $182,000; to members incapacitated on account of sickness or accident while in military or naval service, $44,130, and to dependent members of the families of these men $31,324.

At the outbreak on the Mexican border the directors of the railroad company granted furloughs to employees who entered military or naval service and a special fund was created to provide financial assistance for these employees, as well as their families, in case of necessity. In April of the following year when the United States declared war on Germany, it was decided to continue the same arrangement during the world war, and employees who were members of the Relief Fund and who were disabled while in military or naval service, have regularly received the benefits provided by the rules. A special bureau was established in Philadelphia, which kept in touch with the military authorities; and the Voluntary Relief Department made prompt payment of benefits accruing to employees in the same manner as though they had been in the service of the railroad at the time.

Steel Strike Situation

The strike in the steel mills in the Chicago district, after continuing for almost two days without serious clashes between police, mill guards and strikers, resulted, on September 24, in fighting between strikers and workers leaving the plants. At the Indiana Harbor, Indiana plant of the Mark Manufacturing Company eight or ten men were badly beaten and others slightly injured in clashes between the loyal workers and members of the unions which are on strike. Very little change is recorded in the strike situation in the Chicago district. Union officers and company officers have issued statements concerning the situation which do not agree. The Elgin, Joliet & Eastern Railway, which is owned by the Steel Corporation and handles much of tonnage to the steel producing districts near Chicago, has not experienced any serious trouble so far and is handling regular tonnage already fabricated. However, the traffic from the cement plant to the steel mills has been practically eliminated because of the closing down of many of the furnaces. No action has been taken in the Chicago district by members of the railroad brotherhoods in regard to the strike.

Senator Hoke Smith Denounces Plumb Plan

Senator Hoke Smith of Georgia recently stated his position in regard to the Sims bill, in which is embodied the Plumb plan for government ownership of the railways and their operation by the employees, in a letter to Atlantic Coast Line Shop Federation officers in reply to a letter requesting him to aid in the passage of this bill. Senator Smith's letter in part is as follows:

"I desire to answer you with entire frankness. I am opposed to the 'Plumb Bill,' and do not believe it will receive considerable support in Congress. I feel sure it should not receive such support. I have had a number of letters from my constituents with reference to it, and all, except railroad men directly interested in the bill, have protested against its passage. I do not believe the railroad men will urge it when they fully understand it.

"As you perhaps know, for many years I have earnestly sought to help the men employed in the railroad service to better their conditions. I have insisted that the owners of the roads should not be permitted arbitrarily to fix the pay of the men, or to fix the conditions under which they were to work, and that the men were entitled to a hearing, and that finally, if the men and the owners could not agree, impartial arbitration should settle their disputes. This was the position of the brotherhoods for many years, and the right of arbitration was contested by owners of the properties.

"It is proposed in the 'Plumb Bill' that these properties bought by the Government shall be operated by the National Railway Operating Corporation, which is to be a corporation without capital stock; the Board of Directors, Official Employees and Classified Employees to constitute the corporation. The bill provides that the corporation is to be operated by fifteen directors, five named by the President and confirmed by the Senate, and five by the Classified Employees and five by the employees other than classified. But the employees, without putting up a dollar, are to have ten of the directors and control the corporation.

"The 'Plumb Bill' therefore proposes that one hundred and ten millions of people buy eighteen billions of dollars worth of property and turn it over to be controlled by a Board of Directors, two-thirds of whom are selected by the employees of the railroads.

"The proposition is so unreasonable it scarcely deserves serious discussion.

"Again, how could you obtain the railroads by issuing the

bonds. The owners would not be compelled to sell except for money. It would probably be necessary to go into the markets and sell the bonds. We know the difficulty with which we sold Liberty and Victory bonds. It required the patriotic enthusiasm of the entire people to absorb them. It created a vast quantity of credit, and to a substantial extent, disorganized the business of the country. To put eighteen billions more of bonds upon the market would be most unwise.

"Furthermore, if such a course was justified as to railroads it would be justified as to all other industries. It would be justified as to farms. The amount of the bond issue would reach a fabulous sum. It would be to substitute Russian conditions for our own.

"Now, let me say to you a word which comes from my sincere regard for you, and my earnest desire for your welfare.

"Last year the payroll of the employees of the railroads was increased approximately one billion dollars. It may be that this amount was not equally distributed among the employees. If so, adjustments should be made. But this one billion dollars increased the cost of living of all the people. It went to increase freight rates and increased passenger rates. The necessities of life became more expensive as a result of this increased compensation to the railroad employees. This one billion dollars is carried by the farmer, by the man in town, and by the man in the city. Not only did the railroad employees receive their increase in pay, but they received approximately five hundred millions of dollars in back pay.

"Be wise and be reasonable. Do not allow yourselves to be persuaded to adopt extreme measures. You have won the confidence of your fellow citizens. In years past you have enjoyed their intense sympathy. You cannot afford to lose it. You cannot afford to put yourself in the position of seeking to force discriminatory advantages.

"When you were opposed I fought for you, and now I beg of you not to take action which will place you in the position of seeking to do injustice to others."

Shortage of Automobile Cars

On account of the acute shortage of automobile box cars in the Michigan-Ohio territory, R. H. Aishton, regional director of the Northwestern Region has issued instructions to suspend the loading of automobile cars at all points within 500 miles of Chicago and expedite these empty cars east through Chicago. The only exception to this order is actual automobile loading within the restricted territory.

Master Car and Locomotive Painters' Convention

The Master Car and Locomotive Painters' Association met at the Hotel LaSalle, Chicago, on September 9, for its forty-eighth convention, with J. F. Gearhart, foreman painter, of the Pennsylvania Railroad at Altoona, Pa., presiding. The association was welcomed by a representative of the Chicago Association of Commerce, following which the president addressed the convention and the secretary-treasurer presented his report. The association then proceeded to the consideration of technical papers.

At the Wednesday morning session the question of amalgamation with the American Railroad Association was considered and it was voted unanimously to join as a division of the Mechanical Section.

Roadmasters' Association Elects Officers

At the closing session of the thirty-seventh annual convention of the Roadmasters' and Maintenance of Way Association in Chicago on Thursday of last week the following officers were elected for the ensuing year: President, J. W. Powers, supervisor, N. Y. C., Rochester, N. Y.; first vice-president, W. P. Wiltsee, principal assistant engineer, N. & W., Roanoke, Va.; second vice-president, L. M. Denny, supervisor, C. C. C. & St. L., Indianapolis, Ind.; secretary, P. J. McAndrews, roadmaster, C. & N. W., Sterling, Ill., (re-elected); treasurer, Coleman King, supervisor, L. I., Jamaica, N. Y. (re-elected). Directors: J. B. Baker, supervisor, general manager's staff, Penn. R. R., Philadelphia, Pa.; R. J. Vaughan, general roadmaster, U. P., Green River, Wyo.; T. E. White, roadmaster, A. C. L., Sumter, S. C.

Traffic News

All previous records for the handling of livestock cars were shattered at the South Omaha, Nebr., yards on Monday, September 15, when the receipts of stock cars totaled 1,337 cars. Again on Friday night, September 19, a record for the month of September was established for the loading of live stock cars at the same yards, a total of 475 cars being loaded and moved.

Thomas J. Lipton, Inc., London, Eng., has established a traffic department in Chicago with A. C. Hedlund as western traffic manager. Mr. Hedlund was formerly connected with the Chicago office of the Southern Pacific for fifteen years, holding various positions. He was foreign trade agent of the Southern Pacific at Chicago previous to the closing of that office by the Railroad Administration. Since that time he has been connected with the Trans-Oceanic Company, with office in Chicago.

The United States Grain Corporation recently announced that it is paying country grain dealers thousands of dollars each week under the terms of an agreement that any dealer unable to ship at least 20 per cent of his holdings within a given week is entitled to 3½ mills a bushel a week from the corporation to cover interest and insurance charges. The shortage of cars for shipment of grain has resulted in many claims being made for such allowances and these are being paid by the Grain Corporation.

Dracos A. Dimitry, traffic manager of the New Orleans & South America Steamship Company, New Orleans, La., has been placed in temporary charge of that concern's new office in Chicago. Mr. Dimitry was for a number of years connected with the traffic departments of the Southern Pacific and the New Orleans & North Eastern, with office at New Orleans, La., and before serving in the war as an army aviator he was traffic manager of the Great Southern Lumber Company at Bogalusa, La.

The Traffic and Transportation Bureau of the Tacoma (Wash.) Commercial Club and Chamber of Commerce, believing that shippers should express their views on the question of proposed railroad legislation, has adopted a plan for the solution of the railroad problem. This plan is based largely upon the plan adopted by the Chamber of Commerce of the United States, but with a number of changes. Copies of the plan have been forwarded to members of the Senate and House committees on interstate commerce for their consideration.

The Railroad Administration's report on export traffic for the week ending September 17 shows 6,899 cars of commercial export freight received at North Atlantic ports, as compared with 941 cars for the same week of 1918, an increase of 5,958 cars or 621 per cent. At South Atlantic and Gulf ports there were 8,925 cars of export freight on hand on September 16, as against 8,621 cars one week previous, an increase of 304 cars. For the week ended September 17 there were 14,885,043 bushels of grain in elevators at North Atlantic ports and at South Atlantic and Gulf ports 9,211,442 bushels. The elevators at Port Arthur were empty.

Macon (Georgia) Prepares for Railway Strike

The Macon (Ga.) Chamber of Commerce, fearing the possibility of a general railroad strike, has organized a fleet of 500 motor trucks to haul freight to and from Macon in event threats of the leaders of the railroad unions to call a nation-wide strike of employees should materialize. Furthermore, the motor truck division of the transportation department of the Chamber has organized a force of drivers and adopted plans for conserving supplies of gasoline and lubricating oil. This motor transportation plant was formed primarily to insure an adequate food supply coming from the rural

districts around Macon, but it could also carry merchandise to farms and country towns.

Also, the Chamber of Commerce has adopted resolutions advocating amicable settlement of the differences between the railroads and their employees, opposing any steps that may constitute a surrender of the carriers to bolshevistic tendencies.

Civic and commercial organizations of Georgia have been informed of the action taken and their cooperation requested. It is proposed to establish motor express lines, paralleling the railroads and connecting with each other.

Refrigerator Car Shortage

Some interesting facts on the production and movement of perishables have been compiled by William Sproule, district director of the United States Railroad Administration at San Francisco, Cal. His view of the car shortage situation, insofar as California perishables are concerned, is as follows:

"The fruit and vegetable crops throughout the United States have been very large and shipments heavy. Every car that could be had anywhere has been pressed into this national service. The fruit is carried in special trains and returning refrigerator cars have preference over every kind of freight except livestock. The production of fruit was greatly stimulated during the war, but no refrigerator cars could be built. This stimulation is still felt and it naturally creates an acute demand for each refrigerator car in this year when the crops requiring such cars are heavy everywhere from California to Georgia, and from Florida to the Pacific Northwest. It is a crop surplus rather than a car shortage. For the past three months shipments from California were about 50 per cent above the same period last year. During the first twelve days of the current month, the Pacific Fruit Express alone furnished 71 per cent more cars for fruits and vegetables in California than during the same days in 1917, and 66 per cent more than during the same days in 1916. For the five months, June to October, inclusive, the increase in shipments of fruits and vegetables this year will probably be about 45 per cent and possibly 50 per cent above last year."

Terminal Committees to Expedite Car Movement

The traffic managers at Kansas City, Mo.; Omaha, Nebr.; Peoria, Ill.; Des Moines, Iowa; Davenport, Iowa, and Alton, Ill., and the chairmen of the local operating committees at Denver, Colo., and St. Joseph, Mo., have been instructed by Hale Holden, regional director of the Central Western Region, to create a special committee at once to specialize in the handling of all equipment matters at terminals under the jurisdiction and supervision of the terminal managers and chairmen of the local operating committees. The purpose of these committees will be, in general, to expedite the handling of equipment at terminals in order to relieve, as far as possible, the present acute car shortage. A study of methods of speeding up road and yard movement, securing heavier loading equipment, establishing and maintaining complete and accurate yard checks, reducing the number of bad order cars, making prompt delivery to connections, effecting earlier deliveries at freight houses and team tracks, preventing delays and abuse of equipment loaded with company material and expediting movement of grain cars in terminals will be made. In addition the committees will give particular attention to the service to and from industries and to interchange between lines. It is believed by means of this study and work that much lost motion in the delivery of cars to industries, either loaded for unloading or empty for loading, and in taking away such cars promptly when they are ready to move, either as loads or empty, will be taken up. The men selected by the terminal managers and the chairmen of the local operating committees to serve on the special committees are to belong to the terminal organizations and be carried on the payrolls of the present employing road. In addition, as many outside inspectors as are necessary to make the committee's work effective are to be employed and the committee will function as a separate department of the terminal organization.

Commission and Court News

State Commissions

The Railroad Commission of California has received from Tehama County an appeal that the Commission compel the Southern Pacific to proceed with the construction of a subway under its tracks near Red Bluff. The county officers declare that the plans for the subway have been approved by the county, the highway commission and the railroad and that the county is ready to proceed with its share of the work. It is asserted in the application that eight months ago the railroad sought delay due to the fact that labor and material were increasing in cost, that furthermore this condition is likely to continue and that therefore no further delay should be tolerated.

Nebraska is again suffering from the seasonal shortage of grain cars, according to a bulletin issued by the Nebraska Railway Commission. This shortage bids fair to be as severe as that of 1916 with a difference that at the present time the price of grain is fixed, whereas in 1916 the price was steadily rising. After considering the matter carefully, the commission decided that it would make no efforts this fall to see that cars were equitably distributed between railroad stations and between shippers at stations. This position was taken because, under the decisions of the Supreme Court, the federal government has supreme power in handling the railroads during the period of government control and state commissions cannot attack its jurisdiction.

Personnel of Commissions

Simon J. McLean, whose appointment as assistant chief railway commissioner of the Board of Railway Commissioners of Canada was announced in the *Railway Age* of September 12, was born on June 14, 1871 in Quebec, Que., and was educated at private and public schools in that city. He was graduated from the University of Toronto in 1894 and from 1894 to 1897 he was a graduate student in economics at the Universities of Toronto, Columbia and Chicago. From 1897 to 1902 he was professor of economics and sociology at the University of Arkansas, in addition to which he served as an expert on railway commission legislation and as a special commissioner on railway rate investigations for the Department of Railways and Canals of Canada. From 1902 to 1905 he was associate professor of economics and social science at the Leland Stanford Jr. University, California. In 1903 and 1904 he served as expert in charge of railway valuation in the Rocky Mountain states for the Bureau of the Census and the Interstate Commerce Commission. From 1906 to 1908 he was associate professor of political economy at the University of Toronto and in 1908 was appointed a member of the Board of Railway Commissioners of Canada. He was re-appointed for a second term in 1918, in which capacity he served until his recent promotion.

Court News

"Stop, Look, Listen"

The Pennsylvania rule as to the traveler's duty to stop, look and listen before attempting to cross a railroad is somewhat more stringent than in the majority of the states. It is an absolute and unbending rule that a traveler must stop, look and listen before he crosses any tracks. If he has done this and then proceeds, the question whether or not he has thereafter exercised proper care and whether it is necessary for him to stop again, is held a question for the jury. The fact that the first track was a siding on which cars impeded the traveler's view did not, the Pennsylvania Supreme Court holds, relieve him from the obligation of the rule. It has also been held that when a driver stops at a point where an

obstruction prevents a proper view of the railroad, he must descend from his vehicle, and, if necessary, walk to a point where the prospect is clear.—Benner v. Philadelphia & Reading (Pa.), 105 Atl. 283.

The Alabama Supreme Court holds that a person attempting to cross a railroad track on which cars and locomotives are liable to be passing cannot recover for simple negligence of the railroad unless he stops and looks in both directions and listens; and this duty is absolute at any railroad crossing, whether in a city or the country, or whether the track crossed be the main line or a side track, and regardless of the frequency of passing trains.—A. C. L. v Jones (Ala.), 80 So. 44.

Employers' Liability Act

An employee was injured while riding to work on an engine provided by his employer. His regular work consisted in cleaning fires and coaling locomotives, part of which were engaged in interstate commerce. The New York Appellate Division holds that he was at the time of injury engaged in interstate commerce within the act.—Lindstrom v. New York Central, 174 N. Y. Supp. 224.

Fires from Sparks

In an action for damages from fire from a locomotive, the Connecticut Supreme Court of Errors holds, Gra. Rock Spring Co., v. Central New England Ry. Co., 105 Atl. 350, that evidence of other fires, and of the emission of sparks, and of the finding of cinders, should be limited in point of time and place to facts having some probative value in establishing the probable cause of the particular fire in question. The admissibility of such evidence is a matter of judicial discretion.

Intrastate Shipments—Limitation of Liability

Where rates for intrastate shipments are based on the value of the property as set out in the contract, the Kansas Supreme Court holds that a provision thereof limiting the carrier's liability to that amount is valid, even with respect to loss occasioned by its negligence. In the absence of evidence to the contrary, it will be presumed that the tariffs in use by a carrier have been properly filed with the utilities commission.—Kennedy v. Atchison, T. & S. F. (Kan.), 179 Pac. 314.

Burden of Proof of Non-Delivery

The burden rests upon the shipper, in an action against a railroad, to establish the fact of nondelivery of freight. The New York Appellate Division holds that the mere fact that the goods were receipted for at destination by a third party was no evidence of nondelivery to the consignee, in the absence of proof that such party was not authorized to accept the goods on his behalf; nor was hearsay evidence of an assertion by the consignee that he had not received the goods.—Hirsch v. L. V., 174 N. Y. Supp. 68.

Refusal of Train Men to Extinguish Timber Fire

The Pennsylvania Supreme Court has repeatedly held that where a railroad company takes the necessary precautions and employs a proper mechanism to prevent the escape of sparks from its engines, there can be no recovery of damages for any injury which results simply from the throwing of sparks, provided the mechanism is in proper condition. A somewhat different question arose in a recent case. A fire started on land contiguous to a railroad's coal branch, but not on its right of way, and not from any negligent operation of its trains. The fire extended to land beyond and set fire to timber thereon. In an action for the destruction of the timber the negligence alleged was that of the train men in not extinguishing the fire. It was held that the railroad was not liable for the refusal of the train men to leave their train and extinguish the fire, as this duty was not within the scope of their employment.—Genter v. Pennsylvania (Pa.), 105 Atl. 824.—Decided January 4, 1919.

Foreign Railway News

Exports of Locomotives in July

Only a few locomotives were exported during July. The following figures compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce shows a total of only 17 valued at $322,775.

Countries.	Number.	Dollars.
France	4	170,450
Canada	1	3,000
Mexico	2	25,000
Brazil	1	11,100
Chosen	2	18,300
Philippine Islands	7	94,925
Total	17	322,775

French Canals Opened

Water communication between Belgium and the liberated regions along the old battlefront may be considered as reestablished, according to a report made to President Poincare by M. Clavelle; Minister of Public Works and Transport. The report states that navigation is almost normal once more along the Aire, Deule, Sensee, St. Quentin and Somme canals; that since the armistice approximately 350 miles of double track railroad and 300 miles of single track line have been reconstructed and only 29 railroad stations remain to be opened to traffic. Among other works completed, it is stated, are 367 bridges which were destroyed during the war.

Electrification of Railway from Christiania to Drammen

The Norwegian Government, writes Consul General Marion Letcher of Christiania, Norway, has recently accepted the bids submitted by three Norwegian firms for the electrification of the railway from Christiania to Drammen. The three companies are: A/S Norsk Electrisk & Brown Boveri; Norsk Maskinindustri, A/S; A/S Per Kure.

The bids include 18 standard gage electric locomotives, which are to be built at Thunes Mekaniske Verksted at Christiania. This is the first definite step to be taken in the plan for the electrification of the entire Norwegian railway system. The power is to be obtained from the Hakavik power station, which is located not far from Kongsberg, Norway, where can be produced about 25,000 horsepower.

Bolivia-Argentina Line to Be Pushed

Announcement is made, says a press despatch from Buenos Ayres, that the Bolivian Legation has concluded preliminary arrangements with the Argentine Government which are calculated to expedite work on the proposed railroad from Formosa, Argentina, to Cochabamba, Bolivia. The line as now planned will have 500 kilometers in Argentina and 850 in Bolivia. English engineers are already at work on the survey and construction is expected to begin as soon as the railroad material market shall have returned to normal.

This line when finished will open up the rich forest lands of the Bolivian and Argentine Chaco, development of which has been anxiously waited for many years. It will also place the Bolivian montaña in easy communication with Buenos Ayres via the extension from Formosa to Embarcacion and will be of great advantage to Santa Cruz, an important city of eastern Bolivia. In addition, this line will provide another transcontinental railroad, for at Cochabamba, a junction will be effected with the Antofagasta Railroad.

Sweden is to get 5,000,000 tons of coal annually from America under an agreement reached with American exporters, according to press despatches from Stockholm. The freight charges on the coal will be about $25 a ton. Sweden is beginning to feel the lack of coal, due to British restrictions on its shipment from Germany.

Equipment and Supplies

Locomotives

MITSUI & Co., LTD., 65 Broadway, New York, is inquiring for ten Consolidation type locomotives, and six ten-wheel locomotives for the Hankow-Canton Railroad.

THE IMPERIAL KARAFUTA GOVERNMENT has ordered, through Mitsui & Co., Ltd., 65 Broadway, New York, two light locomotives from the American Locomotive Company.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., is in the market for a second-hand standard gage, consolidation type locomotive, with wheel centers of from 44 to 48 in., cylinders 20 in. by 24 in. or 26 in., a steam pressure of 180 lb., wheel base not over 23 ft., and a tractive power of not less than 26,000 lb.

Freight Cars

THE TREMONT & GULF is inquiring for 10 flat cars.

THE ATLANTIC COAST LINE has renewed an inquiry for 100 50-ton phosphate cars.

THE WESTERN MARYLAND is asking for prices for repairs on about 700 freight cars.

THE MEDART PATENT PULLEY COMPANY, St. Louis, Mo., is inquiring for one flat car.

THE BOSTON (MASS.) ELEVATED RAILWAY COMPANY is inquiring for 2 double-truck snow sweepers.

THE CHESAPEAKE & OHIO is asking for prices for repairs on between 2,000 and 3,000 freight cars.

THE FORKS COAL COMPANY, Portage, Pa., has ordered 25 mine cars from the American Car & Foundry Company.

THE PENNSYLVANIA COAL COMPANY, New York, has ordered 200 mine cars from the American Car & Foundry Company.

THE PITTSBURGH & LAKE ERIE is inquiring for 1,000 hopper car bodies and is also asking prices for repairs to freight cars.

THE CROWN OIL & REFINING COMPANY has ordered 300 40-ton 8,000 gal. tank cars from the American Car & Foundry Company.

THE ESTATE OF JOHN MURRIN, Carbondale, Pa., has ordered 25 mine car bodies from the American Car & Foundry Company.

THE CUBAN CENTRAL has ordered 200 30-ton box cars from the Pressed Steel Car Company and 200 flat cars from the Standard Steel Car Company.

WILLITS & PATTERSON, San Francisco, Cal., have ordered twenty 8,050-gal., 50-ton tank cars, equipped for the shipment of edible oils, from the Standard Tank Car Company, Sharon, Pa.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, Pa., wants to lease 15 8,000 to 10,000 gal. tank cars, with coils, for one year from October 15, and will buy or lease 35 acid tank cars.

THE UNITED RAILWAYS OF HAVANA are inquiring for 25 40-ton hopper cars. This company has also ordered 300 30-ton box cars from the Pressed Steel Car Company and 300 flat cars from the Standard Steel Car Company.

Passenger Cars

THE SOUTHERN PACIFIC has ordered 15 baggage cars from the Pullman Company.

Supply Trade News

S. B. Andrews, mechanical engineer of the Seaboard Air Line with office at Portsmouth, Va., has resigned to become vice-president and general manager of the Union **Iron Works, Inc.**, at Berkley-Norfolk, Va.

George A. Cooper, of the sales and advertising department of the United States Graphite Company, Saginaw, Mich., has been appointed advertising and export manager of the **Detroit Lubricator Company**, Detroit, Mich.

The Pollak Steel Company, Cincinnati, Ohio, has appointed the **Lake Shore Engine Works**, Marquette, Mich., as its agent for the upper peninsula of Michigan and the **E. R. Hensel Steel & Copper Company**, Security building, St. Louis, Mo., agents for the St. Louis district.

E. McCormick, treasurer of the **Railway Steel Spring Company**, New York, has been appointed assistant to the president. **H. S. Banghart**, assistant treasurer, succeeds Mr. McCormick as treasurer and B. C. Dunn has been appointed assistant treasurer; all will have their headquarters at New York.

The Carborundum Company, Niagara Falls, N. Y., has opened a branch office and warehouse in the Burkhardt building at Second and Larned streets, Detroit, Mich. This branch is under the management of **Anthony Dobson**, who will have charge of the Detroit sales district.

John F. Schurch, operating vice-president of the T. H. Symington Company Lincoln Park Works, Rochester, N. Y., has been elected vice-president of the same company in charge of all western sales, with headquarters in Chicago. Mr. Schurch graduated from the University of Minnesota in 1893. He entered the service of the Minneapolis, St. Paul & Saulte Ste. Marie the same year, serving consecutively in the office of the auditor, and of the general superintendent and in the transportation departments, resigning in 1905 after having obtained the position of chief clerk to the vice-president. From 1905 until 1914 he was associated with the Railway Materials Company of Chicago. In February, 1914, he was elected vice-president of the Damascus Brake Beam Company with office in Cleveland, Ohio, and in June, 1914, he was elected president of the same company which position he resigned the same year and was elected vice-president in executive charge under President C. H. Symington of the Symington interests in the production of 75 m.m. guns, shells and forgings. The Symington interest included the Symington Anderson Company, the Symington Machine Corp., the Symington Forge Corp., with office in Rochester, N. Y., and the Symington Chicago Corp., with office in Chicago. In August, 1918, in addition to these offices he was made operating vice-president of the T. H. Symington Lincoln Park Works. Mr. Schurch is also vice-president of the Railway Supply Manufacturers Association.

J. F. Schurch

Lawrence A. Rowe, mechanical inspector on the Atchison, Topeka & Santa Fe, with headquarters at Chicago, has been appointed general manager of the **Universal Packing & Service Company**, with office at Chicago. **The Universal Packing**

& Service Company was organized recently to manufacture and sell spring journal box packing and in addition will maintain a service department.

Joel B. Ives of the engineering and contracting department of the **American Steel Export Company,** New York, has just sailed for Italy where he will confer with M. Ferrarris & Co., Italian agents of the company, as to the means and methods for insuring a continuance of the company's sale service in that country.

Louis W. Ulmer, has been appointed eastern railway sales representative of the Detroit White Lead Works, with office in Philadelphia, Pa. Mr. Ulmer has recently been released from his duties in the United States Marine Corps. Mr. Ulmer was connected with the Detroit White Lead Works before he entered the military service.

E. G. Buckwell, secretary and manager of sales of the **Cleveland Twist Drill Company,** Cleveland, Ohio, has just returned from a three-months visit to England and the Continent, where he has made a thorough trade investigation in conjunction with the Cleveland Twist Drill Company of Great Britain, Ltd., London, the European branch of the Cleveland Twist Drill Company.

The American Car & Foundry Company has purchased two pieces of property adjacent to its plant in Chicago at a consideration of approximately $90,000, with an encumbrance of $15,000. One of the properties is 361 ft. by 240 ft. and the other 100 ft. by 240 ft. The company contemplates the building of an addition to the present plant which, together with the rebuilding of the old plant, will cost approximately $2,000,000.

John D. Rogers has received his discharge as captain of engineers in the office of the director general of military railways in Washington, D. C., and is now in the foreign sales department of the **Baldwin Locomotive Works** at Philadelphia. Prior to entering the army, Mr. Rogers was shop superintendent on the Virginian Railroad, having previously served on the Chesapeake & Ohio, the Pere Marquette, and the Union Pacific railroads.

The Vanadium Corporation of America, New York, has bought the property and rights of the American Vanadium Company, and has elected officers as follows: **J. Leonard Replogle,** president; **Merrill G. Baker,** vice-president; **Lawrence E. Diffenderfer,** treasurer and **Edward F. Nickerson,** secretary. The directors are **Chas. M. Schwab, J. Leonard Replogle, E. R. Tinker, Allan A. Ryan, Ledyard Cogswell, T. Coleman du Pont, Harry Payne Whitney,** and **Joseph D. Wyckoff.** J. Leonard Replogle was born in Bedford county, Pa., on May 6, 1876, and was educated in the public schools of Johnstown. He entered the employ of the Cambria Steel Company as office boy at the age of 13, and served successively as clerk, shipper, assistant superintendent of the axle department, superintendent of the forge, axle and bolt departments, assistant to the assistant general manager, superintendent of the order department, assistant general manager, assistant to president, and in September, 1912, was elected vice-president and general manager of sales. In February, 1915, he resigned from the Cambria Steel Company to become vice-president and general manager of sales of the American Vanadium Company, and subsequently became president and general manager of sales of the same company. He is also president of the Wharton & Northern Railroad, and chairman of the board of directors of the Wharton Steel Company. Mr. Replogle, during the war also served as director of steel supplies for the War Industries Board and had conferred upon him recently by the French Government the decoration of Chevalier of the Legion of Honor in recognition of the service he rendered for the Allied cause.

J. L. Replogle

The Dunbar Manufacturing Company, Chicago, has appointed **W. C. Irwin** as district sales representative in St. Louis and the southwest, with offices in the Frisco building, St. Louis, Mo. Mr. Irwin has been in the railway supply business for several years and at present is district representative for the Boss Nut Company, Chicago, the Railroad Supply Company, Chicago, and the Woven Steel Hose & Rubber Company, Trenton, N. J. During the war Mr. Irwin was captain in the Engineer Corps of the United States Army.

Grading and tracklaying have been started at the Niles, Ohio, plant of the Youngstown Steel Car Company, Haselton, Ohio. Erection of the superstructure of the first unit of the plant, 80 ft. by 400 ft., will begin in the immediate future. The erection of the first building is to be followed by a second of the same size. The new plant will be used for repairing cars for railroad companies and private owners. Industrial cars of smaller dimensions than standard rolling stock will be built early in 1920. It is said the complete new plant will be in operation in January, 1920.

F. H. Crawford, sales manager of **F. H. Niles & Co., Inc.,** Woolworth building, New York, has been appointed secretary, and J. E. Haetten, assistant sales manager, has been appointed sales manager. **G. P. Goodman,** who for several years has represented the Hisey-Wolf Machine Company, Cincinnati, Ohio, in the East, will become associated, on October 1 with the F. H. Niles & Co., Inc., in charge of its portable tool department. This company handles in the east the Hisey-Wolf line of electric machine tools, and the Canton pneumatic hammers and drills made by the Pittsburg Pneumatic Company, Canton, Ohio.

Otto A. Ruemelin, second vice-president and manager of production of the **Pawling & Harnischfeger Company,** manufacturer of traveling electric cranes, Milwaukee, Wis., died on September 1 after a long illness. Mr. Ruemelin was born in Milwaukee in 1872. He joined the Pawling-Harnischfeger interests as an apprentice in 1889. After several years as journeyman, he was made a foreman, serving in various departments. Later he was appointed assistant superintendent and after several years, superintendent. In 1912 he became works manager and later was elected to the second vice-presidency, in which position he served until two weeks prior to his death.

L. R. Custer, formerly development engineer for the Midvale Steel & Ordnance Company has been elected a vice-president of the **Cambria Steel Company.** He was born in Altoona in 1873, and graduated from Cornell University in 1902. His first work was as a machinist for the Pennsylvania Railroad. He later was in the employ of the Baldwin Locomotive Works, and then served as a draftsman for the Jones & Laughlin Steel Company, Pittsburgh. He entered the service of the Homestead Steel Company as a construction foreman and in 1914, was made superintendent of the armor plate department. During the early part of the war he developed the ordnance department of that company. Shortly before the close of the war he left the Homestead Company to go with the Midvale Company.

Trade Publications

STORAGE BATTERY CARS.—Typical installations of Edison equipped railway storage battery cars are shown in Bulletin 106, consisting of 16 pages and issued by the Edison Storage Battery Car Company, New York. Illustrations show cars in service in various parts of the United States, Central and South America, Mexico and Alaska. A short analysis is included of the relative costs of storage battery and steam operation on the Long Island Railroad and the Edison nickel-iron-alkaline storage battery is described.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This road has awarded a contract for the building of a 15 mile line from Porterville, Cal., to Ducor, to the Sharp & Fellows Contracting Company, Los Angeles, Cal.

BALTIMORE & OHIO, WESTERN LINES.—Sheesley & Janney, contractors, Johnstown, Pa., have been awarded the contract for the construction of a 38 ft. concrete arch bridge over Kellogg Creek, one mile south of Painesville, Ohio.

CHICAGO, ROCK ISLAND & PACIFIC.—Preparations are being made to extend the Chattanooga (Okla.) branch southward 15 miles to Grandfield, Okla., on the Wichita Falls & Northwestern. This branch connects with the Enid-Waurika line at Lawton, Okla.

DAVENPORT, SPRINGFIELD & SOUTHERN.—The company has applied to the Public Utilities Commission of Illinois for authority to construct and operate an electric railroad from Rock Island, Ill., to Metropolis, with branches from Pinckneyville and East St. Louis and other short spurs.

CHICAGO & EASTERN ILLINOIS.—Work has been started on a combined passenger station and freight house at Salem, Ill. It is to be a one-story structure, 28 ft. by 108 ft., and will cost approximately $20,000. The contractor is T. S. Leake & Co., Chicago, who expect the work to be completed by December.

CANADIAN PACIFIC.—A new station is to be built at Trois Rivieres, Que. The building is to be in the French chateau style of architecture and of fireproof construction. The exterior facing is to be of trim brick, with cut stone of Deschambault or similar limestone. The floors will be of marble and terrazo tile, and the inside walls finished with marble wainscoats with Caen stone or marble above.

GRAND TRUNK PACIFIC.—The Board of Railway Commissioners for Canada has ordered this company to file plans with the board for a station at Prince George, B. C., and to complete and place the proposed station in operation on or before December 31, 1919. Owing to the exigencies of the war and the state of the railway company's finances, the requirements of a similar order issued in November, 1914, were not enforced.

CHICAGO UNION STATION.—Work on the Chicago Union Station, which has been delayed by building trades union strikes for some time, has been resumed. Completion of the viaducts at Twelfth, Taylor, Polk and Harrison streets and of the headhouse at Canal street, is now being rushed and it is expected that contracts will be let in the near future for the erection of the superstructure of the Harrison street and of the Twelfth street viaducts.

ATCHISON, TOPEKA & SANTA FE.—This road is constructing a branch road from its main line at Shattuck, Okla., to Spearman, Tex. Seventy miles of the 84 miles of new construction have been completed. The line is through the extreme upper part of the Panhandle and affords a transportation outlet for a wide stretch of wheat producing territory that was formerly 50 to 75 miles from the nearest railroad point. It is not expected that the line will be extended beyond Spearman for some time.

HONEST LABOR THE REMEDY.—It is not by demands of higher wages for a shorter day's work, by the threat of strikes and by strikes, by wild plans for the nationalization of industries and increased inefficiency of workers at the expense of the taxpayers, that workmen will help themselves and the public. So far as these methods are successful, they cripple production and swell the cost of living. There is but one way to diminish that cost. That is, for every workman to do an honest and a hard day's work. The best labor of every member of the producing community must be given without interruption. The high cost of living can be lowered in that way, and in no other.—*New York Times.*

Railway Officers

Railroad Administration

Operating

S. B. Andrews, mechanical engineer of the Seaboard Air Line, has resigned from railroad service.

Harry D. Mudgett, formerly trainmaster on the Northern Pacific at Livingston, Mont., has recently been released from military service and has resumed his former position, succeeding J. J. Sexton, transferred.

W. G. Curren, special agent of transportation at New York City, has been appointed superintendent of transportation of the Baltimore & Ohio, Eastern Lines, with office at Baltimore, succeeding **H. B. Voorhees,** promoted.

H. B. Voorhees, general superintendent of transportation of the Baltimore & Ohio, has been appointed manager of the Staten Island Rapid Transit, the Staten Island, the Baltimore & Ohio, New York Terminals, and the Baltimore and New York, with offices at New York City, succeeding **J. M. Davis,** resigned to accept service elsewhere.

Traffic

J. O. Adams has been appointed general eastern freight agent of the Grand Trunk, Lines in Canada, with office at New York City, vice **S. E. Dewey,** deceased.

W. C. Douglas, assistant general freight agent of the Michigan Central, with office at Detroit, Mich., has been transferred to Chicago, succeeding **F. J. Parker,** who has resigned to become assistant cashier of the First and Old Detroit National Bank, Detroit. **E. W. Brunck,** chief clerk to the general freight agent of the Michigan Central at Detroit, has been appointed to succeed Mr. Douglas.

V. C. Williams has been appointed division freight agent of the Pennsylvania at Pittsburgh with jurisdiction over: Pittsburgh division, main line and branches, Conemaugh to Pittsburgh inclusive except Southwest branch and Youghiogheny branch; Conemaugh division Cedar Point and Blairsville Intersection to Butler and Karns, to Allegheny, inclusive; Monongahela Division, Pittsburgh to Allenport, inclusive; Cresson division, Josephine only. **J. T. Wray** has been appointed division freight agent at Erie, Pa., with jurisdiction over: Renovo division, Buffalo division. Glade to Ridge View, Sand Co., inclusive. Allegheny division, David Ready to Oil City, inclusive and north of Oil City to Corry, inclusive. Other appointments have been made as follows: **C. T. Mackenson, Jr.,** division freight agent at Pittsburgh with jurisdiction over: Allegheny division, Oil City exclusive, to Kiskiminetas Junction Red Bank to Mix Run, inclusive. Conemaugh division, Pittsburgh to Kiskeminetas Junction, inclusive. **Joseph Weed,** division freight agent at Uniontown, Pa., succeeding Mr. Mackenson, with jurisdiction over: Pittsburgh division, Southwest branch and Youghiogheny branch. Monongehela division south of Allenport.

Engineering and Rolling Stock

Lawrence A. Rowe, mechanical inspector of the Atchison, Topeka & Santa Fe, has resigned to become general manager of the Universal Packing & Service Company, with office at Chicago.

F. C. Hohn, division engineer of the maintenance of way department of the Pennsylvania division of the Delaware & Hudson at Carbondale, Pa., has resigned, effective September 1. Mr. Hohn has been succeeded by **J. C. Dorsey,** division engineer of the Saratoga division of the Delaware & Hudson at Albany, N. Y.

L. R. Wink, general foreman of shops on the Galena and Wisconsin divisions and the Chicago terminals of the Chi-

cago & North Western, has been appointed assistant superintendent of the car department, with headquarters at Chicago, and **C. J. Nelson** has been appointed general foreman, succeeding Mr. Wink.

R. B. Johnson, assistant engineer on the Montana division of the Oregon Short Line has resigned to enter private practice at Idaho Falls, Idaho, and **A. H. Hoult,** has been appointed his successor. **R. B. Reasoner,** formerly division engineer on the Oregon Short Line with headquarters at Pocatello, Ohio, has recently been released from military service and has resumed his former duties.

G. A. Carroll, formerly divisional engineer of the El Paso division of the Chicago, Rock Island & Pacific, recently discharged from military service has been appointed division engineer of the same road at Eldon, Mo., succeeding **W. A. Wallace,** who is appointed division engineer of the Nebraska division with headquarters at Fairbury, Neb. **A. G. Bradley,** formerly division engineer of El Reno, Okla., also discharged from military service recently, has been reappointed to the same position, succeeding **G. H. Pash,** assigned to other duties.

John Edward Fanning, whose appointment as chief engineer of the Gulf & Ship Island and the Mississippi Central with office at Hattiesburg, Miss., was announced in the *Railway Age,* September 5, page 490, was born at Okolona, Miss., on August 13, 1885, and was educated at the University of Mississippi. He entered railway service in 1905 with the Gulf & Ship Island and was successively transit man, assistant engineer and supervisor of track. In 1910 he was appointed assistant engineer, in which capacity he served until 1917, when he went to the Illinois Central.

C. H. Paris, assistant engineer on the Chicago & North Western, with office at Huron, S. D., has been transferred to Winona, Minn., succeeding **R. D. Anderson,** promoted. **L. B. Dodge,** assistant engineer, Galena division, with office at Chicago, has been transferred to Huron, S. D., succeeding **C. H. Paris. C. H. Wells,** assistant engineer in the valuation department, has been transferred to the Galena division, succeeding **L. B. Dodge. R. D. Ransen** has been transferred from the federal manager's office in Chicago as assistant engineer to the valuation department, succeeding **C. H. Wells.**

C. J. Wymer, sales representative of the Grip Nut Company of Chicago, has been appointed superintendent of the car department of the Chicago & Eastern Illinois, with headquarters at Danville, Ill. Mr. Wymer entered railroad service in 1891 with the Atchison, Topeka & Santa Fe. He later became connected with the car inspecting department of the Chicago & Eastern Illinois, resigning as general car inspector in 1912. He was then appointed general car foreman on the Belt Railroad of Chicago. In May, 1916, he was appointed sales representative at the Chicago office of the Grip Nut Company, in which capacity he served until his recent appointment. Mr. Wymer's appointment places him in entire charge of the car department of the Chicago & Eastern Illinois and is the first appointment of this nature made by that road.

Leonard L. Sparrow, whose appointment as principal assistant engineer of the Atlanta Coast Line, with headquarters at Wilmington, N. C., succeeding **T. L. Morton,** deceased, was announced in *Railway Age* of September 5th, was born in November, 1872, at Philadelphia, Pa. Mr. Sparrow is a graduate of the University of Tennessee. In 1895 he entered the employ of the Baltimore & Ohio as rodman on the Philadelphia division and the next year was transferred to the second division with headquarters at Martinsburg, W. Va. From 1899 to 1904 he was assistant engineer and resident engineer on surveys and grade reduction work on that road and in May, 1904, he left the Baltimore & Ohio to take charge of the construction of terminals at Jacksonville, Fla., for the Atlantic Coast Line, remaining in that position until 1907 when he was appointed engineer of roadway, first division, with headquarters at Rocky Mount, N. C., being transferred in August, 1908, to the third division with office at Jacksonville, Fla., in charge of maintenance of all lines in Florida. In September, 1917, he was appointed office engineer in the office of the chief engineer at Wilmington, N. C., which position he held at the time of his recent appointment.

Purchasing

T. C. Hopkins has been appointed local storekeeper of the Baltimore & Ohio at Cleveland, Ohio, succeding **L. F. Ryan,** resigned.

J. M. Strong has been appointed division storekeeper of the Schuylkill division, Pennsylvania Eastern Lines with headquarters in Reading, Pa.

J. A. Laughlin and **Henry Stephens** have been appointed assistant general storekeepers of the New York Central, Lines West of Buffalo, with headquarters at Collingwood, Ohio. Mr. Laughlin has been storekeeper at Elkhart, Ind.

Corporate

Engineering and Rolling Stock

H. K. Morrison, resident engineer on the Superior division of the Canadian National Railways, with office at Hornepayme, Ont., has been appointed division engineer, a newly created position, with the same headquarters.

F. S. Rosseter, assistant superintendent of the Sudbury division, Altoma district, of the Canadian Pacific, with office at Sudbury, Ont., has been transferred to the Toronto terminal division, Ontario district, with headquarters at West Toronto, Ont., succeeding **W. J. Stinson,** who has been transferred to the Trenton division, Ontario district, with headquarters at Havelock, Ont. Mr. Stinson succeeds **R. de B. Girouard,** who has been transferred.

Obituary

Hon. Francis Cochrane, former Canadian Minister of Railways and Canals, died at his home in Ottawa, Ont., on September 22, at the age of 67. Mr. Cochrane was born in Clarenceville, Que. He had been connected with the government for about 15 years, and in 1905 was minister of lands and mines. He was appointed to the Ministry of Railways in 1911.

EMERGENCY BULLETIN

PUBLISHED BY THE SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK

October 6, 1919

Special Strike Bulletin.

As stated in the editorial "Another Strike!" on page 603 of the September 26 issue of the *Railway Age*, we have suspended publication indefinitely because of a strike called for the reason that we refused to meet the arbitrary and unreasonable demands of certain printing trades' unions who flatly refused to arbitrate and whose members deserted the presses in the face of existing contracts.

And as promised in that editorial, it is our purpose to make certain that both subscribers and advertisers are kept informed of happenings in the railway field which seem to us of special interest to each.

Hence this, the first of a series of bulletins which will be published at least once a week during the suspension of the paper, and more frequently, if necessary.

Organized Labor Versus Organized Society!

The entire civilized world is today following with intense interest the railroad strike in Great Britain and the steel mill strike in the United States. This is the case because the civilized world is keenly alive to the fact that these strikes do not involve merely the wages and working conditions of working people, but are tests of the relative strength of organized labor and organized society in the two leading Anglo-Saxon countries.

This is more clearly true of the railroad strike in Great Britain than of the steel strike in this country. In Great Britain the Government is operating the railroads. The employees made certain demands which the Government refused to grant and almost without warning the strike order was put into effect. Premier Lloyd George has leaned toward the workers in almost all their disputes with capital. Nevertheless, he has denounced the railroad strike. The "precipitancy" with which it was entered upon "caused the impression" he declares, "of a deliberate and mature intention on the part of some individuals to seek a quarrel at any cost."

There is no doubt in the mind of any intelligent observer as to the reason for seeking a quarrel. Organized labor in Great Britain is dominated by radicals who are trying to bring about syndicalism—that is, government ownership of industries and their management by, and primarily for the benefit of, the employees. These radical leaders have been calling one great strike after another since the war ended in an effort to force the adoption of syndicalism. The recent strike in the British coal mines, which also were being operated by the Government, was ordered by the same element for the same purpose.

The steel mills of the United States are not being operated by the Government. The strike in them has been brought about, however, by the same kind of leaders who have caused the coal and railroad strikes in Great Britain, and for the same general purpose. The principal organizer of the steel workers and promoter of the strike was formerly an organizer for the I. W. W. and has been preaching syndicalism for years. Samuel Gompers and other leaders of organized labor who have claimed to be, and have been regarded as, conservative, deny that the steel strike has any revolutionary purpose. But it is evident that, for the present at least, men such as Gompers have lost control of the organized labor movement in the United States. Mr. Gompers has opposed the espousal of socialism by the American Federation of Labor; but recently the United Mine Workers of America and the railway labor brotherhoods have begun advocating what would be practically syndicalism on the railroads and in the coal mines. The character of the men who are leading the steel strike is evidence enough that if they should succeed in making organized labor as strong in the steel mills as it is on the railroads and in the coal mines, it would be but a short time until we should be confronted with demands for syndicalizing the steel mills similar to those which already have been made with respect to the railroads and the coal mines.

The situation in Great Britain and the United States raises two vitally important questions. The first is as to whether the people of these countries want the syndicalistic or Bolshevistic system of industry substituted for the system of private ownership and management. That is an economic and political question which is open to argument. If organized labor, by ordinary political methods, can get a majority of the people to favor the syndicalist system, it has a right to do so. The syndicalist system might work well or ill, but if a majority of the people want it, it ought, on democratic principles, to be established.

The second and more important question which the present situation in Great Britain and the United States raises is whether the system of syndicalism is going to be imposed upon the public by force, regardless of whether the public want it or not. It is idle to say that no attempt to impose it by force will be made. Such attempt actually is being made in Great Britain right now. The railroad strike in that country is an obvious and audacious attempt to starve the public until it will compel the Government to yield to the demands of the strikers. That may not be exactly the use of force, but if the Government attempts to operate the railroads with non-union men the strikers undoubtedly will interfere with, and try to maim and even kill the "scabs," and there is no doubt that this would involve the use of force.

It may be said, and truly, that the leader of the steel strikers has offered to arbitrate. But the railroad labor brotherhoods used to demand and insist upon arbitration. When, however, they thought they had become strong enough to enforce their demands by strikes and threats of strikes they began absolutely to refuse to arbitrate. Experience seems to show that, under the kind of leadership it now has, organized labor will submit its claims to arbitration only when it seems practically certain that it cannot win by the strike. But if syndicalism is to be established or any other great change in our industrial or political system is to be

made, not by political methods but by force, then those who have become able by the use of force to effect the change have overthrown the Government and have substituted their sovereignty for that of the people.

The first question to be settled, therefore, is whether organized labor is going to be able, by the use of the strike, to bring about an industrial and political revolution—or is even going to be allowed to try to bring it about—by force. If organized labor wins in such struggles as that of the railroad workers with the Government in Great Britain and that of the steel workers with the steel companies in the United States, there undoubtedly will be an increase in the use of the strike and of strike violence for revolutionary purposes until either the present industrial and political system is overthrown or organized society rises in its full strength and subjects organized labor to some form of control which will make the use of the strike for revolutionary purposes impossible.

In this great crisis it is essential that the people should clearly understand the issue presented and align themselves accordingly. Organized labor, under radical leadership, is trying to impose its will upon organized society by force. The avowed ultimate object of its radical leaders is the overthrow of the present industrial and democratic political system, and the establishment of an industrial and political autocracy of the proletariat. As long as organized labor submits to such leadership, and uses the methods its radical leaders favor, the rest of the people, however friendly their attitude toward organized labor may have been in the past, must, as a matter of self-protection, take a united stand against organized labor.

Relation of Freight Charges to Commodity Values

The argument has been made by some persons in high official positions that freight rates ought not be advanced, even though an advance may be necessary to prevent a railroad deficit, because an increase in the freight rate would increase the cost of living. A most striking demonstration of how little influence freight rates have upon the cost of living is made in a letter which Julius Kruttschnitt has written to Chairman Esch of the House committee on Interstate and Foreign Commerce. Briefly, Mr. Kruttschnitt shows that in 1914 the average value per ton of freight carried on the railroads of the United States was $56 and that the average rate on it was $2 per ton, which was 3.6 per cent of the value of the freight. In 1919 the average value of a ton of freight is $119 and the average freight charge on it only $2.80, which is but 2.4 per cent of the value of the freight. Between 1914 and 1919 the average value of a ton of freight increased $63, while the average charge on it increased only 80 cents. Therefore, the increase in the average freight charge per ton was only 1.3 per cent of the increase in the value of the freight. Mr. Kruttschnitt shows that between 1899 and 1900, when commodity prices in general advanced, freight rates were unchanged; between 1907 and 1908, when there was a fall in prices, freight rates were declining; that between 1915 and 1916, when there was a further increase in prices, freight rates were still declining; in 1916 and 1917, when prices were higher than at any time in 19 years, freight rates were lower than at any time in 19 years. He also shows that the sharp advance in freight rates in 1918 was followed by a decline in prices. The explanation, of course, is that the freight charge is so very small in relation to the average value of commodities that it would take a relatively enormous change in rates to affect prices. It is a notable fact that in 1914 the freight charge was 3.6 per cent of the average value of commodities, while in 1919 it was only 2.4 per cent, which demonstrates that if freight rates were advanced at the present time exactly 50 per cent they would be made only as large relatively to the value of commodities as they were five years ago.

Agreement Entered Into With the Shop Employees

For the first time the railroads of this country, through the Railroad Administration, have entered into a national agreement with the shop crafts as represented by the Railway Employees' Department of the American Federation of Labor and its affiliated organizations of the Mechanical Section and Divisions 1, 2 and 3 thereof, including the International Association of Machinists, International Brotherhood of Boilermakers, Iron Shipbuilders and Helpers of America, International Brotherhood of Blacksmiths and Helpers, Amalgamated Sheet Metal Workers' International Alliance, International Brotherhood of Electrical Workers and the Brotherhood of Railway Car Men of America.

The agreement includes 186 rules. The first section covers general rules applying to all trades and is followed by special rules for the machinists, boilermakers, blacksmiths, sheet metal workers, electrical workers and carmen. The wages have been raised to put them on an equal basis with wages paid to other railroad employees. The rate for mechanics who have been receiving 68 cents an hour has been increased four cents an hour; steel car workers and other mechanics in the car department who were receiving 63 cents an hour have been increased four cents an hour; other mechanics in the car department who were receiving 58 cents an hour will be increased nine cents an hour. In all cases these increases are effective as of May 1, 1919. Apprentices, helpers and other classes of workmen covered by Supplement 4 to General Order 27 have been increased four cents an hour, effective May 1, 1919, except for linemen and others, ground men, coal pier elevator operators and coal pier electric hoist operators, who are covered by special rules.

Hearings Before the House Interstate Commerce Committee

Interstate Commerce Commissioner Edgar E. Clark appeared before the House Committee on Interstate Commerce on September 25 and 26. He denied that regulation of railroad rates had operated to reduce revenues, and thought that the only thing that could be done with the weak roads was to put them through a reorganization.

A. P. Thom, general counsel for the Association of Railway Executives, introduced a letter from Charles E. Hughes, formerly Justice of the Supreme Court of the United States, expressing an opinion on the provision of the Cummins Bill which would take away all of the profits of a successful road above a certain fixed percentage. Justice Hughes' opinion, in brief, is that if rates which produce so-called excess earnings are just and reasonable rates, as they are presumed to be when fixed and regulated by a public authority like the Interstate Commerce Commission, then the earnings from those rates are the property of the railroad companies. They may be taxed, but they cannot be taken away. This would be confiscation.

Mr. Thom took up the question of the relation of state rates to interstate rates. He thought that it was absolutely essential that one federal body should be given jurisdiction over the rates on every interstate carrier, whether the carrier itself was wholly within one state or not, and whether the haul was wholly within one state or not. He said, however, that if at this time Congress did not wish to go so far as to make a specific declaration of this scope, there should be an amendment made to the Esch Bill to provide (1)

that the carrier should have the right to complain to the Interstate Commerce Commission against the state rate, (2) that not only discrimination but unequality and undue burden on other rates could be complained of in regard to a state rate, and (3) to confer power on the Interstate Commerce Commission to suspend intrastate rates and to grant reparation in respect to such rates.

June Mechanical Conventions

The General Committee of the Mechanical Section of the American Railroad Association held a meeting at the Hotel Traymore, Atlantic City, N. J., on October 23 and 24, at which, among other business, the plans for the next convention were laid. A joint conference was held with a committee of the Railway Supply Manufacturers' Asscoiation and the Hotel Men's Association of Atlantic City, and it was decided to hold the 1920 and 1921 conventions on Young's Pier. The dates selected for the 1920 convention are June 9-16. The first three days of this period will be devoted to papers on locomotive subjects and the last three to car subjects, consolidated committees reporting on Monday, June 14. An invitation was extended to Section VI, Purchases and Stores, to hold its convention simultaneously with Section III, in order that the members might avail themselves of the opportunity to visit the extensive exhibit. A number of new committees were appointed and important changes were made in the personnel of others.

The Railway Supply Manufacturers' Association will hold its usual exhibit. The following committee appointments have been made by the executive committee of that association: Chairman exhibit committee, J. G. Platt, Hunt-Spiller Manufacturing Corporation, South Boston, Mass.; chairman entertainment committee, W. K. Krepps, Crucible Steel Company of America, New York; chairman enrollment committee, C. H. Gayetty, Quaker City Rubber Company, Philadelphia, Pa.; chairman finance committee, George A. Cooper; chairman transportation committee, John C. Kuhns, Burden Iron Company, Troy, N. Y. John D. Conway was re-elected secretary-treasurer of the association. The management of the Young's Pier at Atlantic City has agreed to enlarge the seating capacity of Convention Hall from 600 to 850.

Railway Business Association on Railroad Problem

Alba B. Johnson, president of the Railway Business Association, has sent to Senator Joseph S. Frelinghuysen a letter commenting on and comparing certain vital points in the Frelinghuysen and Cummins bills. These comments relate particularly to the transportation board, consolidation of roads, regulation of security issues, the adequacy of revenue and the dangers involved in the six per cent return. President Johnson has also sent a letter to Congressman John J. Esch, chairman of the House Committee on Interstate and Foreign Commerce, emphasizing certain recommendations of the Railway Business Association and commenting upon the testimony of Guy M. Freer, president of the National Industrial Traffic League.

President Rea Addresses Bankers

Samuel Rea, president of the Pennsylvania Railroad Company, made an address on "Our Railroad Problem" before the Savings Bank Section of the American Bankers' Association at St. Louis, Mo., on October 1. He outlined the plan of restoring the railroads as advocated by the Association of Railway Executives and went into a very thorough discussion of the Cummins bill, particularly in relation to the objectionable features from the standpoint of the railway executives.

A Great Railroad Strike in Britain

The railways of England, Scotland and Wales were paralyzed on Friday, September 26, by the most complete strike in their history, and all the business of the country was disorganized for several days; but as we go to press it seems certain that the strike will fail. Sir Eric Geddes, in control of the railways for the Government, took a firm stand from the outset, and was vigorously sustained by the Ministry; people and press condemned the strikers with substantial unanimity. The two largest unions joined in the strike, the National Union of Railwaymen, and the Society of Engineers and Firemen. The stoppage of suburban traffic and of all trains on the London underground railways caused extensive curtailment of activities in shops and offices in London and to a less extent in other cities. No serious violence was reported. David Lloyd George, prime minister, declared that the leaders were striking against society, and were seeking a quarrel at any cost; he was convinced that a vast majority of union labor was opposed to the movement, which he described as an anarchist conspiracy.

It was estimated that the strikers numbered about 600,000. The Government at once suspended the demobilization of the military forces and prepared to run trains with volunteers. By Monday, the 29th, it was said that the Government had the situation well in hand. Automobiles were brought into use by the thousands for the transportation of food, and the Government proceeded as it would have done in case of an invasion by a foreign enemy. Airplanes were used extensively to carry mails. Over 80,000 private motors were offered to the Government. Making use of the services of volunteers, the principal railways ran some passenger trains on Monday, all train movements being made at long intervals because of the signalmen being on strike. Partial train service was resumed on two underground lines on Monday evening. Along the coast the Government used naval vessels to carry mails.

Passenger service was first restored for suburban travel; but by Tuesday most of the main lines ran a few through trains, and the Great Western declared that its service was almost normal. The airplane mail service between London and Paris, which had been running three times a week, was at once put on a daily timetable.

On Wednesday, October 1, the Ministry of Transport announced that the number of passenger trains run on that day was about 2,000, or double the number in service on the preceding day. This was exclusive of the London underground service, which was much improved. Of the large numbers of men at work on the trains the reporters were unable to decide what portion was made up of volunteers and what of returning strikers.

Though the Government made continual prorgess, there was, of course, much disorganization, and even on Wednesday the large London newspapers printed only four pages each.

Obituary

John J. Reardon, superintendent of the Litchfield & Madison, died at his home in Edwardsville, Ill., on September 19, at the age of 57.

John B. Brownell, formerly assistant general auditor of the Deleware & Hudson, died suddenly at his home in Altamont, N. Y., on September 12.

Eugene Chamberlain, who recently retired from the position of manager of the Equipment Clearing House of the New York Central Lines, died at his home in Mount Vernon, N. Y., on September 30, after a long illness, at the age of 70.

Frank H. Clark Goes to China

Frank H. Clark, consulting engineer, New York city, and formerly general superintendent motive power of the Baltimore & Ohio, is shortly going to Peking, where he will temporarily act as technical adviser to the Ministry of Communications of the Republic of China.

International Trade Conference

This conference, which was called by the Chamber of Commerce of the United States to meet at Atlantic City the first week in October, has been postponed until Monday, October 20. This was necessary because of delays in the departure of delegates from Italy, France and Belgium.

Fiftieth Anniversary of the Westinghouse Air Brake Company

Over 800 veterans of the Westinghouse Air Brake Company and its subsidiary companies in Milwaukee, St. Louis, California, Pittsburgh and Canada met at the William Penn Hotel, Pittsburgh, Saturday evening, September 27, to celebrate the fiftieth anniversary of the formation of the Westinghouse Air Brake Company.

Official Changes

Charles H. Markham, director of the Allegheny region, has resigned from the Railroad Administration to return to the presidency of the Illinois Central; he is succeeded by L. W. Baldwin, heretofore operating assistant to Mr. Markham.

H. M. Adams has resigned as traffic assistant to the regional director of the Southwestern region, and has been appointed vice-president of the Union Pacific, in charge of traffic, with office at Omaha.

C. B. Porter has been appointed acting purchsaing agent of the Texas & Pacific and allied lines, with office at Dallas, Tex., R. I. Irwin, purchasing agent, having been granted leave of absence.

J. M. Rosevear, general auditor of the Grand Trunk, has been appointed controller, in place of W. H. Ardley; and J. B. McLearn, auditor of revenue, succeeds Mr. Rosevear.

W. A. Parker, division engineer of the Kansas division of the Union Pacific, with office at Marysville, Kans., has been promoted to assistant engineer, maintenance of way, with headquarters at Omaha, Neb.

William H. Menner, road foreman of engines of the Erie, with headquarters at Jersey City, N. J., has been appointed supervisor of locomotive operation, succeeding E. Salley, deceased.

A. G. Miller, chief travelling auditor of the Nashville, Chattanooga & St. Louis, has been appointed auditor of disbursements, succeeding J. H. McEwen, deceased.

W. C. Dorsey, senior accountant for Clink, Bean & Co., accountants, San Francisco, Cal., has been appointed auditor of expenditures on the Chicago, Milwaukee & St. Paul, with office at Chicago, succeeding F. G. Allen, resigned.

Supply Trade News

The Buda Company has opened branch offices in Buenos Aires, Brazil; London, England; and Paris, France.

C. N. Replogle has resigned as general manager of the Ralston Steel Car Company, Columbus, Ohio, to become general manager of the new plant of the Timken Roller Bearing Company, Canton, Ohio.

The Boston & Maine has ordered 360 tons of steel from the American Bridge Company, for bridges to be built at Winchendon, Mass., and at Webb, N. H.

Fred J. Holden has been promoted to sales manager of the Railway Division of the B. N. Jones Company, Inc., with office at 192 Chambers street, New York City.

The Canadian Pacific has awarded a contract to the Union Switch & Signal Company, Swissvale, Pa., for the complete installation of two Saxby & Farmer interlockings at Brantford, Ont.; one of 24 levers and one of 20.

The Canadian National has awarded a contract to the Union Switch & Signal Company, Swissvale, Pa., to remodel the mechanical interlocking at the Grand Trunk crossing, Elm street, Port Colborne, Ont.

Mitsui & Co., Ltd., 65 Broadway, New York, has given an order to the McClintic-Marshall Company, New York, for 2,100 tons of steel for bridges, to be built on the South Manchurian Railroad. There will be 32 spans, varying in length from 65 feet to 110 feet each.

The United States Railroad Administration has placed an order for 200,000 tons of steel rails. This has been allocated between the United States Steel Corporation, the Bethlehem Steel Corporation, and the Lackawanna Steel Company. The exact division of the rail order has not yet been announced.

Freight Car Inquiries.—Morris & Co., Chicago, is inquiring for 400 refrigerator cars. The Oklahoma Iron Works, Tulsa, Okla., is inquiring for one special 36-ft. 30-ton flat car. Charles E. Sharp, St. Louis, Mo., is inquiring for 50 steel cane cars for export to Mexico. The American Industrial & Development Company, Inc., New York, is inquiring for two special flat cars for export to France.

Freight Cars Ordered.—The American Car & Foundry Company has received the following orders: 50 mine cars, from the Hillside Coal & Iron Company, Scranton, Pa.; twenty-five 40-ton tank cars from the Sterling Oil & Refining Company; twenty-five 40-ton tank cars from John H. Witte & Sons, Minneapolis, Minn.; twenty-five mine cars from the Pennsylvania Coal Company.

Locomotive Deliveries.—New locomotives shipped by manufacturers to railroads under federal control are reported, for the week ending September 13, as follows: By the American Locomotive Company, to the Atlantic Coast Line, 6 engines, U. S. R. A., Pacific. By the Lima Locomotive Works to the Missouri Pacific, 5, U. S. R. A., Mikado. By the Baldwin Locomotive Works to the Pennsylvania Lines West, 3, and to the Lehigh Valley 5 Santa Fe type; to the Norfolk & Western, 1, and to the Wheeling & Lake Erie, 1, U. S. R. A., Mallet; and to the Seaboard Air Line, 1, U. S. R. A. Santa Fe type. Total shipments, 22 locomotives.

Railway Construction.—The Portland, Astoria & Pacific is constructing a 32-mile railroad from Wilkesboro, Oregon, to Keasey. The Chicago, Milwaukee & St. Paul has begun work on additions to its yards at Sioux City, Iowa. The Cisco Banking Company, Cisco, Tex., is constructing a road from Cisco into the oil fields of Stephens county, a distance of about 35 miles, to be known as the Cisco & Northeastern. Articles of incorporation have been approved by the Attorney General of Texas for the Panhandle Short Line; construction will start in the near future between Dalhart, Tex., and Lubbock; the financial and purchasing agent is S. M. Porter, Caney, Kan. Jake L. Hamon of Ardmore, Okla., and Frank Kell, of Wichita Falls, Tex., are constructing a railroad from New Castle, Tex., to Dublin, through Breckenridge and Ranger; the project comprises the construction of 105 miles of main line, to be known as the Wichita Falls, Ranger & Fort Worth.

Railway Age

EMERGENCY BULLETIN

PUBLISHED BY THE SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK

October 13, 1919

This is the second issue of our Emergency Bulletin. Labor difficulties still persist in the printing industry in New York City and we are unable to predict when the RAILWAY AGE will resume publication.

Roads Will Be Returned January 1

Director General Hines has sent a letter to Chairman Esch of the House Committee urging early legislation to determine the status of the railroads in order to avoid uncertainty and consequent demoralization of service. If such a bill is not passed before the end of the year he indicates that it would be impracticable for the Government to retain the roads and he says that the corporations will be greatly hampered in their plans for next year unless legislation is enacted.

'Longshoremen's Strike at New York

Freight traffic at the port of New York has been seriously disturbed since October 1 because of suspension or congestion of ocean commerce. Because of the railroad strike in England, the Shipping Board cancelled all sailings for Great Britain, and the Railroad Administration was obliged to put a partial embargo on shipments from the interior for export; that is to say, the permit system was revived and no shipments were accepted until it was certain that vessel room would be ready. Before this difficulty was removed, following the settlement of the English strike, many thousands of 'longshoremen at New York left their work; and on Wednesday, October 8, all permits for shipments of freight to New York, either for export or for coastwise vessels, were suspended. This will stop a movement amounting normally to about 6,000 cars a day. The grain movement, to a large extent, was not affected. The strike is not authorized by union leaders and the situation is confused but an early settlement is hoped for. But by the 11th, the trouble had spread to other ports and at New York the railroad passenger ferries stopped running.

Railroad Legislation Still in Doubtful Stage

Observers of the progress of the two Congressional committees that are wrestling with the railroad problem are becoming increasingly doubtful as to whether any comprehensive railroad legislation is to be expected at this session of congress, which Congressional leaders are now talking of adjourning possibly by the first part of November. At the same time it is realized that to throw the railroad question into the regular session which begins in December would be to give little chance for the passage of a bill before January 1.

It is not believed that the Congressmen more directly interested in railroad legislation are planning to postpone action. On the contrary, members of the interstate commerce committees of the two houses are working hard in the effort to prepare bills that can be passed before any question can be raised as to the return of the roads to their owners on the date announced by the President; but many of their colleagues think it is not possible to reach an agreement in the time available and have already begun speculation as to whether that state of affairs would cause a change in the president's plans. The Railroad Administration, however, is proceeding on the assumption that the roads are to be returned as the President has stated and reiterated, and is making various preparations to that end, although with a realization that probably a considerable part of its organization will be needed for some time after the actual relinquishment of federal control to wind up its affairs and adjust the numerous problems that will remain to be straightened out. The administration does not desire to retain control of the roads for an uncertain tenure and is understood to believe that it would be better to relinquish them even without legislation than to continue the uncertainty.

The House committee concluded its hearings on reconstruction railroad legislation on September 26, although it held another hearing on October 4 to give the labor representatives another chance to object to compulsory arbitration. A sub-committee, consisting of Chairman Esch and Representatives Winslow, Hamilton, Sims and Barkley, was appointed to draft a bill for consideration by the full committee and has since been busily engaged on its work in executive session. The Esch-Pomerene bill representing the Interstate Commerce Commission's ideas as to needed amendments to the act to regulate commerce is still being taken as the basis, but it had long been apparent to most members of the committee that something more fundamental would have to be added to it; and much consideration is being given both to the problem of assuring adequate revenues and to some basis for adjusting labor controversies without strikes. Chairman Esch has indicated that he is in favor of strengthening his bill so as to assure adequate revenues and credit to the carriers, and Commissioner Clark, who represented the commission at the hearings and who admitted from the start that the Esch-Pomerene bill did not attempt to cover the whole ground, finally took the position that it would be desirable to have a recognized standard of measurement of railroad return, fixed by Congress as a matter of public policy rather than by an administrative body, and said that of various plans proposed for establishing such a standard he would prefer the Warfield plan.

The Senate committee, which has been holding frequent sessions on the Cummins bill, has indicated a hope that it would be able to report a bill by the middle of this month. Its principal struggle has been with the provisions intended to establish an adequate basis of rates and while the original bill left the fixing of the standard return with the Interstate Commerce Commission the committee has recently come around to an effort to establish a standard itself.

The work of the committee is still in a tentative stage but considerable progress has been made during the past two weeks and it is understood that the original provision for an absolute limitation of railway return has been definitely abandoned and that a tentative agreement has been reached

on a provision for a rate basis to produce 6 per cent. and for a division of the earnings above that requirement, the proportion to be retained by the company decreasing as the amount above 6 per cent. increases. The committee has also adopted a provision giving the Interstate Commerce Commission a power of suspension over State rates during the five months' period of readjustment provided in the bill. In spite of the protests of the labor leaders, the Senate committee has decided to retain the anti-strike provision in the bill.

Hearings Before the House Interstate Commerce Committee

Samuel Gompers, president of the American Federation of Labor, testified before the committee on October 4 in opposition to any provision that may be inserted in the Railroad bill providing for compulsory arbitration. Arbitration, he said, must be voluntary or it cannot be successful, and labor must always have the right to strike. Mere discussion of such legislation is likely to produce serious consequences by giving the radical element the means of undermining the more conservative element.

W. N. Doak, vice-president of the Brotherhood of Railroad Trainmen, also opposed any kind of compulsory arbitration and said that Congress ought not to "start anything" that would further alienate labor and capital. He said a get-together conference between railroad operators and employees is probable after the railroads are given up by the Government and that voluntary agreements without additional legislation will prove more satisfactory.

S. Davies Warfield, president of the National Association of Owners of Railroad Securities, has filed with both the Senate and House committees on interstate commerce an opinion by Elihu Root, John G. Milburn, John S. Miller, Hugh L. Bond, Jr., and Forney Johnston, advisory counsel of the association, that Congress has the constitutional power to regulate excess earnings of railroads over and above a fair return upon the value of their property. The opinion takes decided issue with that recently furnished by Charles E. Hughes, and states that such excess earnings are the result of rates made to meet the actual necessities essential to the preservation of the life of the transportation system of the country.

Director General Suggests That Railroad Companies Prepare for Rate Advance

Director General Hines has disposed of various rumors of an impending general advance in freight rates by announcing in a letter to T. De Witt Cuyler, chairman of the Association of Railway Executives, that it will be impossible for the Government to establish any general readjustment of rates prior to January 1, 1920, the date set for the return of the roads to their owners, but that if the corporations desire to make progress at this time with preparations for an advance he will assist them by placing the traffc organizations of the Railroad Administration at their disposal for a study of the problem to determine what tariffs they think ought to be proposed.

Mr. Hines is thus passing to the railroad companies the responsibility for proposing a rate advance to meet the increase in railroad expenses that has occurred during federal control, but in his letter, dated October 7, he states the reasons why he considers that such a step is necessary. He has long made it plain that he did not consider the earnings of the first half of this year to afford a proper measure for the advance to be made, but shippers and others have felt so certain that an advance was being contemplated that both Houses of Congress have passed the Cummins bill to take out of his hands the war power to order increases without the approval of the Interstate Commerce Commission. The bill restoring the commission's suspension power was passed by the House with amendments to the Senate bill and, therefore, required a conference to reconcile the differences, but the conferees have agreed and their report only awaits final passage, which was expected possibly this week, and at any rate could certainly be passed before the director general could get out a rate order.

Capital and Labor in Conference at Washington

The conference of representatives of employers, employees and the public called by President Wilson for the purpose of reaching, if possible, "some common ground of agreement and action with regard to the future conduct of industry" and "means of bettering the whole relationship of capital and labor" began its sessions at Washington on October 6 but spent the first three days in getting started. After organizing and adopting rules to govern its procedure which required that any proposal to be made to the conference should first have the assent of one of the three groups, the conference adjourned on Wednesday morning until Thursday in order to give the groups an opportunity to hold meetings.

Franklin K. Lane, Secretary of the Interior, was elected chairman and Lathrop Brown and J. J. Cotter secretaries. A general committee was chosen consisting of five representatives of each group which is to pass upon all proposals made to the conference which have first received the assent of the group in which they originate, and voting is to be by groups, while a majority vote in each of the three groups is a prerequisite for any expression or conclusion by the conference, although one-third of any group may express itself in a minority report. The plan of group voting operates against a possible combination of the public group with that representing either the employees or labor and the manner in which the rules were adopted indicated the greatest caution on the part of both the labor and the employers' group to prevent any action by the conference to which they could not assent.

The members of the conference were not selected with reference to particular industries but after the railroad labor organizations had demanded and had been given more direct representation than that of the delegates selected by Mr. Gompers, two delegates were appointed by the President to represent the railroads, R. H. Aishton, regional director of the Northwestern region of the Railroad Administration and Carl R. Gray, president of the Western Maryland, who was director of the Division of Operation during 1918. L. F. Loree, president of the Delaware & Hudson, is also a member of the employers' group as one of the five selected by the National Industrial Conference. Fifteen labor delegates were selected by Mr. Gompers but the railroad organizations demanded a representative for each of their 14 organizations. By a compromise suggested by Director General Hines, the train service brotherhoods were invited to select four representatives and Bert M. Jewell, acting president of the Railroad Employees' Department of the American Federation of Labor, was named as one of the public representatives by the President.

For a time the brotherhoods threatened to stay away but when the roll was called they were found represented by H. E. Wills, vice-president of the Brotherhood of Locomotive Engineers; Timothy Shea, acting president of the Brotherhood of Locomotive Firemen and Enginemen; L. E. Sheppard, president of the Order of Railway Conductors and W. G. Lee, president of the Brotherhood of Railroad Trainmen.

The public group consists of 25 members, including 3 women; the employers' group includes 17, including 5 selected by the Chamber of Commerce of the United States, 3 by farmers' organizations, 2 by the Investment Bankers'

Association, 5 by the National Industrial Conference, and the 2 railroad executives appointed by the President. The organized labor group includes 15 chosen by Mr. Gompers and the 4 brotherhood representatives, but the representatives of the miners and the carpenters were not present. However, the public group includes several members who would naturally be classified in the other groups, ranging from E. H. Gary and J. D. Rockfeller, Jr., to John Spargo and C. E. Russell, socialists, while Mr. Jewell, representing 10 organizations of railway employees, is also a member of that group.

Thomas L. Chadbourne of New York, was elected chairman and Frank Morrison and John J. Raskob secretaries of the general committee. The chairmen of the groups were chosen as follows: Public, B. M. Baruch, of New York; employers, H. A. Wheeler, of Chicago; labor, Samuel Gompers, of Washington.

National Railroad Accident Prevention Drive

The safety supervisors of all the principal railroads are now actively engaged in preparations for the campaign, to be conducted for two weeks, October 18 to 31, to reduce the personal injury record. Marcus A. Dow, of the New York Central, is leader of a "safety squadron" which will conduct a 23-day campaign holding rallies in 23 cities on the lines of that company.

The British Railroad Strike

The strike of railroad employees in England, Scotland and Wales, was suddenly ended on Sunday afternoon, October 5, by an agreement between the Government and representatives of the employees' unions. It was agreed that work should be resumed immediately; that negotiations should be resumed and be completed before January 1; that wages should be stabilized at the present level until September 30, 1920, though at any time after August 1, next, they may be reviewed in the light of circumstances then existing; that no adult employee should receive less than 51 shillings a week while the cost of living is 110 per cent. above the pre-war level; strikers are to work harmoniously with those who had returned to work, or who had not struck; arrears of wages to be paid on resumption of work.

The last clause refers evidently to the fact that wages due to the employees on the pay day which occurred soon after the beginning of the strike were not paid.

Important Railway Club Meetings

Frank McManamy, assistant director, Division of Operation, United States Railroad Administration, will make an address on Shop Efficiency at the meeting of the New England Railroad Club at the American House, Boston, on Tuesday evening, October 14.

W. C. Kendall, manager, Car Service Section, Division of Operation, United States Railroad Administration, will make an address on the Utilization of Freight Car Equipment at the meeting of the New York Railroad Club, Engineering Societies Building, New York, on Friday evening October 17.

L. K. Sillcox, master car builder, Chicago, Milwaukee & St. Paul, will make an address on Principles in Connection with the Economics of Freight Car Maintainance and Operation, at the meeting of the Western Railway Club, to be held at the Hotel Sherman, Chicago, Monday evening, October 20

Railway Financial News

Eugene Davis, Eureka, Nev., has purchased the Eureka Nevada from Mrs. Whitelaw Reid and Ogden Mills, of New York, and George Whittell, of San Francisco, for approximately $1,000,000; the road runs between Palisade, Nev., and Eureka, 84 miles.

The Chicago, Rock Island & Pacific has sold to the Central Union Trust Company and the National Bank of Commerce, New York, $5,500,000 one-year, six per cent. collateral trust notes, secured by its first and refunding bonds.

The Sacramento Northern has applied to the California State Railroad Commission for an order authorizing capital expenditures to the extent of $436,380, and for an authority to apply to that amount funds in the hands of the company received from the sale of bonds.

Railway Construction

The Central Texas Electric Company has been incorporated with $500,000 capital; the principal office is to be at Temple, Tex., and the road is to build about 70 miles of interurban electric lines between Temple and Waco, and Temple and Marlin.

The Erie Railroad has given a contract to the Arthur McMullen Company, New York, for building the sub-structure of a bascule bridge over the Passaic river at Newark, N. J.; bids will be asked for in the near future for the steel work of the superstructure.

The Cleveland, Cincinnati, Chicago & St. Louis has awarded a contract to the Walsh Construction Company, Davenport, Iowa, for building a second track on its lines between Ansonia, Ohio, and Houston; the work involves realinement and grade reduction, 50,000 cu. yd. of grading per mile and the construction of 11 concrete bridges.

Official Changes

Brigadier General William W. Atterbury has resumed his former position as vice-president in charge of operation of the Pennsylvania Eastern Lines, with headquarters at Philadelphia.

Charles Donnelly, general solicitor of the Northern Pacific, has been appointed executive vice-president, with headquarters at St. Paul, Minn., succeeding Thomas Cooper, who has been granted leave of absence.

Wilbur C. Fisk, president of the Hudson & Manhattan, has been elected chairman of the board. Oren Root, vice-president, has succeeded Mr. Fisk as president.

W. G. Curren has been appointed general superintendent of transportation of the Baltimore & Ohio, with headquarters at Baltimore, Md.

J. K. Savage, assistant general superintendent of the Canadian Pacific, Eastern Lines, has been appointed acting general superintendent.

H. G. Griffin, manager of the National Bridge Company, Montreal, Quebec, has resigned to become general superintendent of the car department of Morris & Co., Chicago.

A. J. Devlin has been appointed master mechanic of the St. Louis-San Francisco Western division, with headquarters at Enid, Okla.

W. E. Harmison, master mechanic of the Erie with office at Kent, Ohio, has been appointed shop superintendent at Galion, Ohio.

Frederick H. Murray has been appointed master mechanic, Erie Railroad, New York division, with headquarters at Jersey City.

C. E. Perkins, freight traffic manager of the Missouri Pacific, has been appointed general traffic manager, with office at St. Louis; this position has been newly created.

W. A. Rambach, assistant freight traffic manager of the Missouri Pacific, has been appointed freight traffic manager of that road, with headquarters at St. Louis, Mo.

H. S. Clarke has been appointed division engineer of the Pennsylvania division of the Delaware & Hudson with headquarters at Carbondale, Pa.

J. D. Irving, assistant engineer of the Chicago & North

Western, has been promoted to division engineer of the Madison division with headquarters at South Pekin, Ill.

J. C. Wrenshall, Jr., has returned to the position of division engineer of the Philadelphia & Reading at Spring Garden St., Philadelphia.

Obituary

Walter H. Graves, formerly chief engineer of the Oregon Short Line and president of the Oregon Society of Civil Engineers, died suddenly at Salinas, Cal., September 26.

William R. Hudson, general manager of the Atlanta, Birmingham & Atlantic, Charleston & Western Carolina, Augusta & Summerville, Atlanta & West Point, Western Railroad of Alabama, Georgia Railroad, Augusta Union Station, Atlanta Terminal and Augusta Belt, with headquarters at Augusta, Ga., died September 25.

Lewis S. Smith, federal treasurer of the Texas & Pacific, died October 1 at his old home in Franklin, La.

Supply Trade News

Horace S. Wilkinson, of Syracuse, N. Y., has been elected chairman of the Crucible Steel Company of America, Pittsburgh, Pa., to succeed Herbert Du Puy, resigned.

H. H. Gilbert, assistant manager of sales at Chicago of the Pressed Steel Car Company and the Western Steel Car & Foundry Company, has been promoted to manager of sales, succeeding J. H. Mitchell, assigned to other duties.

Harry M. Giles has been appointed general superintendent of the South Philadelphia Works of the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., succeeding the late Oscar Otto.

A. C. Allshul, in charge of the Milwaukee, Wis., district office of Joseph T. Ryerson & Son, Chicago, has been appointed branch manager of its new warehouse plant at Buffalo, N. Y.

Lieut. Vernon S. Henry, who served prior to the war in an engineering capacity with the Safety Car Heating & Lighting Company, New York, has re-entered the service of that company and is now connected with the Philadelphia office as sales representative.

The Bucyrus Company, South Milwaukee, Wis., has moved its southern sales office from New Orleans, La., to Birmingham, Ala., room 212, Jefferson County Bank Building.

The American Brake Company, St. Louis, Mo., is planning on erecting a four-story machine shop, at an estimated cost of $225,000.

L. A. Muttart, railroad salesman for the Western Electric Company, Inc., Chicago, with headquarters in that city, has been promoted to manager of the Chicago railroad sales department of that company.

E. L. Chollman, formerly with the Southern Locomotive Valve Gear Company, has been made vice-president and sales manager of the Paxton-Mitchell Company, Omaha, Neb.

T. W. Holt, assistant general manager of the Curtain Supply Company, Chicago, has been elected a director and secretary, in place of William S. Estell, resigned.

Charles H. Small and George F. Shade have established an office in the Monadnock Building, San Francisco, Cal., as agents for the Sargent Company, Chicago, auxiliary locomotive device manufacturers. They will also act as agents for other manufacturers of railway specialties.

The statement in the *Emergency Bulletin* for October 6, that the United States Railroad Administration has placed an order for 200,000 tons of steel rails is incorrect. The Railroad Administration has been giving consideration to such an order for several weeks but has not yet placed an order.

Locomotives Ordered

The Imperial Karafuta Government (Japan) has ordered two Prairie type locomotives from the American Locomotive Company.

The Cordoba Central Railway (Argentine) has ordered six Mikado type locomotives from the American Locomotive Company.

Mora & Mendoza (Cuba) has ordered one four-wheel switching locomotive from the American Locomotive Company.

The Trinidad Government Railways have ordered three freight and three switching locomotives from the American Locomotive Company.

The Jamaica Government Railway has ordered three locomotives from the Baldwin Locomotive Works.

Freight Car Inquiries

The Skinner Packing Company, Omaha, Neb., is inquiring for 100 refrigerator cars.

Mitsui & Co., Chicago, exporters to Japan, are inquiring for 500 freight car trucks for export.

Perin & Marshall, 2 Rector street, New York, are inquiring for eighty 50-ton freight cars; these will include 50 flat cars, 20 coke and 10 self-dumping gondolas, some of which are for export to India.

The Belgian State Railways are inquiring for 2,000 twenty metric ton gondola cars.

The Peking Sui Yuan Railway, China, is inquiring for five hundred 40-ton gondola cars.

The Pennsylvania Lines West are inquiring for 200 cabin-car underframes, and for options on an additional 250.

Freight Cars Ordered

The Atlantic Coast Line has ordered one hundred 50-ton phosphate cars from the Standard Steel Car Company.

The Pennsylvania Coal Company, New York City, has ordered 25 mine cars from the American Car & Foundry Company.

The Jamaica Government Railway has ordered 12 flat and 30 cane cars from the Magor Car Corporation.

The Cuban Central has ordered 50 narrow gage 15-ton cane cars from the Gregg Company.

The United Fruit Company has ordered for its railway lines in Cuba four 5,000-gal. tank cars and four 8,000-gal. tank cars from the Pennsylvania Tank Car Company.

The Tela Railroad, Honduras, has ordered through the United Fruit Company, fifty 30-ton fruit cars from the Magor Car Corporation.

The Trinidad Government Railways has ordered 70 cane cars from the Magor Car Corporation.

The Sterling Oil & Refining Company, Wichita, Kan., has ordered twenty-five 40-ton tank cars from the American Car & Foundry Company.

The Acme Petroleum Company, Chicago, has ordered ten 8,000-gal. and ten 10,000-gal. tank cars from the General American Tank Car Company, East Chicago, Indiana.

Passenger Car Inquiries

The Atlantic Coast Line is inquiring for four dining cars.

Passenger Car Orders

The United Railways of Havana have ordered eight first-class and six third-class passenger cars from the Wason Manufacturing Company, and six baggage cars from the Osgood-Bradley Car Company.

The Cuban Central has ordered six third-class passenger cars from the Wason Manufacturing Company and six baggage cars from the Osgood-Bradley Car Company.

The Cuba Railroad has ordered six passenger cars from the Pullman Company.

The Atlantic Coast Line has ordered four six-wheel dining cars from the Pullman Company.

Railway Age

EMERGENCY BULLETIN

PUBLISHED BY THE SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK

October 20, 1919.

The labor situation in the printing industry of New York City is still such that we are unable to publish the RAILWAY AGE. This is the third Emergency Bulletin which has been sent out since the RAILWAY AGE of September 26 was published. For convenient reference and in order to provide for the binding and indexing of the Bulletin with the regular issues, we have allowed page numbers for the two previous Bulletins and are numbering the pages of this one. Preserve your Bulletins in order to keep your files complete.

Baseless Charges Regarding Railroad Capitalization

One of the most remarkable hallucinations about business which ever obsessed the minds of any intelligent people is the hallucination of probably a majority of the people of the United States that the railways of this country as a whole are enormously overcapitalized. That some railways have been greatly overcapitalized everybody knows, and from this the conclusion has been drawn that all railroads are overcapitalized. The facts that there are numerous important roads, such as the Pennsylvania, the Burlington, the Lackawanna and the Santa Fe, which it is possible to demonstrate are, measured by any standard, greatly undercapitalized, and that not a few railroads which have been overcapitalized such as the Rock Island, have reduced their capitalization to a normal basis, do not seem to be known to many people.

The railroad labor brotherhoods within recent years, in order to array public opinion against private management of railroads, have carried on a widespread propaganda on the subject of overcapitalization, the obvious purpose being to convince the public that it is the return paid upon watered capitalization, and not the increased wages of labor, which is making necessary advances in railway rates.

The *Railway Age* repeatedly has exposed the fallacy, and even the falsehood, of many of the charges made. Glenn E. Plumb, on behalf of the labor brotherhoods, recently made a sweeping and indiscriminate attack upon the financial management of American railroads and demanded that his charges should be investigated before the roads were returned to private operation. The *Railway Age* showed that in the period to which he referred—that from 1900 to 1919—the operating income of the railway companies had increased only 98 per cent while the wages of the employees had increased 391 per cent. Doubtless this is the reason why when Mr. Plumb and Warren S. Stone recently appeared before the House Committee on Interstate Commerce to urge again the investigation of Mr. Plumb's charges, they complained to the House Committee that the *Railway Age* had been "abusing" the railway labor organizations and based upon this alleged "abuse" the allegation that the railway companies are trying to prevent investigation of their charges.

The *Railway Age* hopes that Congress will order an investigation of their charges. An investigation would be beneficial to all concerned, and especially the railway companies.

The principal charge the spokesmen of the brotherhoods are now making is that the railways are overcapitalized, and that their book cost of road and equipment account is padded to the extent of $8,000,000,000 to $10,000,000,000. The book cost of road and equipment is larger than the net capitalization and therefore we will examine this charge as applied to it.

In the year 1916, the latest for which complete statistics are available, the total book cost of road and equipment as reported by the railroads to the Interstate Commerce Commission, was $17,525,576,908. Prior to 1907 this account on many roads undoubtedly was made higher or lower than the actual investment, since the companies up to that time kept their accounts as each thought best. Since 1907, however, the companies have kept their accounts as required by the Interstate Commerce Commission and therefore it must be assumed that all additions made to the book cost of road and equipment since 1907 represent actual investment. The increase in book cost of road and equipment between 1907 and 1916 was $4,495,232,580. Meantime the increase in the railroad mileage of the country was 24,299 miles.

Let us now go back to 1907. We find that at that time the total book cost of road and equipment was reported as $13,030,344,328. The number of miles of railroad in the country was 229,951. If, as is alleged, the book cost has been padded to the extent of $8,000,000,000 to $10,000,000,000, all this padding was prior to the end of the fiscal year 1907. If we assume that the padding up to 1907 was, as alleged, $8,000,000,000 to $10,000,000,000, then we must conclude that up to that time the railway companies had built approximately 230,000 miles of railroad for from $3,000,000,000 to $5,000,000,000. If we assume that the "watering" amounted to only $8,000,000,000, we are obliged to conclude that the companies had built 230,000 miles of railroads for $5,030,000,000, or an avreage of less than $22,000 per mile.

The railroads of the United States in 1907 were good railroads, many of them with double or more tracks. Never in any country in the world was even a good single track railroad built and equipped for $22,000 a mile, or for any amount approaching this sum. In 1907 the cost of construction of the Government owned and operated railways of New South Wales and Australia, was reported as $60,000 a mile; the cost of construction of the government-owned Intercolonial Railway of Canada was officially given as $60,163 a mile; and the cost of construction of the government-owned railways of Germany, where the wages paid were half those paid in this country, was reported as over $107,000 a mile.

The charge that the railways of the country are overcapitalized to the extent of $8,000,000,000 to $10,000,000,000, or any other large sum, seems so absolutely preposterous to anybody who has a scintilla of knowledge regarding railroad matters as not to be worth a moment's notice and yet these outrageous charges regarding overcapitalization must be

answered again and again because, while as applied to the railways as a whole they have not the slightest foundation, they are made with such confidence and repeated so often that many people are led to believe them.

We should greatly regret to see the return of the railroads to private operation delayed in order that a Congressional committee might investigate a charge known to be false by everybody who knows anything about the railroad business. At the same time, we should like to see a thorough investigation and complete report upon the subject of railroad capitalization in the United States made by some such committee as the present House Committee on Interstate and Foreign Commerce. Such an investigation and report would demonstrate the baselessness of the charge of great overcapitalization and thereby do more than almost anything else could do to put the railway companies in good standing before the American public.

Railroads Will Be Returned January 1

Regardless of any congressional action which may or may not be taken before January 1, 1920, the railroads will be handed back to their owners December 31 by the Railroad Administration, according to a statement by Director General Hines at a conference of the officers of the Central, Western, Southwestern and Norwestern regions in Chicago, October 16. The director general said there has been no qualification whatever of the President's announcement made in a message to Congress last May that the railroads will be handed back to owners at the end of this year. The Railroad Administration is making all its plans to this effect, with the view of making the transfer back to private management at that date with the least possible disturbance to public service.

Regarding questions as to maintenance of railroads during federal control, and whether they will be in proper physical condition when turned back, Mr. Hines' judgement is that at December 31, the physical condition of the property will compare favorably with conditions when properties were taken over on December 31, 1917, and this is what the government's obligation contemplates. On some particular railroads it may turn out that less maintenance of a particular sort has been done, this being due to inability to get material during the war, but he believes that this will be more than offset by maintenance of other character which has been done, so that it is a fair general statement to say that the government will turn back the railroads in the condition required by the contract. In specific instances, there may have to be readjustment, some involving payments to the government, some involving payments by government.

Senate Railroad Bill Nearly Completed

The Senate committee on interstate commerce were engaged last week in putting the finishing touches on amendments to the Cummins railroad bill as drafted by its subcommittee and introduced in the Senate by Senator Cummins. At a meeting on Tuesday the committee reached an agreement by vote of 10 to 5 on a provision requiring the Interstate Commerce Commission to make rates which will produce a net operating income equal to an average of 5½ per cent on the value of the property of the railroads in a rate-making group, authorizing the commission to add ½ of 1 per cent to take care of non-productive improvements, and providing for a distribution of the excess.

Because of the objections of the labor leaders to any plan of profit-sharing, the committee has abandoned the profit-sharing provision contained in the original Cummins bill, but it has declined to be influenced by their objections to anti-strike legislation and by a vote of 14 to 1 the committee decided to report some such provision.

A provision tentatively agreed upon, authorizing the Interstate Commerce Commission to sustain state rates during the readjustment period was reconsidered and action on it postponed. The provision in the original Cummins bill for an absolute long and short haul clause has been stricken out of the bill. At a meeting on Wednesday the committee gave consideration to the method of providing for the indebtedness of the railroads to the government, but took no action, and Chairman Cummins and Senator Kellogg were appointed a sub-committee to consider the plans proposed by the Railroad Administration and the railroad companies. It was roughly estimated before the committee that the government advances to the railroads for capital expenditures would amount to approximately $1,200,000,000 and other advances might bring the total up to $1,500,000,000. The railroads have asked that indebtedness for capital expenditures be funded for a period of years, while the Railroad Administration wants to offset as large a portion of it as possible by the indebtedness of the government to the railroads on account of rental.

The Railway Executives and Higher Freight Rates

The Association of Railway Executives has written to Director General Hines that the Association is of the opinion that since higher rates are made necessary because of the increases made in expenses by the government, it is the duty of the government to itself make the necessary increases in rates. The Association therefore asks the director general to meet a committee to discuss the situation.

The committee appointed to confer with the director general is as follows: T. DeWitt Cuyler, Alfred P. Thom, J. H. Hustis, Howard Elliott, Samuel Rea, A. H. Smith, Daniel Willard, E. E. Loomis, S. M. Felton, C. H. Markham, Carl H. Gray, R. M. Calkins, E. N. Brown, Henry Walters, Julius Krutschnitt and Bird M. Robinson, president of the American Short Line Railroad Association.

Cross Ties for Next Year

The question of the procedure to be adopted in making purchases of ties and other railroad materials and supplies which will be needed by the railroads next year and which it is necessary to order several months in advance, is still under consideration by the Railroad Administration. The question is particularly acute in the case of cross-ties which must be ordered before the close of the year if an adequate supply is to be available for next year. This was considered at a meeting of the chairmen of the regional purchasing committees with officers of the Division of Purchases at Washington, but no decision was reached as to whether the Railroad Administration should place orders in the usual course and transfer the contracts to the railroads after the return to private management or whether the corporations should be asked to make their own purchases for next year in the same way that Director General Hines has suggested that they make their own arrangements, with the assistance of the Railroad Administration, for proposing such general advance in freight rates as they considered necessary.

Disastrous Strikes at New York City

The strike of longshoremen at New York City, reported in the Emergency Bulletin of last week, remains unsettled; though a considerable proportion of the men have returned to work, and the strength of the strike seems to be broken. The delays to ocean traffic have been very serious.

Since Monday the 13th, the business of the American Railway Express Company has been almost completely paralyzed in New York City, Jersey City and Hoboken,

by a strike of about 7,000 teamsters and helpers, the strike spreading on Wednesday to a number of suburban cities. The express company, like the railroads, succeeded in saving much perishable freight by diversion. The express strikers say that the United States Railroad Administration has been unreasonably slow in considering their claim for increases in pay; but the director general has written a letter explaining the impossibility of dealing promptly with all of the multitude of wage questions which come before the Board at Washington.

Strike at Altoona

A strike of engine house shopmen of the Pennsylvania Railroad at Enginehouse No. 3, Altoona, Pa., on Wednesday, October 8, spread on the 10th to the large shops, and by Friday night there was an almost complete stoppage of work, about 20,000 men having left their places; but by the following Monday the men had listened to the admonition of the director general of railroads, and his message that no grievances could be considered while the men were out, and they returned to work. The strike was started because an assistant foreman had been transferred from Hollidaysburg to Altoona in disregard, as claimed, of the seniority rule. The three engine-houses at Altoona employ about 1,900 men. The railroad company brought about 200 men from other shops, chiefly foremen, bosses and inspectors, and succeeded in keeping passenger trains running without interruption. The movement of freight was also kept up with a fair degree of success, although employees at Juniata, Hollidaysburg, Bellwood and Tyrone joined in the strike. This is said to be the first serious strike that has occurred at Altoona in forty-two years.

The Society of Railway Financial Officers

The Society of Railway Financial Officers held its annual meeting at the Waldorf Astoria, New York, on October 15, 16 and 17. On Wednesday afternoon, the question of what constitutes a good and sufficient reason for refunding payments on account of Liberty Loan subscriptions was introduced by H. R. Wheeler, federal treasurer of the Boston & Maine. The amount of bonds which are being taken by the railroad company either because the employee subscribing for them left the service or got into financial difficulties because of sickness or death in the family, varied from four per cent of the total amount subscribed for by employees of the company to nine per cent, with some instances of an even greater percentage. This means that when the roads are returned to their owners, the question of what shall be done with these bonds subscribed for at par by the Railroad Administration, and now selling below par, will have to be settled.

J. H. Ellis, federal treasurer of the Louisville & Nashville, introduced a discussion of the delivery of "order notify" shipments without the surrender of the bill of lading. It was generally agreed that General Order No. 25 of the Railroad Administration worked out unsatisfactorily and defeated the purpose of this kind of bill of lading and shipment since it prevented the consignor from getting payment on or before delivery of the goods to the consignee. It was suggested that if a bond were required upon the deposit of which a new bill of lading could be issued and deposited with the consignor's bank for collection, the difficulty would be overcome.

Industrial Conference

J. J. Forrester, president of the Brotherhood of Railway and Steamship Clerks, has been substituted as a member of the public group for Bert M. Jewell, acting president of the Railroad Employees' Department of the American Federation of Labor.

General News

The American Railroad Association will hold its regular meeting at the Blackstone, Chicago, on Wednesday, November 19.

The American Railway Bridge & Building Association will hold its annual convention at Cleveland, Ohio, on October 21, 22 and 23.

The National Industrial Traffic League will hold its annual meeting at Hotel Sherman, Chicago, on November 12, 13 and 14.

The Senate on October 14 adopted and sent to the House the Kellogg resolution postponing until July 1, 1920, the effective date of Section 10 of the Clayton Anti-Trust law requiring railroads to obtain competitive bids on purchases and other transactions with companies in which they have an interlocking interest.

The International Order of Railway Yardmasters has submitted a petition to Director General Hines, asking that yardmasters be given the benefit of several provisions of wage orders which have been allowed for employees, such as an eight-hour day and extra pay for overtime. They also ask more exact classification of grades of employees.

To study the expedition of the movement of freight cars, both loaded and empty, within terminals in order to overcome avoidable delays and thus increase the efficiency of the freight car equipment of the country, special terminal committees have been arranged for by the Railroad Administration at 70 of the principal terminals of the nation, each to be composed of local railroad representatives and a representative of shippers.

The question of supply of railroad fuel in the event of the coal strike which is threatened for November 1 has been considered by the Division of Purchases. It is understood that most of the railroads have not a reserve supply which would protect them for many days and that they were urged to do as much as possible in the way of accumulating a reserve without engaging in competitive bidding against each other for the available supply of free coal.

Early in the present year the Railroad Administration issued instructions that cars be loaded in the direction of home with a view to getting cars re-located on home lines to a larger extent. The conclusion has been reached that this policy will still further be aided by re-establishing the per diem rules whereby one railroad is required to account for per diem on cars used by it belonging to another railroad. A general order making this requirement has therefore been issued.

Hearings were held week before last at Washington before the Board of Wages and Working Conditions on the demands for increased wages presented to the Railroad Administration in August by the Brotherhood of Locomotive Firemen and Enginemen. Timothy Shea, acting president of the brotherhood, made the opening statement for the organization and was followed by other officers of the brotherhood, while the railroads were represented by a committee of operating officers appointed by the regional directors.

Official Changes

Ralph Budd, vice-president of the Great Northern Railway Co., has been elected president, succeeding Louis W. Hill who has resigned as president but retains office as chairman of the board of directors.

B. A. Wait, assistant engineer on the First Division of

the Chicago, Rock Island & Pacific with headquarters at Des Moines, Iowa, has been promoted to division engineer of the Cedar Rapids division with office at Cedar Rapids, Iowa, succeeding Garrett Davis, who has been assigned to other duties.

Obituary

Patrick Laden, district engineer on the Illinois Central, with office at Waterloo, Iowa, died at his home in Rockford, Ill., on October 13, following a stroke of apoplexy.

Supply Trade News

H. W. Ross has been elected vice-president of Templeton, Kenly & Co., Ltd., Chicago, manufacturers of Simplex jacks.

Mudge & Co., Chicago, has appointed the Canuck Supply Co., Montreal, Ont., as its Canadian sales agent.

The name of the Schroeder Headlight & Generating Co., Evansville, Ind., was changed to Sunbeam Electric Manufacturing Company on September 27, 1919.

James S. Hearons has become affiliated with the Gustin-Bacon Manufacturing Company, Kansas City, Mo., as railroad representative.

The Duncan Lumber Company, Portland, Ore., has been appointed the exclusive sales agent of the Luedinghaus Lumber Company, Dryad, Wash., and the Meskill Lumber Company, Meskill, Wash.

The T. Geo. Stiles Co., Arlington, N. J., designers and manufacturers of railroad signals, interlocking and third rail safety appliances and supplies, has appointed the C. H. Whall Co., 170 Summer Street, Boston, Mass., sales agents for its materials, in territory covering all railroads in the New England States.

K. C. Gardner, assistant manager of sales of the Pressed Steel Car Company and the Western Steel & Foundry Company, has been appointed manager of sales of the Central district with office at Pittsburgh, Pa., and Huntley H. Gilbert, assistant manager of sales, has been appointed manager of sales of the Western district with office at Chicago, vice J. H. Mitchell, assigned to other duties.

Extensions are contemplated by the Lima Locomotive Works, Lima, Ohio, which will increase the plant's capacity approximately 50 per cent and involve an expenditure of $1,250,000. Additions to the present plant include a new erecting shop with a capacity of 70 locomotives a month, and a superheater shop extension for the boiler and tank works. New machinery costing approximately $300,000 will be purchased.

Railway Construction

The Chicago & Alton has begun work on the second unit of a two-unit freight house at Chicago. The new building will be of steel construction, 165 feet by 460 feet.

The Chicago, Rock Island & Pacific will receive bids up to October 22 for the construction of a double track bridge across the Des Moines river at Eldon, Iowa; the bridge will consist of eight 93-foot and one 46-foot concrete arch spans, and two 44-foot deck plate girders with concrete decks.

Freight and Passenger Car Inquiries

The Arms Palace Horse Car Co. is inquiring for 25 horse cars.

The Bell Locomotive Works, New York City, is inquiring for 45 narrow gage flat, coal and tank cars.

Clark & Hutcheson, 80 Wall Street, New York City, are inquiring for a number of electric storage battery steel cars for export to South America.

The Detroit United Railway, Detroit, Mich., is inquiring for 25 express trailer cars and three interurban bodies.

The Eastern Steel Company, Pottsville, Pa., is inquiring for 33 hopper cars and 5 gondola cars; all of 50-ton capacity.

The National Enameling & Stamping Company, Granite City, Ill., is inquiring for 5 all steel 50-ton gondola cars.

The New York, Chicago & St. Louis is inquiring for 11 passenger cars.

The Pacific Car & Foundry Co., Seattle, Wash., is inquiring for steel underframes for passenger cars.

The Peking Sui Yuan has increased to 1,000 its inquiry through Mitsui & Co., New York, for 500 40-ton high side gondola cars.

The Standard Supply & Equipment Co., Philadelphia, Pa., is inquiring for one self-acting dump car.

Cars Ordered

The Ashford Coal Co., Ashford, W. Va., has ordered 30 wooden mine cars from the American Car & Foundry Co.

The Chelsea Refining Co., Ardmore, Okla., has ordered 50 8000-gal. tank cars from the American Car & Foundry Co.

The Eagle Refining Co., Wichita Falls, Tex., has ordered 50 8050-gal. tank cars, from the Pennsylvania Tank Car Company.

The Foco Oil Company, Franklin, Pa., has ordered 10 8050-gal. tank cars from the Pennsylvania Tank Car Co.

The Freedom Oil Works, Freedom, Pa., has ordered 50 10050-gal. tank cars, from the Pennsylvania Tank Car Co.

The H. C. Frick Coke Co., Pittsburgh, Pa., has ordered 100 mine cars from the American Car & Foundry Co.

The Holland Coal Co., Altoona, Pa., has ordered 50 low-vein pit cars from the American Car & Foundry Co.

Holmes, Bulkley & Wardrop, 61 Broadway, New York, have ordered 100 8050-gal. tank cars, from the Pennsylvania Tank Car Co.

The Lubrite Refining Co., St. Louis, Mo., has ordered 50 10000-gal. tank cars from the American Car & Foundry Co.

The Magnolia Petroleum Co., Dallas, Tex., has ordered 100 40-ton, 8000-gal. tank cars from the American Car & Foundry Co.

The Manila Railroad Co., New York City, has ordered 25 first-class coaches from the American Car & Foundry Co., for export to the Philippine Islands.

F. M. Pease, Chicago, has ordered 20 8050-gal. tank cars from the Pennsylvania Tank Car Company.

The Ranger Refining Co., Kansas City, Mo., has ordered 25 8000-gal. and 25 10000-gal. tank cars from the American Car & Foundry Co., and 20 10050-gal. tank cars, from the Pennsylvania Tank Car Company.

The Transcontinental Oil Co., Pittsburgh, Pa., has ordered 50 8000-gal. tank cars from the American Car & Foundry Co.

The United States Industrial Alcohol Co., 27 William Street, New York, has ordered 124 8050-gal. tank cars, from the Pennsylvania Tank Car Company.

Locomotives Ordered

The South Manchurian Railways have ordered 12 0-8-0 type locomotives from the Baldwin Locomotive Works.

The Steel & Tube Company of America, Indiana Harbor, Ind., has ordered 2 0-6-0 type switching locomotives from the Baldwin Locomotive Works.

Remember the "National Railroad Accident Prevention Drive!" October 18 to 31.

WOOLWORTH BUILDING, NEW YORK

November 6, 1919

Cummins Bill Cannot Be Passed By Jan. 1

The Senate Committee on Interstate Commerce on Wednesday practically decided that it was impossible to pass comprehensive railroad legislation before the end of the year; it tentatively decided to substitute for the Cummins bill a brief resolution providing for the return of the roads, January 1, with temporary extension of the guaranty. Some conferences are to be held to determine just what terms can be enacted without opposition and the committee is to meet again Friday.

The Printers' Strike

No Emergency Bulletin was issued last week—this for reasons beyond our control. We expect to resume publication of the *Railway Age* in a few days.

Just a few words about the strike. The employing printers had entered into an agreement with the international unions of the printing trades to give the men a 44-hour week beginning May, 1921. The pressmen and feeders union in New York City, whose local agreement expired September 30 last, insisted on an increase of $14 a week and also on the immediate adoption of the 44-hour week. The employing printers offered the men, who were already well paid, an increase of $6 a week. The men refused this offer and went on a strike. Their international organization, which is affiliated with the American Federation of Labor, insisted on the men returning to work and finally revoked the charter of the union and classed the men as "outlaws."

The compositors officially remained at work, but actually went on a "vacation strike" in sympathy with the striking pressmen and feeders. As their local agreement had run out and contained no continuing clause the international organization has been unable to revoke their charter—no agreement having been broken—and has had to content itself with advising the men to return to work. The binders and mailers have signed an agreement with the employers.

The international organization of the pressmen and feeders is trying to get the men back into its organization, but is determined to rid itself of the radical element, which it classes as bolshevists. After five weeks of idleness the men are beginning to realize that they have been misled by their local officers and are gradually taking out new international cards and returning to work. A few employers gave in to the local pressmen and feeders' union, but other unions affiliated with the American Federation of Labor regard their output as "struck work" and are boycotting them.

For the first three weeks of the strike the publishers, to protect the employing printers, decided not to take their work out of the city, even temporarily. This encouraged the men who realized that they could recoup their losses after the strike by overtime work. Recently many publishers have left New York City, temporarily or permanently, and periodicals are gradually coming out, most of them somewhat incomplete and unfinished because of lack of adequate facilities. These handicaps, it is expected, will shortly be overcome, if indeed the strike is not ended by a complete victory for the employers.

Enormous Increase of Travel—No Increase of Cars

The public is expecting that soon after the railways are returned to private operation there will be a great improvement of service and especially of passenger service. Doubtless there soon will be some improvement, but how difficult it is going to be and how long it is likely to take to make service as good as it was before government operation was adopted is indicated in a striking way by the statistics regarding the changes which have occurred in the amount of travel within recent years and in the number of cars which have been provided to carry passengers.

Between the years 1910 and 1916 the number of passenger cars in service increased from 47,095 to 54,774, or 16 per cent. Meantime, the increase in the number of passengers carried one mile, which is the measure of the total amount of travel, was 36 per cent.

After the United States entered the war in the spring of 1917 the railways, in order to enable them better to handle the country's war business, began sharply curtailing passenger service, and also in order to enable the manufacturing resources of the country to be devoted almost exclusively to war work they sharply curtailed the number of cars, including passenger cars, ordered. In 1917 the increase in the number of passenger cars in service was 1,167.

Government control was established at the beginning of 1918, and during that year the total passenger cars ordered for all the railroads was only 131, and in 1919 no substantial orders for passenger cars have been placed. In consequence, within the last two years there has been no increase in the number of passenger cars, and probably, owing to retirement of old cars, there has been some decrease.

Meantime there has been occurring an increase in the volume of passenger traffic which far surpasses all records ever made before. As already stated, the increase in travel in the six years from 1910 to 1916 was 36 per cent. In 1917 alone it was 14½ per cent. In 1918 the increase over 1917 exceeded 8 per cent. In the first eight months of 1919 the passenger business handled was 6.3 per cent greater than handled in the same months of 1918. These cumulative increases since 1916 aggregate 32 per cent.

The large increase in passenger traffic in 1917 and 1918 has been attributed chiefly to the movement of troops and to the traveling of their relatives and friends to and from the cantonments where they were located. Since 1918, however, there has been a very large reduction in the movement of troops, and yet the statistics of the Railroad Administration show that the amount of travel in July, 1919, was 12½ per cent greater than in July, 1918.

The relationship of passenger rates and this enormous increase of travel is very interesting. It always has been contended that reductions in passenger fares would increase travel, and that advances in passenger fares would reduce it. In June, 1918, passenger fares throughout most of the United States were increased 50 per cent. We do not know what was the increase in travel during the month immediately following, but we do know that within two months—that is, in August, 1918—the increase in travel over August, 1917, was almost 12 per cent; that in September, 1918, it was 14 per cent; and that the increase in in travel has gone on ever since, the volume of it in July, 1919, being, as we have already shown, 12½ per cent greater than in July, 1918. In other words, the largest increase in travel which probably ever took place in so short a time occurred immediately after the 50 per cent increase in passenger fares; and the amount of travel has continued rapidly to increase ever since then. The explanation doubtless is that the working people of the country are being paid higher wages than ever before and that they are doing more traveling than ever before.

There is no present reason for doubting that the present large amount of travel will continue, and even increase. If the railroads during the last three years had bought only as many passenger cars per year as they did in the preceding six years they would have bought in this three years at least 7,000 more cars than they actually did. But the increase in passenger business in the last three years has been almost as great as in all of the preceding six years together. Taking into consideration both the very small number of passenger cars that has been bought during the last three years and the enormous increase in passenger business which has occurred, it is safe to say that the railways after they are returned to private operation would have to have at least 8,000 and probably 10,000 more passenger cars than they actually will have in order to handle their passenger business in the same way that they handled it in 1916. But the largest number of passenger cars ever built in the United States and Canada together in one year was only 4,412. It is evident, therefore, that no matter how anxious the railways may be to give satisfactory service after the resumption of private operation it will take several years to make up for the deficiency of passenger cars which has accumulated during the last three years.

Cummins Bill Reported to Senate

The Cummins bill, providing for a reorganization of the system of railroad regulation and also for the gradual reorganization of the railroads into 20 to 35 competing systems, was reported to the Senate on October 23 in the form of a new bill, S. 3288, including the many important revisions which have been made by the Committee on Interstate Commerce since it was originally introduced on September 2 as the work of a subcommittee.

In submitting it to the Senate, Senator Cummins read his letter from Director General Hines urging early action on railroad legislation and also his reply to Mr. Hines stating his intention to do everything in his power to bring the bill forward for consideration by the Senate the moment it is free from the present involved subject of the peace treaty. He said that while there has been a movement in Congress for an early adjournment he intended to oppose it with all the influence he could command and that in his opinion two weeks of steady work ought to secure a final vote on the bill. He also stated to the Senate that he agreed with Mr. Hines that Congress ought to give its consideration to the bill to the exclusion of every other measure.

"I believe," he added, "that if the Senate were to adjourn before it has disposed of this question it would be subject to the condemnation of every right-minded man in America, for there is nothing that would be so disastrous to the commerce of America as a long delay in establishing a policy respecting the return of these vast properties to their owners." He promised to present a report on the bill within a few days. Senator La Follette announced that he would file a minority report expressing his dissent from the provisions of the bill and at the appropriate time would also propose a substitute measure.

The revised bill is a vastly different bill from that tentatively drafted by the subcommittee, which was outlined in the *Railway Age* of September 5, page 448. It is based on no single plan of the many that have been proposed but probably bears a closer resemblance to that proposed by the National Transportation Conference than to any other, as that plan itself represented the selection of ideas from the principal plans previously proposed.

The most important change made by the committee was the adoption of the idea of establishing a definite percentage of return for the guidance of the Interstate Commerce Commission in rate-making, with a provision for a division of net operating income above 6 per cent but not for distribution to the so-called "weak roads." In 1925 and every fifth year thereafter, however, the commission may revise the percentage basis in accordance with conditions. To meet the constitutional and other objections to the idea of taking from a prosperous or efficient road directly for the benefit of its less fortunate or less deserving neighbors it is provided that the contributions made by roads having excess earnings shall go into a general railroad contingent fund to be administered by a federal transportation board for common railroad purposes, which includes the possibility of loans to roads that need assistance. The provisions in the original bill providing for the use of half the excess earnings for the benefit of the employes were omitted because of the objections made before the committee by labor leaders.

The provisions dealing with the method of funding the indebtedness of the railroads to the government, and those relating to the settlement of labor disputes, have been entirely rewritten; the regulation of security issues is transferred from the Interstate Commerce Commission to the proposed new transportation board, and there are new provisions relating to the co-ordination of rail and water traffic and to the powers of corporations incorporated under the act. The provisions relating to control of telegraph and telephone systems were omitted. The revised bill contains no provision giving the Interstate Commerce Commission power to suspend state rates during the transition period after federal control although at one time the committee tentatively approved such a plan.

Rules for Competitive Bidding

The Interstate Commerce Commission has issued regulations governing the method of obtaining competitive bids on transactions by a common carrier and companies which have "interlocking" relationships, as provided by Section 10 of the Clayton law, but it is expected that Congress will have extended the effective date of the law before the regulations become effective on January 1.

General News

The Railroad Administration has ordered 40,000 tons of rail from the Bethlehem Steel Company.

The annual meeting of the National Industrial Traffic League will be held at the Hotel Sherman, Chicago, Ill., on November 12, 13 and 14.

An extra storage charge of $10 a car as an emergency measure, is now imposed on refrigerator cars not unloaded within five days; and on cars of lumber held for reconsignment, after two days. The National Bureau of Whole-

sale Lumber Distributors, has instructed its traffic committee, to seek a conference with Director General Hines to protest against this charge on emergency lumber.

Official Changes

Frank Hedley, vice-president and general manager of the Interborough Rapid Transit Company, New York, has been elected president of that company succeeding Theodore P. Shonts.

I. B. Tigrett, president of the Birmingham & Northwestern and the Meridien & Memphis, has been appointed president of the Gulf, Mobile & Northern with headquarters at Mobile, Ala., succeeding John W. Platten, resigned to become chairman of the board of directors. Mr. Tigrett will continue also as president of the two roads first mentioned.

LaRue Brown, assistant U. S. attorney general, has been appointed general solicitor of the Railroad Administration to fill the vacancy created by the recent appointment of E. Marvin Underwood as general counsel of the administration.

Benjamin B. Greer, assistant regional director of the Central Western region, has been appointed federal manager of the Chicago, Milwaukee & St. Paul, the Ontonagon and the Escanaba & Lake Superior, succeeding H. E. Byram, who has resigned to become president of the Chicago, Milwaukee & St. Paul Railroad Company, which office he held prior to his appointment under federal management.

C. R. Capps, traffic assistant at Philadelphia to Regional Director L. W. Baldwin, of the Allegheny region, has resigned to resume his former duties as senior vice-president of the Seaboard Air Line with headquarters at Norfolk, Va. William Hodgdon, traffic manager of the Pennsylvania, Western Lines, has been appointed Mr. Capps' successor.

F. E. Clarity, transportation assistant to the regional director of the Central Western region, has been promoted to assistant regional director succeeding B. B. Greer.

W. G. Curren has been appointed general superintendent of transportation of the Baltimore & Ohio, with headquarters at Baltimore, Md.

F. L. Johnson, general superintendent of the Missouri district of the Chicago, Burlington & Quincy, with headquarters at St. Louis, Mo., has been appointed assistant to the general manager, with office at Chicago, a newly-created position. M. L. Howard, assistant to the federal manager, with office at Chicago, has been appointed to succeed Mr. Johnson at St. Louis.

E. W. Hoffman, superintendent of the Ohio division of the Baltimore & Ohio, with office at Chillicothe, Ohio, has been transferred to the Chicago division, with office at Chicago, succeeding J. H. Jackson, who has resigned.

M. C. LaBertew, superintendent of the Great Northern, at Harve, Mont., has been transferred to the Kalispell division, succeeding J. L. Close, granted leave of absence; T. F. Dixon, trainmaster of the Great Northern at Great Falls, Mont., has been appointed acting division superintendent during the absence of Mr. LaBertew.

C. W. Crosby, trainmaster of the Piedmont & Northern at Greenville, S. C., has been promoted to superintendent in charge of the operating department with headquarters at Greenville, succeeding E. Thomson, general manager, who has resigned.

W. H. Oliver, division engineer on the Atchison, Topeka & Santa Fe, with headquarters at San Bernardino, Cal., has been promoted to engineer of the Grand division with headquarters at Los Angeles, Cal.

W. A. Wallace, division engineer on the Chicago, Rock Island & Pacific, at Eldon, Mo., has been transferred to the Nebraska division, with headquarters at Fairbury, Nebr., a newly-created position.

W. H. Lowther, division engineer of the Idaho division of the Oregon Short Line, has been appointed division engineer of the Kansas division of the Union Pacific succeeding W. A. Parker, whose promotion was noted in the Emergency Bulletin of October 6.

W. Malthaner, general master mechanic of the Northwest district of the Baltimore & Ohio, Western Lines, with headquarters at Cleveland, Ohio, has been appointed acting superintendent maintenance of equipment with headquarters at Cincinnati, Ohio. W. G. Johnston, master mechanic of the Newark division with headquarters at Newark, Ohio, has been appointed Mr. Malthaner's successor and F. E. Cooper, shop superintendent at Newark, Ohio, has been appointed to succeed Mr. Johnston.

J. S. Jennings, division master mechanic on the Michigan Central at Bay City, Mich., has been promoted to assistant superintendent of motive power with headquarters at Detroit, Mich., a newly-created position. J. O. Goodwin, road foreman of engines with office at West Bay City, Mich., has been appointed to succeed Mr. Jennings at Bay City.

W. F. Kiesel, Jr., acting mechanical engineer of the Pennsylvania, at Altoona, Pa., has been appointed mechanical engineer succeeding A. S. Vogt, retired; H. A. Hoke has been appointed Mr. Kiesel's successor; R. N. Miller, assistant engineer at Altoona, has been appointed acting assistant mechanical engineer, succeeding Mr. Hoke, and B. S. Brown is Mr. Miller's successor. J. V. B. Duer, assistant engineer at Altoona, has been made electrical engineer, and S. M. Viele assistant electrical engineer of the new electrical engineering department operated in conjunction with the mechanical engineering department at Altoona.

S. A. Schickedanz, chief draftsman of the Chicago & Eastern Illinois, at Chicago, has been promoted to mechanical engineer, at Danville, Ill., succeeding W. H. Hauser, who has resigned to become connected with the A. B. C. Transit Refrigeration Company, Chicago.

J. C. Brekenfeld has been appointed shop supervisor of the St. Louis-San Francisco, with headquarters at Springfield, Mo., succeeding A. J. Devlin, whose transfer was noticed in the Emergency Bulletin of October 13.

S. Lenzner, master car builder of the Michigan Central with headquarters at Detroit, Mich., has been appointed supervisor of passenger equipment, a newly-created position.

Supply Trade Notes

J. H. Mitchell, manager of sales of the western district for the Pressed Steel Car Company and the Western Steel Car & Foundry Company, with headquarters in Chicago, left recently for Havana, Cuba, to assume the position of executive vice-president of the American Steel Company of Cuba.

S. C. Amsden, advertising manager of Mudge & Co., Chicago, with headquarters in that city, has been appointed district manager of the southwestern territory, with headquarters at St. Louis, Mo.

The American Automatic Train Control Corporation, American building, Baltimore, Md., which has been organized as the successor of the American Train Control Company, announces that it is preparing to push activities on a large scale, with its own factories. The president of the corporation is Calvin W. Hendrick, and the vice-president is Finley J. Shepard, New York City, vice-president of the Missouri Pacific Railroad Company. The other members of the board of directors are John B. Ramsay, Morris Whitridge, M. M. Elkan (New York); T. R. Thomas, L. A. Cover, W. J. Donnelly, R. L. Williams and S. H. Lauchheimer, all of Baltimore except Mr Elkan.

C. W. Cross has been appointed manager of western railroad sales of the Chicago Pneumatic Tool Company, Chicago. Mr. Cross will have his headquarters in the Fisher building, Chicago.

The Ingersoll-Rand Company, New York, has established a branch office in the Sam Houston Life building, Dallas, Tex., in charge of R. H. Brown, Jr., as manager.

Jean K. Vanatta, service manager of Mudge & Co., Chicago, has been appointed district manager of the central territory with headquarters at Chicago.

The Railway Lock-Spike Company, Atlanta, Ga., has been chartered with $300,000 capital and the privilege of increasing to $1,000,000, to manufacture railway spikes and other railway supplies. H. E. Harris, W. E. Paschall and J. J. Casteel are the incorporators.

R. E. Trout has resigned as signal engineer of the St. Louis-San Francisco to become general sales manager of the primary battery division of Thomas A. Edison, Inc., with office at Bloomfield, N. J.

Locomotive Inquiries

The Hukuang Railway of China is inquiring for 25 locomotives.

The Pennsylvania Equipment Company, Philadelphia, Pa., is in the market for a second-hand, standard gage, four-wheel, saddle tank Baldwin or Porter locomotive, weighing not less than 10 tons, or more than 12 tons.

Locomotives Ordered

The Central Railway of Brazil has ordered five Consolidation locomotives from the American Locomotive Company. They will have 17-in. x 20-in. cylinders, with a total weight in working order of 93,000 lb.

The Chicago, Milwaukee & St. Paul is having repairs made to about 40 locomotives at the Baldwin Locomotive Works.

The Egyptian State Railways have ordered 50 locomotives from the Baldwin Locomotive Works. Thirty of these are of the 2-6-0 type and will have 21-in. cylinders, and 20 are of the 4-4-2 type, and will have 20-in. cylinders. The Egyptian State Railways are also said to be asking prices on 65 additional locomotives.

The United Fruit Company has ordered two Consolidation locomotives from the Baldwin Locomotive Works. They will have 17-in. by 24-in. cylinders, and are for use on its lines in Cuba.

The United Verde Copper Company, New York, has ordered two Mallet locomotives from the American Locomotive Company. They will have 23½ x 37 x 32-in. cylinders, and a total weight in working order of 448,000 lb.

Perin & Marshall, 2 Rector street, New York, have ordered five 2-6-4 type locomotives from the Baldwin Locomotive Works for the Mysore State Railways (India).

Freight Car Inquiries

The Famous Broadway Shows, Cincinnati, Ohio, is inquiring for five 60-ft. flat cars.

The Ford Motor Company, Detroit, Mich., is inquiring for fifty 50-ton flat cars and for twelve 50-ton high side, coke rack gondola cars.

Frazar & Company, 30 Church street, New York City, is inquiring for one 3-ft. gage freight motor car.

The International Railway Supply Company, New York, is inquiring for 100 low-side cane cars, for the Trinidad Government Railways. These cars are in addition to the 70 cane cars ordered recently by the International Railway Supply Company from the Magor Car Corporation for the same railroad.

The National Steel Car Company, Ltd., Hamilton, Ont., is estimating on 100 ten-ton drop side gondolas and 100 ten-ton box cars for the Morocco State Railways.

The Pennsylvania Equipment Company, Philadelphia, Pa., is in the market for eight second-hand steel underframe box cars, also for a second-hand well car.

Perin & Marshall, New York, are in the market for 40 all-steel ore hopper cars and 60 steel platform cars, 20 ft. long, for the Mysore State Railways (India).

The Tennessee Coal, Iron & Railroad Company is asking for prices on 30 coke cars of 70-ton capacity.

A. C. Torbert, Chicago, is inquiring for 50 gondola cars.

The United States War Department is asking for prices on 500 tank cars of 10,000 gal. capacity.

Freight Car Orders

The Brimstone Railroad & Canals Company, Sulphur, La., has ordered 25 hopper cars from the Pressed Steel Car Company, Pittsburgh, Pa.

The Cuyamel Fruit Company, New Orleans, La., has ordered 15 fruit cars from the Magor Car Corporation, for export to Honduras.

F. M. Pease, Chicago, has ordered thirty-five 8,050-gal. tank cars from the Pennsylvania Tank Car Company. This is in addition to the 20 cars recently ordered from the same company.

The Pekin-Suiyuan has ordered 100 forty-ton gondola cars from the General American Tank Car Company, and it is understood has given the same company an additional order for 500-forty-ton high side gondola cars.

Then Penn Coal & Coke Corporation, Cresson, Pa., has ordered 75 wood and 100 steel and wood mine cars from the American Car & Foundry Co.

The United Railways of Havana reported in the *Railway Age* of September 26, as inquiring for twenty-five 40-ton hopper ballast cars, have ordered this equipment from the Standard Steel Car Company.

The Wabash Railroad is having repairs made by the Pressed Steel Car Company to 300 of its wooden freight cars.

Passenger Car Inquiries

The Crownshield Trading Corp., 30 Church street, New York City, is inquiring for two passenger cars, one first and second class and one second class.

Dodwell & Company, 161 Water street, New York City, are inquiring for one kerosene motor coach for export to China.

Jardine, Matheson & Co., Ltd., New York City, are inquiring for two passenger coaches.

The Long Island Railroad is inquiring for 50 trailer cars, 30 steam coaches, and 20 motor cars, all to be 54 feet long.

C. E. Morfoot, Starkville, Miss., is inquiring for one combination sleeping and baggage car.

The Nashville, Chattanooga & St. Louis is inquiring for four 70-ft. coaches and for two 70-ft. partition coaches.

The Penn General Supply Company, Pittsburgh, Pa., is inquiring for from 30 to 40 steel railway velocipedes.

Perin & Marshall, 2 Rector street, New York, are in the market for steel underframes and trucks for five passenger cars and five baggage cars.

Ricardo, Gomez & Dietlin Co., 161 Maiden Lane, New York, is inquiring for 80 tramway chasses, for export to Italy.

The Stephensville & Desdemona Oil Railway Company, Stephensville, Tex., is inquiring for five narrow-gage wooden passenger cars.

The Texas & Pacific is inquiring for 69 miscellaneous passenger cars, including 50 coaches, 5 diners, 12 baggage and express and 2 mail cars.

The United Railways of Havana are in the market for three sleeping cars.

Another Apology

FOR SEVEN WEEKS, since September 26, publication of the *Railway Age* has been delayed because of the strike of feeders and pressmen in New York City. The situation was fully outlined in our Emergency Bulletin for November 6.

The delayed issues will be published as rapidly as possible; the news articles in each issue will, however, be strictly up to date. While each number will bear the date of the delayed issue, it will be coupled with the actual date of publication in order that there may be no confusion in referring to the papers in the future. This method of handling is necessary because the railroads of this country are now passing through the most critical period in their entire history, and it is necessary to keep our readers fully and promptly informed as to the course of events.

Since September 26, the date of the previous issue, we have found it possible to publish four Emergency Bulletins which have briefly covered some of the more important developments and news items. These were dated as of the day of mailing and were allowed—and in the case of the last two bulletins actually carried—page numbers, so that they will be indexed and may be bound with the current volume.

We wish to take this opportunity of thanking both our subscribers and advertisers for the cordial and hearty support they have given to us in the emergency.

Libraries and those wishing to bind their numbers of the *Railway Age* to keep complete files, should preserve the Emergency Bulletins.

The Shop Craft Agreement

For the first time the railroads of this country have entered into a national agreement with the shop crafts. While the statement has been made that the increases in wages granted are insignificant and are only such as to bring the rates for the shopmen up to a basis comparable to that of other railroad employees, this is hardly borne out by a close study of the agreement. For instance, the rates of pay for mechanics who have been receiving 68 cents an hour have been increased 4 cents an hour, effective May 1, 1919; steel car workers and other mechanics in the car department who have been receiving 63 cents an hour have also been increased 4 cents an hour; while other mechanics in the car department who were receiving 58 cents an hour have been increased 9 cents, all these changes being effective May 1, 1919. Apprentices, helpers, and other classes of workers, except certain ones covered in a special rule, also received an increase of 4 cents an hour effective May 1, 1919. These increases may, to some, seem insignificant compared with the high rates which the men have been receiving, but they promise to make a very considerable addition to the expenses of the individual roads. One peculiar weakness in railroad organization is indicated by rule 34 of the agreement, which reads: "Should an employee be assigned temporarily to fill the place of a foreman he will be paid his own rate, straight time for straight time hours, and overtime for overtime hours, if greater than the foreman's rate. If it is not he will get the foreman's rate." If the former condition is true how much will the workman who is acting temporarily as foreman look up to or respect his immediate superior when he returns to his job as a mechanic? The foreman coming into intimate contact with the workmen should surely be placed on a much higher plane than this if the management expects real results. This shortcoming is not a development which has come about under federal control, although it may have been intensified by it. It is a "hangover" from pre-war days. One great weakness of American railroads is the lack of adequate supervision. The roads must invest their officers and foremen with real dignity and importance if the efficiency and effectiveness of the various departments are to be improved.

The High Cost of Living

Restricted production directly increases the cost of living. The *Railway Age* has pointed this out time and time again during recent months. A keen observer, thoroughly familiar with railroad mechanical departments and their practices and who has made several trips over the country in recent years, says that he was astounded, on a recent trip, to note the idleness on the part of railroad shop men, and their apparent lack of interest in their work. Tourists returning from their summer vacations tell of inattention, brusqueness and indifference on the part of station employees with whom they came in contact in buying tickets and in checking baggage. A professional man in a city which is largely made up of railroad employees (it has a large locomotive and car repair shop and terminal yards) tells of surprising extravagances on the part of railroad men. The habits of thrift which they cultivated in pre-war days have been succeeded by the most thoughtless and careless expenditures. These are not isolated instances; unfortunately they are too general. If this country is to take its real place among the nations of the world; if its citizens are to enjoy prosperity and comfort, these disturbing conditions which exist throughout our industries and railroads must be corrected. The coming winter promises distress and even suffering among the poor and less favored classes, and this not because of any failure in our natural resources, but largely because of restricted production at a time when the need was never so great, coupled with a spirit of extravagance. Fortunately, people are gradually awakening to the fact that those who hamper or restrict production are just as guilty as the profiteer. If this feeling on the part of the public can inspire the Administration or Congress to conduct a spirited campaign of education in economics relating to labor, production, money, wealth, etc., it will be most helpful. This will be particularly true if at the same time the labor leaders and the radical element in the ranks of labor will awaken to the fact that the public is sick and tired of strikes and threats of strikes and is in a mood no longer to tolerate restricted production.

Needed Railroad Development and the Cummins Bill

THE DEVELOPMENT OF THE RAILROADS may be five years behind that of the rest of the country. It is certainly not less than three years behind.

This is much the most important fact regarding the present railroad situation. It necessarily follows that so far as the welfare of the country is determined by the condition of the railroads the thing most vitally necessary to the promotion of its welfare is that measures should be adopted which will make sure that the development of the railroads will speedily catch up with the development of the country. The only way in which the development of the railroads can be made to catch up with that of the country is to cause an enormous investment to be made in new facilities. Railroad facilities are today utterly inadequate to the handling of the commerce of the United States. If they are to be made adequate within the next three years there must be invested in them within the next three years at least three times as much new capital as ever has been invested in them in any three years.

There never has been a time since the fall of 1915 when the railroads under either private or government management could handle all of the available traffic, and there never will be such a time again until billions of new capital have been invested in them.

While this condition of affairs exists Congress is trying to frame legislation under which the railways can be returned to private operation. It is considering especially what amount of return the railroad companies should be allowed to earn. It is aware that an increase of railroad facilities is needed and that this cannot be secured unless the railroad companies are enabled to earn larger net returns than they did under the old system of regulation. But does Congress, or even those of its members who are especially engaged in framing railroad legislation, fully realize how great is the existing shortage of railroad facilities, and how vast is the amount of new capital which must be raised and invested to remedy this deficiency? We fear not.

The most ambitious and constructive effort which has been made in Congress to frame a measure the adoption of which would provide railroad development has resulted in the production of the Cummins bill. In relation to the return which the railways should be allowed to earn, this bill provides, first, that the return allowed to be earned by the railways in each territory shall be based upon the combined valuation of their properties. This at once introduces an element of uncertainty because no investor knows, or soon will know, what the valuation of any group of railways is to be. Probably, however, this is unavoidable because it is doubtful whether, in case the return is to be measured by any specific standard, any basis except valuation could be taken which would be satisfactory to the country. Second, it requires that the rates of each group of railways shall be so made that they will be able to earn an average of 5½ per cent upon the valuation. Since bonds of the strongest railroad companies are now selling at prices which yield an average return of 5.8 per cent, it seems improbable that if the average return allowed should be only 5½ per cent, the railroad companies could even raise vast sums of capital by the issuance of bonds. Furthermore, their bonded debt already is so large that future financing should be done chiefly by the issuance of stocks. It is further provided, however, that the Interstate Commerce Commission "may in its discretion" permit an additional ½ per cent to be earned, to be used, however, solely for unproductive improvements which should not be capitalized. It is a well recognized principle that unproductive improvements should be made from earnings. If the railroad companies are to make any considerable amount of unproductive improvements from earnings they must have an average return of at least 6 per cent. Why, therefore, should it be left to the discretion of the Interstate Commerce Commission to determine whether the railways shall be allowed to earn this ½ of 1 per cent?

Third, under the Cummins bill if a railway earns over 6 per cent, one-half of the excess between 6 and 7 per cent must be paid into a general railroad contingent fund. It will be seen that up to this point no carrier would have a return of more than 5½ per cent, which it could pay out as interest and dividends upon its stocks. After a carrier had accumulated and was maintaining a reserve fund equal to 5 per cent on its property, if it earned in any year more than 6 per cent upon its valuation it could keep one-third of the surplus over 6 per cent and use it for its own purposes, and must pay the remaining two-thirds of the surplus into the general railroad contingent fund. Manifestly, however, if a company may pay into its reserve fund each year only one-half of its surplus earnings between 6 and 7 per cent and only one-fourth of its surplus earnings over 7 per cent, it will take even strong carriers a long time to build up a reserve fund equal to 5 per cent of the value of the properties. Meantime, according to our interpretation of the bill, no road will be able to use a net return of more than 5½ per cent upon its valuation with which to pay its dividends on its bonds and stocks.

The general railroad contingent fund "shall be invested or expended by the Board in furtherance of the public interest in railway transportation by carriers subject to the Act to Regulate Commerce in avoiding congestions, interruptions or hindrances to the railway service of the United States by carriers subject to the Act to Regulate Commerce, or in furthering the public service rendered by them, either by way of purchase lease or rental of transportation equipment and facilities to be used by such carriers wherever the public interest may require, or by way of loans to such carriers, upon such fair and reasonable terms and conditions, in either case, as the board may prescribe."

The first comment which an examination of this plan of providing and dealing with net earnings suggests is that it is extremely complicated and by no means clear. As the provisions stand today they are susceptible of different interpretations, and these different interpretations lead to different conclusions as to how much money a railroad earning a given return upon its valuation would have available for interest and dividends. Secondly, it does not afford sufficient incentive to the efficient operation of any railway which is able to earn 6 per cent. Everybody knows the excess profits tax law is a breeder of extravagance in the management of every business earning a large return. A railway company which was earning 9 per cent would not be able to pay out more than 6 per cent to its security owners until it had built its own reserve fund up to 5 per cent, which, apparently, would take five years. After that it would be able to pay out only 7 per cent, since it would have to pay into the general railroad contingent fund two-thirds of its excess earnings over 6 per cent. Third, it seems very doubtful whether under this plan any but the strongest roads would be able for a long time to finance improvements by the issuance of stocks. Fourth, altogether aside from the question of legality, it seems very doubtful whether, as a matter of principle, earnings should be taken by the government from some roads and used for the purpose of helping to finance other roads. It may be that part of the surplus earnings of the rich roads should be taken by the government for taxation, but it certainly seems very doubtful whether the government should advance money raised in this or in any other way to railroad companies. The government should make it possible for any well-managed railroad company to earn enough to finance its own requirements. Having done this it will have done its full duty, and if then an individual railroad is not able to finance its own requirements that fact

will show, not that the government should extend paternal aid to it, but that there should be some kind of change in the management of the road.

The most important question to be considered in relation to the provisions in the Cummins and other bills relative to railway net return is whether they are well adapted to enable the railway companies to raise about six billion dollars in new capital during the next three years. Railroad facilities are today wholly inadequate to the needs of the country, and unless six billion dollars or more is invested in new facilities within the next three years railroad facilities at the end of the next three years will still be inadequate to the needs of the country. The present provisions of the Cummins bill are a great improvement over the provisions it contained in the original draft, and their adoption would enable a majority of the railroads of the country to earn a larger net return than they earned before the adoption of government control. But it is very doubtful whether the return the existing provisions would allow to be earned and retained by the more prosperous roads would be sufficient either to cause the greatest efficiency in their operation or to enable them to raise as large a part as they ought to raise of the six billion dollars of new capital which ought to be invested in railroad facilities before the end of the year 1922.

Improvement in Financial Results Mainly Real, But Partly Nominal

TAKING THE STATISTICS for August at their face value, the railways in that month produced the best financial results that they have this year. The Class I roads, which are practically identical with the railways under government control, earned a net operating income of $92,397,000. The average net operating income earned in August of the three years on which the guaranteed return to the companies is based was $86,860,000. Nominally, therefore, the roads earned for the government a surplus of about $5,537,000.

These figures indicate a remarkable improvement since March. In that month the ratio of operating expenses to total earnings was 92 per cent and the net operating income was only 16 per cent of the government's guarantee for March. In August the ratio of expenses to earnings had declined to 76 per cent and the net operating income was 107 per cent of the government's guarantee for that month.

The real as well as the nominal improvement in financial results has been very great. Between March and August total operating revenues increased from $377,000,000 to $472,000,000, or 25 per cent. This increase of about $95,000,000 in earnings reflected a corresponding increase in the amount of traffic handled, and the increase in transportation expenses incurred in handling it was only $6,200,000, or a little over 3½ per cent. As we have often pointed out, a saving in transportation expenses is always a real and permanent saving, and this large increase in total earnings and the very small increase in transportation expenses with which it was accompanied indicate a great increase in operating efficiency between March and August.

But there is a fly in the ointment; in fact, more than one. The statistics indicate very strongly—indeed, we venture to state, conclusively—that during this time the expenditures being made for maintenance of equipment and maintenance of way were inadequate and that a large part of the improvement in financial results was secured by unduly holding down maintenance expenditures. The following table gives the percentages of increase or decrease between March and August, 1919, and March and August, 1917, the last year of private operation, in operating revenues, operating expenses and the three large classes into which operating expenses are divided:

Percentage of Increase (or Decrease) March to August, 1917, and 1918.

	1917.	1919.
Operating Revenues	15.2	25.2
Operating Expenses	7.6	3.4
Maintenance of Equipment	8.2	—4.4
Maintenance of Way	19.6	14.7
Conducting Transportation	4.4	3.6

It will be seen that between March and August, 1917, the increase in operating revenues was a little over 15 per cent. This was accompanied by an increase in expenditures for maintenance of equipment of 8.2 per cent and for maintenance of way of 19.6 per cent. There is no reason for believing that these increases in maintenance expenditures were, under the conditions, more than normal. An increase in the business handled puts an extra strain upon equipment and makes necessary more work on it to keep it in shape. There is normally a very sharp increase of expenditures for maintenance of way between March, when the large expenditures for this purpose begin, and August, when they ought to be at their maximum. On the other hand, however, between March and August, 1919, when the increase in total operating revenues was 25 per cent, there was an actual decrease of 4.4 per cent in expenditures for maintenance of equipment and an increase of only 14.7 per cent in expenditures for maintenance of way.

Careful consideration of these figures and other pertinent facts leads to the conclusion that, while nominally the Railroad Administration earned a surplus in August, actually it did not earn a surplus. Its expenditures for maintenance of equipment were $4,250,000 less than they were in March. In view of the present condition of equipment, and especially of freight cars, and also the increase in the business handled, they probably ought to have been increased at least $10,000,000 instead of being reduced $4,000,000. If they had been increased this much the Railroad Administration would have incurred a small deficit.

Furthermore, the statistics indicate that there ought to have been a substantially larger increase in expenditures for maintenance of way, and this conclusion is supported by the well-known deficiency in the tonnage of rail and ties that have been laid this year.

There is another point of some importance to be considered. The contracts with the railroad companies not only guarantee them the average return earned in the test years on investment which had been made up to the end of those years, but also a return upon all new capital invested by the companies since January 1, 1918. We do not know just what the investment made by the companies since the railways have been under control has been, but it amounts to several hundred millions of dollars, and the interest upon it must be added to the results disclosed by the statistics of the Interstate Commerce Commission and the Railroad Administration in estimating the total deficit being incurred.

The great improvement in financial results indicated by the statistics of the Interstate Commerce Commission and the Railroad Administration since March is in the main a real improvement and is highly gratifying. But it is partly nominal and reflects not only an increase in efficiency of operation, but also an excessive zeal on the part of the Railroad Administration in curtailing maintenance expenses. While the rate at which a deficit is being incurred by the Railroad Administration is being rapidly lowered, it undoubtedly would be still incurring a substantial deficit if it were adequately maintaining the properties.

In order to put the properties in good condition and render satisfactory service to the public the railway companies will have to increase expenditures for maintenance of equipment and maintenance of way after private operation is resumed, and this very important fact should not be overlooked in considering the question of what rates the railway companies will have to be allowed to charge.

Co-ordination of Railroads Under Private Operation

WHILE IT IS APPARENT that Congress will have great difficulty in passing needed legislation before that date, spokesmen of the administration continue to say without reservation that the railroads will be returned to private operation on January 1. The financial problem raised by the prospective return of the railroads is extremely difficult and important and much attention is being given to it, but hardly less difficult and important is the operating problem raised.

The American Railroad Association will meet in Chicago on November 19. It has been reorganized to bring into it as sections most of the other important railroad organizations. The association is now composed exclusively of railway officers who are in the service of the Railroad Administration, but a committee of executives representing the railway corporations has been appointed to co-operate with the executive committee of the A. R. A. in determining what methods which have been adopted by the Railroad Administration and what parts of its organization shall be retained after private operation is resumed. Our understanding is that the various questions raised have been referred to committees which will make reports to the meeting of the American Railroad Association in Chicago on November 19.

The necessity for some kind of co-ordination of the operation of the railroads of the United States after they are returned to private control cannot be too strongly emphasized. The body which should decide in what way this co-ordination shall be effected is the American Railroad Association, which, of course, should act with the advice and in harmony with the officers of the railroad corporations. Unless there is a radical change in plans it will be only a few weeks until private operation will be resumed, and therefore decisions must be made and action taken concerning this most important matter with the greatest possible expedition. There is much criticism of Congress because it is not making faster progress in the solution of the regulatory problem involved. Railway officers should not subject themselves to similar just criticism by being equally slow in solving the problem of future co-ordination of operation.

When the need for co-ordination of the operation of the railroads is emphasized, it does not follow that this means that unified operation as worked out under the Railroad Administration is desirable and should be continued. The fact is that the need for close co-operation regarding operating matters between the different railroads was recognized by the railroad corporations themselves when the war began in 1917, with the result that the Railroads' War Board was appointed and that a large organization which acted under its direction was built up. The need for some such organization as that of the Railroads' War Board existed because the traffic of the country had become larger and more complex than could be handled by the railways without closer co-operation than had previously existed. Even before the Railroads' War Board was created, however, there were numerous committees of different kinds in different sections of the country which had been formed to co-ordinate more or less the operation of the railroads in the different territories.

The adoption of government operation resulted in the destruction or absorption by the Railroad Administration of all the operating organizations which existed before. On January 1, with the cessation of government control, the entire organization of the Railroad Administration will automatically go out of existence. If, therefore, arrangements have not been made meantime for the creation of new organizations or for the continuance of the life of different parts of the Railroad Administration's organization, there will be no organization after January 1 through which the railroads can work together. The Car Service Section would go out of existence and there would be no commission or car service as there was before government control to handle the distribution of cars. The various officials who have been given charge of the joint operation of terminals in Chicago and other cities would lose their positions and the joint operation of terminals would suddenly be discontinued. The consolidated city ticket offices in the various cities would go out of existence, and there would be no individual city ticket office of the individual lines to take their place.

What would be the result? The result would be something very similar to chaos. We are told when the statistics are available it will be found that in October the railways handled more passenger and freight business than in any previous October in their history. In other words, the traffic which was moving at that time was larger than the traffic which was moving in 1917, the last year of private operation. But the railroads could not have handled the traffic in 1917 as they did if it had not been for co-ordinated operation under the Railroads' War Board. They could not have handled the railway traffic in 1918 as they did if it had not been for the co-ordinated operation under the Railroad Administration. The result of the Railroad Administration suddenly going out of existence without some organization or organizations being provided by the railroad companies to take its place would be necessarily a revival of the competitive rivalries of the individual roads, a reduction in the efficiency with which facilities in general were used, acute congestions of traffic at all the large terminals, and an enormous increase in the shortage of freight cars.

The demoralization which would ensue would not only be disastrous to the commerce of the country, but also to the prestige of private operation. The public now believes that private operation is greatly superior to government operation in efficiency, but if the return of the railroads to private operation should suddenly be followed by a great decline in the efficiency of operation, as it inevitably would be if the railway companies had not made suitable arrangements to co-ordinate their operations, there probably would be a sudden change of public sentiment on the question of government versus private operation which would be very harmful.

It is a rather astonishing fact that many persons who should be familiar with the existing conditions do not seem to realize the chaos which would come if the railroads should suddenly be returned to private operation without definite and complete preparations being made for the future control of the distribution of freight cars, for the continuance of unified operation of terminals in many large centers, and for many other matters of that kind. We fear that these persons have not given due consideration to the vast increase in passenger and freight traffic which has been taking place in this country within recent years, while there has been only a trifling increase in railroad facilities.

All the traffic now available cannot possibly be handled with the present facilities under any system of operation, and therefore it is absolutely essential that the very best use of the existing facilities shall be made. The best use of existing facilities cannot be made without the closest co-operation between the railroad companies. An immediate revival of competitive service, either passenger or freight, such as prevailed on our railroads prior to 1917 would be immediately disastrous. Some railroads might profit from it, but the roads as whole and the country as whole would suffer.

The operating problems which will be presented by the return to private operation ought to be very carefully and fully considered at the meeting of the American Railroad Association, and definite constructive action for solving them should be decided upon. That meeting will be the most important the association ever held, and it is easily conceivable that it may largely determine the future of railroad management in this country.

Cummins Railroad Bill Reported to Senate

Provides Legislative Standard for Percentage of Return and Division of Excess Earnings

THE RAILWAY AGE EMERGENCY BULLETIN of November 6, noted that the new Cummins Bill, S. 3288, was reported to the Senate on October 23, and the changes from the bill as originally introduced were commented on in a general way. The following is a summary of the provisions of the bill.

Summary

Section 1 provides for the repeal of the federal control act at midnight on the last day of the month in which the new act becomes a law and that the President shall then relinquish control of railroad and transportation systems. All rights and remedies, whether provided for by contract or by the terms of the federal control act, are preserved for the purpose of adjusting and closing up all matters, arising out of and incident to federal control. Proceedings based on causes of action growing out of federal control may be brought in any court which would have jurisdiction if the the cause of action were against the carrier and shall be brought against the United States.

The rights and interests of the United States acquired under the provision of the federal control act authorizing expenditures for the utilization and operation of waterways are transferred to the United States Shipping Board.

Rates, fares and charges and divisions of joint rates in force at the time the repeal of the former act takes effect shall remain in force until changed by competent authority.

Indebtedness to the Government

Section 2 provides that the indebtedness of any carrier corporation to the United States for additions or betterments or for advances to pay off indebtedness properly chargeable to capital account shall, at the request of the carrier, be extended for 10 years, or less, at the option of the carrier, with interest at 6 per cent, to be evidenced, if practicable, by the first mortgage bonds of the carrier, but if this is impracticable, in such form as shall be prescribed by the President. Any other indebtedness shall be evidenced by demand notes at 6 per cent.

The President may, in his discretion, apply upon any indebtedness to the United States any sum due the carrier from the United States as is permitted to be deducted currently under any contract now or hereafter made, or where no such contract exists, as would be permitted by the terms of the standard contract relative to deductions from compensation; but no application shall be made of any sum so due to the carrier unless there shall have been paid such sums due it as shall have been necessary to enable the carrier to pay the fixed charges as defined in the contract, dividends at the regular rate paid during federal control, and such sums as may be necessary to provide the carrier with working capital in amount not less than one month's operating expenses or due on account of material and supplies not returned in kind. If the President and the carriers or any of them shall enter into agreement for funding the indebtedness to the United States for equipment, such indebtedness shall not be refundable under the foregoing provisions.

All powers invested in the President by this act, except those relating to the appointment of the transportation board, may be executed by him through such officers, agents or agencies as he may from time to hime appoint, and the power of the President under the federal control act is confirmed and extended to authorize him, through such agencies as he may determine, to adjust, settle and close in a manner not inconsistent with the provisions of the act or this act, all matters growing out of federal control.

Section 4 provides that for the purpose of ascertaining the adequacy of rates, fares and charges in producing revenues as hereinafter provided, the commission shall, as soon as practicable, divide the country into rate districts, and the railway carriers into railway rate groups and shall have power to hear and determine upon complaints of the carriers or any one interested in transportation, or upon its own motion, apart from the question of rates upon particular commodities or for particular communities, the issue of the adequacy of the rates for any one district and the carriers therein as a whole; and the adequacy or inadequacy of rates, fares and charges in producing revenues for the rate district or rate group as a whole shall not be put in issue in controversies relating only to rates, fares and charges upon particular commodities or for particular communities.

Section 5 provides that schedules of rates, etc., filed with the commission within 60 days after federal control ceases shall become effective at the end of four months, with such changes and modifications as in the meantime may be ordered by the commission, and the commission within that time shall determine whether they or any of them are to be so modified or changed in order to make them just and reasonable rates for the service to be performed.

"Until the commission renders its decision in that regard, or until the expiration of the four months' period, this act shall constitute a guaranty to each carrier with which the President has entered into a contract for compensation under the act of March 21, 1918, of an operating income for the said period proportionate to the compensation so agreed upon. With respect to those carriers of which the President is in possession or control at the time this act takes effect, but with which he has not entered into contract fixing compensation under said act of March 21, 1918, and with respect to those carriers of which federal control was reliquished prior to July 1, 1918, as provided in the act of March 21, 1918, this act shall constitute a guaranty for the said period of a proportionate railway operating income, computed in the manner prescribed in the said act of March 21, 1918, for ascertaining what is commonly known as the standard return; and, in the case of carriers which did not earn an operating income in the test period, and therefore have no standard return which can be used as a basis, the guaranty in this act provided shall cover and include the deficit in actual operating expenses, including taxes, of any such road, and such deficit shall be determined and certified in the same manner as provided with respect to the standard return.

The commission shall as soon as practicable after the expiration of the period of such guaranty certify the amount of the actual railway operating income, showing the excess or deficit as compared with the guaranty and the board, or the secretary of the treasury if the board be not then organized, is directed to draw warrants in favor of the carriers upon the treasury of the United States for the amount of any deficit shown, provided however, that if the operating income of any carrier exceeds the guaranty it shall pay the excess into the treasury.

In computing the railway operating income for the purpose of this section, the commission shall not allow as operating expenses, for maintenance for any month of the period covered by such guaranty, more than the monthly

proportion of the amount fixed by the commission as the amount applicable for such maintenance under the provisions in Section 5 of the standard contract, but the cost of fire insurance may be included in such expenses. The commission may, in its discretion, make further allowances as operating expenses in accordance with a provision in the standard contract to the extent that in its judgment will be necessary so that the amount of the guaranty shall be the substantial equivalent, proportionately for the time being, of the standard return. If the commission shall find in the case of any carrier that charges to operating expenses other than maintenance are clearly abnormal for any month, it shall have the power to require the restatement of the operating expenses for the period in question to the extent necessary to make them reasonably applicable to that month.

Rule of Rate-Making

The rule of rate-making and the provisions governing the division of earnings are contained in Section 6 as follows:

"Section 6. In dividing the country into districts and the carriers into rate-making groups the commission shall have in view the similarity of transportation and traffic conditions therein. Rates of transportation shall at all times be just and reasonable and sufficient to produce a reasonable return upon the aggregate value of the property in each rate group used or held for the service of transportation.

"It being impracticable to establish a level of uniform rates and charges within competitive areas which will sustain sundry carriers indispensable to the communities served by them, without enabling more favorably situated carriers to receive revenue from such rates, negligibly as to each service but in the aggregate substantially and unreasonably in excess of the aggregate over a fair return upon their property, unless regulated in the interest of the commerce of the United States as a whole, it is hereby provided that, subject to the exceptions and conditions of this act, no carrier subject to the provisions of this act shall be authorized to receive and retain for the transportation services rendered such proportion of the rates and charges collected by it as may yield in the aggregate more than a reasonable return upon its property investment. In changing or modifying rates, fares, charges, and classifications from time to time in the manner provided in the act to regulate commerce, as amended, and in viewing them from the standpoint of their effect in producing revenue in any rate-making group as a whole, the commission shall initiate, modify, or adjust rates, fares, charges and classifications, as nearly as may be, so that the railway carriers as a whole allocated to each district and subject to this act shall earn an aggregate annual net railway operating income equal, as nearly as may be, to 5½ per centum upon the aggregate value, as determined in accordance with the provisions hereof, of the railway property of such carriers in the district held for and used in the service of transportation: *Provided,* That in this respect the commission shall have reasonable latitude in order to adjust any particular rate, fare, or charge which may be found unreasonably high or unreasonably low. And it may, in its discretion, add to the basis above mentioned one-half of 1 per centum upon the aggregate value of said property, to make provision, in whole or in part, as the case may be, for what are commonly known as nonproductive improvements, betterments, or equpiment, which, according to the custom heretofore prevailing, have been charged to capital account, but which, to the extent that such allowance for such purpose shall be reflected in the net operating income of the several carriers, to be determined by the commission, shall not be capitalized or used in any way as a basis for increased rates, fares, or charges by those carriers whose net operating income for the year exceeds 5½ per centum upon the value of their respective properties.

"In so changing or modifying rates, fares, charges, and classifications from time to time in the manner provided in the act to regulate commerce, as amended, the commission shall take into consideration the interests of the public, the shippers, the wages of labor, the cost of maintenance and operation, including taxes, the requirements for additional capital in order to enable the carriers to adequately perform their duties to the public, and the conditions under which the same can be secured; and shall, so far as practicable, adjust rates, fares, charges, and classifications that the net operating income of the several carriers shall bear the same relation to the value of their respective properties. For the purpose aforesaid, the commission shall from time to time determine the value of the property in each district and rate-making group so held for and used in the service of transportation, and lower or advance the rates, fares, or charges for transportation to produce, as nearly as may be, the net operating income above mentioned.

"If, under the above provisions, any carrier shall receive a net railway operating income in any year of more than 6 per centum, after allowance, as aforesaid, by the commission for nonproductive improvements, upon the said value of its property, one-half of such excess between 6 and 7 per centum shall be placed in a reserve fund established and maintained by such carrier, and the remaining one-half of such excess between 6 and 7 per centum, shall within the first four months of the succeeding year, be paid to and recoverable by the board for the purpose of establishing and maintaining a general railroad contingent fund, as hereinafter described. Of any such excess above 7 per centum, one-fourth thereof shall be placed in the reserve fund to be established and maintained by the carrier and the remaining three-fourths thereof shall, within the time aforesaid, be paid to and recoverable by the board as a part of said general railroad contingent fund.

"For the purpose of paying dividends or interest on its obligations, a carrier company may draw upon its said reserve fund whenever and to the extent that its annual net railway operating income shall fall below 6 per centum of the value of its property, determined as provided in this act.

"In any year in which the said income of a carrier company which has accumulated and is maintaining a reserve fund equal to 5 per centum of the value of its property, determined as provided in this act, exceeds 6 per centum of such value, such carrier shall pay, within the first four months of the succeeding year, two-thirds of such excess to the board as a part of such general railroad contingent fund and the remaining one-third shall be retained by the carrier for such lawful use or disposition as it may determine.

"The aforesaid general railroad contingent fund and accretions thereof shall be administered by the board and invested in obligations of the United States or deposited in authorized depositaries of the United States, subject to the rules promulgated from time to time by the secretary of the treasury relating to government deposits. And the said fund and all accretions thereof shall be employed or invested or expended by the board in furtherance of the public interest in railway transportation by carriers subject to the act to regulate commerce in avoiding congestions, interruptions or hindrances to the railway service of the United States by carriers subject to the act to regulate commerce, or in furthering the public service rendered by them, either by way of purchase, lease, or rental of transportation equipment and facilities to be used by such carriers wherever the public interests may require, or by way of loans, to such carriers, upon such fair and reasonble terms and conditions, in either case, as the board may prescribe.

"The commission shall prescribe rules and regulations for the determination and recovery of the excess earnings of the respective carriers subject to this act over and above the reasonable maximum provided for herein. To that end the

commission may, in addition to the exercise of its general powers, require such security or prescribe such reasonable regulations and conditions as it may find necessary.

"The provisions of this section shall not be construed as depriving shippers of their right to reparation in case of overcharges, unlawfully excessive or discriminatory rates, or rates excessive in their relation to other comparable rates, but no shipper shall be entitled to recover upon the sole ground that particular rates may reflect a proportion of excess earnings produced and to be recovered in the public interest under the provisions of this act: *Provided, however,* That in the year 1925, and in every fifth year thereafter the commission shall determine what, under the conditions then existing, constitutes a fair return upon the value of such railway property, and it may increase or decrease the 5½ per centum basis herein prescribed, or the basis for the determination of excess income."

Transportation Board

Section 7 provides for the creation of a transportation board of five members appointed by the President, with the advice and consent of the Senate, the chairman to be selected by the members of the board to serve as chairman during his term of office. Members of the board are to receive a salary of $12,000 per year. Not more than three members shall be appointed from the same political party and no member shall during his term of office hold any office or employment under any common carrier subject to the act to regulate commerce, or own securities thereof or be in any manner pecuniarily interested therein.

Section 9 declares it to be the policy of the United States that the railways of continental United States shall as soon as may be practicable be divided in ownership and for operation into not less than 20 nor more than 35 separate and distinct systems, each to be owned and operated by a distinct corporation organized or reorganized under this act. In the division into systems competition shall be preserved as fully as possible and wherever practicable the existing routes and channels of trade and commerce shall be maintained. The several systems shall be so arranged that the cost of transportation as between competitive systems and as related to the value of the properties shall be the same, as far as practicable, so that the systems can employ uniform rates in the movement of competitive traffic and under efficient management earn substantially the same rate of return upon the value of the railway properties involved in the comparison.

Section 10. Immediately after its organization the board shall prepare and adopt a plan for the consolidation, and when it has agreed upon a tentative plan it shall give the same due publicity and hear persons who may file or present objections. After the hearings are at an end the board shall adopt and publish a plan for such consolidations, provided that it may at any time thereafter upon its own motion or upon application reopen the subject for such changes or modifications as in its judgment will promote the public welfare. The voluntary consolidation hereinafter provided for shall be in harmony with the plan and the compulsory consolidations which are to ensue after the period hereinafter mentioned shall be in completion thereof. The general plan of consolidation into systems shall be submitted to the Interstate Commerce Commission and be subject to its approval. Street and interurban railways whose chief business is the transportation of passengers, plant trackage facilities owned by private industries, and terminal and other railways owned or controlled by industrial corporations and principally used for the transportation of their products shall not be included in the plan of enforced consolidation, but terminals, belt lines, tap lines and others short lines or lines owned and operated by distinct corporations and so situated or in such financial condition as to be practically incapable of consolidation may be excluded if in the judgment of the board it is for the public interest.

Among the duties of the board are the following:

"The board shall carefully and continuously make inquiry respecting the transportation needs and facilities of the whole country, and of each transportation situation as it may arise, the adequacy and efficiency of such transportation facilities and service, and when and how they should be enlarged or improved.

"It shall inquire into the state of the credit of all such common carriers subject to the said act to regulate commerce, as amended, and inform itself of the relation between the operating revenues, the operating income and the net operating income of such carriers.

"It shall inquire as to the new capital which the public interest may require the carriers or any carrier to secure in order that adequate and efficient transportation service and facilities may at all times be provided, and into the conditions under which said new capital may be secured. From time to time it shall certify to the commission its findings in these respects, and the commission shall accept such certificate or certificates as prima facie evidence in any hearing upon the matters to which such certificate or certificates respectively relate.

"It shall have the authority to lay before the commission, by petition or application, any matter within the jurisdiction of the said commission for action thereon, or make representations in the public interest and show such cause as it may, in the performance of its duties imposed by this act, deem proper and appropriate.

"It shall from time to time make reports to Congress, accompanied by recommendations of such measures and policies as in its opinion will promote and protect the interest of the public in respect of the efficiency of the transportation service and the adequacy of transportation facilities."

The following functions and powers now exercised by the commission are hereby transferred to the board:

(a) The functions and powers created and conferred by the act commonly known as the "car service act."

(b) The functions and powers created and conferred in the last paragraph of section 1 of the "act to regulate commerce," relating to the construction, maintenance and operation of switch connections and side tracks.

(c) The functions and powers created and conferred by the act of August 24, 1912, with respect to the matters contained in paragraph (a) in the publication of the "act to regulate commerce," as amended.

(d) The functions and powers created and conferred in what are commonly known as the "safety appliance acts."

(e) The functions and powers created and conferred by the act requiring carriers to make full reports of all accidents to the Interstate Commerce Commission and authorizing investigations thereof by the commission.

(f) The functions and powers created and conferred by "an act to promote the security of travel upon railroads engaged in interstate commerce, and to encourage the saving of life."

(g) The functions and powers created and conferred by the hours of service act.

(h) The functions and powers created and conferred by "An act to promote the safety of employees on railroads," approved May 30, 1908.

(i) The functions and powers created and conferred by "An act to promote the safe transportation in interstate commerce of explosives and other dangerous articles, and to provide penalties for its violation," approved Mar. 4, '09.

(j) The functions and powers created and conferred by the act compelling common carriers to equip their locomotives with safe and suitable boilers and appurtenances.

(k) The functions and powers created and conferred by

"joint resolution directing the Interstate Commerce Commission to investigate and report on block-signal systems and appliances for the automatic control of railway trains." approved June 30, 1906.

All bureaus, divisions, or departments heretofore organized for the discharge of the foregoing functions and powers, and the employees, books, papers, and records pertaining to such functions and powers, are likewise transferred, and shall hereafter be under the exclusive jurisdiction of the board.

To Encourage Water Transportation

It is declared to be the policy of Congress "to promote, encourage and develop water transportation, service and facilities in connection with the commerce of the United States, and to preserve in full vigor both rail and water transportation.

"With that end in view the board shall inquire into water transportation facilities both for internal and external commerce, and especially into the relations between carriers by land and carriers by water, and the best method of coordinating the two kinds of transportation, when the carriage is partly by land and partly by water; shall investigate the appropriate types of boats suitable for different classes of waterways, also the subject of water terminals both for water traffic and for through traffic by water and rail, including the necessary docks, warehouses, apparatus, equipment, and appliances in connection therewith and railroad spurs and switches connecting with such terminals with a view to devising the types most appropriate for different locations, and for the more expeditious and economical transfer or interchange of passengers or property between carriers by water and carriers by rail; shall advise with communities, cities and towns regarding the appropriate location of such terminals, and cooperate with them in the preparation of plans for suitable terminal facilities; shall investigate the existing status of water transportation upon the different waterways of the country with a view to determining whether such waterways are being utilized to the extent of their capacity, to what extent they are meeting the demands of traffic, and whether the water carriers utilizing such waterways are interchanging traffic with the railroads; shall cooperate with communities, cities and towns and established lines of water transportation in obtaining joint and proportional through rates on traffic carried partly by water and partly by rail; and shall investigate any other matter that may tend to promote and encourage water transportation.

"It shall also be the province and duty of the board to compile, publish, and supply from time to time such useful statistics, data, and information concerning transportation by water as may be of value to the commercial interest of the country, and make such annual recommendations to Congress for the regulation and improvement of transportation by water as it deems advisable."

Section II provides that the board shall also have the following powers:

(a) If it finds that a carrier can not, by reason of the congestion of its lines, properly handle its traffic it shall have power to require the distribution of such obstructed traffic over other lines upon such terms as it may find under the circumstances to be just and reasonable. If any traffic shall be diverted from a carrier which it is ready and able to handle properly, then such carrier shall be entitled to recover from the carrier to which such traffic shall be thus diverted, the revenue accruing in excess of the actual out-of-pocket cost of transporting the same; and if such revenue shall not be awarded by the board and duly and promptly paid, then such carrier shall be entitled to recover by suit or action against the carrier or carriers liable therefor.

With respect to traffic not routed by the shipper, to direct the route which such traffic shall take after it arrives at the terminus of one carrier and is to be delivered to another whenever practicable and a fair distribution of traffic and the public interest may require.

(b) If it finds it to be in the public interest and to be practicable, without impairing the ability or substantial convenience of such a carrier owning or entitled to the enjoyment of terminal or other facilities to handle its own business, it shall have power to require the use of any such terminal or other facilities including main-line track or tracks for a reasonable distance outside of such terminals of any carrier by another or other carriers on such terms and for such compensation as the carriers may agree upon, or, in the event of their failure to agree, as the board may fix as reasonable and just for the permitted use, to be ascertained on the principle controlling compensation in condemnation proceedings (which compensation shall be paid or adequately secured before the enjoyment of the use is entered on). If the carrier whose terminal or other facilities are thus to be used by others, is not satisfied with such requirement or with the terms fixed for such use, or if the amount of compensation is not duly and promptly paid, the carrier whose terminal or other facilities have thus been thrown open to use, shall be entitled to recover the damages growing out of such requirement and just compensation for the privileges awarded.

Consolidations

Section 12 provides that it shall be lawful for two or more railway corporations, common carriers and engaged in interstate commerce, to consolidate their properties or any part thereof into one corpoation for the ownership, management and operation of the properties under the following conditions:

The proposed consolidation must be in harmony with and in furtherance of the ultimate complete consolidation and must be recommended by the board and approved by the commission.

The corporation which is to become the owner of the consolidated properties must be either organized under the provisions of this act or must be reincorporated and become a federal railway corporation pursuant to the provisions of the act.

The capitalization shall not exceed the value of the consolidated properties as determined by the commission, including a reasonable working capital. The value shall be ascertained by the commission in accordance with the valuation act and it shall be its duty to proceed immediately to the ascertaining of such values for the properties involved in the proposed consolidation upon the filing of the application.

When a railway corporation proposes a consolidation it shall present its application to the commission which shall at once refer it to the board for a report and recommendation. The board having made its report, the commission shall notify the board, the authorities of the states in which any part of the properties is situated, and the railway corporations involved, of the time and place for public hearing. If after such hearing the commission shall find that the public interest will be promoted by the consolidation and that the conditions of this section have been or will be fulfilled, it shall enter an order authorizing the railway corporation so engaged in interstate commerce to acquire the properties to be consolidated and they may then be acquired in any lawful manner that will result in such consolidation and in single ownership and operation, the provisions of any state law to the contrary notwithstanding.

Section 13 provides that seven years after the passage of the act the commission and the board shall proceed to the completion of the plan of consolidation and if in any proposed system complete consolidation has not occurred it shall be the duty of the board to secure the incorporation of a

railway company under the provisions of the act, either by initiating its organization or by co-operation with other corporations in fully effecting the consolidation and reorganization. It shall have the power, subject to the approval of the commission, to make contracts with such existing corporations as will co-operate, providing for a guaranteed operating income pending the reorganization, provided the guaranty shall not exceed that authorized in the federal control act, with due allowances for subsequent additions for betterments and extensions. When the reorganization and consolidation provided for is complete the board shall be reduced to three members by omitting to appoint successors to the two members whose terms of office first expire.

Section 14 provides that "any railway corporation which now owns and operates any line of railway engaged in the transportation of interstate or foreign commerce, having been incorporated under the laws of any state or territory, is hereby authorized and empowered to reincorporate itself and become a corporation under the laws of the United States in the manner and subject to the terms and conditions herein provided."

Sections 15, 16, 17, 18, 19 and 20, prescribe the method of reincorporation under the laws of the United States and for the organization, powers and duties of such corporations. The board of directors of any such reincorporated company shall consist of not less than 11 nor more than 15 persons, and there shall at all times be two directors selected from the classified employees of the company and also two directors appointed by the transportation board. Upon all committees of the board of directors upon which power to act in any manner relating to the affairs of the corporation is conferred, there shall be one director selected from the classified employees and one appointed by the board. Each railway carrier corporation subject to the act to regulate commerce not reincorporated or organized under the new act shall after June 30, 1920, where practicable and consistent with the laws of the state creating such corporation, make provision for at least one director selected from the classified employees of not less than 10 years' service on the road, if available, or if not, from those senior in the service of the road, and at least one person appointed by the transportation board where the board of directors consists of less than 11 directors, and two such representatives of the public and two from the senior classified employees where such board consists of 11 or more.

Section 21 provides that five or more citizens of the United States, with the recommendation of the board, may incorporate themselves under the act for the ownership, maintenance and operation of one of the railway systems or for the construction, ownership, maintenance and operation of new lines or systems into which the railways are to be divided by the board. This capital stock shall be fixed by the commission and new stock shall be issued at par and only for money or property of equivalent value actually received. The corporation shall engage in no other business than that of constructing, owning, maintaining, operating, bettering or extending the system of railways, nor shall it become the owner of any property save that which is reasonably necessary for the performance of its duties and obligations as a common carrier. The new system companies incorporated under the act shall have as members of their boards of directors at least two selected from the classified employees, and two appointed by the board, and one director selected from the employees and one appointed by the board shall have place upon each committee.

Section 23 provides that the property of railway corporations organized or reincorporated under the act shall not be exempt by virtue of the act from taxation by the several states or other lawfully constituted taxing authorities, but all discrimination in the taxation of such property is prohibited. Nothing in the act is to be construed to affect the existing laws or powers of the states in relation to taxation or lawful police powers, including the power to make and regulate intrastate rates of transportation except as provided in the act.

Regulation of Securities

Section 24 provides for the regulation of security issues. From and after 90 days after approval of the act it shall be unlawful for any railway or water common carrier subject to the act to issue securities except for some lawful object within its corporate purposes and compatible with the public interest and with the approval of the transportation board, which shall have power to grant or deny the application as made or in part or with such modifications and upon such terms and conditions as it may deem necessary or appropriate. It may also make supplemental orders modifying the provisions of any previous order. The board is required to give notice of applications for authority to issue securities to the governor of each state in which the equipment of the carrier operates and the state authorities are given the right to make such representations as they deem just and proper for conserving the rights and interests of their people and the states involved.

Nothing in the act is to be construed to imply any guaranty or obligations as to such securities. The provisions relating to the regulation of security issues do not apply to notes maturing in not more than two years and aggregating not more than 5 per cent on the par value of the securities of the carrier then outsanding. The board shall require reports from the carriers issuing securities, showing the disposition of the securities and the application of the proceeds. After two years from the passage of the act it shall be unlawful for any person to hold the position of officer or director of more than one carrier subject to the act, except with the approval of the commission upon showing that neither public nor private interest will be adversely affected.

Adjudication of Labor Disputes

Section 25 provides for the settling of disputes and controversies, not adjusted under existing provisions of law or otherwise, between carriers and their employees, through a committee of wages and working conditions and three regional boards of adjustment. The committee of wages and working conditions is to consist of four representatives of labor and four representatives of the carriers, appointed by the board for terms of four years, on nominations of the various railway crafts and of the carriers. The committee of wages and working conditions shall have jurisdiction over controversies respecting wages and working conditions and to hear and determine cases on appeal from the regional boards. It shall be its duty to consider all complaints respecting wages and working conditions submitted by representatives of employees or of the carriers and to make decisions by majority vote as promptly as practicable, which shall be certified to the board and take effect when approved by the board. If it shall be evenly divided the matter in dispute shall be referred to the board, whose decision shall be final. The board shall certify to the commission all decisions of the committee of wages and working conditions when approved by said board or decisions by the board itself in cases referred to it, and its certificate shall be conclusive evidence before the commission of the matters so determined and certified.

Section 26 provides that wages and salaries, hours of labor and other conditions of employment shall be fair, just and reasonable. In determining the fairness, justness and reasonableness of wages and salaries, the committee and the board shall take into consideration, among other relevant circumstances, wages paid for similar work in other indus-

tries, the relation between wages and cost of living, hazards of the employment, training and skill required, degree of responsibility and the character and regularity of the employment.

Section 27 provides for regional boards of adjustment, located at such places, and having jurisdiction over such territory, as the transportation board may determine. They shall consist of six members each, three representing labor and three representing carriers, and shall be empowered to hear and determine complaints, grievances, matters and disputes, including questions of discipline and controversies arising in ordinary railway operations, other than controversies relating to wages and working conditions, where the officers of a railroad corporation and the accredited representatives of an employee or group of employees fail or are unable to reach a satisfactory settlement, it being the intention to encourage the voluntary settlement of disputes between carriers and their employees.

All decisions other than those relating to personal discipline shall be filed with the committee of wages and working conditions, which for the purpose of securing uniformity of practice shall have power within 30 days to review and to amend or disapprove the same. In the event a regional board is evenly divided either party to the controversy may have the proceedings transferred to the committee for its decision. The committee and the boards are authorized to subdivide into sections for the hearing of cases and to hold hearings at any point within the United States. Members of the committee are to receive a salary of $7,500 and of the boards a salary of $5,000 per annum. It is provided that nothing in the act shall be held to repeal the Adamson law of September 3, 1916, nor to authorize the committee or the boards to make any rule, regulation or decision contrary to any law of the United States.

Section 29 provides that any carrier or any officer thereof knowingly refusing to obey the decision of the committee after it has been approved by the board or of the board in cases referred to it, shall be guilty of a misdemeanor and open conviction shall be punishable by a fine not exceeding $500 or by imprisonment not exceeding six months or by both.

Anti-Strike Provisions

The anti-strike provisions are as follows:

"Section 30. It shall be unlawful for two or more persons, being officers, directors, managers, agents, attorneys, or employees of any carrier or carriers subject to the act to regulate commerce, as amended, for the purpose of maintaining, adjusting, or settling any dispute, demand, or controversy which, under the provisions of this act, can be submitted for decision to the committee of wages and working conditions or to a regional board of adjustment, to enter into any combination or agreement with the intent substantially to hinder, restrain, or prevent the operation of trains or other facilities of transportation for the movement of commodities or persons in interstate commerce, or in pursuance of any such combination or agreement and with like purpose substantially to hinder, restrain, or prevent the operation of trains or other facilities of transportation for the movement of commodities or persons in interstate commerce; and, upon conviction, any such persons shall be punished by a fine not exceeding $500 or by imprisonment not exceeding six months, or by both such fine and imprisonment: *Provided,* That nothing herein shall be taken to deny to any individual the right to quit his employment for any reason.

"Section 31. Whoever knowingly and with like intent shall aid, abet, counsel, command, induce, or procure the commission or performance of any act made unlawful in the last preceding section hereof shall be held guilty of a misdemeanor and upon conviction shall be punished by a fine not exceeding $500 or by imprisonment not exceeding six months, or by both such fine and imprisonment."

Section 32 provides a means whereby companies may be dissolved or divested of their corporate powers and privileges. Corporations organized under the act may be dissolved by the stockholders if upon application the commission shall certify that the company has fully discharged its duties and obligations as a common carrier and that its continuance is no longer necessary or convenient in the public interest for the transportation of persons and property, and that its obligations have been duly provided for.

Section 33 increases the compensation of each member of the Interstate Commerce Commission to $12,000 per annum.

Car Service

Section 34 contains the provisions relating to car service as an amendment to the amendment of Section 1 of the act to regulate commerce, approved May 29, 1917, which is made to read as follows:

"The term 'car service' in this act shall include the use, control, supply, movement, distribution, exchange and interchange, and return of locomotives, cars, and other vehicles used in the transportation of property by or to any carrier subject to this act, or by or to any shipper making or offering any shipment or shipments subject to this act.

"It shall be the duty of every carrier by railroad subject to this act to furnish safe and adequate car service and to establish, observe, and enforce just and reasonable rules, regulations, and practices with respect to car service; and every unjust and unreasonable rule, regulation, and practice with respect to car service is prohibited and declared to be unlawful.

"The board is hereby authorized by general or special orders to require all carriers by railroad subject to this act, or any of them, to file with it from time to time their rules and regulations with respect to car service, and the board may, in its discretion, direct that the said rules and regulations shall be incorporated in their schedules showing rates, fares, and charges for transportation, and be subject to any or all of the provisions of this act relating thereto.

"The board may, after hearing, on a complaint, or upon its own initiative without complaint, establish reasonable rules, regulations, and practices with respect to car service, including the compensation to be paid for the use of any locomotive, car, or other vehicle not owned by the carrier using it, and the penalties or other sanctions for non-observance of such rules.

"Whenever the board shall be of opinion that shortage of equipment, congestion of traffic, or other emergency requiring immediate action exists in any section of the country or upon any railroad the board shall have, and it is hereby given, authority, either upon complaint or upon its own initiative without complaint, at once, if it so orders, without answer or other formal pleading by the interested carrier or carriers, and with or without notice, hearing, or the making or filing of a report, according as the board may determine, to suspend the operation of any or all rules, regulations, or practices then established with respect to car service for such time as may be determined by the board, and also authority to make such just and reasonable directions with respect to car service and the interchange and use of locomotives, cars, and other vehicles, without regard to ownership, during such emergency as in its opinion will best promote the service in the interest of the public and the commerce of the people, and also authority to give directions for preference or priority in transportation, embargoes, or movement of traffic under permits, at such times and for such periods as it may determine, and to modify, change, suspend, or annul them. In time of war or threatened war the President may certify to the board

that it is essential to the national defense and security that certain traffic shall have preference or priority in transportation, and the board shall, under the power herein conferred, direct that such preference or priority be afforded.

"The directions of the board as to car service may be made through and by such agents or agencies as the board shall designate and appoint for that purpose. It shall be the duty of all carriers by railroad subject to this act, and of their officers, agents, and employees, to obey strictly and conform promptly to such orders or directions of the board, and in case of failure or refusal on the part of any carrier, receiver, or trustee to comply with any such order or direction such carrier, receiver, or trustee shall be liable to a penalty of not less than $100 nor more than $500 for each such offense and $50 for each and every day of the continuance of such offense, which shall accrue to the United States and may be recovered in a civil action brought by the United States.

"It shall further be the duty of every carrier by railroad, subject to this act, serving coal mines located upon its line or lines to make just, reasonable and nondiscriminatory distribution among such mines of all cars available for the transportation of coal during any period (hereinafter called a car shortage period) when the carrier's supply of cars for such service does not equal the requirements of such mines. To that end, every such carrier shall make and establish rules and regulations providing for the rating of such mines and, during car-shortage periods, the distribution of cars among them in proportion to such ratings. The rules and regulations so established shall provide, among other things, that each and every car furnished or used for the transportation of coal during a car-shortage period shall be counted against the proportionate distributive share of the mine receiving or using it, and that no cars shall be furnished to or used by any mine for the transportation of coal during a car-shortage period in excess of the proportionate distributive share of such mine, regardless, in either case, of who the consigner or consignors or the consignee or consignees or the owner or owners of the coal loaded or to be loaded in such cars may be, or of the purpose for which such coal may be used or intended, or of the ownership of such car or cars. It shall be unlawful for any such carrier, by any rule, regulation, or practice, either directly or indirectly, to fail or refuse to count against the proportionate distributive share of any mine any car or cars furnished to or used by such mine for the transportaition of coal during a car-shortage period or to furnish to any mine for the transportation of coal during a car-shortage period any car or cars in excess of the proportionate distributive share of such mine, regardless, in either case, of who the consignor or consgnors or the consignee or consignees or the owner or owners of the coal loaded or to be loaded in such cars may be, or of the purpose for which such coal may be used or intended, or of the ownership of the car or cars. The proportionate distribution required by this paragraph shall be accomplished during successive 14-day periods which may be designated from time to time by the carrier: *Provided,* That in the event the board finds that it is necessary in order to furnish transportation companies with coal to be used in the movement of trains, cars to be loaded with coal to be used for fuel in the movement of trains may be omitted in the said count to the extent, and only to the extent, prescribed by the order of the board. In case of failure or refusal on the part of any carrier, receiver, or trustee to count any car or cars against the proportionate distributive share of any mine, or the furnishing for loading by any carrier, receiver, or trustee of any cars in excess of the proportionate distributive share of any mine, as herein provided, such carrier, receiver, or trustee shall be liable to a penalty of not less than $100 nor more than $500 for each offense (and each failure or refusal to count any one car or each furnishing of any one car shall be deemed a separate offense), which penalty shall accrue to the United States and may be recovered in a civil action brought by the United States. The provisions of this paragraph shall not be construed to limit or restrict the power or authority of the board to require the establishment, observance, enforcement, and filing of reasonable rules, regulations, and practices with respect to car service not in conflict herewith.

Certificate of Public Interest

"From and after January 1, 1920, no carrier by railroad subject to this act shall undertake the extension of its line of railroad, or the construction of a new line of railroad, or shall acquire or operate any line of railroad, or extension thereof, or shall engage in transportation under this act over or by means of such line of railroad, or extension thereof, unless and until there shall first have been obtained from the board a certificate that the present or future public interest requires or will require the construction, or operation, or construction and operation, of such line of railroad, or extension thereof, and no carrier by railroad subject to this act shall abandon any portion or all of its line of railroad, or the operation thereof, unless and until there shall first have been obtained from the board a certificate that the present or future public interest permits such abandonment.

"The application for and issuance of any such certificate shall be under such rules and regulations as to hearings and other matters as the board may from time to time prescribe, and the provisions of this act shall apply to all such proceedings. Upon receipt of such applications by the board it shall file or cause to be filed copies thereof with the governor of each state in which such line of railroad, or extension thereof, is proposed to be constructed or operated, or any portion or all of such line of railroad, or the operation thereof, is proposed to be abandoned, with the right to be heard as hereinafter provided with respect to the hearing of complaints or the issuance of securities.

"The board shall have power to issue such certificate as prayed for or to refuse to issue it, or to issue it for a portion or portions of a line of railroad, or extension thereof, described in the application, or for the partial exercise only of such right or privilege, and may attach to the issuance of said certificate such terms and conditions as in its judgment the public interest may require. From and after issuance of such certificate, and not before, said carrier by railroad may comply with the terms and conditions of such certificate or attach to the issuance thereof and proceed with the construction, operation, or abandonment covered thereby. Any construction, operation, or abandonment contrary to the foregoing provisions of this section may be enjoined by any court of competent jurisdiction at the suit of the United States, the board, any commission or regulating body of the state or states affected, or any party in interest, and any carrier knowingly violating any of the foreging provisions shall be guilty of a misdemeanor and upon conviction shall be punished by a fine of not more than $10,000 or imprisonment for not more than three years, or both such fine and imprisonment, in the discretion of the court.

"The board may, after hearing, in a proceeding upon complaint or upon its own initiative without complaint, authorize or require by order any carrier by railroad subject to this act, party to such proceeding, to provide itself with safe and adequate facilities for performing as a common carrier its car service as that term is used in this act, and to extend its line or lines: *Provided,* That the board shall find that such provision of facilities or extension is reasonably necessary in the public interest and will not impair the ability of the carrier to perform its duty to the public; and, with respect to extensions, that the carrier has the necessary funds or can obtain the same at a reasonable rate of interest: *Provided further,* That the authority of the board

conferred by this section shall not extend to the construction or abandonment of side tracks, spurs, industrial, team or switching tracks, street car and electric interurban lines located or to be located wholly within one state."

Section 35 applies the provisions of the act prohibiting rebating to the transmission of intelligence by wire or wireless.

Section 36 amends the second paragraph of section 3 of the act to regulate commerce to provide that all carriers subject to the provisions of the act shall, according to their respective powers, afford all reasonable, proper and equal facilities for the interchange of traffic between their respective lines and for the receiving, forwarding and delivering of passengers to and from their several lines and those connecting therewith and shall not discriminate in their rates, fares and charges between such connecting lines.

Section 37 amends the long and short haul clause of the commerce act, authorizing the commission to permit carriers to charge less for longer than for shorter distances, but the commission shall not permit the establishment of any charge to or from the more distant point that is not fairly compensatory for the service performed, and if a circuitous rail line or route is because of circuity granted authority to meet the charges of a more direct line or route to or from competitive points and to maintain higher charges to and from intermediate points on its line, the authority shall not include intermediate points as to which the haul of the petitioning line or route is not longer than that of the direct line or route between the competitive points; and no such authorization shall be granted on account of merely potential water competition not actually in existence.

Section 38 amends the anti-pooling section of the commerce act by inserting the words "except upon specific approval by order of the commission as in this section provided." The commission is given authority to authorize divisions of traffic or earnings between carriers under prescribed rules and regulations whenever it shall be of the opinion that such division of traffic or earnings will be in the interest of better service to the public, economy in operation, or otherwise of advantage to the convenience of commerce and the people and will tend to equalize earnings between carriers and will not unduly restrain competition.

Section 39 adds to Section 6 of the commerce act a provision authorizing the commission to make suitable rules and regulations for the simplification of schedules of rates, fares, charges and classifications and to permit in such rules and regulations the filing of an amendment of, or change in, any rate, fare, charge or classification without filing complete schedules covering rates not changed, if in its judgment the public will be better informed by so doing.

Section 40 authorizes the transportation board to establish physical connection between the lines of the rail carrier and the dock at which interchange of passengers or property is to be made, by direction to either to rail or the water carrier or to both.

Section 41 extends the authority of the commission to prescribe rates by substituting for the words "maximum joint rates" and "maximum proportional rates" the words "joint rates or maximum or minimum or maximum and minimum joint rates" and "proportional rates or maximum or minimum or maximum and minimum proportional rates."

Section 42 amends Section 7 of the commerce act to prohibit common carriers from entering into any combination, contract or agreement to prevent by change of time schedule carriage in different cars or by other means or divisions the carriage of freights from being continuous from the point of origin to the place of destination; and no break of bulk, stoppage or interruption made by such carrier shall prevent the carriage of freights from being and being treated as one continuous carriage from the place of origin to the place of destination unless made in good faith for some necessary purpose and without intent to avoid or necessarily interrupt continuous carriage.

State Rates

Section 43 provides for a method of co-operation between the federal and state commissions in all proceedings by amending Section 13 of the commerce act by adding at the end thereof the following:

"Whenever in any investigation under the provisions of this act there shall be brought in issue any rate, fare, charge, classification, regulation, or practice made or imposed by authority of any state, the commission, before proceeding to hear and dispose of such issue, shall cause such state or states to be notified of the proceeding. The commission shall confer with authorities of any state having regulatory jurisdiction over the class of persons and corporations subject to this act with respect to the relationship between rates, fares, charges, classifications, regulations, or practices of carriers subject to the jurisdiction of such state bodies and of the commission; and to that end is authorized and empowered, under rules to be prescribed by it, and which may be modified from time to time, to hold joint hearings with any such state regulating bodies on any matters wherein the commission is empowered to act and where the rate-making authority of a state is or may be affected by the action taken by the commission. The commission is also authorized to avail itself of the co-operation, services, records and facilities of such state authorities in the enforcement of any provision of this act.

"The commission shall, after full hearing, make such findings and orders as will in its judgment remove any undue or unreasonable advantage, preference, or prejudice as between persons or localities in state and interstate or foreign commerce, or any undue, unreasonable, or unjust discrimination against interstate or foreign commerce, which is hereby forbidden and declared to be unlawful, and such findings or orders shall be observed while in effect by the carriers parties to such proceeding affected thereby, and shall make the rates, fares, and charges, or the minimum and maximum of such rates, fares, and charges, and any classification, regulation, or practice which, in its judgment, will remove such advantage, preference or prejudice.

"Nothing in this act shall be construed to amend, repeal, impair, or affect the existing laws or powers of the states or other local authorities in relation to taxation or the lawful police powers of the several states, including the power to make and regulate intrastate rates, except as in this act otherwise provided. Any carrier shall have the right to make complaint to the commission respecting any such intrastate rate, fare, charge, classification, regulation or practice."

Section 44 authorizes the commission, whenever it shall be of opinion that any rate, etc., is or will be unlawful, to determine and prescribe what will be the just and reasonable individual or joint rate, fare or charge or rates, fares, or charges to be thereafter observed in such case, or the maximum or minimum or maximum and minimum to be charged, and what individual or joint classification, regulation or practice is or will be just, fair and reasonable to be thereafter followed, and to make an order for the future. Except as otherwise provided, orders of the commission other than those for the payment of money shall take effect within such reasonable time, not less than 30 days, and shall continue in force until its further order or for a specific period of time.

The section also gives the commission complete jurisdiction over divisions of joint rates between carriers, providing that the commission shall inform itself and take into consideration the efficiency with which the carriers are operated,

the amount of revenue required to pay operating expenses, taxes and a fair return, the importance of the carrier to the public, whether the participating carrier is an originating, intermediate or delivering line, and any other fact or circumstance which would ordinarily entitle one carrier to a greater or less proportion of the joint rate than another.

In establishing through routes the commission shall not, except as provided in Section 3, require any carrier without its consent to embrace in such route substantially less than the entire length of its railroad and of an intermediate railroad operated in conjunction and under common management or control therewith which lies between the termini of such proposed through routes unless such inclusion of lines would make the through route unreasonably long as compared with another practicable through route which could otherwise be established. It is provided, however, that in time of shortage of equipment, congestion of traffic, or other emergency, it may establish temporarily such through routes as in its opinion are necessary or desirable in the public interest. This section also amends the provisions of the present law as to suspensions, which are limited to 120 days. If the hearing cannot be concluded within this period the commission may extend the time of suspension for a further period not exceeding 30 days and if the proceeding has not then been concluded the proposed rate shall go into effect.

Whenever property shall have been diverted or delivered by one carrier to another contrary to the routing instructions in the bill of lading, any carrier thus deprived of its right to participate in the haul shall be entitled to recover from the carrier or carriers to which such traffic shall be thus diverted the revenue accruing on such diverted traffic.

Section 45 requires ocean-going common carriers engaged in foreign commerce or in coastwise or in coast-to-coast commerce, whose ships are registered under the laws of the United States, to file with the transportation board schedules showing the routes over which the boats ply, the sailing dates and the rates, fares, and charges for transportation to and from the various ports, stating the period during which such rates are to be in effect. The board shall cause such information to be published for the information of shippers and furnish such publication to rail carriers in such quantities that they may supply them to their agents in each shipping community sufficiently important to be specified by the board for that purpose. The absorption of the necessary reasonable cost for the transfer of shipments from rail lines to boats in the transportation charge of the rail carrier is authorized under such rules and regulations as the board may prescribe and under regulations prescribed by the board, rail carriers are required to issue through bills of lading.

Section 46 provides a penalty of $5,000 for each offense for violations of the provisions of Sections 3, 13 or 15.

Section 47 amends the fifth paragraph of Section 20 of the commerce act to provide that the commission shall have access to all accounts, records and memoranda, including documents, papers and correspondence kept or required to be kept by carriers subject to the act.

Section 48 provides that Sections 20, 24, 25, 26, 27, and 28 shall not apply to street, suburban or interurban electric railways operated chiefly for the transportation of passengers and not a part or parts of a general system of transportation conducted and operated in the ordinary way.

The University of London proposes to grant degrees in commerce. Under this scheme it is proposed to grant the degree of bachelor of commerce to candidates who pass the necessary examinations after a three years' course of study. Those who so desire may later proceed to the degree of master of commerce, after a minimum of two years' practical experience in the particular trade or industry taken up.

Provision for Funding Equipment Ordered by Government

A BILL WHICH WOULD PERMIT the United States Railroad Administration to accept stock in the proposed national equipment corporation for funding the cost of locomotives and cars ordered for the railroads last year by the government, in accordance with the plan worked out for the Association of Railway Executives by a committee of bankers, has been introduced in the Senate by Chairman Cummins, of the Committee on Interstate Commerce, and in the House by Chairman Esch, of the Committee on Interstate and Foreign Commerce. The bill provides that in order to make provision for the reimbursement of the United States for the sums advanced to provide motive power, cars and other equipment ordered by the President for the carriers, the President may, upon such terms as he shall deem advisable, receive in reimbursement cash or obligations of any carrier, or part cash and part such obligations, or, in his discretion, he may accept for such motive power, cars or other equipment cash or the shares of stock or obligations, secured or unsecured, of any corporation not a carrier, organized for the purpose of owning equipment or equipment obligations, or part cash and part such shares of stock and obligations, and he may transfer to such corporation any obligations of carriers received on account of motive power, cars or other equipment, and he may execute any instruments necessary and proper to carry out the intent of the provision of the federal control act which authorized the President to order equipment, to the end that title to the equipment ordered for the carriers may rest in them or their trustees or nominees.

The President is also authorized to dispose in the manner and for the consideration aforesaid of the equipment provided by him in accordance with any other provisions of the section of the law referred to, and of any obligations of carriers that may be received in reimbursement of the cost thereof. It is also provided that any contract for the sale of the equipment may provide that title thereto, notwithstanding delivery of possession, shall not vest in the carrier until the purchase price, which may be payable in instalments during any period not exceeding 15 years, shall be fully paid and the conditions of purchase fully performed.

The plan, which has now been practically agreed upon, provides for the financing in a single operation of all or a large part of the cars and locomotives purchased by the government, the total cost of which is estimated at approximately $400,000,000. The bankers' committee proposed to sell $280,000,000 six per cent 15-year equipment trust certificates to the public, while the remaining $120,000,000 worth of equipment and a reserve fund of $28,000,000 would be constituted by a stock issue of $148,000,000, which, it was suggested, should be subscribed for by the Railroad Administration. The corporation would take title to the equipment and the various companies accepting it would obligate themselves to the equipment corporation to purchase it in 15 annual installments with interest at 6 per cent.

The bill has been passed and has been approved by the President.

BRITISH COAL PRODUCTION.—During the four weeks which ended on July 19th last, the total output of coal in the United Kingdom aggregated 18,120,700 tons, while the number of persons employed was 1,146,700.

THE CITY OF WINNEPEG, MANITOBA, to build its recently completed aqueduct, constructed its own standard gage railway and a telegraph line. The road is 110 miles long and its locomotives and 115 cars are valued at $1,439,522.—*Fire and Water Engineering.*

Railroad Labor Questions Coming to a Head

WASHINGTON, D. C.

THE STEEL AND COAL STRIKES having materialized, the question whether they are to be followed by a strike or strikes of railroad employees has naturally aroused much speculation, in view of the various threats that have been uttered by railroad labor leaders in connection with their demands for increased wages, as well as in connection with their protests against proposed anti-strike legislation in Congress, and for a time there was some talk of a general strike in which the railroad employees would participate. It has become apparent, however, that the railroad labor organizations are mainly engaged in looking out for their own interests and that the working arrangement between the train service brotherhoods and the American Federation of Labor is not so close as to induce them to depart from their traditional policy against sympathetic strikes, and while the demands of the railroad organizations include the possibilities of a crisis, they are not regarded so seriously as they were before November 1.

It is understood that Grand Chief Stone, of the Engineers, has been making some efforts to bring about a peaceful settlement of the coal strike in order to avoid consequences which might be disastrous to all organized labor, and the firm policy adopted by the administration in dealing with the United Mine Workers has undoubtedly given much food for thought to any other labor leaders that might have been planning to go farther than to threaten a strike. While the labor leaders have been protesting loudly against proposed anti-strike legislation such as that embodied in the Cummins bill and bills introduced in the House, they seem to have overlooked entirely the teeth in the food and fuel control act which has proved so potent in dealing with the coal strike. This has been in existence since August 10, 1917, and was strengthened as late as October 22. As amended at that time it makes it unlawful to "conspire, combine, agree, or arrange with any other person, (a) to limit the facilities for transporting, producing, harvesting, manufacturing, supplying, storing, or dealing in any necessaries"; and the stress which has been laid upon the effect of the coal strike upon transportation in the proceedings in connection with Judge Anderson's injunction leaves no room for doubt that the same law could be applied in the case of a railroad strike.

Officers of the railroad brotherhoods were called into conferences with the leaders of the steel and coal strikes, presumably for the purpose of enlisting their co-operation, and it is understood that they agreed not to oppose walkouts by individual employees of industrial roads serving the steel plants on which the employees are not under contract with the Railroad Administration, but so far apparently the co-operation of the brotherhoods has been confined to "moral support."

L. E. Sheppard, president of the Order of Railway Conductors, in announcing the intention of the brotherhood representatives to withdraw from the Industrial Conference on October 22, said:

"I regret beyond the power of words to express that I must in the near future, if things go as the stage is set, fight men that I fought years and years ago, but whom, for some years at least, we have been on friendly relations with—the railroad men and the railroad managers, who have gotten together, and have been getting along in peace and harmony, and who have begun to fully realize what can be accomplished by co-operation, but now it seems that all that we have accomplished is to be sacrificed, and that we are to be drawn into the vortex of this industrial warfare.

"Railway labor cannot stay out of the controversy. The railroad men are the key to the whole situation. You cannot have a controversy of any description, of any magnitude, that the railroads are not drawn into it. We want to live up to our contracts; we are threatening to expel from membership those who do not live up to our contracts; but what assistance do we get from the conference which has taken place here? What can we say to our men, when the men are leaving the service of the employers all about us—'Stay at your work and help tear down the other workers?' That is what it means, and I say it is not fair to the men who want to do the right thing."

W. G. Lee, president of the Brotherhood of Railroad Trainmen, was quoted on November 1 as having given the following reply to a question as to the attitude of his organization in connection with the coal strike:

"Our organization is fully in sympathy with the miners in attempting to secure a living wage and better working conditions, and believes that the position taken by the government in connection with the injunction issued will probably disturb industrial conditions to a far greater extent than recognized by those in charge of governmental affairs.

"The railroad brotherhoods will assist the miners in every honorable and consistent way and the officers of the miners' organization fully understand the brotherhoods' position.

"I have not assumed to impose my opinion or presence either at the White House or upon the Attorney General in connection with the miners' strike, because no intimation from the officers of the miners' organization has come to the trainmen's brotherhood, to my knowledge, requesting such assistance or the use of our influence."

Apparently the first concern of the railroad labor organizations has been to prevent the return of the railroads on December 31, not because they are particularly enamored of government control, but because they have thus far been able to get more of what they wanted from the Railroad Administration than from private management, and their representatives have recently been very busy in working with members of Congress for an extension of federal control. They have also laid plans for getting as much as possible from the Railroad Administration before it lets go and will probably make some demonstration in an effort to insist on their demands before the railroads are returned, but present indications are that their efforts will not meet with entire success.

The demands for general increases in wages presented in July and August have been held in abeyance in accordance with the President's request that the government be allowed a reasonable time in which to attempt to reduce the cost of living, and meanwhile the Board of Railroad Wages and Working Conditions has been holding hearings and making recommendations to Mr. Hines on requests for readjustments to correct alleged inequalities. Some of the labor leaders have expressed impatience with the slowness of the results achieved in the direction of reducing prices and have declared they will regard the "reasonable time" as having elapsed very shortly.

Director General Hines has arranged for an early conference with the executives of the four brotherhoods, and also of the maintenance of way employees' organization, at which he is expected to give them some kind of a definite answer on the various demands that have been made, including the question of time and one-half for overtime in road train service. The engineers and conductors have not presented any formal wage demands, but the conductors are involved in the demands presented by the Brotherhood of Railroad Trainmen. A hearing on the firemen's demands has recently been concluded by the wage board.

Railroads Expected to Be Returned January 1

Temporary Legislation May Be Necessary if Permanent Act Is Not Passed by That Time.

ACTIVE PREPARATIONS FOR THE RETURN of the railroads to their owners at midnight of December 31 are now under way, both on the part of the Railroad Administration and by the executives of the railroad companies that expect to resume their operating functions. However, the proposed legislation to provide for the regulation of the roads after their return, or for their reorganization, as contemplated by the Senate bill, has encountered so many snags that it now seems probable that the roads will go back with only temporary legislation providing for a continuation of the guaranteed standard return until a permanent bill can be enacted and efforts are still being made to continue the present form of control for another year or two.

The House committee completed its work on the revised Esch bill on November 8 with the purpose of reporting it the following Monday, and of attempting to pass it during the week. Chairman Cummins, of the Senate committee, also planned to attempt to get consideration of the committee's bill in the Senate during the week in an effort to pass it, but it is recognized that it will be practically impossible to do so or to obtain an agreement before the end of the year between the House and the Senate on the two conflicting bills if both should succeed in passing them. After that situation is made clearly apparent it is proposed to pass a temporary resolution in December, although the plan will encounter some opposition on the part of members of Congress who will favor a further extension of the period of federal control.

The House committee has held almost daily sessions on its bill since a tentative bill was reported to the full committee on October 29, by a sub-committee which had worked on it since the conclusion of the committee's public hearings on September 26. The Senate committee reported the revised Cummins bill on October 23, but later the committee reached a point where it was practically ready to agree that the Cummins bill could not be passed before January 1, and that the only practicable course to pursue would be to put through a temporary resolution on which an agreement could be reached with the House, avoiding all points of controversy. When the House leaders objected to this idea and insisted that it would be possible to pass the Esch bill in time for an early adjournment it was decided to make another effort in the Senate and postpone the proposed temporary resolution until December. Before that time conferences will be held between Chairmen Cummins and Esch of the two committees, Director-General Hines and representatives of the railway executives as to the terms of the temporary resolution.

Political considerations, the desire of Congress for an adjournment of the present extra session before the new session begins in December, the interminable character of the Senate debate on the peace treaty and wide differences of opinion between the House and Senate committees as to what should be included in the railroad bill, have been added to the inherent complexity of the railroad problem as factors causing the delay. The Democrats apparently have made up their minds to wash their hands of the railroads, while the Republicans, who have taken great delight in criticising Democratic management of the roads, have recently evinced increasing reluctance to assume the problem themselves and this situation has added strength to the element in Gongress, backed by the railroad labor organizations, for an extension of federal control until after the election, next fall. Representatives of the 14 railroad labor organizations at a recent meeting in Washington decided to work for a two-year extension.

For a long time members of Congress and others seem to have harbored an idea that the President could be easily induced to retain his control of the railroads indefinitely pending the completion of the railroad legislation, in spite of his declaration last May that they would be returned at the end of the year. This idea seems to have been rather definitely dispelled by recent announcements of the director general that he was planning for the return of the roads regardless of legislation, and has given way to a realization that the Republicans can no longer dodge their responsibility. Director General Hines has made it plain on several occasions that he does not consider it practicable for the government to continue the operation of the roads for a brief or uncertain period, and during the past week he seems to have made it plain that the President is not going to change his mind. The idea has prevailed in many minds that the railroad labor situation now coming to a head would interfere with the plans for the relinquishment, but as the preparations for winding up the active operations of the Railroad Administration have proceeded, it has been more frequently suggested that the labor situation represents one of the reasons why the government would be glad to let go.

Senator Cummins Urges Action

On November 4, Senator Cummins urged the Senate to dispose of the German treaty during the week in order that the railroad bill might be taken up, and said that if he could not be assured in some manner that the railroads would not be returned to their owners in the absence of adequate and protective legislation he would feel it his duty to ask that the treaty be displaced. "Nine months ago, substantially," he said, "the President declared that not later than the first of January he would feel it his duty to return the railways to their owners, under a power which he undoubtedly possesses. I have good reason to believe that his purpose at that time has not been changed. I cannot speak positively with regard to his intent, but I am led to think that about the first of January these properties will be returned to their owners. Nor could anyone criticise the President with much severity, because we have had ample opportunity to prepare and enact into law the legislation which I regard as absolutely necessary in the return of our systems of transportation to their owners. In view of the impending calamity—and it will be a calamity from which we cannot escape, if the railroads are returned without adequate legislation—the German treaty ought to be disposed of.

"If the railroads are returned without adequate legislation, you will not only see an intensification of all the difficulties which are now observed in the labor world, but in my judgment you will witness a financial catastrophe against which it will be very hard for us to contend."

Senator Cummins added that if he were in the President's stead, he thought he would not return the roads until adequate legislation is enacted, "yet there are a great many reasons which move in that direction." "At this time," he said, "there is almost complete demoralization in the railway service. The employees cannot maintain that degree of efficiency which ought to be manifest in all such service. The railway companies are utterly incapable of doing anything, for they have nothing with which to accomplish any purpose. The

properties are not in their possession; the working capital is not in their possession; they are unable even to prepare fairly for the approaching return of the properties. There is every consideration for the rapid disposition of the subject."

When it became apparent that the Senate was not able to agree upon an early date for the disposition of the treaty the Senate committee on interstate commerce held a meeting on November 5 and decided to propose the plan of temporary legislation. The House committee, however, showed a disposition to go ahead and attempt to pass its bill and Chairman Cummins gave out a statement to make it clear that the effort to pass permanent legislation had not been entirely abandoned.

"We are informed definitely that the railroads will be returned by the President to the companies on January 1," he said. "In that situation, and with the uncertainty about passing much-needed legislation before they are returned, the Senate Committee on Interstate Commerce has been in a conference to consider the possibility of taking steps to pass temporary measures to render the transitional period easier. By that I mean, particularly, the extension of the guaranteed return for some brief period until the permanent reconstruction legislation can be passed.

"There was complete agreement as to the necessity for getting legislation passed before the roads go back, but realizing the difficulties that will confront it in the Senate I have begun to doubt whether we could pass it at this session, or even before the beginning of the new year."

The Anti-Strike Clause

It is understood that some of the House leaders and also members of the steering committee of the Senate urged that the Senate committee omit from its bill the proposed anti-strike legislation in order to expedite the passage of a bill, or even to put it into a separate bill.

Organized labor is preparing for one of the biggest fights in its history in an attempt to defeat any anti-strike legislation. The officers of the four railroad brotherhoods conferred with Chairman Cummins of the Senate committee on October 31, and made formal application for another hearing on the so-called anti-strike provisions of the Cummins bill, although they had had a three-day hearing in September. They had prepared written objections to the bill which Senator Cummins submitted to the committee, but by unanimous vote the committee declined to reopen the hearings.

Representative Sims, on November 5, introduced a bill providing for an extension of federal control until December 31, 1921, "or until Congress otherwise orders." This is in accordance with the proposals of the railroad labor organizations. Mr. Sims had proposed a six-months' extension the week before in the House committee, but the proposal had been voted down. It was reported, however, that a strong support might be gained for a one-year extension, as a compromise between those who were opposed to a continuation of the guaranty unless the roads are retained by the government and those who favored the labor plan for a two-year extension. Mr. Sims had a long conference with Director General Hines the day before he introduced his bill.

Mr. Sims also introduced a bill to provide that for one year from the end of federal control no attachment, execution, order of sale, or other process, mesne or final, shall be issued or levied upon or against the property of any railroad company subject to the federal control act, used or necessary to be used by such company as a common carrier engaged in general transportation; but that actions at law or suits in equity may be brought against such carriers and judgments rendered as now provided by law. He also introduced another bill to provide that not more than $20,000 of the salary of any railroad officer shall be charged to operating expenses, or be considered by the Interstate Commerce Commission in reaching its conclusion as to the justness or reasonableness of any rate, fare, charge, classification, regulation or practice.

The House bill, as sent to the printers on November 8, differs radically from the Cummins bill. It centers authority in the Interstate Commerce Commission, with no provision for a transportation board. It does not provide for federal incorporation nor compulstory consolidation. It has no definite standard of rate-making and it contains no anti-strike provisions. It contains a rule of rate-making requiring the commission to consider "the interest of the public, the shippers, the reasonable cost of maintenance and operation, including the wages of labor, depreciation and taxes, and a fair return on the value of the property used or held for the service of transportation" in reaching its conclusions.

The bill provides for the termination of the present government control at the end of the month within which the measure is approved by the President, for the temporary continuation of rates initiated by the government during federal control, for the continuation of the guaranteed standard return for six month, including a similar provision for short lines that were relinquished, and for a funding of the indebtedness of the roads by the government for 10 years. Provision is made for voluntary adjustment of labor controversies through boards similar to those created by the Railroad Administration and for the assessment of damages against the company or against a labor union for violation of a contract by a lockout or strike.

Minimum Weights in Grain Increased

The Railroad Administration has filed with the Interstate Commerce Commission supplements to tariffs providing for the establishment of minimum weights on grain and grain products designed to secure heavier loading and to make available additional freight cars for the transportation of grain and grain products. The amended tariffs will provide that the new minima are made effective purely as an emergency matter. When the emergency has passed, the tariffs will be withdrawn.

This step had been made necessary by the extremely heavy demands which are being made upon the Railroad Administration for the transportation of grain and grain products and by the fact that in many markets cars are being ordered loaded only to the existing minimum weights even though these are considerably less than the capacity of the cars. These minima are not being established for the purpose of securing revenue or as a permanent policy, but solely to assist in providing more freight cars during the present emergency.

The new minimum weights will be as follows:

On grain, all kinds, the minimum weight will be the marked capacity of the car except that where the marked capacity is less than 40,000 lb. the minimum weight will be 40,000 lb. per car. The actual weight will apply when grain is loaded to within 24 in. of the roof at the side walls of the car for the purpose of federal or state inspection by grain exchange at points where federal inspection is maintained (notation to that effect being inserted in the bill of lading by shippers) or when grain is loaded to proper grain line of cars so marked.

On grain products, the minimum weight will be 60,000 lb. per car provided that when the marked capacity of the car is less, the marked capacity, but not less than 40,000 lb. per car, will apply, and provided further than when a car is loaded to full space capacity the actual weight will apply.

Organized Labor Opposes Anti-Strike Legislation

General Labor Conference Called; Anti-Strike Bills Introduced in Both Houses

WASHINGTON, D. C.

THE RAILROAD LABOR ORGANIZATIONS and the American Federation of Labor have united their forces to oppose the proposed anti-strike legislation now pending in Congress, which is included in the Cummins bill in the Senate and several bills in the House. After having assumed a belligerent attitude during the summer the railroad labor leaders have been rather put on the defensive recently by the evidences of strong support in Congress for such a law.

A Conference Called

The executive officers of the four train service brotherhoods have joined with the executive council of the American Federation of Labor in a call for a general labor conference to be held at Washington on December 13 by representatives of 112 national and international unions affiliated with the American Federation of Labor and possibly by representatives of some of the farmers' organizations. The call for the conference says:

"In this critical reconstruction period labor is confronted with grave dangers affecting the very foundation of its structure. So grave is the situation regarded that at its recent meeting the executive council of the American Federation of Labor and the representatives of the railroad brotherhoods agreed that the executives of the national and international unions should be invited to participate in a conference at the headquarters of the American Federation of Labor at 10 o'clock on the morning of December 13, 1919, and there to take counsel and to formulate such action as may be essential to safeguard and promote the rights, interests and freedom of the wage-earners, the workers, who form the great mass of the people of our republic.

"It is imperative that the responsible representatives of the labor movement shall, therefore, consider the situation in the industrial and legislative field and agree upon fundamental principles and a program which the wage-earners will accept in performing their duties as citizens and at the same time maintaining the right of free men in order to conserve human interest and welfare."

This conference was decided upon at a meeting on October 25 at which, according to Mr. Gompers' announcement, "general discussion ensued regarding the legislation pending in Congress inimical to the rights and interests of industrial and agricultural workers," and "further discussion ensued regarding legislation which should be urged at the hands of Congress in the interests of the above." Mr. Gompers said that the representatives of the farmers' organizations, "although in entire sympathy with the discussion and purposes, stated that they had no authority to join in the call, but in their convention, which would be held within a month from now, would be glad to receive invitations upon which to act."

Timothy Shea Says Anti-Strike Law Would Not Be Observed

W. H. Johnston, president of the International Association of Machinists, was quoted in the newspapers as saying that in the event of the passage by either House of Congress of proposed anti-strike legislation he would immediately order a strike vote of his 350,000 members and that he had no doubt similar action would be taken by other unions. Timothy Shea, acting president of the Brotherhood of Locomoive Firemen and Enginemen, issued a statement on October 25 opposing the proposed anti-strike law, saying that firemen and hostlers would not observe "any law which deprives them of the rights of American citizens."

Mr. Shea's statement was prompted by the publication of extracts from his recent testimony before the wage board when he announced the program he proposed to insist upon as a condition precedent to the return of the railroads.

"We are now waiting," said Mr. Shea, "the outcome of this campaign against the high cost of living. We wish to see prices reduced. If prices are not reduced, however, we shall have to have further advances in our wage schedules in order that the standards of living of locomotive firemen and hostlers shall at least be maintained on a subsistence level."

Mr. Shea pointed to the war activities of the railway workers, whose patriotism and patience during the war years, he claims, were notable. For nearly four years, he said, the railway men have been waiting for the establishment of a reasonable work day, with time and one-half pay for overtime.

"We considered," he continued, "it our duty to remain at work in the transportation industry in a time of war emergency, even though we suffered great financial loss in so doing. We looked upon the war as a time to give the full measure of our capabilities and experience to the country and not as a time to make money.

"Strikes occur in industry for various reasons. The experience of the world has shown that anti-strike legislation has always been abortive. The Senate committee which has reported the Cummins bill, has a report, prepared two years ago, which was based on an exhaustive study of anti-strike legislation in Europe, Great Britain and Australia, and the conclusion was drawn that in all countries where it had been tried it was found to have been a failure. Now, we find this same committee, in the face of its own exhaustive investigations and conclusions, and contrary to the well-known experience of the leading industrial and commercial nations of the world, submitting anti-strike legislation. The irrationality of such action is only equalled by its ineffectiveness.

"If railroad employees are given their simple, fundamental, economic rights, together with proper machinery for adjusting current and less important grievances, there would be no occasion for strikes and few strikes would occur. This is the intelligent and effective policy to pursue. If the members of the Senate committee were possessed of the elements of real industrial insight and constructive statesmanship, they would recommend such a policy instead of the foolish and futile anti-strike provisions of the Cummins bill or the proposed amendment to the federal control act introduced by Congressman Black."

Shea asserted that firemen cannot physically endure the hours they are now required to work and that after four years of waiting they have decided that the shorter workday issue cannot long be postponed. Unless the cost of living is reduced, he added, the rates of pay must also be advanced to meet the increased cost of living.

He also made reference to the labor provisions of the League of Nations which guarantee to all industrial workers a living wage and an eight-hour day.

"These two principles," he adds, "have, therefore, been sanctioned by the enlightened opinion of the civilized world. They are obligatory upon our government and upon the Railroad Administration to see that they are practically applied. It is the duty of the Senate to see that they are embodied in any legislation as a condition precedent to the

return of the railroads to their private owners or to any change in the present method of operation. If they wish to bring about stability of operation of the railroads and prevent strikes or interruption of traffic, they should assure the employees of these fundamental rights.

"If anyone will take the time to review the history of the transportation brotherhoods they will have no trouble to ascertain that strikes have been an almost unknown quantity. It is true that now and then, here and there, on an individual road there has been a temporary stoppage of traffic, but not until every other effort to secure justice had been exhausted. There have been no sympathetic strikes sanctioned. The public has been always free from any inconvenience, and to have the Congress single out railroad employees and attempt to deprive them by statute of the economic right to strike if need be, to prevent injustice being imposed upon them, must be accepted, in connection with other information we have, as a foregone conclusion that the railroad interests contemplate putting into effect a general reduction in wages of railroad employees after the roads are returned to private control, and to prepare for this action they desire a law to prevent such employees from striking to combat injustices which may be perpetrated by reducing their wages or interfering with their hours of labor or rules of employment which have been established.

"If these interests or the legislators believe railroad employees will unresistingly submit to any such invasion of their rights as citizens, they had better expel that thought from their minds, because I believe I speak for locomotive firemen and hostlers, at least, when I say that any law which deprives them of the rights of American citizenship would not be observed, not because this class of American citizens are lawbreakers, but because such a law would be unwarranted, un-American, and contrary to American institutions.

"If an anti-strike law is enacted, the responsibility for any upheaval which might follow lies with Congress."

Public Opinion Crystallized

While many observers of the course of legislation in Congress have freely predicted that it would not pass an anti-strike law and some surprise was expressed when the Senate committee voted for the anti-strike section of its bill by a vote of 14 to 1, Senator La Follette constituting the minority, the coal and steel strikes have caused a remarkable crystallization of feeling against strikes and several bills on the subject were introduced independently.

An anti-strike bill, H. R. 10138, was introduced in the House on October 23 by Representative Black as an amendment to the federal control act, providing that during the period of federal control if two or more persons enter into any combination or agreement with the intent substantially to hinder, restrain or prevent the movement of commodities or persons over the lines of railroads or systems of transportation under federal control, they shall be deemed guilty of a conspiracy, and punishable by a fine not exceeding $500 or by imprisonment not exceeding six months, or by both. It is provided, however, that nothing in the act shall be taken to deny to any individual employee the right to quit his employment for any reason, but that it is the purpose expressly to prohibit his conspiring with other employees to do so by means of a strike.

Another bill, introduced by Representative Blanton, would make coal miners or railroad employees who strike subject to $5,000 fine, or two years' imprisonment, or both.

Representative Snyder on October 29 introduced in the House a bill, H. R. 10256, providing for the creation of a railroad wages and supplies board to decide controversies between common carriers and either their employees or corporations, firms, partnerships or individuals engaged in furnishing such common carriers with materials and supplies. The board would be empowered in cases of disputes between common carriers and their employees to prescribe for the future just and reasonable wages, terms and conditions of employment, hours of service, or working conditions. It would also make it unlawful for any group of employees to enter upon a strike before its controversy with the employer carrier or carriers has been submitted to the board and until the board has made a finding thereon. If the carriers conform to the findings of the board the right of the employees thereafter to strike in order to obtain their demands is prohibited and declared unlawful. The common carrier refusing to abide by the finding of the board would be made punishable by a fine of $25,000 for each offense and its officers who advise or acquiesce in the action of the carrier in refusing to comply with the findings would be made subject to indictment and a fine of not less than $5,000 or imprisonment for not more than two years, or both. Any group of employees striking after the board had rendered its findings would be made punishable by a fine of not more than $2,000 each or imprisonment for not more than one year, or both. The word "group" is defined to mean two or more employees and a strike is defined to mean the abandonment of employment by such group, pursuant to an agreement, understanding, or by concert of action.

The bill also provides that when any carrier shall need material or supplies and shall be unable to agree with the manufacturer or seller upon the price or the terms and conditions, or when contracts have been made and the proposed charges are alleged to be unreasonable, the carrier may file a petition with the board, which shall enter upon a hearing and thereafter determine and prescribe just and reasonable prices, terms and conditions. A decision of the board would be subject to court review.

Plumb Plan League Issues a Newspaper

The Plumb Plan League, which for some time has been issuing a small weekly paper called "Railroad Democracy," has made it into a newspaper and changed the name to "Labor." It contains news articles and editorials regarding current labor issues outside of as well as within the railroad field, and on the first page appeals to all organized labor "to fight for rail democracy" by becoming members of the Plumb Plan League. Everybody is invited to take out individual memberships for a fee of one dollar a year, and lodge memberships for $10. One news item, "Action Postponed on Return of Roads," apparently is intended to state that leaders in both parties of Congress have come to the conclusion that there will be no railroad legislation before the December session, although one line of the type is missing. It is stated, however, that a report on the House bill is not expected until November and that the Cummins bill will also be held up pending further developments and that "this action may be interpreted as the first victory of the Plumb plan in the legislative struggle for a solution of the railroad problem. Two months ago there was no question in the mind of Congress of any action except a return of the railroads to their private owners. Since then they have had time to think the matter over."

The news in the paper includes a report of the testimony before the Senate committee on the steel strike and of the railroad labor leaders before another Senate committee on the Cummins bill, stories regarding the British railroad strike, etc.

Managers of the League have announced that the State of Ohio has been selected for the first intensive organization in support of the "Plumb Plan." Plumb Plan leagues are to be organized at once in Cleveland, Cincinnati, Toledo, Columbus and other cities, following which the labor unions are to be organized in support of the plan. Efforts will later be made to obtain additional support from the farmers.

Railway Executives to Ask for Rate Advance

Administration Refuses to Increase Rates; Gives Data in Its Possession to Railway Executives

Director General Hines, having announced his conclusion that the Railroad Administration should not establish any general readjustment of rates during the remaining period of federal control for the purpose of increasing revenues, the railway executives had begun preparations for filing tariffs with the Interstate Commerce Commission designed to establish a proper relationship between the revenues and expenses of the railroads. In this they are taking advantage of Mr. Hines' offer of the assistance of the traffic department of the Railroad Administration which had already done a good deal of work toward the tentative preparation of tariffs during the time while the Railroad Administration was considering the advisability of a rate advance on its own account. The first point to be decided is as to what increase in revenue will be required; this is a difficult problem because of the uncertainty as to the volume of traffic and also as to whether further increases in wages will be granted. It is understood that the plans so far considered have contemplated not a horizontal percentage advance, but a readjustment designed to bring up the low spots in the present rate structure.

Director General Hines announced his conclusion that the government should not increase rates and gave his reasons in a letter dated October 7 to Thomas De Witt Cuyler, chairman of the Association of Railway Executives, confirming a previous conversation on the subject. Mr. Hines said:

Why Director General Will Not Increase Rates

"From time to time I have discussed with you and other representatives of the railroad executives, the question of what, if any, increases should be made in railroad rates, and the manner in which such increases should be made. My view has been and is that this important matter must be handled in accordance with the two following considerations:

"First: The question of an increase in rates could not properly be considered on the exclusive basis of the unfavorable showing which the Railroad Administration was making in the early part of this year, because that showing was very largely due to an abnormally small freight business, so that the results of that period could not fairly be taken as a test for making increases in rates. Necessarily, therefore, it seemed to me that the formulation of any proposal for a general increase in rates would have to await a better opportunity for making an estimate as to what the earning capacity would be under normal conditions. I have been increasingly confirmed in this opinion by the various developments which have taken place.

"Second: It has seemed to me that the public would not be satisfied under existing conditions to have any general increase in rates put into effect without the concurrence of the Interstate Commerce Commission. The public sentiment to this effect has been manifested in many ways throughout the year and has been emphasized by the recent passage by the two houses of Congress of bills providing that there shall be an opportunity to review any rates proposed by the Railroad Administration before those rates shall go into effect. It follows, therefore, that time and opportunity must be provided for public consideration by the regular rate-making authority of any rate proposals now made.

"Since the foregoing controlling factors must be respected, it is evident that it would be impossible for the government to establish any general readjustment of rates prior to January 1, 1920. It is also evident that any new basis to be established for the future should naturally be considered, not from the standpoint of unified operation of all the railroads, but to a greater extent from the standpoint of the necessities of the separate railroads. A rate adjustment which might fully protect the government when operating all the railroads as a unit might wholly fail to protect equally or fairly the different railroads when separately operated.

"I, therefore, see no escape from the conclusion that if the corporations desire to make progress at this time with this matter, they enter themselves upon a study of the problem to determine what tariffs they think ought to be proposed, with a view to filing tariffs accordingly with the appropriate public authority.

"I suggest, therefore, that you advise the railroad corporations that, if they desire to take this course, I shall be glad to place at their disposal all the information in the possession of the Railroad Administration bearing on the subject. Since most of the traffic experts who would ordinarily be relied upon by the railroad companies in a matter of this sort are now employed by the Railroad Administration, I shall be glad to provide that the traffic experts so employed shall aid the railroad corporations in studying this problem and bringing it to a conclusion."

To this Mr. Cuyler replied on October 13, as follows:

Railroad Executives Pass Resolution

"I duly received your letter of October 7, confirming our conversation in reference to the increase in railroad rates, and submitted the same today to meetings of the steering committee, the standing committee and the full membership roads, all of which were very fully attended.

"The committee came to the conclusion unanimously that they did not see their way clear to accept your suggestion of an application by the roads to the Interstate Commerce Commission for an increase in rates before a further conference with you on the subject. A very strong feeling was developed that it was the duty of the government, in view of all the circumstances, to make an increase of their own volition. I enclose you herewith a copy of the resolution that was adopted by both the steering and standing committees and the general membership.

"Under the terms of the resolution, I propose to appoint a committee to confer with you, and I shall be glad if you will advise me when you can conveniently see the committee at as early a date as possible."

The resolution reads:

"Resolved: 1. That the Association of Railway Executives respectfully insists that the duty rests upon the government to restore, on its own initiative and by its own action, the relationship between revenues and expenses which the government's action, in increasing expenses, has disturbed; and that appropriate action in this direction is necessary in order to be in conformity with the statement of the President, when the railroads were taken over by the government, that investors in railroad securities might rest assured that their rights and interests would be as scrupulously looked after by the government as they could be by the directors of the several railway systems.

"2. That a committee be appointed by the chairman, of which he shall be chairman, to take such action as it may consider appropriate to secure a reconsideration of the conclusion of the director general as stated in the letter above referred to, and to take such other action as they may deem

necessary in order to protect the interests of the railroads in regard to rates to be effective after the end of federal control."

Director General Hines Replies

Regarding the position of the railway executives, Mr. Hines, while at Duluth, Minn., on October 18, authorized the following statement:

"The suggestion of the railroad executives that the Railroad Administration make increases in rates can mean only one thing and that is, that the Railroad Administration shall make these increases during federal control for the sole and exclusive benefit of the railroads under private management after the end of federal control. This is true because the conclusion has been reached with the approval of the President that it is not in the public interest to make an immediate increase in rates for the purpose of increasing the revenues of the Railroad Administration during federal control. A fundamentally wrong conception is involved in the claim that the President ought to exercise the emergency rate-making power conferred upon him for the purpose of deciding as between the railroads and the public what the former shall charge and what the latter shall pay after federal control shall end. The theory of federal control was that the movement would guarantee a rental during federal control but not afterward. The idea, of course, was that after federal control the permanent statutory revisions and procedure would be looked to by the railroad companies to secure for themselves adequate compensation. The resolution of the railroad executives in effect takes the position that they are not willing to resort to the permanent statutory provisions to protect their interests, but instead they want the President to use his emergency power so as to provide for their compensation after federal control, in addition to having guaranteed them their return during federal control. There is no duty whatever, either legal or moral, resting upon the Railroad Administration, to initiate for the benefit of the railroad corporations rates which it believes to be inexpedient to initiate for its own benefit. On the contrary, the railroad companies have the power to protect their interests in this matter just as fully as they have had in the past, and they ought to resort to it unless they choose to stand on the rates as they are.

"With regard to the position suggested by the railway executives that the Railroad Administration ought to increase the rates because of the Railroad Administration's action in increasing the expense, this could not be true as to increases in expenses which would have taken place if the Railroad Administration had not been in existence. In view of the extraordinary increases in expenses of all forms of industry under private management, there is no basis for demonstrating that the increases in expenses of the Railroad Administration were due to any cause other than those which affected all forms of industry, hence no basis for claiming that a temporary emergency power of rate-making during federal control should be employed for the exclusive purpose of meeting them after federal control shall have ended. Even though the Railroad Administration deemed it expedient to increase rates for its own benefit, it would still be true that the increases it would make under which to defray the expenses of the unified operation of all the railroads in the country might be very different from the increases which would be necessary to protect the separate railroads or separate territorial groups of railroads in different parts of the county."

Final Action

Director General Hines met with the committee of executives at their request. After some discussion of the position of the executives, which was reaffirmed by them, that the government itself should initiate a revision in rates prior to January 1, 1920, and a reiteration by the director general of his previously announced position, the executives advised the director general that they would take advantage of his offer. At a separate meeting following the conference with the director general the executives agreed upon the following statement, a copy of which was left with the director general:

"Following the recent correspondence between the director general of railroads and the chairman of the Association of Railway Executives, a conference was held today between the director general and a committee of railway executives for the purpose of considering the request of the executives that the director general reconsider his decision not to make a general readjustment of rates during federal control. The director general having after discussion announced that he felt obliged to adhere to the conclusion he had already reached, he reiterated his offer to place at the disposal of the railroad companies all the information in the possession of the Railroad Administration bearing on the subject and to provide the aid of the traffic experts employed by the Railroad Administration in studying the problem and bringing it to a conclusion.

"It was thereupon resolved that the above-mentioned offer of the director general be accepted and immediate steps be taken by the railroad companies, with such aid, to ascertain the pertinent facts and to prepare their proposals for a readjustment of rates in such way and to such extent as will establish a proper relationship between the expenses and revenues of the railroad companies, in order that their financial needs may be adequately provided for and they be put in a position to perform efficiently their transportation duties after their properties are returned to them."

Plumb Plan Propaganda

THE PLUMB PLAN LEAGUE has a large appropriation for printing and postage for its publicity work, but it is not always necessary to draw on its fund for the distribution of its propaganda. Members of the Plumb Plan League have been receiving during the past few days an official looking envelope bearing in its upper left-hand corner in large type, the following imprint:

House of Representatives U. S.
Part of Cong. Record—Free
GUARD YOUR LIVING COSTS
Shall Dividends Be Guaranteed on
Watered Stock Equal to Rebuilding the Railroads?
The Plumb Conspiracy Letter.

In the upper right-hand corner, where ordinary mail usually carries a stamp, is the printed autograph of George Huddleston, M. C., who is a representative from Alabama in the House of Representatives. The envelope contains a printed document headed as follows:

CONSPIRACY OF THE RAILROADS
To Tax the Public on Their Debts
and Raise the Cost of Living
CAPITALIZATION DOUBLES THE COST
OF REBUILDING THE RAILROADS. NEW.
SHALL DIVIDENDS ON BILLIONS OF WATERED
STOCK BE GOVERNMENT GUARANTEED
AT 6 PER CENT?

Below is the information that this refers to a speech of the Hon. George Huddleston of Alabama in the House of Representatives on August 18, 1919, and that it was printed at Washington in the Government Printing Office in 1919. The speech was one delivered by Representative Huddleston in connection with the introduction of a resolution providing for a Congressional investigation of alleged "sensational" charges made before the committee on interstate and foreign commerce by "the responsible representatives of 2,200,000 railroad employees," that "the railroads of the United States are now seeking to validate billions of fraudulent capitalization, thereby burdening the American people in the cost of living with unjust and oppressive charges for transportation.

Firemen Given Hearing Before Wage Board

Board of Railroad Wages and Working Conditions Exposes Fallacy of Timothy Shea's Arguments

RAILROAD EMPLOYEES PROPOSE to demand, as a condition precedent to the return of the railroads to private management, the granting of their demands for increased wages and other concessions, according to a statement made by Timothy Shea, acting president of the Brotherhood of Locomotive Firemen and Enginemen, at a hearing before the Board of Railroad Wages and Working Conditions. This hearing was on the demands of the organization for increased wages, new rules governing working conditions and the installation of labor-saving equipment on locomotives, which were presented to the Railroad Administration in August. Mr. Shea used the word "we," which presumably refers to his organization, and did not state whether he was voicing the views of other organizations. He declared that the Railroad Administration had never complied with the proclamation made by the President at the time the War Labor Board was established stating the right of workers to a living wage based on a standard of health and reasonable comfort, and he continued:

"If our demands for a living wage cannot be considered at the present time and should they not be met when the time approaches for turning back the railroads to their private owners, we shall demand that as an essential preliminary to the turning back of the railroads to their private owners there shall be established as a conditions precedent to the change to private operation the realization of the fundamental rights of labor, the living wage, the eight-hour day on all federal controlled roads, time and one-half for overtime, and other principles to which the government pledged itself during the war, which have now been made a part of the Treaty of Peace and which so far the Railroad Administration has never fulfilled."

The hearing before the board was begun on October 1. Because of Director General Hines' instructions to the wage board that it was not authorized to consider at this time general increases in wages, but was limited to consideration of readjustments to correct inequalities, the complete demands of the firemen's brotherhood were not considered at the hearing, but Mr. Shea stated that the stay is only temporary and that it will be absolutely necessary for his organization to seek "relief" within the very near future for the reason that existing rates of pay to firemen and hostlers are so inadequate and their earnings have fallen so far below living requirements that immediate relief is necessary unless there is an immediate reduction in the cost of living. He was convinced that the measures being taken by the government to reduce the cost of living are inadequate and will not meet with success and he declared that the President should first have ordered the director general to increase the wages of railroad employees so as to restore prewar conditions, at least, and then if the cost of living were reduced an adjustment could have been made. The government, he said, should take control of and administer the available supplies of food, raw materials and manufactured goods and stop profiteering.

"Living Right Up to the Margin"

"There is an increase due to firemen and hostlers," Mr. Shea said, "and they have got to have it. If I cannot get it out of this conference it may be necessary to use other means, but I am going to get it. I want to make that position pretty clear."

W. E. Morse, a member of the board, asked Mr. Shea if he thought the cost of living could be reduced and wages increased simultaneously. Mr. Shea said he thought it could be done. He insisted that labor costs constitute only a small part of the price of a majority of commodities and he gave some figures to illustrate his point, but members of the board brought out the fact that his figures for labor cost usually represented only the labor cost of manufacture and did not include the labor cost involved in production and distribution of raw materials nor those of the wholesaler and retailer involved in the distribution of the finished product. Because of the increased cost of living, Mr. Shea said, his men are unable to provide for their families and are going without proper food and proper clothing. He said that when he began railroading as a brakeman, men could build their homes and live well on $1.25 a day and had more than they now have. Asked if the question of thrift did not enter into the situation, Mr. Shea said he did not think it possible for working people to curtail expenditures any more; that the men he represents are living "right on the margin" and depriving themselves and their families of the necessities of life.

"Do you represent any men who are buying automobiles and those things?" asked Mr. Morse.

"I do not hear of any fireman, or many firemen, buying automobiles," replied Mr. Shea.

"You would not regard an automobile as a necessity, would you?"

"Yes, I would."

"Well, I have denied myself a necessity all my life, then," said Mr. Morse, who was general manager of a railroad before becoming a member of the wage board.

"An automobile may be a necessity to any man," said Mr. Shea. "I have an automobile and it is a necessity to me and my family to a considerable extent. That would apply with equal force to any man and I think we have reached a period of our life where the laboring man must enjoy some of the necessaries and luxuries of life. I do not think the time is at hand when the American working man should be required to make any great sacrifices now. They have made their sacrifice."

Mr. Shea testified that the number of protests received from members of his organization as to the inadequacy of the rates established in Supplement No. 15 of General Order No. 27 exceeded those received against any previous wage increase or any other matter affecting the interests of the organization. A revised schedule of wages and rules for firemen and hostlers and their helpers was submitted to the Railroad Administration on August 23 and he was informed on August 27 that the board would hold a hearing, but was not authorized to consider requests involving general increases. Mr. Shea then wrote to Director General Hines, requesting advice as to what matters could be considered and asking whether the director general did not intend to settle the question of time and one-half for overtime in road train service pending the outcome of the efforts to reduce the cost of living. He also asked whether the proposed rules relating to final terminal detention, dead-heading, overtime, time held away from home terminals, expenses while away from home, monthly guarantees and installation of labor saving appliances on locomotives and relieving the firemen of incidental work, were to be precluded from consideration. He also asked for a comparative statement of wages by classes in December, 1915, December, 1917, and

at the present time, which would omit the effect of abnormal increases resulting from reclassifications.

To this Director General Hines had replied on September 12, stating that his instructions insured such consideration of the request as will result in any improper effect of Supplement No. 15 being corrected. As to the labor saving appliances, Mr. Hines said that as they involved capital expenditures which would require the concurrence of the corporations before they could be authorized, he did not see what good would result from such consideration by the wage board, and that they should be handled by himself and the director of the Division of Operation. As to data covering the effect of reclassification of employees, he said, no reliable data is available and the board's report of the hearing will doubtless cover arguments for the proposed rules, including the question of time and one-half for overtime and any additional information it might be able to offer him would receive full consideration.

Labor Saving Devices

Mr. Shea said that he had taken up the question of equipping locomotives with labor saving appliances in June, 1918, with Director General McAdoo and had held conferences on the subject with the directors of the divisions of operation and of labor and the director general. The locomotives ordered by the railroad Administration were so equipped and the regional directors were instructed to take up the question of equipping the other locomotives with the federal managers with a view to securing the approval of the corporations, but little had been accomplished.

"Unless you secure the consent of the corporations to the installation of these labor saving devices and to relieve the firemen from the hardships to which they are now subjected," Mr. Shea said, "it will be necessary for the organization to press its claim for two firemen on large locomotives."

Wages of Firemen and Shop Employes

Mr. Shea based his case principally on the statement that the wages of locomotive firemen in 1914 were inadequate and since that time have been increased only 50 per cent, while the cost of living has increased 85 per cent, and also upon comparisons of the firemen's rates with those of other classes of employees. He declared that there had been an inequality in the rates of firemen and hostlers as compared with those of other classes since federal control because time and one-half overtime, Sundays and holidays, had been granted to all employees except those in road service. He also claimed an inequality as to the expenses while away from home on duty, saying that Supplement No. 4 allowed $2.00 a day for meals and lodging to shop employees for expenses when away from home. He put H. J. Arries, a clerk in the Grand Lodge office at Cleveland, on the stand to introduce a series of exhibits of comparative wages, which he had made up from information furnished by the general chairmen in the absence of the information he had requested from the director general. The comparisons between the wages of firemen and shop employees aroused the ire of A. O. Wharton, chairman of the board, who was the head of the shop employees' federation before becoming a member of the board, and led to a controversy between him and Mr. Shea which extended over several days.

Mr. Wharton declared that Mr. Shea had used rates of pay instead of actual earnings, whereas the schedules applying to train service make it possible for the employees to earn much more than the basic rates of pay for a given time; that he had not made proper allowance for the effect of the introduction of the eight-hour basic day, and that he had so misunderstood the conditions applying to the shop employees that his comparisons were exceedingly unfair. He also pointed out that firemen's rates apply to inexperienced men on their first trip, whereas the shopmen's rates quoted apply to skilled employees who had been required to serve an apprenticeship before receiving full rates. Mr. Shea insisted that the fireman was a skilled employee and the fact that he was not required to serve a previous apprenticeship was offset by the fact that he does not receive full time employment at first. Mr. Wharton said that the rates of pay quoted have nothing to do with the earnings and he objected to the idea of using the shopmen's wages as an argument for increasing those of the firemen, saying that the shop crafts had never used the rates for transportation service for comparison.

"As a trade unionist," he said, "I have never dreamed that a man representing a labor union would bring before the tribunal data which shows such an incorrect picture of the conditions and the earnings of the men as you have presented." Mr. Wharton also objected to Mr. Shea's efforts to compare the mileage rates of the trainmen with the piecework rates of the shopmen.

"Do you know of any other class of employees," he asked, "who have established as a condition of pay a system that would permit them to draw a full day's pay and not give in return therefor the number of hours' service constituting a day's work?"

"Yes, if they are on the piecework basis, the same as the enginemen," replied Mr. Shea.

Mr. Wharton said that the piece worker produces for each minute or hour worked the amount of work represented by the price paid. Mr. Shea said that a trainman does also and that the man in the shop by speeding up could earn in five hours as much as his fellow machinist on an hourly basis could earn in eight hours.

"Does the man on the 57-mile run, who is paid for 100 miles, speed up?" asked Mr. Wharton.

"It all depends entirely upon the condition of the road, the tonnage hauled, the condition of the locomotive and the density of the traffic," replied Mr. Shea.

"That does not answer my question," said Mr. Wharton. "One fireman runs 57 miles in four hours and gets paid for 100 miles and another runs 100 miles in eight hours and gets the same. Who is responsible for one train going over a division faster than the other?"

"Well, it would be hard work to say," replied Mr. Shea. "One man would have the advantage over the other."

"I am afraid you do not understand piece work as I understand it and know it," said Mr. Wharton, who added that he would be able to show before the hearing closes that on the average shopmen have not received as much for a day's services as firemen.

Mr. Wharton also produced a statement of a large number of instances where inexperienced firemen had received increases in pay ranging up to 140 per cent. When Mr. Shea protested that this was only by comparison with the former rates of pay of men who had been "oppressed" and whose schedules had not been made by the organization, Mr. Wharton said that was the kind of comparisons Mr. Shea had been using to show that the shopmen had received greater percentages of increases than the firemen. When Mr. Wharton also produced some examples of firemen's earnings which Mr. Shea said were abnormal and did not represent average conditions, Mr. Shea said that he had just got the director general to order a limitation of the mileage which a man could make in accordance with a principle adopted by the brotherhood at a convention several years ago for the purpose of reducing excessive earnings of men resulting from large mileage.

Mr. Shea took the position that the director general's instructions contemplated that each class of employees should be given the same amount of increase in dollars and cents and that if the firemen had received an increase of $1.50 a day while other classes had received a $2 increase the fire-

men were 50 cents behind and the discrepancy should be corrected. And while the question of a general increase for firemen was not supposed to be considered at the hearing he kept arguing for one, saying that he understood the restriction was only for a limited period in order to determine whether or not the campaign of the government for a reduction in the cost of living is to be effective. After a reasonable time if there is no reduction, he said, it must be accepted that the present cost of living is permanent for the time being at least and the wages of railroad employees must be increased accordingly. "So I anticipate that by the first of November at least the board will have to be giving consideration to railroad employees on further requests for general increases."

Claims Board Is Unfair

Mr. Wharton objected repeatedly because Mr. Shea was comparing the hourly basic rates of foremen with the piecework earnings of shop employees, saying that if the comparisons were to be made the earnings should be used, not the rates. Mr. Shea said he never discussed earnings because they often resulted from excessive hours or mileage, but confined his arguments to the minimum basic rates, on the theory that the basis rate for eight hours and 26 days a month ought to produce an adequate earning. He insisted that the board was adopting a manifestly unfair attitude for the purpose of discrediting his presentation.

D. B. Robertson, vice-president of the firemen's brotherhood was put on the witness stand with an exhibit showing the expenses of firemen for meals and lodging while away from their home terminals. This covered 397 men, with an average expense of $34.08 per month, ranging from $15.50 to $55.50. One man reported 90 meals for a month and two beds a day, which aroused considerable discussion as to what kind of a run the man had. Mr. Shea tried to argue that an increase of $40 a month meant little to the firemen if they had to pay out $34 for living away from home, but members of the board remarked that only the increased cost of living away from home should be considered, because the expenses away from home had been considered in fixing the wage rates, and that, moreover, the majority of firemen do not regularly have as much expense as was reported. The demand presented by the brotherhood asks that the railroads provide meals and lodging away from home terminals or make an allowance in the form of an expense account.

Mr. Morse also made the point that the expense away from home is not always an extra expense to the single man. Mr. Shea retorted that that made no difference because a man may be single today but married tomorrow. "He may also be married today and single tomorrow," said Mr. Morse. When Mr. Shea argued that supervisory officials have expense accounts, Mr. Morse said that they work 12 to 14 hours a day without overtime, but Mr. Shea said it was generally difficult to find one at his office before 10 in the morning, or after 4 in the afternoon.

"We are now living in an advanced age," said Mr. Shea, "and labor is coming into its own now. Labor must have something to say regarding the conditions of employment and the salaries they receive and we must have a wage that is sufficient to maintain the American standard of living."

	Increase per month.	Per Cent Increase.
Supplement No. 4	$33.83	36.2
7	27.11	39.9
8	26.94	47.
13	44.93	57.1
14	25.65	35
15	51.14	36
16	49.50	42.1
17	28.07	54.9
18	28.88	60.4

Most of the time of the hearing was taken up with a technical discussion of the effect of various schedule provisions on earning power. Mr. Wharton put into the record a table showing the increase in percentages and in dollars and cents brought about by the general wage order and its various supplements for the various classes affected by the supplements, including the latest increase to the shop employees, as shown in the preceding table..

The exhibit showed the average earning prior to General Order No. 27 as $83.79 and the present average $118.24, per month.

Men to Be Judges of Wages

Mr. Shea said he had read in the press that the management in New York had settled with the dock workers after they had been on strike several days by granting an increase of approximately 10 per cent. "I have been wondering," he said, "if it will be necessary for the Brotherhood of Locomotive Firemen and Enginemen to use this same method, or if we are to infer that the strike is the only way that we can hope to secure fair treatment and increases in wages and better conditions of employment. We have reached a point now in our industrial life where labor must be recognized. They must receive fair wages, fair treatment, and if they do not they are going to resort to other methods, and when they do the responsibility will not be placed on labor."

"I am wondering," asked Mr. Morse, "in connection with that statement, who are going to be the judges as to whether their wages are fair and the conditions are fair, the men themselves or some joint conference?"

"The men themselves, or as a group," replied Mr. Shea, "and when it can be shown that a class of working men in the employ of rich corporations are not receiving a wage sufficient to maintain themselves and their families then they are to be the judges as to what shall be fair rates, nobody else."

W. J. Lauck presented a statistical exhibit comparing the wages of firemen with those of other classes of employees. Chairman Wharton insisted that the present methods of compiling the statistics do not make it possible to make fair comparisons. Other witnesses representing the firemen's brotherhood were also heard on various phases of the demands, including a number of firemen. On October 20 Mr. Shea made a final argument reviewing the testimony that had been presented and the arguments for each of the articles in the demands and on October 23 and 24 Elisha Lee, chairman of a committee representing the regional directors, presented a statement in reply, presenting the position of the management as to each of the articles in the demand, whereupon the hearing was adjourned.

Arrival of the First German Prisoners at Stuttgart.

Meeting of General Committee, Mechanical Section, A. R. A.

The General Committee of the Mechanical Section of the American Railroad Association held a meeting at the Hotel Traymore, Atlantic City, N. J., on October 23 and 24, at which, among other business, the plans for the next convention were laid. A joint conference was held with the executive committee of the Railway Supply Manufacturers' Association and a committee of the Hotel Men's Association of Atlantic City, and it was decided to hold the 1920 and 1921 conventions on Young's Pier. The dates selected for the 1920 convention are June 9-16. The first three days of this period will be devoted to papers on locomotive subjects and the last three to car subjects, consolidated committees reporting on Monday, June 14. An invitation was extended to Section VI, Purchases and Stores, to hold its convention simultaneously with Section III, in order that the members might avail themselves of the opportunity to visit the extensive exhibit.

Several new committees were formed and important changes were made in the personnel of others. The new subjects assigned to committees are as follows: Auxiliary or Safety Connections Between Engines and Tenders, M. H. Haig (A. T. & S. F.), chairman; Feed Water Heaters for Locomotives, F. M. Waring (P. R. R.), chairman; Engine Terminals, Design and Operation, C. E. Fuller (U. P.), chairman; Modernization of Stationary Boiler Plants, A. G. Trumbull (Erie), chairman; Repair Shop Layouts, I. S. Downing (C. C. C. & St. L.), chairman; Scheduling and Routing Systems for Locomotive Repair Shops, H. Gardner (B. & O.), chairman; Standard Method of Packing Journal Boxes on Freight Cars, C. J. Bodemer (L. & N.), chairman.

A new Committee on Couplers and Draft Gears was formed by consolidating the two committees on these subjects, R. L. Kleine (P. R. R.) being the new chairman. Duplication of committees of the Master Car Builders' Association and the American Railway Master Mechanics' Association has been eliminated by consolidating the committees on Specifications and Tests, F. M. Waring (P. R. R.) chairman, and on Standard and Recommended Practices, W. E. Dunham (C. & N. W.), chairman. The Arbitration Committee has been increased to eight members by the addition of J. E. O'Brien (M. P.), and T. H. Goodnow (C. & N. W.) has been appointed chairman.

New chairmen were appointed for other committees as follows: Committee on Loading Rules, R. L. Kleine (P. R. R.); Committee on Mechanical Stokers, M. A. Kinney (H. V.); Committee on Depreciation of Freight Cars, C. E. Chambers (U. S. R. A.); Committee on Prices for Labor and Material, G. E. Carson (N. Y. C.); Committee on Superheater Locomotives, H. R. Warnock (C. M. & Vt. P.). The Committee on Welding Truck Side Frames, Bolsters and Arch Bars was changed to the Committee on Autogenous and Electric Welding, and J. T. Wallis (P. R. R.) was appointed chairman. The Committee on Train Brake and Signal Equipment was enlarged and was assigned the subject of automatic hose connectors. The scope of the committee on Locomotive Headlights was enlarged to include also classification lamps.

The following subjects were assigned for individual papers: The Modernization of Existing Old Locomotives, to include a study of locomotive operation from the point of view of a large investment, G. M. Basford (G. M. Basford Company); Automatic Coal Weighing Devices for Locomotive Tenders, J. S. Spurway (secretary, New South Wales Government Railways and Tramways); Snow Fighting Apparatus, C. E. Fuller (U. P.).

The committee decided that the date effective of the specifications requiring boiler plate steel, flange quality, for tanks of Class III tank cars should be extended to December 31, 119. Arrangements were made to publish the specifications and standards of the former Master Mechanics' and Master Car Builders' Associations in a separate volume, as standards of Section III, Mechanical.

A committee consisting of A. W. Gibbs (P. R. R.), C. B. Young (U. S. R. A.) and V. R. Hawthorne (A. R. A.) was appointed to act as a conference committee with the American Society for Testing Materials. W. E. Dunham (C. & N. W.) was appointed to represent the Mechanical Section on the joint committee of the American Society of Mechanical Engineers to consider standard designs of pipe unions. The proposed amalgamation of the Master Car and Locomotive Painters' Association as the Equipment Painting Division of the Mechanical Section was approved.

The Rules of Interchange were approved with the changes recommended by the Arbitration Committee, the only additional change being the abolition of the differential between the labor rates on steel and wood cars and the increase of the labor rates from 58 cents to 67 cents an hour for freight cars and from 68 cents to 72 cents for passenger cars.

The management of the pier has agreed to enlarge the seating capacity of Convention Hall from 600 to 850.

The executive committee of the Railway Supply Manufacturers' Association, after the meeting at Atlantic City, announced the following committee appointments: Chairman of the exhibit committee, J. G. Platt, Hunt-Spiller Manufacturing Corporation, Boston, Mass.; chairman entertainment committee, W. K. Krepps, Crucible Steel Company of America, New York; chairman enrollment committee, C. H. Gayetty, Quaker City Rubber Company, Philadelphia, Pa.; chairman finance committee, George A. Cooper, Frost Railway Supply Company, Detroit, Mich.; chairman transportation committee, John C. Kuhns, Burden Iron Company, Troy, N. Y. The executive committee also re-elected John D. Conway as secretary-treasurer. In addition to the exhibits on the pier the usual track exhibit will be made on Mississippi avenue.

Hines Urges Early Railroad Legislation

Director General Hines on October 7 sent the following letter to Chairman Cummins of the Senate committee and Chairman Esch of the House committee:

"I know that you are exceedingly anxious to press the railroad legislation to the earliest possible conclusion. It occurs to me that you may naturally find that there are legislators that have not followed the subject as closely as you have and who may not have an equal appreciation of the reasons why the public interest necessitates the earliest possible solution. I, therefore, write this letter to point out that delay in legislation will seriously impair the public service by virtually suspending improvements and the acquisition of equipment and by seriously imperiling the morale of the railroad organization.

"The difficulties I point out could not be obviated by the government remaining in control of the railroads from week to week pending adoption of the legislation, because the suspension of the improvement and equipment program and the impairment of morale could not be remedied by such a course.

"Pending the passage of railroad legislation uncertainty naturally exists. Such uncertainty makes it impossible for the government to plan or carry forward necessary additions and betterments and to acquire essential new equipment. And such uncertainty likewise makes it impossible for the railroad companies to make such preparations.

"In order to keep abreast of the growth of business in this country it is indispensable that the railroads should continue to spend large sums in the acquisition of new equipment, the enlargement and unification of terminals and the construction of additional and the enlargement of existing shops, engine houses, turntables, etc., and in the carrying forward of normal programs for the revision of grades, construction of additional main tracks, longer and more numerous passing tracks, etc.

"In the year or two prior to the beginning of federal control this work was largely arrested by the difficulties of securing materials and labor and also by the difficulty of securing new capital. During the year 1918 this work was largely restricted to things which could be promptly done and which would have a relation to winning the war and also restricted by the scarcity of materials. The result was that comprehensive programs for developing the railroads were largely interrupted. During the calendar year 1919 there has been unavoidably an almost complete stoppage of all these matters because of the prospect of early termination of federal control and the resulting indisposition on the part of Congress to make appropriations large enough to provide for extensive improvement programs to be carried on with government funds under the direction of the Railroad Administration.

"Hence a vast amount of work now remains to be done which the intervention of the war has necessarily delayed and accumulated and the result is that during the year 1920 very large capital expenditures ought to be made to make up for the interruptions inevitably due to the war and to prepare the railroads to serve adequately the increased traffic throughout the country. This is particularly true as to equipment, as it seems to be reasonably certain that in the fall of 1920 there will be need for materially more freight cars than will be available if the corporpations are not able promptly to make plans for the additional equipment which the government has been without provision to acquire.

"In order to make the necessary preparations for additions and betterments, including equipment, it is obvious that considerable time must be allowed for planning the improvements and for raising the money. Even the physical planning for the improvements cannot be successfully made until the legislation shall be determined upon and the improvements cannot be entered upon without knowledge as to how the money can be raised to pay for them, and the raising of the money will, of course, be dependent upon the fact and character of the legislation. Even 30 days' delay in the ability to make plans means a probably much greater delay in carrying the plans into effect, and if legislation should be so delayed as to prevent the definite making of plans until well along in the spring the probability is that the plans could not be carried out at all in time to meet the railroad traffic requirements in the latter part of the summer and fall of 1920.

"What I have said above with regard to capital expenditures of course does not affect the situation as to maintenance work on the railroads. The Federal Control Act and the contracts which the government has made with the majority of the railroad corporations imposes an obligation to return the railroads to their owners in substantially the same condition as they were in when they were taken over, and the Railroad Administration is carrying on its maintenance work on this basis.

"A different and entirely distinct element of great importance is the question of morale of the railroad forces. Undoubtedly uncertainty and suspense cannot improve morale and serious prolongation of uncertainty and suspense would very greatly impair morale. So far I feel both the railroad officials and the railroad employees are withstanding in a splendid way the injurious influences of uncertainty and suspense, but I am sure that it will become more and more difficult for both officials and employees to concentrate upon the present performance of their work rather than dwell upon the future condition of the railroad business and their relation thereto. This is an inevitable manifestation of human nature which is not subject to any criticism. But it is a fact and the sooner legislation can be completed the sooner can a favorable influence take the place of the unfavorable influence which the uncertainty is bound to breed.

"While I believe that you personally are fully alive to the importance of these factors, it has occurred to me that it might be helpful to you to have my views in regard to them."

Per Diem Reinstalled

Early in the present year the Railroad Administration issued instructions that cars be loaded in the direction of home, with a view to getting cars relocated on home lines to a larger extent. The conclusion has been reached that this policy will still further be aided by re-establishing the per diem rules whereby one railroad is required to account for per diem on cars used by it belonging to another railroad.

A general order making this requirement has therefore been issued. This order will not only promote the policy of the Railroad Administration, but accords with the wishes of the officers of the railroad corporations, who are anxious, as far as practicable, to get cars relocated upon home lines prior to the termination of Federal control.

The general order is as follows:

"Effective October 1, 1919, the following rules and regulations shall govern the accounting for the use of equipment of one carrier in federal operation by or for the account of another carrier in federal operation (cancelling instructions in conflict therewith in General Order No. 31).

"The practice of recording, computing and paying per diem, mileage, or rental for the use of freight and passenger train cars of one carrier in federal operation by or for account of another carrier in federal operation, and the adjustment of differences, reclaims, etc., between such carriers shall be reinstated, in accordance with such detailed instructions as may be issued by the Division of Operation, Car Service Section."

Commissioner McChord on Railroad Credit

Commissioner McChord has submitted a memorandum to the sub-committee of the House Committee on Interstate and Foreign Commerce, which has been working on the railroad bill, referring, as he says, to a statement made by Judge R. S. Lovett to the House committee "in effect that he had seen statements from four of the present members of the Interstate Commerce Commission wherein they declared that they did not know of the existence of any problem of railroad credit."

Judge Lovett's statement, as it appears in the printed record of the hearing, was: "I have seen statements, some of them in the newspapers, where three or four members of the commission as now constituted apparently do not realize or appear not to be aware of, the existence of any problem of railroad credit."

"I have no idea to whom or to what statements reference is made," Commissioner McChord says. "If he has reference to statements in decisions of the commission in various advance rate cases wherein at least four commissioners took the position that there was no good reason for decline of railroad credit, it appears that these discussions were with respect to the cause of the decline. Nowhere do I find a

denial of the fact that there had been a decline of credit.

"So far as I can recollect, I have never in public or private statement announced that railroad credit is not a problem that must be considered. I have from time to time expressed my surprise at the continual announcement of high officials in railroad circles that railroad securities were no longer worthy of consideration from a safe investor's standpoint. I have pointed out that the propaganda directed against the value of these securities in the first instance had reacted so as to unnecessarily depress railroad credit. I also pointed out that while this was going on railroad earnings had increased."

"I have also pointed out that while under federal control the income of the railroad companies is based on the operating income they received for the three fiscal years of 1915, 1916 and 1917. They are insured that income no matter what has been or what may be the conditions of traffic. Under the law their properties are to be returned to them in as good physical condition as when they passed to federal control.

"That the net income the railroads now receive is based on the highest average earnings they have ever received in any three-year period. The average yearly return on which payment is now made is approximately $936,000,000."

Commissioner McChord's memorandum also includes tables of statistics to support his contention. He shows that the average income for the three years, 1912, 1913 and 1914, was $761,938,378, while for the three years, 1916, 1917 and 1918, the average was $939,809,635, or about $3,000,000 more than the guaranteed income.

"The income from operation in the calendar year 1918 was $29,874,077, or 3.9 per cent less than the average for the three years, 1912, 1913 and 1914; $21,967,175, or 2.9 per cent less than the average for 1913, 1914 and 1915, while the average income for the calendar years 1916, 1917 and 1918 exceeds that for the fiscal years 1912, 1913 and 1914 by $177,875,257, or 23.4 per cent.

"It is true there has been an increase in capital issues and property investment since 1912. From reports of the railroads to the commission the average percentage of operating income to the average outstanding capital for the three fiscal years 1912, 1913 and 1914 was 3.98 and to property investment 4.59. The average percentage of operating income to the average outstanding capital for the calendar years 1916, 1917 and 1918, was 4.75, and to property investment, 5.08. This shows that the percentage of operating income to capital increased .77 per cent and to property investment .49 per cent.

"From the returns already received, which include only a few of the roads of the country, it appears that the credit balances will be as large on January 1, 1919, as on January 1, 1918. During the year 1918 dividends were paid in substantially the same amount as during the previous year, while the roads were under private management. The guaranteed operating income for 1919 will be approximately the same as received in 1918. Add to this the corporate income for the year, and the credit balance of the railroads as a whole will be substantially the same on January 1, 1920, as on January 1, 1918."

Regarding estimates based upon the earnings of the first six months of this year that the earnings of the carriers will fall short of the government guaranty of variously estimated amounts, Commissioner McChord points out that for the years 1912 to 1918, inclusive, the actual railway operating income for 12 months was considerably in excess of what it would have been based on the first six months. In conclusion, he says:

"I am unable to appreciate how such statements of facts can be tortured by anyone to mean that I have not and do not recognize that railroad credit has nevertheless declined and that there is a problem as to railroad credit.

"I have repeatedly asserted that whatever decline there was in railroad credit, previous to federal control, was not due to any action of the Interstate Commerce Commission.

"My attitude and my assertions were in refutation of the repeated declaration that the railroads of the country were, or are, in a state of bankruptcy. It has been my effort to defend the railroads as against their traducers."

Regional Director Markham Resigns

CHARLES H. MARKHAM, director of the Allegheny region, has resigned from the Railroad Administration to return to the presidency of the Illinois Central. He is succeeded by L. W. Baldwin, operating assistant.

Mr. Markham was president of the Illinois Central when the railroads were taken over by the government in January, 1918. At the request of William G. McAdoo, then director general, Mr. Markham became director of the Southern region, with office at Atlanta, Ga., the country at that time being divided into three regions only, the Eastern, the Southern and the Western. In June, 1918, when the Allegheny region was formed, Mr. Markham was appointed director of this region, with office at Philadelphia, Pa. This region takes in, roughly, the territory south of New York and north of Washington, from the Atlantic seaboard to

C. H. Markham

L. W. Baldwin

Pittsburgh, Wheeling and Erie, the Pennsylvania, the Philadelphia & Reading and the Baltimore & Ohio being the largest roads. In the beginning the Allegheny region included the Pennsylvania and the Baltimore & Ohio only as far west as Pittsburgh and Wheeling, but in December last the operating departments being free from the stress of war conditions, the western lines of both companies were taken out of the Eastern region and added to the Allegheny. This was the most badly congested region in the country when Mr. Markham assumed jurisdiction in June, 1918, and the operating conditions were described at some length in the *Railway Age* of August 23, 1918, page 331. Something more was required than a good operating man for the straightening out of the railroad situation in the Allegheny region at that time. It is probable that Mr. Markham was selected not only for his general railroad knowledge and experience, but for his diplomatic abilities as well.

When Mr. Markham was elected president of the Illinois Central the morale of that company was shaken. The ousting of Stuyvesant Fish a few years before had left an organization somewhat uncertain in its loyalty to the succeeding president, J. T. Harahan, and manipulation of car repair bills by certain officers later tended still further to weaken the organization. Moreover, the Illinois Central

had serious difficulties with some classes of employees and went through a rather severe strike of boilermakers. Under the management preceding Mr. Markham the southern end of the road had been left to itself and the relations between the company and its patrons were not as good as they should have been.

In his handling of this situation, Mr. Markham showed great tact and remarkable patience. The Illinois Central had been, under Stuyvesant Fish, one of the financially strongest roads in the country. Under the Harriman-Harahan management this credit was preserved, but the cash position of the road when Mr. Markham took it needed strengthening. Strikes did considerable damage and there was one year in which the Illinois Central was somewhat hard pressed to pay its dividends. During this trying period no ill-considered move was made in an attempt to temporarily better conditions. Underlying causes were studied and remedies were applied to eliminate the cause of troubles rather than to cover up the symptoms. When Mr. Markham turned over the Illinois Central to the government it was in good shape physically; it had a loyal organization, and its patrons, both on the north and south lines, were entirely friendly.

Under Mr. Markham's directorship, congestion in the Allegheny region was entirely cleared up and even before the signing of the armistice order had been brought out of chaos. Coal, iron and steel and the supplies for the American Expeditionary Forces were moving freely to the seaboard. With the great let-down in traffic which followed the signing of the armistice a new problem arose for both the director of the Allegheny region and the director of the Eastern region. This was the equitable routing of what traffic there was between the different roads within the two regions. The return of competitive conditions was in sight and naturally the corporate officers of the different properties watched with a jealous eye the routing of all important traffic. In this situation Mr. Markham's diplomatic qualities probably stood him in good stead, although under any circumstances it was a rather trying position.

Mr. Markham is succeeded by L. W. Baldwin, who has been his operating assistant. Mr. Baldwin, like Mr. Markham, served in the Southern region before going to Philadelphia. He is best known as an officer of the Illinois Central, for which company he served about 19 years, mostly in the roadway department. Mr. Baldwin was born in Waterbury, Md., in 1875, and was graduated from Lehigh University, South Bethlehem, Pa., in 1896. He entered the service of the Illinois Central in that year, and soon was made assistant engineer. In 1900 he was supervisor of track, and for three years, 1901-1904, was roadmaster. Then for two years he was trainmaster, and in 1906 was superintendent. In 1910 he was appointed engineer of maintenance of way, with office at Chicago. In April, 1913, he was appointed superintendent of the Kentucky Division, and in January, 1915, was promoted to the position of general superintendent of the southern lines of the Illinois Central with headquarters at New Orleans, La. On November 15, 1915, he resigned his position on the Illinois Central and went to the Central of Georgia as general manager, and a year later was elected also vice-president of that road. He was drafted into the service of the Railroad Administration in February, 1918, being made operating assistant to the regional director at Atlanta.

The movement of freight over the Pittsburgh Division of the Pennsylvania Railroad for the first fifteen days of September, counting both eastbound and westbound was 6,991 cars (loaded and empty); which is an increase of 32 per cent over the average in April last. On September 15 the number of freight cars moving westbound past Gallitzin was 4,802, or 35 cars more than the highest previous record which was for April 10, 1916.

American Manufacturers' Export Association

The American Manufacturers' Export Association held its tenth annual convention at the Waldorf-Astoria Hotel, New York, October 16 and 17. The first day of the session was devoted to a consideration of trade with eastern and central Europe, including in particular Russia, the Central Empires, the Near East and the "new states." The second day of the meeting was devoted to more general topics, sessions being held on "Our Diplomatic and Commercial Service Under New World Conditions" and on "Our International Financial and Commercial Policies." The annual banquet, Friday evening, was addressed by representatives of the French, British and Italian governments, by William C. Redfield and others.

A number of important points were brought out at the general sessions, among them in particular being the matter of the low salaries paid consular representatives and the difficulty resulting therefrom in getting and keeping good men. Speakers also referred to the present difficult exchange situation, the matter of credits to cover sales abroad and the steps that were being taken to overcome our present disadvantages.

Those who spoke on our trade relations with Russia, the Near East and the so-called new countries, brought out that these countries should prove large markets for American goods and that the American business man would be well repaid in investigating these countries, in following their reconstruction work, and in carrying out development work which, although it might not pay at the start would be well worth while in the long run.

A number of the speakers referred to the lack of transportation facilities in the several countries and the large amount of equipment needed to bring the railway lines up to proper standard.

Poland

In speaking of Poland, G. Barthel de Weydenthal, acting consul general of Poland, said:

"The Poland of today has a population in excess of 35,000,000 and an area greater than that of Italy. Warsaw, its capital, has a population of upward of 1,000,000, and has rightly been termed the 'Hub of Central Europe.'

"One of the most crying needs of Poland today is adequate transportation facilities. The railroads of Poland, before the war, were in the hands of the several imperial governments, and their development was regulated almost entirely by strategical considerations, absolutely no attention being given to the interests of local population or commercial needs.

"In the United States, where so much importance is attached to railroad building, it is almost inconceivable that the total length of railways in Poland does not amount to more than 12,150 miles, or seven miles on every hundred square miles of territory. Most of the railroad development has been concentrated in former Prussian Poland where, in pursuance of its policy of aggression, the imperial German authorities laid out a railroad net for their own ambitious interests. The total length of railroads in former Prussian Poland is about 4,500 miles or, roughly, 15 miles for every hundred square miles of territory.

"Just the opposite policy of preventing railroad construction was always pursued by the Russian government and a lamentable scarcity of transportation was the result. In this section the total length of railroads does not exceed 5,000 miles, or 4.5 per hundred square miles of territory.

"The Polish railroad administration has already taken steps to remedy the situation: New lines, as a part of a comprehensive system, are now in course of construction, and electrification on a larger scale is under consideration.

. . . The present time is ideal for an extensive railroad, waterway and road construction program. Little doubt exists but that American capitalists could accomplish extraordinary results through a concentration of efforts in this formerly neglected country."

Jugo-Slovakia

"The kingdom of the Serbs, Croats and Slovenes is a new state, combined of the Kingdom of Serbia, Kingdom of Montenegro and the provinces inhabited by the Serbs, Croats and Slovenes, which formerly belonged to Austria-Hungary," said Aco Despitch of the Royal Serbian Trading Agency.

"The area of this new state is about 100,000 square miles, corresponding to the combined area of Pennsylvania, Ohio and Maryland. The population is about 13,000,000, the combined population of Pennsylvania and Ohio. The density of population is about 130 per square mile, as compared with Pennsylvania's density of 200 per square mile. There are 2,000 miles of railways and about 12,000 miles of roads. Both railways and roads need to be thoroughly repaired."

Russia

"Russia," said Dr. Joseph M. Goldstein, professor of political economy of the University of Moscow, "with a population of 160,000,000 has a railway mileage not much in excess of that of Canada with a population of only 8,000,000."

Russia, he said, to raise her economic productivity to the level of even so backward a country as Austria-Hungary was before the war, will have to expend in the next ten years a sum of no less than $56,000,000,000, of which $5,500,000,000 is for new railroads and $3,500,000,000 for equipment. The former amount for new railroads is figured on the basis of the construction of 3,500 to 4,000 miles yearly for ten years, a total of 35,000 to 40,000 miles at $150,000 a mile. The $3,500,000,000 for new equipment includes expenditures for new freight and passenger cars, and repair of old locomotives and cars.

W. L. Saunders, chairman of the board of the Ingersoll-Rand Company, New York, was elected president of the association.

Wheat Transportation Limited by Elevator Capacity

Director General Hines on October 9 authorized the following statement regarding the difficulties being experienced in the handling of wheat:

"My associates and I have been and are giving most earnest consideration to the transportation of wheat, but it is important to have it clearly understood that the present inability to transport the wheat is due to causes which the Railroad Administration cannot control. On May 20 and again on May 29 the Railroad Administration issued notices to the public that in view of an expected large crop of wheat and the necessity of utilizing all available railroad equipment to the fullest possible extent, the wheat crop would have to be handled under the permit system under which wheat would not be accepted for transportation until there were facilities for unloading it at destination. The permit system, which is administered in connection with the Grain Corporation, was put into effect in accordance with public notice on August 1, and since that time permits for the shipment of wheat have been issued only when there were facilities at destination for unloading it.

"The reason the Railroad Administration has not been supplying more cars for wheat is that the elevators are full at the proposed destinations and consequently the wheat could not be unloaded from the cars. It is absolutely necessary to avoid a situation where vast numbers of railroad cars would be filled with grain which could not be disposed of at destination, because this would result in practically taking the cars out of transportation service and using them for storage and depriving the public generally of cars which are badly needed for business of every sort. The Railroad Administration is prepared as an emergency measure to provide ample freight cars to take care of all wheat that can be unloaded out of the cars at destination, giving preference to wheat on the ground. The situation thus becomes one of finding elevator capacity to take care of the wheat at destination. My associates and I are using every endeavor to improve this situation through co-operation with the United States Grain Corporation and that corporation is following up the matter in a most active way. It must be appreciated, however, that there are world-wide limitations upon the extent to which grain can be immediately moved out of the elevators on account of conditions in the foreign markets and conditions of ocean shipping and it will be exceedingly difficult to overcome these limitations. Just as fast as elevator capacity can be provided at destination, the Railroad Administration proposes to give preference to the wheat movement and furnish the cars to move it, but it would make the situation worse and greatly injure transportation generally to tie up cars by loading them with wheat which could not be unloaded at destination."

Roads Earned $16,000,000 in August

The Operating Statistics Section of the Railroad Administration has published figures covering the financial results of operation for the month of August for all Class 1 Roads in federal operation. These comprise 231,964 miles of road, or 97 per cent of the total of 240,177 miles of road federally operated.

The condensed income account is as follows:

	August.		Increase or Decrease.	
	1919.	1918.	Amount.	Per cent.
Operating revenues	$464,550,969	$497,689,570	D.$33,138,601	D.6.7
Operating expenses	353,416,001	354,682,438	D. 1,266,437	D.0.4
Net operating revenue	111,134,968	143,007,132	D.31,872,164	....
Taxes, rents, etc.	20,485,967	16,324,502	4,161,465	....
Net operating income	90,649,001	126,672,630	D.36,023,629	....
Operating ratio	76.1	71.3	4.8	....

Note.—*D.* indicates decrease.

One-twelfth of the annual rental due the companies covered by the report amounts to $74,352,976, so that the net profit to the government was $16,296,025 for these properties. In this connection, however, it should be observed that the August expenses do not include the increases in wages recently granted the shopmen which are retroactive to May 1, 1919. It is estimated that these increases will amount to approximately $4,000,000 per month. Freight and passenger rates are on substantially the same basis in both years. The expenses in August, 1918, include about $19,000,000 back pay applicable to prior months, but they do not on the other hand reflect the increases to agents, telegraphers, trackmen, clerks, enginemen and trainmen, granted subsequent to August, 1918, which are included in the August, 1919, expenses.

The condensed income account for the eight months ended August 31 is as follows:

	8 Months Ended Aug. 31.		Increase or Decrease.	
	1919.	1918.	Amount.	Per ct.
Operating revenues	$3,238,744,231	$3,017,761,965	$220,982,266	7.3
Operating expenses	2,763,103,717	2,457,633,745	305,469,972	12.4
Net operating revenue	475,640,514	560,128,220	D.84,487,706	..
Taxes, rents, etc.	151,326,023	144,976,921	6,349,102	..
Net operating income	324,314,491	415,151,299	D.90,836,808	..
8-12 of annual rental	594,823,808	594,823,808	.....	..
Operating loss	270,509,317	179,672,509	90,836,808	..
Operating ratio	85.3	81.4	3.9	..

The comparison between the eight months' period is substantially affected by the fact that the rate increases, approximately 25 per cent, which were in effect this year, became effective for passenger and freight traffic, respectively, the middle and latter part of June, 1918.

Director General in Charge of Coal Distribution

Coal Stocks Will Last at Least a Month; Locomotives May Be Converted to Burn Oil

In addition to his functions as director general of some 230,000 miles of railroad, Walker D. Hines has taken over a large part of the functions formerly exercised by the United States Fuel Administrator.

Because of the vital interest of the railroads in an adequate supply of fuel, without which they could not serve other consumers, and also because they already had an organization in the field, as well as a directing organization at Washington, whereas that of the Fuel Administration had been practically disintegrated, the Railroad Administration, in anticipation of the coal strike, was given the important function of allocating the available fuel supply, or that which is available for distribution to other consumers after the essential needs of the railroads have been supplied.

The orders and regulations of the Fuel Administration had never been cancelled but had been merely suspended on January 31 last, and although the organization of the Fuel Administration had ceased to function, Dr. Garfield's resignation had not been accepted. Dr. Garfield was called to Washington for consultation on the plans for dealing with the coal strike situation, and it was a simple matter to issue an executive order reinstating his former regulations, after which he issued another order designating Director General Hines and his representatives to carry the orders into effect so far as the distribution and allocation of coal was concerned. The Department of Justice was given charge of enforcing the maximum price regulations.

Coal in Transit Commandeered

Director General Hines on the day before that set for the strike had issued orders to the regional directors authorizing them to commandeer all coal in transit which should be necessary to the establishment of proper reserves, making exemptions in accordance with the old priority list of the Fuel Administration, and on November 1 Mr. Hines announced the organization of a central coal committee at Washington and regional and district coal committees at other points to handle the distribution.

For several weeks prior to the strike the Railroad Administration had been putting forth every effort to transport a maximum of coal, both in order to overcome the shortage in production during the first part of the year and by way of preparation for the strike, and for two weeks before the strike preference was given to the coal traffic in order to get as much coal away from the mines as possible. Open top equipment was devoted to coal loading to the exclusion of other classes of traffic and the movement of such equipment was expedited.

On October 16 Director General Hines held a meeting with the western regional directors in Chicago and conferred by telephone with those in the east on the coal situation, as a result of which instructions were issued to railroads serving coal mines to make preferential efforts to furnish mines with empty coal cars up to the ability of the mines to load daily and to non-coal loading railroads to deliver daily to their nearest coal loading or coal route connections empty coal cars up to the maximum ability of the connections to receive them. Instructions were also issued on the same day to the effect that open-top cars should be immediately withdrawn from non-coal service in numbers sufficient to permit placement at mines and deliveries to coal loading connections as required, also that consignees not unloading coal within 24 hours after cars were placed for unloading so that the cars could be returned to the mines should have no additional cars placed for unloading. The result of these instructions was indicated by a large increase in production during the week ending October 25, estimated at 13,118,000 net tons, the highest week's record this year.

Up to October 30, the day before the strike, the Railroad Administration had permitted coal to go to the designated consignees in order to interfere as little as possible with the normal course of distribution of coal traffic. After it became certain that the strike order would not be recalled, however, and it became necessary to be prepared to insure against all temporary contingencies in order that the transportation service might be protected, Mr. Hines announced that the regional directors had been instructed to accumulate a necessary reserve of coal when it was not already on hand, purchasing it, if possible, and otherwise holding coal in transit. Mr. Hines' instructions were that in holding such coal exceptions should be made as far as possible of coal destined to certain classes of consignees in the order of priority adopted during the war by the Fuel Administration. Coal held in transit was not to be unloaded from storage nor used until actually needed, so that if its use was later found unnecessary, it could be forwarded to destination whenever practicable.

The instructions issued also provided that there should be as little disturbance as possible in the distribution of coal, but that the necessities of the railroads, which have a public duty to perform, should be protected.

During the first six months of this year an abnormally small amount of bituminous coal had been mined and transported because of the lack of demand. The demand began to improve in June and July. Slight car shortages for the movement of bituminous coal began to become evident in June and became more pronounced about July 15. In a statement sent to the Senate under date of August 14, in response to a Senate resolution, Mr. Hines said that he did not anticipate any shortages in transportation which would be in any sense exceptional or abnormal, or which would justify oppressive prices for coal. On September 4 he appeared before a sub-committee of the Interstate Commerce Committee of the Senate investigating the coal problem, and stated that the Railroad Administration would be able to transport the necessary coal and that the Railroad Administration proposed to adopt whatever expedients were necessary to accomplish that purpose. He called attention to the fact that while the highest production that had ever been made in a week was 13,000,000 tons, the highest that had been averaged for any considerable period of weeks was something over 11,000,000 tons.

Speeding Up Coal Production

Up to September not exceeding 10,000,000 tons of bituminous coal had been transported per week. The Railroad Administration early in September instructed that the railroads endeavor to provide transportation for 11,000,000 tons per week.

Reports for the week ended November 1 show that railroad cars were supplied for practically all bituminous coal offered. Bituminous coal mines in the Eastern, Allegheny, Northwestern, Central Western and Southwestern regions during the week mentioned had 100 per cent car supply and in the Pocahontas and Southern regions car placements were 96 per cent of cars ordered.

Restrictions resulting in curtailment of car supply for the loading of stone, sand and gravel which were placed in

effect temporarily to enable the full loading of bituminous coal were removed on October 30, after it was determined that requirements for bituminous mines were fully protected up to November 1.

On October 31 President Wilson, at the advice of Dr. Garfield and members of his cabinet, and in accordance with the plans arranged at previous conferences, signed an executive order revoking the orders of January 31 and February 20, 1919, which had suspended the previous rules, regulations and proclamations relating to the fixing of prices, the production, sale, shipment, distribution, apportionment, storage and use of coal, and restoring to the extent necessary the orders fixing prices of bituminous and lignite coal at the mines, fixing or regulating the commissions of middlemen, and fixing or regulating the gross margins or prices of wholesale and retail dealers in bituminous or lignite coal. The Fuel Administrator was also authorized to restore, change or make such other rules or regulations as in his judgment might be necessary.

On the same day Fuel Administrator Garfield issued a detailed order, and Director General Hines gave instructions through the regional directors to put its provisions into effect immediately.

Railroad Administration in Charge of Distribution

Mr. Garfield's order restored the order of January 14, 1918 and portions of the order of May 25, 1918 setting up preference lists and designated Mr. Hines to carry out the former.

Dr. Garfield explained that it would have required too much time to set up the old machinery of the Fuel Administration, so it had been decided that the Department of Justice would have charge of seeing that the maximum price list is observed and the Railroad Administration, with its staff already in the field, would direct the distribution. For the present, he said, no action would be necessary with reference to anthracite coal, but on November 5 President Wilson issued orders giving Dr. Garfield authority to reinstate the regulations and maximum prices as to anthracite coal if it should become necessary.

Method of Distributing Coal

The following is an outline, as announced by the Railroad Administration on November 1, of the instructions governing the procedure to be followed in the handling of commercial coal diverted in accordance with instructions of the Director General under the authority conferred by the fuel administrator:

1. Bituminous coal, including lignite, taken and held in accordance with the instructions of the director general of October 29 and 31, or thereafter, will be handled by the director general and the regional directors through the agency of a central coal committee at Washington and regional coal committees which will be established jointly by the regional directors and the fuel administration. Such regional coal committee will comprise the following representatives: one appointed by the United States fuel administrator and such others as the regional director may select to handle in matters of purchase, distribution and accounting.

2. The bituminous coal held must be distributed only to those consumers who have no reserve supply and must have coal to meet their emergency needs. The following order of preference shall govern the regional coal committee in such distribution as they may make within their jurisdiction for emergency consumption in the United States and Canada: (a) Railroads. (b) Army and Navy, together with other departments of the federal government. (c) State and county departments and institutions. (d) Public utilities. (e) Retail dealers. (f) Manufacturing plants on War Industries Board's preference list. (g) Manufacturing plants not on War Industries Board's preference list. (h) Jobbers. (i) Lake. (j) Tidewater.

3. When commercial coal is diverted to other than original consignee, promptly notify shipper and original consignee of each car and keep adequate record for later settlement.

4. Originating coal roads should hold a considerable portion of the commercial coal near coal waybilling points, available for prompt distribution.

5. Intermediate and terminal carriers should, as far as practicable, move commercial coal to, and hold it in the vicinity of, points most convenient for prompt rehandling and distribution.

6. Coal must not be delivered to commercial consumers either in accordance with the priority list (established in Rule 2) or otherwise, except with specific authority from the coal committee having jurisdiction.

7. Regional directors will immediately notify each railroad under federal control of the regional coal committee with which it shall deal.

8. Each railroad shall report at once to the central coal committee and to the regional coal committee the name, title, location and telephone address of the representative in whom this whole matter will be centered for that railroad.

9. In order that the central coal committee may be informed of the requirements for coal in each region and of the necessity for transferring coal from one region to another, each regional coal committee will make such daily reports to the central coal committee as are provided for herein and may be called for from time to time.

10. Each railroad (or each grand division of a railroad) shall report daily by wire to the regional coal committee, to be received not later than 9:00 a. m., information as to its coal situation for the 24 hours ending at 1:00 a. m., that day.

11. Each regional coal committee will report daily by wire to the central coal committee, as promptly as information is available, a summary of the coal situation for the 24 hours ending at 1:00 a. m., that day.

12. Applications to regional coal committees for delivery of coal to commercial consumers must be made through the railroad which will make delivery of the coal; such applications must show complete and accurate information with respect to the preferred nature of the requirements, the amount of coal which the applicant has on hand, and the amount which the applicant requires for the preferred use, together with the rate of consumption and the kind and size of the coal desired, all as set forth in Form C attached hereto.

13. Each regional coal committee will apply a consecutive number to all orders authorizing the delivery of coal, and compliance with such orders must be reported promptly by the railroad to the regional coal committee.

14. Coal diverted for commercial uses shall be paid for in accordance with the fuel administrator's order dated January 14, 1918. In order to insure payments coal shall be diverted for commercial use to such applicants only who shall satisfy the federal or general manager of their financial responsibility or who shall deposit a certified check or other satisfactory security in such sum as will insure full payment for any coal furnished. The applicant shall make definite written obligation to pay the shipper for the coal promptly upon presentation of bill. The legal transportation charges, including war taxes, from mines to point of delivery to the applicant, will be collected on delivery in the usual way.

It was announced that where other priorities had been taken care of and the requirements of the railroads had been provided for, ships would be given bunker coal sufficient to take them to the first fuel station en route to destination. The Shipping Board on November 3 issued an order cutting off the export of coal and on November 6 the Central Coal Committee ordered that the supply of coal to foreign-owned ships in American ports be stopped immediately.

Passenger Train Service Curtailed.

The regional directors were given authority to curtail passenger train service if necessary, and a few trains were taken off, although partly in accordance with seasonal reductions in schedules. Some complaints were received because of the taking off of trains and some because trains were not taken off. The fuel administrator of Iowa sent a telegram saying that he did not believe "there is any law in peace times that will deprive the citizens of Iowa of heat, water, health and happiness in order that the Railroad Administration may be allowed to run luxurious California trains over the state and continent."

Mr. Hines on November 6 authorized the following:

"The machinery set up by the Railroad Administration to distribute the coal held in transit by the railroads in accordance with the directions of the Fuel Administrator is in full operation, and, as a result, wherever possible coal is being distributed in accordance with the priority list established by the Fuel Administrator where such coal is absolutely needed. Therefore, where there is real need for coal, the problem should be taken up immediately with the railroad ordinarily supplying the coal and every effort will be made by such railroad to meet the demand. It is, of course, essential both because of the present bituminous coal strike and in order that the needs for the coming winter may be looked after, that fuel be used as economically as possible. It should also be remembered that the railroads did not interfere with the delivery of coal to designated consignees until the day before the present strike began. In order to conserve coal as much as possible, regional directors of railroads have been given authority wherever it seems absolutely necessary to eliminate for the time being train service, but in order to provide for the essential business needs of the country, no general curtailment of train service is contemplated. The maintenance of the public transportation service is of paramount importance in order to serve the countless needs of the general public, and the interruption of that service should be minimized as far as possible."

Although the Railroad Administration has not made public figures showing the amount of its coal stocks on hand, it is understood that the supply is sufficient to last for at least a month.

Locomotives May Be Converted to Oil Burners

If the strike of the coal miners should be sufficiently protracted to reduce seriously the available supply of fuel, a large number of locomotives could be converted to burn oil instead of coal on fairly short notice, according to information gathered by the mechanical department of the Railroad Administration. Without expecting that such a contingency should arise, an investigation has been made of the possibilities which shows that a locomotive could be converted to an oil burner in about 10 days in any of the principal shops of the railroads or the locomotive companies, and that about 250 could be converted per week. It would also be possible to obtain the use of about 1,200 acid tank cars which were used by the ordnance department of the Army, of 7,000 gallons capacity, which could be readily converted for use in transporting an oil supply. It is understood that a considerable number of industries have been making investigations of the possibility of changing from coal to oil if necessary.

The central coal committee consists of: H. B. Spencer, director of the Division of Purchases, chairman; Brice Clagett, assistant to the director general; S. Porcher, assistant director of the Division of Purchases; B. P. Philippe, fuel distributor; E. J. Roth, manager stores section; F. C. Wright, assistant director, Division of Operation; A. G. Gutheim, assistant manager, car service section; F. M. Whittaker, manager inland fuel traffic; S. H. E. Freund, assistant general counsel, and H. Y. Saint, representing the Fuel Administration.

The list of regional coal committees is given herewith:

Southwest Region, St. Louis, Mo.—P. H. Greenlaw, chairman; C. A. How, Z. W. Brice, J. G. Livengood.

Southern Region, Atlanta, Ga.—A. M. Smith, chairman; J. J. King, Horace Epes, F. H. Fechtig, S. L. Yerkes, G. W. Lamb.

Northwest Region, Chicago, Ill.—T. W. Proctor, chairman; Geo. W. Reed.

Central Western Region, Chicago, Ill.—B. J. Rowe, chairman; P. Hunter, F. C. Honnold.

Eastern Region, New York City.—G. N. Snider, chairman; A. K. Morris, R. D. Starbuck, A. E. Russell, E. B. Wight, H. L. Ingersoll, J. W. Searles.

Allegheny Region, Philadelphia, Pa.—J. B. Fisher, chairman; E. H. Bankard, W. S. Yeatts, J. W. Laurel, C. C. Foedisch.

Pocahontas Region, Roanoke, Va.—D. E. Spangler, chairman; E. J. Howe, F. L. Poindexter, E. T. Burnett, J. W. Coxe, T. D. Hobart.

At the conference on November 14, after considerable preliminary sparring, an agreement was reached to proceed with negotiations on a wage scale for the central competitive field, to be followed by negotiations to cover the other fields.

Director General Hines announced that the strike order having been rescinded, the Railroad Administration had completed plans for releasing coal held under authority of the Fuel Administrator just as rapidly as additional coal is produced. There was some shortage of coal in the Southwest, and these needs would be cared for at once, coal now being in movement to that region.

The object of diverting the coal in the possession of the railroads, he said, was to continue the operation of the railroads which were first on the Fuel Administrator's priority list and at the same time to supply needed coal to other domestic consumers. The need for coal by consumers other than the railroads began to be felt on November 6, although before that time some coal had been released on a showing that it was needed. In the period from November 6 to November 9, inclusive, a total of 2,655,300 tons of bituminous coal, or an average of 663,575 tons per day, was released by the railroads to consumers other than railroads, while during the same period a total of 1,442,100 tons of bituminous coal was loaded, or an average of 360,525 tons per day, the coal released to domestic consumers other than railroads in that period being an excess of 1,213,200 tons, or an average excess of 303,050 tons per day above the amount of bituminous coal loaded in the same period.

It was estimated that the reserve stocks held by the railroads and under the supervision of the central coal committee when the strike was called off amounted to slightly less than 15,000,000 tons, or about a 30-day supply.

The production of bituminous coal in the week of November 8, during which the strike was in progress, was estimated at 3,477,000 tons, or approximately 29 per cent of the average for the four weeks ending October 25, in which production was at the highest rate attained this year, according to the Geological Survey report. As indicated in the reports from the mines for the week of November 1, this production was outside of the central competitive district, which includes Illinois, Indiana, Ohio, and Western Pennsylvania. The union fields were almost completely shut down, the open-shop districts but partially, and the non-union fields little, if any, affected. Thus production was maintained in the general territory extending from parts of Western and Central Pennsylvania, south to Alabama, in Western Kentucky, Utah, Colorado, and New Mexico. The only fields normally supplying the upper and central Mississippi Valley markets at work were those in southern West Virginia and Kentucky.

Production in the week of November 8 was, of course, the lowest recorded in recent years, for no strike has ever before affected all union mines at the same time as has this one.

The daily average output in the week, of 580,000 tons, was 54 per cent greater than on Saturday, November 1, the first day of the strike.

The strike became effective at midnight, October 1, and the reports for the week ended November 1 thus include five days of work and one day of strike in those fields which have been affected. For the week as a whole and in the last five days of October in particular the bituminous mines enjoyed the best car supply of which there is definite record in a period of active demand and full labor supply. The average loss of time on account of car shortage for all mines reporting was but 3.4 per cent, and in most fields car shortage was so small as to be negligible. The performance of the railroads in that week is noteworthy when it is understood that under the item of car shortage is included all transportation disability that curtails the output of coal; such items as derailment, congestion of loads on tracks, etc., which to a limited extent will always prevent the prompt service of cars to mines, no matter how many empty cars may be available nearby the mines.

Strike of Bituminous Miners Called off

Government Uses Full Powers to Prevent Shortage of Fuel and Stoppage of Transportation

THE STRIKE OF MINERS AND MINE WORKERS in the bituminous coal fields, called by the United Mine Workers of America, encountered the full force of the law when Judge A. B. Anderson, of the United States district court at Indianapolis, on November 8, issued a mandatory injunction enjoining the union leaders from permitting the strike order to remain in effect and commanding them to issue a withdrawal and cancellation of the strike order by 6:00 p. m., November 11.

Declaring that the government and laws of the United States are supreme, even above the dictates of the leaders of organized labor, the court pronounced the strike call a conspiracy to limit the production and transportation of coal and other necessaries of life, prohibited by the food and fuel control act, and held that the law is still in force and that the provisions of the Clayton act, designed to protect the right of labor to organize, does not apply as against the more recent law.

Most of the unionized miners and mine workers in the bituminous coal fields, or approximately 425,000, responded to the strike call on November 1, and during the first week bituminous production was principally confined to the non-union mines, although many defections from the ranks of the strikers were reported. Every effort had been made by the President and members of his cabinet to avert a strike by peaceful settlement, but when the union leaders refused to consider any proposal that involved a calling off or postponement of the strike the federal authorities prepared to exercise all the powers of the government to make it ineffective by attacking it as a conspiracy in violation of the food and fuel control act.

On November 1, on petition of the federal authorities, the court issued a temporary order restraining the union leaders from taking any part in directing the strike and from disbursing any of the $15,000,000 fund reserved for strike benefits. It was hoped that in depriving the strikers both of leadership and of strike benefits much of the impetus of the strike would soon be expended and federal troops were dispatched to the mine fields to give protection to all who were willing to work, but during the first week, pending the hearing on the injunction, little effort was made by the operators to open the mines.

Both the President and the attorney general had pronounced the strike unlawful and unjustifiable both as an abrogation of a wage contract extending until the termination of the war and as a conspiracy in violation of the Lever act, and without attempting in any way to pass upon the merits of the demands for a 60 per cent increase in wages, a 6-hour day and a 5-day week, insisted that the issues be settled by negotiation or arbitration without imposing disaster upon the country.

The President reinstated the orders of the Fuel Administration fixing the price of coal and governing its allocation which were suspended earlier in the year, and Fuel Administrator Garfield issued an order designating Director General Hines and the Railroad Administration as his representatives to carry the orders into effect so far as the distribution and allocation of coal is concerned, while the Department of Justice was given charge of enforcing the maximum price regulations.

The demand of the United Mine Workers was adopted by the delegates at a convention held in Cleveland on September 23 at which it was decided that all contracts in the bituminous field should be regarded as having automatically expired on November 1, and the executive officers were authorized to call a strike of all bituminous miners and mine workers throughout the country if a satisfactory wage agreement should not have been secured by that time for the central competitive field. The demands were presented to the operators at meetings at Buffalo and Philadelphia at which the operators declined to negotiate a new contract on the ground that the agreement as to wages which was made with the sanction of the United States Fuel Administration was to run during the continuance of the war, but not beyond April 1, 1920, and that some of the wage contracts had dates not dependent upon the war.

The strike order was then issued on October 15, and Secretary of Labor Wilson, acting by direction of the President's cabinet, immediately called into conference at Washington the heads of the union and the operators' association. Subsequently the full scale committees of each side were called in and various proposals were offered and rejected by the union leaders, who declined to withdraw the strike order except after full compliance with their demands. The final proposal was made by President Wilson, who insisted that after negotiations without reservation all questions still in dispute should be submitted to arbitration and that the operation of the mines be continued pending a final settlement. The operators offered to accept this suggestion in its entirety, while the union leaders proposed to accept the offer of negotiation, but held the other two proposals "for consideration later." This action abruptly terminated the conference.

After a special meeting of the cabinet held on October 25, at which Director General Hines was also present, and at which the government's attitude toward the threatened strike and plans for action were discussed, President Wilson issued a statement for the purpose of making the issue clear to the

ountry and to give the miners' leaders an opportunity to ecall the strike order.

The President's statement pointed out that it was pro-osed to abrogate an agreement as to wages made with the anction of the Fuel Administration, and that the strike was roposed at a time when the government was making a most arnest effort to reduce the cost of living and had appealed vith success to other classes of workers to postpone similar isputes until a reasonable opportunity had been afforded or dealing with the cost of living. He also said that the var itself was still a fact, the world was still in suspense s to negotiations for peace, our troops were still being ransported and their means of transport was in urgent need f fuel.

Members of the international executive board of the Jnited Mine Workers, the scale committee of the central ompetitive district and the district presidents held a meet-ng at Indianapolis on October 29, at which consideration vas given to the President's statement and a statement was iven out saying that "a canvass of the entire situation shows nat a strike of bituminous miners cannot be avoided."

Word of this action was received at a conference attended y Joseph P. Tumulty, secretary to the President; W. B. Vilson, secretary of Labor; Walker D. Hines, director gen-ral of railroads; Dr. H. A. Garfield, former fuel adminis-rator, and Attorney General A. Mitchell Palmer. The at-orney general then issued a statement designed to show that ne government was not attacking labor in general, nor the ight of labor to strike, but to differentiate the coal strike rom other strikes, both because it represented an abrogation f a contract and because it was a conspiracy in violation f the food and fuel act. These facts, he said, put the trike outside the pale of the law and made it necessary for ne government to use all its resources for the protection of ne public interest.

Strike Leaders Enjoined

On October 31, Judge A. B. Anderson, of the United tates district court at Indianapolis, issued a temporary in-unction restraining the officials of the United Mine Workers rom all activity in the direction of the strike or from issuing trike benefits. The injunction was issued on a petition filed n behalf of the United States government by C. B. Ames, ssistant attorney general in charge of the enforcement of ne food and fuel control act, as an emergency measure. he hearing of the case was set for November 8, when the ederal authorities were to ask that the strike order be re-alled. In presenting the petition Mr. Ames explained that ne case did not involve the general right to strike, but that involved the right of the government to enforce its laws nd to protect the public interest. The petition asserted that ne strike, if effective, would stop the operation of the rail-oads and make it impossible for the Railroad Administra-on to earn the guaranteed return for the use of the railroad roperties by the government so that the federal government ould have to supply the deficit in income out of the public nds, and that suspension of railroad operations would ean also the stopping of the mails and the transportation the armed forces of the United States and a cessation of terstate commerce. It was also stated that the Railroad dministration has more than 1,200 contracts for coal, 60 er cent of which are based upon the extension of the Wash-gton wage agreement to March 1, 1920.

Before the injunction was served, Acting President Lewis, the United Mine Workers, had sent out telegrams with structions to carry the strike order into effect.

The application for the injunction apparently came as a rprise to the labor leaders and at once aroused bitter pro-sts among them. President Gompers and other officials of e American Federation of Labor immediately called on At-torney General Palmer to voice their objections. Officers of several of the principal railroad labor organizations, including Warren S. Stone, L. E. Sheppard, P. J. McNamara, B. M. Jewell and J. J. Forrester, also called on him about the same time, but the attorney general said later they had merely offered their services toward bringing about a settlement of the coal strike and did not join in the protest against the injunction proceedings, although they had told him the government "was taking a grave step." Nor did they join in a statement issued later by Mr. Gompers and the A. F. of L. officials declaring that the injunction "can only result in creating new and more disturbing issues, which may not be confined solely to the miners."

Miners' Argument

The argument of the union for a five-day week and a six-hour day is that there is not enough work to keep the miners busy, that during 1919 they have not had work more than about 50 per cent of the time, and that the present number of miners working on the basis proposed in their demands distributed evenly throughout the year could produce enough coal to meet the requirements of the country. They also ridiculed the claim of the operators that the contract had not yet been legally terminated and made much of the point that the orders fixing the prices of coal had been suspended several months ago. Before proceeding against the miners, however, the government reinstated its price-fixing orders, and Attorney General Palmer made it plain that the government intended to deal just as firmly with any attempt to take advantage of the opportunity to profiteer as against the striker.

The miners' union argument was advanced in a statement by Samuel Gompers, in which he attempted to show that the demands are by no means radical. He said the miners were not permitted to work more than 160 to 180 days a year because the operators wish to restrict the output in order to keep prices up. The executive committee of the coal operators of the central competitive field issued a statement denying that the miners have averaged only 160 to 180 working days and that they are not permitted to work full time. It was stated that the operators have no control over the demand for coal and that it is not possible to distribute the work evenly and, moreover, that virtually every bituminous mine in the country has on its payroll a substantial number of men who deliberately lay off from one to three days a week when they have an opportunity to work.

In a statement issued by Mr. Gompers on November 5, he declared that the injunction was "not only wrong, but a gross blunder," because it practically took away the "constructive influence of the officers of the organization and indeed bars them from attempting to end the strike." He said that if the injunction were vacated and the Department of Labor would invite the operators and the representatives of the United Mine Workers to a further conference, he had "an abiding faith" that a mutually honorable adjustment could be negotiated and effected whereby the coal strike could be brought to an end. Acting President Lewis also said that an immediate resumption of negotiations could follow dismissal of the injunction suit, but he would not say that the strike would be called off pending the negotiations. Assistant Attorney General Ames, however, announced that the strike itself was a violation of the law and that as long as it continued there could be no thought of dismissal of the injunction proceedings.

On November 6, counsel for the United Mine Workers filed a motion with the court to dissolve the temporary injunction on the ground that the petition did not disclose any interest of the government in the case. It was also argued that the government was "without clean hands" in filing its petition in that it had recognized the efforts at "collective

bargaining" in the negotiations between the union and the operators by calling the parties to Washington for conferences with the Secretary of Labor. Apparently the theory was that as the government had recognized the phase of collective bargaining involved in the negotiations it should also recognize the strike as a proper phase of collective bargaining. It was further argued that it is not unlawful to strike and that the President had no constitutional power to restore the orders of the Fuel Administration after the exigencies of the war had passed.

When the hearing on the question of making the injunction permanent was called on November 8, at Indianapolis, attorneys for the union moved for a postponement to allow time for a settlement. This was opposed by Assistant Attorney General Ames on the ground that the questions involved are too important to admit of delay. Arguments were then had on the question of a dissolution of the injunction and the petition for an order that the strike call be cancelled. Mr. Ames offered affidavits from officers of the Railroad Administration to show the requirements of the railroads for coal and that the government's deficit in the operation of the railroads would be increased by a forced curtailment of railroad service. These were to show the interest of the government in the case. An affidavit detailing the alleged violation of the wage contracts was also presented and the reinstatement of the Fuel Administration orders was established. The argument of the defense was based largely on claims of the right to strike and that the contracts had been terminated by the practical cessation of hostilities.

"Do you mean to tell me that any group of men have the right to conspire to stop the railroads?" Judge Anderson asked of Henry Warrum, counsel for the union.

"I do claim the right of the men to exercise the primary right to stop work," Mr. Warrum replied.

"I hold that the Lever act is valid right now," said Judge Anderson, "and that the act of men who conspire to reduce production and transportation of coal is unlawful. I am going to hold that it would result in irreparable loss—why, it would result in the loss of millions to the government alone. The Lever act is plainly constitutional, plainly in force. I think that the government is right and that the Clayton act does not apply at all. I think that this restraining order should be made a mandatory injunction and that the strike order should be withdrawn."

Strike Called Off

The strike was called off on November 11 when the officers of the United Mine Workers sent out a notice cancelling the strike order in accordance with the mandatory order issued by Judge Anderson, of the United States district court at Indianapolis, on November 11. The decision to obey the court order was announced after a long conference of the union officials by John L. Lewis, acting president of the United Mine Workers, who said: "We are Americans. We cannot fight our government. We comply with the order of the court, but under protest."

The federal authorities had let it be known that they would endeavor to prepare the way for the opening of negotiations between the miners and the operators as soon as the strike order was recalled, and Secretary Wilson, of the Department of Labor, immediately called representatives of the unions and of the operators to a conference at Washington for that purpose on November 14, but comparatively few of the miners returned to work.

Exports of Iron and Steel in August, 1919, aggregated $75,831,942, compared with $95,780,230 in the same month of August, 1918. For the year ending August, 1919, the total exports amounted to $689,661,816, against the total of $704,675,554 for the twelve months ending August, 1918.

Glenn E. Plumb on Speaking Tour

Glenn E. Plumb, counsel for the railroad labor organizations, is spending the month of November on an extended speaking tour in the interest of the Plumb plan. During October he spoke at a large number of meetings in the East, including New England, and during the latter part of the month he transferred his attentions to the Northwest, speaking in Grand Forks, N. D., and Duluth St. Cloud, Minneapolis and St. Paul, Minn. Some of the principal points on his schedule for November were Sioux Falls, Aberdeen, Sioux City, Omaha, St. Joseph, Topeka Kansas City, St. Louis, Chicago, Memphis, Madison, Wis. Grand Rapids, Mich, and Des Moines, Ia. He also covered a large number of smaller towns.

In addition, the Plumb Plan League has a number of other speakers who are kept busy, including ex-Congressman C. C. Dill, who is also on a western trip; W. E. Kennedy M. L. Clausen and Frederic C. Howe, and during the winter it expects to have a large staff of lecturers in addition to a volunteer army of "four-minute" speakers.

The following extracts from Mr. Plumb's speech as sent out to newspapers by his press bureau will give a sample of the kind of doctrine that is being used to settle the "spirit of unrest" among the railroad employees:

"As a condition of resuming private ownership, the owners of the railways demand a right which we have never heretofore accorded them, a right which they seek to have embodied in the written law, permitting them to charge the public such rates for service as will insure them a minimum return of 6 per cent upon the assumed value of their properties—this assumed value to be found in the book report of their 'property investment account.'

"In order that you may understand what this means, I must define the 'property investment account' of these railroads.

"Theoretically the right of the railroad to charge for its service depends on the amount of the money invested; that is, the extent of the liabilities which it has incurred to its stockholders and bondholders for money furnished, and its liabilities for materials purchased. Theoretically its asset that is, the right to charge the people for service, exactly balances its liabilities, and things which are equal to the same thing are equal to each other; therefore, its liabilities constitute its assets. And the greater its liabilities the greater its assets.

"In fact, a railroad corporation has no asset except its liabilities. This makes it necessary for the men owning the railroad and conducting its operations, in self-interest, to make the liabilities as large as possible. The result is that the railroad experience of the past 80 years shows that no railroad ever paid off an indebtedness except by creating a new indebtedness of the same or greater par value. We have now in the liabilities of our railroad companies the indebtedness incurred generations ago.

"Therefore the money expended for rails, ties, and equipment in the days of our grandfathers, and long since passed out of existence, still demands its return in the present rates.

"Today we are still paying for the use of locomotives long since sent to the scrap heap. We are paying returns on the shades of ties that have been ashes for generations. Rails that have been replaced half a dozen times still demand from us the earnings paid by our ancestors. The 'property investment account' of these railways is nothing but a whitened sepulcher, full of corruption and dead men's bones. Within that charnel-house we find billions of shadow dollars representing shadow certificates of stock that never meant anything in service to the public.

"This coffin of the past they drag into Congress, and now demand of the people that it be brought to life and made a

living thing by a guaranty of 6 per cent on the total sum of its dust and corruption, in order that the 'faith and credit'—God save the mark!—of this empty grave may be re-established amongst living men of this generation, and fastened as a perpetual burden upon our children and our children's children to the end of time.

"Who shall deliver us from the body of this death?

"It is out of this chaos of corruption that labor's plan has been evolved."

Engineers' Board Proposes Industrial Commission

On November 2 the advisory board of the Brotherhood of Locomotive Engineers issued a statement at Washington deploring the "attempt at government by injunction," and declaring that the principle of "collective bargaining" is of vital importance to the members of the organization. It also suggested that steps be taken to assemble an industrial commission that is "not pledged to oppose collective bargaining."

The statement follows:

"In view of the conditions facing our country at this time, which in our judgment is far more serious than during the late war, inasmuch as it affects all classes of the people, and in consideration of the situation, the advisory board of the Brotherhood of Locomotive Engineers, assembled at Washington and formulated the following declaration of principles:

"The advisory board of locomotive engineers, the undoubted Americanism of whose membership should assure them of recognition, not only by the government, but every factor contributing to the welfare of all the people, believe that:

"The industrial conditions now confronting the nation, with capital and labor occupying a militant attitude toward each other, while the whole country is suffering from high cost of living caused by hoarding and profiteering, resulting in general discontent which tends to lower production, has brought about the most serious crisis in the history of our country.

"We believe that there is no industrial dispute or misunderstanding that cannot be adjusted upon a basis of justice and right, and we further believe that in seeking justice, justice should be practiced by all concerned.

"We believe in the laws and institutions of our country which guarantee that all the people shall have equal opportunity and a fair and impartial hearing before being condemned. We deplore the action of the federal government in its present attempt at government by injunction, believing such action will only tend to make conditions worse and defer if not defeat a peaceful settlement.

"The advisory board have full assurance that we express unanimous sentiment of the 85,000 members of our organization that the principle of collective bargaining is of vital importance to them and cannot be construed as harmful to any interest which desires to be just and fair.

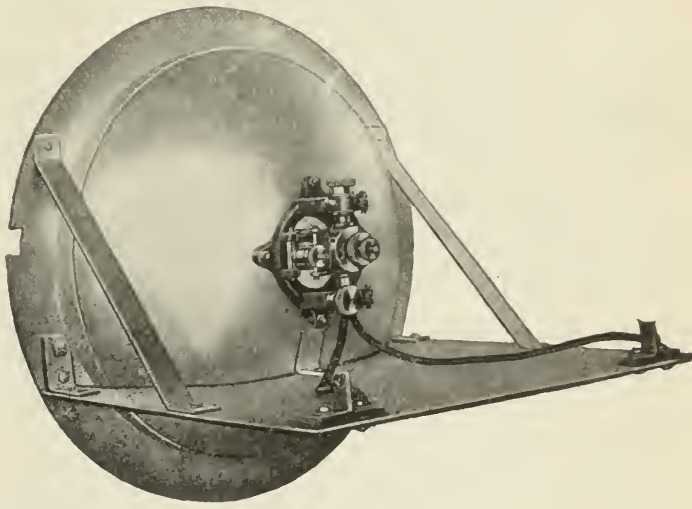
"As a remedy for the present turbulent conditions we suggest that immediate steps be taken to assemble at Washington an industrial commission that will recognize the rights of all citizens and is not pledged to oppose collective bargaining, as this is a time for deliberate action on the part of all concerned in a peaceful solution of the present conditions.

"We pledge the support of our organization to the government in every just and reasonable effort toward stabilizing industrial conditions, to the end that normal conditions be restored.

"We believe that if such a policy is adopted, reason and justice will take the place of passion, and the autocratic and militant attitude now being displayed, a successful and permanent adjustment of the relations between capital and labor, which vitally concerns all the people, could be hoped for."

Demountable Mirror Unit for Locomotive Headlight

The Electric Service Supplies Company, Philadelphia, Pa., has introduced a demountable mirror unit for locomotive headlights, which is designed primarily for the purpose of replacing 18-in. by 9-in. metal reflectors with a reflector which will not corrode in service. These mirror units are supplied for practically all of the standard 18-in. cases now in general use, and are so constructed as to slide into the cases without fitting or other alterations. They consist of a heavy sheet steel shield and



Rear View of Demountable Mirror Unit, Showing Mirror Protective Shield and Micrometer Screw Focusing Device

flange fitted into a horizontal steel base at a midway point and secured thereto with steel braces. The shield is lined with felt at its extreme edges where the reflector rests, for the purpose of protecting the reflector. A clamping ring, secured by screws which bear against a ground surface on the outer periphery, holds the reflector in place.

These units are supplied with universal focusing devices which are mounted on the back of the sheet steel shield. Leads from the lamp sockets are supplied which connect to the brass contacts mounted on the back of the shield base.

Standard Cars Being Placed in Service

Director General Hines announced on November 6 that only 168 of the freight cars ordered by the Railroad Administration and already built remained to be lettered and numbered and placed in service, and that this remaining supply would be lettered and numbered and placed in service immediately. During the week ended November 1, 1919, the cars already built and in storage were lettered and numbered and placed in service at the rate of 62 a day, and new cars were constructed and placed in service at the rate of 187 a day. Of the original order of 100,000 freight cars there remained to be built 17,881.

General News Department

The Vicksburg, Shreveport & Pacific has been transferred from the southwestern region to the southern.

R. C. Richards, claim agent of the Chicago & Northwestern, has been elected president of the National Safety Council.

The American Association of Railway Surgeons held its sixteenth annual meeting at the Hotel Sherman, Chicago, on October 22, 23 and 24.

The new passenger terminal of the Canadian National Railways at Vancouver, B. C., was opened for business on Saturday, November 1.

At Clearing, near Chicago, the operation of the hump yard, which was discontinued several months ago, because of lack of traffic, was resumed on October 27.

The bill making an additional appropriation for the construction of the Alaska Railroad, $17,000,000, has passed both Houses of Congress and has become a law without the President's signature.

William Barr, consulting chemist of the Union Pacific will present a paper on "The Treatment of Water for Locomotive Boilers" before the next meeting of the Western Railway Club which will be held at the Hotel Sherman, Chicago, on November 17.

The Western Society of Engineers, Chicago, completed successfully a seven-day drive for 2,000 additional members on Friday, October 17, increasing the membership of the society to 3,200. Among the enlarged activities which will be undertaken is the establishment of a railroad section.

The National Safety Council is to organize an Engineering Section, a special committee having been appointed for that purpose. It will be composed of members of the Council (or their employees) who are also members of the national engineering societies; or who have had ten years' experience in engineering work and five years' experience in responsible charge of such work.

The airplane mail from Cleveland, Ohio, to New York city, was carried through on Thursday, September 25, in three hours, twelve minutes, including a stop of 13 minutes at Bellefonte, Pa. The distance through is calculated at 430 miles, making the rate of speed 134 miles an hour, or, excluding the stop, more than 140 miles an hour. The mail carried on this trip weighed 355 pounds.

The Interstate Commerce Commission has announced a hearing for oral argument on the valuation proceedings in the Texas Midland, Winston-Salem Southbound & Elgin, Joliet & Eastern costs at Washington on January 7, and has granted leave to the parties to file briefs upon the final value which the commission should find, the elements to be considered and the weight to be attached thereto.

Normal time was resumed throughout the United States on Sunday, October 26, by the setting back of clocks one hour at 2 a. m. The railways of Canada, which also have used summer time—without special statutory authority—made the change at the same hour. The cities of Cleveland, Ohio, and Cincinnati, Ohio, left their clocks unchanged and now are regulating their activities by Eastern instead of Central standard.

Henry J. Aukerman, general secretary of the railroad Young Men's Christian Association, at Altoona, Pa. (Pennsylvania Railroad), has retired from that position after a service of 37 years, and will henceforth be known as secretary emeritus. Mr. Aukerman is succeeded by R. D Emerick, who for the last seven years has been general supervising secretary of railroad associations on the Buffalo, Rochester & Pittsburgh.

Railroad enginemen and firemen to the number of more than 100 were called before Health Commissioner John Dill Robertson of Chicago, on October 16, and accused of permitting locomotives to violate the smoke abatement ordinance of that city. Representatives of the railroads and of employees' unions were present and joined with the city representatives in examining the men. Those found guilty of violating the ordinance were warned not to repeat the offense.

The strike of drivers of the American Railway Express Company in New York and adjacent cities was ended on Thursday, October 23, by the men voting to return to work. A committee had been sent to Washington to see the director-general, but he told them that unless they returned to work by Friday evening, the 24th, their places would be filled. The strike leaders in New York interpreted Mr. Hines' position as an intention to employ soldiers on the express wagons if necessary. The Merchants' Association of New York city sent to the director-general a formal complaint of the great inconvenience and considerable losses caused to the business interests of New York by the ten days' strike.

Disastrous Collisions in Europe

Press dispatches of October 25 report a collision between a passenger train and a freight near Kranowitz, Silesia, in which 40 persons were burned to death. Over 60 others were severely injured.

Forty-one persons were killed and many others were injured in a collision at Vigerslev, Denmark, on the first of November, five coaches being wrecked.

Twenty or more persons were reported killed, and about 20 injured, in a collision on the night of November 3 at Pont-sur-Yonne, France, about 60 miles southeast of Paris.

Changes in Interchange Rules

The Mechanical Section of the American Railroad Association has issued circulars 69 and 70 covering minor changes in the code of car interchange rules. Circular 69 provides that the charge for Pintsch gas from October 1, 1919, to December 31, 1919, shall be $1.40 per receiver. The addition of 30 per cent as authorized by passenger car rule No. 20 is not applicable in this case. Circular No. 70 calls attention to errors in freight car rule 131 and passenger car rule 24 which show the dates on which the 1919 code becomes effective as October 1, 1919. The new rules went into effect November 1, 1919, as provided by Circular 63.

American Society of Civil Engineers Nominates Officers

The American Society of Civil Engineers has made public the report of the nominating committee, suggesting the following members for officers for the ensuing year: President (one year), Arthur P. Davis, chief engineer, U. S. Reclamation Service, Washington, D. C.; vice-presidents (two years), Robert A. Cummings, construction engineer, Pittsburgh, Pa., and Francis Lee Stuart, construction engineer New York City; treasurer (one year), Arthur S. Tuttle, deputy chief engineer, Board of Estimate and Apportionment, New York City; directors (three years), Clarence W. Hudson, professor of civil engineering, Polytechnic Institute of Brooklyn, New York City; Carleton Green, construction engineer, New York City; John A. O'Connor, construction

engineer, New York City; John C. Hoyt, hydraulic engineer in charge, Surface Water Division, U. S. Geological Survey, Washington, D. C.; Anson Marston, dean of engineering, Iowa State College, Ames, Iowa; and David C. Henry, construction hydraulic engineer, Portland, Ore.

Steel Treaters' Society Holds Convention

The American Steel Treaters' Society held its first convention at the Seventh Regiment Armory, Chicago, on September 23 to 27. This organization, which was formed several months ago, has for its object the promotion of the art of heat treatment as applied to steel. Numerous papers dealing with various phases of heat treatment were presented and an extensive exhibit was held in connection with the convention. The following officers were elected: President, T. E. Barker, Miehle Printing Press & Manufacturing Company, Chicago; first vice-president, E. J. Janitzky, Illinois Steel Company, Chicago; second vice-president, D. J. Barnes, Cann & Saul, Philadelphia, Pa.; secretary, A. G. Henry, Illinois Tool Works, Chicago; treasurer; A. L. Boissoneau William Ganschow Company, Chicago.

B. & B. Association Meets in Cleveland

The twenty-ninth annual convention of the American Railway Bridge and Building Association was held at the Statler Hotel, Cleveland, on October 21, 22 and 23, over 250 members in attendance, a larger number than at any previous convention.

At the annual meeting on the third day the following officers were elected for the ensuing year: President, F. E. Weise (C., M. & St. P.), Chicago; first vice-president, W. F. Strouse, Baltimore, Md.,; second vice-president, C. R. Knowles (I. C.), Chicago; third vice-president, Arthur Ridgway (D. & R. G.), Denver, Colo.; fourth vice-president, J. S. Robinson (C. & N. W.), Chicago; secretary-treasurer, C. A. Lichty (C. & N. W.), Chicago; members of executive committee, J. P. Wood (P. M.), Saginaw, Mich.; A. B. McVay (L. & N.), Evansville, Ind.; J. H. Johnston (G. T.), Montreal, Que.; E. T. Howson, *Railway Age*, Chicago; C. W. Wright (L. I.), Jamaica, N. Y. and G. A. Manthey (D. S. S. & A.), Marquette, Mich.

Atlanta, Georgia, was selected as the location for the next convention.

Thirty-four firms presented, in rooms adjoining the convention hall, exhibits of material used in the bridge, building and water service departments.

Freight Traffic Committee to Close Docket

The Dallas (Tex.) District Freight Traffic Committee in Circular No. 130 has reproduced a letter received from Washington to the effect that the work of all freight traffic committees should be brought to a close on or before January 1, and all subjects now before the committees be disposed of. Changes in rates, etc., which may result from the committees' work should be not only published but made effective before the end of federal control. No further consideration is to be given by any freight traffic committee to any subject involving a general revision of rates, except where consideration has already been authorized. This withdraws the instructions of February 15, 1919, under which these general questions could be referred to Washington, and is intended to save the committees' time in the preliminary consideration of such subjects.

After November 10, no new applications are to be accepted by any committee nor docketed for public consideration except as follows:

(1) To publish new commodity rates, on articles which usually take commodity rates, to cover newly developed traffic, where only class or combination rates are in effect.

(2) To publish new class of commodity rates on newly constructed lines.

(3) To correct clerical errors.

(4) To readjust rates thrown out of line by General Order No. 28.

(5) To make changes necessary to comply with orders of the Interstate Commerce Commission (these applications to be made only by one of the general committees and only in cases where the Interstate Commerce Commission has ordered the removal of discrimination without setting the rates).

(6) On subjects concerning which a request for consideration is received from Washington.

In the consideration of pending subjects, committees are requested to give preference to those which have been longest before the committee and those which are of the most importance.

Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

Air Brake Association.—F. M. Nellis, 165 Broadway, New York City. Next convention, May 5-7, 1920, Chicago.

American Association of Demurrage Officers.—F. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

American Association of Dining Car Superintendents.—S. W. Derr, C. R. R. of N. J., Philadelphia, Pa.

American Association of Freight Agents.—R. O. Wells, Illinois Central, Chicago. Next annual meeting, June, 1920.

American Association of General Baggage Agents.—E. R. Reynolds, C. G. W. R. R., Chicago. Next meeting, November 11-13, 1919, New Orleans, La.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, October 28-29, Chicago.

American Association of Railroad Superintendents.—J. Rothschild, Union Station, St. Louis, Mo.

American Electric Railway Association.—E. B. Burritt, 8 W. 40th St., New York. Next convention, October 6-10, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—C. F. J. Dell, 50 E. 42nd St., New York.

American Railroad Master Tinners', Coppersmiths' and Pipe Fitters' Association.—Otto E. Schlinck, 185 W. 5th St., Peru, Ind.

American Railroad Association.—J. E. Fairbanks, 75 Church St., New York:

Section I, Operating (including former activities of Association of Railway Telegraph Superintendents).

Section II, Engineering.—E. H. Fritch, 431 South Dearborn St., Chicago.

Signal Division.—H. S. Balliet, 75 Church St., New York. Next annual meeting, September 17-19, Congress Hall and Annex, Chicago.

Section III, Mechanical (including former activities of Master Car Builders' and Master Mechanics' Association).—V. R. Hawthorne, 431 South Dearborn St., Chicago.

Section IV, Traffic (including former activities of Fregiht Claim Association).

Section V, Transportation (including former activities of Association of Transportation and Car Accounting Officers).

Section VI, Purchases and Stores (including former activities of Railway Storekeepers' Association). J. P. Murphy, N. Y. C. R. R., Collinwood, Ohio.

Section VII, Freight Claims (including former activities of the Freight Claim Association).

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W. Ry., 319 N. Waller Ave., Austin Station, Chicago. Next convention, October 21-23, 1919, Cleveland, O.

American Railway Engineering Association.—(Works in co-operation with the American Railroad Association, Section II.) E. H. Fritch, 431 South Dearborn St., Chicago. Next convention, March 16-18, 1920, Chicago.

American Railway Master Mechanics' Association.—(See American Railroad Association, Section III, Mechanical.)

American Railway Perishable Freight Association.—E. F. McPike, 135 E. 11th Place, Chicago. Regular meetings, 2d Wednesday in March and September.

American Railway Tool Foremen's Association.—R. D. Fletcher, 1145 East Marquette Road, Chicago.

American Society for Testing Materials.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Charles W. Hunt, Engineering Societies Building, 33 W. 39th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 33 W. 39th St., New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Train Despatchers' Association.—D. L. Darling, Northern Pacific Ry., Spokane, Wash.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next annual meeting, February 10-12, 1920, Hotel Sherman, Chicago.

Association of Railway Claim Agents.—Willis H. Failing, C. R. R. of N. J., Jersey City, N. J. Next meeting, May, 1920. Atlantic City, N. J.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Next meeting, October, 1919, Chicago.

Association of Railway Telegraph Superintendents.—(See American Railway Association, Section I, Operating.)

Association of Transportation and Car Accounting Officers.—(See American Railroad Association, Section V, Transportation.)

Bridge and Building Supply Men's Association.—M. J. Trees, Chicago Bridge & Iron Works, Chicago. Next annual convention, October 21-23, 1919, Cleveland, O.

Canadian Railway Club.—W. A. Booth, 131 Charron St., Montreal, Que.

Car Foremen's Association of Chicago.—Aaron Kline, 626 North Pine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

Car Foremen's Association of St. Louis.—Thomas B. Kocneke, Federal Reserve Bank Bldg., St. Louis, Mo.

CENTRAL RAILWAY CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November, and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—H. J. Smith, D. L. & W. R. R., Scranton, Pa. Next annual convention, September 23-25, 1919, St. Louis, Mo.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, Lehon Company, 45th and Oakley Sts., Chicago. Next annual convention, September 23-25, 1919, St. Louis, Mo.

EASTERN RAILROAD ASSOCIATION.—D. G. Stuart, Washington, D. C.

FREIGHT CLAIM ASSOCIATION (See American Railroad Association, Section IV, Traffic).

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3rd Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, B. & O., Lima, Ohio.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeting, May, 1920, Hotel Sherman, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wabash Ave., Winona, Minn.

MAINTENANCE OF WAY MASTER PAINTERS' ASSOCIATION.—F. W. Hager, 1323 Hurley Ave., Ft. Worth, Tex. Next annual convention, October 21-23, 1919, American Annex Hotel, St. Louis, Mo.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 9-11, 1919, Hotel La Salle, Chicago.

MASTER CAR BUILDERS' ASSOCIATION.—(See American Railroad Association, Section III, Mechanical.)

NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York. Next annual convention, October 14, 1919; Indianapolis, Ind.

NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York. Next convention, May 12-15, 1920, San Francisco.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—George A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Regular meetings, 3d Tuesday in each month, Tenjost Hall, Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meeting 2d Thursday in month, alternately in San Francisco and Oakland.

RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Bldg., Washington, D. C.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Next annual meeting, December, 1919, New York, N. Y.

RAILWAY CLUB OF PITTSBURGH.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month except June, July and August, Americus Club House, Pittsburgh, Pa.

RAILWAY DEVELOPMENT ASSOCIATION.—D. C. Welty, Missouri Pacific R. R., Little Rock, Ark.

RAILWAY ELECTRIC SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Next annual meeting, September, 1919, Hotel Sherman, Chicago.

RAILWAY FIRE PROTECTION ASSOCIATION.—G. L. Ball, St. Louis-San Francisco Ry., St. Louis, Mo. Next annual meeting, October 21-23, 1919, La Salle Hotel, Chicago.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, C. & O., Richmond, Va.

RAILWAY SIGNAL ASSOCIATION.—(See American Railroad Association, Section II, Signal Division.)

RAILWAY STOREKEEPERS' ASSOCIATION.—(See American Railroad Association, Section VI, Purchases and Stores.)

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 16-18, 1919, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, West Nyack, Rockland County, New York.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa. Next annual meeting, October 16-17, New York City.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.

SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Next annual convention, September 16-18, 1919, Auditorium Hotel, Chicago.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. P. Finan, A. T. & S. F. Ry., Needles, Cal.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Cleveland, O. Next annual meeting, September 16-19, 1919, Hotel Sherman, Chicago.

WESTERN ASSOCIATION OF SHORT LINE RAILROADS.—Clarence M. Oddie, Mills Bldg., San Francisco.

WESTERN RAILWAY CLUB.—A. F. Stuebing, 750 Transportation Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except July and August.

Traffic News

The Board of Railway Commissioners for Canada, has refused to condemn increased round-trip passenger fares which were put into effect by certain Canadian roads on February 1.

The bill making an additional appropriation for the construction of the Alaska Railroad, $17,000,000, has passed both Houses of Congress and has become a law without the President's signature.

The Mexican Government has issued an order abolishing all special freight rates on the railroads of the republic which have been granted to foster "infant industries." The promotion of traffic by this means is a custom of long standing. The American Chamber of Commerce in the City of Mexico has entered a protest against the enforcement of the order

A. S. Titus, special claim adjuster for the Southern Pacific with headquarters at San Francisco, Cal., has been appointed traffic manager of the California White & Sugar Pine Manufacturers' Association with office at San Francisco. Mr. Titus was formerly connected with the freight claim departments of the Southern at Washington, D. C., and the Southern Pacific at San Francisco. In his new position he will handle all traffic matters for the mills in the association.

Charles E. Christopher, formerly sales representative of the Joseph T. Ryerson & Son Company, Chicago, with headquarters in that city, has been appointed traffic manager of the Midco Oil Sales Co., Tulsa, Okla., and assistant traffic manager of the Mid-Co Gasoline Co., Tulsa, and the Mid-Co Petroleum Co., Tulsa. Mr. Christopher was formerly connected with the general freight departments of the Chicago, Milwaukee & St. Paul, the Kansas City Southern and the Missouri, Oklahoma & Gulf.

The National Industrial Traffic League has complained to the Interstate Commerce Commission, concerning the two-year clause in the uniform bill of lading. Some roads are construing this as forbidding the payment of valid claims for damages after the expiration of two years and one day, the time limit named in the bill of lading. The League calls for a more reasonable construction; for an interpretation which will not forbid the voluntary payment of claims, and will make the clause applicable only in cases where no claim has been filed.

The longshoremen's strike at New York City was broken by November 1, but it was not subdued until November 6. Even then, though most of the men were back at work, the relations of employers and employees were confused. Export and coastwise freight traffic, though badly hampered, had adjusted itself to the situation in some degree, so that the congestion was less than would be expected from such a long-continued blockade. Normal conditions had not, however, been restored before many ocean vessels were again held up by the scarcity of coal, because of the strike of the bituminous miners, the United States Fuel Administration refusing to supply coal to foreign-owned vessels.

Stricter Packing Rules for Express

The American Railway Express Company announces the adoption of new and stricter packing rules, to be put into effect December 10. The rules will forbid the use of paper wrapping for packages weighing over 25 pounds, or of ordinary paper boxes, wrapped or unwrapped, when the weight of the contents is over that limit. For heavier packages, the regulations, like those used in the freight department of railroads, will require wood, fibre board, corrugated strawboard, etc., of specified test strengths; though in the express service a wider latitude is permitted in the size of the carton used. The new regulations are embodied in Supplement No. 5, to Express Classification No. 26.

Foreign Railway News

The government of India is considering methods of mak- India more independent of outside sources in the supply railway material. It is proposed to guarantee the pur- ase in India of 2,500 standard gauge and 500 meter gauge gons yearly for ten years, provided the price is no higher d the quality no lower than in the case of imported gons.

Electrification in Brazil.—The London Times Trade Sup- ment states that the electrification of the Barra to Pirahy ilway is likely to be carried out shortly as a government mmission has recommended the system to be employed. e power will be obtained from one of the existing power mpanies. The cost of rolling stock, sub-station plant and nsmission line will be nearly £1,000,000.

Ninety per cent. of the railroad rolling stock in the Perm, katerinburg and Cheliabinsk districts of Russia was pulled t before the territory was given over to the Bolsheviki. his is the substance of an Associated Press dispatch from nsk, Siberia, dated in July and printed in American papers August. The statement was credited to General Jack of e Inter-Allied Technical Committee. The number of loco- otives saved was about 600 and of freight cars about 30,- 0. The railroad machine shops, as well as other factories the territory given over to the Bolsheviki, were left intact, effort being made to destroy them.

Poland Takes Over Railways

A cablegram from the American Legation at Warsaw states at it is reported by the Polish authorities that all railway es of Poland, comprising a total of 7,110 miles, are now der the control of the Government. Of the railways thus erated, 5,606 miles are under the civil authorities and 1,504 les under the Polish War Department.

New Railway in Nicaragua

London.

A new railway, 75 miles in length, is to be constructed in caragua, says Modern Transport, from a point on the aculaya River, following the course of the Bamabana and conguas Rivers, of which 40 miles have already been con- ructed.

In the Belgian Congo

It is proposed to extend the Katanga Railway, which now ds at Bukama, to a new terminus at a place which the lgian Administration calls Kibouerbo, on the upper waters of e Congo. This is expected to get over the difficulty of navi- tion on the upper channels between Kabolo and Bukama, hich at present often necessitate the discharge of cargo owing the lowness of the water.

The Drama-Cavalla Railway of Greece

An important railway and sea connection is being undertaken the Greek Government, writes Trade Commissioner Eliot Mears, from Athens. This line will connect up the Salonica- rres-Constantinople Railway at Drama with the Aegean Sea Cavalla. At the present time the only outside outlet is in stern Thrace at Dedeagatch, an open roadstead unprotected om the strong southerly winds. The Drama-Cavalla line has en considered a commercial necessity for many years, but der Turkish rule nothing was done. Cavalla is the only im- rtant Macedonian port except Salonica, and is the most im- rtant tobacco-exporting port in Greece.

The right of way will be 43 kilometers (27 miles), compared th 36 kilometers (22.5 miles) by the carriage road. The untry is mountainous, which necessitates several tunnels, one of them about 2½ kilometers (1.5 miles) long. The cost of construction will be over twice what it would have been before the war. A conservative estimate would allow at least two years for the completion of this line.

Standardization of Brazilian Equipment

Commercial Attaché J. E. Philippi, Rio de Janeiro, reports that a commission has been appointed to make a special study looking to the adoption of uniform types of equipment and material for the Government railways of Brazil. The members of the commission are to be engineers from the Federal Department of Railway Inspection and the Federal railways. The first study will be devoted to the selection of uniform types of locomotives, passenger cars and freight cars for the railroads of one meter gage.

Cars and Locomotives in Russia

London.

The Ironmonger states that at the declaration of war Russia possessed in the neighborhood of 30,000 locomotives and 570,000 cars and that at the time of the revolution there were 6,200 locomotives and 120,000 cars in good condition with 3,900 locomotives and 145,000 cars needing repairs. This has been considerably reduced and this year a new Commission of the Russian Government does not record more than 4,000 locomotives and 95,000 cars.

Brazil's Transport Difficulty

According to La Nacion, the Minister of Public Works, the Congressional Committees and the managers of the Brazilian railways met recently with a view of finding a solution to the transportation problems in Brazil. At the meeting it was suggested that the Brazilian Government should take up the matter diplomatically with the United States in an effort to obtain rolling stock, in order to enable residents of the interior of Brazil to find a better and more profitable market for their goods.

Danish Railways Run by U. S. Coal

Owing to the British coal strikes several contracts were made with agents for American coal merchants. According to reports the General Director of the Danish State Railways said that the Danish railway authorities have bought large quantities of coal in the United States. He is satisfied with this coal and wants imports from America to continue American coal is slightly more expensive in Denmark than British coal, and it is reported that the Scandinavians will have to buy it if they do not wish to be without coal during the coming winter.

Railway Extensions in Columbia

London.

Modern Transport states that $100,000 is to be raised for the completion and extension of the railway from Tolima to Ibagne. A trial trip has already been made over the Gualanday Divide.

Plans are being prepared for the construction of the Uraba Railway, and when ready will be submitted to the National Congress of the Republic.

A further extension of the Sabana Railway is also to be carried out which extension will run from Facativa to Pacho.

British Westinghouse Becomes Metropolitan Vickers

The name of the British Westinghouse Electric & Manufacturing Company, Limited, has been changed to Metropolitan-Vickers Electrical Company, Limited, following an amalgamation with the extensive Vickers interests of the Metropolitan Carriage, Wagon & Finance Company, Ltd.

From its inception in 1899 until 1917 the British Westinghouse Electric & Manufacturing Company, Ltd., was controlled by American interests, but in 1917 the American holdings were taken over by the Metropolitan Carriage, Wagon

& Finance Company, Ltd., followed later by amalgamation with the Vickers interests.

The change of name will not affect the general policy of the company. As a direct result of the amalgamation, much additional strength will be gained, allowing particularly greater possibilities of competition in the markets of the world.

$25,000,000 Loan to China

A loan of $25,000,000 to the Republic of China, which has been arranged with the consent of the Four Power Consortium, will shortly be offered in this country by a syndicate headed by the Continental & Commercial Trust Co. and the Chase Securities Corp.

The proceeds of the loan will be used for the development of railroad properties in China. The first offering, unless the plans are changed, will be limited to $15,000,000, but it is expected that later offerings will raise the total to $25,000,000, if this amount is not offered in the first place.

The loan is the first that has been authorized by the consortium.

Proposed Electrification of Italian Railways

The London Times Trade Supplement reports that the Council of Ministers has approved a scheme, proposed by the Transport Minister, De Vito, for the electrification of the State railways. The bill provides for the exploitation of the national water power resources and their utilization for propulsion. The first programme, which limited the improvement to 2,000 kilometers is now extended to 6,000 kilometers. This includes the two principal trunk lines across the Apennines, viz., the two "Direttissime", Genoa-Tortone and Bologna-Florence, eight mountain passes and the principal arteries of the railway system of the peninsular from Trient to Reggio, Calabria, or from Turin to Trieste. The bill provides for an expenditure of 800,000,000 lire spread over eight years. Other sums are provided for the acquisition of material and for the government's subsidies to the new plants. The bill will be submitted to the King shortly. The Trentino alone can provide at least 1,000,000 horse-power, while the mountain basins of numerous rivers and torrents along the Alps and the Apennines can be transformed into artificial lakes.

Exports of Locomotives in August

Exports of locomotives in August totaled 69, a value of $1,539,540. This was considerably more than in July, but not as great as the exports of some of the preceding months. One-half the August total from the standpoint of value were destined for Japanese China. The figures in detail as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Number	Dollars
Canada	7	57,865
Cuba	5	57,595
Dominican Republic	1	6,200
Bolivia	1	19,500
Brazil	5	162,990
Chile	18	198,583
Ecuador	1	11,400
Paraguay	1	10,600
Peru	5	18,694
Japanese China	16	833,600
British India	2	17,205
Philippine Islands	5	116,508
British South Africa	2	28,800
Total	69	1,539,540

New Locomotives for Indian Railways

London.

An extract from Modern Transport states that the Indian State Railways have placed contracts with the Vulcan Foundry, Limited, of Newton-le-Wiliows, Lancs, for 82 0—6—0 type locomotives; with the Hunslet Engine Co., Lt., for 26 4—6—0 type locomotives, and 70 2—8—0 type locomotives from Messrs. Kitson & Co., Limited, of the Airdale Foundry, Leeds. The North British Locomotive Co., Limited, of Glasgow, has an order for thirty broad gage and five meter gage locomotives for the Bengal-Nagpur Railway. Sir W. G. Armstrong Whitworth & Co., Limited, are to deliver 25 2—8—0 type broad gage locomotives for the Bombay, B roda & Central Indian Railway, and 17 2—8—0 type broad ga locomotives for the Madras & Southern Mahratta Railwa Nasmyth, Wilson & Co., Limited, of Patricroft, Manchest have orders for the delivery of 17 locomotives for the Burr Railway, 12 for the Assam-Bengal Railway, 10 for t Eastern Bengal State Railway, 10 for the South Indi Railway, and 9 for the Nizam's Guaranteed State Railwa All these locomotives are to be fitted with the Robins type super-heater.

The Great Indian Peninsular Railway has recently plac contracts with the North British Locomotive Co., Ltd., Glasgow, for 100 locomotives for their broad gage (5 6 in.) lines, comprising 30 2—10—0 type engines, 60 2—8— type goods engines and 10 0—8—4 "Ghat" tank locomotive and an order has been placed with the Vulcan Foundr Ltd., for 4 standard 4—6—0 passenger engines.

Exports of Car Wheels and Axles in August

The exports of car wheels and axles in August total $1,302,546, nearly one-half of which total was destined f Japan. There were also large shipments to British India a to France. The figures as compiled by the Division of St tistics of the Bureau of Foreign and Domestic Commerce a as follows:

Countries	Dollars
France	111,829
Italy	30,654
Norway	56,680
Scotland	9,163
Canada	17,936
Costa Rica	816
Honduras	480
Salvador	546
Mexico	239
Jamaica	212
Cuba	29,773
Dominican Republic	333
Argentina	19,770
Brazil	29,647
Chile	5,800
Colombia	1,875
Ecuador	145
Peru	10,497
China	81,648
Japanese China	37,064
British India	282,202
Dutch East Indies	13,958
Japan	546,554
Turkey in Asia	2,500
Australia	574
Philippine Islands	8,790
British South Africa	2,852
Total	1,302,546

Portuguese East African Railway Development

At present only one railway line has been constructed in th Beira district, running from Beira to Macequece and Umtal called the Beira & Mashonaland Railway, and operated entirel by British employees. Another railway is, however, about t be constructed. It will link up the Central African Railway with Beira, and will be constructed from Chindio, on th Central African Railways, to a point on the Beira and Mashona land Railway about 20 miles out of Beira. The total distanc will be about 200 miles, and the survey has been completed The gage is to be 3 ft. 6 in., the gage common to nearly al the South African Railways.

As at present the Beira and Mashonaland Railways as fa as possible obtain all their supplies in the United Kingdom, i is probable that efforts will be made to secure materials re quired for construction and the necessary rolling stock fo this new line in the United Kingdom also.

The line presents no abnormal difficulties, excepting the bridg over the Zambezi, and the estimated time for construction i two years. One of the effects of this line will be that, although Morromeu will send its sugar to Chinde by the Zambezi River Sena and all the factories in that district will certainly despatch their sugar by rail. Instead of loading sugar at Sena, trans-shipping it at Chinde, and possibly again transhipping it a Beira, the sugar will be railed to Beira and shipped to its destination.

There is also a possibility though no survey has yet been made, that a railway will be constructed from Melsetta to Villa Perry. Should this line be constructed, a large area o farming land would be opened up. A plan has been passed

and the work is to be executed immediately, for deepening the lighter channel so that lighters can approach the wooden jetties at all states of the tide to load or discharge cargo. A very great saving in time will ensue from this work, as at present at low tide work is almost at a standstill.

Exports of Railway Track Materials in August

The exports of railway track material in August were greater than in July, but not as great as in June or May. Of spikes, 4,009,107 pounds, valued at $216,154, were exported in August as compared with exports in July of 3,803,927 pounds, valued at $209,054. The August exports of rails totaled 48,700 tons, valued at $2,768,558 as compared with July exports of 32,707 tons, valued at $1,870,583. August exports of switches, frogs, etc., totaled $538,914 as compared with $289,232 in July. Nearly one-half the August shipments of rails went to Japan.

The detailed prices for August as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Spikes Pounds	Spikes Dollars	Steel Rails Tons	Steel Rails Dollars	Switches, Frogs, Splice Bars, etc. Dollars

To Extend Quebec Hotel.—President Beatty of the Canadian Pacific has announced that his company will spend over $2,000,000 in the extension of the Chateau Frontenac Hotel at Quebec, Canada.

England, with an area of less than the State of New York is planning to invest $17,000,000 in a ten year campaign to reforest 250,000 acres of land, so as to replace for future commercial use the timber used in France during the war.

Wages of Japanese Laborers.—The average wage for an unskilled Japanese male laborer to-day is 2s. ($.48) and for a female laborer 1s. 4d. (.32); for a skilled male laborer it is from 5s. ($1.20) to 7d. ($1.68) per day. These rates are about 70 per cent above pre-war rates. Besides the daily rates, however, yearly bonuses are given of a month's wages, and often considerably more. The working hours may be given generally as 70 hours per week, and the amount of work produced per hour by a Japanese workman may be put down very roughly at one-half of that produced by an average British workman where large jobs and heavy machinery are concerned. As regards holidays, the general rule is to close down twice a month only, about the 1st and the 15th.—*The Engineer, London.*

Equipment and Supplies

Locomotives

The Birmingham Southern is inquiring for two locomotives.

The Chesapeake & Ohio is inquiring for five Pacific type locomotives.

The Pennsylvania Equipment Company, 1420 Chestnut street, Philadelphia, Pa., is in the market for a second-hand, standard gage gasolene locomotive.

Freight Cars

A. J. Ceccaro, 1 Broadway, New York, is inquiring for 51 half-ton capacity cane cars for export.

Gaston, Williams & Wigmore, 39 Broadway, New York City, is inquiring for 6 box cars and 6 flat cars.

The Youngstown Sheet & Tube Company, Youngstown, Ohio, is inquiring for 7 tank cars of 10,000-gal. capacity.

W. R. Grace & Co., New York City, has ordered 60 all-steel flat cars for export from the American Car & Foundry Company.

The L. O. Steinbeck Lumber Company, Charleston, W. Va., has ordered 10 15-ton narrow-gage logging cars from the American Car & Foundry Company.

The Union Tank Car Company has distributed an order for 2,000 tank cars between the Standard Steel Car Company, the Cambria Steel Company and the Pressed Steel Car Company.

Passenger Cars

Gaston, Williams & Wigmore, 39 Broadway, New York City, are inquiring for six passenger cars.

Iron and Steel

The Government of Netherlands has ordered through its New York office 15,000 tons of steel rails for export to the Dutch East Indies.

Mitsui & Co., 65 Broadway, New York, are in the market for export for 3,300 steel high-tension transmission towers, and the necessary insulation material.

The Pennsylvania Railroad System is inquiring for 200,000 tons of steel rails to be delivered after the termination of the federal control of the railroads.

The Baltimore & Ohio has ordered 5,600 tons of bridge steel from the American Bridge Company, for its bridge over the Allegheny river at Pittsburgh, Pa.

The Southern Railway has ordered 2,300 tons of bridge steel from the American Bridge Company, for its bridge over the Tennessee river at Chattanooga, Tenn.

The Northern Railway of Costa Rica has ordered, through the United Fruit Company, a 103-ft. riveted truss span bridge from the U. S. Steel Products Company.

Perin & Marshall, 2 Rector street, New York, has given an order to the Consolidated Steel Company for 2,357 tons of 30-lb. steel rail; also for the necessary splices, bolts and dog-eared spikes; and for 50 complete turnouts for the Mysore State Railways (India).

Sophus Berendsen is inquiring for 210 tons of 116-lb. groove rails with the necessary angle plates, tie bars and bolts, to be laid on the wharves in connection with harbor improvement

work, and has ordered from the United States Steel Corporation 1,500 tons of 94-lb. rails and the necessary accessories for the Copenhagen Tramways (Denmark).

Rodney D. Chipp, United States representative at New York, of the Parana Railway, Brazil, is inquiring for 51 tons of 44-lb. rail, 3,000 pairs of splice bars, 10,000 splice bolts, 1,000 track screws, 8 complete switches, 2 velocipedes and 15 extra wheels, and for the Sao Paulo Rio Grande Railway, 370 tons of 50-lb. rail, 140,500 splice bolts, 2,000 track screws, 21 complete switches, 6 velocipedes and 18 extra wheels.

The United Fruit Company has given orders to the United States Steel Products Company as follows: For 2,357 tons of 60-lb. rail for its lines in Cuba; for 2,357 tons for its lines in Costa Rica; for 2,263 tons for the Trujillo Railroad in Honduras, and for 230 tons of steel for three bridges to be erected on the Cuba lines. A contract has also been given to the Lackawanna Bridge Company for a 210-ft. steel span to be built on the Trujillo Railroad.

Machinery and Tools

The Pennsylvania, Lines West, are inquiring for a large number of machine tools for shops at Columbus, Ohio, Crestline and Stark, and at Terre Haute, Ind.

The Tela Railroad, Honduras, has ordered the following shop equipment through the United Fruit Company: a driving wheel lathe, car wheel press, car wheel boring machine, steam pile hammer and a crank shaper.

Track Specialties

The Oneida & Western is inquiring for 12 miles of 40-lb. relaying rails with angle bars and spikes.

Miscellaneous

Sophus Berendsen, 15 Broad street, New York, is inquiring for 85 copper firebox plates to have a tensile strength of 32,700 lb. to the square inch. These plates are for the Danish State Railways.

The Du Pont Chemical Company, Wilmington, Del., is disposing of the equipment used in its war plants and has issued a circular giving a list of the machinery, equipment and material which is for sale, including machine shop and foundry equipment, power plant equipment, etc.

Signaling

The Canadian National Railways have ordered from the Federal Signal Company, Albany, N. Y., a mechanical interlocking for Villeroy, Quebec; Saxby & Farmer, 32 levers.

The Pennsylvania, Lines West, have ordered material for an all-electric interlocking plant at Leetonia, Ohio, from the General Railway Signal Company, Rochester, N. Y., 52 working levers and 20 spare spaces.

Americanization Work among foreign born employees of Chicago industrial plants, conducted by the committee on Americanization of the Chicago Association of Commerce in collaboration with the Board of Education has grown remarkably since it was started a year ago. More than 6,000 students are attending 65 classes which hold sessions in 30 different plants.

The Highway Authorities of Great Britain, according to a report received by the Bureau of Foreign and Domestic Commerce, have made grants, to July 31, 1919, amounting to $45,500,000 for the repair of roads and bridges in the British Isles. This grant was divided as follows: England, $39,240,000; Scotland, $2,640,000; Ireland, $645,000; Wales, $2,975.000.

Supply Trade News

The **Bowen Motors Railway Corporation**, Terre Haute, Ind., has completed plans for a plant to produce gasoline-propelled passenger cars.

The **C. A. S. Engineering Company**, 790 Woodward Ave., Detroit, Mich., has been appointed Detroit district representative of the Pollak Steel Company, Cincinnati, Ohio.

The Terre Haute, Ind. plant of the **American Car & Foundry Company**, was damaged by fire, on October 7, causing a loss of $100,000. Rebuilding will be started immediately.

W. Russell Walsh, son of W. J. Walsh, district manager of the Galena-Signal Oil Company at Chicago, has recently become associated with the **Glidden Company**, Cleveland, Ohio,

The **Edgewater Steel Company**, Pittsburgh, Pa., has appointed **Rank & Goodell**, 906 Merchants Ban kBuilding, St. Paul, its selling agents for St. Paul, Minneapolis, Duluth and adjacent territory.

R. H. Brown, Jr., of the St. Louis, Mo., office of the Ingersoll-Rand Company, New York, has been appointed manager of the new office of the company in the Sam Houston Life building at Dallas, Tex.

Mudge & Co., Chicago, has completed the construction of its new railway motor car plant at Chicago. **C. P. Benning**, assistant general manager, with headquarters at Chicago, has been appointed factory manager.

The **Steel & Tube Company of America**, Chicago, is asking for bids on an additional merchant blast furnace stack to be erected either at South Chicago, Ill., or Indiana Harbor, Ind. The capacity will be rated at about 600 tons per day.

The **Lyon Metallic Manufacturing Company**, Aurora, Ill., has opened a New England district sales branch at 161 Devonshire street, Boston, Mass., in charge of **J. B. Throckmorton**, formerly New York City representative of the company.

The **Pettibone-Mulliken Company**, Chicago, manufacturers of railroad specialties, has awarded a contract to Westinghouse, Church, Kerr & Company, New York City, for a one-story foundry, 150 ft. by 240 ft. at Chicago, to cost $200,000, including equipment.

C. E. Hutchison, formerly district representative at St. Louis, Mo., of the La Belle Iron Works, Steubenville, Ohio, has resigned to become associated with the Youngstown Sheet & Tube Company, Youngstown, Ohio, with headquarters at Cleveland, Ohio.

Dan Greene, who has been engaged in the Signal Valuation department of the Wabash at Decatur, Ill., has been appointed service engineer in the railroad sales department of the **National Carbon Company, Inc.**, Cleveland, Ohio, with headquarters at Chicago.

The **Rock Island Brake Shoe & Foundry Company**, Rock Island, Ill., has been incorporated with $200,000 capital stock to manufacture brake shoes and other railway supplies. The incorporators are **Simon Lewis, Hyman Lewis** and **M. I. Morris**, all of Rock Island.

The Detroit Lubricator Company, Detroit, Mich., is making additions to its plant, which include a new general office building and a new machine shop. The construction will cost $500,000 and is such as to admit of adding more stories to the building as necessity may require.

Robert N. Dickman, mining engineer on the staff of **Robert W. Hunt & Company**, engineers, Chicago, died on September 14, at La Jolla, Cal., following an operation. Mr. Dickman was formerly associated with the mining engineering firm of Dickman & MacKenzie.

G. E. Anderson, formerly assistant to vice-president of the American Locomotive Company, has been appointed assistant eastern sales manager, of the **Duff Manufacturing Company,** Pittsburgh, Pa., with headquarters at its eastern sales offices, 50 Church street, New York.

The **Pollak Steel Company,** Cincinnati, Ohio, has appointed the **C. A. S. Engineering Company,** 790 Woodward avenue, Detroit, Mich., as its representative in the Detroit district, which embraces Michigan and northern Ohio, including the cities of Toledo, Elyria and Cleveland.

John B. Jordan, assistant manager of the railroad sales department of the **Crane Company,** with headquarters at Chicago, has been appointed manager of the department with the same headquarters, succeeding **F. D. Finn** who has been granted an indefinite leave of absence.

The Railway Signaling Text Book Corporation, Utica, N. Y., has filed articles of incorporation at the office of the secretary of state, Albany, N. Y., to deal in school supplies; capital $60,000. The incorporators are H. C. Williams, H. L. Strobel, and A. M. Kieffer, all of Utica.

The Ohio Brass Company, Mansfield, Ohio, has been given an order to replace all couplers on the electrically operated cars of the Long Island Railroad, with the Tomlinson coupler which, in addition to coupling the cars connects the air pipe. A total of 154 cars will be equipped in this way.

H. V. McKedy, assistant to the vice-president in charge of sales of the American Locomotive Company, has severed his connection with that company. He has been appointed eastern railway representative of the **Glidden Company,** Cleveland, Ohio, with headquarters at 636 West 34th street, New York City.

W. W. Herron has organized the **Herron Lumber Company** with office in the Henry building, Seattle, Wash., and will make a specialty of shipments to railroads, railroad contractors, and car manufacturers. The new company will take over the interest of the Herron Company of Seattle and will maintain the latter's branch office in Chicago.

The **T. H. Symington Company,** New York, announces that at the meeting of its board of directors held in New York on October 22, **C. J. Symington** was elected president in charge of sales and operation, vice **T. H. Symington,** elected chairman of the board, both with headquarters at New York. **Donald Symington,** vice-president in charge of operation at Rochester has resigned from the company.

Dr. Leonard F. Fuller has been appointed assistant manager of the insulator factory at Barberton, Ohio of the **Ohio Brass Company,** Mansfield, Ohio. Dr. Fuller did some notable work in connection with the laboratories of the Federal Telegraph Company at Palo Alto, Cal., and in recognition of his work in wireless telegraphy, was recently given the degree of Ph.D. in Electrical Engineering by Leland Stanford University.

A. G. Gibbons has become associated with the **Wetmore Reamer Company,** Milwaukee, Wis., as production engineer. He was formerly superintendent of tools and supplies for Winslow Brothers Company, Chicago. He also served with the Cadillac Company and the Brown & Sharpe Manufacturing Company for many years. The Wetmore plant has been re-arranged and additional equipment installed under the direction of Mr. Gibbons.

Valentine Winters, president of the Winters National Bank, Dayton, Ohio, has been appointed receiver for the **Barney & Smith Car Company,** of that city, on petition of Frank H. Ballman and Edwin U. Irvin, partners, doing business as Ballman & Irvin of Cincinnati. Suspension of the business of building and equipping both freight and passenger cars, caused by the war, is defined as the chief reason for the receivership action. The receiver has been authorized to borrow on receiver notes to the extent of $100,000 with which to carry on the business. The company, it is set forth, possesses assets largely in excess of the liabilities, but it is unable to meet the liabilities as they mature.

Railway Construction

Canadian National Railways.—This system has let contracts for building about 410 miles of line as follows: To Grant, Smith & McDonell, Ltd., Calgary, Alta., 25 miles on the Arcadia Valley branch; the Western Construction Company, Ltd., North Battleford, Sask., 21 miles on the Jackfish Lake branch from mile 61.95 to mile 83, and on the Luck Lake branch from mile 13.64 to mile 35, a distance of 21.36 miles. On the Peebles-Lampman branch 20 miles has been let to the Canadian Construction Company, Ltd., Winnipeg, Man., on the Swift Current branch 27 miles from mile 92 to mile 120 to Gibbs Brothers, Gravelbourg, Sask.; on the Peace River branch 38 miles, beginning at mile 34 has been let to Malcolm McCrimmon & Son, Edmonton, Alta.; on the Thunderhill branch, 9 miles from mile 100 to D. R. & D. J. McDonald, Netherill, Sask.; on the Munson-Wayne branch a contract has been let for double tracking from mile 312 to 322 to J. Manning, Drumheller, Alta., and on the Rosebud Creek diversion, Carter-Halls-Aldinger Company, Ltd., Winnipeg, has a contract for the Calgary subdiversion. The Canadian Construction Company, Ltd., also have received contracts for two extensions on the Hanna-Medicine Hat branch for a total of 88 miles, and J. W. Stewart & Co., Winnipeg, has received contracts covering 150 miles of construction on the following branches: 35 miles on the Eston southeasterly line, 30 miles on the Melfort northeast line, 28 miles on the Melfort-Humbolt branch, 15 miles on the Amaranth extension, 22 miles on the Oliver northeast branch and 20 miles addition on the Amaranth extension to Ste. Rose du Lac north.

Canadian National.—Extensive improvements have been made by this road on its lines through Alberta, Canada. A second track has been completed between Munson Junction, Alta, and Drumheller, a distance of 11 miles, and is being extended to Wayne, a further distance of 7 miles. On this stretch a 300-ft. tunnel is being built, together with a number of diversions to eliminate a number of Trestles along the Rosebud and Red Deer River valleys. At Drumheller a new freight yard accommodating 750 cars and a new roundhouse have been completed.

A branch line extending from Peace River Junction, Alta., to Whitecourt, a distance of 78 miles, is nearing completion. Freight service is in operation from Peace River Junction to Sangudo, 31 miles, and grading and preparation for track laying have been completed to Whitecourt.

The Canadian National is also improving its station at New Glasgow, N. S., by building a brick extension, two stories high, 38 ft. wide and 41 ft. long. The work is being carried out by company forces.

Pennsylvania, Lines West.—Officers of this road and the municipal officers of the Akron, Ohio, have signed an agreement to collaborate in the construction of a temporary grade separation viaduct at South Main street and Miller avenue in Akron. As soon as the signatures of officers of the Baltimore & Ohio and Erie, both of which roads are interested in the project, are obtained, the work will be started, The articles signed include a plan providing for a structure across the south Main street yard at Miller avenue, which will serve to carry traffic over tracks in the southern end of the city while viaducts are being built over other crossings. The cost of the temporary structure is estimated to be $150,000.

Tidewater Southern.—A survey has been completed for a proposed extension from Hilmar, Cal., 62 miles southerly to the San Joaquin River, at a point known as Skaggs Bridge. It has not been decided when construction work on this line will be started.

The Italian Economic Mission to the United States has had its departure postponed until October 15.

To Create Public Sentiment for the Plumb plan, a large mass meeting was held in the Hippodrome Theatre at Pottsville, Pa., on September 29, under the auspices of the Plumb Plan League of that city.

Railway Financial News

ARTESIAN BELT.—The sale of the Artesian Belt to Harry Landa of New Braunfels, Tex., J. E. Jarrett and W. R. Wiseman of San Antonio, Tex., and others, for $167,500, has been confirmed by the court at Jourdanton, Tex. The purchasers will organize a company and will continue to operate the line. The road extends from Kirk, Tex., to Christine, a distance of 45 miles. An increase in traffic is expected from the development of the Somerset oil fields.

CENTRAL OF GEORGIA.—Charles H. Markham has been elected chairman of the board of directors to succeed Charles A. Peabody, resigned.

CHICAGO & NORTH WESTERN.—This road has obtained authority from the Public Utilities Commission of Michigan to issue unsecured five and one-quarter per cent promissory notes in the aggregate amount of $800,000 for the purpose of enlarging and extending the capacity of its rain elevator and interchange facilities connected therewith in Chicago. The notes will be issued in denominatons of $1000 and $5000 and shall be made payable at the rate of $100,000 per year.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—This company has applied to the Public Utilities Commission of Ilinois for leave to execute its refunding and improvement mortgage, dated June 27, 1919, and to issue bonds thereunder to an amount not exceeding $20,000,000. The petition filed by this company also asked for rehearing and for modification of the order dated July 1, 1919, and elimination from this order of provisions for the payment of a fee by the petitioner for authority to issue bonds.

GEORGIA COAST & PIEDMONT.—Judge Evans of the United States District Court at Savannah, Ga., on October 18 confirmed the sale of this road to H. H. Dean, of Gainesville, Ga., for $426,500. The business interests of Brunswick, Ga., and points along the line put in a bid for $410,000, with a view of operating the railway as a going concern. Mr. Dean announced after the sale that the road would be dismantled except a small portion of a few miles which he had sold to the citizens of Reidsville, Ga., for $3,500 a mile. The bridge over the Altamaha river at Darien, which is five miles long and practically the only passageway for motor traffic between Jacksonville and points north, is offered for sale by Mr. Dean.

GREAT NORTHERN.—Seward Prosser, president and director of the Bankers Trust Company of New York, has been elected a director succeeding Roger Shepard of St. Paul, Minn.

GULF, FLORIDA & ALABAMA.—H. B. Thorne, vice-president of the Metropolitan Trust Company of New York, representing the bondholders' committee purchased this road, on October 14 at Pensacola, Fla., for $500,000. A new company to be known as the Pensacola, Gulf & Northern is being organized to operate the property.

ILLINOIS CENTRAL.—After a long legal battle the Cook County (Chicago) Board of Review has ruled that the Illinois Central must pay taxes amounting to $300,000 on approximately $10,000,000 worth of stocks and bonds of other corporate organizations, held by the company. The railroad company had maintained for years that the bonds were not subject to taxation. The city attempted to collect taxes this year and when the railroad objected the case was taken to the Board of Review. The contention of the city's corporation counsel that the bonds were nonchartered property and taxable was sustained. Immediately after the return of the decision, E. J. Brundage, attorney-general of Illinois, announced that he would file claims for back taxes on the stock and intimated that a large sum would be involved.

INTERNATIONAL & GREAT NORTHERN. — An extension until November 1, 1922, with interest at 7 per cent has been granted on the $11,290,500 first mortgage 6 per cent bonds of this company, due November 1, 1919.

Railway Officers

Railroad Administration

Central

Major C. E. Lester has been discharged from military service and appointed assistant supervisor of equipment with the Railroad Administration at Meadville, Pa.

A. M. MacGillivray, resident engineer on the Canadian National at Port William, Ont., has been promoted to district engineer at Saskatoon, Sask., succeeding **H. L. Vercoe,** who has been assigned to other duties.

Purchasing

A. S. Perry, of the New York City office of the Panama Railroad Company, has been appointed assistant commissary purchasing agent at New Orleans, La., a newly created position.

Obituary

Edgar Shimp, freight agent of the Pennsylvania Western Lines, at Alliance, Pa., died September 8 at his home in Alliance, Pa.

J. R. Anderson, superintendent of the Blue Ridge at Anderson, S. C., died suddenly of apoplexy in the railroad yards at Anderson, November 4.

John T. Finerty, trainmaster of the Delaware, Lackawanna & Western, at Scranton, died October 27 at his home, 362 Butler Street, Dunmore, Pa.

Robert Weddell, founder of the Weddell Bridge & Engine Works, Trenton, Ont., which has executed many contracts for the Dominion Department of Railways and Canals, died at Trenton recently.

William Zabel, designing engineer and formerly engineer of production of the Union Switch & Signal Company, Swissvale, Pa., with office in that city, died at Wilkinsburg, Pa., on October 22, at the age of 39 years.

Z. T. Brantner, superintendent of the maintenance of the way shops of the Baltimore & Ohio at Martinsburg, W. Va., died in that city October 21. Mr. Brantner has been in the service of the Baltimore & Ohio for 57 consecutive years.

Samuel O. Malin, formerly special agent of the Northern Central and the Philadelphia, Baltimore & Washington, with headquarters at Baltimore, died recently at his home in that city. Mr. Malin retired in 1916 at the age of 70 years.

Howard B. Bryning, district passenger agent on the Chicago Great Western, with office at Kansas City, Mo., died in that city recently at the age of 47 years. He was at one time traveling passenger agent on the Northern Pacific.

George W. Thompson, assistant to **R. J. Parker,** general manager of the Panhandle & Sante Fe, and formerly general superintendnt of the Detroit, Toledo & Ironton, died in Springfield, Ohio, October 19 following a nervous breakdown.

William C. Copley, special agent of the Pennsylvania, with headquarters at Altoona, Pa., died October 15, at his home in Altoona after an illness of four years. Previous to his appointment in 1918, as special agent, Mr. Copley was freight trainmaster of the same road.

James C. Rogers, former division superintendent of the Vancouver division of the Spokane, Portland & Seattle with headquarters at Vancouver, B. C., died recently in Spokane, Wash., at the age of 54 years. Mr. Rogers was in the service of the Great Northern from 1889 to 1900 as dispatcher and superintendent. Later he went to Alaska in the service of the White Pass & Yukon, where he remained for seven years prior to becoming connected with the Spokane, Portland & Seattle.

John B. Brownell, formerly assistant general auditor of the Delaware & Hudson, died suddenly at his home in Altamont, N. Y., Sept. 12. Mr. Brownell was born at Schenectady, N. Y., December 31, 1842. In 1870 he entered railroad service as clerk in the freight office of the Delaware & Hudson at Troy, N. Y., and continued in the service of that company 48 years. In 1903 he was appointed auditor of revenue and nine years later was promoted to assistant general auditor, a position he held until pensioned on July 1, 1918.

Doctor James Burry, chief surgeon of the Elgin, Joliet & Eastern and the Illinois Steel Company, was found dead on the suburban tracks of the Illinois Central near Harrison

street in Chicago recently. Whether he had been robbed and then thrown from a railroad train or had been the victim of an accident the police have been unable to determine. Doctor Burry, who was 65 years old, was born in Montreal, Canada, and came to Chicago at the age of 15 years. He was graduated from the Chicago Medical College in 1875 and began practicing in Chicago in 1883, and has been chief surgeon of the Elgin, Joliet & Eastern for 25 years.

Patrick Laden, district engineer of the Illinois Central at Waterloo, Iowa, died at his home in Rockford, Ill., on October 13, following a stroke of apoplexy. He was 57 years old. Mr. Laden entered railway service with the Illinois Central in 1887 as extra gang foreman. In 1888 he was promoted to road supervisor, with office at Rockford, Ill., and in 1889 was made roadmaster of the Mississippi division with office at Jackson, Tenn. From that year until 1907 he was roadmaster on various other divisions and in the latter year was made superintendent with office at Mattoon, Ill. In 1912 he was appointed district engineer of the Northern and Western lines with office at Waterloo.

Joseph S. Ford, former secretary and auditor of the Chicago & Eastern Illinois, with headquarters in Chicago, died October 16 at Jamaica Plain, Mass. Mr. Ford was born at Damariscotta, Maine, in 1839. He entered railway service in 1868 as treasurer of the Missouri Valley and served successively as treasurer, auditor and controller of several western roads until October, 1901, when he was appointed assistant secretary and assistant treasurer of the St. Louis-San Francisco with headquarters at New York. In 1903 he resigned to become secretary and auditor of the Chicago & Eastern Illinois. He served the latter company until May 1, 1916, when he resigned on account of ill-health.

John H. Pratt, cashier and paymaster of the Chicago & Eastern Illinois, died October 31, at Asheville, N. C. Mr. Pratt was born in Swaffham, Norfolk, England, on July 10, 1871, and came to the United States in March, 1889. He entered railway service in 1890 as a clerk in the general office of the Chicago, Rock Island & Pacific. In 1895 he resigned, returning to Europe to visit relatives. In August, 1896, he returned and became connected with the Chicago & Eastern Illinois, with headquarters at Chicago. In April, 1903, he was appointed cashier and paymaster which position he held until his death. Because of ill health he was granted a leave of absence in May, 1918.

George H. Earl, vice-president of the Northern Pacific, died October 25 at his home in Jersey City. Mr. Earl was born in Jersey City in 1857 and graduated from the Jersey City High School with the class of 1877. Two years later he began railroad work as clerk to the general counsel of the Northern Pacific. Later he became stenographer and clerk to the vice-president. From October 21, 1886, until October, 1890, he was assistant secretary. He was appointed secretary in 1890 and retained that position until August 15, 1893, when he became assistant secretary and treasurer. In 1897 he resumed the duties of secretary and became assistant treasurer, in which capacity he served until October 24, 1916, when he was elected vice-president.

William R. Hudson, general manager of the Atlanta, Birmingham & Atlantic, Charleston & Western Carolina, Augusta & Summerville, Atlanta & West Point, Western Railroad of Alabama, Georgia Railroad, Augusta Union Station, Atlanta Terminal and Augusta Belt, with headquarters at Augusta, Ga., died September 25. Mr. Hudson was born in Pulaski County, Va., in November, 1886, and received a grammar and high school education. He entered railroad service in 1882 as freight handler with the Norfolk & Western, remaining with that company until 1901, during which time he advanced to trainmaster. The year just mentioned he became trainmaster of the Seaboard Air Line; in 1907 was promoted to superintendent and in May of the same year left the Seaboard Air Line to become general superintendent of the Norfolk Southern. From August to October, 1912, he was assistant general manager of the Atlanta, Birmingham & Atlantic; from then until April, 1918, served as general superintendent of the Chesapeake & Ohio. In April, 1918, he returned to the Seaboard Air Line as general superintendent but resigned in December of that year to accept the position he held at his death, general managership of the roads mentioned above.

John J. Reardon, for the past 12 years superintendent of the Litchfield & Madison at Edwardsville, Ill., died Sept. 19 at Edwardsville. Mr. Reardon was born in May, 1862, at Southfields, N. Y., and received a public school education. He entered railroad service at the age of 17 as station agent, of the Erie. Two years later he became station agent, telegraph operator and interlocking tower man of the Long Island. In 1884 he was appointed train dispatcher and sometime later chief train dispatcher of the Long Island. Eight years following he was trainmaster of the Chicago & Alton at Bloomington, Ill., a position he held ten years and left to become general yard master of the Chicago Terminal. Having served in the capacity just mentioned two years, he was appointed superintendent of the Litchfield & Madison.

David Bosman, vice-president, secretary and treasurer of the Erie, and for two years Mayor of Rutherford, N. J., died October 24 at his home in Rutherford after several months' illness. Mr. Bosman was born in Brooklyn, N. Y., December 18, 1864. He was graduated from the Brooklyn High School and for the first few years after graduation from school he was employed in the law office of William B. Hornblower, New York city. At the age of 23 he began railroad work as clerk in the office of the general manager of the Erie. The following year he was appointed secretary to the vice-president and in 1894, secretary to the receiver. In 1895, he became secretary of the Chicago & Erie, now part of the Erie, and in 1903, assistant secretary of the Erie Later that year he was made secretary. He received his appointment as vice-president in 1911. In 1918 he was appointed treasurer of the Erie.

Morgan K. Barnum, corporate mechanical engineer of the Baltimore & Ohio, died suddenly October 26 at Baltimore, Md. Mr. Barnum acted as assistant to the vice-president of the Baltimore & Ohio, giving special attention to the conservation of material of all kinds from stationery to locomotive and car material and such as is used for the maintenance of way and buildings. He undertook this work in February, 1917, the position having been created for him. He graduated from Syracuse University in 1884 with the degree of A.B. and later received the degree of A.M. Shortly after graduation he began railroad work as apprentice in the shops of the New York, Lake Erie & Western, now the Erie, at Susquehanna, Pa. He soon became machinist and mechanical inspector and two years later was promoted to general foreman of the same road at Salamanca, N. Y. In 1889 he was appointed general foreman of the Louisville & Nashville at New Decatur, Ala., and in September of the following year became superintendent of shops of the Atchinson, Topeka & Santa Fe at Cheyenne, Wyo. During the years intervening between 1890 and 1904 he continued to rise, serving for periods with the Union Pacific, Southern and the Chicago, Rock Island & Pacific in different positions. In 1904 he was appointed mechanical expert of the Chicago, Burlington & Quincy and left that road in April, 1910, to become general superintendent of motive power of the Illinois Central and the Yazoo & Mississippi Valley. He joined the staff of the Baltimore & Ohio in July, 1913, as general mechanical inspector and in September of the next year was promoted to superintendent of motive power, the position he held when he was appointed corporate mechanical engineer.

THE CO-OPERATIVE STORE PROJECT among railroad employees is looked upon with favor by the allied shop employees of New Castle, Pa., who have started a movement for such a store through which they will purchase their foodstuffs, etc. Incorporation and a capital of $30,000 with which to start are proposed.

The Plumb Plan in the Movies

The Plumb plan will be dramatized and presented to the public as a movie. This information comes from press reports accredited to reliable correspondents in the movie-producing field about Los Angeles, Cal. It is practically impossible to even hazard a guess as to the manner in which the Plumb plan could be incorporated, as the dramatic *raison d'etre*, in a story. However, one who has studied the plan in all its ramifications can readily see many features, especially in its results, that would lend themselves admirably to moving pictures rather than to any other form of exposition. For instance, the steady stream of dollars from the taxpayer's pockets to the government for the paying of deficits incurred under this form of railway ownership and management certainly would require a moving picture with its rapidity to adequately present the situation. If the authors and producers of this new development in the present economic struggle tell the "whole truth and nothing but the truth," they certainly will outrival the greatest authors and producers of this age, who have considered the sovietizing of the world's greatest republic a subject too great for them to chronicle in this period.

Americanization on Railroads

This country is suffering severely from the almost absolute lack of any system for educating to our customs and ideals the great hordes of immigrants that flocked to our shores year after year before the opening of the world war. Foreigners have been left largely to themselves; little real interest has been shown in their methods of living or of their habits or beliefs; in many cases they have been exploited by selfish and unprincipaled interests. The seriousness and danger of this neglect—and in some cases abuse—is clearly evident today. There are many foreigners in the employ of the railroads and it is questionable whether any better investment can be made by the management than that involved in an aggressive Americanization program. The Railroad Y. M. C. A., in connection with its continental extension program, is planning on directing some of its energies to this end and the railroads can well afford to back up this effort; indeed, they should supplement it, for there are many points that are not served or cannot be reached by the Y. M. C. A. One suggestion made by the Railroad Y. M. C. A. is the formation of clubs with the slogan, "Every member a voter"; but why should not the roads as a whole enter into such a campaign; why not have the different divisions vie with each other in having every employee become an American citizen as soon as possible—and also an intelligent voter? This movement is every bit as important as a Liberty Loan or Victory Loan campaign. Why not instill the same spirit and organization into it and "put it over the top?" Even an optimist must admit that the days to come will be full of serious problems for this country and that of making real Americans of our foreign population is not the least of these. Let it not be said by our sons and grandsons that we lacked in preparedness in this respect.

A Short-Sighted Policy

It is a question whether the general movement toward drastic railway regulation during the last two decades was more the result of the wide publicity given to several notorious cases of gross mismanagement, or arbitrary business methods on the part of certain railway officers in cases where lack of competition gave them the advantage over the shipper. While most railway executives now see the folly of this policy, it is a fact that evidences of this tendency still crop out from time to time. To illustrate: A recent derailment on the coal track of an industrial plant caused a car to run through a corner of the building and block the track so that three coal cars could not be withdrawn. When the track was repaired the industry entered a claim for damage to the building, and the railroad presented a bill for demurrage on the three cars for the time that they were tied up on the track and proceeded to take advantage of its strategic position by refusing further service until the bill was paid. The merits of the controversy are of no importance; it is entirely possible that the industry was responsible for the maintenance of the track and liable for all damage done by the derailment. Nevertheless, a shortsighted, arbitrary disposal of a case such as this can have but one effect—to make another strong advocate of rigid and minute regulation of the roads by the local regulating authority. Because of the thoughtless acts of a few, many may be forced to suffer unjustly.

The Russian Situation

One of the sessions of the recent meeting of the American Manufacturers' Export Association held in New York on October 16 and 17, was devoted to trade with Russia. The several speakers who addressed the session clearly brought out the important fact that the American business man owes it to himself to study Russia and to lay his plan for cultivating that country as a future export market. Russia today does not present much of a market for anything, but it is well to remember that the tide in that great country has turned and the plague of Bolshevism is gradually being eradicated. Russia represents not only a great nation but a great market, and one that we will make a great mistake in believing that we cannot cultivate. At present it is apparent that the Germans are much more alert to the possibilities there than we are. Germany, from its experience before the war, understands the Russian market probably better than any other country. Today she has the advantage over most of her competitors in the almost ridiculously low value of the mark. But we must not agree that we are to be left out because of these factors. It would no doubt help Germany the better to meet her obligations to the world to cultivate the Russian market, but the rest of the world is in no position to sit back and let the Russian market get into the hands of a single nation—especially one such as Germany has shown herself to be commercially or otherwise. The railway supply industry of this country is perhaps the best fitted of any American industry to take up the work in hand.

Russia needs railway equipment as probably no other nation needs it. We and England are the only nations in a position to supply it in quantity at present. The other countries—Germany among them—have no small task on their hands to supply their own needs and even Britain will have difficulty in supplying her own dependencies, especially India. The American railway supply field should, therefore, closely watch the Russian situation and should be the most interested in being first on the ground when normal conditions are once more restored.

Running Passenger Trains on Time

THE MOVEMENT started by Regional Director Winchell of the Southern region to stimulate rivalry between the different railways in running passenger trains on time has been broadened by the Railroad Administration, which is now giving publicity to data regarding the "on time" records in the different regions. The statistics for August show that in that month 320,718 passenger trains were operated on 156 roads and that of this number 226,184, or 83 per cent, arrived at their final terminals on time. In September 317,742 trains were operated, of which 74.3 per cent arrived on time. In August the worst record was made in the Pocahontas region, in which only 74.3 per cent of the trains were on time, while the best was made in the Allegheny region, in which 88.1 per cent were on time. In September the Pocahontas region showed a great improvement, with 84.5 per cent on time. The poorest record made in September was that of the Southwestern region, with 77.3 per cent of its trains on time, and the best was that of the Allegheny region, with 88.7 per cent on time.

Some trains originate in one region and run to a final terminal in another. The region in which the best record was made in September in handling both trains which originated in it and trains which originated outside of it was the Southern, in which 91.9 per cent of all trains either arrived on schedule time, or, if late when received in that region, made runs in it in schedule time or less. The improvement in the general results in September as compared with August is gratifying, but the total showing made is by no means satisfactory. In September one passenger train in every six run on the railways of the United States was late in reaching its final terminal. In 1917 the average number of passengers carried per train was 65. In view of the large increase of passenger business since then, and especially of the curtailment of passenger train service, it is safe to estimate that the average number of passengers carried per train in September, 1919, was 75. The number of trains late in that month was 50,034. This means that in that month at least 3,750,000 people were inconvenienced, irritated, and perhaps caused loss by delayed passenger trains.

As a matter of fact, the number was much larger, since a train which is late at its terminal usually has been late at intermediate stations. Every one of those people helped to make public opinion regarding railroad operation and probably none of them helped to make it more friendly to government operation.

The late passenger train as an American institution cannot, however, be attributed to government operation. It was very frequently in evidence under private operation—perhaps as frequently as it has been under government operation. The Railroad Administration deserves great credit for stimulating the movement for getting passenger trains on an "on time" basis, and it is to be hoped that after the railways are returned to private operation the companies will continue the efforts now being made to cause all trains to be run more nearly in accordance with their published schedules.

The Elwood Collision

ONCE MORE, WE ARE INDEBTED to the Bureau of Safety of the Interstate Commerce Commission for disclosing details of collisions not brought out by the ordinary published accounts. Reporting on the rear collision of passenger trains which occurred at Elwood, N. J., on August 24 (see *Railway Age*, September 12, page 514), Chief Borland concludes that the engineman at fault "must have dozed off or have suffered a momentary lapse of his mental faculties"; and that he "had probably had less than four hours' sleep since Saturday morning." The collision occurred at 4:45 Sunday morning.

Being awake 19 hours out of 23 is not a condition to condemn an engineman, absolutely; but it is significant that sleepiness has been a chief factor in four of our worst recent collisions: Mount Union, Pa., February 27, 1917; Ivanhoe, Ind., June 22, 1918; South Byron, N. Y., January 12, 1919, and now Elwood. The law requiring enginemen to take eight hours off duty may almost be looked upon as a farce. It does prevent those extreme abuses which formerly were frequently heard of; but there are men who, when off 12 or 24 hours, or even much longer, continue their former irregular habits of sleeping whenever they please; and the comparative frequency with which cases of that kind become public indicates that actually there must be multitudes of them. Obsessed by a combination of lack of knowledge, insufficient experience and dull consciences, such men get into a condition where they will start out on a trip in a foggy night with apparently no realization of the awful responsibility they are taking.

The fact that our best roads make such unsatisfactory progress in coping with this difficulty—the difficulty of knowing that runners always go on duty fresh and rested—reinforces very strongly the argument for the use of the automatic train stop. The objection that automatic stops are costly will always be with us; but of the other arguments—those of a technical or scientific character—all have been silenced, except that concerning this matter of improving discipline. In the face of 25 years' unsuccessful efforts to build up a measurably perfect personnel for our locomotives, the argument persists that the automatic stop and its perplexities must be frowned on because we can provide "something else just as good." This means, if it means anything, that our discipline is good enough, or is becoming good enough, to warrant passengers in entrusting their lives to enginemen depending for competency on the use of their eyes, and perfect habits in using them. (We go on ignoring the benefits to be derived from signal adjuncts making use of enginemen's ears.) This claim is not being made good. And if this is the situation on our best roads, what shall we say of those which are second best? Or of those parts of the big roads where the officers, the enginemen and the signaling are below the highest standard? Keeping a large force of enginemen 100 per cent efficient—or even keeping them somewhere near that—is not accomplished to a satisfactory degree in the passenger service, let alone the freight.

As long as the Chicago & Eastern Illinois can boast of five years' favorable experience with an extensive installation of automatic stops; and the Great Western of England can report 12 years' satisfactory experience with its large number of cab signals (many of them fitted also with brake-setting apparatus), the burden of proof rests on American railroads to show what reason, except lack of money, justifies them in their policy of inaction. And it is just possible that the financial side of the question might profitably be studied somewhat more in detail. Figures showing the money cost of each one of the last ten—or the last fifty—notable train wrecks in the United States would make a striking impression, even when set beside the highest estimates of what automatic stops would cost.

The Elwood report, abstracted on another page, shows that the collision was occasioned—not caused—by an unexplained electrical failure in connection with an automatic block signal; a striking example of the delicate nature of the signal maintainer's responsibilities. The report also contains instructive details concerning auxiliary causes. The flagman and the firemen had little or no acquaintance with the road, and even the engineman apparently had none too much.

The case also affords a very interesting example of how, with the best visual block signals, the flagman, with his torpedoes and fusees, cannot be expected to furnish a satisfactory supplementary safeguard. The line of road is straight and nearly level, and is well signaled; but the conditions on that August morning afford very definite evidence that with sixteen passenger trains following one another, on a foggy night, as closely as they can, the desideratum is a block system on which the dependence can be absolute. This report shows with what difficulty and how very imperfectly the flagging rule is carried out under such circumstances. Operating officers will do well to read every page of it. There is no map or diagram of the line, and it is difficult to localize and make clear all of the doings of the men on the three or four trains, the movements of which are discussed; but there is ample testimony to the great gap between the words of Rule 99, as they are quoted in courts and other public hearings, and the practice of the men who are expected to put the rule in practice. Even where the conduct of a flagman has been measurably correct, it is next to impossible, in a case like this, to demonstrate the fact, with any satisfaction, in a subsequent inquiry. The flagging system finds itself powerless, in the final test, to avail itself of what little virtue it does possess, for no one is able to put the witnesses' testimony together into a lucid story.

Corporations and Liberty Bond Subscribers

The United States Railroad Administration sold a large amount of each of the Liberty Loan bonds to railroad employees and officers, on the installment plan under which payments for the bonds were deducted from the payroll. Whether intentionally or not, there was actually considerable pressure brought to bear on the individual to subscribe to bonds to an amount equal to the average subscription of others earning about the same amount. Since the individual capacity to save, even when such accidents as sickness or death in the family do not arise, differs widely between different individuals, there were a considerable number of railroad men who found the payments on their bond subscriptions irksome, if not impossible. In most cases, the federal managers of the railroads refunded partly paid subscriptions to individuals who had sickness or death in the family, and to those who left the employ of the railroad before all of the payments had been completed. Payments on the Fourth Liberty Loan and the Victory Loan are not in all cases completed yet. Furthermore, the cashing of the coupons on the bonds and the exchange of the present temporary bonds for definitive bonds is something which the employees have looked to the railroad company to do for them. When the roads are turned back to the owning corporations, what is to become of the bonds which the federal treasurers hold, and which they have paid par for in the expectation of having the bonds taken off their hands through monthly subscriptions by employees? This subject was discussed at some length at the annual meeting of the Society of Railroad Financial Officers, which includes in its membership both federal and corporate officers. No action was taken officially by the Association, but the consensus of opinion was plainly that either the bonds should be retained by the government and treated as unsold treasury bonds, or turned over to the corporations at market value, not par value. This seems so obviously fair that it needs no comment.

On the other hand, as to continuing the work of collecting subscriptions, cashing coupons and exchanging bonds, there seem to be among certain railroad financial officers a feeling that this was not a duty that devolved on the corporations when they resumed operation. While this attitude is easily understood, and in a narrow sense may be justified, a broader way of looking at it would be to cheerfully shoulder the burden of this work, accepting it as part of the after-war costs that we all have to pay. The experience of having bought Liberty bonds with the resulting regular saving of part of the monthly wage was of inestimable value to railroad wage earners, as to other wage earners, and the railroad corporations can well afford to bear a certain amount of the left-over trouble and expense of completing the transaction.

The Extraordinary Railway Labor Conditions

The present conditions in the railroad labor field are the most remarkable that ever existed. A little over three years ago a controversy arose between the railway companies and the train service employees over the demands of the latter for the use of an eight-hour day as a basis for calculating wages and for time and a half for overtime. The railway companies offered to arbitrate. The employees declined arbitration in any form or before any tribunal. President Wilson supported their declination, saying the eight-hour day was not an arbitrable matter. Congress on the President's recommendation passed the Adamson law establishing the basic eight-hour day.

Subsequently, during the sixteen months which remained of private operation, the railway companies made advances in wages, including those caused by the Adamson law, amounting to probably $300,000,000. On January 1, 1918, government operation began. The government has openly and expressly encouraged the organization of railway employees, practically refusing to deal with them except through unions. Never were railway labor unions treated with so much consideration as since government operation was adopted. The eight-hour day and the basic eight-hour day have been made practically universal. Advances in wages have been granted amounting to $1,000,000,000 a year, which, added to those made under private operation, makes the total advances during the last three years about $1,300,000,000 a year.

The traditional visitor from Mars might expect to find the railway labor situation, as a result of these changes, settled and untroubled. On the contrary, the railway labor situation never was so unsettled and troubled. Three years ago Congress was rushing through legislation to give certain railway employees what they asked to keep them from striking. Today Congress is seriously considering the enactment of legislation to make it a criminal offense for railway employees to strike, or for any person or persons to incite them to strike. In spite of the vast advances in wages which have been made the railroad labor organizations are threatening to strike unless the government either reduces the cost of living or grants another huge advance in wages. They are also threatening to strike if Congress passes legislation to prohibit railroad strikes. One of the charges formerly urged against private management of railways was that it was not successful in dealing with labor. The government, in spite of all the enormous concessions it has made, has been just as unsuccessful as the companies in satisfying labor.

Meantime, the public has revised its ideas regarding the

true causes of the controversies which were chronic under private operation. Having found that the labor leaders are as hard to satisfy and as belligerent under government as under private operation the public has begun to assume an attitude which is distinctly hostile to organized railroad labor. This attitude is reflected in the compulsory arbitration provisions of the Cummins bill. These provisions are more drastic than any ever suggested by the spokesmen of the railway companies. The farthest the spokesmen of the railways have suggested legislation should go is to make strikes and lockouts unlawful until the merits of the points in controversy have been investigated and reported upon by some tribunal in which representatives of the public hold the balance of power. The senators who drafted the Cummins bill propose to make strikes and lockouts absolutely illegal.

The *Railway Age* never has advocated compulsory arbitration. It does believe, however, that strikes and lockouts which will interrupt transportation should be made unlawful until the matters in controversy have been heard and passed upon by some tribunal on which the public is represented. Furthermore, we believe the law should contain provisions which would insure that no strike would be ordered until it actually had been authorized by the members of the labor organizations concerned, and authorized under conditions which gave all of them opportunity to know what the matters in dispute really were, to vote their true sentiments, and to have their votes correctly counted and reported. Our European editor has sent us an extremely interesting article about the railway strike in Great Britain. It shows, among other things, that their strike occurred without the men having an opportunity to vote on it and without a large majority of them knowing what they were striking about.

The question of whether the railroads of this country shall be tied up is far more important than most of the issues voted on in our state and national elections—more important to railway employees and to the public. Therefore, if strikes are to be permitted after the matters in dispute have been fully investigated by representatives of the public the law should provide for the following: First, that all strike votes shall be taken by the Australian ballot system so that every member of a union considering a strike will be given a ballot setting forth clearly and correctly what it is proposed to strike for and have opportunity to go into a booth by himself and vote on the question as his reason and conscience dictate, without pressure or dictation from his fellow members or leaders. Second, that every strike vote shall be counted and reported by public officials to make sure whether those voting actually have voted to strike or not.

The railway labor leaders say that the absolute prohibition of strikes would mean "involuntary servitude" for railway employees and would be contrary to American institutions. There would certanly be nothing undemocratic or un-American, however, in legislation the only effect of which would be to require such an important issue to be passed upon freely and intelligently by those who were considering striking. The public clearly has a right to protection from railroad strikes, such as that in Great Britain, which are ordered by labor leaders regardless of the views of their followers.

Meantime it behooves the members as well as the leaders of the railway labor organizations carefully to consider what the present attitude of Congress means. A large majority of its members, if they should vote their true sentiments, would vote in favor of the anti-strike provisions of the Cummins bill. Nobody who comes in contact with all classes of the people will question that the attitude of members of Congress reflects that of a large majority of the people of the United States. The present attitude of the public is due to the destruction of voluntary arbitration by the leaders of the railway brotherhoods three years ago and to the incessant threatenings of strikes and revolutions in which they have been indulging ever since. They have been trying to bluff the American people, and the American people have about made up their minds to call the bluff.

Now, there is no use in railway employees fooling themselves with the belief that they can dictate to the entire American public. British railway employees tried to dictate to the British public by actually striking. The government resisted them, a vast majority of the public backed it, and the strikers were whipped. The immediate outcome would be the same in the United States. The ultimate outcome might be the destruction of the railway labor organizations.

The railway companies dictated in politics in many states for years. Then the public arose against them and for almost fifteen years the companies have been struggling, not to get back the power that they have lost, but merely to get something like decent and fair treatment from the public. A wise man once said that "experience is the best teacher, but a man is a d—— fool who will not learn by the experience of other people."

Nobody is in the least scared by the talk of Mr. Stone, Mr. Shea, Mr. Plumb and others about a revolution. Revolutions to which a vast majority of the people of a democratic country are opposed never occur. A vast majority of the people of the United States are not in favor of a revolution of any kind; they don't intend to have one, and furthermore, they don't intend to be ruled or bluffed by any particular class. The sooner the organized railway employees recognize these plain facts and begin to act accordingly the better it will be for everybody, and especially for them.

New Books

America's Munitions, 1917-1918, *Report of Benedict Crowell, Assistant Secretary of War and Director of Munitions.* 592 *pages,* 6 *in. by* 9 *in., illustrated. Bound in cloth. Government Printing Office, Washington.*

This rather unusual government publication steps outside the bounds usually set up for such documents and takes a place among the really interesting and readable books. It contains a complete description of America's many-sided and extensive activities included under the name in the title. Each chapter is devoted to a particular part of the work, such as gun production; mobile field artillery; railway artillery; explosives, propellants and artillery ammunition; machine guns; airplane production; the Liberty engine; balloons; engineer activities; gas defence, and so on, over the wide range of activity that had to be carried on. Written in an interesting fashion, each chapter describes the material to which it relates and shows how different models were investigated and adopted—French, English and American, as the case may have been. It then shows how the models adopted were put into production, which required in many cases the building of entirely new plants, or at any, rate extensive additions, and the installation of the new machinery. Naturally, the book is written in a somewhat optimistic vein and one does not find much trace of the criticism that racked the country at the time concerning the slowness with which many of the things to be done were gotten under way and carried out. There is some attempt nevertheless, to explain many things that unfortunately reached the point where they needed explaining.

In view of the great part that the railway supply industry played during the war, the book will be found of no small interest to readers of the *Railway Age.* The author has recognized the able work done by the industries of the country during the war, and has given in detail the work done by the individual concerns, with special reference to those cases where they had to overcome unusual obstacles or carried out their contracts with exceptional despatch.

The Deserted Great Eastern Railway Goods Siding at Strotford, London.

Great Britain's Nine-Day Railway Strike

Test of Strength Between Railwaymen's Union and Government Decided by Public Opinion

By Robert E. Thayer,
European Editor of the *Railway Age*.

London, England.

Never before in the annals of organized labor has there been called a strike of such great proportions and which affected so vitally the life of a nation on such unwarranted grounds as that of the nine-days' railway men's strike in Great Britain. The fundamental cause of this strike was a minimum wage which the government proposed to put into effect after the cost of living had been reduced to a certain amount, and under no circumstances until the end of next March—six months hence. That a body of men, such as the executive committee of the National Union of Railwaymen, should precipitate such a serious crisis as a complete tie-up of railway transportation when there was at least still six months before any reduction would be made in existing wages, is beyond belief. A consideration of the facts as they stand gives strong support to the accusation, already made in Great Britain, that this Union was seeking an excuse for a strike; in other words it was seeking to test its strength against the government.

While the union executives persistently made the claim that it was a strike wholly and solely for the betterment of conditions and increased compensation, the public, regardless of its views as to the justice of the men's claims, could not consider it as such. To the public it was not so much a matter of wages as it was an insurrection, and the people rose to meet the situation in a wonderful spirit. The unpopularity of the strike and the weakness of the cause were further illustrated by the action of other labor unions which came to the rescue of the National Union of Railwaymen, and so ably brought about "an honorable settlement," which again opens the discussion of the minimum wage and advances six months—to the end of September, 1920—the period during which no reduction shall be made in the existing wages, which in any case would not have been put into effect unless there was a reduction in the cost of living.

While the responsibility of the strike has been placed on the railway men it is a question whether they as a class should be charged with it, for the strike was precipitated more by the action of the executive committee of the union rather than by the men themselves. When the strike was called on Friday, September 26, at midnight, there were but few railway men throughout Great Britain that really knew the details of the disputed points which led to the strike, but they followed their leaders blindly. The men had absolutely no voice in the matter, as no strike vote was taken on the questions involved.

The Important Lessons of the Strike

One great lesson to be learned is that no government, deserving the name of a government, despite the extremely poor situation it may be in, will permit itself to be dictated to by a class of workers no matter how important their position may be in the economic life of the country. The government of Great Britain was surely in no position to fight a strike that involved the cessation of work by its railway workers, but it did not permit itself to be dictated to by them.

Another important lesson taught by the strike was that of the independence of a nation when faced with a crisis so grave as that of a general cessation of work by its railway workers. Both the government and the railway men were greatly surprised to find how well the nation could physically exist with meagre transportation facilities. Of course,

it is not meant to imply that a nation would economically exist for any length of time without adequate railway transportation, but as for being starved into submission by the refusal of the transportation men to work, it was shown that it could not be done—at least in Great Britain. Other means of transportation have developed so rapidly during the war that it was not difficult to provide adequate means for properly distributing the food supply of the nation, thus keeping it alive without the aid of the railways. With the experience gained from the war and the equipment available as a heritage from the war, England found little difficulty in rapidly organizing a comprehensive and adequate system of motor transport to meet the pressing needs in the distribution of food.

A third point which the strike strongly emphasized is that of the necessity of the laboring classes using greater care in the selection of the men who represent them and whom they give such unlimited powers. The strength of the labor unions in all countries depends upon their being led by men of greater ability and broader vision than are many of the union leaders today. The organization of labor has become so large and has so great an influence on the economic welfare of the nation that as much thought and care should be exercised in choosing its leaders as is done in choosing the leaders of a nation. It is not enough for labor unions at the present time to think in terms of increased wages and better working conditions—they must also consider their economic position as regards the nation as a whole.

A fourth essential point is the necessity of "open diplomacy" in controversies between labor and the government. It was not until three days after the strike had been called that the public of Great Britain had an opportunity really to

Photo copyright by Keystone View Co., N. Y.

The Volunteer Workers Helped Save the Day. A Scene at Marylebone Station

find out what the strike was about, and until then it was unable to form any definite opinion as to the justice of the position of either the unions or the government. Had the conferences and the questions at issue been thoroughly understood, not only by the public, but by the rank and file of the railway men, it is very doubtful if there would have been a strike. The justice of the unions' claim for an increase of the minimum wage was entirely forgotten when it was learned that the union had still six months in which to seek a settlement before any reduction could be made.

In commenting on the strike a few days after it had closed, the Prime Minister stated that in order to preclude the recurrence of similar misunderstandings, the community must make it clear that it means to deal justly and fairly with the claims of all classes. A man's property, whatever form it takes, whether that of land, buildings or labor, if the community needs it, it must pay a fair price for it. "We must make it clear," he said, "that the nation means to be master in its own house—a firm master, a strong master. We must make it clear—a fair master and a generous master —but always a master in its own house."

The Questions in Dispute

During the war the British government found it necessary, in order to meet the increased cost of living, to advance the wages of the railway men. This was done on a sliding scale and the pre-war wage was still maintained as a base. The increase made applied to every railway man in the country and at the beginning of the year it amounted to 33 shillings ($7.92) per week per man which was to be added to the regular pre-war rate of pay. Last March an agreement was made between the government and the unions—the National Union of Railwaymen, the organization which

Passengers Removing Their Own Luggage at Waterloo Station, London & South Western Railway

precipitated the present strike, and the Associated Society of Locomotive Engineers and Firemen—to the effect that the railway workers should continue to receive this 33 shilling bonus until the end of this year and during that time a permanent standard wage should be determined for all railway workers to apply to all the railways throughout Great Britain. This has been given the constant attention of the government, and last August standard rates of pay were determined and accepted by the union for the locomotive engineers, firemen and cleaners.

These new rates were such as to include and in some cases to exceed, for most of the engineers and firemen, the 33 shilling war bonus. The plan was to increase the wages by an average of over 100 per cent over the pre-war wage. Several schemes were also submitted to the National Union of Railwaymen for the other railway workers, which includes porters, ticket collectors, passenger guards (conductors), goods guards (freight conductors), shunters, checkers, carmen and plate layers (track men). These men are of the lower wage class and in applying the 100 per cent increase to their wages the new standard wage was not sufficiently high to absorb the 33 shilling war bonus. A minimum wage was established at 40 shillings ($9.60) per week for all adult workers. These men did not receive the same increase in actual money as the engineers and firemen and it was to this that the National Union of Railwaymen objected, claiming that members of its organization should receive as much as the members of the Associated Society of Locomotive Engineers and Firemen. In presenting the new wage schedule to the union the government stated that as soon as these new rates were agreed upon they would come

into immediate effect with the added stipulation that in no case would a reduction in wages be made before the first of the year. The union considering this as a definite order and at the same time declining it, announced on Wednesday afternoon, September 24, that the railwaymen would be called upon to strike at midnight on Friday, September 26.

The negotiations with the union had been carried on by the Board of Trade and the Railway Executive Committee, but the declaration of the strike brought forth a conference between the Prime Minister and the Cabinet on the one hand and the executive committee of the National Union of Railwaymen on the other. Conferences were held the following Thursday and Friday in which the union demanded that the permanent standard minimum wage would be the highest maximum paid in each class of service before the

Photo copyright by Keystone View Co., N. Y.

The Rev. W. Pollack-Hill, Chaplain to the Forces, Doing Duty as a Porter at Paddington Station

war plus the 33 shilling war bonus. The secretary of the union pointed out that when the cost of living had been reduced it would be time for the government *to ask the union* to review the circumstances in the light of conditions which existed at that time. The government made a further offer that in no case would the existing wage, including the 33 shilling war bonus, which was fixed when the cost of living was 125 per cent above the pre-war cost be reduced until the cost of living had fallen and remained for three months at not more than 110 per cent of the pre-war cost. The following is a summary of the government's final analysis of what it had given and would give the men:

1. Standard wage of an average of 100 per cent over the pre-war wage with a minimum of 40 shillings, to remain in effect irrespective of the decline in the cost of living.

2. Time and a half for Sunday duty and time and a quarter for night duty with overtime over eight hours. This has already been conceded and is in operation and represents an average increase to the railway workers of 20 per cent over the pre-war wage.

3. In addition to these advantages in money the government has already reduced the hours of labor to eight.

4. In any event no reduction in the present wage will be made before January 1, 1920, and from that time on no reduction will be made until the cost of living has fallen and remained for three months at not more than 110 per cent.

It will thus be seen that the men who were to receive more than the 33 shillings in their new adjusted permanent wage would be better off by the acceptance of this schedule, and further that those who did not receive an advance equal to 33 shillings per week would not suffer any reduction until the first of April next, and not then if the cost of living had not remained as low as 110 per cent of the pre-war cost for the three preceding months.

The schedule of weekly wages proposed by the government for the men in the lower wage class and concerning which the controversy was principally about is shown, in shillings (24 cents), in the following table which gives the

A Cameron Highlander on Duty at Marylebone Station, Great Central Ry., London

pre-war wage, the present wage guaranteed until March 31, the minimum standard wage and the bonus which rises or falls with the cost of living:

	Pre-war wage	Present wage guaranteed to March 31	Minimum standard wage	War bonus which rises and falls with the cost of living
Porters	16 to 22	49 to 55	40 to 49	9 to 6
Parcel porters	22 to 30	53 to 63	45 to 54	8 to 9
Ticket collectors	21 to 31	54 to 64	45 to 54	9 to 10
Passenger conductors	25 to 35	58 to 68	48 to 60	10 to 8
Goods conductors	25 to 35	58 to 68	48 to 60	10 to 8
Shunters	20 to 31	53 to 64	46 to 60	7 to 4
Goods porters	20 to 26	53 to 59	40 to 47	13 to 12
Checkers	21 to 31	54 to 64	46 to 55	8 to 9
Carmen	20 to 29	53 to 62	45 to 52	8 to 10
Plate layers (trackmen)	21 to 24	54 to 57	40 to 50	14 to 7

Note (1). The lower rates apply chiefly in the country; the higher rates in industrial areas.

Note (2). The figures of the cost of living, that is, rent, retail prices of food, clothing, fuel, light and so forth, are to be those shown in the *Labor Gazette*.

Regardless of the fact that the situation would not be changed until six months hence, the executive committee of the Union would not accept the terms and despite the Prime Minister's request that more time be taken for discussion it permitted the strike to go into effect.

Throughout the negotiations every effort was made to im-

press upon the Union's Committee what the concessions would cost in increased operating expenses. Sir Robert Horne, the minister of labor, estimated the proposed increase at approximately $335,000,000, or 140 per cent of the pre-war wage. To meet this added cost in railway operation it was stated that the passenger rates, which it has been hoped would be reduced from their 50 per cent increase, would have to remain as they are, and that freight rates would undoubtedly have to be raised if the government acceded to the Union's demands.

Attempts at Reconciliation

The call of the Union for a strike received a remarkable response from the railway men, and on Saturday, and Sunday the first two days of the strike, railway services was practically at a standstill. The engineers and firemen, although they had accepted their revision in wages, went on strike in sympathy with the Railwaymen's Union. The Union was thus very much encouraged and throughout the country made the prediction to its men that the government would accede to their demands within three days. But such was not the case. Public opinion was unanimous in support of the government, and it was not long before it was seen that the Railwaymen's Union was playing a losing game.

On Wednesday, the fifth day of the strike, the Transport Workers' Federation, an organization made up of over 30 unions, including the dockmen, and licensed vehicle workers and having a membership of about 500,000 men, held a conference to discuss, it was supposed, the matter of a sympathetic strike. Representatives of various other prominent labor organizations which were not directly interested in transport were called to attend this conference. While nothing is available regarding the discussions at this conference, the succeeding actions indicate that the more level headed and conservative elements in labor recognized the serious position in which the National Union of Railwaymen had placed the whole labor cause. The result of this conference was the appointment of a conciliation committee consisting of conservative labor representatives, which acted as an intermediary between the railway men and the government. A meeting was arranged between the railway men Executive Committee and the Prime Minister with the distinct understanding that the government would no resume negotiations with the Union until the striking railway men had resumed work.

As a result of these conferences on Wednesday and Thursday the Government made the following proposal of the basis on which negotiations could be continued:

1. That upon the men now on strike returning to work negotiations shall be taken up where they were broken off last Friday.
2. That in accordance with the offer made by the Prime Minister on Friday last the government guarantee that there will be no reduction in wages until March 31, 1920, and the government undertake that any time after December 31, 1919, they will be ready to discuss, in view of the circumstances then existing, the possible extension of that date.
3. That the government are prepared to discuss with the railwaymen any unfairness or hardships affecting any particular grade of workmen through the operation of the scheme of standardization already put forward by the government, and to consider any anomaly as between the various grades in the application of the percentage of increase proposed to each grade.
4. In the event of failure to agree upon any question arising out of the matter mentioned in paragraph 3 the point of difference be referred to arbitration.

The National Union of Railwaymen declined to accept these terms.

At a meeting on Friday morning the Prime Minister proposed that the N.U.R. should agree to a truce of the strike for a limited period of a few days in order that negotiations might be resumed with a view to reaching a settlement. The Prime Minister further indicated that if the railwaymen returned to work on this basis arrears of wages would be paid to them.

The N.U.R. agreed to the suggestion made by a truce, but only "on condition of the government being prepared to work out a basis for standardization which shall operate in the same manner to the various grades as in the case of those grades for which a settlement has been effected."

The government rejected this proposal on the grounds that the grades referred to were settled as was claimed by the railwaymen on their special merits and on the understanding that the other grades now in dispute would be treated on their merits, and that the demand made now was only a repetition of the original scheme which had already been declined.

The Prime Minister then made the following counter-proposals:

1. The government are prepared to agree to a truce of seven days to count from the full resumption of work in order to discuss —
(a) The period of standardization of wages.
(b) Any alleged unfairness or hardship affecting any particular grade of workmen through the operation of the scheme of standardization already brought forward by the government, and any anomalies as between the various grades in the application of the percentage of increase proposed to be made for each grade. In the event of failure to agree upon any question arising out of the matters mentioned.
2. The government are prepared to submit the questions in dispute to arbitration. If at the end of five days after the full resumption of work the representatives of the men come to the conclusion that the negotiations cannot be brought to a satisfactory issue, they will undertake to give 48 hours' notice before any cessation of work takes place. If negotiations be again broken off, the men agree to hand over all plants in good working order, and to run all trains to their destination. The men agree to work harmoniously with the railway servants who have remained, or who have returned to work. The railway executives agree to undertake that there will be no victimization of the men who have gone on strike.

The Marquis of Cholmondeley, Unloading Eggs at Paddington Station

This proposal was rejected by the N.U.R.

The intermediary committee, however, attempted to find a way of renewing the negotiations, and late on Sunday, the ninth day of the strike, a compromise was made, the terms of which are as follows:

1. Work to be resumed forthwith.
2. On full resumption of work negotiations shall be continued with the understanding that they will be completed before December 31, 1919.
3. Wages will be stabilized in the United Kingdom at their present level

until September 30, 1920. Any time after August 1, 1920, they may be reviewed in the light of circumstances then existing.

4. No adult railwayman in Great Britain shall receive less than 51 shillings so long as the cost of living is not less than 110 per cent above pre-war level.

5. The National Union of Railwaymen and Amalgamated Society of Locomotive Engineers and Firemen shall agree that the men work harmoniously with the servants who have remained at or reported to work, and the government and the National Union of Railwaymen and Amalgamated Society of Locomotive Engineers and Firemen agreed that no man shall be prejudiced in any way as the result of the strike.

6. The arrears of wages which have been withheld in consequence of breach of contract will be paid after the resumption of work.

The British Railway Strike—The Closed Gates at Victoria Station

A seventh point was brought to light in the report of Mr. Thomas, the general secretary of the National Union of Railwaymen, to his men, but which was not included in the government's report of the settlement. It was, in effect, that if the standardization of wages resulted in an increase over that which the men are now receiving, it is to be paid as from August 18 of this year. Thus the final settlement appears to include an extension of the guarantee that the present level of wages, including the war bonus, will in no case be reduced until September 30, 1920, and that any increases over the present wage will be retroactive to August 18.

Features of the Strike

At the beginning of the strike the response to the call of the labor union executives was remarkable. Practically all train services were at a standstill on Saturday and Sunday, no trains being run into or out of London on Saturday. On Monday a few trains were run, and from that time on the number increased rapidly each day. On Tuesday over 800 passenger trains were run, on Wednesday 2,380, on Thursday 2,593, on Friday over 3,400, and on Saturday a similar number. The number of freight trains operated remained at a very low figure throughout the entire strike. The improvement in the passenger service was obtained through the gradual return of the strikers to work and by the aid of volunteers. The action of the union's executive committee in declaring a strike was so precipitate and so little information had been published regarding the negotiations between the union and the government before the strike, that but very few of the railwaymen understood the points of contention, and they were under the impression that there was to be a drastic reduction in wages. The union was so thoroughly organized and the men had such faith in their leaders that there was no difficulty in getting an immediate response to the strike orders.

A correspondent of the London Post who mixed among the strikers during the week found them to be very much misinformed. Practically every striker he interviewed was out to resist a reduction of wages—an immediate and heavy reduction. Those who were not familiar with the situation were under the misapprehension that all wages were going to be reduced to 40 shillings a week except for the engine drivers. The correspondent attributed the misunderstanding to the propaganda of the railwaymen's union.

It is a conceded fact that had the strike been balloted and had the men thoroughly understood the questions at issue there would have been no strike. W. A. Appleton, secretary of the General Federation of Trades Unions, is reported

Sailors from the Navy Try Their Hand at Plate Laying

to have said that as no reductions were liable to be made within the next three or six months there would have been no strike had the men been allowed to ballot. In fact, a railway office at one important railway center obtained a pledge from the local union that the men would return to work if the government promised that there would be no reduction in wages before the end of March. This point had already been conceded by the government before the strike was called, and the circumstance indicated the unfamiliarity of the men with the points at issue.

Another factor that influenced the men in returning to work was the fact that the government threatened to withhold the two weeks' pay that was due the workers unless they returned immediately to work, the argument of the government being that the men broke their contract and stopped work without due notice and in complete disregard of the effect of their action on persons and property. Further the government did not feel justified in handing over to the strikers money which would be used to prolong the struggle. The amount involved in this question was some $5,000,000. In addition to this the strike pay fixed by the Union was only 12 shillings ($2.88) a week for scale A men, which comprised about 75 per cent of the strikers, and 6 shillings ($1.44) a week for the remainder, with one shilling for each child under 12. This absurdly low allotment—which, by the way, was on a pre-war basis—would put the strikers to a very great disadvantage in a long strike and as time went on the prospects were that the strike would last for some time.

Not only did this monetary consideration and the unreasonableness of the strike influence the strikers in returning to work but in addition the fact that public opinion was so strongly against them and the response of volunteers to the government's appeal for aid was so great that the more intelligent of the strikers saw that they were playing a losing game.

Under the head of "Fight for the Life of the Community" the government issued a strong appeal for volunteers to assist in maintaining the necessary transport service. Not only thousands of individuals, but many organizations, responded to this call, and offered their services. Notable among the latter was the British Federation of Discharged Soldiers and Sailors having a membership of 7,800, the Gillingham Branch of the Comrades of the Great War which had a membership of 1,600, the British Engineers' Association and the Scottish Middle Class Union. In four days this last named association placed in railway service at Glasgow 57 locomotive engineers and firemen, and over 200 men in other positions. Many prominent persons entered into the struggle acting in various capacities from that of porter to motor and engine driver. Graham White, the well known aviator, volunteered to serve as a motorman on the Underground system in London. One of the first trains to leave London for the north of England was driven by a son of a Peer with his chauffeur acting as fireman. Lord Portarlington acted as porter on the Great Western Railway at Paddington station and various other members of English society acted in other capacities.

At London over 35,000 volunteers offered their services not only as railway operatives but as motor car drivers for the extensive system of motor transport the goverment instituted to assist in the distribution of food immediately on the strike being called.

London was particularly hard hit because of the fact that the underground subway workers went on a sympathetic strike with the railwaymen. People in the outlying districts of London found it particularly hard to get to their places of employment. Thousands had to walk to the city and those with automobiles were ever ready to give assistance. Large business houses which operated motor trucks offered them to the service of the public with only a nominal charge.

Food and Mail Situation

The food situation was, of course, the greatest problem the government had to contend with. It was here that the government did remarkable work. It was only a matter of hours before a well developed and effective distributing system was inaugurated in order to provide all sections of the country with food, and in no case was any serious shortage reported during the strike. In explaining this organization, after the strike, the Prime Minister stated that an organization for just such an emergency was started last February. At that time there were signs that such a crisis was coming, and the Prime Minister left the Peace Conference in Paris to come to England to see what could be done. With the aid of his colleagues the organization, which was a purely civilian one, was started under the chairmanship of the Home Secretary, and the plans were so well developed that it was put into operation in a very short time. He made it clear that it had nothing to do with the war forces and was an entirely separate organization which will be kept alive in a dormant state for any other similar crisis.

On the sixth day of the strike it was reported that there were 150,000 vehicles of various kinds in use by the government for transport work.

The flour mills had found it possible to despatch 50 per cent of their output and the bakers were further assisted by flour from the government's reserves. Hyde Park, one of the largest parks in London, was requisitioned for the distribution of milk to London, and on the sixth day of the strike this distribution was up to 75 per cent of normal. As a further precaution to prevent any undue privations, emergency rations were put into effect. Inasmuch as a rationing system was already in effect the difficulty on this score was not great and the situation was met by still further reducing the rations. The weekly ration of sugar was set at 6 ounces, butter one ounce and butchers' meat 40 cents' worth. At hotels and restaurants the total quantities of meat, flour, bread and sugar were fixed not to exceed the following scale per meal:—

	Meat, oz.	Sugar, oz.	Bread, oz.	Flour, oz.
Breakfast	2	¼	2	nil
Dinner, including supper and meat, tea	4	¼	2	1
Luncheon, including meat dinner	4	¼	2	1
Tea	nil	¼	2	nil

The consumption of bread and cakes at afternoon tea was limited to 2 ounces in all. No sugar or butter was served separately at any meal; except to children under ten, no milk could be consumed except in tea, coffee, cocoa and chocolate, as usually served. Furthermore maximum prices were fixed for articles of food which had not previously been scheduled. In London 12,000 tons of food were required daily and one thousand motor lorries were used in the distribution of milk. Throughout the entire nine days of the strike no reports of any privations were received.

The use of motor lorries proved so successful that plans are being developed for using this means of transportation for relieving the breakdown in the system of inland trasportation which has been a serious matter in England for some time and which has contributed so seriously to the congestion of the docks. It is believed that something like 1,000 lorries are to be used at Liverpool for this purpose. Such use of this means of transportation will show how far it can be used as a practical proposition for commercial purposes. Some believe that until petrol falls in price, the motor lorry will be too expensive for long distance traffic. The more efficient lorries used by the government are capable of running 8 to 9 miles on one gallon of petrol, but most of the vehicles cannot do more than 6 miles to the gallon. During the strike the Ministry of Food charged traders making use of the motor transport 12 cents per ton per mile. It is believed that any loss which may be occasioned by using this means of transport to relieve dock congestion will be more

than offset by decreasing the large loss resulting by the detention of ships which are unable to discharge their cargoes.

The transportation of mail created another serious problem. This was handled by army lorries and such few trains as were running at the beginning of the week. In a very few days an aeroplane service was inaugurated from London to Bristol, Birmingham, Newcastle, Manchester and Glasgow, in addition to a continental service between London and Paris and London and Brussels. The aeroplane service worked out extremely well and on Tuesday, the fourth day of the strike, 54 aeroplanes were in service. A charge of

A Volunteer Attending to a Lamp on an Underground Coach

two shillings an ounce on each letter was made for this special service. On one day a Handley-Page machine carried 1,400 pounds of mail matter to Brussels for Holland and Norway and brought back 2,000 pounds. A strong effort has been made through the press to retain this service which worked so successfully, but as the train services improved during the latter part of the strike, the aeroplane service was discontinued.

Effects of the Strike on Industry

While it is impossible to calculate the monetary loss to the country of the nine days' strike, it has been estimated to be in the vicinity of $250,000,000. Despite the fact that Mr. Smillie, the head of the Miners' unions, stated that a week's strike would put 90 per cent of the miners out of work, this did not prove to be true. A large number of mines, however, suffered greatly from the lack of cars but in many instances the mined coal was stored until cars could be procured. A week after the strike had been in effect the majority of the firms in the iron and steel industry had been somewhat affected. In some cases it was necessary to close down the furnaces. The textile industry was not affected to any appreciable degree, nor were the engineering industries. In fact at that time very little reduction of production was reported.

General Gassouin, Director of Transport of France, in commenting on the strike stated that it was particularly serious for that country. France is dependent on England for a coal supply, as the Germans are far behind in their promised delivery of coal. Furthermore in addition it was stated that the export business of France was completely paralyzed and while it was not a matter of great importance to certain lines of merchandise it was fraught with serious consequences in the case of perishable foodstuffs.

Italy too suffered, for the lack of coal, as it relies on England for a monthly supply of 500,000 tons. The quantity of coal coming from America, Belgium, and Germany through France is comparatively small.

A press despatch from Amsterdam presented another phase of how the strike affected Holland. The British fishing fleet, owing to the strike in Great Britain, sought to dispose of its catch in the Amsterdam market and the Ship Owners' Association there requested the government to take measures to prevent this, for otherwise the natural herring industry of Holland would be seriously affected.

Four Atlantic liners were held at Liverpool and the passengers were not allowed to disembark until means could be provided for sending them to their destinations. Both England and the United States were also affected by the cancellation of sailings announced by the American Shipping Board on account of the strike.

Military Measures

It is quite remarkable that there were not more cases of sabotage during the strike. A few instances were reported where engine drivers and other men who had remained loyal

Photo from Central News.

A Parade of Strikers

to the government were attacked; numerous cases of stone throwing were reported, and one or two cases of attempts to derail trains. The government precluded any serious attempts to cause trouble by the distribution of soldiers to strategic points on the railways. The terminals were guarded by police and detachments of soldiers which camped on the station grounds. In some cases machine guns were in readiness to prevent any serious demonstrations. While exact figures of the number of troops involved have not been published it was stated that in the Birmingham district 2,000

soldiers were on duty. Wherever an indication of trouble was found, troops were immediately despatched to provide protection. In some cases detachments of men were carried in the baggage cars of the trains in readiness for any disturbances along the line. One cause of the lack of serious demonstrations on the part of the strikers was undoubtedly due to the counsel of the strike leaders, for they urged the men to refrain from demonstration, and it is a fine commentary on the character of the railwaymen that more trouble was not experienced.

However, it was believed desirable on Friday, October 3, seven days after the strike had been in effect, to issue an appeal to all citizens in all countries, cities and ports to form a citizen guard to act in co-operation with the police in the duty of protection and maintenance of order. This organization is somewhat after the plan of the home guards which were recruited in the United States during the war. The appeal went on to say that if the food and the safety of the nation

Photo from Central News.

A Rush for a Tram

were to be safeguarded in face of the menace by which they were confronted, it was essential that all citizens who were willing to contribute labor should do so without interference or apprehension. While the cessation of the strike made unnecessary the formation of such an organization, it is reported that the plans will be carried forward in order to have such an organization well developed in case any future similar occasion arises.

The Leaders in the Dispute

Too much credit cannot be given Lloyd George, the British Premier, for the tactful way in which he handled the entire situation during the discussions prior to and after the strike was called. There was no attempt to "bulldoze" the men. In fact he made the statment that before the war the railway workers were very disgracefully paid and their hours of labor were too long; in a latter statement he said that the government was not fighting trade unionism, for trade unionism is a recognized factor in the industrial life of the country, but that the government was fighting to prevent the extremists of any industrial body from gaining their ends by attacking the life of the community and so bringing untold misery upon thousands of innocent people. It was evident that he was seeking to give the railwaymen a square deal, but at the same time he could not permit the government to be held up at the point of a pistol by a group of workers who considered only their own selfish ends. After the settlement had been made he disclaimed any credit on the part of the government for having won a victory and said that neither he nor the government wanted a victory over the men. They only wanted a settlement, and that was the spirit in which the negotiations had been conducted.

J. H. Thomas, the leader and general secretary of the National Union of Railwaymen, on the other hand disclosed throughout the controversy a very Prussianistic attitude. He acted as though he felt he had the power to make the government accede to his every wish and he certainly must have had an overdose of egotism to believe that he could challange the government of Great Britain on such a frail excuse as that for which the strike was called. A side light on the character of the man is shown by the following extract from a talk he made to the railway men at Clapham Common during the early days of the strike. He was commenting on a

Photo from Central News.

A Lift on a Motor Truck

statement made by the government to the effect that the strike was a war against society. (The arrangement of the quotation and the italics are ours.)

He said:

"*I* have warned them all through that if it is, the responsibility is theirs.
"*I* say to the government: Do they know what they are playing with? Do they know they are letting loose passions that it will be difficult to control?

"*I* have refused the offer of other trade unions to call their men out.
"*I* have refused the busmen and tramway men.
"*I* have refused the electricians, but
"*I* am not going to continue to do so now that
"*I* am driven to this fight and
"*My* back is to the wall."

That labor leaders in general were not in accord with the action of the railwaymen's executive committee is well illustrated by the action they took in seeking a reconciliation and also by the following statement issued, after the strike, by J. R. Clynes, who is a strong labor man:

"Workmen must more and more look upon the public as a jury which to a great extent can influence governments and determine the settlement on the verdict they may give, whether the men act rightly or wrongly.

"A large number of people who have fully believed the railwaymen should get better terms have not been on the railwaymen's side just because of the manner in which the trouble started."

This statement sums up the situation well, for the strike was settled by public opinion.

Will New Legislation Cause Railroad Expansion?

Real Test of Value of the Law—Carriers Should Invest $6,000,000,000 Within Three Years

By Samuel O. Dunn
Editor of the *Railway Age*

WHEN GOVERNMENT OPERATION was adopted there were many persons in the country who favored government ownership and management. After almost two years of government operation the only large class that now favors government ownership is the railroad employees, and there is no large class which is in favor of government management. I shall not attempt to review the reasons why there has developed such an overwhelming public sentiment against government management. That it exists is unquestionable. It appears certain that the railroads will be returned to private operation at the end of this year.

Assuming, as we all must, that the railways are going to be returned to private management, it would appear that regardless of our individual views on the question of government ownership versus private ownership we should want to see the conditions made favorable to the success of private management. This is a democratic country and if the public ever wills, as it may, that government ownership shall be made the policy of the nation, I shall want to see the system of management adopted one which will insure that government management will be made as successful as it is possible to make it. On the other hand, since the public has willed, that for some years to come, at least, the system of private management shall prevail, every patriotic citizen should desire to see legislation enacted which will give opportunity to make private management as successful as it can be made.

Imperative Need of Railroad Revival

At the present time the most imperative need of the country from a transportation standpoint is an immediate revival of the expansion of railroad facilities on a very large scale. This need does not exist because the railways are going to be returned to private management. It would exist just the same if government ownership and management or the Plumb plan were going to be adopted.

The fact that there is need for an early and very large expansion of railroad facilities has been emphasized repeatedly by the director general of railroads, Mr. Walker D. Hines, who is strategically in the best position to know what the transportation situation is. In a recent address he said:

"In the year or two preceding federal control of the railroads the normal additions to cars and other transportation facilities were not made because prices were very high, labor was scarce, and financing on the part of the railroad companies was unusually difficult. * * * During the first year of federal control there was a severe limitation as to the amount of material that could be taken from other war purposes to use for providing additional railroad facilities. * * * When the year 1919 began we were then confronted with a new difficulty in the way of adding to the facilities, and that was that federal control naturally was approaching its end from the time the armistice was signed. More than that, the failure of the appropriation on the 4th of March last, which had been sought by the Railroad Administration to enable it to meet its obligations already incurred, postponed the construction of even the hundred thousand cars that had been ordered, because they could not be paid for, and the equipment companies naturally had to slow down on their production. The railroad companies were unwilling to furnish money for new equipment because of uncertainty as to their own future, so the result has been that the Railroad Administration during the year 1919 has not been in position to provide any additional facilities except those which were needed, as an emergency measure, unless the railroad companies were willing to furnish the money, and the result is that at the present time the Railroad Administration has been unable to order or obtain authority to order any cars in addition to the hundred thousand that were ordered last year.

"So that that inadequacy of facilities, which were inadequate before federal control began, and which have become increasingly inadequate since that time, principally accounts for the fact that the facilities are not sufficient to handle all of the enormous business which is offering to the railroads of the country. * * * We are in a waiting and uncertain situation with reference to the provision of transportation facilities, and it is a matter of very grave concern to the country. In my judgment if the legislation cannot take definite shape during the month of December, so that the railroads will know where they stand, and can begin making their plans to get the additional facilities they will undoubtedly need to handle the business of next fall, the country will be most disastrously handicapped next fall in having its business moved."

Enormous Deficiency of Investment

If Mr. Hines had chosen to use the available statistics bearing upon the subject of the inadequacy of railroad facilities he could have presented the existing situation in a manner which would have been positively startling. There are several different ways in which you can estimate the amount of new investment which must be made to increase the facilities of the railways enough to bring them abreast of the demands of the country's commerce. Probably the best way to estimate it is on the basis of the increases which have occurred in the investment in the properties and in the amount of traffic handled. Mr. Hines remarked that in the year or two before this country entered the war the railway companies had been unable materially to increase their facilities because of the difficulty of raising new capital. His remark takes us back practically to the year 1915.

Now, in the ten years from June 30, 1905, to June 30, 1915, the increase in the freight business was 61 per cent and the increase in the passenger business 45 per cent. Meantime ,the investment made in new facilities was $5,300,000,000, or 44 per cent. The increase in freight business since the year ended June 30, 1915, has been 57 per cent, and the increase in passenger business 32 per cent, each being almost as great as it was in the preceding 10 years. If the new investment had been as great in proportion to the increase in traffic during the last four and a half years as it was during the preceding 10 years it would have been about $5,000,000,000. As a matter of fact, it has been less than $1,900,000,000. Furthermore, because of advances in wages and in prices of materials, a dollar would not buy during the last four and a half years more than two-thirds, and perhaps not more than one-half as much as it would buy on the average during the preceding 10 years. Therefore, equated on the 1905-1915 basis of the value of money the investment during the last four and a half years has been only about $1,300,000,000.

Assuming that investment should have been made during this four and a half years as fast in proportion to the in-

* From an address delivered before the annual convention of the American Mining Congress, St. Louis, Mo.

crease of traffic as it was during the preceding ten years, the investment in the railways has fallen behind approximately $3,700,000,000 during this time. But that is stating the deficiency in the pre-war value of money. In the year 1919 two dollars will not buy a railroad any more labor, equipment and materials than a dollar would on the average in the years 1905-1915. The average wage of an employee is now 125 per cent higher than it was then. Now, the deficiency of investment must be made up in dollars of the present value. On that basis it would take over $7,000,000,000 to make up the deficiency in railroad investment which has been allowed to accrue since 1915.

Great Increase of Traffic—Little Increase of Facilities

This deficiency in investment is strongly reflected in the remarkably small increase in facilities which has been made. During the ten years ending with 1915 the increase in the freight traffic of the country was 61 per cent and the increase in the number of freight cars in service was 36 per cent. During the last four and a half years the increase in the freight traffic of the country has been 57 per cent and the increase in the number of freight cars in service has been only about 5 per cent.

Between 1905 and 1915 the increase in passenger traffic in this country was 45 per cent and the increase in the number of passenger cars in service was 36 per cent. Since 1915 the increase in passenger business has been 32 per cent and there has been practically no increase in the number of passenger cars. The increase in the number of locomotives in the country in the ten years from 1905 to 1915 was 30 per cent. In spite of the enormous increase of traffic since 1915 there has been practically no increase in the number of locomotives. The increase in the railroad mileage of the country between 1905 and 1915 was over 40,000 miles, or over 4,000 miles a year. There has been almost no increase in mileage at all in the last four years, the mileage torn up or abandoned being practically equal to that built. There has been a great increase in the efficiency with which railway facilities have been used in recent years—most of this increase having taken place under private management during 1916 and 1917—and therefore it undoubtedly would be an exaggeration to assume that there must be an investment of $7,000,000,000 to make good the deficiency which has accrued since 1915. But allow all that we dare for that increase of efficiency, and cut the estimated deficiency in half, and you will still have a deficiency to make good of at least $3,500,000,000.

Besides making up this deficiency of investment and facilities, the railways must provide in future still other additional facilities to care for the future increase of business. As I have shown, the average investment per year in the ten years ended June 30, 1915, was $530,000,000. With present wages and prices it would cost at least $1,000,000,000 to provide as much additional facilities as were formerly provided for a half billion dollars. With a deficiency of at least $3,500,000,000 to make good and an investment of at least $1,000,000,000 a year required to provide for the growth of business, it follows that the railways, if they are to provide for the needs of American commerce, must raise and invest at least $6,000,000,000 or $6,500,000,000 of new capital within the next three years if they are to catch up with the needs of the country. This is a conservative estimate. They ought to acquire within that time, for example, about 800,000 freight cars, 20,000 locomotives and 10,000 passenger cars and to provide other facilities — new lines, tracks, sidings, yards, terminals, roundhouses, shops, and so on—in proportion.

It is needless to tell any man who ships goods or who travels upon our railroads that the vast deficiency in railroad investment which has accrued is reflected in the service now being rendered. It has become impossible for the railroads to handle all the traffic which is offered to them at any time when the country is producing to anywhere near the limit of its capacity. In the fall of 1917 the Railroads' War Board warned the government that even then it had become impossible to handle all the available freight and that if the essential war traffic was to be handled the so-called "non-essentials" would have to be excluded. In 1918, under government operation, in spite of the fact that the government had almost unlimited power and the advantage of $577,000,000 worth of additional facilities the railway companies had provided in 1917, it was able to increase the freight handled only 2 per cent, and it found it necessary constantly to embargo many kinds of commodities. Last spring, when the railways lost a large amount of war business, there was a temporary surplusage of cars, but as soon as the country began to produce again on a peace basis this surplusage disappeared and during recent months it has again been impossible to handle all the available freight.

I do not say merely that it has been impossible to handle all the freight satisfactorily. I say it has been impossible to handle much of it at all. It has been impossible to furnish sufficient cars to the coal mines and that has cut down the production of coal. It has been impossible to furnish enough cars for the movement of lumber and that has curtailed the production of lumber. It has been impossible to furnish enough cars for the movement of wheat and that has curtailed the movement of wheat. The various state, municipal and other governments have appropriated $633,000,000 to be spent during the next year in building new roads. Those roads can't be built simply because the railways can't handle the materials.

Railways Limiting Factor in Production

People talk about the need for an increase in production. There is great need of an increase of production, but there cannot be any further substantial increase of production in this country until there has been a substantial increase in the facilities of transportation, because there can be no substantially increased production without increased transportation. Unless there is invested in new railroad facilities within the next three years at least $6,000,000,000 of new capital, it is a perfectly safe prediction that three years from now the railroads will still be unable to move all the commodities that the country can produce; and regardless of the amount of new investment made in railroads meantime there will not be a year in the next three, unless there is a severe depression in general business, when the railroads, whether under government or private management, will be able to move all the traffic which the industries of the country can offer.

Many people seem to think that as soon as the railways are returned to private operation there will be a restoration of the good freight and passenger service which formerly was rendered. The good service formerly rendered will not be restored immediately or very soon after a return to private operation because the cars, locomotives, tracks and yards required to render it do not and will not exist. They can be provided only by a vast expenditure of new capital, and unless there is a vast expenditure of new capital they never will exist.

Having provided means of preventing abuses in financial management in future the public must also in its own interest in some way assure to those who make investments in railways that they will be given opportunity to derive a reasonable return from their investments.

The True Test of Regulation

The principal test which should be applied to any measure to solve the railroad problem which is introduced in Congress is the question, "Would this proposed legislation

if passed enable the railroad companies to raise and invest in their properties at least $6,000,000,000 of new capital within the next three years?" If the answer "Yes" can be made to that question, then the proposed legislation may be sufficient, but if the answer "No" must be made, then the proposed legislation certainly is not sufficient, no matter how good it may be in other respects. The question of what net return the railway companies are to be allowed to earn, is from the standpoint of the public as well as that of the companies the very essence of the railroad problem. Without that question clearly and soundly settled no advance whatever will have been made. Without that question clearly and correctly answered by new legislation the return of the railways to private operation will not be followed by a revival of the expansion of railroad facilities; and without a revival of railroad expansion the country's industrial and commercial growth will be practically stopped.

Effects of Temporary Legislation

President Wilson announced in May that the railways would be returned to their owners at the end of the present year. It was generally recognized at that time that before they were returned some important legislation should be passed. It now appears probable that if they are returned to their owners on January 1 it will be under some kind of temporary legislation which will continue the present government guarantees, but which will not definitely settle what return the railways are to be allowed to earn after the guarantees are withdrawn. It will be better to return the railways to their owners under such temporary legislation than not to return them at all at the end of the year; but every day that permanent legislation is delayed will postpone the beginning of the expansion of railroad facilities. There will be no revival of investment in railroad securities on a large scale unless the government has definitely indicated to investors what kind of a "run for their money" it intends to give them in future.

At the same time, the railways will be returned to their owners under conditions which for some time will render successful private operation of them very difficult, and unless the right kind of legislation is passed the results of private management will be disappointing to the public. In that case we shall be in great danger of drifting into government ownership, in spite of the strong sentiment against it which now exists.

President Vetoes Bill to Restore I. C. C. Rate Powers

President Wilson on November 18 vetoed the Cummins bill, S. 641, restoring to the Interstate Commerce Commission its pre-war rate-making power. The President said the immediate effect of the proposed law would be to deprive the federal government of the ability "to cope promptly and decisively with operating emergencies which are now arising and must continue to arise during the existing period of heavy traffic."

"This bill," said the President's message, "deprives the government of the United States, while still charged with the exclusive responsibility for operating the railroads during federal control, of any power to make any change in any intrastate rate, fare, charge, classification, regulation or practice without having first secured the approval of the proper state regulating tribunals, whereas under the federal control act as originally enacted the government of the United States has the same power to determine the intrastate matters as it had to determine similar matters of an interstate character.

"Recently the Railroad Administration found that refrigerator cars were being unduly detained by consignees at a time when there was urgent demand for an enlarged transportation use of such cars. The Railroad Administration was able substantially and promptly to correct this situation by the imposition of an emergency charge. Such a step could not have been taken promptly if it had been necessary to consult also state authorities throughout the Union.

"Since the authorities of each state would under this bill have the full power to exercise an independent judgment, the probable result would have been, if this bill had been in effect, to prevent any uniform practice at all, notwithstanding the fact that the federal government was the sole operator of the railroads, and as such conducting the intrastate operations, as well as the interstate operations.

"At the present time the Railroad Administration is proceeding with an important measure to secure the heavier loading of cars with grain and grain products so as to meet more fully the urgent need for a greater transportation of those commodities. If it should be necessary to obtain the independent judgment of each state tribunal, the delay would probably be so great as to defeat the purpose of the plan.

"The matters I have mentioned are illustrative of pressing practical emergencies which must be dealt with promptly if they are to be dealt with effectively, and while the federal government alone is responsible for railroad operation, it ought to have within itself the power to deal with these problems.

"The practice of the Railroad Administration to secure the advice of the Interstate Commerce Commission upon matters of importance reasonably insures an adequate representation of the public interest and avoids the divided action and inevitable delay which would result if each state authority should have exclusive and final power as to regulation of all matters of intrastate traffic within its borders.

"Beyond these pressing practical exigencies, I feel that it is a far sounder general principle to vest in the federal government power to raise the revenue to operate the railroads when the federal government alone is responsible for paying the bills for their operation.

"In a country of such great extent it is undoubtedly desirable to get the fullest practical benefit of local advice upon local matters, and this is equally as much to be desired in respect of local interstate rates and practices in a given portion of the country as in respect of intrastate rates and practices covering a similar extent in the same locality. It is the policy and practice of the Railroad Administration, which I heartily endorse, to secure as far as practicable the full benefit of the suggestions of the state authorities, both as to intrastate rates and as to local interstate rates, but in the last analysis, while the federal government is solely responsible, it seems to me that entirely independent and final power as to a large proportion of these vital matters should not be transferred to the respective states.

"The broad question of general principle which I have just discussed might perhaps be waived in view of the short duration of federal control, but the practical emergencies to which I have first referred are matters with which the federal government must deal day by day in the discharge of its responsibility and I do not think its ability to deal with them promptly and conclusively should be impaired even during a brief period of federal control.

"The leading principle of this bill, which is to give the Interstate Commerce Commission power, pending its provision thereon, to suspend rates, practices, etc., initiated by the President, is entirely acceptable to me, although if in the future the bill should be repassed I should hope to see some modifications in detail which would avoid attaching a presumption of unreasonableness (as this bill appears to do) to changes so initiated in rates, practices, etc.

"I should also hope to see another modification which would avoid any possibility of bringing in question the

validity of orders which already have been made by the Railroad Administration in the discharge of its responsibility."

Chairman Cummins of the Senate interstate commerce committee, who introduced the original bill, later amended by the House, said it was not likely that any attempt would be made to pass the measure over the President's veto, as the rate-making powers of the commission would be restored when the roads were returned to private operation January 1.

Senator Cummins said the President's action was not a surprise.

Republican Leader Mondell, approving the President's veto of the bill, said the measure "should never have been passed," and he added that he expected no effort would be made by the House to override the veto.

A. R. A.---Section VII

THE EXECUTIVE COMMITTEE of the American Railroad Association, at a meeting held on July 31, created a new section, to be known as Section VII—Freight Claims; and H. C. Pribble of Topeka, Kan., chairman of the section, has issued a circular setting forth the plans for the organization of the section.

The temporary general committee, appointed by the executive committee of the association to manage matters until a regular election shall be held, consists of prominent members of the former Freight Claim Association, as follows:

H. C. Pribble (chairman) A. T. & S. F.
H. C. Howe, C. & N. W.
J. H. Howard, manager, Claims and Property Protection Section, United States Railroad Administration.
J. J. Hooper, Southern.
R. L. Calkins, New York Central.
W. O. Bunger, C. R. I. & P.
E. J. Bloodgood, C. & N. W.
J. B. Baskerville, N. & W.
W. S. Reed, Pitts. & W. Va.

This general committee met in Chicago on August 11 and elected Mr. Pribble chairman, Mr. Howe, first vice-chairman, and Mr. Howard, second vice-chairman; and Lewis Pilcher, Richmond, Va., was chosen secretary. The constitution and rules of the Freight Claim Association, as published in 1917, were adopted, with suitable changes in the wording.

The committees were also continued, but the secretary of the section is to act as secretary of all committees.

The seven arbitration committees of The Freight Claim Association were elected to serve as the arbitration committees of Section VII. Six of these will be known as loss and damage committees, and are composed of men handling loss and damage claims; one will be known as the overcharge committee, and is composed of men handling overcharge claims exclusively, to which shall be referred all overcharge claims for arbitration. The appeal committee of The Freight Claim Association was also elected to serve in the same capacity with Section VII.

Members are requested to submit to the secretary of the section any subjects upon which it is desired to have the committees pass, so that they may be docketed and placed in the hands of the committeemen without delay. The Committee on Cause and Prevention has already met and is asking for suggestions. The other committees will hold their initial meetings as early as practicable. Copies of the adopted rules of order and freight claim rules and rulings, with names of those composing the several committees, will soon be mailed to members.

Chairman Pribble announces that henceforth the cost of arbitration will be $15 per claim and the deposit on appeal $25 per claim.

Report of Elwood Collision

THE INTERSTATE COMMERCE COMMISSION has issued a report, dated September 2, and signed by W. P. Borland, chief of the Bureau of Safety, on the rear collision of passenger trains on the West Jersey & Seashore, near Elwood, N. J., on August 24, in which one passenger was killed and 25 injured. This collision was made the subject of a special report by C. S. Lake, assistant director of the Division of Operation, of the Railroad Administration which was given in the *Railway Age* of September 12, page 514. Extra (excursion) passenger train 2416 was run into at the rear by extra passenger train 5342 at 4:43 a. m., the latter train having run past distant and home automatic block signals set against it. The speed of the colliding train at the moment of contact is believed to have been about 20 miles an hour; and the leading train had been started, after a stop of several minutes, and was running at six or eight miles an hour. The three rear cars of the leading train were considerably damaged.

At Elwood station there is an automatic signal which is used also as a train order signal. When, as in this case, the station operator is off duty, a stop signal must be investigated particularly; and, this signal having been at stop, with no discoverable cause, a freight train preceding the excursion trains had stopped long enough to make sure that the operator was not on duty; and the delay of the freight had delayed several excursion trains preceding those involved in the collision. At one time there were at least three and perhaps four of these passenger trains standing short distances apart, north of Elwood. For a part of the time at least, the signal was operating properly, and whether or not more than one failure occurred could not be definitely established.

The report contains several pages of the testimony of the men on the different excursion trains, with regard to fog and other conditions; but on the whole it appears that the fog was not serious enough to prevent seeing the signals several hundred feet, and probably several hundred yards, before reaching them. The engineman of train 5342 said that he saw the stop signal when only about six feet away from it, and he appears to have admitted passing the caution signal without seeing it. His testimony, however, seems to be regarded by the investigator as not worthy of credence. He had been resting from noon the preceding day until 12:10 a. m., the 24th, when he was called for this run; but the report concludes that he had not slept over four hours during the preceding 23 hours. It is stated that he had run over this line on August 16, and on July 27; and had fired over it for eleven days in July; and apparently these runs (13 days) constituted the whole of his acquaintance with the road. The fireman was not familiar with the road; he appears to have called signals to the engineman, more or less faithfully, but his testimony is not clear.

The flagman of train 2416 is held responsible for not providing adequate protection by flag; but his testimony appears to be of little value. Because of the delays occasioned by the slackening of preceding trains he had had occasion to go back several times, but, the last time, he put down torpedoes only about 150 ft. back from his train. Asked why he went such a short distance he made no satisfactory explanation.

The engineman of train 5342 is 30 years old, and entered the service as fireman in 1912. He was promoted to engineman in May, 1918, and had a good record. He said positively that he was wide awake all the time, but the inspector believes, nevertheless, that he must have dozed off.

CHINA is planning to educate her farmers to modern methods and with that object in view is to have a demonstrating farm every fifty miles along her railways.

The Esch Bill Passed by the House

Policy Pursued of Attempting to Build on Existing Structure of Regulation Rather Than Adopt New Plan

FOLLOWING IS AN EXTRACT of the Esch bill, as submitted by John J. Esch, chairman of the House Committee on Interstate and Foreign Commerce, giving a discussion of the committee's conclusions in various phases of the proposed railroad legislation. (The bill was passed on November 17.)

H. R. 4378, introduced June 2, 1919, constituted the basis for the hearings held by the committee. Only one other bill, H. R. 8157, introduced by Hon. Thetus W. Sims, a member of the committee on interstate and foreign commerce, and presenting the so-called "Plumb plan," was introduced. The committee began hearings on July 15. These hearings continued with morning and afternoon sessions continuously until September 27. Some 3,500 pages of testimony have been printed. Exclusive of the printed hearings, numerous exhibits were filed. Proponents of various plans were first heard. These were followed by witnesses interested in special features of the railroad problem, or special interests which would be affected by the legislation. Practically every person who applied for a hearing had his request granted. Every class, condition, and interest found one or more representatives in the long list of witnesses. These witnesses came from no particular section but from every part of the country. Almost without exception, the witnesses were well versed in the subjects they sought to present. The special and general knowledge of many of them will make these hearings of especial value. No more elaborate and intensive investigation of the railroads and their relations to the government and to the public has ever been undertaken by a committee of Congress. Your committee respectfully offers these hearings for careful study not only by members of Congress but by the country generally. Scores of witnesses voluntarily appeared and gave us the benefit of their views and study. Private individuals appeared representing nobody but themselves. Labor organizations appeared through numerous representatives. The side of the shippers and of the general public was given full presentation. Days were devoted to listening to representatives of carriers by rail and water. The wire systems—telegraph, telephone, cable, and wireless made their showing.

Although H. R. 4378 (Esch-Pomerene bill) was made the basis of consideration during the course of the hearings and in executive sessions of the committee, drafts of bills presented to the committee but not introduced in Senate or House were carefully examined and their special features given due consideration. Among such drafts and bills were those presented: By the railway executives, known as the "Railway Executives plan"; by the transportation conference, being the plan indorsed by the United States Chamber of Commerce, known as the "Transportation Conference plan"; by the National Association of Owners of Railroad Securities, known as the "Warfield plan"; by the Citizens' National Railroads League, outlined in S. 2889, known as the "Amster-Lenroot plan"; by the railroad brotherhoods as set forth in H. R. 8157, known as the "Plumb plan." Several other plans less pretentious in purpose and scope were presented. In addition to these drafts and bills witnesses offered many amendments to H. R. 4378 and also amendments to the other drafts and bills. As H. R. 4378 was originally introduced it contained no provisions relating to the termination of federal control, or to the financial readjustment of the carriers with the government necessitated by such control, or for financing the carriers during the period of reconstruction immediately following the termination of such control. The bill now reported makes such provisions and the details will be hereinafter explained.

Government Ownership and Plumb Plan

In view of the fact that the President early this year delivered to the Houses in joint session a message in which he expressed his intention to return the roads to private ownership and control by the end of the current year, and in view of the desire on the part of the carriers to be so returned and the wide-spread demand among the people that federal control cease as soon as suitable legislation could be enacted, your committee has not recommended government ownership as a solution for the railroad problem. Only one bill (Plumb plan) has been introduced at this session providing for ownership of the railroads by the United States government. This bill not merely asks that the government should secure ownership and control of the railroads, but also asks for employee operation thereof. The provisions of this bill are so radical and the principles so foreign to the fundamental principles of our government that it was considered by our committee as impossible. Notwithstanding this fact, the committee devoted six days to listening to its proponents. As a result of a rigid cross-examination of these proponents, the committee was all the more strongly convinced that it was not and ought not to be the solution which should be proposed to the House.

There is appended a summary of the proposed plans for railroad legislation, prepared by Richard Waterman, secretary, Railroad Committee, Chamber of Commerce of the United States. An examination of this summary discloses the fact that the several bills and drafts or plans have certain features in common. All except the "Plumb plan" provide for ownership of all railroads of the United States by private corporations, with operation by such carriers. All advocate consolidations including the "Plumb plan." Some, including the pending bill, go only to the extent of permissive consolidation. Some provide for permissive and some for compulsory federal incorporation. All drafts, bills, and plans set forth in the above summary provide for full control by the Interstate Commerce Commission over stock and bond issues. As to wages and working conditions the various drafts, bills, and plans differ widely. Most of them provide for some form of arbitration board, with the right of appealing to some higher board, such as a "transportation board." As to the federal agency of regulation there is also much diversity of a plan and method. All of them agree, however, in the maintenance of the Interstate Commerce Commission with its present rate-making powers. In addition to the commission some of the plans provide for a federal "transportation board"; others, such as the pending bill, increase the powers of the commission instead of granting such additional powers to the "transportation board," or other like agency.

Objections to Including in the Pending Bill Some of the Features Found in One or More of the Proposed Drafts, Bills, or Plans.

1. Transportation Board

In support of a transportation board advisory to or wholly independent of the Interstate Commerce Commission, it is argued that the Interstate Commerce Commission

as now functioning has administrative as well as quasi judicial powers and that the exercise of such powers by a single agency is contrary to the spirit of our Constitution; that the commission is now overburdened with work and that its burdens will still further be increased should the pending bill be enacted; that the transportation board would be able to take a broader view of transportation problems and after investigation be able to recommend plans and policies looking to the better coordination of all forms of transportation—rail, highway, and water; that it would more wisely determine the financial needs of the carriers; could formulate the transportation budgets and declare what should be the level of rates and issue a mandate to the Interstate Commerce Commission to so adjust the level of rates as to meet the financial needs as found by the transportation board; that the grant to and exercise of such powers by the board would "fortify" the Interstate Commerce Commission in any action it might take in fixing the rates necessary to meet the board's mandate. Your committee, while conceding the merits of some of the arguments presented in support of a transportation board, concluded that such board was not necessary and for the following, among others reasons:

The transportation board with its members nominated by the President and confirmed by the Senate would in all probability be made subject to political influence, certainly more so than the Interstate Commerce Commission—a quasi judicial body; it would not and could not have for many years to come the intimate knowledge of all phases of the railroad problem, financial, commercial, operative, or otherwise. It would be impossible to so separate the functions of the transportation board from those of the Interstate Commerce Commission as to prevent duplication of work or conflict of authority. It would be but another governmental agency whose gauntlet of regulations and restraints would have to be run by the shippers of the country. With the high salaries that would have to be paid to secure competent members, with a staff of experts, accountants, attorneys, agents, and examiners, a large and increasing burden would be laid upon the federal Treasury. The Interstate Commerce Commission does not need any governmental agency to "fortify" it for the performance of its duties. No other official body in our government stands higher in the estimation of our people. Its integrity, nonpartisanship, and fearlessness in the performance of its duties can not be questioned.

The creation of a transportation board to take over the various administrative duties of the Interstate Commerce Commission with reference to safety-appliance acts, hours-of-service act, explosives act, boiler-inspection act, and other acts, can not be justified on the ground that the administration of these several acts by the Interstate Commerce Commission has not been efficient and satisfactory. It is certain that these acts can not be better administered if their administration were transferred to the board. If this be true, why transfer their administration? Under the organization now existing under the commission for the administration of these several acts, the judicial functions of the commission have not been interfered with. In fact, the commission has been aided in the performance of its judicial functions by reason of the intimate knowledge its members have acquired as to practical problems of railroad administration arising out of the administration of these several acts. In short, your committee fears that the creation of a transportation board, no matter how clearly its duties may be differentiated from those that are to be left to the Interstate Commerce Commission, will result in a division of authority and hence in a divided responsibility. If the recommendations of the transportation board are to be merely advisory to the commission, the country will gain little. If the commission ignores the recommendation of the board, occasion for misunderstanding and jealousy might arise. If, on the other hand, the recommendations of the board were in the nature of a mandate to the commission, the commission would degenerate in prestige and influence and lose the position it now occupies in the public mind. The people of the United States would not approve of any legislation which would have such a result.

2. Federal Incorporation

Federal incorporation was strongly urged before the Newlands Joint Commission in 1916 and the chief reason offered then and re-offered during the course of the hearings recently ended before your committee was to get rid of the so-called "48 masters," that is, the regulatory bodies established by the states of the Union. It is admitted that the uncertainty of regularitory laws enacted by the several states with no attempt at uniformity has proven, in many instances, burdensome. This is especially true as to safety appliances, full crews, and laws relating to physical operation. The laws of many of the states require consent of the state regulatory bodies as a condition precedent to the issue of stocks and bonds and has resulted in delay and the exaction of unjust conditions. In view of the fact that the pending bill gives the Interstate Commerce Commission exclusive jurisdiction over the issuance of railroad securities, the conflicting laws of the several states with reference to this matter could no longer be urged as an argument for federal incorporation, for Congress once occupying the field it is entitled to occupy under the commerce clause of the Constitution, the right of the states to legislate on the subject matter abates. But a principal argument for federal incorporation lies in the fact that the carriers so incorporated would be relieved, in a large measure, of the regulation by the states for they, being the creatures of the federal government, might no longer be subject to the jurisdiction of the states. Once federal incorporation is accomplished the claim would be immediately made that jurisdiction of the several states over rates, fares, charges, etc., would no longer be tenable. The primary purpose behind federal incorporation is the elimination of state control. While ultimately this may come to pass, we are convinced that the country is not yet ready to indorse legislation which would bring about so radical a change. The increasing tendency of Congress to exercise to the full the powers granted it under the commerce clause of the Constitution, and the decisions of the Supreme Court of the United States in the Shreveport and Minnesota rates cases, indicate a gradual but certain diminution of state control.

Federal incorporation necessarily involves some grave constitutional questions and eminent counsel have submitted to your committee briefs arguing with much show of reason that Congress has no authority to compel a common carrier, holding a state charter, to become federally incorporated. Without determining in our own minds the relative merits of the constitutional aspects of this question, we are persuaded that the carrying out of a plan of federal incorporation would entail large expense, long delays, and a vast amount of litigation. It is but natural that the stockholders in a common carrier chartered by a state, enjoying special privileges which that state charter conferred, would reject or refuse to entertain a proposition for exchange of their securities in the state corporation, for the securities of a federal corporation no matter how attractive such offer might be. Refusal to accept such exchange by recalcitrant security holders might be compelled on the part of the government by the right of eminent domain. This would mean litigation and would not be decided until the Supreme Court of the United States had passed thereon. The situation which will confront the carriers at the conclusion of federal control is one which requires a plan that can be readily applied. The period of reconstruction is one which should not invite litigation as

to the legal status of the carriers. It is better to deal with them under their existing charters.

Under federal incorporation a new status as to taxes both federal and state might arise. If the carriers are federally incorporated they could, and would in all probability, be taxed by the federal government. The states are jealous of their taxing powers and even under the federal control act, during the war period, the right of the states to tax the railroad properties within their boundaries was specifically recognized. Should federal incorporation raise an issue between the states and the federal government on the matter of taxation, this would constitute another reason why federal incorporation should not be included in the pending bill. For the above, among other reasons, your committee has not adopted federal incorporation and made it a part of the pending bill.

3. Consolidations

As to consolidations the plans presented to your committee differed materially. But two are recommended. One, permissive consolidation, and the other, compulsory consolidation. The pending bill favors permissive consolidation, subject to approval by the Interstate Commerce Commission. The so-called "Warfield plan" advocates the same policy. The "Amster plan" favors complete consolidation of all railroad companies into a single corporation—resulting in an end to competition. The "Senate Committee plan" (Cummins bill) and the "Railway executives' plan" favors the consolidation of existing lines into a certain number of strong competitive systems. The "Senate plan" permits voluntary consolidation if accomplished within seven years after the approval of the act. Many of the objections we have above urged against federal incorporation arising out of delays, expenses, and litigation are alike applicable to compulsory consolidations. In our opinion, the interests of the public will be better served where the consolidations are voluntarily entered into, upon approval by the Interstate Commerce Commission, and where such consolidation or merger is in the interest of better service to the public, or economy in operation, or otherwise of advantage to the convenience or commerce of the people. Under such a plan the problem of weak roads when taken in connection with the other provisions of the pending bill will, in a large measure, be capable of solution.

Your committee believing that the creation of regions for incorporation, administrative, and rate-making purposes would not permit of the fullest measure of competition and would make rate making based on average conditions of carriers within a given region an impossible task, have not deemed it wise to adopt any such plan in the pending bill. Rate making even as it now is, is a most difficult task. If rate making is to be based upon regions, or upon systems of roads within a region, the great railroad systems of the country traversing vast areas would in many instances have to be placed in one or more regions or group systems. If the regions are to follow existing trunk lines, especially in official and western classification territories, their rates would be affected by the rate structure adopted in the several regions through which they passed. This would involve differences in the application of through routes on their systems. Trunk-line roads running north and south and traversing more than one region and not, because of their length, capable of being embraced within single regions, would still further add to the complexity of the problem.

4. Regional Commissions or Commissioners

Owing to the present large task of the Interstate Commerce Commission and the fact that the pending bill will increase its duties, some of the plans presented and some of the individual recommendations urged the creation of regional commissions subordinate to the Interstate Commerce Commission, or, in lieu of such regional commissions, that regional commissioners be appointed. This phase of the problem was given very full consideration in the hearings and by the committee, with the result that the committee believed that it was better to leave the administration of the existing law and of the pending bill, should it become law, solely in the hands of the Interstate Commerce Commission. While such subordinate agencies might relieve the commission of some of its work, decisions would result which lacked uniformity. There might be as much diversity of decisions as there has been on the part of district courts with reference to war-time prohibition. Such diversity of decisions begets uncertainty, and uncertainty—especially in rate matters—is highly detrimental to the shipping interests and to the general public. Moreover, no time will be saved in the adjudication of rate cases by the creation of these subordinate agencies. The amount involved can not be the limitation, as in the case of the United States district courts, because of the fact that a rate case in which but a small amount of money is involved may involve the application of a principle of widest application. This would mean that appeals would be necessarily taken from the subordinate agency to the commission here at Washington resulting in greater delay than if no subordinate agency had passed upon the question.

Your committee believes that the increased duties imposed upon the commission by the pending bill can be met by increasing by two the membership of the committee, and the bill provides for such increase. Under the present practice, attorney examiners representing the commission take testimony as to rate matters in the field and thus obviate the necessity of witnesses coming to Washington. It is hoped that with the increase of the number of the commissioners that the practice of 10 years ago may be revived and that the commissioners may, so far as their work here at Washington will permit, visit the various sections of the country personally and hear cases. This would, in a measure, meet the complaint that the commission was not in as close touch with the shipping and consuming public as it might be.

5. Guaranty

Some of the witnesses and some of the plans favored a guaranty on the part of the government of a certain rate per cent upon the property of the carriers used in the public interest. This is what has been designated as a straight guaranty and is the plan that has been adopted to some extent in foreign countries. The success of such plan in these countries has not been such as to warrant its adoption in the United States. In most cases such guaranty has resulted in the taking over by the government of the roads. The failure of the roads to earn the guaranty created such an indebtedness as to compel the government in its own interest to take over the roads to protect the investment it already had made therein.

A straight guaranty, irrespective of the amount in percentage either on a basis of capitalization or of valuation, is destructive of all initiative and would lead to extravagance, inefficiency, an increased cost of transportation, and to government ownership.

A modified form of guaranty has been incorporated in some of the plans above referred to and has been suggested by individual witnesses. It consists in dividing the railroads of the country into groups, or by regions, and then requiring the maintenance of a general rate level by the Interstate Commerce Commission under a statutory rule prescribing that rates shall, as nearly as possible, produce not less than a certain per cent on aggregate investment account of the railroads in each group or system; or, that the Interstate Commerce Commission under a statutory rule of rate making should provide a rate structure designed to yield a certain percentage on the aggregate fair value of the roads in each traffic section of the country. This form of

guaranty is based upon the ability of the commission to so fix the level of rates within each group system, or region, as will produce the percentage on property investment account, or on valuation, as fixed by Congress. We question the ability of the commission, or any regulatory body, to accomplish this result. It is well known that freight and passenger revenues fluctuate from year to year, and even during a single year. These fluctuations may be due to drought—affecting crops throughout great areas—or may be due to crop failures due to pests, or may be due to floods destroying tracks and bridges and delaying traffic, or may be due to economic causes national or international in scope. The difficulty, and, in fact, the impossibility of maintaining the level of rates required to produce the percentage rate fixed by the statute should make us hesitate to adopt any such plan. If the rate level must be changed to meet such fluctuations there can be no stability of rates. As business is interested almost as much in the stability as in the amount of the rates business would inevitably suffer as the result of any such plan. By making a given region, or traffic area, a unit within which the required rate level is to be maintained, a uniformity of kind and quantity of production would seem to be necessary.

But in a country like ours with such diversified interests and because of the large extent of the territory which each unit or traffic area under the plans proposed would have to cover, it would be difficult for the Interstate Commerce Commission to make a fair estimate of average conditions. If New England is to constitute a region, or traffic section, the commission would have to consider in arriving at an average the agricultural and timber products of northern Maine, and the manufacturing production in the densely populated States of Massachusetts and Connecticut. It seems to the committee that such a plan is unworkable and imposes upon the commission an impossible task. It is contended that this plan is not in fact a guaranty, in that the government is not responsible for losses. Yet the government, through the commission, assures the security holders of the railroads that it will, under all circumstances and regardless of fluctuations in traffic, so adjust the rates that they will produce 6 per cent, for example, on the aggregate property investment account. This is nothing less than a guaranty. The objections to a straight guaranty based on the fact that such guaranty destroys initiative and leads to extravagance and inefficiency, and to government ownership is applicable to this modified form of guaranty. But the plan proposed seeks to meet the objection by permitting the carriers to retain a certain portion of the excess over the guaranteed return. In our opinion the retention of only a portion of the surplus will not be sufficient to promote enterprise, develop initiative, and preserve the morale of the administrative and operative forces of the carriers. Such a plan is not new in its main details. It has been tried elsewhere with the result that no surplus has been developed. On the other hand, the prospect of sharing the surplus with the government, or with labor, leads to extravagance in expenditures. This has been the experience of the state of New Hampshire and the Republic of Brazil.

This question of sharing any excess over the fixed return as established by the statute gives rise to the question of the constitutional right of Congress of making any such law. Very distinguished counsel in briefs and orally have contended that as the rates fixed by the Interstate Commerce Commission are the legal rates, whatever return to the owners such rates produced as a matter of law, belonged to them and could not, therefore, be taken away from them under any plan providing for the division of the excess—that the deprivation of any part of such excess was in violation of the fifth amendment to the Constitution. Without passing upon the legality of this portion of the guaranty plan we have felt it better and wiser to continue the methods prescribed by the interstate commerce act and followed for years—requiring the commission upon the initiation of the carriers to determine the justness and reasonableness of rates. While this guaranty plan is propounded with much confidence as the solution of the problem of the so-called "weak sisters," we believe that such elaborate machinery—so elaborate as to be unworkable in some of its parts—will result in disappointment. We believe that equally good, if not better, results can be obtained by the provisions of the pending bill. These provisions would authorize the commission to permit the voluntary consolidation of the weaker with the stronger lines. By the application of minimum as well as maximum rates to permit a longer and weaker line to get a greater share of the business than heretofore, and with the initiative in the commission to establish joint rates and through routes, and the division of the rates, would still further aid the short or weaker lines.

There is another, and fundamental, reason why your committee opposes the fixing by act of Congress of a percentage return. This reason is political. As one Congress can not bind its successor, this Congress, should it fix the percentage return at 6 per cent, can give no assurance that this rate will remain fixed or continue for any stated period. If, because of political agitation, a majority of the people, or any considerable portion of them, are led to believe that the percentage rate fixed by this Congress is excessive, the percentage rate might, and in all probability would, become a political issue of large importance and wide-reaching effect. This would result in dragging rate making into politics and would endanger the stability of the rate structure. We believe that existing law as to the standard of rates, and that the rates that are fixed pursuant to such standard, should be continued. Neither the standard nor the rate structure prescribed by the commission thereunder have heretofore been the object of political strife.

The Pending Bill

The policy pursued by the committee in framing the pending bill was not to adopt new and untried plans, but rather to build on a structure already in existence, whose foundations were well laid. In the period of reconstruction when conditions are still unsettled and the public mind is in more or less of ferment resulting from the World War, it was thought wise not to make experiments with the largest single industry in the United States, outside of agriculture, but what the committee sought to do in the bill now presented, was to provide for an adjustment of financial relations between the carriers and the government arising out of federal control and to provide, during the brief period of reconstruction, for financial support and for temporary relief in the way of loans, as might be asked for by the weaker roads. In addition to these provisions of a financial character, the bill seeks to preserve to the people such advantages arising out of unified management and control as have been demonstrated during the last two years, having more particular reference to joint use of terminals, a greater degree of coordination between rail and water carriers—especially on inland waters—and consolidations together with pooling of traffic, earnings, and equipment.

The Elimination of Wire Systems and Water Transportation

The bill H. R. 4378 as originally introduced placed wire systems (telephone, telegraph, cable, and wireless) under the full jurisdiction of the Interstate Commerce Commission and applied to them as common carriers the provisions of the interstate commerce act, and also applied to them the provisions of the bill with reference to requiring a certificate of convenience and necessity for any extensions or abandonments, and also the provision requiring certificates from the commission for issues of stocks and bonds. As a result of

the hearings and a fuller consideration of the situation, the committee left the control of wire systems practically as it was under the interstate commerce act prior to federal control. There was practically no demand for placing with added powers the wire systems under the commission. Since 1910, when the wire systems were declared to be common carriers and the commission was granted authority to pass upon the justness and reasonableness of their rates, only a half dozen cases have been brought before the commission. Moreover, over 80 per cent of the business transacted by telephone companies is intrastate and therefore very largely under the jurisdiction of state regulatory bodies.

As there are over 10,000 telephone companies in the United States and most of these of small capitalization, it was not thought wise to subject these thousands of small companies, who, because of their various exchanges, might be doing an interstate business, to the restrictions, obligations, and penalties of the interstate commerce act. While the situation as to telegraph companies is somewhat different, in that they do a larger percentage of interstate business, there are but two large companies, and if their rates are unjust and unreasonable, the present interstate commerce act affords proper remedy. But the committee was also persuaded that wire systems should be eliminated from this bill, as the bill deals primarily with railroads, and it was not thought wise at this time to complicate the solution of the railroad question with the peculiar problems connected with the regulation of wire systems. The better course to pursue would be at a later date to take up the whole situation as to wire control and deal with it in a separate measure.

The original bill (H. R. 4378) gave to the Interstate Commerce Commission jurisdiction over transportation by water. Under the existing law the commission had jurisdiction over water transportation only when such transportation constituted a part of a through route and gave it no jurisdiction over port-to-port traffic. In the original bill jurisdiction was given over port-to-port traffic on inland waters, the Great Lakes, and the coastwise trade, including Alaska. Much opposition was developed in the hearings against the water transportation features of the bill. Opponents of these provisions contended that water transportation, especially coastwise, should remain free and unrestricted as heretofore, and that if jurisdiction were given to the commission our shipping interests would be seriously hampered and in some instances destroyed. For these and other reasons the committee eliminated the provisions giving jurisdiction to the commission over transportation by water, retaining, however, those provisions relating to physical connection between rail and dock and the construction of docks. The bill makes provision for the continued operation of government tows and barges on the Black Warrior and Mississippi rivers, placing the operation thereof in the hands of the War Department, but giving to the commission authority to regulate the rates, fares, charges, etc.

Important Features of the Bill

The bill is divided into four titles for purposes of clarity and easier reference. Title I deals with definitions. Title II deals with the termination of federal control, government-owned boats on inland waterways—which has already been referred to—settlement of matters arising out of federal control, inspection of the records of carriers because of action arising during federal control, refunding of carriers' indebtedness to the United States, continuing in effect existing rates, guaranty to railroads after termination of federal control, new loans to railroads, and execution of the powers of the President.

Under the terms of the bill (sec. 206) "all rates, fares, and charges, all divisions of joint rates, and all classifications, regulations, and practices in anywise changing, affecting, or determining any part or the aggregate of rates, fares, or charges, or the value of the service rendered, which, immediately preceding the termination of federal control, are in effect on the lines of carriers subject to this act, shall continue in force and effect until thereafter changed by or pursuant to authority of law." Without such a provision the rates, fares, charges, etc., authorized under federal control would terminate immediately upon the termination of federal control and would revert to the status existing prior to time they were changed or increased by order of the President. In view of the enormous increase in operating costs of carriers due to increased wages and cost of materials, a restoration to the former level would result in such an enormous decrease in the revenues as would render it utterly impossible, even for the stronger railroads, to meet operating expenses. By the insertion of the above section the existing rates, fares, charges, etc., are to continue in force and effect until changed by or pursuant to authority of law—that is, until changed by the appropriate regulatory body.

The financial sections of Title II relating to: Refunding of carriers' indebtedness to the United States; guaranty to railroads after the termination of federal control, and new loans to railroads, require further explanation.

Refunding of Carriers' Indebtedness to the United States

Section 205 provides for the refunding of the indebtedness of the carriers to the United States arising out of matters of federal control. The indebtedness of the carriers for additions and betterments made during federal control and for advances made to it by the United States, and chargeable to capital account, shall at the carrier's request, be extended for 10 years, or a shorter period at the carrier's option, with interest at the same rate as that fixed by the President, under section 4 of the federal control act, on the cost of additions and betterments made during federal control by order of the President. First-mortgage bonds are to be taken if possible, and if not, then the security is to be such as the President may prescribe. Any other indebtedness of the carrier to the United States is to be evidenced by notes payable on demand with interest at 6 per cent per annum.

The President is authorized to set off against such indebtedness any indebtedness of the United States to the carriers to the extent that such set-off is permitted under the terms of the standard contract between the carriers and the United States, in such manner as to leave the railroads with sufficient funds to pay their fixed charges and dividends and have a month's working capital.

Guaranty to Railroads After Termination of Federal Control

Section 207 provides that during the six months following the termination of federal control the United States guarantees to each railroad at any time under federal control that its railway operating income for such guaranty period as a whole shall not be less than the average of its railway operating income for the three corresponding periods of six months each during the three years' test period ending June 30, 1917. If the road was not meeting expenses during the test period the guaranty is of the amount by which the deficit for the guaranty period exceeds the average deficit for the three corresponding periods during the test period.

In order to prevent excessive charges to operating expenses and for maintenance of way and structures or maintenance of equipment during the guaranty period, the section provides that the amount of such expenditures, for the purposes of the guaranty, shall be limited by the Interstate Commerce Commission in such manner as to correspond as closely as may be to the average expenditures for such purposes during the test period.

In order that the carriers may have sufficient sums to meet

their fixed charges and operating expenses during the guaranty period the Secretary of the Treasury, on certificate from the Interstate Commerce Commission, may make advances during the period of the guaranty on proper security being given that, if the amount of the advance exceeds the amount of the guaranty when that is ascertained, the difference shall be paid to the United States.

In order to prevent the railroad from relying on the guaranty and making no effort to increase its rates until the guaranty period has expired the section provides that the guaranty shall not be given to any road which does not within 60 days after the termination of federal control file with the Interstate Commerce Commission schedules embodying general increases in its rates.

New Loans to Railroads

Section 208 provides a revolving fund of $250,000,000 for the purpose of making loans to railroads during the two years' period following the termination of federal control. Such loans shall be made by the Secretary of the Treasury for terms not exceeding five years with interest at 6 per cent and the security given must be adequate to secure the loan.

Title III. Disputes Between Carriers and Their Employees

One of the most difficult phases of the pending railroad legislation is to provide for a fair and just method for the adjudication of disputes between the carriers and their employees arising out of wages, working conditions, and hours of service. It is agreed on every hand that the tribunal created to decide disputes and to reduce or prevent strikes must be of such character as to create respect on the part of the parties to the controversy, as well as on the part of the general public. Many plans were suggested, ranging from those which provided only for mediation and conciliation, to those making strikes, pending, or after an award, illegal and penalizing disobedience of the award. An intermediate plan, patterned after the Canadian arbitration act, proposed to prohibit a strike or lockout pending consideration of the matter in dispute by the arbitration board, was also considered. Your committee believed that fulfillment of contracts between carrier and employee is fundamental and that organized labor can not win or retain public confidence where contracts duly entered into are violated without notice or without sufficient cause.

The public expects the carrier to fulfill to the letter its wage contracts and knows of no sufficient reason why employes should not, with a full sense of responsibility, fulfill their part of the contract. It is true that many of the recently organized unions among railroad employees, with little or no experience in the ranks of organized labor, have not felt the binding effect of contract obligations, or been as scrupulous in this connection as the members of the older organizations represented by the four brotherhoods. Nevertheless, these newer organizations should submit to the discipline prescribed by their own rules and regulations and should be made to feel that they injure their own cause by a nonobservance of their contracts. The committee, therefore, has adopted provisions authorizing the bringing of actions for damages by the parties injured because of the violation of contracts or agreements relating to wages, hours of service, and working conditions. After hearing numerous witnesses and after a full view of the situation, your committee deemed it unwise to include in its plan an anti-strike provision. The committee is eager and willing to go as far as it is possible to go to enact a just, workable, and effective law.

Believing in the potency of public opinion based upon the findings and recommendations of a disinterested tribunal, the committee advocates the plan of conciliation and arbitration, and to this end presents the following plan:

Railway Labor Adjustment Board

The board shall be composed of a group of employee members consisting of one representative for each union, who shall be a member thereof, to be appointed by its chief executive, and a group of members representing the employers or carriers. The employer group is also to have a representative for the express companies, and one for the sleeping-car company. If either the employee or employer group does not appoint a representative on the Adjustment Board within a specified time, the President is to make the appointment. This Adjustment Board, consisting of 30 or more members and representing both groups, is to constitute a panel from which, whenever such board shall receive for hearing and decision any dispute between a carrier and union or member thereof, the Adjustment Board shall refer such dispute to a conference committee composed of an equal number of representatives of each group. This conference committee is to use due diligence in reaching a decision upon the dispute and is to report its decision to the parties interested and to the Board of Labor Appeals and also to the President, making public its findings and recommendations in such manner as the Adjustment Board may determine. The Adjustment Board neither hears nor decides any such dispute nor does it review the decision of the conference committee, but the decision of the committee is made in the name and constitutes the decision of the Adjustment Board. The Adjustment Board is to hold its first meeting within six weeks after the passage of this act at Chicago, Ill., and maintain its central offices in that city. But the Adjustment Board, or any committee thereof, may meet at such other places as it may determine. The board is to determine all matters relating to its own procedure and to appoint its own employees. The salaries of members are paid by the constituent elements of the employee and employer groups.

Railway Board of Labor Appeals

The bill further provides for the establishment of a Railway Board of Labor Appeals to be composed of three divisions of three members each. One division is composed of three members representing the unions, one to be appointed by the President of the United States from each of three sets of six nominees offered by the group of employee members of the Adjustment Board. Another represents the carriers and its members, all also appointed by the President from the nominees offered by the employer members of the Adjustment Board. The third division represents the public, and is also appointed by the President, in such manner that the agricultural interests, commercial interests, and unorganized labor shall be represented. No member of the Appeals Board shall be a member of the Adjustment Board nor shall any member of the Appeals Board, during his term of office, be a member or in the employ of, or hold any official relationship to any union or carrier. Members of the Appeals Board shall after the first appointments hold for terms of six years, and shall receive from the United States an annual salary of $10,000. Members may be removed from office for inefficiency, neglect of duty, or malfeasance in office, but for no other reason.

While all members of the Board of Labor Appeals shall participate in the hearing and consideration of any dispute certified to it by a conference committee of the Adjustment Board or by the President, only the members of the divisions representing the unions shall decide any such dispute or vote in respect thereto. The decision of the Appeals Board requires the concurrence therein of at least five of the six members of the divisions representing the unions and car-

riers. The decisions shall immediately be communicated to the parties to the dispute, to the Adjustment Board, and to the President, and shall be made public in such manner as the Appeals Board may determine. The Appeals Board shall also maintain central offices at Chicago but it may meet at such other places as it may determine. The board shall investigate and study the relations between carriers and their employees, particularly questions relating to wages, hours of labor, and other conditions of employment and the respective privileges, rights, and duties of such employers and employees, and shall gather, compile, classify, digest, and publish from time to time data and information relating to such questions. Any party to any dispute to be considered by a conference committee of the Adjustment Board or by the Appeals Board shall be entitled to a hearing either in person or by counsel. Full authority is granted for the production of any books, paper, document, or other evidence; securing the attendance of witnesses, and the taking of depositions. Failure to comply with any subpœna or with any order of the court in cases of contumacy is made punishable.

Any carrier which breaks any term of contract of hire based upon the decision of the Adjustment or Appeals Board shall be liable for full damages to the union member arising from such breach. In case any union which authorizes any member to break any term or terms of any such contract of hire, or in case such contract is modified by any decision of the Adjustment Board or Appeals Board, then of such contract as so modified, or which aids, abets, counsels, commands, induces, procures, or consents to, or conspires to effect any such breach by its member shall be liable for the full damages to the carrier arising from the breach. For the purpose of enforcing such liability (1) service of papers may be made upon the chief executive or other principal officer of the union; (2) no action for such damages shall abate by reason of the death, resignation, removal, or legal incapacity of any official or member of such union or by reason of any change in the membership thereof; (3) such action may be commenced and prosecuted against the union in its recognized group name; and (4) satisfaction of any judgment rendered against the union shall be limited to the common property thereof, and no insurance, pension, or other benefit fund shall be held a part of such common property. Expenses of the Adjustment Board and the Appeals Board, including salaries of secretaries and other employees and necessary expenses, shall be paid by the Federal Government. The sum of $100,000 is appropriated for the salaries and expenses of the Appeals Board for the fiscal year ending June 30, 1920, and the sum of $50,000 for the Adjustment Board.

Title IV

Title IV relates to amendments to the commerce act. Only such amendments as materially change existing law will be given particular attention.

In paragraph 4 of section 400 it is made the duty of every common carrier "in case of joint rates, fares, or charges, to establish just and reasonable divisions thereof as between the carriers subject to this act participating therein which shall not unduly prefer or prejudice any of such participating carriers." The commission upon complaint or upon its own initiative can compel a division of the rate. This is a matter in which the so-called "short-lines" are vitally interested. Ofter short lines refrain from making complaint against their trunk line connection because of the fear of giving offense. By giving the commisssion the initiative in such matters the short line is relieved in this respect.

Car Service

Section 402 amends the car service act of May 29, 1917, in several particulars. Originally the term "car service" included "the movement, distribution, exchange, interchange, and return of cars used in the transportation of property." As amended the term is made to include the use, control, supply, movement, distribution, etc., not only of cars, but of locomotives and other vehicles. It is further extended to include, "the supply, movement, and operation of trains by any carrier by railroad subject to this act," and so require every carrier by railroad "to furnish safe and adequate car service." In a recent decision of the Supreme Court of the United States it was held that under the commerce act the commission does not have the authority to order a common carrier to supply itself with certain cars. The pending bill gives the commission such authority. The same section makes it the duty of every common carrier, or railroad, "to make just and reasonable distribution of cars for transportation of coal among the coal mines served by it, whether located upon its line or lines of customarily dependent upon it for car supply. During any period when the supply of cars available for such service does not equal the requirements of such mines it shall be the duty of the carrier to maintain and apply just and reasonable ratings of such mines and to count each and every car furnished to or used by any such mine for transportation of coal against the mine." During federal control such a rule has been followed by the director general and the committee follows the decisions of the Interstate Commerce Commission and the present practice and has put in form of law what had been enunciated as proper practice.

Whenever the commission is of the opinion that shortage of equipment, congestion of traffic, or other emergency requiring immediate action exists in any section of the country, it is given authority to suspend the operation of any or all rules, regulations, or practices with respect to car service for such time as may be determined and to make such just and reasonable directions with respect to car service "without regard to the ownership of locomotives, cars, and other vehicles, and to handling, routing, and movement of traffic during such emergency."

Joint Use of Terminals

The commission is further given the authority to require such joint or common use of terminals as in its opinion will best meet the emergency and serve the public interest and grant such preferences or priority in transportation, embargoes, or movement of traffic under permits, at such time and for such periods as it deems necessary to meet the emergency. Some objections have been urged against these provisions with respect to car service on the part of owners of private cars. In view of the recommendations of the commission in its report on private cars in 1918 holding that private cars perform a distinct public service and facilitate transportation, it is believed that the owners of private cars need have no fear if the above provisions as to car service are enacted into law.

Extensions and Abandonments

Section 402 further provides that extensions of an existing railroad or the construction of a new line or the abandonment of a line shall not be permitted unless and until there shall have been obtained from the commission a certificate that the present or future public convenience and necessity require or will require such construction or abandonment. A like provision can be found in the statutes of a number of states. Your committee believes that the requirement of such a certificate, so far as extensions are concerned, will tend to stabilize existing conditions and prevent the construction of unnecessary or parallel lines which, without any reasonable hope of profitable operation, would become a burden to the public. A similar provision in the laws of several states has proven successful in preventing the construction of weak lines. This provision of the bill, however, does not extend to

the construction or abandonment of sidetracks, or of spur, industrial, team, or switching tracks, or of street car and electric interurban lines, if such tracks or lines are located or are to be located wholly within one state.

Terminals

Under section 405 the commission may require the terminals of any carrier to be open to the traffic of other carriers upon such just and reasonable terms and conditions, including just compensation to the owners thereof, as the commission, after full hearing, upon complaint or upon its own initiative, may by order prescribe. The advantages of joint use of terminals have been fully demonstrated under federal control, and it is to preserve these advantages that the above power has been granted to the commission in this bill. While the question of compensation may present some difficulties, these can be overcome. The right of the individual carrier to the exclusive use of its own property should be made to yield to the superior right of the public. In these days, when the cost of terminals in the larger cities is almost prohibitive, the joint use of terminals under regulations prescribed by the commission will result in large economies in operation, and in many instances add to the convenience of the public.

Consolidations, Mergers, and Pooling

Ever since 1887, when the original commerce act was enacted, pooling of traffic earnings or equipment has been prohibited. Our experience during the war, when the railroads of the entire country were operated as a unified system, consolidations and poolings became a necessity. Many of the objections formerly raised have in many respects lost their significance. Your committee, therefore, (sec. 407), permits unification, consolidation, or merger by purchase, lease, stock control, or in any other way, also the pooling of traffic, earnings, or facilities upon application to the commission and its findings that these will be in the interest of better service to the public or economy in operation, or otherwise be of advantage or convenience to the commerce of the people. In this connection the commission is given the authority to approve and authorize the unification, consolidation, or merger of the four express companies into the American Railway Express Company upon application by such company.

Amendment to the Panama Canal Act

The Panama canal act of August 4, 1912, is amended (sec. 408) so as to permit the ownership and operation of vessels owned by rail carriers even where such vessel may compete with the rail line, except where such vessel passes through the Panama canal. The testimony before the committee indicated that the divorcement of vessels from their rail owners, except where such vessel passed through the Panama canal has been of no public benefit. On the contrary, such divorcement has proven a serious loss to shipping along the Atlantic coast and on the Great Lakes and to the communities served by such shipping. The enforcement of the Panama canal act caused rail lines, such as the Erie, New York Central, Lehigh Valley, Pennsylvania, and other lines to dispose of their lake vessels. Only two vessels owned by rail carriers are now plying on the Great Lakes; in consequence, the packet freight business has been reduced to a minimum, to the great loss of the cities along the Great Lakes. Section 408 permits existing service by water to continue and also permits new service if, in the opinion of the commission, such service will be in the interest of the public.

Connections Between Docks and Rail

Section 411 extends to the provisions of the Panama canal act of 1912, in the matter of a better coordination of rail and water transportation. To this end the commission is authorized to direct either or both the rail and water carrier, individually or in connection with one another, to construct a suitable dock and construct and connect with the lines of the rail carrier a track or tracks to the dock. Such dock shall be considered a terminal with full authority in the commission to determine and prescribe the terms and conditions upon which these docks and connecting tracks shall be operated, and to determine what sum shall be paid to or by either carrier in the construction of such dock and track.

Minimum and Maximum Rates

Under section 412 the commission is authorized to fix minimum as well as maximum rates. Under the Interstate Commerce act the commission ever since 1887 has only been empowered to declare the maximum rate to be charged. As a result of the testimony the committee believes that the commission should also be granted authority to prescribe joint rates, or maximum, or minimum, or maximum and minimum joint rates. With this power the commission could prevent a rail carrier from reducing a rate out of proportion to the cost of service, by establishing a minimum, below which such carrier could not fix its rate. It would also prevent a rail carrier from destroying water competition between competitive points by prohibiting such carrier from so reducing its rates as to destroy its water competitor. Circumstances have been cited where the rail carrier destroyed its water competitor by such a reduction of rates as to make it impossible for the water carrier to survive. When once competition was thus driven off the rail rates would be restored or would rise to even higher levels. The power to fix minimum rates will also enable the commission to adjust many cases under the fourth section of the commerce act, known as the "long and short haul clause."

Adjusting Conflicts Between Inter and Intra State Rates

Whenever, in any investigation under the provisions of the Commerce act, or in any investigation instituted upon petition of the carrier concerned, there shall be brought in issue any rate, fare, charge, classification, regulation, or practice made or imposed by authority of any state, the commission (sec. 415) before proceeding to hear and dispose of such issue shall cause such state or states to be notified of the proceeding. The commission can ask the state regulatory body to "sit in" with it and hold joint hearings and to avail itself of the co-operation, services, records, and facilities of such state authorities. After such hearing the commission shall make such findings and orders as may in its judgment tend to remove any undue advantage, preference, or prejudice as between persons or localities in state and interstate or foreign commerce. The provision practically enacts into law the decision of the Supreme Court in the so-called "Shreveport" case. Any undue burden upon interstate or foreign commerce is forbidden and declared to be unlawful. It is believed that the provisions of this section will have a beneficial and harmonizing effect and will tend to reduce the number of so-called "Shreveport" cases, while at the same time recognizing the regulatory bodies of the several states.

Rule of Rate Making

Section 417 provides as follows:

"The commission shall be charged with the duty and responsibility of observing and keeping informed as to the transportation needs and the transportation facilities and service of the country, and as to the operating revenues necessary to the adequacy and efficiency of such transportation facilities and service. In reaching its conclusions as to the justness and reasonableness of any rate, fare, charge, classification, regulation, or practice, the commission shall take

into consideration the interest of the public, the shippers, the reasonable cost of maintenance and operation (including the wages of labor, depreciation, and taxes), and a fair return upon the value of the property used or held for the service of transportation."

Suspension of Rates

Paragraph 4 of section 417 changes the existing law with reference to the period of suspension by the commission. Under existing law there is a fixed period of four months which upon application may be extended for an additional six months, making a period of 10 months not including the period of 30 days notice. It has been contended that this is too long a period. The pending bill limits this period of suspension to 120 days. If at the conclusion of this period the commission has not passed upon the lawfulness of the proposed change of rate, fare, charge, classification, regulation, or practice, the commission may require the carrier or carriers to keep accurate account in detail of all amounts received by reason of such increase, where an application for an increase is made, to the end that a refund with interest may be made to the persons interested.

Under section 419 where a carrier suffers loss by reason of the diversion or delivery by one carrier to another contrary to routing instructions in the bill of lading, unless such diversion or delivery is in compliance with a lawful order, rule, or regulation of the commission, such carrier shall have a right of action for the recovery of loss of full freight charges by reason of such diversion or delivery. This provision is inserted in order to put an end to a practice frequently indulged in and mainly by the larger lines to the detriment of the short lines.

Size of Divisions

Paragraph 5 of section 429 changes the existing law by permitting the division of valuation of railroad property under the physical valuation act to consist of three instead of five members. All other divisions of the commission consist of three members. Owing to the increased duties which will be imposed upon the commission by the enactment of the pending bill, it was deemed advisable to permit the valuation work to be placed in charge of a division of three members. This will not mean that this division will finally determine the principles of valuation. Its findings and recommendations will be passed upon by the full commission.

Stock and Bond Issues

Section 437 gives the commission control over stock and bond issues. In 1914 and again in 1916 the House passed bills containing almost the identical provisions now embraced in section 437. These provisions are familiar to the House and need not be dwelt upon. Suffice it to say that practically all of the witnesses indorsed the provisions of section 437. Had such provisions been on the statute books during the last 10 years the financial wrecking of such roads as the Frisco, the Rock Island, Pere Marquette, Pittsburgh Terminal, the New Haven, and others, would not have been possible. Provisions similar to those contained in section 437 are found in the statutes of several of the states. The experience of these states with the regulation of stock and bond issues has proven successful. Without federal control the carriers would have to be subjected to the diversified requirements of the several states. These requirements have been burdensome to the carriers and resulted in expense and delay. The enactment of the pending bill will put the control over stock and bond issues exclusively in the hands of the federal government and will result in uniformity and greater promptness of action.

Enlargement of the Commission

Section 438 enlarges the Interstate Commerce Commission so as to consist of 11 members instead of 9 and increases the salaries of the members from $10,000 to $12,000 per annum. In view of the provisions of the pending bill giving the commission increased duties over car service and operation and the provisions giving it control over stock and bond issues, the committee felt that it was absolutely necessary to increase the membership of the commission so there could be created in it a division which could take charge of the issuance of securities.

Automatic Train Control

Section 439 gives the commission after investigation authority to order any carrier by railroad to install automatic train-stop or train-control devices, which comply with specifications and requirements prescribed by the commission. Automatic train-control devices have passed the experimental stage and in the interest of the public as well as of the safety of employees, your committee believes that some action should be taken by Congress which would hasten the installation of such safety devices. In the end the installation of such devices would be an economy to the carrier. The annual losses, by reason of collisions, which would be prevented by the installation of automatic train-stop and train-control devices, would equip many miles of road. The saving of lives as well as property should be a sufficient justification for the enactment of this section.

Bills to Authorize Commission to Require Automatic Train Stops

A section of the Esch bill for the further regulation of the railroads which was passed by the House on November 17 authorizes the Interstate Commerce Commission after investigation to order any carrier by railroad subject to the act to regulate commerce, within a time specified in the order, to install automatic train stop or train control devices which comply with specifications and requirements prescribed by the commission, upon the whole or any part of its railroad, such order to be issued and published one year before the date specified for its fulfillment. It is provided, however, that a carrier shall not be held to be negligent because of its failue to install such devices upon a portion of its railroad not included in the order and any action arising because of an accident happening upon such portion of its railroad shall be determined without consideration of the use of such devices upon another portion. Any common carrier which refuses or neglects to comply with any order of the commission made under the authority conferred by this section, would be made liable to a penalty of $100 for each day that such refusal or neglect continues, to be recovered in a civil action brought by the United States. In its report referring to this section, the committee said:

"Automatic train-control devices have passed the experimental stage and in the interest of the public as well as of the safety of employees, your committee believes that some action should be taken by Congress which would hasten the installation of such safety devices. In the end the installation of such devices would be an economy to the carrier. The annual losses, by reason of collisions, which would be prevented by the installation of automatic train-stop and train-control devices, would equip many miles of roads. The saving of lives as well as property should be a sufficient justification for the enactment of this section."

Another bill, introduced by Representative Vestal on November 10, to require railroads to provide such service, way, structures, facilities, rules and operating methods as shall promote the safety of employees and passengers, also contains a section somewhat similar to that in the Esch bill, authorizing the commission to require carriers to install an automatic train-control system, such an order to be issued

at least six months before the date specified for its fulfillment.

The bill also authorizes the commission to require carriers to adopt a block signal system on not more than one-fourth of its entire line during any calendar year, to require the installation of interlocking plants or systems at railroad crossings at grade, railroad junctions, terminals, cross-overs, switches, draw-bridges, and other similar locations where, in its judgment, such a system is necessary, and wherever there shall exist on a railroad line where the block system is in use or is to be adopted in accordance with the act, any switch, draw-bridge, railroad crossing or street railroad crossing not provided with adequate signals, the commission would be authorized to require the carrier to submit for approval a rule or code of rules regulating and limiting to a safe rate the speed of all trains passing or approaching such point.

Another section would authorize the commission after hearing and notice to issue orders fixing, determining and designating changes, improvements and repairs to be made in the way and structures, equipment, supplies and operating rules governing the movement of trains.

Another section authorizes the commission in its discretion to conduct experimental tests of automatic train control devices or systems and to require the installation and use for development purposes of any automatic train control devices or systems on any line or portion of a line.

Tariffs to Be Prepared for Resumption of Private Operation

By way of preparation for the return of the railroads the Interstate Commerce Commission on November 22 issued the following instructions to all carriers of passengers or property that are subject to the act to regulate commerce to get their tariff files with the commission in proper shape:

"The act to regulate commerce requires all common carriers of property and passengers that are subject to the provisions of the act to publish, post and file with the commission schedules of their fares and charges. It prohibits such carriers from engaging in transportation except under schedules so published, posted and filed; and from charging, demanding, collecting or receiving a greater or less or different compensation for transportation or any service in connection therewith than is provided and specified in the schedules on file with the commission.

"Each such carrier must publish and file such schedules for itself, or by power of attorney or concurrence, in form required or approved by the commission, authorize publication by an agent, or concur in the publication of another carrier.

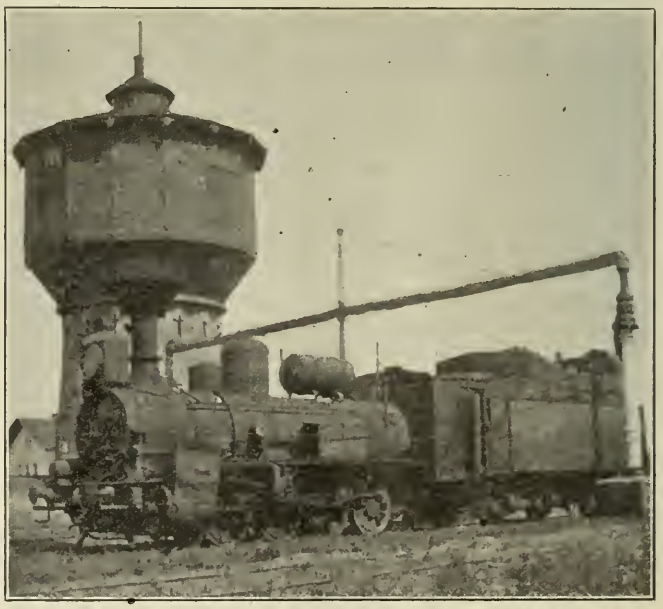
"The forms of powers of attorney and concurrences approved and prescribed by the commission and regulations in connection therewith appear in the commission's regulations governing the construction and filing of freight tariffs and classifications and passenger fare schedules, Tariff Circular No. 18-A.

"After the carriers generally were taken under federal control the Railroad Administration decided that it was not necessary for carriers under federal control to exchange concurrences with each other inasmuch as they were all operated by one administration and as part of a unified system. There is a probability that the carriers will be released from federal control at a not distant date. After their return to private control it will be necessary for all carriers and their agents to conform to the commission's regulations in connection with schedules thereafter published, including the requirement that the schedule shall show the names of all participating carriers and the forms and numbers of the powers of attorney or concurrences under which that participation is authorized. It is, therefore, important that before federal control terminates complete arrangements for exchange and filing of powers of attorney and concurrences shall be made, and that in every instance in which a carrier is shown as participant in a schedule filed by an agent or another carrier and it is desired to continue that participation it shall be authorized by power of attorney or concurrence that is on file with the commission.

"Powers of attorney and concurrences that were on file with the commission when the carriers were taken under federal control and that have not been revoked prior to the termination of federal control will be still on file and available for use just as if there had been no interruption of private control. In instances where such instruments have been or are revoked or where it is desired to publish joint rates, fares or charges that are not covered by such powers of attorney or concurrences it will be necessary to execute and file new powers of attorney or concurrences.

"It is very desirable that this matter should have prompt and careful attention in order that controversies as to the legality of a schedule may be avoided.

"It is proposed in a bill which has been receiving consideration in Congress to provide that all rates, fares, and charges, divisions of rates, classifications, regulations and practices, which may be in effect immediately preceding the termination of federal control, shall continue in force and effect until changed by or pursuant to authority of law. If that shall become law prior to the termination of federal control, it will, of course, be conclusive on that point, but if that provision shall not be contained in the law, or if no legislation is enacted prior to the termination of federal control, the commission will adopt and follow the rule above referred to. That is, that unless it shall conflict with a law that may be enacted the commission will hold that the tariffs on file and in effect at the termination of federal control will be and remain the tariffs of the carriers participants therein until they are changed by or pursuant to authority of the law, and that all changes therein must be made under and in conformity with the commission's tariff regulations or in accordance with special permissions granted by the commission."



Baikal Engine and One of the Curious Water Tanks in Use on the Trans-Siberian

The Test was Witnessed by Many Prominent Men

Test of New C. M. & St. P. Electric Locomotive

Two Steam Motive Power Units Used to Try Capabilities of Giant Electric Competitor

TESTS WERE MADE on one of the five electric locomotives built by the General Electric Company for the Chicago, Milwaukee & St. Paul at Erie, Pa., on Friday, November 7. The large number of prominent engineers and railroad men present at the demonstration was evidence of the interest taken in the subject of electrification. The representation included 11 American railroads, two Canadian railroads, the Chilean Railway Commission, manufacturers from the United States, France and Japan, several consulting engineers, and representatives of the General Electric Company from various parts of the world.

During the morning a number of speed runs were made along the three-mile test track. Two passenger cars were

Two Steam Locomotives Were Used as Prime Movers for Regeneration Test

hauled on some of these runs and some were made with the locomotive running light. The runs were continued until every one had had an opportunity to ride on the locomotive. It was particularly interesting to note that practically all of the railroad men who rode in the cab of the locomotive under-estimated the speed. A speed of 60 miles an hour was estimated usually at about 45.

In the afternoon tests were made to show what could be done with regenerative braking. Two New York Central steam locomotives were brought onto the test track. One of these was a (4-6-2) Pacific type and the other a (4-8-2) Mohawk type. These were coupled in tandem to the electric locomotive and used to push it while the electric locomotive was made to regenerate electric power to the trolley and thereby resist the power of the steam locomotives. The steam engineers were instructed to use all the power they could, but it was possible with both steam locomotives working to full capacity to hold the speed down to any desired value by regenerating with the electric. The noise of the exhausts was good evidence of the fact that reverse levers were left in the extreme forward position and that throttles were wide open. A measurement of just what the steam locomotives were doing was obtainable in the sub-station where the meters showed that the electric locomotive was returning 1,200 amperes at 3,000 volts or almost 5,000 hp. of electrical energy to the power system. This was done at a speed of about 25 miles an hour. When pushed by another electric locomotive, one of these engines has returned as much as 1,600 amperes to the line.

After a number of regeneration tests had been run all of the observers were taken in a train hauled by an oil-electric locomotive to a point near one end of the test track, where a tug-of-war test was made. This part of the track was used because of the possibility of damaging rails by slipping drivers. The three units were coupled as before and at a given signal the steam locomotive engineers started to push the electric locomotive, and the driver of the electric started to push against them. The steam engineers showed some expert handling in this test, and neither one slipped the drivers of his engine. At first the steam locomotives were allowed to push the electric a short distance. Then additional power was applied to the electric until the steam locomotives were pushed slowly backward. This was repeated several times. Comparative data for the two locomotives is given in the table. The total weights given for the steam locomotives do not include the tender.

	Pacific	Mohawk	Electric
Total weight, lb.	273,000	343,000	530,000
Weight on drivers, lb.	173,000	234,000	458,000
Weight on each driving axle, lb.	57,667	58,500	38,167
Diameter of driving wheels, in.	72	62	44
Size of cylinders, in.	22x28	28x28	.....
Number of driving axles	3	4	12

From the data in the table it may be seen that the total weight on drivers of the electric locomotive is 51,000 lb. greater than that of both steam locomotives. For this reason the test did not illustrate the fact that greater adhesion is

possible with the electric locomotive because of uniform torque. On the other hand, it shows that a great amount of power can be delivered to the rails by an electric locomotive. The test showed the ease with which an electric locomotive can be controlled, and illustrated the possibilities of regenerative braking in a manner to convince the most skeptical. A description of one of the electric locomotives will appear in an early issue of the *Railway Age*.

Train Accidents in August[1]

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of August, 1919:

COLLISIONS

Date	Road	Place	Kind of Accident	Kind of Train	Kil'd	Inj'd
20.	Pere Marquette	Sabin	bc	P. & F.	6	34
24.	W. J. & Seashore	Elwood	rc	P. & P.	1	22
28.	Southern	Rankin	xc	P. & F.	..	..

DERAILMENTS

Date	Road	Place	Cause of Derailment	Kind of Train	Kil'd	Inj'd
2.	Kan. City So.	Bunch	unx	P.	2	17
8.	Fort Worth & D. C.	Vernon	....	P.	0	4
13.	Colorado So.	Walsenburg	....	P.	1	2
14.	Chicago, B. & Q.	Dewees	unx	P	0	1
20.	Central Ga.	Leeds	....	P.	1	3
21.	Norfolk & W.	Boyce	b. truck	P.	0	13
27.	Chi., R. I. & P.	Tucumcari	....	P.	2	4
31.	N. Y. C.	Painesville	....	P. & F.	1	0

The trains in collision on the Pere Marquette at Sabin, Mich., four miles south of Traverse City, on the evening of the 20th of August, were a southbound passenger and a northbound freight. Both locomotives were wrecked. Six trainmen were killed and 34 passengers were injured. The collision was due to neglect on the part of the men in charge of the freight (an extra) who overlooked the schedule of the passenger train.

The trains in collision on the West Jersey & Seashore near Elwood, N. J., on the 24th of August, were the 9th and 10th sections of an excursion train from Washington destined for Atlantic City. The ninth section had been stopped because of a train ahead, and it was run into at the rear by the tenth section, badly damaging three cars. One passenger was killed and 22 were injured. The tenth section had run past cautionary and stop automatic block signals set against it. This collision was made the subject of a special report by C. S. Lake, assistant director of the division of operation. In this report, summarized in the *Railway Age* of September 12, page 514, the fault of the engineman is held inexcusable, and responsibility is placed also on the flagman of the ninth section and also on one other brakeman and the conductor of that section.

The trains in collision at Rankin, Tenn., on the 28th were passenger train No. 102, eastbound, and a westbound freight train. The freight was on a side track and had nearly cleared the main line when the passenger train approached at uncontrollable speed, striking the caboose. Responsibility for the collision is charged against the passenger train for approaching at a higher speed than was proper, according to the rules, and against the freight for not being protected by flag. It appears that the flagman of the freight was sent forward, but he had not gone far beyond the forward end of his train when he was struck and killed by the pasesnger train. The conductor in charge of a locomotive, standing on the side track, also was killed. Officers of the road have not been able to determine the cause of the death of either of these men, but neither death was caused by the collision.

The train derailed at Bunch, Okla., on the 2nd of August, was southbound passenger No. 3. The train was running about 35 miles an hour when the locomotive was thrown off the track and the whole train, except the two rear cars, was ditched. The mail car was wrecked. The engineman and fireman were fatally scalded and 15 passengers and two trainmen were injured. The cause of the derailment was not determined.

The train derailed on the Fort Worth & Denver City near Vernon, Tex., on the 8th, was southbound passenger No. 4. Three Pullman cars were overturned; four passengers injured.

The train derailed on the Colorado & Southern, near Walsenburg, Colo., on the 13th. was southbound passenger No. 2. Two cars were overturned. The engineman was killed and the fireman and express messenger were injured.

The train derailed near Dewees, Neb., on the 14th was an eastbound passenger. The fireman was injured. The cause of the derailment was not determined.

The train derailed on the Central of Georgia near Leeds, Ala., on the 20th was the westbound Seminole Limited, No. 9. The engine and tender fell through a trestle bridge spanning the track of the Southern Railway and a stream of water, and lodged in the stream. A foreman carpenter working beneath the bridge was killed and three other men were injured; but the engineman and fireman escaped with slight injuries.

The train derailed near Boyce, Va., on the 21st about 1 a. m. was northbound passenger No. 2. One coach and two sleeping cars were overturned. Twelve passengers and one trainman were injured. The train, running at about 45 miles an hour, was thrown off the track by a broken tender truck.

The train derailed on the Chicago, Rock Island & Pacific near Tucumcari, N. M., on the 27th was the eastbound Golden State Limited. The engine and first two cars were overturned. The engineman and fireman were killed, and four other trainmen were injured.

The trains involved in the accident on the New York Central near Painesville, Ohio, on the 31st of August were an eastbound freight and the eastbound Twentieth Century Limited express, running on parallel tracks. Four cars in the freight train were thrown off the track and fouled the track on which the passenger train was running and were struck by the engine of the passenger. The runner of this engine was killed. A few passengers were injured by broken glass.

Electric Car Accidents.—Near Parkersburg, Ohio, on the 14th an electric car ran into a locomotive of the Baltimore & Ohio and 11 or more occupants of the car, mostly children, were killed. About 30 were injured.

Canada.—Near Stonecliff, Ont., on the 4th the eastbound Imperial Limited, of the Canadian Pacific (train No. 2) was derailed, and one passenger was killed. Four cars were overturned and a number of persons were injured. The derailment was reported as due to a broken rail.

[1] Abbreviations and marks used in Accident List:
rc, Rear collision——bc, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc, obst., Accidental obstruction—malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——firc, Cars burned while running——P, or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

Plans for Census.—Special effort is being put forth to make the manufacturers' section of the approaching fourteenth decennial census the most complete and comprehensive ever made. The schedules for use in tabulating the information will be mailed to every manufacturing establishment in the United States in December. The questions relate to the calendar year 1919. In 1914, the year the last manufactures census was taken, about 275,000 manufacturing establishments were listed. This time more than 300,000 schedules will be sent out; and, in addition, it is expected that about 50,000 mines and quarries will also be reported.

Salaries of Railroad Officers in 1917

Eleven Shown as Having Received $75,000 or Over; Ten as Being Paid $60,000 and Fourteen About $50,000

A LIST OF 208 RAILROAD OFFICERS and officers of the Pullman Company receiving salaries in excess of $20,000 a year during the year 1917 was put into the Congressional Record of November 18 as an extension of remarks by Representative Thetus W. Sims of Tennessee in connection with his proposed amendment to the Esch railroad bill to provide that not exceeding $20,000 of the compensation of a railroad official should be charged to operating expenses or be considered by the Interstate Commerce Commission in reaching its conclusion as to the reasonableness of rates. Mr. Sims also used it as an argument against a proposed section of the bill, which was eliminated, requiring the commission to take into consideration "the reasonable cost of maintenance and operation." In the list, which Mr. Sims said he got from "the report of the Government Railroad Wage Board," the highest compensation shown was that of J. M. Dickinson, receiver of the Chicago, Rock Island & Pacific, $120,732.90. R. S. Lovett, as chairman of the executive committee of the Union Pacific, is shown as having received $104,104.16. Julius Kruttschnitt, A. J. Earling, Walker D. Hines, L. F. Loree, Samuel Rea, E. P. Ripley, A. H. Smith, W. H. Truesdale and F. D. Underwood are shown as receiving $75,000 or over. There are 10 shown as receiving approximately $60,000, and 14 shown as receiving approximately $50,000.

A list of the salaries over $10,000 was made up by Director General McAdoo's office early in 1918 at the request of the Senate committee on interstate commerce but it was not made public. Mr. Sims said in part:

"My personal friend, the able gentleman from Virginia, ex-Gov. Montague, says that there is a tendency to have too many employees under government operation. It may be true—I am not controverting it—but what in the name of consistency has been the tendency of the railroad companies when they had the right to employ as many as they pleased and pay as many officials as they pleased and as much as they pleased and all of it to be charged up to expense of operation? Take the greatest railroad system in this country, which is, according to my judgment, the Pennsylvania Railroad System. It had for the year 1917 a president at a salary of $75,460, which is more than the President of the United States receives. It has 11 vice presidents with compensations beginning with $40,620 and running down to $25,000. I have only included the officers of this system receiving salaries of $20,000 and over. In all, it has in this class 23 officers and attorneys whose compensation is from $20,000 up to $75,460, amounting in all to $681,960. The President of the United States receives $75,000. Ten Cabinet officers receive altogether $120,000. The nine Justices of the Supreme Court received $126,500. The Vice-President of the United States receives $12,000. The Speaker of the House of Representatives receives $12,000. These 23, the highest-paid officials of all departments of the Government, executive, judicial, and legislative, all combined, receive salaries amounting to $345,500, just a little more than half the 23 executive officials of the Pennsylvania Railroad System amount to all combined.

"Did the Interstate Commerce Commission have any power to consider the reasonableness of expenses of operation, including the payment of salaries to railroad officials greater than that of the President of the United States in fixing rates? I said the other day in my opening remarks that some of the ablest railroad officials in the United States have never received salaries of more than $25,000.

"This amendment is to limit expenses chargeable to costs of operation, and does not prevent these railroad officials receiving any amount in excess of $20,000 each, provided it is paid out of the net earnings which belong to the stock holders who elect the directors, who allow these exorbitant salaries. They undoubtedly do it for other reasons than the public interest, as the public interest requires no such extravagant expenses of operation of this kind. The owners of the roads are responsible for the employment and compensation of these officials.

"I do not object to giving Mr. Rea the salary he receives if it comes out of the net earnings in excess of $20,000. A distinguished official of the Southern Railroad, coming from Virginia, a fine young man, gets $50,500. These salaries of railroad officials that I have referred to were for the year 1917, and my information comes from the report of the Government Railroad Wage Board. Now, the director general may have employed more laborers under operation and effect of the Adamson eight-hour law, and for the further reason that the best men they had were taken from them for Army service, both here and abroad, but everyone knows that they have not employed more general officers than did the railroads themselves before they were taken over. The railroads, prior to federal control, had for the year 1917 208 general officers, including attorneys and receivers, receiving $20,000 and over a year as salaries or compensation."

The list as given by Mr. Sims follows:

List of railroad officers and attorneys who received a salary of $20,000 or more during 1917.

	Compensation.
Aishton, Richard H., president, Chicago & North Western	$50,240.00
Atterbury, W. W., vice-president in charge of operations, Pennsylvania	40,000.00
Auch, John F., vice-president and traffic manager, Philadelphia & Reading	20,000.00
Baker, Botts, Parker & Garwood, attorneys, Southern Pacific	30,000.00
Bannard, Wm. Newell, special agent to general manager, Pennsylvania	25,000.00
Batchelder, F. C., president, Baltimore & Ohio, Chicago Terminal	22,015.00
Bell, M. L., general counsel, Chicago, Rock Island & Pacific Railway Co.	59,486.45
Bernet, J. J., president and general manager, Nashville, Chattanooga & St. Louis	26,906.66
Berry, J. B., consulting engineer, Los Angeles & Salt Lake	23,600.00
Besler, W. G., president and general manager, Central Railroad Co. of N. J.	50,210.00
Biddle, W. P., president, St. Louis-San Francesco Railroad	39,879.00
Bierd, W. G., president, Chicago & Alton	36,646.55
Biscoe, H. M., vice-president, Boston & Albany	20,010.00
Blair, Joseph P., general counsel, Southern Pacific	34,500.00
Bledsoe, Samuel T., assistant general solicitor, Atchison, Topeka & Santa Fe	20,000.00
Blendinger, F. L., vice-president, Lehigh Valley	20,120.00
Bond, Hugh L., Jr., general counsel and director, Baltimore & Ohio	25,290.00
Bowes, Frank B., vice-president, Illinois Central	20,115.00
Brown, E. N., chairman board of directors, Pere Marquette	21,666.67
Brownell, Geo. F., vice-president and general solicitor, Erie	49,610.00
Bruce, Helm, local counsel, Louisville & Nashville	27,770.00
Buckland, Edward G., vice-president and general counsel, New York, New Haven & Hartford	22,699.99
Budd, Ralph, assistant to president, Great Northern	20,000.00
Burn, Charles W., general counsel, Northern Pacific	30,000.00
Burnham, C. G., vice-president, Chicago, Burlington & Quincy	31,249.98
Bush, B. F., president, Missouri Pacific	44,170.00
Bush, D. L., vice-president, Chicago, Milwaukee & St. Paul	20,010.00
Butler, Pierce, counsel of Federal Valuation, Missouri Pacific	45,000.00
Byram, H. E., president, Chicago, Milwaukee & St. Paul	60,000.00
Byram, H. E., vice president, Chicago, Burlington & Quincy	22,500.00
Calvin, Edgar E., president, Union Pacific	35,080.00
Campbell, Benjamin, senior vice-president and director New York, New Haven & Hartford	28,343.33
Capps, Chas. R., first vice-president and director, Seaboard Air Line	20,000.00
Carey & Kerr, general counsel, Spokane, Portland & Seattle	22,500.00
Carpenter, Myron J., president, Chicago, Terre Haute & Southeastern	25,040.00
Carter, Ledyard & Milburn, general counsel, Denver & Rio Grande	55,000.00
Carstensen, John, vice-president, New York Central	35,000.00

	Compensation.
Cary, Robert J., general counsel, New York Central	22,000.00
Chadbourne & Shores, counsel, Denver & Rio Grande	63,000.00
Chambers, Edward, vice-president, Atchison, Topeka & Santa Fe	25,000.00
Clark, James T., president, Chicago, St. Paul, Minneapolis & Omaha	25,160.00
Coapman, F. H., vice-president, Southern	30,150.00
Cooke, Delos W., vice-president, Erie	25,826.67
Cooper, Thomas, assistant to president, Missouri Pacific	25,000.00
Cravath & Henderson, general counsel, St. Louis & San Francisco	20,000.00
Crowley, P. E., operating vice-president, New York Central	25,000.00
Daly, C. F., vice-president, New York Central	35,000.00
Darlow, E. R., president, Buffalo & Susquehanna	35,300.00
Davis, J. M., vice-president, charge of operations and maintenance, Baltimore & Ohio	24,000.00
Dean, Richmond, vice-president, Pullman Co	30,000.00
Depew, Chauncey M., chairman, board of directors, New York Central	25,260.00
Dice, Agnew T., president, Philadelphia & Reading	35,000.00
Dickinson, J. M., receiver, Chicago, Rock Island & Pacific	120,732.90
Dixson, Geo. Dallas, vice-president in charge of traffic, Pennsylvania	30,000.00
Donnelly, Chas., assistant general counsel, Northern Pacific	20,000.00
Doran, Joseph L., general counsel, Norfolk & Western	20,310.00
Earling, A. J., president, Chicago, Milwaukee & St. Paul	75,319.00
Earling, H. B., vice-president, Chicago, Milwaukee & St. Paul	20,000.00
Edson, J. A., president, Kansas City Southern	25,000.00
Elliott, Howard, director, president and chairman, New York, New Haven & Hartford	37,381.69
Evans, W. F., general solicitor, St. Louis & San Francisco	25,000.00
Fahnestock, James F., treasurer, Pennsylvania	20,000.00
Farrell, J. D., president, Union Pacific	30,030.00
Felton, S. M., president, Chicago Great Western	40,259.96
Galloway, Chas. Wm., general manager, Baltimore & Ohio	20,210.00
Gilman, L. C., president, Spokane, Portland & Seattle	30,000.00
Gorman, J. E., president, Chicago, Rock Island & Pacific	47,715.00
Gowan, Marcus L., general counsel, Pennsylvania Railroad	30,000.00
Gowan, Francis I., general counsel, Pennsylvania	30,000.00
Gray, C. K., chairman of board, Western Maryland Railway	32,960.00
Gruber, James M., vice-president and general manager, Great Northern	25,000.00
Hannaford, J. M., president, Northern Pacific	50,000.00
Hanson, Burton, general counsel, Chicago, Milwaukee & St. Paul	25,000.00
Harahan, W. J., president, Seaboard Air Line	40,857.00
Hardin, A. T., vice-president, New York Central	35,020.00
Harris, Albert H., vice-president, New York Central	35,560.00
Harrison, Fairfax, president, Southern	50,500.00
Hawkins, W. A., general attorney, El Paso & Southwestern	25,000.00
Heiseman, C. B., general counsel, Pennsylvania Western	20,000.00
Henderson & Burr, solicitors, Pennsylvania System	29,700.00
Herbert, J. M., president, St. Louis Southwestern of Texas	20,343.36
Herrin, William F., vice-president and chief counsel, Southern Pacific	38,170.00
Hill, Louis W., chairman, Great Northern	50,000.00
Hillard, Charles W., fourth vice-president, St. Louis-San Francisco	20,000.00
Hines, Walker D., director, chairman, Atchison, Topeka & Santa Fe	77,210.00
Holden, Hale, president and director, Chicago, Burlington & Quincy	65,000.00
House, F. E., president and general manager, Duluth & Iron Range	34,645.00
Howard, E. A., vice-president, Chicago, Burlington & Quincy	20,000.00
Hughitt, Marvin, Sr., chairman, board of directors, Chicago & North Western	60,460.00
Hughitt, Marvin, Jr., vice-president, Chicago & North Western	25,050.00
Hungerford, L. S., general manager, Pullman Co	20,000.00
Huntington, C. W., president, Virginian Railway Co	20,660.00
Huntington, G. R., general manager, Minneapolis, St. Paul & Sault Ste. Marie	20,000.00
Hustis, James H., president, Boston & Maine	35,200.00
Hyser, Edward M., vice-president and general counsel, Chicago & North Western Railway	36,260.00
Ingersoll, Howard L., assistant to president, New York Central	20,000.00
Inglis, Wm. W., vice-president and manager, Delaware, Lackawanna & Western	30,030.00
Jackson, Wm. J., receiver, Chicago & Eastern Illinois	27,000.00
James, Arthur Curtis, vice-president, El Paso & Southwestern	26,650.00
Jeffery, E. T., chairman of board, Denver & Rio Grande	20,166.66
Jeffries, L. E., general counsel, Southern Railway	23,083.32
Jenney, Wm. S., vice-president and general counsel, Delaware, Lackawanna & Western Railroad	31,383.98
Johnson, L. E., president, Missouri Pacific	60,090.00
Jungen, C. W., manager, Southern Pacific	21,500.00
Kearney, Ed. F., president, Wabash	50,120.00
Keeley, E. S., vice-president, Chicago, Milwaukee & St. Paul	20,000.00
Kenney, Wm. P., vice-president, Great Northern	22,500.00
Kerr, John B., president and general manager-director, New York, Ontario & Western Railway	20,230.00
Kramer, Le Roy, vice-president, Pullman Co	24,000.00
Kruttschnitt, J., chairman of executive committee of board of directors, Southern Pacific Transportation System	88,860.00
Kurn, J. M., president, Detroit, Toledo & Ironton	20,000.00
Lamb, E. T., president, Atlanta, Birmingham & Atlantic	25,110.00
Lancaster, J. L., president and receiver, Texas & Pacific	20,470.00
Lathrop, Gardiner, general solicitor, Atchison, Topeka & Santa Fe	25,000.00
Lawton-Cunningham, general and division counsel, Central of Georgia	21,000.00
Ledyard, H. B., chairman, board of directors, Michigan Central	30,240.00
Levey, Chas. M., president, the Western Pacific	25,420.00
Levy, Edw. D., first vice-president and general manager, St. Louis & San Francisco	27,600.00
Lincoln, Robt. T., chairman, board of directors, Pullman Co	25,300.00
Lindley, E. C., vice-president, director and general manager, Great Northern	20,000.00
Loesch & Richards, solicitors, Pennsylvania	25,805.00
Loomis, E. E., president, Lehigh Valley	44,287.18
Loomis, N. J., general solicitor, Union Pacific	20,000.00
Loree, L. F., president, Delaware & Hudson	50,800.00
Loree, L. F., chairman, board and executive committee, the Kansas City Southern	30,825.00
Lovett, R. S., chairman, executive committee, Union Pacific	104,104.16
Lyford, Will H., general counsel to receiver, Chicago & Eastern Illinois	24,040.00
McAllister, Henry, Jr., general counsel, Denver & Rio Grande	55,000.00
McCabe, D. T., vice-president, Pennsylvania	30,000.00
McChesney, W. S., president, Terminal Railroad Association, St. Louis	22,450.00
McCormack, E. O., vice-president of traffic, Southern Pacific	30,200.00
McDonald, A. D., vice-president and controller, Southern Pacific	26,250.00
McDonald, Morris, president, Maine Central	35,735.12
McGonagle, William A., president and general manager, Duluth, Missabe & Northern	21,000.00
McKeen, B., vice-president, Pennsylvania Lines	25,020.00
McKenna, E. W., member conference committee, Chicago, Milwaukee & St. Paul	20,000.00
McKenney & Flannery, solicitors, Pennsylvania	21,250.00
Maher, N. D., vice-president of operations, Norfolk & Western	36,350.00
Markham, C. H., president, Illinois Central	60,555.00
Martin, W. L., vice-president and traffic manager, Minneapolis, St. Paul & S. Ste. Marie	20,160.00
Middleton, J. A., vice-president, Lehigh Valley	30,445.00
Minnis, James L., vice-president and general solicitor, Wabash	20,833.33
Mudge, H. U., president, Denver & Rio Grande	43,232.00
Myers, W. Heyward, vice-president, Pennsylvania	25,000.00
Noonan, William T., president, Buffalo, Rochester & Pittsburgh	50,000.00
O'Brien, Boardman, Harper & Fox, counsel, Pennsylvania	26,500.00
Pardee, Dwight W., secretary, New York Central	21,500.00
Patterson, G. S., general solicitor, Pennsylvania	30,000.00
Platt, H. V., vice-president and general manager, Union Pacific	20,000.00
Pearson, Edw. J., president, New York, New Haven & Hartford	40,000.00
Peck, G. L., fourth vice-president, Pennsylvania	30,030.00
Pennington, E., president, Minneapolis, St. Paul & S. Ste. Marie	52,723.34
Peters, Ralph, president, Long Island	30,470.00
Pierce, Winslow S., general counsel, Wabash	24,000.00
Place, Ira A., vice-president, New York Central Lines	35,150.00
Potter, Mark W., president, Carolina, Clinchfield & Ohio	20,000.00
Randolph, Epes, president, Arizona Eastern	26,465.00
Rea, Samuel, president, Pennsylvania	75,460.00
Reed, J. H., president and director, Bessemer & Lake Erie	23,562.00
Ridgway, A. C., vice-president, Chicago, Rock Island & Pacific	25,390.00
Rine, E. M., vice-president and general manager, Delaware, Lackawanna & Western	33,373.33
Ripley, Ed. P., president, Atchison, Topeka & Santa Fe	75,400.00
Robertson, Alexander, vice-president, Missouri Pacific	25,869.55
Rodd, Thomas, chief engineer, Pennsylvania Lines West	21,080.00
Ross, Walter L., president and receiver, Toledo, St. Louis & Western	25,090.00
Ruhlender, Henry, chairman, board of directors, St. Louis & San Francisco	40,000.00
Runnells, John S., president, Pullman Co	60,500.00
Russel, Henry, vice-president, Michigan Central	20,095.00
Schaff, Charles E., receiver and president, Missouri, Kansas & Texas	43,000.00
Schoomaker, J. M., vice-president, Pennsylvania	25,000.00
Schumacher, Thomas M., president, El Paso & Southwestern	60,150.00
Scott, W. B., president, Morgan's Louisiana & Texas Railroad & Steamship	27,225.00
Scott, William R., vice-president and general manager, Southern Pacific	23,766.67
Seger, C. B., vice-president and comptroller, Union Pacific	37,016.87
Sewall, E. D., vice-president, Chicago, Milwaukee & St Paul	20,160.00
Seymour, M. V., counsel, St. Paul Union Depot	27,000.00
Shriver, G. M., vice-president, Baltimore & Ohio	30,250.00
Sloan, George T., first vice-president, Northern Pacific	35,120.00
Smith, A. H., president, New York Central	78,360.00
Smith, Milton H., president, Louisville & Nashville	20,639.09
Spence, L. F., director of traffic, Southern Pacific	36,525.00
Spencer, O. M., general counsel, Chicago, Burlington & Quincy	27,123.28
Sproule, William, president, Southern Pacific	62,036.67
Stevens, George W., president, Chesapeake & Ohio	31,873.26
Stone, A. J., vice-president, Erie	29,070.00
Storey, W. B., vice-president, Atchison, Topeka & Santa Fe	32,950.00
Strong, A. H., general attorney, Pennsylvania	20,000.00
Slade, George T., first vice-president, Northern Pacific	35,120.00
Tatnall, Henry, vice-president, Pennsylvania	35,200.00
Taylor, Edw. B., vice-president, Pennsylvania Lines West	31,235.00
Thomas, E. B., chairman of board, Lehigh Valley	50,880.00
Thompson, Arthur W., vice-president, Baltimore & Ohio	30,510.00
Todd, Percy R., president, Bangor & Aroostook	30,395.00
Trabue, Doolan & Cox, district attorneys for Kentucky, Illinois Central	27,720 00
Truesdale, William H., president, Delaware, Lackawanna & Western	75,399.88
Trumbull, Frank, chairman of board, Chesapeake & Ohio	26,738.97
Turner, James J., senior vice-president, Pennsylvania Lines West	40,620.00
Underwood, F. D., president and chairman, executive committee, Erie	77,950.00
Utley, F. H., vice-president and general manager, Bessemer & Lake Erie	20,867.12
Warfield, S. Davis, chairman of board, Seaboard Air Line	50,000.00
Waterhouse, Frank, foreign freight agent, Union Pacific	24,000.00
Williams, W. N., vice-president, Delaware & Hudson	20,636.66
Williams, Henry R., vice-president, Chicago, Milwaukee & St Paul	31,117.00
Winburn, W. A., president, Central of Georgia	21,855.00
Winchell, B. L., director of traffic, Union Pacific	36,000.00
Woodworth, James G., second vice-president, Northern Pacific	22,500.00
Worcester, H. A., vice-president and general manager, Cleveland, Cincinnati, Chicago & St. Louis	22,395.00
Young, J. H., president and director, Norfolk Southern	26,020.00

L. E. Johnson is given in the list as president of the Missouri Pacific, evidently through a typographical error. Lucius E. Johnson in 1917 was president of the Norfolk & Western. H. E. Byram, whose name is included twice, left the Burlington during the year to become president of the St. Paul.

Doings of the United States Railroad Administration

Time and One-half for Overtime in Freight Service—Results of Accident Prevention Drive

DIRECTOR GENERAL HINES announced on November 1 that gratifying progress in connection with the National Railroad Accident Prevention Drive was shown in reports received by the Safety Section of the Railroad Administration. The figures follow, the comparison being with the same number of days in the same period a year ago:

Eastern Region, 11 days, decrease of	428 casualties
Pocahontas Region, 11 days, decrease of	38 casualties
Allegheny Region, 11 days, decrease of	589 casualties
Southern Region, 9 days, decrease of	287 casualties
Northwestern Region, 7 days, decrease of	305 casualties
Central Western Region, 11 days, decrease of	390 casualties
Southwestern Region, 10 days, decrease of	148 casualties
Total	2,185 casualties

Time and One-Half for Overtime in Freight Service.

The Railroad Administration, according to a statement authorized by Director General Hines on November 15, has proposed to the four brotherhoods representing the train and engine employees that in order to give an additional measure of compensation to the employees in the slow freight service, time and one-half will be paid for time required to make their runs in excess of what would be required if an average speed of 12½ miles per hour were maintained, provided, however, that all arbitraries and special allowances now paid in various forms of freight train service are entirely eliminated. The proposal was taken under consideration by the officials of the brotherhoods that have been conferring with Mr. Hines and Railroad Administration officials, with a view to consideration and further discussion. The statement says it is estimated that the net cost of this proposal will be approximately $3,000,000 a month, or $36,000,000 a year.

The Railroad Administration has thus conceded as to the freight service the principle which the brotherhoods have contended for since 1916, when time and one-half for overtime was one of the principal features of their demand which led to the enactment of the Adamson eight-hour law. The demand for time and one-half was waived during their negotiations with the President in 1916 but was repeated when new wage increases were demanded in 1917, and again before the wage board created by the Railroad Administration. Time and one-half for yard service was allowed last year. The wage board submitted to the director general a divided report earlier in the year, and Mr. Hines has since had the question before him for decision, while some of the brotherhood leaders have been insisting on the demand being granted before the roads are returned to private management.

The Railroad Administration has not complied with the full demands of the brotherhoods, however, for the principle of time and one-half will not be applied in the passenger service, as requested, nor will it be applied for Sundays and holidays as provided for in the new demands submitted by the Brotherhood of Locomotive Trainmen and the Brotherhood of Locomotive Firemen and Enginemen this year. Neither does Mr. Hines agree with the brotherhoods on the principle of "punitive overtime." He prefers to base his proposal on the conclusion that the train service employees in freight service who are habitually averaging less than 12½ miles per hour do not get an opportunity to earn a reasonable monthly wage as compared with employees in fast freight service, or in passenger service without working abnormally long hours per month, and are entitled to an equalization. He also requires a concession from the brotherhoods in return which they have refused to consider when it has been proposed by the railroad companies.

Mr. Hines' statement was in part as follows:

"The Railroad Administration, in discharging its responsibility to make readjustments necessary to avoid unjust inequalities in the compensation of different classes of railroad employees, has proposed to the four brotherhoods representing the train and enginemen that, in order to give an additional measure of compensation to the train service employees in the slow freight service, time and one-half will be paid for time required to make runs in excess of what would be required if an average speed of 12½ miles per hour were maintained, provided, however, that all arbitraries and special allowances now paid in various forms of freight train service are entirely eliminated for the railroads as a whole.

"Last August the President suggested to Congress that in view of the early approach of the termination of federal control it would be desirable to have these questions of further compensation for railroad employees committed to a special tribunal to be created by act of Congress. The Congress, however, was unwilling to adopt this course and the Senate Committee on Interstate Commerce took the position that such legislation was not needed because ample power was conferred upon the director general under the federal control act to deal with these matters. The policy was thereupon adopted by the Railroad Administration that, while it could not consider increases in the general level of railroad wages until a reasonable opportunity had been afforded to ascertain the result of the efforts of the government was making to reduce the cost of living, nevertheless, the Railroad Administration would endeavor to correct unjust inequalities as between different classes of railroad labor.

"In discharging the responsibility which thus unavoidably rested upon the Railroad Administration consideration has been given to the claim that various classes of train and engine employees are relatively underpaid. In considering these claims, the conclusion has been reached that the train service employees in freight train service who are habitually averaging less than 12½ miles per hour do not get an opportunity to earn a reasonable monthly wage as compared with employees in fast freight service or employees in passenger train service, without working abnormally long hours per month, frequently amounting to from 275 to 300 hours or more per month, and the above method has been decided to be the best way in which to make a fair equalization of this condition.

"It has frequently been the practice to make employees in freight train service various arbitrary payments and special allowances in addition to their mileage rates, and the proposal of the Railroad Administration contemplates that all of these arbitraries and special allowances must be eliminated from all freight service on all railroads under federal control.

"For many years the train and enginemen have urged that time and one-half ought to be allowed for excess time as a punitive measure to compel trains to be run at a higher average speed. The director general, however, has decided that this step is not justifiable as a punitive measure, because it is not, generally speaking, feasible or reasonable, to economically run the heavy freight trains at a speed as high as 12½ miles per hour. The present proposal, therefore, is not adopted as a punitive measure, but simply to enable an

important class of train service employees to earn a reasonable monthly wage as compared with other train service employees, without working an abnormal number of hours.

"The conditions above explained grow out of the fact that for many years train service employees have been paid according to the number of miles they have made, with a guaranty of a minimum number of miles per hour, which minimum was formerly 10 miles, and by reason of the Adamson act became 12½ miles per hour. The result of this is that employees on freight trains which habitually make 12½ miles per hour or more get an important benefit from the additional mileage they make, whereas this benefit is entirely denied to those employees working on trains which habitually make less than 12½ miles per hour, and this inequality will be substantially corrected by the proposal now made.

"It is important to emphasize that this proposal will operate exclusively for the benefit of employees in the slow freight train service. These employees have all the disadvantages of spending a large time away from home at their own personal expense and yet have not the advantages of the larger compensation enjoyed by employees in fast freight service and also in passenger service, making much larger mileage in the same or less length of time. It is these employees making large mileage in a comparatively short time who are frequently accepted by the public as indicating the standard of compensation for men in all train service.

"It is estimated that with the average speeds now made by the slower freight trains the net cost of this proposal will be approximately $3,000,000 per month. Undoubtedly, however, the proposal would have the effect of correcting many extreme cases of trains being kept an abnormally long time upon the road and to the extent that this condition can be so corrected the cost will be reduced."

Timothy Shea, acting president of the firemen's brotherhood, was quoted as saying in Chicago that apparently Mr. Hines proposed to allow an increase of $36,000,000 and to take away $30,000,000 in arbitraries and special allowances. He said that the brotherhoods would continue to insist on general wage increases.

New Freight Cars Put in Service.

Director General Hines has announced that with the exception of 17 cars which were damaged while in storage and have to undergo repairs, all of the freight cars ordered by the Railroad Administration which had been completed and placed in storage awaiting lettering and numbering have now been placed in service. Of the total order of 100,000 freight cars, 16,636 remain to be built. During the six days from November 1 to November 6 new cars were constructed and put in service at the rate of 207 a day.

Traffic Committees Instructed to Wind Up Their Work.

The directors of the Division of Traffic and Public Service have written letters to the regional and local traffic committees, saying that in view of the probable return of the railroads to their owners on or about January 1, 1920, they desire the work of all freight traffic committees brought to a close on or before that date and all subjects before the committees disposed of so that the publication of changes in rates, etc., which may result from the committee's work may be not only published but made effective before the end of federal control. Detailed instructions are given, under which after November 10 no new applications were to be accepted by any committee nor docketed for public consideration, except in such cases as applications to publish new commodity rates to cover newly developed traffic or for newly constructed lines, applications to correct clerical errors or to readjust rates thrown out of line by General Order No. 28, or to make changes necessary to comply with orders of the Interstate Commerce Commission, and subjects of which either the Division of Traffic and the Division of Public Service may request consideration.

Rules for Per Diem Settlements

The Car Service Section has issued instructions supplementing those of Director General Hines, effective October 1, governing the settlement of passenger and freight car hire accounts between the railroads. The new regulations are contained in Circular CS-77, which supersedes Circular CS-59, and are, in part, as follows: "In accordance with director general's order 31-A October 3, 1919, effective October 1, 1919, the settlement of passenger and freight car hire accounts will be in accordance with the following:

"Per diem settlements for use of freight cars will be in accordance with the Code of Per Diem Rules in effect July 1, 1918, with the following exceptions:

"Rule 3. Suspended.

"Rule 15. All regulations embraced in Circular CS-57, covering the issuance of embargoes are continued in effect and will supersede paragraph 3, of the rule.

"Rule 19. Suspended.

"Per diem and mileage settlements for use of passenger cars will be in accordance with Rules 7 and 8 of the Code of Car Service Rules in effect July 1, 1918.

"1. The settlement of car hire accounts between Canadian roads and United States roads through the Car Hire Bureau at Buffalo will discontinue with per diem reports for the month of September, 1919.

"Per diem accruing from October 1, 1919, should be reported direct to the car owner.

"Per diem due to or from Canadian roads account of discrepancies and reclaims for period May 1, 1919, to September 30, 1919, will be handled through the Car Hire Bureau at Buffalo.

"Per diem due to or from Canadian roads account of discrepancies and reclaims covering period to May 1, 1919 (not in process of settlement through Car Hire Bureau), will be handled direct by the interested lines.

"2. The settlement of car hire accounts between Federal and non-Federal roads within the United States through the assigned Federal road will be discontinued with the per diem reports for the month of September, 1919.

"Per diem accruing from October 1, 1919, should be reported direct to car owner.

"Per diem due to or from non-Federal roads account of discrepancies and reclaims covering period prior to May 1, 1919, will be handled direct between the interested lines.

"Per diem due to or from non-Federal roads on account of discrepancies and reclaims for period May 1, 1919, to September 30, 1919, will be handled through the assigned Federal road."

Sub-Committee on Upkeep, Additions and Betterments.

The Railroad Administration has appointed a sub-committee on upkeep, additions and betterments, to make an investigation and report on what part of the cost of additions and betterments made during the period of federal control should be charged to the capital accounts of the railroad companies, what part to maintenance and what part should be borne by the government. The committee consists of S. H. E. Freund, representing the Division of Law; E. M. Alvord, representing the Division of Operation; C. W. Hillman, representing the Division of Accounting, and George N. Huss, representing the engineering department. The work of the committee will include an investigation of a large number of cases where improvements were made for the joint benefit of two or more carriers or for the general purposes of the government, as to which there is a question as to whether they can be properly charged to any railroad.

General News Department

The bill providing for the acquisition of the Grand Trunk Railway by the Canadian Government has passed both houses of Parliament by large majorities.

The Great Northern Railway Company has been authorized by the Minnesota Railroad and Warehouse Commission to abandon a certain portion of its present track, and its passenger and freight stations at Hibbing, Minn. Business interests protested against carrying out the change before the whole village of Hibbing had been removed to Alice, two miles away. The change is to allow the extension of certain coal mining operations.

Subsidiary oil companies of the Southern Pacific plan extensive oil operations in the near future; this is shown by the transfer of oil leases covering 8,000 acres situated in Eastland county, Tex., and 2,000 acres in Comanche County, by the Rio Bravo Oil Company of Texas to the Associated Oil Company of California. Both are subsidiaries of the Southern Pacific. The necessary operating facilities are now being arranged for.

The railroad sections, which have been organized by the American Association of Engineers during the last six months have been so successful that the board of directors of the association has decided to extend the plant to other industries, so that sections may be formed wherever there is a special group who desire such an organization. These sections will be subordinate to the chapters, which have jurisdiction in their respective sections of the country.

The unauthorized convention of the Federated Railway Shop Crafts at Chicago, called by the Chicago District Council of the organization without the sanction of the International shopmen's brotherhood officers, ended on September 28, after sitting three days, with the repudiation of the international officers of the organization by the delegates and a refusal on their part to pay further per capita taxes or dues into their various international unions until the repudiated officers gain the demands which they presented to the Railroad Administration for increased wages and better shop conditions. The delegates also denounced the "one big union" idea.

The Chesapeake & Delaware Canal has been formally taken over by the United States Government, and the event was the subject of a celebration at Delaware City, Del., on October 11. This canal is about 15 miles long from Delaware City on the Delaware river, westward to Chesapeake City, Md., on a stream flowing into Chesapeake Bay. The canal was chartered in 1799. The last session of Congress appropriated $2,514,290 for the purchase of the canal, and about 500,000 additional for deepening and widening. It is proposed to make it a sea-level canal, which involves excavation to make it 10 ft. lower for a considerable distance at the summit. With adequate enlargement this canal will complete an inland waterway from Philadelphia to Norfolk.

Employees of the Canadian National Railways have subscribed $5,076,300 in the Canadian Victory Bond Campaign which has just closed in Canada. This amount was subscribed by 27,000 employees. At the outset of the drive the directors of the Canadian National set their objective at $5,000,000, and an elaborate organization was perfected to reach this amount. Apart from the bonds taken by the employees, outside subscriptions amounting to $1,960,800 were reported through the Canadian National auspices, and the total subscribed by the employees or secured by them was $7,037,100. The Brotherhood of Railway Carmen of America has subscribed $100,000 to the Canadian Victory Loan of 1919. The announcement was made by Thomas Broad, vice-president of the Canadian Pacific Railway Joint Protective Board of the brotherhood. A total subscription of $210,000 has been made by the brotherhood to the various Canadian public loans.

Signal Division—A. R. A.

The Signal Division of the American Railroad Association will hold its fourth meeting at Hotel McAlpin, 34th street and Broadway, New York City, on Tuesday and Wednesday, December 2 and 3. Committee reports to be discussed will be distributed on Tuesday morning.

Chicago Car Foremen's Association

At the annual meeting of the Car Foremen's Association of Chicago, held at the Morrison Hotel, October 13, the following officers were elected: President, M. F. Covert, Standard Car Construction Company; first vice-president, James Reed, assistant master car builder, New York City; second vice-president, E. H. Mattingley, general car foreman, Baltimore & Ohio; treasurer, F. C. Schultz, Chicago Car Interchange Bureau; secretary, Aaron Kline.

An Unusual Souvenir

Subscribers to the Bulletin of the International Railway Congress, have received from Brussels a rare souvenir; copies of the Bulletin for September and October, 1914. This bulletin, it appears from a slip attached to it, "was printed at the moment when Brussels was occupied (by the invaders) in August, 1914." The contents of this number consists mainly of reports presented for discussion at the Ninth session of the Congress; but it contains also the usual elaborate indexes of the volume for that year—January-October, 1914.

Grade Crossing Disaster

In a grade crossing accident at Clarksboro, N. J., on the night of November 1, about 11:20, sixteen persons were killed and about twenty injured, an automobile truck, occupied by thirty men and four women, on a pleasure trip, being struck by train No. 1926 of the West Jersey & Seashore, at a crossing which was without warning signals, but with approaches giving an unobstructed view. Clarksboro is on the Salem branch, 14 miles south of Camden. A coroner's jury on November 3 exonerated from blame the men in charge of this train. It appears from newspaper accounts that the pleasure-seekers were moving southward, and the passenger train northward, the crossing of the highway being at an acute angle with the railroad track; and there was a house near the crossing, except for which the headlight of the locomotive might have been seen sooner by the driver of the automobile.

Highway Crossings in Pennsylvania

The state of Pennsylvania is to have cautionary signals at all highway crossings which are not already protected, the Public Service Commission having arranged with the railroad companies of the state to furnish these signals. The total cost will be something like $200,000. The setting and care of these signals, which will devolve on the town, city, or county authorities, seems to be a matter which is still the subject of negotiation, there being no compulsory law touching this feature of the matter. The Public Service Commission finds that there are in the state 11,738 highway grade crossings, of which 9,773 are unprotected. The signals are

to be of the well-known standard already in use in several other states, a circular disk bearing the letters RR in black on a white ground, and fixed on a post at the right of the road about 300 ft. short of the crossing.

Engineer Company Being Recruited for European Service

The Secretary of War has announced that it is desired to enlist immediately for service with American Forces in France and Germany, 253 men to constitute an engineer company for possible use in railway operations and maintenance. Only white men will be enlisted. Enlistments will be for periods of one or three years. Former military service will not be required. Men eligible for discharge and reenlistment under existing instructions may also be reenlisted under this authority. Men enlisted under this authority for the service indicated will be sent to Camp Humphreys, Va. Furloughs upon reenlistment will not be required.

Railway Revenues for August

The Interstate Commerce Commission's monthly summary of railway returns for August and eight months of the calendar year, covering 186 Class I railroads and 17 switching and terminal roads, is as shown in table 1.

TABLE 1*—GROSS AND NET RECEIPTS OF PRINCIPAL RAILWAYS TO SEPTEMBER 1

		August				Eight Months			
		Amount		Per mile of road operated		Amount		Per mile of road operated	
		1919	1918	1919	1918	1919	1918	1919	1918

26.	Ratio of operating expenses to operating revenues, per cent	76.16	71.42	.....	.....	85.54	81.63	.....	.....

*Credit item.

Note—The average railway operating income corresponding to item 22 above for August in the three years 1914, 1915 and 1916, included in the test period was $396 per mile of line.

New Industrial Conference Called

President Wilson has called a new industrial conference to meet at Washington on December 1, in accordance with the recommendation made by the public group at the conference which met in October, to endeavor to work out some plan for an improvement in the relations between employers and employees. None of the delegates to the former conference are included in the list of those invited to attend the new one, and there will be no specific representation of either capital or labor.

The personnel of the new body follows: Thomas W. Gregory, Austin, Texas, lawyer and former attorney general; George W. Wickersham, New York, lawyer, attorney general in Taft cabinet; Oscar S. Straus, New York, diplomat, lawyer and author, secretary of commerce and labor under Roosevelt; Frank Taussig, Washington, former college professor and chairman of the United States tariff commission; Samuel W. McCall, Boston, lawyer, former governor of Massachusetts; Herbert Hoover, former food administrator, mining engineer; Martin H. Glynn, Albany, N. Y., newspaper man and former governor of New York; H. C. Stuart, Richmond, Va., business man, former governor of Virginia; W. O. Thompson, president of Ohio State University and Presbyterian minister; George T. Slade, St. Paul, former vice-president Northern Pacific; Julius Rosenwald, Chicago, president Sears, Roebuck & Co.; O. D. Young, New York, lawyer; Henry J. Waters, editor Kansas City *Star*, and former president Kansas State College of Agriculture; Stanley King, lawyer, of Boston and Washington, former member of the council of national defense and special assistant to the secretary of war; Henry W. Robinson, Pasadena, Cal., former member United States shipping board: Richard Hooker, Springfield, Mass., newspaper man, former Washington correspondent.

The President said in his letter of invitation: "Guided by the experience of the last conference, I have thought it advisable that in this new body there should be no recognition of distinctive groups, but that all of the new representatives should have concern that our industries may be conducted with such regard for justice and fair dealing that the workman will feel himself induced to put forth his best efforts, that the employer will have an encouraging profit, and that the public will not suffer at the hands of either class.

"It is my hope that this conference may lay the foundation for the development of standards and machinery within our industries by which these results may be attained.

"It is not expected that you will deal directly with any condition which exists today, but that you may be fortunate enough to find such ways as will avoid the repetition of these deplorable conditions."

Aviator Crosses Continent in 79 Hours

Lieutenant B. W. Maynard, of the United States Army, flying in a DeHaviland 4, and starting from Mineola, N. Y., near New York city, on Wednesday, Oct. 8, completed a round trip to the Pacific Coast and return, in a trifle over ten days; and, in accordance with the regulations of the War Department, he made prescribed stops at regular landings throughout the journey and did no flying at night or on Sunday. He remained in San Francisco from Saturday until Tuesday. Lieutenant Maynard was the leader of 47 contestants in this elaborate race. A large proportion of the men dropped out before finishing the trip. Numerous accidents in flying resulted in the death of nine of the competitors and the injury of several others.

Lieutenant Maynard left Mineola at 9:23 a. m., on Oct. 8, and arrived in San Francisco at 1:12 p. m. on Oct. 11, making the time 78 hours 49 minutes for a calculated distance of 2,701 miles. The time actually on the wing was 24 hours 58 minutes 55 seconds. Eastbound he left San Francisco on Oct. 14, at 1:19 p. m., and arrived at Mineola at 1:50 p. m. on the 18th. The time in the air was about the same as on the westbound journey, but the elapsed time, 93 hours 31 minutes, included 18 hours lost in Nebraska because of a broken motor shaft.

On Saturday, the 18th, Lieutenant Queen flew from Bryan, Ohio, to Cheyenne, Wyo., 1,046 miles, the longest single day's flight in this contest.

The San Diego Arizona Completed

With the driving of a golden spike on Nov. 16, six miles east of Jacumba Hot Springs, Cal., by John D. Spreckels, president, the construction of the San Diego & Arizona was completed. The road extends from San Diego, Cal., eastward to El Centro, a distance of 147 miles, much of which is through the Ysidro mountains. It connects at El Centro with the Southern Pacific, running south to the Mexican border at Tia Juana, Cal., where connection is made with the Inter-California (Southern Pacific), which debouches southerly 16 miles from the international line, thence easterly and northerly to the boundary of the United States again where, at Cantu, Cal., connection is made again with the Southern Pacific. The length of line in Mexican territory is 44 miles. Local train service on the new road between San Diego and the Imperial Valley will begin Dec. 1. On Dec. 10 it is expected to begin Pullman car service between San Diego and Chicago by way of the new road, the Southern Pacific and the Chicago, Rock Island & Pacific. A freight terminal costing $100,000 has been completed at San Diego and also a union station. This project comprises the only heavy railroad construction that has been carried on in the United States since the entry of the country into war with Germany and Austria. It was released from federal control within a short time after the roads were taken over by the government and, because of the pressing necessity for the completion of the line, authority was given to proceed with the construction.

The company has applied to the Railway Commission of California for authority to issue bonds to the amount of $710,912 with which to reimburse the Southern Pacific Company for money advanced for construction. Increases in the cost of labor and materials materially increased the cost of building and equipping the road. According to the financial statement filed with the application, the actual investment in road and equipment in the San Diego & Arizona on Sept. 30, 1919, amounted to $15,945,800. In order to avoid complications and to comply with the Mexican laws, a separate corporation, known as the Tijuana & Tecate Railway Company has been formed to manage that part of the road which lies in Mexico. The officers of this corporation, however, are the same as those of the San Diego & Arizona.

Henry Ford, president of Henry Ford & Son, Inc., Detroit, Mich., has designed a passenger car for street or interurban service to be driven by an internal combustion motor. It is expected that the car will be tried out on the Michigan Central tracks within the next 60 days.

Traffic News

J. E. Houck has been appointed traffic manager of the Samson Tractor Company, Janesville, Wis.

The Canadian Pacific Ocean Services Ltd., has moved its Chicago office from 140 South Clark street to 40 North Dearborn street.

T. J. McGeoy, has been appointed general western freight agent in charge of the Chicago office of the Luckenbach Steamship Company, Inc., of New York City.

W. I. Nokely, formerly in charge of the Toledo (Ohio) office of the United States Grain Corporation, has been appointed traffic manager of the Paragon Refining Company, Toledo, Ohio.

Albert L. Wilson, chief tariff clerk in the Chicago offices of the Illinois Central, has been appointed traffic agent of the 4-Ones, a national association of manufacturers of wirebound boxes, with headquarters at Chicago.

The Car Service Section of the United States Railroad Administration, acting on an appeal from the Louisiana Railway Highway Council, has promised to furnish a better supply of open cars for carrying gravel in Louisiana.

Changes in Boston Suburban Fares

The Massachusetts Public Service Commission, acting on a request from the director general at Washington, has investigated the request of railroads centering in Boston for authority to make increases in suburban passenger rates; and it holds that no increase is necessary except that on the New York, New Haven & Hartford five-ride tickets, good to points within five miles, may be discontinued. These have been sold at 5.6 cents a ride, but it does not appear that the increase in fares which will follow this discontinuance will amount to much.

All three of the roads had applied for authority to make the increases, because of congestion of traffic due to an advance in rates on surface and elevated electric railroads which has driven large numbers of suburban passengers to the steam roads; but the commission declares that this claim of congestion, from this cause, is unfounded, except as regards outbound trains on the New Haven road between 5 and 6 o'clock in the evening. At other hours, and on the Boston & Albany and the Boston & Maine at all hours, the congestion is not intolerable. The commission finds that rush-hour traffic on the New Haven road has increased 83 per cent in a year, and other traffic 28 per cent; but the company has added only one train since 1913; but on the rush-hour trains the number of cars is about 24 per cent more than one year ago.

Where 83 per cent increase in traffic can be handled without increasing the number of trains, the commissioners think that the traffic must be more nearly remunerative than it was at any time in the past.

Director General Hines has issued a circular reiterating his belief that the disparity between the fares on the steam roads and on the elevated lines must inevitably tend to impair comfort if not safety on the steam railroads, and that the twelve-ride tickets, which will be used in place of the former five-ride tickets, ought to be advanced in price substantially; but in view of the Massachusetts Commission's unfavorable attitude, and also in view of the prospect of federal control terminating on Dec. 31, he will take no action. Charles A. Prouty, representing the United States Railroad Administration, sat with the Massachusetts Commissioners in their hearings on this matter. The Administration will discontinue the sale of the "open form" of 25-ride tickets between Boston and stations within 15 miles, this change apparently being not disapproved by the Massachusetts Commission.

English Goods Traffic Rates Increased

LONDON.

An abstract from the London Times states that the Ministry of Transport is considering the schedules of rates for goods traffic. It is estimated that there will be increase amounting to about 50 per cent.

Railway Rates in Brazil Raised

LONDON.

Modern Transport states that as a temporary measure designed to meet the transport crisis in Brazil all railway rates are to be raised immediately. It is also announced that a bill is to be introduced empowering the government to revise railway contracts.

Cost of England's Railway Strike

LONDON.

The total cost of the nine days' railway strike in Great Britain is estimated at about $50,000, including delay in demobilization estimated at $25,000,000. Mr. Bottomley, Independent Labor member, called on the government at once to introduce legislation rendering illegal any stoppage of public services at the instance of trade union executives without due notice to and a ballot of the members concerned.

Railway Congestion at Nigeria

LONDON.

An extract from the London Times Trade Supplement states that owing to lack of inland transport facilities and to the bad working of the railways due to a deficiency in rolling stock, large quantities of local produce are awaiting removal in different Nigerian trade centers. The pay offered to railway men does not attract good mechanics to the service of the Nigerian railways, with the result that repairs to engines, rolling stock and permanent way suffer from the shortage of skilled labor.

Rebuilding of Railways in Devastated Parts of France

LONDON.

An extract from the Times Trade Supplement states that the rebuilding of the destroyed parts of the Nord and Est railways has recently made great progress. On October 1 only 44km of track and two stations of the Nord line remained to be put in order. Nearly all the bridges are rebuilt, and only two tunnels, those at Feren and Folambray, remain to be reconstructed. On the Est, 175km of track are still to be put in order and only twenty-four stations are not open to the public.

Railway Material from France

LONDON.

An abstract from the London Times says that the Ministry of Transport is hurrying the work of bringing back railway material from France. By means of the train ferry, wagons are returning at the present time at the rate of 500 a week, and it is hoped shortly that this number will increase to 900. The material consists of two kinds, one being that which was taken from the railway companies and which is now being returned to them, and the other that built specially for the war. Locomotives and trucks are being allocated to the railway companies according to priority of need.

Japanese Laborers' Wages

LONDON.

An extract from the Engineer states that the average wage for an unskilled Japanese male laborer today is 48 cents and for a female laborer 32 cents per day. A skilled laborer earns from $1.10 to $1.68 a day. These rates are about 70 per cent above prewar rates. Besides the daily rates, however, yearly bonuses are given of a month's wages, and often considerably more. The working hours may be given generally as 70 hours per week, and the amount of work produced per hour by a Japanese workman is about one-half that produced by an average British workman where large jobs and heavy machinery are concerned.

New Locomotive Works at Essen, Germany

LONDON.

The annual capacity of the new locomotive works of Krupp at Essen are stated, says the Engineer, to be 300 heavy locomotives with tenders and 2,500 15-ton cars. The Prussian State Railways have apparently guaranteed to take 108 locomotives and 2,000 cars a year from the works, and the Krupp Company has undertaken to limit its profits to a very low percentage, no matter what economies in production it may be able to effect, all the excess going to the public exchequer. The government is free of responsibility for any loss that may be sustained by the firm and reserves the right of inquiring into the company's cost prices.

All-Steel Passenger Rolling-Stock for Indian Railways

The Bengal-Nagpur Railway has placed a contract with Cammell Laird & Co., Limited, Nottingham, for the construction of four bogie dining cars, underframes, bogies and ironwork, and for ten third-class bogies, underframes and bogies. These underframes will each be 67 ft. in length. The same company have also received an order from the Great Indian Peninsular Railway for forty-six bogie carriages, each 68-ft. length together with the necessary underframes, bogies, ironwork, as also the ironwork with the metallic furniture, lavatory and electric light details and other fittings for nine ordinary first and second-class bogie carriages for the Assam Bengal railway.

France Will Receive But Few Machine Tools from Germany

LONDON.

Allied commissions which have searched the occupied territory in Germany estimate that of the material and machines stolen from France and Belgium only 10 per cent can be removed in good condition, 15 per cent is useless and the remainder has been totally destroyed, says the Fortnightly Information Review, the publication of the American Chamber of Commerce in Paris. Approximately about 50,000 machine tools were stolen or destroyed in the invaded district of France alone.

British Government to Manufacture Railway Rolling Stock

LONDON.

The government arsenals of Great Britain are to manufacture rolling stock for the railways of Great Britain and there are now on order 2,000 freight cars for the North Eastern and 500 for the Great Western at the Woolwich Arsenal. It is stated, however, that the government will not do this work in competition with the private car builders and will only undertake such work when the railways are unable to get the deliveries required from them. In addition to cars 100 locomotives were manufactured at the arsenal for the government under order from the Ministry of Munitions and a certain amount of repair work of railway rolling stock has been done.

Railway Congestion in England

LONDON.

In reply to a question in Parliament, Sir Eric Geddes, Minister of Transport, stated that the cause of the delay in transport of freight on the railways in England was due chiefly to the congestion at terminals and ports, shortage of freight cars, diversion to railways of traffic which before the war was carried by coast-wise vessels (the rates by water have been greatly increased while those by rail have not changed), the 8-hour day and the more recent dislocation caused by the railway strike.

Over a thousand government-owned motor lorries are being placed at the disposal of the railway companies for the purpose of carrying traffic to and from the railway terminals and in addition to this government lorries are to be used in relieving the congestion at ports.

It is anticipated that the wagon shortage will be alleviated by the return of the 30,000 freight cars sent to France during

the war, and the 8,000 freight cars which were constructed for the war office and which are being consigned to the railways.

Railway Labor Unions Seek Joint Control of English Roads

LONDON.

In negotiations between the government and the National Union of Railwaymen which were resumed shortly after the close of the railway strike presumably to discuss the question of the standardization of railwaymen's wages has, it is learned, developed into the discussion of a scheme placed before the government by the unions relating to the future control of the railways. While it is impossible to obtain any concrete information as to what the plans of the labor leaders are on account of the fact that the negotiations are being kept absolutely secret, it is believed that the labor unions are demanding somewhat the same concessions as those included in the Plumb plan of railway administration in the United States. Press despatches state that the proposals are believed to give the railwaymen a certain amount of control over conditions of labor as well as a share in the formulation of railway policy; in other words, it is believed that the proposals provide for the administration and direction of the railways by joint boards of control.

Improved Conditions in Mexico

According to Col. Paulino Fontes, director general of the National Railways of Mexico, the several lines comprising that system are being gradually improved and brought up to their former standard of efficiency. He recently finished an inspection trip over all of the principal divisions of the system. New steel and ties are being laid upon the main line between the City of Mexico and Laredo. The steel is obtained from the plant of the Monterey Iron & Steel Company, and the ties are for the most part obtained from domestic lumber mills. Plans have been adopted for the erection of several new passenger stations. The new station at Saltillo will be finished in about three months. Large machine shops, roundhouse and other improvements are also being made at Saltillo.

Inactivity on the part of Villa during the last few weeks has enabled the reconstruction of much of the railroad in the state of Chihuahua which has been out of commission for several months. Mr. Fontes said that within the next three months the destroyed bridges, track and roadbed upon the old Mexican Central main line between Torreon and El Paso would be replaced and through traffic resumed.

At Durango much work is now under way. The new station, which will be the finest in the country, is well toward completion. This city is the center of four different lines—the one to Tehauntepec, the one to Torreon, the one to Canitas and the fourth to Llano Grande, which when completed will extend to Mazatlan, on the Pacific coast.

At Aguascalientes, where extensive repair shops are situated, it was arranged so that ten or eleven locomotives should be repaired each month, while not less than 100 freight cars and ten passenger coaches are turned out in complete order within the same period. The creosoting plant at that place was also put into operation. New contracts were let for the delivery of half a million ties monthly until all the lines shall have been put into good condition in this respect.

Electrification in South Africa

LONDON.

The Times Engineering Supplement states that a report has been presented to the government on the problem of electrifying the railways of the Union of South Africa by Mr. C. H. Merz, of Messrs. Merz and McClellan. It deals with four sections of the lines—the main line from Cape Town to Touws River with suburban lines in the peninsula; the Natal main line from Durban to Glencoe, and the Glencoe-Vryheid East branch; the Witbank-Germiston-Randfontein line; and the Delagoa Bay line between Witbank and Komati Poort.

The estimated return on the net capital cost of electrification on the main line from Cape Town to Touws River is 12.1 per cent and on the Simonstown branch of this line 10 per cent, on the Seapoint line 8.1 per cent, on the Docks branch 20.5 per cent, and in the Docks area 9.7 per cent.

The Durban-Glencoe line is calculated as returning 40.5 per cent and the Glencoe-Vyrheid East branch 12.5 per cent. The Witbank-Germiston-Randfontein line is estimated to return 10.8 per cent and the Delagoa Bay line 5.6 per cent. Owing to the anticipated results of the Durban-Glencoe line it is recommended that this electrification be undertaken first, followed by that of the Rand line, the Vryheid East branch, the Cape lines, and finally the Witbank-Komati section.

The direct-current system is regarded as most suitable for South African requirements. Though the narrowness of the gage to some extent restricts the use of high-voltage motors, supply to trains at an average of 3,000 volts is pronounced practicable and desirable. The overhead system is recommended and regenerative working would be adopted.

For main line traffic it is proposed to use freight locomotives with a tractive effort of 48,000 lb. compared with the 53,750 lb. of the present Mallet articulated type, and passenger locomotives with a tractive effort of about 30,000 lb. which would be capable of hauling a 600-ton load up a gradient of 1 in 60. Provision is to be made for a speed of 20 to 23 m. p. h. up ruling gradients by freight trains and of 28 to 39 m. p. h. by passenger trains, as tending to the most economical working. While on the level the express passenger locomotives would haul 15 main line coaches at not less than 55 m. p. h.

For suburban service the trains would be made up on the multiple unit system, each unit consisting of a motor coach and a trailer. In this way trains at busy times could be composed of four or five units (eight or ten coaches), while at other times two units might suffice.

Reorganization of Railway Systems in Serbia, Croatia and Slovakia

LONDON.

The Jugo-Slav minister for transport and war has issued the following provisional order, dealing with the reorganization of railways, says the Journal des Transports, Paris.

1. All railways situated in Serbia, Croatia and Slovakia are placed under the administration of the transport minister.
2. The whole of the system is divided into five district managements, at the head of which is a director.
3. The traffic of the whole system is regulated and directed by the former directorates.
4. The maintenance of the present traffic and the acquisition of the material required are directed by the transport minister.
5. The latter must in the first place provide for military transport.
6. For the purpose of ensuring the regularity of military transport, station commanders are to be stationed in the main stations.
7. Until the end of the war an agent shall be appointed to assist each directing body for the purpose of issuing to the personnel of trains and working services the necessary instructions.
8. The transport minister shall direct the rapid reorganization of railway traffic.
9. Should offers of Hungarian labor prove insufficient, the transport minister shall have the right to requisition, at the expense of the Hungarian state, other Hungarian workmen showing the necessary aptitude for the work.
10. The transport minister is authorized to procure all the tools, plant and material for the construction of bridges.
11. He will take the necessary steps with the French Government to provide that all the railway systems in Serbia and Croatia be placed under the administration of the said minister.
12. In order to ensure as rapid a resumption as possible of traffic on the destroyed systems, steps shall be taken to ensure that the personnel of the Serbian State Railways, on active service, shall be liberated therefrom and placed at the disposal of the transport minister.
13. Necessary credits shall be allotted to the transport minister to cover the expenditure incurred by the execution of railway construction.
14. Until complete demobilization the whole of the railway personnel shall be subject to military law in the event of any disturbances or breach of discipline.
15. The minister of transport and war shall take the necessary steps for the purpose of carrying out the modifications required for the application of the Order of 1908 dealing with the interior.

Equipment and Supplies

Locomotives

The St. Clair Terminal is asking prices on three switching locomotives.

The Sewell Valley has ordered one 2-8-2 type locomotive from the Baldwin Locomotive Works.

The Pennsylvania Railroad has authorized the building of 50 passenger locomotives at its Altoona shops.

The Jamaican Government Railway have ordered three 4-8-0 locomotives from the Canadian Locomotive Company.

The United Verde Copper Company has ordered two 0-6-0 switching locomotives from the American Locomotive Company.

The Broken Hill Proprietary Company (Australia) has ordered two 2-8-2 locomotives from the Baldwin Locomotive Works.

The Terminal Railroad Association of St. Louis has ordered fifteen 0-6-0 type locomotives from the American Locomotive Company. These locomotives will have 22½ in. by 30 in. cylinders, and a total weight in working order of 204,000 lb.

Freight Cars

The Paulista Railway (Brazil) is inquiring for 450 freight cars.

M. A. Hanna & Co., Wilkes-Barre, Pa., are inquiring for 50 mine cars.

The Gulf, Mobile & Northern is in the market for 250 box and coal cars.

The Virginian is inquiring for 1,000 steel coal cars of 100 tons capacity each.

The South African Railways are asking prices on 10 cattle and 60 drop side cars.

The Missouri, Kansas & Texas is asking prices on 300 10,000-gal. capacity tank cars.

The Cie Francais de Chemins de Fer au Dahomey (French Soudan) is inquiring for five cars.

The Chile Exploration Company, New York, is inquiring for 50 ore cars for export to Chile.

John Dunn, Son & Co., 44 Whitehall Street, New York, are in the market for 200 or 300 freight cars for export.

The Maryd Coal Company, Hazelton, Pa., has ordered 30 mile cars from the American Car & Foundry Company.

C. U. Snyder & Co., Chicago, have ordered 25, 8,050 gal., 50-ton truck tank cars from the Pennsylvania Tank Car Company.

The Conley Car Company, Pittsburgh, Pa., has ordered 25, 8,050-gal., 40-ton truck tank cars, from the Pennsylvania Tank Car Company.

The West Penn Power Company, Pittsburgh, Pa., has ordered 10 hopper cars, of 55 tons capacity, from the Pressed Steel Car Company.

The Hately Brothers Company, Chicago, has ordered three 10,050 gal., 50-ton truck tank cars, from the Pennsylvania Tank Car Company.

The Wilhoit Refining Company, Springfield, Mo., has ordered 10, 10,050-gal., 50-ton truck tank cars, from the Pennsylvania Tank Car Company.

The A. E. Staley Manufacturing Company, Decatur, Ill., has ordered ten 8,050-gal. 50-ton truck tank cars from the Pennsylvania Tank Car Company.

The Gillican Chipley Company, Inc., New Orleans, La., has ordered ten 8,050-gal., 40-ton truck tank cars, from the Pennsylvania Tank Car Company.

The Burkburnett Refining Company, Wichita Falls, Tex., has ordered 50, 8,050-gal., 40-ton truck tank cars, from the Pennsylvania Tank Car Company.

The Colonial Collieries Company, North American building, Philadelphia, Pa., has ordered 75 mine car bodies from the American Car & Foundry Company.

The American Railway Equipment Company, Philadelphia, Pa., is inquiring for ten 50-ton steel gondolas, ten 50-ton flat cars and from 40 to 50 50-ton hopper cars.

F. R. Phillips & Sons Company, New York and Philadelphia, are in the market for 3,600 car wheels and 1,800 axles to be mounted; also for 200 steel car frames 37½ ft. long and 300, 30-ft. long, for export.

The Union Tank Car Company has placed orders for 5,500 all steel tank cars of 10,000-gal. capacity each, as follows: 3,500 to the Standard Steel Company, 750 to the Pressed Steel Car Company, 750 to the Cambria Steel Company, 500 are to be built by the Union Tank Car Company at their own shops. The 3,500 tank cars is the largest order ever placed with any individual company, and 5,500 is the largest ever placed by any individual company.

Passenger Cars

Alberto Vales, New Orleans, La., is inquiring for 30 street-railway cars for export to Mexico.

The Seaboard Air Line is inquiring for 2 postal cars and for 5 combination baggage and mail cars.

The Nashville, Chattanooga & St. Louis is inquiring for one baggage and mail car and four baggage cars.

The Texas & Pacific, reported in the Emergency Bulletin of November 6 as being in the market for 50 coaches, 5 diners, 12 baggage and express and 2 mail cars, has ordered this equipment from the Pullman Company.

In the *Railway Age* Emergency Bulletin of October 20, under the heading of freight and passenger car inquiries, it was erroneously stated that the New York, Chicago & St. Louis was inquiring for 11 passenger cars. The error was editorial, the Nashville, Chattanooga & St. Louis being the inquirer.

Iron and Steel

The Erie Railroad Company is inquiring for from 20,000 to 30,000 tons of rails.

John Dunn, Son & Co., 44 Whitehall Street, are inquiring for about 10,000 tons of heavy steel rails and accessories for export.

Mitsui & Co., 65 Broadway, New York, are inquiring for 2,200 tons of 85-lb. rail for the Tientsin-Pukow Railway, and are also inquiring for 500 tons each of 12-lb. sections, 16-lb., 20-lb. and 25-lb. of light rails for export to Japan.

F. R. Phillips & Sons Company, New York and Philadelphia, has ordered 300 tons of 50-lb. rails and the necessary accessories from the United States Steel Products Company, and has also ordered 2,500 tons of rails from the United States Steel Corporation, for export to Brazil.

Signaling

The Pennsylvania Lines West of Pittsburgh have ordered from the General Railway Signal Company an electric interlocking for Leetonia, Ohio, 52 working levers, and 20 spare spaces.

Supply Trade News

O. P. Wilson, assistant general manager of the **Norma Company of America**, New York, has been elected vice-president of that company.

The Chicago Pneumatic Tool Company, Chicago, on October 1, removed its Birmingham office from 801 Brown Marx building to 1925 Fifth avenue, north.

Ballentine will remain as southern sales manager and will be assisted by **E. J. Wilkie**, who for many years has been connected with the sales department at South Milwaukee.

of the board; **W. H. Brevort**, president; **Charles McNeill**, vice-president; **L. K. Diffenderfer**, treasurer, and **S. H. Bell**, secretary. The headquarters of the company are at 120 Broadway, New York.

The **Replogle Steel Company** was incorporated recently in Delaware to take over the rights and property of the Wharton Steel Company, Wharton, N. J., and the Wharton & Northern Railroad. The new company, in addition to the production of iron, ore and pig iron, will maiufacture steel products. The officers are: **J. Leonard Replogle**, chairman

The **Bucyrus Company**, South Milwaukee, Wis., has moved its southern sales office from New Orleans, La., to Birmingham, Ala., room 212, Jefferson County Bank building. **C. N.**

The **Vapor Car Heating Company of Canada, Ltd.**, with headquarters at Montreal, Quebec, has taken over the business of the Canadian branch at Montreal of the Vapor Car Heating Company, Inc., of Chicago.

A. Clark Moore has resigned as vice-president of the **Safety Car Heating & Lighting Company**, Chicago, to become associated with the **Globe Seamless Steel Tubes Company**, with temporary headquarters at Chicago. **J. H. Rodger**, western manager of the Safety Car Heating & Lighting Company, will assume the duties of Mr. Moore without change of title.

The **Permanent Railway Tie Corporation** has been incorporated in Delaware, with a capital of $5,000,000. The office of the corporation in Delaware is with the United States Corporation Company, 311 S. State street, Dover. The following incorporators are all residents of New York: **Joseph A. Silver**, 835 West 178th street; **Edwin L. Carpenter**, 140 West Sixty-ninth street; **Charles H. Phelps**; **Elmer E. Studley**, and **Lawson Sanford**, 17 Battery Place.

William S. Hart, assistant general superintendent at the factory of the **Hazard Manufacturing Company**, Wilkes-Barre, Pa., has been appointed district manager in charge of the Chicago sales office and warehouse, succeeding **Albert W. Gabriel**, district manager for a number of years, who has retired to go into other business. Mr. Hart entered the employ of the Hazard Manufacturing Company in 1886, serving successively as machine runner in the wire rope mill, assistant foreman and foreman. He was transferred to the Pittsburgh branch in 1907, and was for several years assistant district manager there. In 1917 he returned to the factory to take the position of assistant general superintendent.

The **Bossard Railway Signal Corporation**, Troy, N. Y., has been organized to market a system of signaling invented by **Gisbert L. Bossard**, president and general manager, and **Rudolph Zaugg**, advisory signal engineer and director of the new company. The other officers are **W. Edward Hamilton**, vice-president; **John L. Lehman, Jr.**, secretary; **M. J. O'Sullivan**, treasurer, and **Guy F. Swinnerton**, legal advisor and director. The company is capitalized for $150,000, of which $50,000 is preferred and $100,000 common stock. President Bossard is an engineering graduate and has acquired an intimate knowledge of railway signal equipment covering a period of 10 years in that and allied industries. Mr. Zaugg is in charge of the engineering department of the federal railroads in Switzerland, and is an authority on railway signal equipment in that country.

The **Buda Company, Chicago**, has opened branch offices in Buenos Aires, Brazil, London, England, and Paris, France. **J. H. Maher**, departmental manager at the Buda Company's Harvey, Ill., plant, has been appointed sales representative in charge of the Buenos Aires office, with temporary headquarters at the Savoy Hotel, Buenos Aires. **Colonel R. S. Chapman**, recently discharged from the British Army, has been appointed sales representative and manager of the London office, which is at 10 Gloucester Place, Portman Square, London, W. I. **A. Conro Fiero**, connected with the sales force of the home office of the Buda Company, has been appointed sales representative in charge of the Paris office. His headquarters will be 29 Rue de la Rochefaucauld, Paris.

A. C. Allshul, in charge of the Milwaukee, Wis., office of **Joseph T. Ryerson & Son**, Chicago, has been appointed branch manager of its new warehouse plant at Buffalo, N. Y., this company having recently bought the warehouse plant, stock and good will of the Ferguson Steel & Iron Company, Buffalo. The property covered by the purchase at Buffalo includes a main building of about 100,000 sq. ft., divided into three spans, served by several bridge cranes, together with a large crane-served yard, office building, garage and storehouse. Plans are being made to carry out extensive improvements and for the enlargement of the property this coming winter. The Ryerson Company now has plans for warehouse service at Chicago, New York, Detroit, St. Louis and Buffalo.

After the meeting of the stockholders of the **American Locomotive Company** on October 28, **Andrew Fletcher**, president, said that the formation of an export combination of four large railway equipment concerns is now in the hands of the lawyers, and that it would be completed soon. Mr. Fletcher said that the organization was being framed under the terms of the Webb-Pomerene act, permitting combinations in export trade. The work has proceeded rather slowly, inasmuch as the companies are exploring new ground. The enterprise will be confined strictly to the exportation of railway equipment, the idea of a general export financing corporation having been abandoned as too radical a departure. The other companies associated in this undertaking are the **Baldwin Locomotive Works**, the **American Car & Foundry Company** and the **Standard Steel Car Company.**

Trade Publications

Steam Motor.—A description of the steam motor is given in bulletin No. 5, issued by the Steam Motors Company, Springfield, Mass. The bulletin contains 23 pages of descriptive material and many illustrations showing the parts and construction of the motor and the method of its application. The motor is a steam turbine designed for use in direct connected centrifugal pump and blower units.

Locomotive Cranes.—An illustrated folder has recently been issued by the Erie Engine Company, Erie, Pa., which contains short descriptions and illustrations of the various applications of the type-B Erie locomotive crane to dredging, trenching, loading materials, hoisting, etc. Tables and diagrams of the dimensions of this equipment and the capacities, weights, etc., are also given.

Window Fixtures.—Catalogue W-19 of the O. M. Edwards Company, Inc., Syracuse, N. Y., contains 64 pages and should prove of practical value to car designers. It contains considerable detailed information about the fixtures and the service for which the various designs are best adapted and by means of drawings clearly shows their application to single and double sash windows. All of the detail parts, such as sash balances and brackets, sash locks, racks and lifts, compression devices and weather stripping, are shown in numerous sketches and photographs.

Financial and Construction

Railway Financial News

BALTIMORE & OHIO—Paul M. Warburg of New York has been elected a director to succeed his brother, Felix M. Warburg.

CHICAGO & EASTERN ILLINOIS.—The receiver has been authorized by the United States District Court, at Chicago, to refuse the offer of the director general of railroads of $3,280,000 annual compensation for the period that this road has been under control. The order entered directed the receiver not only to refuse the offer of $3,280,000 annual compensation, but to demand compensation from the director general by bringing the case before a board of referees appointed by the Interstate Commerce Commission with power to fix the amount due the road. Federal Judge George A. Carpenter, who rendered the decision, based his findings on the premise that during normal periods the road has earned greatly in excess of the amount offered, on the basis of profit during the three year period prior to 1918, when the road was being reorganized.

OREGON, CALIFORNIA & EASTERN—This company has placed on file in the office of the county clerk at Bend, Ore., a trust deed in favor of the Portland Trust Company, Portland, Ore., covering all property the company now owns or may acquire, to secure a bond issue for the construction of new lines from Bend, Ore., to Klamath Falls, from near Silver Lake to Lakeview, from near Millican to Crane, and from this line to Burns and Narrows.

Railway Construction

CANADIAN PACIFIC—The Board of Railway Commissioners of Canada has authorized this road to construct a three-track ferry slip with a moving leaf on the south shore of Burrard Inlet, Vancouver, B. C.

CHICAGO, ROCK ISLAND & PACIFIC.—This road is now replacing its bridge crossing the Des Moines river, south of Des Moines, Iowa. The work consists of replacing four 150-ft. through trusses with three 150-ft. riveted through truss spans of heavier design and a pile approach.

ERIE RAILROAD—A contract has been given by the Erie Railroad to the Arthur McMullen Company, New York, for building the substructure of a bascule bridge over the Passaic river at Newark, N. J. Bids will be asked for in the near future for the steel work of the superstructure. The bridge will be 434 ft. 6 in. between abutments and will consist of three plate girder spans with a Strauss lift span of 180 ft.

GRAND TRUNK—This road is building a passenger station at Gravenhurst, Ont. The main building will be 68 ft. by 25 ft. with a 15-ft. addition for baggage. The construction will be of concrete with walls of brick to the sill line and a frame superstructure.

KANAWHA, GLEN JEAN & EASTERN.—This company is laying track on its extension from Mount Hope, W. Va., along Mill creek to the new mines of the Lee Coal Company, 1.25 miles. Contracts for grading and ballasting were let in the latter part of August to A. Keathly, Longacre, W. Va. The maximum curvature is 10 deg. and the maximum grade is 3.4 per cent compensated. The work included about 22,000 cu. yds. of solid rock excavation. The principal traffic on this line will be coal and timber.

ST. LOUIS-SAN FRANCISCO—A two-story brick and frame freight depot, with office facilities in the second story, will be erected at Okmulgee, Okla., at a cost of $50,000. A contract for the construction has been let to Charles Cunliff, St. Louis, Mo.

Railway Officers

Railroad Administration

Federal and General Managers

M. P. Blauvelt, assistant regional director of the Allegheny region, has resigned to accept other service.

J. B. Carothers, assistant to the federal manager of the Baltimore & Ohio, Western Lines, with headquarters at Cincinnati, Ohio, has had his jurisdiction extended over the departments of fuel and locomotive operation.

Operating

W. M. Archer has been appointed superintendent of the Blue Ridge at Anderson, S. C., succeeding **J. R. Anderson,** deceased.

H. F. Gibson has been appointed trainmaster of the Aberdeen division of the Chicago, Milwaukee & St. Paul at Aberdeen, S. D. succeeding **H. M. Gillick,** promoted.

C. J. Kavanagh, superintendent of the Detroit, Toledo & Ironton, with headquarters at Springfield, Ohio, has been promoted to general superintendent with the same headquarters.

T. M. Bryden, has been discharged from military service and has resumed his former duties as chief despatcher on the Chicago, Rock Island & Pacific, with headquarters at Pratt, Kans.

Major Fred Brastrup has been discharged from military service and has returned to the Northern Pacific as trainmaster of the Seattle division with headquarters at Seattle, Wash.

F. E. Summers, superintendent of the Slaton division, Atchison, Topeka & Santa Fe, at Slaton, Texas, has been transferred to Emporia, Kan., succeeding **C. T. McLellan,** retired under the pension rules of the company.

H. R. Lake, acting superintendent on the Atchison, Topeka & Santa Fe, with headquarters at Wellington, Kan., has been appointed superintendent, succeeding **J. C. Schaffer,** deceased.

F. J. MacKie, assistant division superintendent of the Atchison, Topeka and Santa Fe at Wellington, Kan., has been appointed superintendent of the Slaton division with headquarters at Slaton, Tex., succeeding **O. J. Ogg,** transferred.

J. S. Walker, Jr., has been appointed assistant trainmaster at Rock Hill, S. C., of the Southern and associated railroads, with jurisdiction over the territory from Kingsville, S. C., to Marion, N. C., including the Sumter and Gaffney branches.

W. F. Thiehoff, assistant to the general manager of the Chicago, Burlington & Quincy Lines West, with office at Omaha, Neb., has been appointed assistant general manager of the Lines West, with the same headquarters, succeeding **G. W. Holdredge.**

Frank McCabe has been appointed superintendent of terminals of the Southern and associated railroads, Eastern District, with headquarters at Charleston, S. C. The portion of Reads' Branch not included in the North Charleston Corporation and to the west switch at Ten Mile will come within Mr. McCabe's jurisdiction.

J. P. Quigley, superintendent of the Western division of the Western Pacific, with headquarters at Sacramento, Cal., has been appointed superintendent of transportation and telegraph, with office at San Francisco, Cal., succeeding

E. W. Mason, whose promotion to general manager of the Western Pacific was announced in the *Railway Age* of September 5, page 490.

John A. Streyer, assistant general manager of the Macon, Dublin & Savannah, with headquarters at Macon, Ga., has resigned to become vice-president of the R. F. Willingham Corporation, Cannery and Storage Warehouses, of Macon. With the exception of four years, Mr. Streyer has been in railroad service since 1890, when he became messenger in the traffic department of the Georgia, Southern & Florida, after which he was promoted to clerk in the general freight office, and in 1894, to assistant chief clerk in the claim department. From 1894 to 1898 he engaged in mercantile business in Macon, but returned to railroad service in October of that year as traveling freight and passenger agent of the Macon & Birmingham Railway. In 1901, he was appointed commercial agent of the Macon & Birmingham; a few months later general agent, freight and passenger departments, and promoted in 1904 to general freight and passenger agent. The road from which he has just resigned secured his services as general agent in February, 1904, a position he held until 1914, when he was appointed general freight and passenger agent and in 1916, traffic manager of the same road. In 1918 he became assistant general manager as told above.

H. B. Voorhees, whose appointment as manager of the Baltimore & Ohio, New York Terminals, Baltimore & New York, Staten Island Rapid Transit and Staten Island Railroad, was announced in the *Railway Age* of Sept. 26 (page 657), was born in Saratoga Springs in 1876 and at the age of twenty graduated from the Rensselaer Polytechnic Institute as civil engineer. His first railroad service was with the Philadelphia & Reading, whose staff he joined in 1897 as assistant supervisor. The next year he was promoted to supervisor and later became respectively assistant trainmaster and trainmaster. In 1901 he went to the Baltimore & Ohio as assistant engineer and while in the service of that company became successively division engineer, assistant to the general superintendent of transportation, superintendent and general agent, assistant to president, general superintendent transportation, general superintendent, general superintendent transportation and manager, the position he held at the time of his recent appointment.

H. B. Voorhees

Edward C. Potter, assistant general manager and federal treasurer of the Brooklyn Eastern District Terminal, has resigned to become resident manager at New York for E. Atkins & Co., raw sugar merchants of Boston, Mass., and Havana, Cuba. Mr. Potter was born in New York in 1885 and received his education in St. Paul's School, Concord, N. H. and Harvard University, being graduated with the class of 1906. After two months' service in the sales department of the American Sugar Refining Company, he entered the employ of the Brooklyn Eastern District Terminal in September, 1906, and until his recent resignation, has served that company continuously as, respectively, car sealer, tally man, billing clerk and cashier; being appointed in 1908 agent of the Delaware, Lackawanna & Western at the Brooklyn Eastern District Terminal; becoming assistant general manager of the whole terminal in February, 1909, and vice-president in charge of traffic, in October, three years later. When the terminal was taken over by the railroad administration, Mr. Potter again entered the operating department as assistant general manager and federal treasurer. In addition to the above, he has been an active member and often chairman of many transportation and commercial committees, as well as social bodies identified with traffic matters in New York and Brooklyn. Furthermore, he is well known as a writer on transportation subjects, some of his volumes being, "The Union Freight Terminal," "Railway Traffic Departments" and "Freight Handling in the Port of New York."

Financial, Legal and Accounting

E. C. Davis, acting federal treasurer of the Detroit, Toledo & Ironton, has been appointed federal treasurer with headquarters at Detroit, Mich.

George S. Patterson, general solicitor of the Pennsylvania, Eastern Lines, with office at Philadelphia, Pa., has resigned, effective December 1. Mr. Patterson was born in Philadelphia, on October 10, 1868, and graduated from the Germantown Academy in 1884. Four years later he was graduated from the University of the Pennsylvania, academic department, and in 1891 from the law department. He entered railway service in 1900 as assistant solicitor of the Pennsylvania and in 1902 became assistant general solicitor. Upon the reorganization of the legal department of the road in November, 1907, he had his title changed to assistant general counsel and on January 1, 1912, was elected to the position from which he has just resigned. In addition to his legal work for the Pennsylvania, he was chairman of the committee of counsel appointed by the presidents of the 38 eastern railroads to handle the presentation of the five and fifteen per cent rate cases instituted before the Interstate Commerce Commission in 1913 and 1917.

G. S. Patterson

E. P. Bracken, general manager of the Chicago, Burlington & Quincy and the Omaha & Kansas City, with headquarters in Chicago, has been promoted to federal manager of the following railroads, succeeding **C. G. Burnham,** who has resigned to resume the position he held prior to government control as executive vice-president of the Chicago, Burlington & Quincy Railroad Company and the Colorado & Southern Railroad Company; the Chicago, Burlington & Quincy; the Quincy, Omaha & Kansas City; the Toledo, Peoria & Western; the Illinois Terminal; the Davenport, Rock Island & Northwestern; the Rapid City, Black Hills & Western; the Missouri & Illinois Bridge & Belt; the Rockport, Langdon & Northern; the Paducah & Illinois; the Winona Bridge; the St. Joseph Union Department; the Hannibal Union Depot and the Keokuk Union Depot. Mr. Bracken entered railway service in 1887 as a gang foreman on the Lincoln division of the Chicago, Burlington & Quincy. From 1888 to 1905 he was successively extra gang foreman on the Wymore division for one year, roadmaster for 13 years and trainmaster for 3 years. From 1905 to 1906 he was assistant superintendent of the Lincoln division and from the latter date until May, 1909, when he was successively superintendent of the Lincoln, Sterling, Sheridan, Brookfield and Galesburg divisions. The following year he was appointed general superintendent of the Wyoming district and from 1910 until 1912 was assistant general manager of the Lines East of the Missouri River with headquarters at Chicago and in 1917 was elected vice-president in charge of the operating department. When the government assumed control of the railroads, he

was appointed general manager of the Chicago, Burlington & Quincy and the Omaha & Kansas City.

Traffic

John M. Hughes, eastern land agent of the Northern Pacific with office at Hudson, Wis., has been appointed land commissioner with office at St. Paul, Minn. The position has been newly created.

D. G. Gray, assistant traffic manager of the Baltimore & Ohio, Western Lines, with headquarters at Chicago, Ill., has been appointed general traffic manager of the Western Maryland with headquarters at Baltimore, Md.

A. E. Buck, chief clerk to the general freight agent of the International & Great Northern, with office at Houston, Tex., has been appointed division freight and passenger agent of the International & Great Northern, the Galveston, Houston & Henderson and the Houston & Brazos Valley, with the same headquarters.

H. E. Heller, assistant general freight and passenger agent of the Chicago, Burlington & Quincy, with headquarters at Kansas City, Mo., has been appointed general freight agent of the Missouri district with headquarters at St. Louis, Mo., succeeding **William Gray,** who has resigned. **Frank A. Hart,** division freight agent with office at Kansas City, has been promoted to succeed Mr. Heller.

George A. Upton, agricultural and industrial agent of the Baltimore & Ohio, with office at Cincinnati, Ohio, has been promoted to foreign freight agent, with office at Chicago.

Lee H. Landis has been appointed industrial commissioner for the Western Pacific, the Tidewater Southern Railway Company and the eep Creek with headquarters at San Francisco, Cal.

D. L. Gray, traffic assistant of the Eastern region, United States Railroad Administration, with offices at the Grand Central Terminal, New York City, and the La Salle Street Station, Chicago, will take over the duties formerly discharged by G. H. Ingalls, following whose recent resignation the position of senior traffic assistant was abolished. **James Webster,** freight traffic manager of the New York Central, with office at Chicago, will supervise the Chicago office during the absence of Mr. Gray.

Thomas D. Guthrie has resigned as assistant general freight agent of the Georgia Southern & Florida to become traffic manager of the Southern Wholesale Grocers' Association, Inc., with headquarters at Jacksonville, Fla. Mr. Guthrie began railroad work in 1905 with the Southern and has also given service to the Georgia Southern & Florida, Macon & Birmingham, Hawkinsville & Florida Southern, associated lines of the Southern. As a railroad man he has held successively such positions as mail correspondent, statistician, tariff and rate clerk, chief clerk to general freight agent and assistant general freight agent.

Engineering and Rolling Stock

R. Tawse, master mechanic of the Detroit, Toledo & Ironton at Jackson, Ohio, has been promoted to superintendent of motive power and equipment, with the same headquarters.

J. O. Hackenberg, division engineer of the Pennsylvania, Eastern Lines, at Wilmington, Del., has been appointed principal assistant engineer, Southern division, succeeding J. C. Auten, granted leave of absence.

F. M. Sloane has been appointed district engineer of the Rocky Mountain, Missoula and Idaho division, of the Chicago, Milwaukee & St. Paul Lines West of Mobridge, at Butte, Mont., succeeding **C. T. Jackson,** transferred.

H. L. Moore, road foreman of engines of the Southern Pacific at Tucson, Ariz., has been appointed road foreman of engines of the Coast Division, Southern Pacific, with headquarters at San Francisco, Cal., succeeding **C. H. Holdredge,** promoted.

George H. Brown, principal assistant engineer at Altoona, Pa., has been appointed assistant engineer, maintenance of way, bridges and structures, succeeding **G. W. Snyder II,** promoted. **T. J. Skillman,** division engineer at Jersey City, N. J., has been appointed Mr. Brown's successor.

Guy Franklin Egbers has resigned from service with the Russian Railway Service Corps and returned to the Northern Pacific as master mechanic, Pasco division, at Pasco, Wash. **Christian A. Worth,** acting master mechanic at Pasco, has resumed his former position as road foreman of the Pasco division.

F. T. Rice, chief joint inspector of the Fort Worth railroads, has moved his office from the first building north of the Fort Worth & Denver City roundhouse to 108 West Front street, Fort Worth, Texas. Hereafter all mail for the Joint Car Association as well as for Mr. Rice should be directed there.

Colonel E. B. Cushing has been discharged from military service and has resumed his duties as engineer maintenance of way of the Southern Pacific Lines, the San Antonio & Aransas Pass, the San Antonio, Uvalde & Gulf and the Trinity & Brazos Valley, with headquarters at Houston, Tex., succeeding **C. R. Morrill,** who has been re-assigned.

E. W. Smith, superintendent motive power of the Pennsylvania, Central Division, at Williamsport, Pa., has been transferred to Altoona, Pa., as acting superintendent motive power, relieving **R. K. Reading,** granted leave of absence because of illness. **John J. Davis,** general foreman machine shops at Philadelphia, has also been transferred to Altoona, succeeding **Henry S. Schumn,** assigned to other duties because of illness.

I. A. Uhr, inspector of electric signals on the St. Louis-San Francisco, with headquarters at Springfield, Mo., has been promoted to signal engineer, succeeding **R. E. Trout,** who has resigned to become general manager of the Primary Battery division of the Thomas A. Edison Co., Inc. Mr. Uhr was born at Atlanta, Ill., on July 5, 1883. In 1904, after several years' employment with a local telephone company, he became connected with the Kinlock Telephone Company, St. Louis, Mo. The latter part of the same year he became foreman of a line gang for the Union Switch & Signal Company, in charge of the installation of signals between Cleveland, Ohio, and Chicago on the Lake Shore & Michigan Southern. He was transferred to Indianapolis, Ind., in the employ of the same company, in July, 1907. From 1908 to 1909 he was a wireman on the Galveston, Harrisburg & San Antonio. In May, 1909, he again became connected with the construction force of the Union Switch & Signal Company as a foreman in the installation of automatic block signals on the St. Louis-San Francisco. In February of the following year he was appointed supervisor of the Ozark division of the St. Louis-San Francisco, and in March, 1914, he became inspector of electric signals for the entire system, which position h eheld until his recent promotion.

I. A. Uhr

Cuba's Cane Railways

In this issue will be found the first of a series of three articles on the railways owned by the sugar plantations of Cuba. These lines, few of which are sizable in themselves, are, however, in the aggregate, an important part of the transportation facilities of that great sugar producing island. So important are they in fact that their total length amounts to 4,633 kilometres, or 750 kilometres more than Cuba's standard gage public lines. The sugar cane railways are owned in nearly all cases by the sugar mills to which they transport the cane, and at any rate the cars and locomotives which run over them are supplied by the mill or "sugar central." This naturally means that they are operated only as a subsidiary feature of the "centrals," so that Cuba has a large net work of railways that are run not nearly so much with a view to their efficiency as railways, as the efficiency of the industry they serve. This does not detract from their importance, for as the articles will clearly bring out everything, big and little, depends on getting the cane to the "centrals" and in keeping the grinding going on without interruption of any kind. The cane railways are of various gages and the types and kinds of equipment they use vary within the widest limits. The articles will bring out these factors and show how their subsidiary operation to the "centrals" has resulted in giving them a secondary aspect in many ways. They will show, for example, the lack of repair facilities even on the lines belonging to the better mills, the lack of care given to the locomotives and cars on the cane railways and the difficulty of including provision for new railway equipment and supplies in the company's requisitions for machinery and material. The Cuban cane railways do, however, present a large market for railway supplies, although one which does not prove as easy to cultivate as might be wished.

Refinements in "Safety-First"

"Too much care cannot be exercised by station employees in handling baggage trucks. . . . The matter has been called frequently to the attention of agents. . . ." These are the main points in a letter to chairmen of safety committees, which has been sent out by H. M. Mayo, superintendent of safety on the Southern Pacific lines in Texas, advising them of the fatal injury (on another road) of Miss Julia Heinrich, an opera singer, when a passing train struck a truck which had been left standing on the station platform too near the track. What can the safety-first man do, in a case like this, more than he is doing? This is typical of those misadventures which occur so infrequently that the average employee will get into trouble, because of them, only once in a life time, if ever; for dangers occurring so rarely all the admonitions, lectures, circulars, and letters that can be thought of afford but a poor preventive. This, as we all know, is the chief underlying reason why safety-first effort cannot always bring 100 per cent results. Logically, the safety-rule with baggage trucks is for the man in charge to leave them out of his sight only when they are placed on the part of the platform farthest from the track and are blocked so that no wind can start them. With this, as with many other safety rules, the hurried (or the lazy) baggageman must carry it out many times when he feels sure that there is no necessity for such extreme precaution. But can the superintendent require any less? And can he require it with reasonable hope of success unless he employs a sufficient number of cold-hearted inspectors to discover a good share of the instances of flagrant neglect of the rule? The only businesslike way to keep trucks three feet clear of the danger line is to insist on their being kept three yards from it—or farther. Mr. Mayo desires that "all agents be additionally cautioned and requested to keep this feature of their station operation constantly and prominently before employees . . ."; but the practical-minded station agent will be disposed to call this an impossible requirement—except as he can make his words concrete by applying them (as we have suggested) to actual trucks, every day. The specially commendable thing about this circular is the fact that it is devoted to this one accident. The whole safety-first movement may be considered as the giving of emphasis to precautions which ordinarily would not be emphasized. How far can this be carried? How frequently, and in how great variety, can such special admonitions be promulgated without defeating themselves by their numerousness?

Training of Employees

It is gratifying to note that not a few railroad officers are doing some real hard thinking in connection with the order recently issued by the Division of Operation, looking toward a more comprehensive training of shop apprentices. It is high time that some actual forward steps were taken by the railroads generally, not only in the training of shop apprentices, but also in the education and training of all employees, new or old. Campaigns in safety first, better car and train loading, fuel conservation, etc., have demonstrated conclusively, time and time again, that much inefficiency and carelessness are due to a lack of knowledge on the part of employees as to just how best to do their work. The *Railway Age* has repeatedly directed attention to this; and yet comparatively few railroad officers have caught the spirit and profited thereby. The Santa Fe has excellent apprenticeship courses in the mechanical department and before the war had planned to extend its educational work to other departments. While the training of a man in a complicated and difficult trade requires time, intensive and limited campaigns have their uses. They may be conducted with excellent results in all departments for new employees; and they are in many cases useful for men who have been in the service for some time and have had considerable experience. The value of such courses was clearly demonstrated in the training of certain technical branches of our army during the war. One reason for the success of the apprentice movement on the Santa Fe was the vision of President Ripley and the unfailing and consistent support which he gave to the movement. The New York Central started a splendid shop apprenticeship system on its lines in 1906; it is still accomplishing fair results, but the movement suffered considerably because of a change in management a number of years ago and a

subsequent lack of the hearty support which was given to this work in its early stages. So great is the problem and so large the possible returns that any board of directors can well afford to give it personal attention; to endorse the movement and see that successive managements carry it out consistently. For this reason it is desirable that the officer in charge of the educational work on any large railroad should be a big man and should report direct to the chief executive.

Protection Against Pay Check Frauds

In the course of miscellaneous discussion during the annual convention of the Railway Financial Officers, the question of protection against pay check frauds was brought up by L. E. Katzenbach, federal treasurer of the Great Northern. The treasury departments of the railroads spend each year considerable sums of money on various safety devices to protect their pay checks, but none of them are entirely satisfactory. Special water-marked paper or other safety paper is used, check writing machines are purchased and used, one after another, and the railroad treasurer is continually on the lookout to throw further safeguards around the pay checks, but frauds still occur. Check writing machines are a source of expense, and as Mr. Katzenbach said, the salesmen of each new device can demonstrate that a clever forger could raise a check written by previously designed machines. Furthermore, there is the ever recurring case of human error, where a check is made out either to the wrong man or to a name which is not on the pay rolls at all. Obviously, in such cases, responsibility rests on the railroad company and not on the bank. A suggestion for doing away with this source of expense in connection with safety devices for checks and with the loss incurred despite safety devices was that a bonding company should be paid a certain premium for taking the responsibility for all losses from whatsoever source, connected with fraud in cashing pay checks. The additional expense of safety devices for writing checks could be entirely done away with, and it is said that some bonding companies are willing to assume not only the risk of a raised check or the signing of one man's name by another man, but also such risks as are incident to making out a check to the wrong man or to a name not on the pay rolls. There is something more involved in this kind of insurance than the mere spreading of risks. It has been found that both with burglar insurance and with the bonding of employees, the knowledge on the part of a would-be criminal that he will be hunted down by the organized forces of the insurance company, is a strong deterrent to criminal action. Railroad treasurers have no nationally organized bureau for such work as this, and the suggestion made at the meeting of financial officers is well worth consideration.

Highway Crossing Protection

THE large number of highway grade crossing accidents occurring throughout the country creates a problem that should receive more consideration from the railroads and the municipalities than it has been given in the past. The majority of these accidents are the result of carelessness upon the part of automobilists and others using the highways. To realize that this is true and to see the chances taken by the average person, it is only necessary for one to watch the traffic passing over almost any railroad crossing.

The railroads have in many cases provided some kind of protection at certain crossings where the conditions are particularly adverse although some roads have been less progressive along this line than others. The type of protection which should be used cannot be determined in a haphazard way because conditions at one location may require the use of a watchman; while another place may need a watchman and gates, and at still other locations some type of audible or audible and visual warning may serve the purpose. The audible warning proved more or less efficient before the advent of automobiles but with their increasing use this method of protection has become less effective as very often the warning cannot be heard above the noise of the engine in the car. To overcome this condition an audible and visual indication has been used to advantage at many crossings.

One of the main considerations in protecting highways is to attract the attention of those using the crossings and this can perhaps be best accomplished by means of a moving visual indication since a moving object attracts attention quicker than a still object. That this is perhaps the best method which has been developed to this time is indicated by the fact that the United States government is using a flashing light in many cases in the light house service as a warning to navigators.

With the increasing number of automobiles each year accidents will normally become more numerous and it is of vital importance that the railroads and the municipalities cooperate closely in effort to lessen the number of these accidents. As a first step, it is essential that careful consideration be given to the selection of the type of protection which will best serve the purpose for which it is intended at each individual point.

Whatever Is Worth Doing Is Worth Doing Well

NOT LONG AGO a division engineer complained bitterly of the grade of bridge paint furnished him, paint which was made by the road under the direction of the company chemist. The poor quality of this paint, as he understood the situation, was not the result of incompetency on the part of the chemist. Instead it arose from potential competition between the company paint plant and the paint manufacurers. To justify the "home made" product it had to be turned out at a cost that compared favorably with prices on the commercial product quoted to the purchasing agent, with the result that quality was sacrificed for unit price.

Another illustration of this same short-sighted policy was noted in a case where the question of outside competition did not enter. The superintendent of a railroad timber treating plant was taken to task by an associate from another road for the indifferent character of some of the treatment observed in an inspection of his plant. In reply he frankly admitted that there was room for considerable improvement, but unfortunately his superiors seemed to be more concerned about the plant investment charge against each stick of timber than in thoroughness of the treatment. To get better results it would be necessary to hold the charges longer in the retorts and he would be severely criticized for the resulting decrease in output.

Of all the arguments presented by those who advocate that railroads manufacture a large part of their own supplies, the one which has been most favorably received is the idea that under company production, the incentive for profit being absent, all interest would be centered in the output of a high quality product. While the two examples given above are not presented here with the idea of establishing the fallacy of this theory, they serve to indicate a tendency that must be watched. Whether produced by railway employees or purchased in the open market, there can be no economy in the use of an inferior article. In the case of the timber treatment the cost of the thorough preservation may be considered unduly high by the management, but the

losses consequent to the use of poorly treated timber may be many times the difference between the cost of good and bad treatment. Under some circumstances it may be entirely proper for a railroad to continue the use of an article made in its own shops at a greater cost than it could purchase the nearest equivalent produced outside, but surely if the railroad plant can compete with the commercial plant only by turning out a shoddy product, it ought to be abandoned.

The Weak and the Strong Road Problem

JOHN E. OLDHAM, of Merrill, Oldham & Co., Boston, in his discussion of the report of the Committee on Railroad Securities of the Investment Bankers' Association, makes an analysis of the bills now pending before Congress for the solution of the railroad problem, which reduces differences of opinion to their lowest common denominator. In Mr. Oldham's opinion, there are two essentially different remedies for providing adequate rates. One is to include in the legislation restoring the roads to their owners a specific rate of interest which shall be allowed to owners of railroad securities based on some valuation of the property, and the other is to leave the determination of this rate to a transportation board or other governmental agency.

Assuming that either one of these two courses is taken, we still have the weak and the strong road problem, so-called. It is in the discussion of this phase of the subject that Mr. Oldham brings out a point which has not been generally discussed. Mr. Oldham's contention is that, broadly speaking, the weak and the strong road problem resolves itself simply into a matter of the financial structure of different companies. In so far as the properties themselves are concerned, there is no great difference between the so-called strong roads and the so-called weak roads. The strong roads have good credit, the weak roads have poor credit, not because the strong roads have a much better railroad property, which can be operated at a much lower ratio of expenses to earnings, but because the margin of safety above fixed charges is much greater with the strong roads than with the weak roads. Mr. Oldham figures that there is not more than a difference of ten per cent between the operating ratio of the very strong roads and the operating ratio of the very weak roads.

This, of course, is a question of fact. Operating men who have labored under the disadvantage of inadequate facilities, light, power, obsolete shops and bad grades, in competition with a road having adequate facilities, modern power and greatly reduced grades, will be inclined to feel that Mr. Oldham is laying far too little stress on the physical characteristics of different roads. On the other hand, an examination of the income account of typical weak and strong roads during the test period will bear out Mr. Oldham's contention to a surprising extent. Furthermore, given good credit, even the roads with physical disabilities would tend in a comparatively short time to overcome this difficulty through modernization of their plant.

As long as the roads remain independent, as they were prior to government operation, if Mr. Oldham is right the strong and the weak road problem will remain only if the financial structures of the companies remain as they now are. Were all the weak roads to go through receivership and drastic reorganization, with a readjustment of their capitalization, so that fixed charges would call for but a small proportion of the total available operating income in normal times, the weak and the strong road problem would be solved. This is assuming, of course, that Mr. Oldham's contention is entirely correct.

Wholesale receiverships, while it might in the long run work out to the advantage of the transportation systems of the United States, would work hardship on individual investors, and might prove disastrous to the whole credit structure of industrial life. On the other hand, the weak and the strong road problem will be perpetuated indefinitely unless something can be done to restore the credit, or rather to establish the credit of the weak roads. It is generally argued that a valuation based on the present market price of railroad securities, which was to be used as a basis for taking over the roads by the government, would be quite unfair to investors in railroad securities. The government has depressed the price of all railroad securities through its policy of railroad regulation, and it would therefore be taking advantage of its own wrong-doing in taking over railroad securities at this depressed market price. Mr. Oldham, however, argues that, roughly speaking, the government's actions have affected all roads. The valuation of securities of one road, as compared with another, on present or rather average market prices of securities is not unfair, either to the weak roads or the strong roads. Therefore, if the roads were to be combined into a dozen or twenty or more systems, they could with equity be put into such combinations roughly on a comparative market valuation of their securities. In fairness to Mr. Oldham, it should be said that this is carrying his argument somewhat further than he does himself, but it would appear to be the logic of his argument.

Assume that such consolidations be made, with a wiping out of railroad financial structures with an undue proportion of interest bearing securities, then the question of what to do with the surplus earnings of the strong roads would have disappeared. There would be no large surplus earnings, for the simple reason that rates would not have to be fixed to take care of weak roads. One of the two principal differences of opinion in the proposals now before Congress would, therefore, have been done away with.

Mr. Oldham's analysis of the situation is searching, and the conclusion which he reaches is drastic, but both analysis and conclusion deserve careful consideration. It might be pointed out that in the reorganization of bankrupt railroad properties success has generally been obtained by drastic measures, and failure has often been the result of a desire to preserve an unsound financial structure. Mr. Oldham's contention rests on the assumption that what applies to the reorganization of a single railroad property would apply also to a readjustment of the affairs of the entire transportation system of the United States.

How Not to Promote Efficiency

MANY students of American railway transportation are firmly convinced that the roads could have been operated more effectively and economically during the war period under private control than under government administration if the private managements could have enjoyed equal freedom from statutory restrictions. However, any one having a thorough knowledge of the facts, appreciates fully that the expenses of railway operation under private management would have increased in a ratio at least partially commensurate with those obtained under the United States Railroad Administration, as a consequence of the pressure for increased wages. On the other hand, not many railroad officers would be willing to admit that conditions of employment under private management would today be surrounded by detailed rules and working conditions like those which have been thrust upon the railroads by the United States Railroad Administration.

With respect to the negotiations recently consummated between Director-General Hines and the officers of the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers, there can be no argument on the

justice of the award to the maintenance of way men of privileges equivalent to those already granted to other classes of employees. The fault in this regard would seem to lie in the initial recognition of such basic principles as the eight-hour day, punitive overtime and other features of the standardized agreements.

A study of employment in the maintenance of way department made several months ago demonstrated that the eight-hour day is not an unmixed privilege. Reports from maintenance of way officers in various parts of the country indicated that many trackmen preferred the longer work day because of the greater earnings and that under some circumstances the railroads were being placed at quite a disadvantage in competition with other sources of employment that offered the men ten-hours work.

But even the eight-hour day and the high hourly wages paid are of secondary consideration. The real cloud that darkens the horizon of the railway officer who is ambitious to improve the efficiency of his department is the working agreement. How fruitful this can be in throttling initiative has been anticipated by the operations of the seniority clauses of the supplements to order No. 27, which have practically eliminated the possibility for improving personnel in cases of reductions in force, promotions, etc., since the rules favor the oldest man, irrespective of relative efficiency. Like all agreements fostered by union labor, the all-important factor is the basic principle of standardization i.e.—standard compensation for the standard workman, with no distinction between the dullest drone and the best man in the gang. With such conditions imposed upon the maintenance of way department, the possibilities for marked increases in the efficiency of the work are not what they might be.

New Books

The Story of the Old Colony Railroad. By Charles E. Fisher, 196 pages, illustrated, 6 in. x 9 in. Bound in paper. Published by the Author. Taunton, Mass.

This is a book which will delight every old employee of the Old Colony, and all of the old employees' intimate friends. The early history of the railroads of New England is always interesting, because of the great variety of facts, scenes and incidents found on every page; and the Old Colony is by no means the least interesting of these early enterprises. It includes the four-mile Quincy railroad, of wooden rails, built in 1826, the first railroad in America. Mr. Fisher evidently is the son of an old-time employee, and his book might perhaps be best described as a transcript of a station agent's, a shopman's or a general office clerk's diary for half a century; possibly the diaries of the author and his father. He gives very full notes from 1844, when the company was chartered, down to the absorption of this road in the New York, New Haven & Hartford; and a good deal of matter of later date. The illustrations are mainly photographs of locomotives. This is a field which has been pretty well worked already, but the present volume contains some illustrations of engines not published elsewhere. The locomotive history of this road is not without general interest, J. N. Lauder, who was president of the Master Mechanics' Association in 1880-82, having been at the head of the Old Colony motive power department for many years.

The Panama Canal reports that for the month of October, the tolls for vessels passing through the canal amounted to $661,000, which is the highest sum on record; the highest preceding month's tolls was recorded in May, 1918, when $644,000 was collected.

Letters to the Editor

Test Their Sincerity

San Antonio, Tex.

To the Editor:

Reading your editorial on page 237, August 8, in reference to the historic "basic eight-hour day" struggle of three years ago, the thought occurs to me that it is time for a showing of sincerity on the part of the brotherhoods as to their representations made at that time, when they were not demanding more pay, but shorter hours. While the chiefs are in consultation over further demands, it is time to ask how the "basic eight-hour day" is working. From all directions come authoritative statements, led off by the President and voiced by Director-General Hines, that "the Railroad Administration is firmly convinced that the eight-hour day is the *natural right* of railroad workers."

W. S. Carter, who is president of the Brotherhood of Locomotive Firemen and Enginemen, and who holds the position in the railroad administration of director-general of labor, complained to his brothers in 1915 that those who enjoy the "social distinction" of seniority, "demand the right to do two men's work in order to earn two men's pay." He cited an instance where one man "made 365 round trips in one year; and at the same time on that same railroad they had cut the firemen's list; there were hundreds and hundreds of men hungry and their families hungry; and yet they call this a brotherhood!", he exclaimed in disgust.

It is apparent that similar conditions still exist notwithstanding the "basic eight-hour day" legislation. Grievance committees are demanding that train crews be taken off while seniority men are making many hundreds of miles over the basic eight-hour day, which would represent 3,000 miles a month in freight service and 4,500 miles a month in passenger service. Now is the time to have a showdown on this question. The brotherhoods should be asked to take action in line with Paragraph 5 of General Order 27, in which Director General McAdoo said: "Since the application of the increases hereby granted will tend in individual cases to give increases, greater than is appropriate or necessary, to those train and enginemen who make abnormal amounts of mileage, and who therefore already make abnormally high monthly earnings, the officials of each railroad shall take up with the respective committees of train and enginemen the limitation of mileage made per month by employees paid upon a mileage basis, so as to prevent employees now making such abnormal mileage from profiting by the wage increases herein fixed greatly in excess of employees habitually making a normal amount of mileage."

Director-General Hines, in Supplement No. 16 to General Order No. 27 under Passenger Service, Article II, Basic Day, says: "One hundred and fifty miles or less (straight away or turn-about) shall constitute a day's work." Again in the same supplement under "Freight Service. Article VI, Basic Day and Overtime, (a) "In all road service except passenger service where under mileage schedules a more favorable condition exists 100 miles or less, eight hours or less (straight away ro turn-around) shall constitute a day's work."

It is conceivable even that many of the returning soldiers who have fought for democracy in Europe may be among those who are left without a job through the selfishness of those who demand the right to ignore the basic eight-hour day and to make two men's pay by doing two men's work.

The Reconstruction of the Belgian Railways

War Loss of $265,000,000—Practically All Lines in Operation Now—Opportunities for American Business.

By Robert E. Thayer
European Editor of the *Railway Age.*

London, November 4, 1919.

TAKEN AS A WHOLE the railways of no country, with the exception of the railways of Russia, suffered during the war to the same extent as the railways of Belgium. During the war those lines that were not directly under German control were operated by the military forces of the Allied armies. With the signing of the armistice, the control of the railways was gradually taken over by the civil railroad administration which entered upon its duties with the railways in a very much dilapidated condition. During the last part of the war, when the Germans began to realize that they were playing a losing game, they entered upon a program of destruction of the railways in Belgium, for the purpose of further crippling that nation economically, with that German thoroughness with which the whole world is familiar. The extent of the destruction was limited only by the time the Germans were given by the advancing Allies and by the facilities they required to handle the retreating forces.

Bridges, buildings, shops and track were destroyed and such materials as could be conveniently taken away were carried forward in the retreat. Shops were robbed of their tools and belting; the cars and locomotives which had to be left behind were left in an extremely dilapidated condition, and the locomotives were for the most part unfit to run. The signalling had either been dismantled or fundamentally altered to meet the needs of the German military forces; telephone and telegraph apparatus had disappeared or was entirely destroyed; interlocking plants were practically of no use, and in fact no detail of the railways was left undisturbed. It was this condition that faced the Belgian Railway Administration on the signing of the armistice, and the manner in which it entered upon its program of rehabilitation is well representative of the industry and perseverance of this small nation.

Destruction of Permanent Way and Buildings

A total of about 1,500 kilometers (approximately 1,000 miles) representing about 35 per cent of the whole line was destroyed at the time the armistice was signed, of which 1,100 kilometers (approximately 700 miles) was main line. This figure, however, does not represent the total amount of destruction done to the lines during the war, for as will be seen from the map, which shows the extent of damage at the time of the armistice and the lines that had been partially rebuilt for the services of the army up to the time of the armistice, a considerable length of line was repaired by the Allied forces before the armistice was signed.

There was but a small amount of damage done to the line which can be charged directly to the fighting, as will be seen from a study of the map. Between the line extending from Ostend through Thourout, Roulers and Courtrai, and the frontier lies the territory in which the lines were destroyed as a result of battle. In addition to this there was some damage done on account of the fighting in the region of Liege, Namur and in the vicinity of Antwerp. The remainder of the damage done to the lines can be attributed to the policy of organized destruction followed by the German army which includes that of wilful destruction and the removal of the tracks for service elsewhere during the German occupation of Belgium.

The territory which suffered most from unwarranted destruction was that lying directly west of a line through Ghent, Ath and Mons. In this district the destruction was most complete. The line was destroyed and all permanent struc-

tures demolished including bridges, stations, water works, shops, etc. Perhaps the most glaring example of wanton destruction which had not the remotest claim to destruction for military reasons was that of the destruction of a number of bridges in an uncompleted line extending from Brussels to Ghent, on which no rails had been laid.

At the time of the armistice, Belgium lacked rail communication with the Allied forces and there was a territory over 30 miles deep over which all communication had to be carried on over extremely poor roads. The devastated region included the great industrial works and coal mines which were so necessary to the country for reconstruction and greatly augmented the rehabilitation work.

The Germans did a large amount of damage to important construction work. The number of important bridges totally destroyed was in the vicinity of 250. One tunnel was blown up, being completely demolished at both ends and at three intermediate points. The great amount of damage done to the masonry work is well illustrated by the photographs. The most important bridges destroyed were those

A Masonry Culvert Near Angre Destroyed by Mines Set in Its Walls in Three Places.

at Huy 150 metres (490 ft.) long and one at Namur 100 meters (327 ft.) long. Other important bridges were destroyed at Boons, Waelhem, Duffel, Termonde, Breedene, Bruges and Grammes. There were destroyed in addition several highway bridges and two important viaducts at Meirelbeke-les-Ghent and the Morelle bridge at Tournai.

Among important buildings destroyed are those of the shops and engine houses at Walcourt, Eecloo, Tournai, Merirelbeke, Audernaerde, Anseghem, Hoboken and Ostend. These buildings were destroyed by burning. Other shops and engine houses were badly damaged, including the car works at Brussels and the locomotive shops at Luttre and Ghentbrugge.

In very nearly all of the shops regardless of whether they were completely destroyed or not, the best machine tools, belting and hand tools were removed by the Germans. Part of the old tools remained intact at the shops of Braine-le-Conte, Piteon, Jemelle, Arlon and Courtrai. At the car works at St. Nicholas and the main locomotive shops at Cuesmes all the up-to-date equipment had been removed while much of the equipment remaining at these shops had its essential parts missing. In the main, it can be stated that nothing was left that could be removed except the old types of machines which were unfit for important work.

Throughout the country the water supply plants were systematically destroyed even to the extent of blowing up canals at various points.

Even the railway stations were not evacuated without having been damaged and practically all the equipment relating to the operation of freight yards such as signaling towers, switches, etc., were left in an inoperative condition.

Destruction of Signals

As has been previously stated the Germans left the signal system in a very much disorganized condition. Not understanding the method of operation and not being able to coerce any of the Belgian railway men into operating the

Tournai Suffered Particularly. This Shows the Collapse of the Morelle Bridge.

signal plant, vast changes were made and an almost complete new system that could be operated by the Germans was installed during the four years of occupation of Belgian territory. A large amount of the equipment was either removed or damaged and due to the changed traffic conditions during the war, the entire arrangement was made inadequate for civil use of the Belgians. The signals were very much

Another Bridge in Ghent Which Is Typical of Belgian Bridges.

simplified, and a great many of the signals and interlocking apparatus were eliminated.

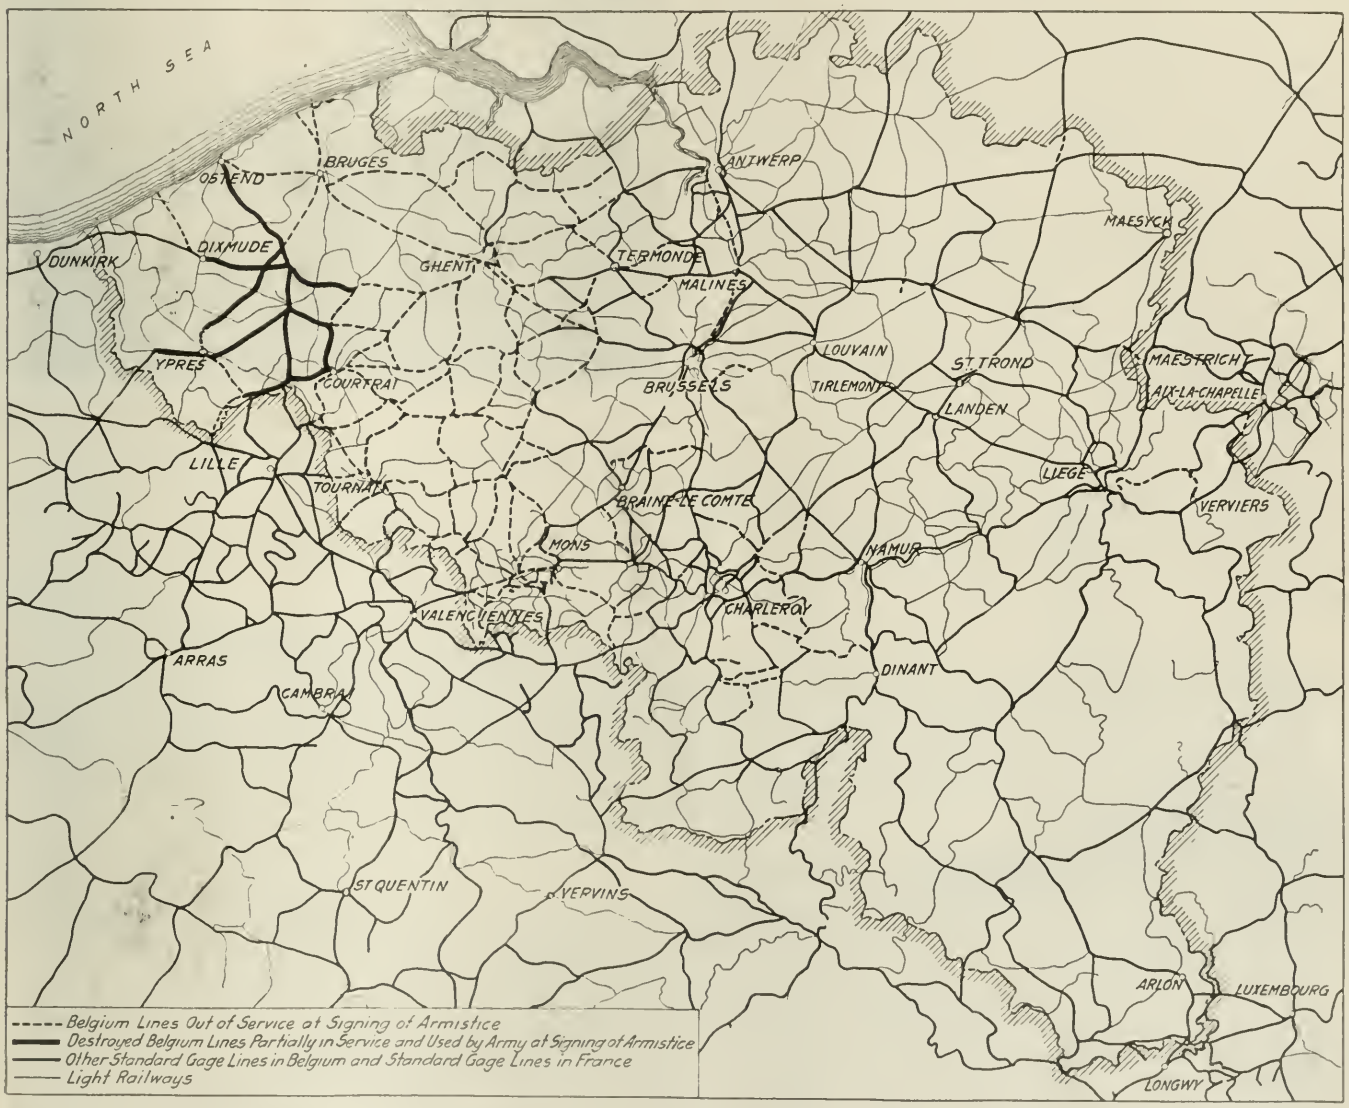
On the cessation of hostilities the railways used the signaling system as it was found, where possible, and in other cases the former signals were partially re-established. Trouble was experienced in this respect because a great many semaphores and much of the mechanical and electrical safety appliances had been removed. In order to ensure safe operation of trains on main lines, a station to station telephone block system was installed which had to be further developed by the re-establishment of the regular system as traffic increased.

Prior to the war, Belgium had in the neighborhood of 4,400 locomotives, 10,000 passenger cars and 92,000 freight cars, and at the time of the armistice there were only about 1,700

locomotives, about 4,000 passenger cars and a very small number of freight cars, all of which were in a very lamentable codition. The locomotives were very much neglected and many of them had some of their parts missing. The Germans left some locomotives fired up without water in the boilers which did considerable damage to the fireboxes, and at the end of December, 1918, 1,200 locomotives were put out of order. To make matters still worse there was considerable difficulty in getting satisfactory equipment from Germany under the terms of the armistice. The damage done to the passenger cars showed the same desire for wanton destruction. Windows were broken, roofs were in bad shape, coal for immediate needs and some had none at all. Great difficulty was experienced in replenishing these yards because of its being impossible for a period to re-establish regular coal trains.

The oil situation for lubricating and lighting was also serious. Quantities of lubricating oil, however, were discovered among the stores the Germans did not have time to remove but this was not adequate and an emergency supply had to be obtained from England.

Among other things lacking were copper for staybolts, wires, firebox plates and tube sheets. The Germans removed the brass tubes and oil boxes from locomotives and



Map of the Belgian Railways, Showing Their Condition at the Signing of the Armistice. The Condition of the French Railways Is Not Indicated.

the air brakes and lighting apparatus were in extremely bad condition, and even the upholstery was ripped from the seats. The heating apparatus had been removed and the supplies in the stores were destroyed. Where the electric light dynamos had not been removed they were impossible to run because no belts were available. The result of this made traveling in Belgium during the past winter extremely uncomfortable and hazardous to health.

Lack of Supplies

As in the case of the track and equipment, the supplies left behind by the Germans for operating trains were exceedingly low. Most of the coal yards had only enough supplies of white metal, zinc and lead. Even the fire brick for locomotive fireboxes, transmission pulleys, rubber hose for washing boilers and for air brake connections, etc., were not available.

The Work of Reconstruction

The rehabilitation of the Belgian railways involves a very large expenditure and the budget, which is shown in the table, for the operation for the year 1919, calls for credits to the amount of 1,137,827,000 francs ($227,565,404) of which 736,103,000 francs ($147,221,000) is chargeable directly to the war. In addition to this the budget calls for 597,338,944 francs ($119,468,000) for expenditures in ar-

rears which is also chargeable to the war. Thus the war has cost the railways of Belgium about $265,000,000. Approximately $100,000,000 is requested for repairing the roadway and $25,000,000 is required for rehabilitation of shops, tools, etc., and $20,000,000 for the maintenance, repairing and renewing of the cars and locomotives.

The first problem of the civilian administration as soon as it became organized after the signing of the armistice was that of re-establishing communications between important points and of bringing the railroads back into operation at the earliest opportunity. At the outset it had to get together such railway rolling stock as could be used. The military forces required a large amount of equipment and still controlled a large territory over which no trains could be run by the civilian administration without military authority. This greatly hampered the reorganization of train services. As the military authorities found opportunity, the operation of the lines and equipment was turned back to the civil management.

There were some 30,000 cars loaded with war material which had to be unloaded and storage space was difficult to find. Therefore the freight cars were cleared but very slowly. In addition to this the enemy left behind in the station yards stocks of explosive bombs, munitions, etc., which presented a real danger to the traffic and serious accidents occurred until the military authorities were able to clear away this material. At the end of the year, however, in spite of these difficulties 330 passenger trains were in operation and shipments of food were handled in such a manner that no undue hardship was caused throughout the country. From November 11 to December 29, 1918, over 270,000 tons of coal, food stuffs and other goods were handled by the civil authorities. On December 12, 1918, the first public time table was published including 155 trains. The service has since been rapidly developing until adequate service is now being obtained.

So rapid has been the work in the reconstruction of 1,500 kilometers of destroyed lines that there is now approximately only 200 kilometers out of operation. The supply of cars and locomotives has been augmented by those claimed from Germany and those returned from France, so that now there are approximately 4,000 locomotives and 75,000 freight cars in operation. There is, however, a shortage of about 30,000 cars.

In reconstructing the lines every attempt has been made to put in permanent structures and only where immediate service was required and the damage was large was any temporary construction used. The illustrations show clearly the manner in which the bridges and viaducts are being rebuilt and also indicate the thoroughness of the destruction by the German armies.

At the beginning of the reconstruction work, the Belgian government was severely hampered by the lack of rails and steel, particularly on account of the fact that none of the steel works were in a condition to operate, and it was not until the early part of June that the first blast furnace was placed in operation. As regards the masonry and brickwork, however, they were particularly fortunate in finding large quantities of cement which had been left by the German army and plenty of bricks and sand were available. It was found possible to use some of the steel work from the destroyed bridges for the construction of the few steel bridges. The work was done by contractors on a cost plus basis with 10 per cent profit. Steel workers were brought from available points and worked on a schedule of 66 hours a week in order to push the reconstruction work through as rapidly as possible. The industry of the workers was quite remarkable and spoke well of the esprit-de-corps of the Belgian workmen and their willing help in re-establishing the trans-

All That There Is Left at the Station of Hollain. Bent Rails Will Be Noted by the Platform. The Belgian Workmen Are Applying Their Screw Spikes.

The Station at St. Pierre Was Thoroughly Destroyed. This Illustration Shows the Viaduct After the Debris Had Been Removed.

portation system. Most of the bridges built for the railways were of brick construction; very few steel structures being used as permanent installations.

Machine Tools

The rehabilitation of the railway shops destroyed by the Germans presents a very large problem. There was a sufficient amount of equipment available to operate the shops

Site of the Bridge Over the Rietgracht at Avelghem. This Was in the Battle Zone and in the Original Photograph Barbed Wire Entanglements Are Faintly Discernible in the Background.

at one-third capacity during the summer. The additional machines required will be met by what can be reclaimed from Germany and by advantageous purchases from the American government. As regards the former it was stated by the Belgian Minister of Economic Affairs on September 21, that since April 1, machinery valued at 2,884,000 fr. had been recovered from Germany. All of this, however, does not apply to railroads. The terms under which machinery will be obtained from the American government have already been published, namely, at the 1914 prices plus 55 per cent F.O.B. Antwerp, with three years in which to make a settlement. There will undoubtedly be opportunities for the sale of the more special types of railway machine tools which must be purchased, as many of these were absolutely destroyed. Furthermore, as in all Europe and England, there will be an increased demand for labor saving machines due to the increased cost of labor.

Electrification Program

The electrification of the Belgian railways which has been mentioned in these columns previously presents another feature in the reconstruction program. Inasmuch as there is such a large amount of reconstruction work to be done, the adoption of electrification becomes a much easier problem. A commission has been formed under the guidance of the government and special committees have been working on the plans with a view of determining the extent to which electrification will be carried out and the system to be used, but in this case, as in others, much depends upon the fall elections as any radical change in the government is liable to result in a reorganization of the railway administration. On this commision are French engineers who have made comprehensive studies of electrification, the benefits of which will accrue to the Belgian commission. There is no question but what electrification will be carried forward but as to detailed plans nothing is known. Previous studies have indicated that Ostend, Ghent and Antwerp would be the most logical points for super-power stations with four additional power stations between Liege and Lille. Ostend, Ghent and Antwerp are so located that fuel can be transported to the power stations by water, and the four power stations between Liege and Lille are contiguous to the coal district.

Another View of the St. Pierre Station with Construction Well Along. This Picture Was Taken April 3, 1919.

Reconstruction of the Signal System

As has been stated above, the Germans during their occupation of Belgium so destroyed the signal system that practically the whole of it will have to be rebuilt. It is estimated that the cost of rebuilding will be about 80,000,-

000 francs ($16,000,000). It is believed that with the facilities at hand in Belgium it will be unnecessary to go out of that country for material, with the exception of the purchase of electric cables. In order to get some idea of the work to be done, the following brief description of the signaling system as it was before the war is given:

The danger points of the line were protected by semaphores with square ended blades and these signals were repeated at a distance of 800 meters or approximately 2,600 ft., with semaphores with pointed blades. When a stop and distance signal were at the same point they were placed on the same signal mast with the principal signal below as in England. In the newer signal work the upper quadrant position signals were used.

At all the junctions and in a large number of stations the levers were centralized in interlocking cabins. There are about 1,000 of these cabins having a total of nearly 20,000 levers. The majority of the interlocking apparatus was of the Saxby mechanical type. Double wires were used in most cases for operating the signals and at a certain number of the cabins there were used for operating the switches.

THE 1919 BUDGET OF THE BELGIUM RAILWAYS

Items	Expenses necessary for normal operation (Francs)	Expenses made necessary by the war (Francs)	Total credits required (Francs)	Expenses in arrears. (These are also chargeable to the war) (Francs)
ORDINARY SERVICES				
Salaries and Indemnities for officials and Staff	815,311	.....	815,311	3,388,644
Remuneration to servants and wages of workmen	182,000	.....	182,000	764,500
Printed matter, tickets, stationery, etc.	5,179,170	1,000 000	6,179,170	80,000
Subsidies to insurance and retirement funds	265 500	.....	265,500	.....
Special workmen benefits	163,000	.....	163,000	160,000
Conferences expenses, including International Railway Congress.	23,000	.....	23,000	.....
Medical attendance including "First Aid" training	125,000	.....	125,000	70,000
PERMANENT WAY AND WORKS				
Salaries and indemnities of officials and staff	3,715,851	.....	3,715,851	13,509,492
Wages of minor foremen, workmen, etc.	14,168,991	.....	14,168,991	55,224,483
Tires, rail and other accessories for permanent way	19,200,000	500,000,000	519,200,000	2,699,000
Tools, implements and cost of maintenance of railway property	31,203,742	125,000,000	156,203,742	57,205,611
LOCOMOTIVE AND ROLLSTOCK				
Salaries and indemnities of officers and staff	3,598,551	.....	3,598,551	15,293,841
Wages of workmen	46,590,698	.....	46,590,698	175,392,960
Bonuses for economy and regularity	3,818,626	.....	3,818,626	14,171,678
Fuel and other car and locomotive supplies.	117,911,000	5,040,000	122,951,000	5,300,000
Maintenance, repairs and renewals	78,306,455	100,067,000	178,373,455	71,058.000
TRANSPORTATION				
Salaries and indemnities of officers and staff	31,148,844	.....	31,148,844	110,638,088
Wages of workmen, guards and cartage	24,899,041	.....	24,899,041	55,689,284
Bonuses for regularity.	1,484,908	.....	1,484,908	6,329,235
Working expenses	13,937,853	4,846,000	18,783,853	423,000
Commercial advertising.	394.000	150,000	544,000	30,000
Loss and damage (indemnities for accidents that have already occurred)	2,130,000	.....	2.130,000	.....
Bonuses to employees who have detected false declarations of freight	10,000	.....	10,000	50,000
AUDITING AND COLLECTION OF RECEIPTS				
Salaries and indemnities of officers and staff	2,299,270	.....	2.299.270	9,273,228
Wages of servants and workmen	153,212	.....	153,212	587,900
Total	401,724,023	736,103,000	1,137,827,023	597,338,944

A number of installations for operating switches and signals by electricity have also been placed in operation, notably at Antwerp, Brussels, Ghent, Alost, Charleroi, Marchienne, Louvain, Namur and Vilvorde. In all the yards the switching was done by means of signals.

The absolute block system was used on the important lines with lock and block apparatus for a track normally closed. There were about 2,500 of these signals. Contrary to the practice in many countries a hand magneto was used to produce an alternating current instead of batteries. The single track lines were operated by means of a telegraph block system, but the lock and block signals had been put in places where these lines joined the double track lines in order to ensure greater safety.

A Masonry Bridge Near Andregnies.

The Germans not being familiar with this system, changed all this. The plans of operation on main line track were based on the regularity of schedule rather than on signals, and the existing block signals of the Belgian railways were not used and in most cases were destroyed or removed. Although the Germans left a certain number of masts in position they generally removed all but one of the signal blades.

Another Example of Bridge Destruction.

They also allotted certain tracks for special service where previously these tracks had no definite assignment. They eliminated a large amount of signals and terminals and all the interlocking apparatus.

The re-establishment of the signaling system of the Belgian railways has been placed under the direct charge of L. P. A. Weissenbruch, who is developing a more refined signaling system than that which was previously used, the details of which are not yet available.

Rehabilitation of Cars and Locomotives

The greatest problem of the Belgian railways as regards equipment was that of obtaining cars and locomotives and repairing those which it already had. After some difficulty Belgium received some 2,000 locomotives from Germany and about 80,000 cars, out of the 5,000 locomotives and 150,000 cars that were to be turned over to the Allies by the German government under the terms of the armistice. Of the cars about 5,800 were passenger and the remainder freight. It will thus be seen that the great majority of the equipment

Destruction of a Bridge Between Avelghem and Audenarde.

on Belgian lines was German equipment which presented a serious problem in maintenance.

As before stated the equipment left behind by the Germans was in a dilapidated condition and all the shop resources were at once put to work on its repair. Contracts were let with Belgian locomotive builders to repair 900 locomotives by January 1, 1920, but it is improbable that this will be done. With the crippled condition of the shops on the railways, these were only running to about one-third capacity a short time ago, and not much help was obtainable from that source.

Some 200 locomotives and 9,000 cars have been purchased

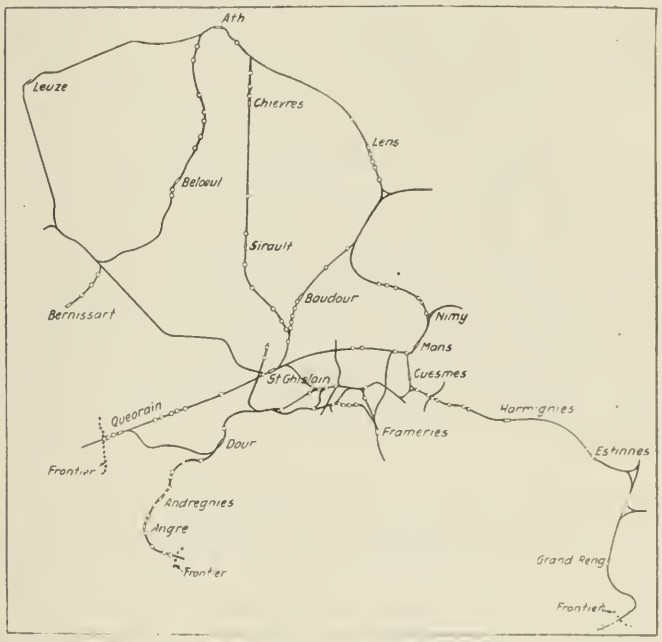
A Masonry Bridge Ready for Rebuilding.

from America, but these are not sufficient properly to rehabilitate the railway. It is the desire of the railway administration to return the cars and locomotives to Germany and demand money with which to buy standard equipment to its own designs, but no decision as to this has yet been made. On March 1, there were about 2,900 locomotives on the Belgian railways of which 1,700 were in working order. On August 1, there were approximately 4,300 locomotives of which 2,560 were in working order.

Prospects for American Business

The above account of the devastation done to the Belgian railways during the German occupation indicates that Belgium presents a wonderful market for railway supply manufacturers, but there are several circumstances which affect the situation, particularly as regards the United States. In the first place, the Belgian railways being state owned must of necessity cater to the home industries. And in the second place the political situation is such at the present time that although the present railway administration has formed definite plans of procedure, it must wait before going too deeply into their development until the elections show which party is to be in power, for the coming elections which will be held on November 16, are very much in doubt. In addition to this there has been some talk about removing the railways from direct control of the state, and placing them in the hands of private companies for their operation. A bill has been introduced for the formation of a company called the Regie Nationale de Chemins des Fer en Belgique.

Furthermore, the quantity of business given to various



Some of the Railways in the Vicinity of Mons. Each Small Rectangle Indicates an Important Station and Each Small Circle a Destroyed Bridge.

countries will depend to a very large extent on the credits that are offered by those countries. It has been stated that England, for instance, has loaned the Belgian government £50,000,000 ($250,000,000) for a term of 25 years. Undoubtedly this will serve to throw a large amount of the Belgian business to England.

Switzerland is also a lively competitor of the United States. Most representatives of American concerns in Belgium have been asking 75 per cent cash with an order notwithstanding the adverse rate of exchange, while the Swiss firms have been extending credits.

As a practical solution of the credit situation the American Chamber of Commerce, Paris, suggests that American manufacturers obtain credits for the purchase of raw products in the United States, that they themselves carry the manufacturing expense, that they sell in francs at an average pegged rate of exchange in Belgium and leave the proceeds of the sale in Belgium until such time as conditions might warrant their withdrawing it. The Chamber argues that the amounts involved would naturally be a great deal smaller

than purchase credits and the plan would result in many advantages to the American manufacturer.

It is also stated that there is in the hands of the Belgian government 7,000,000,000 marks which at the normal rate of exchange would amount to $1,750,000,000. This was, it is reported, bought from the inhabitants at the remarkable price of 1.20 francs to the mark, and the government refuses to let this money go at the present rate of exchange of the mark. (At the present time a mark can be purchased in Belgium for .35 francs.) The government's action in this matter clearly indicates that this money will be used for purchases from Germany as soon as the political situation will permit.

Another thing which has affected particularly the equipment manufacturers in the United States, is the American press reports of a combination entered into between various prominent equipment builders there to facilitate the matter of credits between Belgium and the States. The Belgian government having heard of this report is inclined to look upon it as a trade agreement for the regulation of prices for equipment to Belgium. It will be highly desirable to remove this idea from the minds of the government officials there, for this rumored combination has already had a detrimental effect on American business. As a result of it the Belgians look with suspicion on all prices quoted from America. That equipment will be bought here is quite certain.

As regards machine tools the greatest field of the American manufacturer is in the sale of machines particularly adapted to railway work and machines of improved designs which will reduce the cost of labor and produce a good article cheaply.

It is believed that Belgium will go out of the country for large orders in so far as it is possible for its local industries to get foreign business. In other words, it intends to act as a back stop for its industries, keeping them filled with orders and at the same time leave them free to regain and develop their foreign business which has suffered so greatly during the war.

Colonel Kennedy's Annual Luncheon at Ragged Edge

THE RAILWAY AGE is not much given to chronicling purely social events even when they are participated in by the railroad and railway supply fraternity, but the luncheon given by Colonel Moorhead C. Kennedy at his country home, "Ragged Edge," near Chambersburg, Pa., on October 4, was so interesting, so unique and so largely attended by men in this paper's particular field that it must be mentioned. The luncheon was something more than a social event. It was also a high personal tribute to Colonel Kennedy. It is probable that the only other time on which an equal number of prominent railway men ever got together on a purely social occasion was the dinner given to President E. P. Ripley of the Santa Fe by his friends on his seventieth birthday.

Three special trains were run to Chambersburg to take Colonel Kennedy's guests there; one from Philadelphia, one from Baltimore and one from Pittsburg. The number of guests was about 300 and there were included large numbers of railway presidents, federal managers and other railway officers. There is danger of being invidious in mentioning only part of the guests on an occasion of this kind, but the *Railway Age* ventures to mention "as among those present" the following: Governor Sproule of Pennsylvania; Governor Davis of Virginia; United States Senator Pomerene of Ohio; Samuel Rea, president of the Pennsylvania Railroad; E. T. Stotesbury, chairman, and A. T. Dice, president of the Philadelphia & Reading; C. R. Gray, president of the Western Maryland; W. H. Truesdale, president of the Lackawanna; F. D. Underwood, president of the Erie; W. T. Nooman, president of the Buffalo, Rochester & Pittsburg; E. E. Loomis, president of the Lehigh Valley; Ralph Peters, president of the Long Island Railroad; S. M. Felton, president of the Chicago Great Western; W. T. Tyler, director of operation of the Railroad Administration; B. L. Winchell, Southern Regional Director; Robert Bridges, editor, Scribner's Magazine; T. DeWitt Cuyler, chairman of the Association of Railway Executives; H. H. Westinghouse, chairman of the Westinghouse Air Brake Company, and so on.

How did Colonel Kennedy succeed in getting about 300 men of such prominence to leave their daily tasks and journey to Chambersburg to have lunch with him? Colonel Kennedy and his father, Thomas Benton Kennedy, before him, have been the moving spirits on the Cumberland Valley Railroad almost ever since it was built. Colonel Kennedy became vice-president of the road in 1889 and president in 1913, and since its consolidation with the Pennsylvania System he has been resident vice-president. In 1901, when he built his house and moved to Ragged Edge, he started the custom of giving an annual luncheon to some of his friends, and, with the exception of 1905, the year when his father died, he always gave a luncheon until 1917. In that year he entered the United States Army and was appointed Deputy Director General of Transportation with headquarters in London. Therefore, he gave no luncheons in 1917 and 1918.

At his first luncheon there were not more than 30 or 40 guests, but the number has grown year by year until his luncheon has become a big annual affair in the railroad business. Geographically, Chambersburg is located at about the cross roads between the East and West and the North and South, and this enables him to get together a good many men of prominence from these different directions. The location of Chambersburg would not be sufficient by any means, however, if it were not for the great reputation which Colonel Kennedy has acquired as a host and also the reputation he has acquired for always having good weather. On the sixteen occasions when he has given luncheons he has never had a bad day. Regardless of the kind of weather which has preceded or followed, on his luncheon days it has always been warm and sunshiny, so that he has been able to serve his luncheons on the lawn excepting one year when it was not quite warm enough and he served in the house and on the verandas. When he first built his house it was only a slight frame building 24 feet square, where he and his family spent the summer months, but at different times he has added to it until he has made it his permanent home the year round.

On the occasion of the luncheon on October 4 last the guests on their arrival climbed the tall hill on which "Ragged Edge" stands and were greeted by Colonel Kennedy and Mrs. Kennedy. After this there was informal conversation and visiting until lunch time. The luncheon was novel in the respect that there was no speech-making, but just eating, conversation and some occasional singing by the "old-timers." After luncheon the guests spent some time walking around the grounds and visiting some more, after which they returned to their trains.

Colonel Kennedy's luncheons have been always very simple and informal, which probably is one of the reasons why they have come to attract so many prominent people. It is no derogation from Colonel Kennedy's qualities as a host to add that one reason why so many attend is that the trips to and from his home on the special trains and the meetings at his house give those who attend opportunities to renew from year to year acquaintanceships with a large number of persons that they do not have opportunity to see at other times.

Railroad Regulation Bill Passed by House

Roads Have Some Friends in Congress but Labor Organizations, Commissions, Shippers and Waterways Have More

WASHINGTON, D. C.

THE ESCH BILL, H.R. 10453, described in its title as providing for the termination of federal control of railroads, for the settlement of disputes between carriers and their employees and to further amend the act to regulate commerce, was passed by the House of Representatives on November 17 by a vote of 203 to 160, with 69 not voting, largely by a party vote, the Democrats being opposed to the bill because it provides for a six months' continuation of the guaranteed standard return. The bill was then sent to the Senate where it was referred to the committee on interstate commerce. The text of the bill is published elsewhere.

Consideration of railroad legislation was technically started in the Senate on November 19 just before the adjournment when Senator Cummins moved that the Senate proceed to the consideration of his bill as in committee of the whole. The motion having been agreed to, the bill was temporarily laid aside but it was thus made the unfinished business for consideration at the regular session in December. As soon as the bill encounters obstacles in the Senate and it becomes apparent that it cannot be completed before the end of the year it is planned to introduce a temporary resolution and complete the permanent legislation later.

The hopes of those who had sought for the introduction of some radically new principles into the system of railroad regulation to improve railroad credit must now be transferred to the Senate because during the week of debate the House surrendered some of the most important provisions of the bill as reported by its committee to the demands of the railroad labor organizations, those who object to too much curtailment of the powers of the state railroad commissions, the waterway advocates, and those who object to any legislative instruction to the Interstate Commerce Commission as to the elements of a reasonable rate.

The bill was introduced in the House on November 8, favorably reported by the committee on interstate and foreign commerce on November 10 and its consideration was begun on the floor on November 11 under a rule making it the continuing order of business until its final passage. Sessions were held from 10 a. m. until 10 p. m. and the most important features of the bill were hotly contested throughout. On the general question of whether the roads should be returned to private management there was very little difference of opinion, although several of the recognized spokesmen for organized labor urged the plan for an extension of the period of government control.

The committee bill was based on the original Esch-Pomerene bill introduced in the House at the beginning of the session, which was largely the work of the Interstate Commerce Commission and represented its ideas as to desirable amendments to the act to regulate commerce. As reported, the bill represented many important changes from the original bill and several new features adopted by the committee after hearings extending throughout the summer and at the suggestion of representatives of the railway executives, the Railroad Administration, the commission, shippers, business men, and others that have been working with the committee. Some of the most important changes added during the last week of work on the bill by the committee after it had received the tentative draft prepared by a sub-committee, were struck out by the House before the bill was passed. More than 100 pages of proposed amendments to the original bill were considered by the committee.

The bill is very different from the Cummins bill reported by the Senate committee, as it leaves the regulating authority centered in the Interstate Commerce Commission, (except as it may be interfered with by state commissions), whereas the Senate bill would confer some functions of the commission and many new functions on the transportation board. Many of the details of the two bills, however, are similar. The House bill contains no provision for a transportation board, no prohibition against strikes, no provision for federal incorporation nor for compulsory consolidations, and no definite standard of return to be considered in the fixing of rates. At the last session of the committee a provision was inserted by a vote of 9 to 8 that "in reaching its conclusion as to the justness and reasonableness of any rate, fare, charge, classification, regulation or practice, the commission shall take into consideration the interest of the public, the shippers, the reasonable cost of maintenance and operation (including the wages of labor, depreciation and taxes), and a fair return upon the value of the property used or held for the service of transportation," but this section was entirely eliminated by the House.

Principal Provisions of the Bill

As passed the bill provides for a six-months' extension of the guaranteed rental for railroads that within 60 days file applications for increased rates, and for a funding for not to exceed 10 years of the indebtedness of the railroads to the government for capital expenditures ordered by the government during federal control estimated at $775,000,000, but it first deducts from that amount all indebtedness of the government to the railroads to the extent permitted by the standard contract, leaving other indebtedness of the roads to the government to be evidenced by demand notes. A fund of $250,000,000 is created by the bill from which to make loans to railroads.

While the bill is largely devoted to broadening and rounding out the regulatory powers of the Interstate Commerce Commission, it also gives the commission discretion to remove some of the restrictions heretofore placed on the railroads and contains some provisions of this kind which have been strongly urged by the railroads, including the removal of the prohibition against pooling and consolidation upon approval of the commission as in the interest of better service to the public, economy in operation, or otherwise of advantage to the convenience or commerce of the people. Also the period during which the commission may suspend a change of rates is reduced from four to 10 months to 120 days. The commission is empowered to fix minimum rates. It is also provided that extensions of an existing railroad, or the construction of a new line, or the abandonment of a line, shall not be permitted until there shall have been obtained from the commission a certificate of convenience and necessity.

The commission is given the supervision of security issues and much broader powers than it has heretofore possessed in its regulation of rates and of car service.

The elimination of the rule of rate-making leaves in effect merely the old rule that rates shall be "just and reasonable."

Wage Orders of Railroad Administration Confirmed

Aside from this, probably the most violent change made in the committee bill by the House was the substitution for the labor provisions of the bill, which provided for boards

to adjust wage disputes and also for the assessment of damages against a labor union or a railroad for damages caused by a strike or a lockout in violation of a contract, of an entirely new plan, proposed by the leaders of the railroad labor organizations, which neither provides for arbitration nor against strikes. It was generally discussed as providing for a method of voluntary adjustment by a continuation of the boards of adjustment established by the Railroad Administration but in fact it gives to the boards of adjustment jurisdiction over wages, which is now in the hands of the director general and an advisory wage board, and also creates similar bi-partisan commissions on labor disputes to which may be taken appeals from the adjustment boards, without any provision for a final decision in case of a deadlock. In addition it confirms for the future "all decisions of a general character heretofore made by the United States Railroad Administration affecting the questions of wages, hours of service or conditions of employment," and also decisions applying to individual carriers, which are to remain in effect until superseded by mutual agreement, or by the decision of a board of adjustment or a commission on labor disputes, in accordance with the terms of the bill.

The new labor provisions, offered in an amendment by Representative Anderson of Minnesota after statements had been made that they represented the views of the labor leaders, were adopted by a vote of 161 to 108 after a substitute for the committee provision proposed by Representative Webster, which contained a prohibition against strikes, had been voted down by a vote of 151 to 75.

Several other amendments were adopted to reduce the extent to which the committee bill would have curtailed the authority of the state commissions, particularly one affecting the car service sections, which Chairman Esch of the committee said would ham-string the federal authorities and take the vitality out of the car service act.

Vigorous efforts were made, but unsuccessfully, to eliminate the provisions for a guaranty for six months and making an application for a rate advance a prerequisite for a guaranty. The guaranty provisions, at the suggestion of Director General Hines, were made subject to a direction to the Interstate Commerce Commission to limit the expenditures for maintenance which may be charged to operating expenses to the amount provided for in the standard contracts.

One of the first amendments adopted was proposed by Representative Lanham providing that the period of federal control shall not be computed as a part of the period of limitation in actions against carriers or in claims for reparation to the Interstate Commerce Commission for causes of action arising prior to federal control. Such a provision was included in the bill, S. 641, which was vetoed by the President on November 18.

Funding of Indebtedness

A lively controversy was aroused by an amendment offered by Representative Denison of Illinois as a substitute for the provisions in Section 205 regarding the funding of the carriers' indebtedness. The plan in the committee bill would allow the funding for 10 years, at the same rate of interest allowed the carriers on capital improvements made during federal control, of the indebtedness of the carriers to the government for additions and betterments made by the Railroad Administration during federal control, while other indebtedness would be evidenced by demand notes at 6 per cent, and indebtedness of the government to the carriers would be set off against the amounts for which they would be required to give demand notes.

Mr. Denison's amendment provided for the plan proposed by the Division of Finance of the Railroad Administration, which had been rejected for the other plan by the committee, under which the government would first set off against the additions and betterments the amount of its indebtedness to the carriers which is deductible from the standard return under the standard compensation contracts, after allowing the railroads sufficient to take care of fixed charges, regular dividends and working capital (to the extent that the money due is sufficient for these purposes).

Mr. Denison argued, from data furnished by the Railroad Administration, that under his plan there could be deducted from the $775,000,000 estimated for additions and betterments (excluding equipment), a total of $415,016,000 of indebtedness of the government to the carriers, leaving only $360,000,000 to be funded, whereas under the plan contemplated in the bill only $133,911,000 could be deducted. The result would be, he said, that under his plan the Railroad Administration would require an appropriation of only $171,000,000 to square its accounts, whereas under the other plan it would require $303,355,000 and under the plan of the Senate bill an appropriation of $415,451,000 would be required. This led to a protracted debate in which many members took the position that it was only plain common sense to subtract what the government owes the roads from what they owe it, while those who defended the committee plan pointed out that what the government owes the railroads is for current purposes while the indebtedness for additions and betterments represents capital which would ordinarily be represented by long-term securities.

A letter from Director General Hines to Chairman Esch advocating the plan proposed by the Division of Finance and represented by the Denison amendment was read, in which he argued that the rate of interest to be paid by the government to the railroads on capital improvements should bear no relation to the interest they should pay the government, for which he suggested 6 per cent. He pointed out that the plan of the committee bill, which represented the views of the railway executives, would work out unequally in the amount of working capital it would allow the various roads and he contended that the railroads should be encouraged to obtain money through private financing instead of invited not to repay the government as rapidly as their financial resources might permit.

Representative Sanders of Indiana, one of the advocates of the plan of the bill, said: "It is not enough to say that we are opposed to government ownership unless we are willing to make private ownership a success. Reduced to its simple terms, the question is whether you are going to give a period of 10 years to these carriers to meet these obligations, which would have been in ordinary times long-term obligations or whether we are going to make them pay now, and send them into the market to raise large sums of money at the time of the termination of federal control."

Representative Merritt of Connecticut presented a letter from Alfred P. Thom, counsel for the railway executives, in reply to Mr. Hines' letter, in which he argued for the same rate of interest on both sides of the account and against the plan of offsetting part of the rental against the capital expenditures. Chairman Esch of the committee supported the Denison amendment, which was adopted by a vote of 134 to 69.

State Rights Preserved

The question of state rights came to the fore in connection with Section 206, providing that the existing rates shall continue in effect until changed "by or pursuant to authority of law." Representative Sweet of Iowa proposed an amendment inserting the words by "state or federal authorities respectively," which was adopted by a vote of 73 to 11.

A similar question came up in connection with the section giving the Interstate Commerce Commission extensive powers over car distribution and car service and Representative Sweet secured the adoption of an amendment providing that nothing in the act should impair or affect the right of a state

"to require just and reasonable freight and passenger service and the fair exchange and distribution of equipment for intrastate business." This was adopted by a vote of 95 to 39 and later confirmed on a record vote by 193 to 77.

Also, in connection with the authority of the commission over extensions of lines, an amendment was adopted that the commission's authority shall not extend to the construction or abondonment of any line located or to be located wholly within one state.

Representative Sims led a vigorous fight against the extension of the guaranty for six months, in which he was supported by a large number particularly from the Democratic side, but his motion to strike out the section was defeated by a vote of 114 to 72. There was particular objection to the provision that as a prerequisite to receiving the guaranty a road should apply to the Interstate Commerce Commission for an increase in rates within 60 days. It was explained that this was to prevent a road from resting on its guaranty. Chairman Esch said the six months' period had been fixed because the commission had advised that it could pass upon the rate advance in that time after allowing for two months for notice and preparation. Before the final passage of the bill a motion by Mr. Sims to recommit it to the committee with instructions to strike out the guaranty section was defeated 200 to 165.

An amendment proposed by Mr. Esch was adopted to provide that the contract between the American Railway Express Company and the director general shall remain in effect during the guaranty period so far as it constitutes a guaranty against an operating deficit.

Labor Disputes

Probably the most fiercely contested question in connection with the consideration of the bill was that involving the method of dealing with labor disputes. The committee bill had proposed a railway labor adjustment board to consist of one representative for each union and a similar number of representatives of the carriers, and a railway board of labor appeals to be composed of three representatives of the employees and three of the companies, to adjust and decide labor controversies and to study the relations between carriers and their employers. It contained no prohibition of strikes or lockouts but it did contain a provision making either a railroad or a union liable for damages for a breach of contract of hire.

This had been objected to by representatives of the railway labor organizations and their friends in Congress as more objectionable than the anti-strike provisions of the Cummins bill, but it was not sufficiently drastic for many Representatives and a strong fight was led by Representative Webster of Washington for an amendment providing for a board of railroad wages and working conditions whose findings would be final and binding, and making it unlawful for any group of employees to enter upon a strike pending the decision of the board. It also would make individuals, groups of employees or labor unions liable for damages for breach of contract by a strike or for any breach of findings and conclusions of the board. The plan also provided for the continuation of the three boards of adjustment organized by the Railroad Administration.

The same amendment had been offered in committee and, according to a member, had received only 2 votes out of 21. It proved too drastic for the members of the House and was defeated by a vote of 151 to 75 to substitute the amendment introduced by Representative Anderson of Minnesota, which it was stated represented the views of the labor organizations, and had been proposed in the committee by Representative Sweet. The Anderson amendment was then adopted, 146 to 117, and in a roll call vote before the final passage of the bill this was confirmed by a vote of 253 to 112.

The fact that the Anderson amendment confirms all the acts of the Railroad Administration relating to wages and conditions of employment was almost entirely overlooked in the discussion, although attention was called by Representative Winslow and others to the fact that it provides no permanent investigative body as to the relations of carriers and employees and that it provides but one method of getting a dispute considered by a board of adjustment, namely joint action by a union and a carrier initiated by the employees. There is no provision by which either a union or a carrier alone can refer a dispute to the board. It is provided that, after a failure to settle a controversy through the usual channels, if the contention of the employees' committee is approved by the chief executive officer of the organization, "then the chief operating officials of the carrier and the chief executive officer of the organization concerned *shall* refer the matter" to the proper boards, and "no matter will be considered by the respective boards of adjustment unless officially referred to them in the manner herein prescribed." Apparently the hands of a railroad would be completely tied in any effort to get rid of some of the extreme examples resulting from the blanket wage orders of the Railroad Administration which have been complained of.

Representative Madden of Illinois offered an amendment, which was defeated, providing that no carrier shall enter into or be bound by an agreement with a labor organization that excludes "native born American citizens," meaning negroes. Representative Madden also proposed an amendment to prohibit the issuance of free transportation to families of employees, which was defeated 58 to 8.

In connection with the discussion on the labor provisions, Mr. Esch referred to the statement sent to the press and to members of Congress by the railway labor leaders in the Plumb Plan League to the effect that the labor provisions on the bill as reported had been dictated by Wall Street. He said that no influence outside the committee room had dictated a single line or phrase of it.

Representative Rayburn of Texas also referred to the statement issued by the Plumb Plan League. He said: "The statement that labor representatives were not consulted and were not given a full hearing upon this bill, and the further statement that Wall Street wrote any provision of this bill is a slanderous lie." He also called attention to the fact that Edward Keating, a former member of Congress, who is acting as manager of the Plumb league is also drawing a government salary as head of a commission on reclassification of government salaries.

Representative Madden aroused a controversy which took some time to dispose of by introducing an amendment requiring carriers to furnish equal and identical accommodations regardless of "race, color or previous condition," aimed against the Jim Crow laws of the southern states, which was voted down 142 to 12.

Representative Sims revived the old controversy over the long and short haul clause by proposing an amendment to prevent fourth section relief to meet water competition. This was rejected by a vote of 97 to 50.

Mr. Sims also led the fight against the provisions in Section 407 authorizing the Interstate Commerce Commission to permit pooling and consolidations. An amendment by Representative Hudspeth of Texas to provide that nothing in the act shall relieve any carrier from obedience to the constitution and anti-trust laws of the state of its creation or in which it may operate was rejected, 63 to 32. An amendment by Representative Briggs of Texas to strike out the paragraph relieving carriers from the operation of the anti-trust laws in cases approved by the commission to enable them to perfect unification, consolidation or pooling was rejected. An amendment by Representative Black of Texas to strike out "economy in operation" as one of the reasons for which the commission could authorize consolidation or

pooling was rejected 64 to 33. Mr. Sims' amendment to strike out the entire section relating to consolidation and pooling was rejected 73 to 20.

Waterway Provisions

Several of the waterway advocates endeavored unsuccessfully to amend or strike out section 408 which authorizes the commission to permit the continuance of water line ownership by railroads other than through the Panama Canal when in the interest of the public. Representative Small of North Carolina obtained the adoption of amendments to Section 411, which authorizes the commission to require the establishment of physical connections between the rail lines and docks, striking out the words which would give the commission jurisdiction over docks irrespective of the ownership of the dock. The amendments were adopted en bloc by a vote of 102 to 51 and later confirmed on a record vote by 148 to 97.

Another amendment by Mr. Small to strike out a paragraph authorizing the commission to establish through routes and joint rates between and over rail and water lines and to determine conditions under which such lines shall be operated was adopted 81 to 59. Mr. Small said: "Water is free and water lines ought to be free."

The states' rights advocates made another fight against the adoption of Section 415, which provides for a method of cooperation between the state and federal authorities, where the relation of state to interstate rates is brought into issue, along the lines of the plan proposed by the Interstate Commerce Commission and endorsed by the state commissioners' association, but various amendments were rejected.

Section 417, which contained the proposed rule of rate-making, was stricken out by an amendment by Representative Barkley of Kentucky by a vote of 115 to 42, although the rule was warmly defended by Representatives Sanders of Indiana, Parker of New York, Montague of Virginia, Denison of Illinois, Little of Kansas, Merritt of Connecticut and Watson of Pennsylvania. After the section had been eliminated Mr. Sims offered as an amendment his bill to limit the salaries that may be charged to operating expenses to $20,000 a year, which was rejected 38 to 80.

The proposal to increase the salaries of members of the Interstate Commerce Commission aroused some discussion. An amendment to change the figure to $10,000 was rejected by a vote of 50 to 120 and one by Mr. Sims to make the figure $20,000 was rejected by a vote of 4 to 139. There was also some objection to the proposal to allow the commission to fix the salary of its secretary and an amendment to strike out the provision was agreed to but a committee amendment fixing the salary at $7,500 a year was adopted.

An Army Substitute for the Plumb Plan

A novel solution of the railroad problem which combined with it the advantage of offering jobs to a number of returned soldiers was proposed, apparently seriously, by Representative Evans of Nevada. He said that government operation of the railroads had failed because the railroad managers sought to disgust the public with government operation. Therefore he suggested that the governor of each state nominate five enlisted men from his state and from those thus nominated there should be selected a president, auditor, secretary, seven directors and 230 traveling inspectors, who should be given full power, authority and credit to maintain and operate the railroads until they are upon a sound financial basis and out of debt to the government.

Chicago's Anti-Smoke Campaign.—In a letter directed to C. M. Kittle, federal manager of the Illinois Central, Dr. John Dill Robertson, health commissioner of the City of Chicago, commended the road for its efforts in reducing the smoke evil against which the city is conducting a drive.

Hours of Service Reports; Annual Summary

INSTANCES OF EXCESS SERVICE, involving potential violations of the federal hours of service law were reported by railroads in the fiscal year ending June 30, 1919, to the number of 150,393; of which 149,660 were on roads which [usually] have reported more than 25 instances each. These totals appear in a statistical analysis which has been issued by the Interstate Commerce Commission, and which, for the roads reporting 25 cases or more, gives details for each road.

The final totals in this summary are given separately for each of five years; and we have inserted the word "usually" because of the uncertain or irregular basis on which the smaller roads are excluded. The 733 cases representing the difference between the larger and the smaller numbers above mentioned, were on roads which reported fewer than 25 instances for each of five successive years; while the roads named individually in the five-year table are those which have reported more than 25 instances in some one of the past five years. Some roads reported fewer than 25 instances for each of the four preceding years, but in 1919 reported more than 25; while others have reported in the year 1914 more than 25 instances, but fewer than 25 in each of the five succeeding years. The totals for the five years reported are as follows:

1919	149,660	1916	97,311
1918	263,279	1915	77,885
1917	134,638		

Table 1, for the last fiscal year, giving data concerning men in train service, shows a total of 21,952 instances where men were on duty continuously over 16 hours and not over 17 hours; 21,943 over 17 hours but not over 18; and 12,817 over 18 but not over 19 hours; and so on down to the column reading 24 hours to 25 hours, in which the total is 976; and no fewer than 258 instances are classed as over 36 hours. Forty of these were over 65 hours. The total number in this table is 78,169, of which 14,023 instances were attributable to causes arising after the men had been on duty 14 hours.

Table 2 shows, for each road, the causes of the delays recorded in Table 1. Of the total number of instances 78,169, nearly one-third, or 24,556, are entered under the head of derailments. Engine delays, largely mechanical defects, are charged with 6,547 instances; adverse weather conditions, 2,769; congestion of traffic, 4,631; coupler and drawbar defects, 12,881.

Table 3 shows instances of excess service in 1919 of trainmen who were on duty more than 16 hours in the aggregate—not continuously—and of telegraph operators on duty more than the prescribed length of time—nine hours in offices operated continuously and 13 hours in other offices. The columns covering continuously operated offices contain a total of 66,133 instances, and those representing the 13-hour offices contain 1,333 instances.

Table 4 gives totals for each of five successive years. The total above mentioned, 149,660, for 1919, is made up as follows:

Trainmen on duty for longer than 16 consecutive hours....	78,883
—Returning to duty after 16 hours' continuous service without having 10 consecutive hours off duty.....	237
—Returning to duty after aggregate service of 16 hours without having had eight consecutive hours off duty..	217
—Continuing on duty after aggregate service of 16 hours..	2,685
Telegraphers on duty more than nine hours in continuous offices	66,265
On duty more than 13 hours in day offices.....	1,373

This summary shows the facts as reported by the railroad companies, under oath; and neither the classification of causes nor any other facts shown have any relation to the question of whether the excess service was or was not excusable under the law.

Requisites of Adequate Railroad Legislation

Financing Roads During Transition Period; Adequate Revenues Necessary for Permanent Period

ALFRED P. THOM, counsel for the Association of Railway Executives, has filed with members of the House Committee on interstate and foreign commerce the following memorandum in respect to certain salient features of the proposed railroad legislation:

"In our opinion it is obvious that the proposed railroad legislation has to deal with two distinct periods: First, the period covering the interval between federal control and the time when such a relationship between revenues and expenses is established as will put the roads on a self-sustaining basis. This may be called the 'Period of Restoration'; and second, the period succeeding the 'Period of Restoration.' The latter may be called the 'Permanent Period.'

The Period of Restoration

"1. Entirely aside from the question as to whether there is any blame, and, if so, where the blame lies, in respect to the situation that will confront the railroads at the end of federal control, it will be universally admitted that, during federal control, the relationship between revenue and expenses has been so disturbed that something must be done to restore a proper relationship between them, if the roads are to survive under private management. This will involve a readjustment of the rates, and we think that, as this dislocation occurred during federal control, the duty rests upon the government to make the necessary readjustment. We ask that the duty to make this readjustment be imposed by statute upon the Interstate Commerce Commission, and, of course, unless interstate commerce is to bear a disproportionate part of the burden, the readjustment should cover both state and interstate rates.

"Pending this readjustment, the standard return or rentals should be continued, to cease as soon as the readjustment is made. If it be insisted that a time limit should be put upon this readjustment of rates, we think that the limit should be a year, with the understanding that the guaranty shall cease as soon as the readjustment is made.

"2. In the transitional period the companies will be confronted by a very considerable indebtedness incurred by the carriers to the government during federal control. Under Section 6 of the federal control act, the government could and did impose indebtedness upon the carriers for additions and betterments, and, under Section 7 of the federal control act, carriers could not issue any bonds, notes, or other securities, without the approval of the government. In this way, the financial management of the carriers was practically put in the hands of the government during federal control. The result is a large indebtedness of the carriers to the government for additions and betterments, some of it approved by the carriers and some incurred notwithstanding the carriers' disapproval.

"It is manifest that these capital expenditures for additions and betterments cannot be provided for out of current income. No railroad can have a current income sufficient to provide for its capital expenditures for additions and betterments.

"It is likewise manifest that the duty of providing adequate transportation, which the carriers must assume at the end of federal control, will confront them with very serious difficulties. The properties have been taken from them for governmental purposes for a period of two years. In that time their organizations have necessarily become demoralized, much of their ordinary traffic has been diverted to other lines, and their equipment is widely scattered because of its having been used indiscriminately on other lines wherever needed. The problem of a successful resumption of their transportation duties is thus, at best, difficult. It is impossible to anticipate success if they undertake it with empty treasuries. They must have not only an amount sufficient for ordinary working capital, but sufficient, in addition, to take care of the extraordinary expenses which they will be under in rebuilding their organizations and in re-establishing themselves in respect to their traffic.

"It is manifestly in the public interest that they shall be in a condition to perform successfully their transportation duties. The uncertainties of the future in respect to the system of regulation deprive them for the moment of even the ordinary credit, which, in the best of times, is not adequate. Some provision must, therefore, be made for the capital indebtedness which they owe to the government. We ask that it be funded for a period of not less than 10 years and at a reasonable rate of interest.

"In Section 4 of the federal control act it is provided that for the use of such additions and betterments as have been put upon these properties during federal control, the President shall allow compensation at a reasonable rate per centum, to be fixed by him upon the cost of such additions and betterments and extensions as were made by the carriers during federal control with the approval, or by order, of the President. It is for the cost of such additions and betterements that the carriers will owe the government at the end of federal control, and it is this indebtedness, in large part, which is to be funded.

"In paragraph (d) of Section 7 of the standard contract the President is likewise authorized to fix the rate of interest that is to be paid by him upon such cost. We think it manifestly just that whatever interest the President fixes as reasonable upon the cost of these additions and betterments for their use during federal control, should be accepted as the reasonable rate at which the indebtedness should be funded, and we ask that the rate be fixed during the funding period at the same rate that the President fixes as reasonable during federal control.

The Permanent Period

"1. It is, and must necessarily be, the controlling object of Congress to establish a system of regulation of these carriers which will insure to the commerce of the country adequate facilities and service. The basis of any such system must be an assured credit, and there can be no credit without an adequate and stable rate structure.

"It thus becomes a condition precedent to any successful system of regulation, that there shall be an assurance to the investing public of revenues to these carriers adequate to attract the necessary investment. The prime interest which Congress, therefore, has is to create a system that will insure revenues which the investing public will accept as adequate to attract their investments, and thus to provide for the future of transportation. While the object to properly protect existing investments is a very high one, that is not the first duty of Congress. Congress must deal successfully with the future of transportation, and must rely on the system which it adopts for this purpose to properly take care of existing investments. It must not make existing in-

vestments its prime and only duty, for that might not deal adequately with the future; whereas it can not deal successfully and adequately with the future without providing for due protection to legitimate investments which now exist.

"The first test to which Congress must subject any proposed system of regulation, is the test of whether or not that system will command the confidence of the investing public, for to the investing public a successful appeal must be made.

"When it is considered that Congress has received the assurance from every investing source that the old system of unlimited discretion in the Interstate Commerce Commission has not prevented an alarming decline of credit; when it is remembered that this is reflected in each of the leading plans proposed to Congress—in the Warfield plan, by subjecting the discretion of the Interstate Commerce Commission to a fixed statutory percentage on values as a guide to rates; in the Chamber of Commerce plan, by likewise subjecting the discretion of the commission to a permanent rule of a fixed percentage on values; and in the railway executives' plan, by securing from an independent board, charged with the obligation to see that transportation facilities and service are adequate, a certificate of the amount of revenue that it is necessary for rates to provide; it must be seen that the conviction is widespread, and, outside of governmental circles, universal, that something must be added to the discretion of the Interstate Commerce Commission, if the confidence of the investing public is to be attracted.

"2. In view of these incontestable facts, we submit that, at least, an assurance should be given to the investing public of a rule of rate-making which shall be precise and definite, and shall contain a statutory assurance that the proper elements in determining what revenues rates shall provide will be properly considered by the regulatory body. We do not think that there can be a legitimate doubt that the revenues, considered in respect to average conditions in a traffic group, should be adequate to provide (a) for expenses of operation, including labor and taxes; (b) for a fair return upon the property used or held for the public service; and (c) for a basis of credit to attract the new capital needed for facilities and service which the commerce of the country must have. We think further that, in the present condition of inadequate credit under the system of unrestricted discretion in the commission, it is necessary to provide an authority whose express statutory duty it shall be to see that the facilities and service in transportation are up to the requirements of commerce; to study the credit of the carriers with reference to their needs in order that they may be able to provide such facilities; and to certify the facts to the Interstate Commerce Commission, which should take them as their guide in rate-making.

"3. It is, in our judgment, also necessary to avoid taking away any part of the earnings of a railroad from lawful rates. In our opinion to do so would be unconstitutional, but it is not proposed to restate here the reasons for that view.

"If it is constitutional, it is all the more dangerous, because there would be no relief from it in the courts. The consequence of the assertion in the proposed law of a legislative power to take all the earnings of a road at lawful rates above a limit fixed at the discretion of this Congress, would be that the next, or a succeeding, Congress might take still more, until the point of acknowledged confiscation is reached. The railroad industry would thus be the only industry subject, at the present time, to the assertion of such a power, and the question would be whether the investing public would seek the one subject in the field of industry where the amount of its earnings at lawful rates might be taken away at legislative discretion or caprice. To engraft this principle upon the system of railroad regulation would be to implant in it the seeds of its own death, because no industry can survive when it is thus discriminated against, and thus made unattractive to the investing public.

This aspect of the matter has been developed in our testimony from the standpoint of rates, but it is equally clear that, irrespective of rates, the proposal is both indefensible and destructive. For example, let us take two roads costing exactly the same amount, and doing exactly the same business at exactly the same rates. One of these roads is well managed. The money spent upon it has been used in reducing grades, in eliminating curves, in acquiring engines with greater motive power, and in other directions which promote economy. The money spent upon the other road has not been wisely spent. The *net* result of the two will be entirely different—the difference not being due to dofference in cost, or to difference in business, or to difference in rates, but entirely due to difference in financial management, in wisdom of conception, and, in operation—one may earn precisely the amount Congress may be willing for it to retain, the other more. The proposal is to take from the better managed road all that it earns over a given figure, and reduce it to the dead level of the other road. Outside of the question of law or morals, such a proposal would absolutely destroy enterprise, initiative and good management, and these elements of advantage to the public would be thus withdrawn from the public service.

"Moreover, to adopt this principle would be to open the door to socialism. If the principle can be applied to railroads, which are now regulated by public authority, no answer can be made to the effort to apply it to any subject which may hereafter be regulated, such as fuel, manufacture of essential articles, or even money. If the rate on money, as it even now is, is regulated by public authority, is it not easy for the legislative authority to declare that the interest rate is made as high as it is out of consideration for those weak financially, that it is too high for the strong, and that a part of the earnings of the strong at the legal rate must be 'recaptured' and taken away?

"We respectfully urge that the policy of taking away from a railroad what it earns at lawful rates, no matter to what purpose it may be applied, should not be adopted.

"4. Having provided for adequate revenues, the question arises as to where these revenues are coming from. It is manifest that they should not all be provided by any one class of traffic. They should not all come from interstate commerce, nor should they all come from the state commerce of these interstate carriers. No view can be sound which does not properly distribute the burden of raising these revenues equitably among all the commerce of the carriers, state and interstate. How can this equitable distribution be made? There can be no assurance of equity if one authority fixes one class of these rates, and another authority, or authorities, fix the remainder. There must be some way of bringing the two together.

"The constitutional duty and power to regulate interstate commerce rests upon the national government, and it should be at least the ultimate authority to supervise the distribution of the burden of raising the needed revenue over all the traffic of interstate carriers.

"Moreover, it is well known that many interstate rates can not be fixed or collected unless state rates are fixed in proper relationship to them. This is manifest from every rate situation in the country. If, then, state rates are not fixed in proper relationship to interstate rates, and interstate rates, either actually or practically, have to give way, it is the states that are regulating interstate commerce, and not the national government.

"There must likewise be a prompt method of making this relative adjustment. Interstate commerce can not be allowed,

without serious injustice to those engaged in it, to bear, for any considerable period, a disproportionate part of the burden. From the experience of the Interstate Commerce Commission in administering the Shreveport principle, it is manifest that, under that system, the readjustment of state and interstate rates into a proper relationship will be so indefinitely prolonged as to amount to a denial of justice. We, therefore, ask that, on a *prima facie* showing that state rates are not bearing their just proportion of the burden of producing the necessary revenue, the Interstate Commerce Commission be given the power of suspension, subject to proper reparation to any shipper found ultimately to be prejudiced by such a ruling. We have prepared with much care a provision on this subject which will be found in the supplemental memorandum filed with the Senate committee, and is hereto attached as an exhibit.

"We have mentioned here only some of the salient features of the proposed legislation.

"We, therefore, respectfully ask that, in respect to certain salient features of the proposed legislation, provision be made, as to the period of restoration.

"For a readjustment, by the government itself, of rates, state and interstate, so as to establish a proper relationship between the revenues and the expenses which have been increased during federal control;

"That, until this is done, the standard return shall be continued, with a limit, if a limit be insisted on, of one year; and

"For the funding of the indebtedness of the carriers to the government for additions and betterments at the same rate of interest as the President fixes as reasonable under Section 4 of the federal control act, or under paragraph (d) of Section 7 of the standard contract.

"As to the permanent period: That a rule of rate making be established which shall express, as a plain statutory requirement, the elements that must be considered by the rate-making power, and that the commission, in making the rates, shall be guided by the expert advice of a board specially charged with the responsibility of seeing that transportation facilities and service are adequate, and of ascertaining and certifying to the commission the amount of revenues the carriers need in order to provide them; and

"That the burden of providing these revenues shall be properly distributed by a single authority, which in the nature of things, can only be the national authority—between all the traffic, state and interstate, of the interstate carriers, so that no class of traffic shall be unduly burdened, and no carrier shall be required to furnish service of any class at less than reasonable compensation. To this end we ask the adoption of the provision to be found in the supplemental memorandum, filed with the Senate committee, and hereto attached."

The suggested provision attached as an exhibit is as follows:

"For the information of the commission, every carrier subject to the provisions of this act shall file with the commission, from time to time, schedules showing all its individual or joint rates, fares, charges, classifications, regulations and practices for the transportation of passengers or property wholly within one state; and shall likewise file with the commission copies of all laws and orders of any state railroad commission or other state authority regulating rates, fares, charges, classifications, regulations or practices of said carrier for the transportation of passengers or property wholly within one state. The commission may determine and prescribe the form, time and manner within which said schedules, orders, and acts shall be filed with it.

"The commission shall confer with the authorities of any state having regulatory jurisdiction over the class of persons and corporations subject to this Act with respect to the relationship between rates, fares, charges, classifications, regulations or practices of carriers subject to the jurisdiction of such state bodies and of the commission; and to that end it is authorized and empowered, under rules to be prescribed by it, and which may be modified from time to time, to hold joint hearings with any such state regulating body, on any matters in which the commission is empowered to act, and where the rate-making authority of a state is or may be affected by the action taken by the commission. The commission is also authorized to avail itself of the co-operation, services, records and facilities of such state authorities in the enforcement of any provision of this Act.

"Whenever, either upon the complaint of any carrier, or of any person interested, or upon the initiative of the commission itself, there shall be brought in question any rate, fare, charge, classification, regulation or practice or any body or level of rates made or imposed by authority of any state on a carrier engaged in interstate commerce, the commission shall cause such state, or states, to be notified of the proceedings.

"The commission, after full hearing, shall, as to carriers engaged in interstate commerce, make such findings and orders as will, in its judgment, remove any undue inequality, or undue or unreasonable advantage, preference, or prejudice as between persons, localities, commodities, or other traffic, in state and interstate or foreign commerce, respectively, or any undue, unreasonable, or unjust discrimination against interstate or foreign commerce, which, on the part of carriers engaged in interstate commerce, are hereby forbidden and declared to be unlawful, and such findings or orders shall be observed, while in effect, by the carriers affected thereby, and the commission shall make the rates, fares and charges, or the minimum and maximum of such rates, fares and charges, and any classification, regulation or practice which, in its judgment, will remove such inequality, advantage, preference, prejudice, or discrimination.

"Pending such hearing and consideration, the commission, if it be made to appear to its satisfaction by informal evidence, that any rate, fare, charge, classification, regulation, or practice, or any level or body of rates, applicable to state traffic of a carrier engaged in interstate commerce, constitute an undue inequality, or an undue or unreasonable advantage, preference or prejudice as between persons, localities, commodities, or other traffic, in state, or interstate and foreign commerce, or any undue, unreasonable, or unjust discrimination against interstate or foreign commerce, shall suspend such state-made rate, fare, charge, classification, regulation or practice, or body or level of rates, and direct the carrier, until further order of the commission, to maintain such relationship between state and interstate rates, fares, charges, classifications, regulations, or practices, as to the commission may seem reasonable and just; but, in the event of such suspension and such direction to a carrier, the commission shall make reasonable requirements as to payment of any amount of reparation that may thereafter be ordered by the commission, within one year after the date of final action of the commission in the premises."

The Fourth Industrial Safety Congress of New York State is to be held at the Hotel Onondaga, Syracuse, on December 1, 2, 3 and 4. James M. Lynch, president of the State Industrial Commission, Albany, issuing the call for this congress, urges employers to be present in person; or at least to send their foremen and brightest employees.

Steamers between New York and Asia.—Robert Dollar, of San Francisco, president of the Dollar Steamship Company, has bought 14 acres of land at Hunt's Point, adjacent to New York harbor, for a ship terminal, with the intention, it is understood, to establish a steamship line between New York and Asiatic ports by way of the Panama Canal.

International Trade Conference

PROBLEMS OF WORLD-WIDE trade relationships brought together in Atlantic City, N. J., October 20 to 25, more than 50 delegates from England, France, Italy and Belgium to confer with representatives of American business. The meeting was held under the auspices of the Chamber of Commerce of the United States. For the first three days of the meeting the delegates met in secret session with representatives of certain American industries and with committees covering certain aspects of the work of the conference, while during the latter part of the week the meeting consisted of general sessions attended by several thousand American business men.

With the exception of the British commission, which explained that Britain had no reconstruction problem that it was not in a position to solve of itself, the delegates from the four countries explained in detail the progress that had been made in reconstruction in the industries of their respective countries and showed of what their remaining needs consisted. The problems of credit, the exchange situation, the demands for coal and steel, and of shipping, were considered in particular. Special attention was given to the problem of credits and a strong sentiment in favor of the assistance permitted in the Edge bill now pending in Congress, was particularly noticeable. Considerable attention was also given to a proposed league of business, suggested by Eugene Schneider, head of the French commission, and it is expected that something of this kind will be worked out whereby there will be an international board of directors consisting of two delegates from each member nation of the league of nations.

The committee on reconstruction supplies is typical of the several committee reports and contains considerable data concerning the requirements of railway supplies. The report said:

"Belgium—The Belgians need from us, and principally, first of all, money; then tools, coal, coke, oil, machinery, railroad engines and lumber.

"Italy—Italy's reconstruction problem is principally agricultural, due to the fact that about 90 per cent of her people are engaged in agriculture.

"England—England, as stated by its reconstruction supplies committee, has no reconstruction problem which it is not fully qualified to take care of itself.

"France—The French committee presented an interesting and surprising statement of the reconstruction work which has already taken place in France and tended to show that unemployment is diminishing rapidly, agricultural reconstruction has progressed substantially, the people of the country are going back to work in a most gratifying manner, transportation facilities, such as railroads and canals destroyed during the war, are rapidly approaching their pre-war consideration, immense new public works, transportation, drainage, harbors, etc., are being projected, and in general, the French situation as regards industry and commerce is far and away in advance of what is rather generally believed in this country to be the case.

"The French committee stressed the importance of proceeding along reconstruction lines which will recognize sound economic principles. They propose to buy where the buying is best, and to sell where they can do so with greatest benefit to France.

"They emphasize the importance which their deposits of iron will have in the work of French reconstruction and referred to the great quantities of lumber, wheat and other materials to be found in the French colonies and which would be transported to Europe in French ships.

"They need, as do Belgium and Italy, money, lumber, machinery, automatic car couplers and railroad signal systems and other improvements in their transportation situation."

England was represented at the conference by a commission of some nine members headed by Sir Arthur Shirley Benn, at one time British vice-consul at Mobile, Ala., managing director of Hunter, Benn & Co., a member of Parliament and chairman of the Belgian Relief Commission.

France was represented by some 19 French business men, led by Eugene Schneider, the head of the great iron and steel works of Schneider & Co., at Creusot, France.

The head of the Italian delegates was Count Max Lovatelli, naval attache of the Italian Embassy at Washington, and the party consisted of 19 members.

Florimond Hankar, director of the National Bank of Belgium, and interested in a number of Belgian industrial concerns, was the head of the Belgian party which consisted of six leading business men.

Orders of the Regional Directors

TRANSPORTATION COMMITTEES.—By order 241 of the Southwestern regional director, transportation committees are created at St. Louis, Mo., Wichita, Kans., Little Rock, Ark., Oklahoma City, Okla., Fort Worth, Dallas, San Antonio, Waco, Houston, and Galveston, Tex., Shreveport, La., Joplin, Mo., Wichita Falls, Tex., and Tulsa, Okla., to study terminal operation. Each committee is to consist of at least three members who will work under the direct supervision of terminal, federal and general managers of the roads interested.

Employment of Men in Train and Engine Service.—The Northwestern regional director, file 42-1-87, requires that men entering the service to fill the position of brakemen, flagmen, baggagemen, switchmen and firemen must be able to read and write; will be required to pass uniform examination and will comply with the regulations governing the use of standard watches.

Intensive Loading of Potatoes.—Freight Car Distribution Notice 16 of the Northwestern regional director contains instructions for the reinstating of distribution rules in effect last year for the handling of potatoes. This action has been taken in view of the fact that the potato crop this year is considerably larger. Reports indicate that the loading is not in all cases as heavy as conditions warrant. Standard box cars, including those lined and fitted with false floors and equipped with stoves are to be distributed for loading on a minimum basis of 750 bu. per car; and heavier loading than this be secured wherever possible.

Placarding Cars.—By circular 251 of the Southwestern regional director shippers are allowed to placard cars to indicate the side from which they should be unloaded. This will facilitate the placing of cars for unloading with the least possible switching.

Notice of Timetable Changes.—Order 244, canceling Order 80 of the Southwestern regional director, requires federal managers to announce changes in the schedules of trains which carry passengers, by posting printed notices ten days in advance at all stations at which changes are made; and if folder timetables are reissued a supply of the folders should be in the hands of each agent before the effective date of the new schedules. Order 243, canceling Order 79 of the Southwestern regional director, contains similar instructions and grants authority for the advance notice of the changes in schedules in newspapers. These announcements are to appear not exceeding three times in any one paper; the space occupied is not to exceed two newspaper columns in width and the length is to be only such as may be necessary to give a proper display of the essential information.

Government Ownership on the Plumb Plan*

"More Vicious Than Any Project of This Nature Ever Put Forth By Any Exploiting Wall Street Promoter"

By George C. Sikes

THE ADOPTION OF A PERMANENT POLICY of ownership and unified operation of the railroads by the national government I regard as one of the greatest needs of the country. Therefore, I claim the right to be heard at a conference called in the name of public ownership. However, what I have to say is likely to be displeasing to many in attendance at this gathering, for seemingly the champions of the Plumb plan are in the majority here. But I wish to voice my protest and to warn the genuine public ownership men and women in this meeting that endorsement by them of the Plumb plan will be an act of folly.

For years I have been studying suggested franchise arrangements put forth by privilege-seeking private corporations and have been criticizing such suggestions with the view of protecting public interests. I think I have some familiarity with such matters. In my opinion, the Plumb plan is more vicious than any project of this nature ever put forth by any predatory transportation magnate or exploiting Wall Street promoter. As a public ownership measure, the Plumb plan is a perversion and a fake. It represents an attempt to perpetrate a colossal confidence game on the American public and on the advocates of government ownership. The Plumb plan propaganda, in so far as it wears the mask of public ownership, is misleading, hypocritical and essentially dishonest.

The author of the plan, Glenn E. Plumb, has been given to ingenious activity before in similar lines—usually for the glorification and advantage of Plumb. When I first heard of the man he was trying to break into the street railway game in Chicago. He sought to capitalize popular opposition to Charles T. Yerkes then—much as he is trying to capitalize popular opposition to the raliroads now—as a means of furthering his own schemes as a traction promoter. Mr. Plumb has never been a consistent advocate of public ownership. His aim now, as heretofore, is the transfer of control from one group of selfish private interests to another group of selfish private interests; not for transfer of control from private hands to agencies of the public as a whole.

"Exploitation Is Exploitation"

Exploitation is exploitation, whether by capitalistic promoters or by a group of organized workers. The idea that exploitation is all right if carried on in the interest of certain labor groups may be accepted in Russia. But such doctrine will be spurned by any land that remains steadfast in its adherence to democracy. Autocracy is autocracy, whether the autocrat be a selfish labor group, or a plutocrat, or a kaiser, or a czar. Whenever the workers of a country in large numbers, in selfish disregard of the public welfare, accept the principle of autocracy in the hope that they may benefit from its application, there is danger that the country may fall under the control of the autocracy of the opposite extreme. It was inevitable that the excesses of the French Revolution should produce a Napoleon. If stories from Russia are to be accepted as correct, it cannot be doubted that the conditions there must lead sooner or later to reaction and to some form of despotism. If dependence is to be placed on might, rather than on right, labor rule in any land must be short-lived. Labor can hope to share effectively in control of governmental affairs for any considerable time only by making its cause as broad as the public welfare and by acting in accord with the principles of democracy. Henry George, in memorable words, voiced the true principle when he was a candidate for mayor of New York some years ago, with strong labor backing. While espousing labor's cause, he refused to be regarded as the candidate of labor, in the narrow sense of the term. "I am not for working men," he said, "I am for men."

It is a far cry from the time when Henry George uttered that sentiment, with the approval of labor, to the present, when important labor groups, differentiating themselves from the general public, are brazenly bent upon exploitations for their own selfish benefit, in accordance with the spirit of Prussianism. Psychologically speaking, it looks as if the Germans had won the war. The spirit of Prussianism was never so rampant in the United States as it is today. Certain employing and business interests are more arrogantly autocratic than they ever have been before. And some spokesmen for labor groups are just as bad, if not worse. In a battle between an autocracy of capital and autocracy of labor, I do not believe labor can win. Labor's only hope lies in democracy, in making common cause with all who stand for right and justice and the broad public welfare.

An Effort to Prussianize American Labor Movement

The Plumb plan is an effort to Prussianize the labor movement in America. It is an appeal to certain groups of workers to stand for exploitation of the general public for their own selfish interest, coupled with a deceptive, false appeal to public ownership advocates to help on the undemocratic move.

Under the Plumb plan, if put into effect, the United States will buy the railroads and pay for them. It will not retain control and operate the roads itself in the public interest, however. Instead, it will immediately turn them over, free of charge, to a corporation, under an irrevocable 100-year lease or franchise arrangement, to be controlled by a board of fifteen directors. Five of these fifteen directors will be named by the President of the United States. The remaining ten, or two-thirds of the board, will be selected by the railroad officials and employees. Mr. Plumb seeks to give the impression that the five members of the board of directors to be chosen by employees designated as officials would have a status corresponding somewhat to that of representatives of owners; that their interests would be antagonistic to the interests of the classified employees. This impression is entirely false, of course. Under private ownership, railroad officials represent the owners. But under the Plumb plan, by which the government will own the properties and vest their control in a board of 15 directors, of which it will name but five members, the interests of officials and of employees described as classified employees will be substantially identical.

Not content with providing an arrangement under which the government, after buying the roads, would vest their control in a board of directors dominated by railroad employees, the Plumb plan places the control of salaries and wages absolutely in the hands of a board composed entirely of representatives of those who are to draw pay from the

*An address delivered before the Public Ownership Conference at Chicago on November 16.

railroads. And then, after fixing their own wages, the employees are to participate in a profit-sharing arrangement. If absurdity could go to more extreme limits, my imagination is unequal to the task of conceiving what they might be.

It is said power is left in the Interstate Commerce Commission, under the Plumb plan, to fix rates. This rate-fixing power, if it could affect wages at all, could operate to keep them down only by first depriving the government of any returns whatever upon its enormous investment in railroad property.

On top of all else, the Plumb plan provides that the lease or franchise arrangement under which the employees are to manage the railroad properties in their own interest, shall have a life of 100 years, and be practically irrevocable during that period. What business have public ownership advocates standing for 100-year franchise grants to any kind of a corporation representing mainly private interests?

"All the Public Is to Do Is Hold the Bag"

The Plumb plan is called a public ownership plan. All the public is to do, however, is to hold the bag. It is to furnish all the capital for the purchase of the roads, and then immediately divest itself of control for a 100-year period.

The Plumb plan is so grotesquely absurd and immoral that I do not see how it can command any support whatever. It is another sign of the craziness of the times that such a plan does have advocates in considerable number. That it can ever have the support of the country as a whole seems incredible. As I see it, advocacy of the Plumb plan under the name of public ownership is discrediting public ownership.

If I am any judge of public opinion, the sentiment for government ownership of the railroads is not as strong right now as it has been in the past. I believe a referendum vote at this time would show a majority of the American people to be opposed to government ownership, and to be in favor of the early return of the railroads to their owners. I further believe, however, that public ownership sentiment will begin to develop rapidly again soon after the return of the railroads to private management.

"Fake Plans Can Only Hurt the Cause"

What public ownership advocates should do is to have a program for government ownership and operation of the railroads, to be pushed as opportunity may offer. Fake plans and selfish schemes falsely labeled public ownership can only hurt the cause. If this gathering is a genuine public ownership body it will condemn the Plumb plan as spurious, and stand for government management as well as government ownership of the railroads.

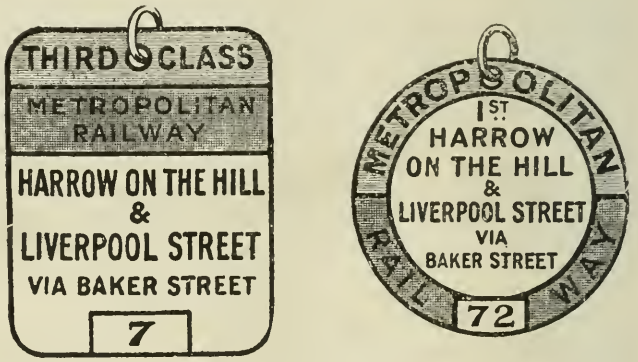
I am aware that some public ownership advocates who see faults in the Plumb plan are drifting with the Plumb plan movement, because it has an organized force behind it, in the hope that the plan will be modified and made more acceptable before it is put into effect. I contend that the Plumb plan is so faulty that it should receive no support from disinterested citizens; that as it comes to be better understood by the general public it will be regarded with marked disfavor; and that a program so changed as to be meritorious but still bearing the Plumb plan label, would be doomed to defeat. To permit the organized public ownership movement to become a mere annex to the Plumb plan propaganda must tend to make that movement an object of derision. If the railroad brotherhoods will not join in an effort to bring about the ownership and permanent operation of the railroads by the government, in the interest of the country as a whole, public ownership advocates should refuse to co-operate with them.

The mechanism for which the Plumb plan makes provision is far too complex to work well. Instead of having a purchase board, a board of directors, a wage board, and the Interstate Commerce Commission, each with important independent powers, there should be but one body, with full authority, subject to supervision by Congress and the President, to acquire and manage the properties. The railroad workers might properly have minority representation in such a body.

I sympathize with the desire of labor for a larger voice in the management of industry. It seems to me, however, that that desire must seek its satisfaction, through development of the co-operative idea, mainly in competitive productive industry, with a measurable output. Railroad transportation should not be looked upon as a business, but as service. It is akin, in this respect, to the postal system, the fire department and the school system. It should not be run upon competitive lines, but it should be dealt with as a public monopoly. The suggestion that the railroad employees be allowed to run the railroads in their own interest, after purchase by the government, is even less defensible in some ways than would be a suggestion that the teachers should manage the schools, or that firemen should direct the affairs of a city fire department, in such a way as to insure primarily the promotion of the interests of the teachers or of the firemen.

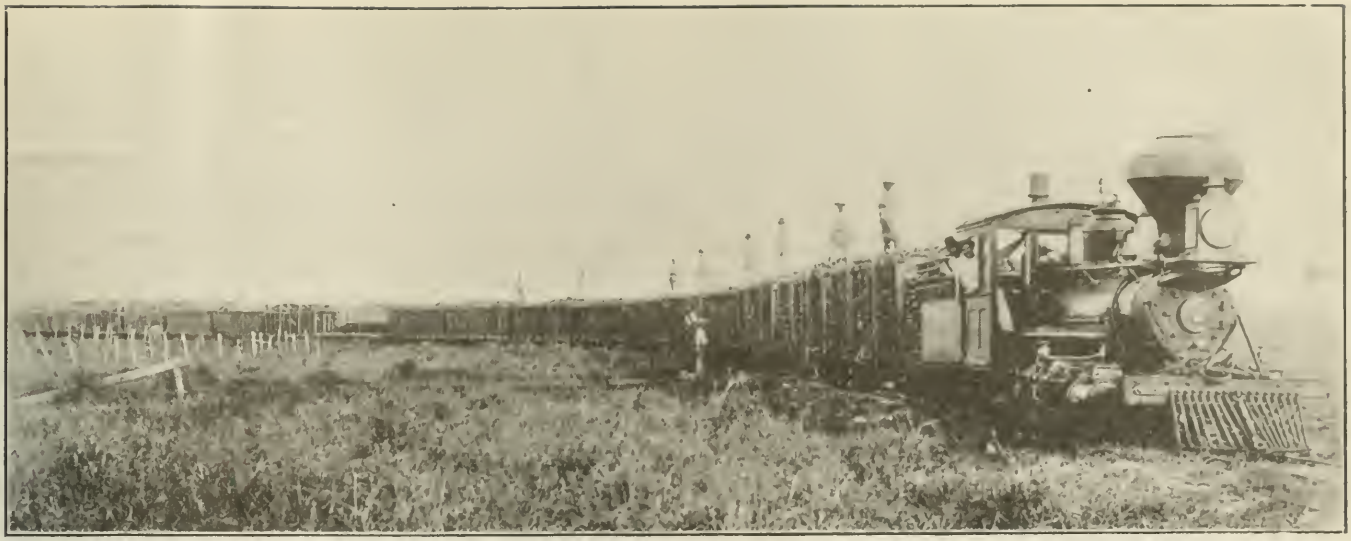
Passenger Tickets of Metal

Enameled metal tickets are in use on the Metropolitan Railway, of London, for passengers traveling every day. Circular disks about 1¼ in. in diameter are used for first class, and disks with straight sides and round corners, about like an old-fashioned American brass baggage check, are used for third class. These tickets have been introduced as an experiment, and will be furnished to any passenger



who will buy one for twelve months, and will apply for it a month before it is needed. The designs are enameled in red, white and blue, the colors being arranged to facilitate identification of different issues. Each ticket has a small ring by which the holder can suspend it from the outside of his coat.

The Kansas City Northwestern ceased operation on November 1, for the second time in three months because of financial difficulties. The decision of 90 yardmen, mechanics and blacksmiths to strike precipitated the last stoppage. Increased cost of coal, wage demands and the prospect of a coal famine contributed to the financial difficulties of the road according to E. H. Campbell, general superintendent. The road is 158 miles long, from Kansas City, Kan., to Virginia, Neb.



Ready to Start for the Mill—a Narrow Gage Cane Train "Loaded to the Guards"

Cuba's Sugar Cane Railways a Large Market*

The Importance and Extent of the Sugar Plantation Lines. Possibilities for Improvements

By John P. Risque

Part I—General Description

ALMOST ANY RAILROAD MAN in Cuba from a *chuchero* (switchman) up, knows that *"la Zafra,"* the Spanish term for the sugar cane harvest, is one of the most potential words on the island. At that important season of the year, which commences about the first of December and lasts until June, all hands and wheels are urged to keep moving 24 hours a day. The switchman referred to and anybody else concerned with the big job of transporting 29 million tons of sugar cane to 195 mills, knows that the "harder the grind the more sure the reward"—and all hands perform accordingly. Nobody knows the meaning of the season better than the *jefe locomotoras* of a plantation, in whose charge is generally found from two to 17 locomotives. The *maestro carpintero* (master carpenter) likewise appreciates the significance of the approach of the country's annual event, for the preparation of all the cane cars is up to him. Their sense of responsibility is well developed; they are aware of the penalties involved by a forced shutting down of the mill for any reasons which could be traced to the locomotive or car departments.

The Main Lines

The principal public lines of Cuba are of 4-ft. 8½-in. gage and are familiarly known in the cane growing districts, as the *"linea principal."* Aside from 13 small and independent companies, which operate about 700 kilometers all told, the *linea principal* is composed of two systems with 3,163 kilometers of line. The western properties comprise the United Railways of Havana, an English corporation, which with its subsidiaries, composes two-thirds of the total, or 2,113 kilometers. These subsidiaries are the Cuban Central Railways, the Western Railway of Havana, the Havana Central Railroad and the Mariano Railway, the two last named being lines electrically operated.

The tracks of the United lines run as far east as the city of Santa Clara, a point which is nearly half-way down the island from west to east. From that point the Cuba railroad, composing the other third of the main line mileage, is an American corporation operating to the eastern end of the island. Between them they maintain fast and frequent train service from Havana, near the western end of the island, to Santiago de Cuba on the extreme eastern end, and intermediate points. The Pullman cars which are provided are always well patronized. Although non-vestibuled, built of wood and mounted on two four-wheel trucks, they are thoroughly comfortable, carry a buffet and provide excellent accommodation. Branch line service is generally convenient and comfortable and as fully dependable as some of our own. First-class day coaches are similar to those on the roads of the United States, and third-class cars, which appear in a majority on each passenger train, are chiefly comprised of old cars, but thoroughly clean and equipped with wooden seats.

With the exception of the third-class cars referred to, which are of unquestionable value in handling the vast army of workers which moves to and from the plantations twice a year—and in considerable numbers at all times of the year—an American railroad man would, as far as the physical equipment is concerned, feel quite at home on a Cuban train. If he should stop at any way station on the main line to observe operations he would recognize American standards at the station and on the right of way. However, if he should write down his impressions of a few railroad customs which he found there, and with which he was unfamiliar, prominent among these notes would probably appear some reference to bright red pilot beams and number plates which characterize the front ends of the United's locomotives—efficient warnings against head-on collisions. A description and possibly a sketch of cast iron water tanks would interest the "boys" in the water service back home.

*This is the first of three articles on the sugar plantation railways of Cuba.

Main line "turn outs" at stations would contribute to the interest of the collection, and in matters of operating, despatching, etc., he could observe much. For lack of any better method of relieving his feelings he could scribble a few caustic comments in plain English on the subject of the station agents who open their ticket windows as the train pulls in, regardless of the size and impatience of the crowd of patrons assembled in the waiting room and on the platform.

He would be interested in, and would probably make note of, the fact that a half a dozen or more empty or loaded cane trains had gone through in quick succession, each drawn by a different type of locomotive whose lettering proclaimed it as belonging to a different owner.

These are the private cane trains, operated by the respective plantations, more or less remote from the main line, which use the *"linea principal"* in their trips to and from distant fields in search for cane for their respective mills.

Extent of the Cane Railways

Records show that privately owned plantation lines exceed the main lines of the island by about 750 kilometers, there being a total of 4,633 kilometers of cane railways, in the service of which there are about 1,200 locomotives and unknown thousands of cars. Two-thirds of the trackage is of 3-ft. gage and some of it is narrower. The balance is 4-ft. 8½-in. Of the total mileage noted, one company operating 17 large plantations owns 1,200 kilometers alone, 380 of which is narrow gage.

A Sugar Mill "Batey"

Tiempo Muerto

Upon completion of the *"Zafra"* in the month of June, the mills shut down and the all-pervading stillness of *tiempo muerto* (dead time) which follows is as noticeable by contrast to the busy harvest season just past as a sudden cessation of the island's famous breezes which rarely ever fail to blow. A visit at this time to any plantation and its mill, known as the *"ingenio"* or *"central,"* completes the evidence that for the time being "everything is off." The annual crop is ground, the sugar and molasses is stored or shipped and the entire personnel—cutters, railroaders, mill hands and others—are gone; some to play, some to work in stores in the cities and perhaps some to run jitneys in Havana—the latter occupation being a pleasant pastime and fully as lucrative as working at the mill.

Long lines of empty and more or less dilapidated cane cars are lined up on tracks near the mill and leading to the fields. The "central's" three, or five, or ten locomotives, as the case may be, may be found under shelter of the sugar mill roof if there is room, or backed onto the most available switch regardless of protection against the weather. There they will stand until *tiempo de reparacion,* or the repair season, arrives about the middle of September. An examination of these engines offers mute testimony to their six months' battle in the fields—24 hours a day—day in and day out with infrequent stops or none at all for boiler washing and the necessary running repairs. Damaged or missing pilots and a dented front cylinder head casting here and there testify to a *choque* (collision) or two, and tell-tale mud on a smokestack, dome casing or jacket would lead to the inference that its owner had failed to negotiate a difficult kink somewhere in the track and had lain upside-down in the field until a crew could be spared to go out to bring it in.

Devoid of even the simplest types of cranes, as these plantations usually are, this frequent job is both arduous and costly. If the *jefe de moviemiento* of the *jefe locomotoras* or the *maestro carpintero*—being the traffic superintendent, the locomotive chief and the car foreman respectively, the "big three" of a railroad end of a large plantation—are still on the job, the keeper of the *ingenio store, el bodeguero,* will know about it. But at this unseasonable time, he will probably admit that *tiempo muerto* has set in in its most aggravated stage and that if *Senor Administrador* (the general manager) has remained, there is no welcome on the mat for people who want to do business; they had better come again.

The last named gentleman is as truly a potentate as ever existed. He is sometimes the owner, but always the boss. His authority is unquestioned and respected, and it not infrequently happens that he is regarded with affection and esteem by every worker on the job—many of whom he has known for years.

The *administrador* is the logical buyer; it is he who in the last analysis, signs or vetoes *pedidos* and requisitions of importance, even though converts must first be made among the department heads of the mill. Frequently it will

be found that the *jefe maquinista* or chief engineer of the mill is an authority on purchases and acquisitions of new methods, including renewals of locomotives and cars and revisions or additions of facilities for their repair—but these organizations vary with the individual mills.

At some plantations the locomotive and car men report to the chief engineer; at others they report direct to the *administrador*. The former official is a good man to cultivate in either case.

As has been pointed out, *tiempo muerto* is a bad time

The Original Cuban Switch Engine

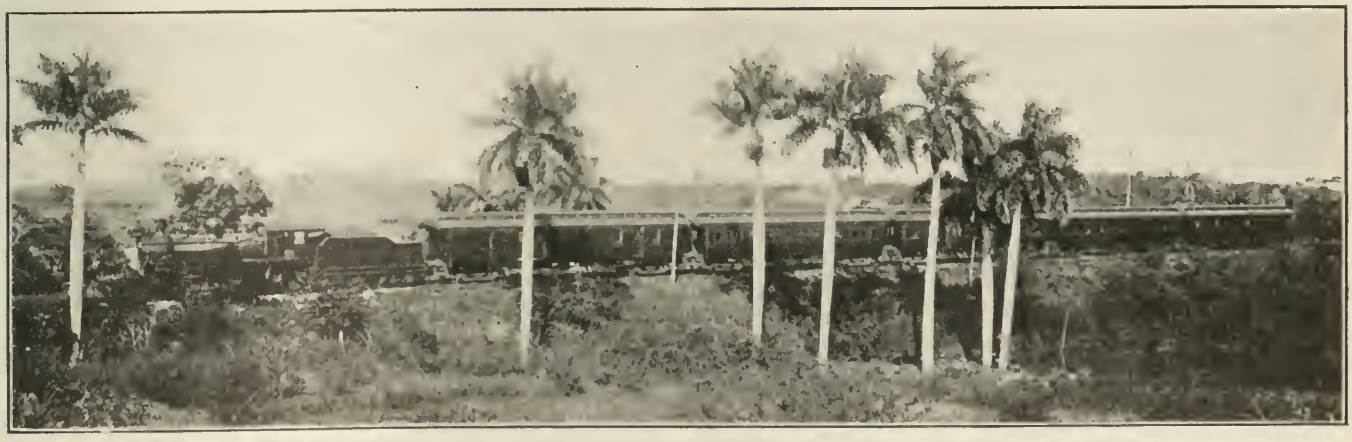
to seek business among the sugar mills of Cuba. Logically it would seem, to the uninitiated, to be the psychological time and it might be, if tradition had not decreed otherwise. If the closing of the mill were followed immediately by a thorough inventory of damaged equipment and the writing of necessary requisitions, the result of such action would doubtless obviate many costly delays in the arrival of all classes of materials indispensable to the next start of operations. But as stated before, tradition relegates this job to more than two months after the shut-down. Even if the management should attempt to advance the requisition date, it would be difficult to find men who would volunteer for the job at any price. Six months' hard labor with many operatives on 12-hour shifts and more, often finds the June vacation due in the minds of the operatives before it arrives.

The passing of *tiempo muerto* is manifested in the middle of August by renewed activity along the main line. Freight trains increase in numbers and length. Conspicuous among the loads appear machinery and building materials with an occasional trainload headed for plantations with far-sighted management. A month later passenger business "comes back" with the advance of the army of returning workers whose arrivals give renewed impetus and hope to the traders in the sugar mill towns. Before the end of September *tiempo de reparacion*—the great preparations for the coming crop—is under way and shortly thereafter, the orders for almost every conceivable kind of supplies are forwarded to the principal centers of supply.

Material Rodante

This is the term for rolling stock. Narrow gage locomotives follow a conventional design and vary slightly. They are principally of 2-6-0 or 2-8-0 types and are represented by the various American models which are illustrated and described in locomotive builders' plantation locomotive catalogs. Outside and inside driving boxes appear, and late models have Walschaert valve gears. Copper fireboxes and tubes, which existed in large numbers, are being replaced by steel and charcoal iron, owing to the high price of copper. Air brakes, vacuum brakes, and electric, carbide and oil headlighting vary according to the tastes of the *jefe locomotoras* and his persuasive powers. Two-inch horizontal steam pumps located on the running board are popular, being used to draw water from shallow ditches along the right of way and supplant injectors when the latter fail to work. Tenders are mostly eight-wheel and are provided with ample water spaces. Standard gage engines vary from wheezy old high wheel Moguls of the vintage of 1880 to modern superheater Consolidations equipped with many modern devices. Belgian 2-6-0 types with elaborate smoke stacks and screw reverse gears and Moguls from the Henschel and Borsig factories in Germany are to be found.

One of the latest German contributions just prior to the war comprised two Moguls, German throughout with the exception of American bar frames—a wise provision as neighbors with engines equipped with European plate frames have found out. The German locomotive man found favor in Cuba, not so much because of his types, but on account of his business policy. He was ready to make almost any kind of a business bargain, even to putting his engines to work to earn their cost. He thus made a great quantity of sales in spite of the remoteness of his base of supplies for repair parts.



The Cienpiegos Express on the United Railways of Havana

That the great war did not overlook contributing its quota of misfortune, even to the selection of cane engines, is witnessed by the presence of familiar old "has beens" from lines in the states. Many of these "thoroughly rebuilt" specimens look as if they were too feeble to venture out of the "batey." Some of them are ex-passenger engines which did their bits with fast schedules in the 90's. Their late owners apparently did not have the heart to relegate them to the scrap pile where they most legitimately belonged,

but were willing to prolong their miserable lives—for a consideration. There is this to be said, however, that these "second-handers" made it possible for some mills to tide over a season and to secure cane. If they had been compelled to rely upon the world's war-time production of locomotives they would have gone without. It is unfortunate, however, that unscrupulous dealers on the island, and off of it, took advantage of the situation and succeeded in selling types and materials that were wholly unfit for the service. As a consequence of promiscuous "hit and miss" locomotive buying, the general run of mills with five or more engines will enjoy a variety. Tubes vary with each type, not to mention numberless varieties and sizes of everything else on the engines. One of the most infrequent and encouraging sights on the island is the plantation with its locomotives all alike—or so nearly so as to simplify one of the most difficult problems with which they have to deal —maintenance and the procurement and stocking of supplies.

No One Can Tell What Interest Rates Will Be

F. J. Lisman, of F. J. Lisman & Co., New York, has sent the following letter to Albert B. Cummins, Chairman of the Senate Interstate Commerce Committee, and to John J. Esch, Chairman of the House Committee on Interstate Commerce:

The principal object of present railroad legislation is intended to be, as I understand it, the rehabilitation of the credit of the railroads in order to enable them to get the necessary additional capital required for purposes of expansion.

As a specialist dealing in railroad securities for about 30 years, I am somewhat familiar with the finances of nearly every railroad company in the United States, and having this information, I want to state emphatically that the 5½ per cent return will not attract capital under present conditions.

I will now proceed to prove this statement as concisely as possible by giving you the prices at which the securities of some of our best railroads are now selling.

Atchison, Topeka & Santa Fe 4s, due 1955, are selling on the New York Stock Exchange, at 69, at which price they pay about 6.15 per cent, taking re-payment at par 36 years hence into consideration.

Baltimore & Ohio Southwestern Div. 3½ per cent bonds, due 1925, are selling on the New York Stock Exchange at prices to pay over 7 per cent. The 5 per cent general mortgage bonds of the system are selling at 71 paying 7 per cent.

Chesapeake & Ohio, 4½s and 5 per cent bonds are selling at prices to pay considerably over 6 per cent.

Chicago Milwaukee & St. Paul bonds are selling at prices to pay over 7½ per cent.

Some of the Chicago, Rock Island & Pacific bonds can be bought at prices to pay over 9 per cent.

Chicago & Western Indiana 4s, a closed first mortgage on an important terminal in Chicago, are selling at a price to yield 6½ per cent.

Denver & Rio Grande System. The first mortgage bonds are selling on a 7½ per cent basis and junior issues which are paying their interest are selling at prices to pay over 9 per cent.

Erie Railroad. Various issues of this system can be bought at prices to pay 10 per cent.

New York Central System. Some of the direct mortgage bonds of this system, like the consolidated 4s, are selling at a price to pay 5¾ per cent.

The 6 per cent Convertible Debenture bonds are selling at 96.

New York, New Haven & Hartford 4 per cent main bonds, that is—Central New England first 4s, are selling at 59, yielding over 7 per cent.

Norfolk & Western 6 per cent debentures are selling on a 5½ per cent basis.

Pennsylvania Railroad. The 5 per cent bonds of this system are selling on a 5.40 per cent basis, and sold a few days ago on a 5.50 per cent basis.

St. Louis-San Francisco prior lien bonds, $70,000,000 of junior securities paying interest back of them, are selling on a 7 per cent basis and some of the junior securities, paying interest, are selling at prices to pay from 10 per cent to 12 per cent.

To the best of my knowledge, there are at the moment three railroads whose securities are not selling below a 5½ per cent basis, and they could not sell any substantial quantity of bonds better than a 6 per cent basis. I refer to Chicago & North Western, Chicago, Burlington & Quincy and Delaware, Lackawanna & Western.

New York city and many other tax-exempt bonds are selling at prices yielding from 4.40 per cent to 5 per cent. Government bonds pay approximately 4¾ per cent at present. Capital will not buy taxable securities and cannot be attracted to taxable securities, unless it gets a yield equal to 4¾, plus the average income tax and in addition thereto some compensation for whatever risk is incurred.

It does not seem reasonable that the railroads should be allowed to earn a return which is less than money is yielding in the open market. Suppose you owned a farm and had a tenant farmer whom you wanted to go ahead and develop and improve said farm and to buy a good team of mules How far do you think this tenant would get if you gave him $500 to buy this team of mules when other people were paying $600 for the same mules? I think you will agree with me that the tenant would not get the mules, and your farm would not be improved.

Unless the suggested rate of interest is changed, the proposed bill is worthless and useless.

I wish to offer the following constructive suggestion. The board of directors of the Federal Reserve Bank is a body nominated by the President with the advice and consent of the Senate. These gentlemen compose the only financial board, which keeps in close touch with the money market and which always knows what would be a fair rate of interest from time to time. Why should not the fixing of a fair return be left to this very competent board?

Practically all of the bonds above named were originally sold to investors on a 4 per cent to a 4¼ per cent basis. The present low price level is due:

1. To the general demand for money the world over, which has made itself felt before the war.

2. To the war and consequent large borrowing by all governments.

3. The extraordinary low price in many ways is due to the uncertainty of the future of the railroads.

Legislation will overcome the third cause but it cannot and will not overcome the first and second causes. No man living under present conditions of the world knows what a fair rate of interest for prime securities is going to be two or five years hence. The directors of the Federal Reserve Bank, however, are unquestionably the best judges of what is a fair rate of interest for borrowers to pay from time to time. Why, therefore, not let them determine this point?

The Utah Legislature has passed a law authorizing the State Public Utilities Commission to grant certificates of convenience and necessity to railroad corporations. The ruling becomes effective on December 5, 1919.

Investment Bankers' Association of America

Report of Committee on Railroad Securities; Weak and Strong Road Problem Analyzed

THE ANNUAL CONVENTION of the Investment Bankers' Association was held in St. Louis on October 20, 21 and 22. John E. Oldham, vice chairman of the committee on railroad securities, presented the following report of his committee:

At the convention held at Atlantic City in December of last year, the association placed itself on record as opposed to the policy of government ownership and operation of the railroads and in favor of their return, as early as possible or practicable, to private ownership under such altered methods of regulation as would insure sound railroad credit and an adequate system of transportation.

It may be said that for some years prior to the taking over of the railroads by the government railroad credit had become so depreciated and doubtful that even the strongest railroad companies were having great difficulty in financing their requirements. There were many who believed that under the circumstances the transportation requirement of the country could not be met unless private credit were supplanted by government credit and that the solution of the problem of satisfactory and adequate transportation was therefore to be found only through government ownership.

At the time the resolutions of the association were passed it appeared probable that there would be an early termination of federal control and it was expected that the question of public or private ownership would at once become a vital public question. It was found, however, that public sentiment was already undergoing such a change in regard to public management in general that at no time during the year has there appeared to be any real danger that Congress would adopt a government ownership plan. Even the proposition of the Railroad Administration for a continuance of federal control for a period of five years for the purpose, as stated by the director general, of establishing more clearly the relative merits of private and government management, was so generally opposed by shippers, railroad managements, the Interstate Commerce Commission, and the public generally that the proposal was not given serious consideration even by the Congressional committee to whom it was referred. There appeared to be great apprehension lest a continuation of federal control would result in an indefinite postponement of the return of the railroads to private management and that government ownership would be the inevitable result. Had the extension of time been proposed with a view to meeting the many difficult problems incident to the transition from federal to private control, without making the eventual return to private management more difficult or more doubtful, it is possible that the opposition would not have been so universal. In view of the circumstances, the committee has not felt called upon during the year to concern itself seriously with the question of government ownership.

Bills Before Congress

A number of bills have been introduced into Congress based upon the plans prepared by various associations, but it does not seem probable that any of these bills will be enacted into legislation without material revisions and changes, for opinions are still at variance on some questions which are of fundamental importance.

These questions have particularly to do with methods of rate-making. They bring up for consideration the relative advantages of incorporating a definite, fixed rule of rate-making in the legislation itself or of incorporating a clear and well defined statement of principles only leaving the application of these principles to the commission which will have jurisdiction over rates and further to be applied in accordance with the facts and circumstances as they may exist from time to time.

The question, therefore, is whether Congress shall at this time determine some fixed minimum rate of return on some unknown value as a measure of a fair return, or whether it will place the responsibility of sustaining credit upon some governmental commission, indicating more clearly than heretofore the principles which the commission will be expected to follow in reaching its conclusions in regard to rates which will be adequate to sustain credit.

A further matter to be considered in connection with the method of rate making is the question of limiting the income of all carriers alike to the same fixed return on some value to be established and making provision for the "recapture" as it is called by some, or "confiscation" as it has been termed by others, of the excess income above the established return whether such excess arises from foresight and good business judgment or from superior management and more efficient operation.

The differences in point of view in regard to these matters are indicated by the provisions for rate making and disposition of so-called excess earnings set forth in the several bills which have been prepared embodying the suggestions of the railroad executives, the Transportation Conference, the National Association of Owners of Railroad Securities and the Senate Committee on Interstate and Foreign Commerce.

Other bills have also been introduced including the Esch bill, which represents the point of view of the Interstate Commerce Commission and the Plumb bill, which is largely in the interests of labor.

The four bills to which special reference is made are the ones which have been given the most serious consideration and the committee in its report will confine itself largely to a discussion of the provisions contained in these bills. These bills all recognize the same fundamental difficulties and differ substantially only in the methods of meeting these difficulties. They agree that successful railroad policy must first of all create conditions which will assure the extension of railroad facilities to meet the industrial and commercial needs of the country. To meet the conditions, they recognize that the credit of the railroads of the country generally, individually and collectively, must be placed on a sound and satisfactory basis.

It is natural under the circumstances that much of the controversy in connection with the various plans should enter upon the proposed method of rate making and the determination of a standard by which an adequate return be measured.

Weak and Strong Roads

To provide rates which will permit the less favorably situated roads to prosper without providing too generous a return for the roads more favorably situated, especially as rates must of necessity be uniform for all roads operating in the same territory, is generally conceded to be the most vital problem to be solved. To meet this problem the National Association of Owners of Railroad Securities proposed that the country be divided into rate making districts and that a fair return should be measured by a return which would be adequate for the average road in each of the districts. It proposed that the aggregate property investment of all the

roads in each district should serve as a basis for computing the return and that 6 per cent on this aggregate investment should constitute the aggregate income for the roads in the district as a whole. It, however, recognized, because of the disparity in operating and financial conditions, that even though the return were adequate for the railroads taken as a whole, there would still be railroads with advantages above the average which would receive a larger return than would be justified if the rates were made only with a view to providing a fair return on the investment in these roads; and also that there would be railroads below the average which would not receive a return commensurate with the fair investment in their properties. It is proposed, therefore, that earnings above 6 per cent in individual cases should be treated as excess income, only a part of which should be retained for the benefit of the owners of the properties and that the balance should be disposed of in ways from which railroad employees and the less successful roads would benefit.

The National Transportation Conference, also recognizing the difficulty of providing an equitable return for both the strong and the weak roads under uniform rates, attempted to solve the difficulty in the same way, determining the aggregate income on the basis of a 6 per cent return on the aggregate property investment of the roads as a whole in each rate-making district.

The essential difference in the plans of the National Association of Owners of Railroad Securities and of the Transportation Conference in regard to matters relating to rate making have to do with determining what part of the income shall be considered excess income in individual cases and the purposes for which this income may be used.

The Transportation Conference or Chamber of Commerce plan, recognized the contention that the so-called excess income tax, determined upon the basis of existing property investment in individual cases as provided in the National Association of Owners of Railroad Securities or Warfield plan, would be a discrimination against the conservatively managed and financed properties in favor of the roads which have been less conservative in their accounting methods. That a railroad which had a large property investment, due to unsound accounting practices, and larger than would be justified by a fair valuation of its property, would distribute less in the form of excess income than a railroad of equal property value which had been more conservative. It, therefore, proposed that the excess income should be determined on the basis of relative earning capacity rather than upon a valuation determined by the existing property investment standing on the books of the individual companies. The Chamber of Commerce plan also provided that a substantially larger part of the so-called excess income should be conserved for the benefit of the properties on which the earnings originated than was provided in the Warfield plan, as a measure of protection to the investors in these properties and contained no provision for the distribution of any part of this income for the benefit of employees.

The Railroad Executives also sought to determine a fair return on the basis of average conditions. They were opposed however to the principle advocated by the other two plans mentioned, that the amount of income necessary to support credit should be determined by any fixed rate or return on property investment. They provided that the amount of income necessary for an adequate return should be left largely to the determination of a transportation board created by the bill and that this board should be instructed to study the conditions under which capital could be obtained; should acquaint itself with the credit position of the individual carriers and with a broad and comprehensive view of the situation should certify to the Interstate Commerce Commission from time to time the amount of income necessary to sustain railroad credit upon a proper basis; that the recommendations of the board should serve as a guide to the Interstate Commerce Commission in its consideration of rates, and rates should be made and adjusted with a view to producing the amount of income recommended by the board unless good cause could be shown for overruling its recommendations.

The Railway Executives take issue with both the Chamber of Commerce and Warfield plans in the matter of distributing the so-called excess income of the strong roads for the benefit of the weak. They contend that it would be unconstitutional to deprive the owners of the successful roads of the income obtained under competitive rates which have been recognized as reasonable by the Interstate Commerce Commission and that the entire earnings should be retained for the benefit of the owners of the properties on which they originate.

The Cummins bill is in line with the other proposals to the extent that the rates should be determined with a view to average conditions. In its original draft, although it is our understanding that the revised bill will probably be changed in this respect, it did not provide for any fixed return but left the matter, as in the case of the Railway Executive bill, to be determined by a Transportation Board, subject to review by the Interstate Commerce Commission. It however contains an excess earnings provision which appears to follow the suggestions of the Warfield plan more nearly than that of the Chamber of Commerce plan as far as the proposed uses of such income is concerned. It is probable that the provisions of the original bill will be changed in this respect also and eventually be brought more in line with the suggestions contained in the bill of the Chamber of Commerce. The determination of the value of the property to be used as a basis for determining the so-called excess income is to be left with the Interstate Commerce Commission.

The National Transportation Conference, the Association of Railway Executives and the Cummins bills are much in accord in providing for the eventual consolidation of existing systems in the several districts into a limited number of strong competing companies, as the best means of meeting the problem of the strong and weak roads, believing that in this way the disparity in operating and financial conditions can be so equalized that the newly constituted systems will be able to earn substantially the same rate of return upon their property investments.

Consolidation or Excess Income Taxation

If these expectations were realized, there would be but little difference in the amount of surplus income of the individual roads and the necessity of making any provision for the disposition of excess income would be correspondingly lessened.

The question to be considered, therefore, is whether the so-called problem of the weak and strong roads is more easily and more satisfactorily solved by removing the disparity in conditions through a consolidation of the properties on such terms as may be reasonable and fair to all concerned, or to allow the disparity in conditions to remain and attempt to provide in some way for a fair distribution of the so-called excess incomes which must necessarily accrue to the more favorably situated railroads under these circumstances.

A study of the essential provisions of these bills taken as a whole seems to indicate that the future railroad policy of the country is likely to be developed along lines which will bring about greater unification of ownership and operation resulting in the consolidation of many existing lines now in competition, these consolidations being undertaken not only for the purpose of simplifying ratemaking through the equalization of conditions of competition but also for the purpose of elimi-

nating waste in operation and preventing unnecessary duplication of facilities. With this in view the proposed legislation universally provides for permissive consolidations and in some cases, after a lapse of a stated period, for compulsory consolidations. To facilitate consolidations the bills all contemplate the removal of restrictions imposed by the Sherman anti-trust law, the majority of them also contain provisions for compulsory federal incorporation in order to remove some of the difficulties occasioned by the conflict of federal and state laws. As a further indication of the tendency toward greater unification it may be pointed out that the proposed legislation quite generally provides for greater common use of terminals, equipment and other facilities, as well as the pooling of traffic under proper restrictions when not incompatible with the public interest.

In the matter of supervision over issues of securities as well as in the matter of control over the expenditures of the proceeds of these securities, there is little difference of opinion, the bills providing that such supervision and control shall rest with the Interstate Commerce Commission.

The Labor Problem

It is obvious that a railroad program cannot be complete or successful which does not insure continued and uninterrupted railroad service and in order to accomplish this, conditions surrounding labor must be satisfactory, wages paid for labor must be as liberal and working conditions as attractive as in other lines of industry. Settlement of labor grievances must be determined promptly by a fair and impartial consideration of the circumstances without resort to strikes and the proposed legislation accordingly provides for boards of arbitration on which labor interests will have proper representation. It may be said that if the point of view and attitude of the railroad employees is fairly represented by the Plumb bill, which is prepared in the interests of labor and which seeks to nationalize the railroads and establish a policy of complete domination of transportation by the labor interests, it seems very doubtful if any of the provisions for arbitration proposed in the bills which have been discussed will be satisfactory from the labor standpoint.

While the progress which has been made during the past year toward a sound permanent policy of railroad regulation may be viewed with some satisfaction, there is, nevertheless, serious danger that adequate provision may not be made for the stabilization of credit during the time which must necessarily elapse before the permanent policy can become effective. The early discontinuance of the guarantee of the standard return as proposed by some of the bills seems to indicate that the difficulties which the weaker systems will have in re-establishing their former status in the field of transportation are not fully appreciated. Not only have the traffic departments of many of these systems been largely reduced or become inoperative but their business generally has been seriously disarranged and to some extent diverted to other systems.

Furthermore, the policy of the administration in the matter of compensation of employees will render it difficult for many roads to regain their former position. While rates can be established which will offset the total increase in wages when applied to the railroads as a whole, the effect of the policy of equalizing wages will render it difficult to distribute the benefits arising from the increase in rates proportionately among the systems to accord with the increase in wages in individual cases.

It is obvious under these circumstances that the increase in wages which has taken place will prove a greater burden to some systems than to others.

It should be understood that before the railroads were taken over by the government, railroad wages were made with relation to the cost of living and wages for similar employment in different communities. The demand of the railroad employees that the same kind of work should be equally compensated regardless of the cost of living and wages for similar employment in different communities was acceded to by the administration and the railroads will doubtless be returned to their owners with this method of determining wages in force. As the responsibility for this situation is the result of a wage policy adopted by the Railroad Administration the government should assume the responsibility for sustaining the credit of the roads affected until the owners of these properties have had an opportunity to adjust themselves to the conditions created by this policy. It is evident that this adjustment can take place only by return to the policy of determining wages as heretofore based on the cost of living and the average wages for similar employment in the communities served or by averaging the cost for the railroads as a whole, which would in part be accomplished if consolidations or properties took place in line with the permanent policy proposed.

The Transition Period

It seems probable that it will take a much longer time than the few months proposed to bring about these adjustments whichever method is adopted. Not only as a measure of justice, but also because of the importance of maintaining railroad credit generally, consideration should be given to continuing the standard return as the simplest way of guaranteeing credit until it is assured that conditions pertaining to the railroads not only as a whole but to the railroads individually, have approached more nearly to those which prevailed prior to federal control or until the new relationships, which are to be established between the railroad lines with the permanent policy proposed, are more nearly completed.

In brief, it may be said that the credit of many railroads during the period of federal control has been dependent entirely upon the guarantee of income provided by the standard return and a discontinuance of this guarantee under circumstances which will render it impossible for a considerable number of railroads to maintain themselves in independent operation will contribute to the further unsettlement and lack of confidence in railroad securities generally. It is further likely also to bring direct losses to the government which might be avoided if credit generally were sustained and capital were thus made available with which to liquidate the many millions of obligations due the government.

While it is desirable from all points of view that the financial relationship between the government and the railroads should be terminated as promptly as possible after the relinquishment of federal management, at the same time if the policy toward railroad rates and revenues is carried out as provided in the legislation the income derived from transportation from the railroads as a whole should be sufficient to guarantee the government against any loss occasioned by the continuance of the standard return. If the rates are not sufficient to guarantee the government against loss, income would not be sufficient to provide the necessary income for the railroads to sustain their credit and it would thus be clearly demonstrated that the proposed legislation had failed to meet its most important objective. It furthermore provides the simplest method of disposing of the problem of the so-called excess income during the time which will elapse before normal conditions are restored.

The result of the consideration and study which your committee has given to this subject confirms the position taken by the Association in connection with the original appointment of the committee that government ownership or operation is both impracticable and unwise and is not in the permanent interest of the railroads, the general pub-

lic, the shippers of labor, and it is our opinion that this conclusion is shared by an increasing number of people and that it can be safely said that public sentiment is, at the time, overwhelmingly against it.

The question of railroad credit is of such momentous and all-embracing importance that its proper solution may be said to be a *sine qua non* to the development and preservation of the prosperity of the country and to all its individual citizens. The committee therefore feels that there must be incorporated in any plan which is finally adopted such conditions as will enable the railroads confidently to appeal to the general public for new money necessary to the development of the situation by the sale of stock as well as bonds and it is well known that stock cannot be sold except where the opportunities exist for a satisfactory return on the investment commensurate with the risks involved.

In conclusion, we wish to record our opinion that a very satisfactory development of public sentiment has taken place during the past year and that the country, as a whole, has a much more normal conception of the railroad problem than perhaps ever before and is more disposed to attack the problem and its solution without passion or pre-conceived prejudices.

We feel that the country is especially to be congratulated on the conscientious intelligent manner in which the subject has been approached by the committee in both houses of Congress. These committees in their personnel have the advantage of experience on the subject of a number of the members who have, by previous service on congressional committees, familiarized themselves with the large problems involved; and we have a feeling of considerable confidence that when the congressional measures are prefected they will exhibit the result of trained intelligence and conscientious effort to solve the problem in a recognition of the vital relations which this mammoth industry bears to the fundamental prosperity of the country. The attitude of the committee also warrants the view that, before final action is taken, the most considerate hearing will be given to such further suggestions or views as may be presented.

The report was signed by Allen B. Forbes, chairman.

Discussion

Mr. Oldham after presenting the committee report discussed it from his own individual point of view in part as follows:

I think this question of the transition period is a most important one, and I do not think it has been fully considered from the standpoint of labor and of the equalization of wages. I think in a general way that we understand that wages have not only been increased, but they have been equalized. But just the bearing of that on the different railroads, as I have said, I do not think is fully appreciated.

Now, that is the problem that is going to be met by the railroads when they are turned back, and it is quite apparent to me if that condition has to be met, while there was a disparity in the operating costs of roads operating in the different communities a uniform rate of wages will apply so unequally, that we are going to find that there will be an even greater disparity when the railroads are turned back because the operating expenses of some roads will have increased very much more in proportion than others. But I think we are going ahead, the legislation appears to be going ahead on the assumption that if we have a basis for rate making which will allow the average railroad to prosper as soon as those rates are put in effect the railroads ought to be self-sustaining. Now, the rates may be sufficient to make them self-sustaining as a whole. You may easily grant an increase in rates which will offset the total increase in wages, but it is a question of some getting more and some getting less, and if we are to have a proper solution of the railroad problem, we must have not only 60 per cent of the railroads with credit, but a full 100 per cent of the railroads must have credit. I think the real problem is a problem of whether we are going to consolidate these railroads or whether we are not. If what we get is only a little more income, I believe that when we turn these railroads loose to operate independently, leaving substantially the same number of railroads that we have operating now, you are going to have just as you have now, about 60 per cent of the railroads, when I say 60 per cent I refer to the portion of the railroads doing 60 per cent of the business, that are properly organized financially, that is, with a proper relation of stock and bonds, and they will be able to finance themselves if you give them a little more liberal rates. But, on the other hand, you are going to have the other 55 to 40 per cent of the railroads not less favorably situated in a large majority of the cases with a large proportion of bonds and a small proportion of stock not represented, perhaps by the face value of the stock, but represented by its market value. That is the real equity, and you are not going to solve the problem unless you undertake to put through plans of consolidation in such a way that you will remedy this question of railroads that have not the proper kind of financial organization, because an increase in rates won't put them in a position where they are going to have credit. I think that is the fundamental thing, I think the question of the fixed return is less important. There is a difference of opinion on the subject, I don't know how the committee would stand on that question.

I think the tendency is towards these consolidations into relatively few systems, and I think there is some confusion in thought in regard to the strong and weak roads. We hear these roads referred to as the more favorably situated and the less favorably situated, and a uniform rate which will permit both to prosper and to equalize conditions we provide for the excess income to be taken away from the strong for the benefit of the weak. The consolidations, if they take place, will serve to equalize the conditions, I believe, as proposed in the plan.

But the difficulty is, when we get talking about these strong roads and the weak roads, we start out with the assumption that the weak roads are less favorably situated from a traffic standpoint, unable to support themselves on the same rate, etc., and after we have gotten through with that then we make the application by classifying every road that has poor credit as a weak road.

Now a large part of those roads which we are accustomed to term weak roads, if they were properly financed and had a proper relation of stocks and bonds would be strong roads. If you should make a comparison of the kind of business they did, the way they did their business, the cost of operation and the amount of money they put back into the property, you would not find a substantial difference between those roads from the strong roads, and you would not discover the real difference until you investigated and saw how they distributed their income, and then you would find that the weak roads were the roads that were distributing practically the same total to the public in the form of interest charges that the strong roads were distributing in both interest charges and dividends.

And that is about what the difference is. But I am satisfied that the difficulties of the strong and weak roads can be overcome best through the plan of consolidation which is the fundamental part of the Transportation Conference plan, and which is the most prominent feature, in my judgment, of the Cummins bill, which has now been acceded to by the railway executives, and if anyone wishes to know their position I would rather they would learn the position of the railroad executives by reading the testimony of Judge Thom before the House Committee than to interpret the

position of the railroad executives, perhaps, from the pamphlet of Judge Lovett and some others. They would see that they have come together, practically, those three organizations, for a consolidation of the railroads of the country into a relatively few strong competing systems and I believe in making this statement, again, I wish to qualify as not representing the views of the committee one way or another, representing simply my own views on that particular point, but I believe that the consolidation of these railroads along the lines which have been suggested, will be the greatest step forward in solving the railroad difficulties.

Railroad Fire Losses in 1918

THE FIRE LOSS AND PROTECTION SECTION of the Railroad Administration has compiled a bulletin recording the fire losses and their causes sustained on 419 railroads under federal control during the year 1918; the percentage that the number of losses from each cause bears to the total number of losses and the percentage that the amount under each cause bears to the total amount of losses sustained. These have been classified for better reference under two general headings, one giving the causes of fires to buildings and their contents and the other the causes of fires to rolling equipment and its lading.

The bulletin says in part: "The details of causes and their relative importance should be carefully studied, so that each cause may be fully understood and the proper remedies applied. The causes are all more or less common and a large majority readily preventable. Every building, car, or piece of property that is destroyed by fire is a distinct loss and an interference to operating efficiency, and the large aggregate of fire loss is a serious charge against the railroads' expenses. The reduction in the fire waste can only be accomplished through the enforcement and acceptance of individual responsibility and the correction of defects which produce fires."

There were 20,628 fires reported, with a total estimated loss of $12,263,220, divided $6,777,410 on buildings and contents and $5,485,810 on rolling stock and lading. This total aggregate of loss included the large item of losses arising from damage to property of others along the line of railroads assumed to have been caused by sparks thrown from locomotives, there being 9,923 fires attributed to this cause, with aggregate loss of $1,610,190, the largest item from any single cause. The total loss from locomotive sparks was nearly three millions, as follows:

	Amount	Number
Railroad property	$567,685	1,203
Property of others along line	1,610,190	9,623
Rolling stock	644,370	1,172
Total	$2,822,247	12,298

Hot coals dropped from locomotives caused 369 fires, amounting to $100,364 loss, while locomotives dropping oil caused eight fires, amounting to $168,666 loss. This group of losses with the above from sparks from locomotives shows the locomotive to be an "excessive culprit" in creating fire waste.

Under buildings and contents losses 116 losses were occasioned by lighting defects, with a loss of $85,766 (not including electricity); and 527 losses through heating defects, with a loss of $254,920. Carelessness was the direct cause of 392 fires, aggregating $236,167, although the majority of fire losses may be said to have been produced through that same general cause. Through the careless handling of oils, paints, etc., 50 fires caused a loss of $20,125. Carelessness in smoking or the use of matches caused 162 fires to buildings and contents, with a loss of $118,458, and 90 fires to rolling equipment, with loss of $51,170, a total of 252 fires of this origin, with a total loss of $169,629, and no doubt many of the "unknown" origins might be attributed to the same cause. Miscellaneous causes including spontaneous ignition and the large number of "unknown" causes produced 1,683 fires. Sixty-nine fires were occasioned through electrical defects, causing a loss of $160,352.

Under "transportation hazards" (fires to rolling stock and lading) a large amount of loss was produced through sparks thrown from locomotives as noted above, there having been 1,172 fires with $644,370 loss. The largest individual amount of loss from any one cause was from wrecks, collisions, and derailments, there having been 194 fires with loss of $1,152,742. Car heaters contributed 56 fires, or $27,959 loss; exposure fires, 180, or $251,828 loss; hot lading, 615 fires, $94,136 loss; forest fires, 17, or $413,732 loss; and there were 1,226 fires of unknown origin with $1,541,269 loss.

The bulletin calls upon employees to study this statement with care and exert their individual interest and effort in reducing the large fire waste.

Plumb Paper Alarmed

LEADERS OF "LABOR," the weekly newspaper published by the Plumb Plan League, were advised in the issue of November 8 that "the railroad interests are preparing to jam through Congress the biggest steal in the history of frenzied finance" and are asked to lend their support to defeat this purpose by writing to their Congressmen and Senators telling them to vote against the Cummins bill and the Esch bill on the ground that "both measures validate eight billions of watered stock." The article makes no differentiation between the two bills, although they differ widely.

The article says the Cummins bill contains "the infamous anti-strike clause which would shackle labor," while the Esch bill does not contain this clause but "in other respects is worse than the Cummins bill." This presumably refers to the provisions for assessing damages against a labor union for breaking a contract. The article adds that both bills instruct the Interstate Commerce Commission to tax the American people a sufficient amount to pay dividends on the eight billions of watered stock which, the article says, "means an increase of from 25 to 50 per cent in freight and passenger rates and, according to Director General Hines, would add five billion dollars to the cost of living in this country." This is said to mean $250 for every family of five in the nation, but the article fails to state whether it would be a 25 per cent or a 50 per cent increase that would do this.

Readers of the paper also are advised to tell their Congressmen and Senators that they want them to vote to continue government control of the railroads for at least two years. It says that Samuel Gompers and the chiefs of the 14 railroad labor organizations recently made known their views on this point to the "labor group" of the House of Representatives in a formal conference and later issued an address to the people of the country in which they stated:

"1. That American labor will exert its influence to the utmost within the limits of the Constitution to defeat the vicious anti-strike provisions in the Cummins bill and other measures of similar character.

"2. That in the opinion of American labor the return of the railroads to private ownership at this time would be a grave mistake. Under plans proposed for the return of the railroads to private operation it would be followed by increase in freight and passenger rates of over 25 per cent. Either result would shake the industrial fabric of the nation

at a time when a war-sick world is looking for moral, financial and political leadership.

"3. In order to avoid these calamitous consequences, the members of Congress were urged to introduce legislation continuing government control of the roads for two years from the conclusion of peace. This will afford the American people an opportunity to consider the many solutions of the railroad problem which have been put forward.

"The railroad question affects the lives of all the people of our country, who should be given opportunity to acquaint themselves with the various solutions proposed, that a mature judgment may be reached. This problem should not be a subject for hasty consideration and decision.

"It was agreed that the legislation suggested on these questions would be drafted at the earliest possible date, and it would be presented and pressed very earnestly in both Houses of Congress, and that every effort possible will be made to defeat all legislation which aims to deny to the wage-earners their right to self-expression in matters affecting their freedom."

Since that time Representative Sims, who introduced the bill providing for the Plumb Plan, has introduced a bill providing for a two-year extension of the period of federal control, but his two years date back from December 31, 1919, rather than from the conclusion of peace. The present federal control law is limited to 21 months after the proclamation of peace.

The Accident Prevention Drive

A. F. Duffy, manager of the Safety Section of the Division of operation, United States Railroad Administration, has issued bulletin No. 9 giving data concerning the work of the Section for the month of August, and a summary of the statistics of accidents for the two weeks ending with October 31, the period of intensified attention to accident prevention which prevailed throughout the territory of the railroads operated under federal control.

The number of persons employed on these railroads in October, 1919, somewhat over two million, being a little larger than in October, 1918, the number killed *in the two weeks was 33 per cent less*—84, as compared with 126 in the corresponding fortnight last year. The number injured fell from 5,102 to 2,371, and the total casualties per hundred employees from 0.266 to 0.119.

The bulletin gives these totals and percentages for each road reporting, and summarizes the whole by regions as below, the different regions being tabulated in the order of their respective percentages of decrease in casualties per 100 employees.

August Casualties.—The number of employees killed, as reported to the Safety Section, on all of the government operated railroads in August, was 150, as compared with 304 in August, 1918; and of injured, 11,370, as compared with 14,421. In the month of August, 1,629 safety meetings were held, with an aggregate attendance of 24,804. The number of copies of safety bulletins, circulars, etc., posted on bulletin boards in the month was 71,447, in addition to which pamphlets and other pieces of safety literature were distributed to the number of 719,287.

Five Persons Were Killed and 143 injured—five fatally, on October 29, in the derailment of northbound train No. 50, on the Southern Pacific, San Joaquin division, near Vincent, Cal. The engineman, the fireman, one passenger and two trespassers were killed. The train was derailed on a 10-deg. curve, descending grade, the engine, two baggage cars and five coaches being overturned. This is the first serious train accident in which a passenger has been killed on the lines of the Southern Pacific in eleven years. The cause is believed to have been excessive speed.

Employees Killed and Injured October 18-31, 1919

Region	Total number of employees		Employees killed		Employees injured		Total casualties to employees		Employee Casualty Decrease	Casualties per 100 employees		Decrease per 100 employees

Operating Statistics for September—New Instructions Covering Interline Waybilling of Freight

WASHINGTON, D. C.

The Operating Statistics Section has published figures covering the financial results of operation for the month of September for all Class I roads in federal operation. These comprise 231,993 miles of road, or 97 per cent of the total of 240,177 miles of road federally operated. The condensed income account is as follows:

	Month of September		Increase or decrease	
	1919	1918	Amount	Per Cent
Operating Revenues....	$492,442,654	$482,676,967	$9,765,,687	2.0
Operating Expenses. ...	393,854,580	364,922,933	28,931,647	7.9
Net Operating Revenue	98,588,074	117,754,034	d19,165,960	
Taxes, Rents, etc.....	20,843,679	18,704,905	2,138,774	
Net Operating Income..	77,744,395	99,049,129	d21,304,734	
Operating Ratio	80.0	75.6	4.4	

Note—d indicates decrease.

One-twelfth of the annual rental amounts to $74,352,976, so that the net profit to the government was $3,391,419 for these properties, but the September expenses include an estimate of the increases in wages recently granted the shopmen which are retroactive to May 1, 1919. Consequently, September expenses include $16,000,000 applicable to the months of May to August, inclusive, and the net profit to the government for the operations applicable to the month of September was approximately $19,000,000. The expenses for September, 1918, include about $9,000,000 back pay applicable to prior months, but they do not, on the other hand, reflect the increases to agents, telegraphers, trackmen, clerks, enginemen and trainmen, and the recent increase to shopmen referred to above, granted subsequent to September, 1918, which are included in the September, 1919, expenses.

The results for the nine months ended September 30th, were as follows:

	Nine months ended Sept. 30		Increase or Decrease	
	1919	1918	Amount	Per Cent
Operating Revenues ...	$3,731,186,885	$3,500,522,249	$230,664,636	6.6
Operating Expenses...	3,156,958,295	2,822,556,678	334,401,617	11.8
Net Operating Revenue.	574,228,590	677,965,571	d103,736,981	
Taxes, Rents, etc.....	172,163,481	163,683,255	8,480,226	
Net Operating Income.	402,065,109	514,282,316	d112,217,207	
9/12 of Annual Rental	594,823,808	594,823,808		
Operating Loss	192,758,699	80,541,492	112,217,207	
Operating Ratio	84.6	80.6	4.0	

Handling of Claims Shows Improvement

Reports both as to the number of loss and damage claims and overcharge claims presented and as to loss and damage freight claims and overcharge claims remaining unsettled just compiled for recent months show a very gratifying improvement in every respect, according to a statement authorized by Director General Hines on November 10. The number of both classes of claims received in the three months ending September 30 and the number of claims remaining unsettled in the three months ending September 30 show a decrease as compared with the preceding three months.

As to loss and damage freight claims presented, the number in the three months period ended June 30 was 1,035,981 and for the three months period ended September 30 was 1,002,642 or a decrease of 33,339. As to overcharge freight claims presented, the number in the three months period ended June 30, 1919, was 347,945 while during the three months ended September 30, 1919, the number was 332,736 or a decrease of 15,209.

Unsettled loss and damage freight claims are checked up on the basis of the number on hand for four months and over and unsettled, whereas overcharge freight claims are checked up on the basis of the number unpaid and unsettled for more than three months. As of June 30, 1919, the number of unsettled loss and damage freight claims on hand for four months and over and unsettled was 251,585 while the number on hand, four months and over and unsettled as of September 30, 1919, was 167,928 or a decrease of 83,657. The number of overcharge freight claims as of June 30, 1919, more than three months old and unpaid was 24,254 and the number of overcharge freight claims more than three months old and unpaid as of September 30, 1919, was 14,699 or a decrease of 9,555.

The figures given above by regions follow:

NEW LOSS AND DAMAGE FREIGHT CLAIMS RECEIVED

	3 Months ended	
Regions—	June 30, 1919	September 30, 1919
Eastern	286,419	270,369
Allegheny	168,831	168,600
Pocahontas	25,0"0	19,104
Southern	159,051	146,031
Northwestern	159,704	169 103
Central Western	142,607	138,691
Southwestern	94,299	90,744
Total	1,035,981	1,002,642

OVERCHARGE FREIGHT CLAIMS PRESENTED

Region—	June 30, 1919	September 30, 1919

Central Western	20,819	12,113
Southwestern	7,575	4,005
Total	251,585	167,928

OVERCHARGE FREIGHT CLAIMS UNPAID AND THREE MONTHS' OLD OR MORE

Region—	June 30, 1919	September 30, 1919
Eastern	5,977	3,557
Allegheny	5,242	3,083
Pocahontas	762	381
Southern	3,694	1,831
Northwestern	3,391	1,949
Central Western	3,331	2,737
Southwestern	1,857	1,161
Total	24,254	14,699

Instructions Covering Interline Waybilling of Freight and Accounting for Freight Charges

In order that the freight revenues at the end of federal control may be stated and allocated between the director general and the corporation in a manner comparable with the stating and allocating of freight revenues at the beginning of federal control, Director General Hines has issued General Order No. 64, in which General Orders Nos. 11 and 21 are canceled, and the following instructions are made applicable to the waybilling of freight on and after December 1, 1919, and the apportionment and settlement of freight revenues thereon:

1. The waybill forms and the methods of waybilling described in General Order No. 60 shall be continued.

2. Interline waybills shall be made for all freight covered by joint through rates; freight not covered by joint through rates shall be waybilled to junction stations except that interline way-

billing arrangements which were in effect immediately prior to federal control will be continued.

3. Complete routing must be shown on each waybill when made, in the space provided therefor. Each forwarding junction agent must stamp each waybill in the space provided therefor and in the order there shown. Such stamps must show the name of the forwarding carrier, the date, and the junction station.

4. Waybills for carload freight must move with the cars; waybills for less carload freight must move with the cars when practicable; otherwise, they shall be mailed in accordance with the requirements of each carrier to junction, transfer, break-bulk or destination station. When waybills for a solid car of less carload freight are mailed, a separate waybill for the car movement must be made on standard form, in duplicate, showing destination and complete routing, and bear notation:

"Merchandise Car. Waybills
Mailed to....."

The original car movement waybill shall accompany the car, the duplicate shall be placed on top of the revenue waybills, all securely fastened together and mailed as outlined above. Agents receiving merchandise waybills without car shall take immediate action to locate car and forward waybills in accordance with the information obtained, and connecting carrier's requirements to junction, transfer, break-bulk or destination station. Single waybills which become separated from the freight shall be promptly mailed to destination. Forwarding junction agents must stamp car movement waybills in the manner provided in paragraph 3.

5. When miscellaneous charges of any character, collectible from consignee, accrue in transit, they shall be covered by "Advances Only" waybills, which shall clearly describe the services for which the charges are made. Such waybills and regular waybills shall be cross-referenced to each other, and the amount and character of the charges shall be noted as information on the regular waybill in the lading column; the "Advance Only" waybill shall be securely attached to and move with the regular waybill when possible.

6. All waybills shall be stamped as of the date of arrival of freight at each junction. Settling carriers in preparing interline accounts shall make separate abstracts for all waybills dated prior to January 1, 1920, and shall show, immediately under each waybill entry, the name of junction through which shipment passed, and the date such shipment reached each junction, as indicated by stamps on waybill. Separate division statements and interline summaries need not be made for waybills dated prior to January 1, 1920. The total of abstracts covering such waybills should be included on division statements with total of abstracts covering waybills dated subsequent to that date. Interline accounts shall be analyzed in audit offices, and revenues from less carload freight that would have been rebilled or settled in junction settlement accounts under practices in effect in December, 1917, and which arrived at junction stations before midnight December 31, 1919, shall be allocated to federal account. There shall also be allocated to federal account, the revenues on all carload freight which arrive at junction stations before midnight December 31, 1919, provided such an allocation was made as of December 31, 1917.

7. In apportioning revenues between carriers, the following shall be observed:

(a) When joint through rates and agreed published divisions or percents are in effect, such divisions or percents shall be used.

(b) When joint through rates are applied, for which divisions or percents have not been arranged by interested carriers, the revenue shall be apportioned on the basis effective in December, 1917.

(c) When freight is moved via routes not authorized by tariffs, all revenue shall be apportioned between carriers on basis of actual mileage, allowing to originating and destination carriers an additional twenty (20) miles each, recognizing established arbitraries.

8. Destination carriers shall completely revise waybills as to rates, classifications, extensions, footings, weights, etc., thus insuring correctness of the revenues based on tariffs applicable, and they shall account to interested carriers for their respective proportions of such revenues in the manner herein prescribed. If flagrant or continued errors are observed by destination carriers, the attention of waybilling carriers must be called thereto. Waybill correction notices shall not be issued to waybilling carriers unless advances or prepaid charges are involved.

9. All waybills dated prior to December 1, 1919, which are included in settlement for December, 1919, or subsequent months, shall be subject to the provisions of this order.

10. Accounting Circular No. 85, dated April 5, 1919, is hereby canceled, and effective with accounts for November, 1919, the plan of Audit Office Interline Freight Settlement prescribed in 1917 Synopsis of the Railway Accounting Officers Association shall govern, except as hereinafter provided.

EXCEPTIONS:

(a) Where corrections are made on waybills, correction notices shall not be issued unless advances or prepaid charges are involved.

(b) The correction minimum between carriers shall be one dollar, instead of twenty-five cents.

(c) The settling carrier shall retain original abstracts and division statements, sending first carbon copy to waybilling carrier and legible copies to each intermediate carried, in time to reach them not later than the 18th of the succeeding month.

(d) Tracing for unreported waybills by intermediate carriers shall be limited to carriers whose methods of accruing revenue make such action necessary.

(e) For all carload shipments, car initials and numbers shall be shown on the interline abstracts; if transferred enroute, the ex-car initials and number shall also be shown.

(f) The forms prescribed in Accounting Circular No. 85, adapted to the requirements of the plan, shall be used.

11. Interline Freight Accounts shall be audited, records shall be checked to establish unreported waybills; abstracts shall be checked against division statements; arithmetical calculations and bases of apportionment, including arbitraries, shall be verified.

12. Junction settlements shall be made periodically on gross or net basis in accordance with practices in effect at December 31, 1917.

13. General Order No. 55 and Accounting Circular No. 76 are hereby canceled. Effective with overcharge and agency relief claims paid or settled on or after December 1, 1919, apportionment between carriers shall be made in accordance with the rules of the Railway Accounting Officers Association, published in the 35th report.

14. Interest payments shall be apportioned between carriers on the same basis as the overcharges.

15. This general order shall not be comstrued as affecting the relations between the public and the carriers.

Passenger Traffic in August

The number of passengers carried one mile in August was 4,375,694,522, according to the monthly report of the Operating Statistics Section. This was an increase of 8.8 per cent over August, 1918. For the eight months ending with August 31 the number of passengers carried one mile was 28,793,142,453, an increase of 6.3 per cent.

Number of Bad Order Cars Being Reduced

Steady and gratifying progress continues to be made in connection with the bad order car situation, according to a statement authorized by Director General Hines.

Excluding cars held out of service as not worth repairing, bad order cars had fallen on November 15 to 130,833 or 5.2 per cent. The figures since October 4 have been:

	No.	Per Cent
October 4	172,210	6.9
October 11	169,343	6.7
October 18	163,986	6.5
October 25	156,372	6.3
November 1	146,702	5.8
November 8	136,238	5.4
November 15	130,833	5.2

Including cars held out of service as not worth repairing, the number of bad order cars has decreased to 150,133 or 5.9 per cent on November 15. The figures since October 4 follow:

	No.	Per Cent
October 4	191,656	7.6
October 11	188,308	7.4
October 18	183,070	7.2
October 25	175,348	7.0
November 1	166,514	6.5
November 8	155,564	6.1
November 15	150,133	5.9

General News Department

William T. Payne, far eastern manager of the Canadian Pacific Ocean Services, Limited, Yokohama, Japan, has been decorated by the Emperor of Japan with the Order of the Eastern Sun, in recognition of his services toward promoting international commercial relations and the improvement of navigation facilities.

W. G. Lee, president of the Brotherhood of Railroad Trainmen, in a recent statement says that during the years 1917, 1918 and 1919, out of 1,322 benefits paid by the brotherhood for deaths due to accidental causes, 400, or nearly one-third of the entire number, were due to the one cause of falling from or being knocked from trains.

Five robbers who boarded a southbound passenger train of the Yazoo & Mississippi Valley at Memphis, Tenn., on the morning of October 11, were foiled by the alertness of a yardmaster, who saw the men board the train and telephoned to West Junction in time to have the train stopped. Several packages were taken from the express car, the messenger being bound. A former railroad employee was arrested, later, and is said to have made a confession.

The American Association of Engineers has announced a membership drive throughout the United States during the first two weeks of December. The clubs and chapters of this organization will divide their membership into teams, each of which will be assigned a certain territory. Telegraphic reports will be made to the central headquarters daily. Special prizes will be awarded to the clubs and members securing the largest results.

Senator Nelson, of Minnesota, has introduced in the Senate a bill, S. 3183, authorizing the Interstate Commerce Commission to investigate the warehouse facilities of railroads at Atlantic, Pacific and Gulf ports for the purpose of determining whether they are proper and adequate for prompt and efficient handling of grain and grain products, to determine what new facilities or additions to existing facilities will be reasonably necessary and to make proper orders requiring carriers to provide such facilities as are determined to be necessary.

The Canadian Pacific, following its custom of naming stations to perpetuate the names of officers and employees of the company, is naming several stations on new lines it is building in the west after officers and employees who were decorated for meritorious service during the war. Among the officers who have been so honored are J. A. Hesketh, assistant engineer, Winnipeg, Man.; W. M. Kirkpatrick, assistant freight traffic manager, Winnipeg; F. A. Gascoigne, superintendent of car service, Montreal, Que.; J. M. Thrasher, fireman, Kenora, Ont.; H. Neighbour, storeman at Winnipeg and L. B. Unwin, accountant at Schreiber, Ont.

The threatened strike of 12,000 members of the Brotherhood of Railway Trainmen in the Chicago switching district on October 30, did not materialize. Reports were circulated throughout the country that a strike vote was taken at a meeting of the 14 locals in this district on October 26. The report was given extensive publicity in the press. W. G. Lee, president of the organization, issued a statement from Washington to the effect that the threatened strike would be wholly unauthorized and without the sanction of the Brotherhood. However, on the day set for the strike several of the local brotherhood officers stated that a general strike vote had not been taken in the Chicago district and the report had gained circulation because a number of men acting on their own initiative held an unofficial meeting and sent their demands to Washington.

California, is the subject of an illustrated booklet for the information of prospective settlers and homeseekers, which has been issued by the Division of Traffic of the United States Railroad Administration. Governor William D. Stephens, writing the introduction, says that there is to be found within the limits of California every condition of soil and of climate existing in any other part of the nation. More nearly than any other State—even more nearly than many of the great nations of the earth—California is capable of sustaining a great population and supplying its every material want or need. The booklet contains 62 pages filled with information about what the Golden State will produce, available lands, irrigation and reclamation, climate and soil, roads, churches, schools, transportation facilities and co-operative marketing.

Boiler Makers' Annual Convention

The executive committee of the Master Boiler Makers' Association has announced that the next annual meeting of that association will be held at the Curtis Hotel, Minneapolis, Minn., May 25-28.

The Automobile Wins

The Holton Interurban Railway Company after substituting for an unprofitable steam train service a passenger bus service, the cars in which were equipped with a combination steel and rubber tire which permitted operation over either rails or the highway, has been authorized by the Railroad Commission of California to discontinue all service on its lines between El Centro, Cal., and Holtville. Both services have been financial failures, the public seemingly preferring automobiles which use the highways exclusively.

A Comprehensive Reform

A bill to require the railroads to coat their ties and roadbeds with "a suitable covering of hydraulic cement of good quality, which shall render the roadbeds practically waterproof and exclude water from coming into contact with the roadbeds and thus render them soft, unstable and dangerous for the operation of cars and rolling stock thereon and thereover," has been introduced in the Senate by Senator Thomas of Colorado. The bill, which is S. 3278, sets forth in the preamble that its purpose is "to more fully insure the safety of human life and property, to reduce the cost of transportation and to make the railways better both physically and financially." One section of the bill would make it unlawful for a railroad to lay any cross tie which shall have been artificially treated by any process by which any poisonous substance has been injected into the pores.

Chicago Telegraphers' Wages

Although a strike vote was ordered taken on October 30 by the 21 chairmen of the Order of Railway Telegraphers representing 23,000 men in the Chicago district, no strike of operators has materialized. The cause of the action was due to a delay in the application of interpretation 2 to Supplement 13 to General Order 27 which had the effect of increasing the hourly rate of pay of telegraphers on railroads where a 26-day month was in effect. This interpretation was issued by the Railroad Administration on August 16, but the railroads involved did not put the wage order into effect and referred the matter back to Director General Hines for modification. The executive committee of the various branches of the organization again submitted the question to the telegraphers employed on 21 roads in the Chicago district; and following conferences with Director General Hines the situation is reported settled satisfactorily to both the roads and the telegraphers.

Railway Revenues for September

The Interstate Commerce Commission's monthly report of railroad earnings and expenses, covering 186 Class 1 roads, and 17 switching and terminal companies, shows gross revenues for September of $498,762,533 and railway operating income of $81,675,721. The details are as shown in the table. Operating income amounted to $349 per mile of road operated, which compares with an average of $415 for September in the three-year test period ended June 30, 1917.

RAILWAY RETURNS FOR SEPTEMBER AND FOR NINE MONTHS.

	September				Nine Months

Southern Pacific Loses Minor Oil Land Suit

The United States Supreme Court on November 17 sustained the government in its proceedings to cancel patents for about 6,000 acres of oil land in California, alleged to have been obtained by the Southern Pacific Company through fraud. The government thus becomes repossessed of the lands granted to the company in 1904 under railroad land grant laws which reserved mineral lands. The Federal District Court held that while there had been no actual discovery of oil on the land, surrounding conditions clearly indicated that it was valuable for oil and the Circuit Court of Appeals, which reversed this opinion, is now in turn reversed by the Supreme Court. The government contended that the company knew of the presence of oil, although in affidavits filed by its land agent the land was declared to be non-mineral. The opinion by Justice Vandevanter declares that the Southern Pacific officers were not acting in good faith; that they endeavored to obtain the property "by representing that the lands were not mineral when they believed the fact was otherwise."

"After considering all the evidence," he said, "we believe that it is adequately shown that the lands were known to be valuable for oil when the patent was sought and obtained; and by this we mean that the known conditions at that time were such as to reasonably engender the belief that the lands contained oil of such quality and in such quantity as would render its extraction profitable, and justify expenditure to that end. Regarding the company's contention that a general land office agent examined the lands and reported them as non-mineral, the court said the report was made in another connection and was not considered by the government in approving the company's selection. This report did not relieve the company from showing that the lands were not mineral, nor did the company understand that it had any such effect."

The decision does not affect the title of the Southern Pacific to about 162,000 acres of oil land involved in another suit, in which the district court sustained the company's claim and which the government has not yet appealed. The case just decided was regarded as the government's strongest case and it is stated that the facts in the case involving the more valuable tract are so different that the present decision affords no basis for drawing any inference in regard to the other case.

The lands involved in the suit now settled are situated in the Elkhills region of Kern County, California, near the town of McKittrick, about 50 miles west of Bakersfield.

Suit to return the lands to the government was started in 1910.

Guarding Against Forest-Fire Dangers

The construction of fire lines along the right-of-way of all railroads in the Northwestern region has been ordered by R. H. Aishton, regional director, as a precaution against field and forest fires caused by sparks from locomotives or from other causes. The rules have been approved by the Executive Committee of the American Railroad Association and are as follows:

"Disposal of inflammable material such as standing dead trees, logs, dead and rotten wood, brush, dry leaves and dry grass. This will involve burning over the right-of-way as often as may be necessary to keep it cleared of inflammable material. Where the right-of-way is less than 200 ft. wide and permission can be obtained from owners of adjoining land a strip should be cleared as above described of 100 ft. or more from the outside rail in each side of the roadway. If such permission cannot be obtained, then such right-of-way as is owned must be cleared to its full width.

"Continuous fire lines must be constructed at the outside edge of the clear strip consisting of a plowed or grubbed line not less than three feet in width which must be renewed yearly before the season of fire hazard, or as often as necessary to keep the soil exposed.

"Fire lines may be omitted where the railroad is paralleled by a stream or body of water not less than 20 ft. wide and not less than 100 ft. nor more than 200 ft. from the nearest track or where the railroad is paralleled by another railroad or a graded road not less than 100 ft. nor more than 200 ft. from the nearest track, or where in prairie regions the grass can be burned off clean in the fall, provided this can be done safely and effectively without plowing a fire line."

Traffic News

The Oklahoma Industrial League has been organized, to interchange ideas concerning traffic matters; H. T. Driscoll, manager of the Oklahoma Traffic Association, is president.

R. M. Field, manager of the traffic department of the Peoria Illinois Association of Commerce, has been appointed shippers' representative on the Chicago Western District Freight Traffic Committee, succeeding J. S. Brown, who has resigned.

The Boston & Maine announces that a general increase in local freight rates of about 25 per cent will go into effect on December 31. It is said that the Massachusetts State Public Service Commission approved this increase in April, 1918, but accounting difficulties had prevented earlier action.

George E. Clinton, chief clerk to the assistant general freight agent of the New York Central, with office at New York City, has been appointed traffic manager of the Sheffield Condensed Milk Company, Inc., and the Sheffield Farms Company, Inc., both of New York, with headquarters in that city.

Suits against the Southern Pacific and the Atchison, Topeka & Santa Fe for damages said to have resulted from non-delivery of cars for transportation of grapes in 1917, have been filed in the Superior Court at Sacramento, Cal., recently by the Earl Fruit Company, San Francisco, Cal. Aggregate damages in excess of $100,000 are asked.

J. R. Bremner, traffic manager of the Association of Commerce of Madison, Wis., has been appointed traffic manager of the South Bend (Ind.) Chamber of Commerce. Prior to his service in the industrial traffic field, Mr. Bremner was employed for 20 years in the traffic departments of the Chicago, Burlington & Quincy and the Union Pacific.

The Canadian Railway War Board in a recent circular calls attention to the practice in vogue on certain railways of using standard bill of lading forms for the conveyance of instructions from the consignor to the carrier covering the shipment and routing of empty tank cars without charges. There has been misunderstanding as to the responsibility of the carrier in such cases and the Board directs that the standard bill of lading forms be used only in connection with revenue bearing traffic. Billing instructions covering the movement of empty cars should be furnished by letter.

Wilmer W. Wood, traffic manager of the United States Cast Iron Pipe & Foundry Company, Philadelphia, Pa., has been appointed general freight agent of the Kerr Steamship Company, Inc., New York City. Prior to his seven years of service with the pipe company, Mr. Wood was connected with the traffic and transportation departments of the Pennsylvania Railroad.

Chinese merchants and students, to the number of 346, recently passed over the Southern Pacific from San Francisco to New Orleans (leaving San Francisco October 11) bound for South America to study commercial and educational methods. These passengers, traveling in a train of 15 coaches, were not allowed to step out of the cars while en route, guards being posted at all of the doors to guard against violations of the Chinese exclusion law.

The opinion of the Interstate Commerce Commission in the consolidated classification case has been turned over by the director of the Division of Traffic of the Railroad Administration to the Consolidated Classification Committee for analysis and report. It will be the duty of the committee to prepare for submission to the director general a modified consolidated classification which will not conflict with the views expressed by the commission, and which, if approved by him, could be promptly filed to supersede existing classifications.

As a result of the experiences of the city of Los Angeles, Cal., during the recent unauthorized strike of employees on the railroads entering that city the Los Angeles Chamber of Commerce, through its Board of Directors, has called on the Chamber of Commerce of the United States to start a national movement to make it a criminal offense for two or more persons engaged in public utility work to enter into a conspiracy to render such an industry impotent in order to compel settlement of some grievance. At Los Angeles two per cent of the population on strike paralyzed rail transportation and isolated the city from the rest of the country.

Improper storage of cotton is the subject of a vigorous note which has been issued by B. L. Winchell, regional director, Southern Region, United States Railroad Administration, and circulated among cotton growers and others in the southern states. Quoting data from a report prepared by the Department of Agriculture, Mr. Winchell declares that millions of dollars are lost every year through improper storage. A bale weighing 492 lb., stored flat on the ground for six months lost 232 lb., which, at 30 cents a pound, meant a loss of $69.60. The Agricultural Department made tests with seven bales. This bale during the test absorbed moisture until it weighed 912 lb., but at the end of six months, 232 lb. had moulded and was worthless. A bale standing on end on the ground lost 120 lb.; one on edge lying on the ground, but turned about once a week, lost 22 lb. A bale standing on edge and covered with tarpaulin lost only four pounds.

The Southern Pacific Company has protested to the United States Railroad Administration against the proposed change in fares which will make travel to the Pacific Coast from eastern states not bordering on the Atlantic much more expensive via New Orleans than over the more direct Ogden route. The Railroad Administration bases fares on mileage, but the protestant claims that this will lessen the available trains to California for a large part of the population of the United States, except on the basis of excess fares. While the distance from eastern cities to San Francisco via New Orleans is 1147 miles greater than by way of Ogden, the distance to Los Angeles via the Ogden route is but 188 miles greater than the distance to the same city by way of New Orleans. Objection is also raised to the mileage basis because of the other factors such as climate and scenic interest, which influence tourists. Finally, attention is called to the fact that, under the new rates, travelers eastward bound from California can reach points in the south by way of Chicago as cheaply as they can by way of New Orleans, although travelers from the East cannot reach California by the New Orleans route without paying additional fares.

Northwestern Transportation Committees

Special transportation committees have been appointed in the Northwestern region as follows: At Chicago, F. H. Rutherford, chairman, superintendent terminals C. & E. I.; W. W. Wade, assistant superintendent, M., St. P. & S. S. M.; A. E. Lloyd, superintendent Western Division, N. Y. C.; and Robert C. Ross, traffic manager, Joseph T. Ryerson & Son, Chicago.

At Duluth and Superior, Minn., H. J. Councilman, chairman, trainmaster, N. P.; W. D. Boyce, trainmaster, M., St. P. & S. S. M.; J. J. Nealey, trainmaster, C., St. P., M. & O., and F. S. Keiser, traffic commissioner, Commercial Club, Duluth, Minn.

At Portland, Ore., F. N. Finch, chairman, assistant general manager, O.-W. R. & N.; E. E. Lillie, assistant general manager, S., P. & S.; E. Lyons, general manager, N. P. Terminal, and J. H. Lothrop, secretary traffic and transportation association, Portland, Ore.

At Seattle and Tacoma, Wash., J. H. O'Neill, chairman, general superintendent, G. N.; I. B. Richards, general superintendent, N. P.; W. B. Foster, general superintendent, C., M. & St. P., and J. D. Mansfield, traffic commissioner of New Seattle Chamber of Commerce, Seattle, Wash.

At St. Paul and Minneapolis, Minn., P. L. Clarity, chairman terminal superintendent, G. N.; G. A. Van Dyke, terminal superintendent, C., M. & St. P.; L. A. Mixener, assistant general freight agent, C., St. P., M. & O. and Joseph H. Beek, traffic director, St. Paul Association.

Freight Movement November 10-17

According to a report on traffic conditions for the week ended November 17, made to Director General Hines, the revenue freight loadings and receipts from connections for the various regions were as follows:

Eastern Region, revenue freight loaded 203,653 cars, a decrease of 4,335 cars under corresponding week last year; receipts from connections, 242,032 cars, a decrease of 8,236 cars under last year; Allegheny Region—revenue freight loaded, 172,390 cars, a decrease of 32,607 over last year; received from connections, 166,223 cars, a decrease of 24,836 under last year; Pocahontas Region—freight loadings, 34,487 cars, a decrease of 1,594 cars under last year; receipts from connections, 15,737 cars, a decrease of 4,471 under last year; Southern Region—freight loadings, 109,566 cars, a decrease of 7,225 under last year; receipts from connections, 73,967 cars, an increase of 577 cars over last year; Northwestern Region—freight loadings, 139,103 cars, an increase of 10,430 cars over last year; received from connections, 73,249 cars, an increase of 1,647 over last year; Central Western Region—freight loadings, 116,323, an increase of 11,334 cars over last year; receipts from connections, 71,702, an increase of 12,727 over same week last year; Southwestern Region—revenue freight loadings, 61,624 cars, an increase of 7,054 over last year; receipts from connections, 51,753 cars, an increase of 6,066 over last year.

Anthracite Shipments for October

The record for anthracite shipments for this year was made in October, 6,560,150 gross tons, the largest record since August, 1918. Shipments exceeded those of September by nearly 880,000 tons, and showed an increase over October, 1918, of 273,784 gross tons. The total shipments for the present coal year have amounted to 41,000,250 gross tons as compared with 38,092,613 tons in the normal year 1916-17.

The shipments by railroads were as follows:

	October 1919	October 1916	Coal Year 1919-1920	Coal Year 1916-1917
P. & R.	1,240,001	1,206,570	7,939,838	7,182,849
L. V.	1,209,345	1,073,176	7,552,394	6,992,276
C. of N. J.	639,924	538,031	3,785,154	3,707,753
D. L. & W.	963,618	946,945	6,341,692	5,941,961
D. & H.	797,041	589,636	4,730,605	4,148,447
Penna.	465,544	480,920	2,926,615	3,226,469
Erie	698,613	623,383	4,500,633	4,301,230
N. Y. O. & W.	187,926	132,291	1,202,978	1,121,892
L. & N. E.	358,138	279,252	2,020,341	1,469,736
	6,560,150	5,870,204	41,000,250	38,092,613

Five Years' Troop Movements on Canadian Railways

In a memorandum addressed recently to the Minister of Militia of Canada, Maj.-Gen. J. Lyons Biggar, quartermaster general of the Canadian Army, set forth statistics regarding "the admirable services" of the railway and steamship companies in the movement of troops during the war. The following is the number of troops which have been carried by the various railways:

CANADIAN PACIFIC	Mobilization	Demobilization
Canadian troops	153,826	175,567
United States troops	54,810	.....
Chinese coolies for overseas	81,530	.....
French battalion, Serbian, Montenegrin and Polish reservists	16,103	.....
Imperial troops	.....	9,032
Total	306,269	184 599
GRAND TRUNK		
Canadian troops	200,273	105,259
United States troops	118,180	.....
Total	318,453	105,259
CANADIAN NATIONAL		
Canadian troops	339,172	267,436
United States troops	5,843	.....
Total	345,015	267,436

The number carried by the Canadian Pacific steamships was as follows:

CANADIAN PACIFIC	Eastbound	Westbound
Canadian troops	121,097	80,811
United States troops	18,407	2,120
Chinese coolies	37,034	3,120
Prisoners of war	1,424	.....
Total	177,962	86,051

Commission and Court News

Railway companies subject to the jurisdiction of the Board of Railway Commissioners for Canada have been granted an extension of time until September 30, 1920, within which to equip freight cars with safety appliances as required by a recent order of the Board.

Pursuant to a Senate resolution calling for information as to the present or prospective ownership or control by the Canadian government of railways in the United States the Interstate Commerce Commission has ordered a proceeding of inquiry and investigation.

The Interstate Commerce Commission's monthly report of railroad earnings and expenses, covering 186 Class 1 roads, and 17 switching and terminal companies, shows gross revenues for September of $498,762,533 and railway operating income of $186,675,721. The details are as shown in the table. Operating income amounted to $349 per mile of road operated, which compares with an average of $415 for September in the three-year test period ended June 30, 1917.

The Quebec, Montreal & Southern has been granted permission by the Board of Railway Commissioners for Canada to increase its standard passenger fares from 3.45 cents to 4 cents a mile between all stations. The application was accompanied by detailed statistics showing the deficits incurred on the road from year to year, the density, average journey and average fare as compared with all other Canadian railways and the percentage of general expenses to total operating expenses.

The Interstate Commerce Commission Bureau of Valuation has served tentative valuations in the cases of the Northern Dakota, the Savannah & Northwestern, the Talbotton, the Santa Fe, Raton & Eastern, the Evansville & Indianapolis, the St. Francois County Railroad (Missouri) and the Mississippi River & Bonne Terre. The commission has also announced a series of hearings on protests of carriers to its tentative valuations before Examiner Flynn at Washington, the case of the Flint River & Northeastern on November 5, the Louisville & Wadley November 6, the Wrightsville & Tennille November 7, and the Norfolk Southern November 17.

Inspection of Stationary Boilers in Canada

The Board of Railway Commissioners for Canada has requested Canadian Railway companies subject to its jurisdiction to file with the Board an expression of opinion on the question as to whether inspection of railway steam boilers other than locomotive boilers should be performed by provincial inspectors or otherwise. These expressions of opinion are requested because of the fact that the attention of the board has been drawn by provincial authorities to the existing conditions under which such inspections have not been performed by provincial inspectors in one or two of the provinces for the reason that the railway companies claim that in complying with the orders of the board they have fulfilled their obligations. The result has been, it is claimed, that the protection aimed at by the different acts is defeated and the public is not safeguarded.

Personnel of Commissions

U. G. Powell and V. E. Wilson, formerly of the Railway Commission of Nebraska, have resigned and formed a partnership for the practice of law, with office at Lincoln, Neb.

William Gerig, engineer at Anchorage, has been appointed assistant chief engineer of the Alaskan Engineering Commission, in place of W. C. Edes. Mr. Edes retains his office as chairman of the commission.

Charles W. Needham, assistant counsel in the Bureau of Law of the Interstate Commerce Commission, has been appointed solicitor of the Bureau of Valuation to succeed C. A.

Benton, who has resigned to succeed C. E. Elmquist as solicitor of the valuation committee of the National Association of Railway and Utilities Commissioners.

State Commissions

The State Railroad Commission of Wisconsin has undertaken a campaign for the elimination of dangerous grade crossings and Colonel H. M. Tripp, formerly associated with the Valuation Division of the Interstate Commerce Commission has been appointed grade crossing engineer, to conduct the campaign.

The Railroad Commission of California recently stated in an opinion, accompanying an order awarding the Ventura Refining Company reparation for overcharges on shipments of refined petroleum from Fillmore, Cal., to Los Angeles, Slauson and Colton over the Southern Pacific, the Atchison Topeka & Santa Fe, the Los Angeles & Salt Lake and the Pacific Electric, that "a more aggravated case of prejudicial and unreasonable treatment would be hard to find." The award, amounting to thousands of dollars, covers shipments of petroleum products made from January 1, 1916, to December 27, 1917, the date upon which the government took over the railroads.

Holding that the United States Supreme Court has sustained the contention of the Southern Pacific that the Railroad Commission of California has no jurisdiction in the matter of determining the switching limits of the railroads in San Francisco, Cal., or over the matter of carload rates between San Francisco and South San Francisco, the commission recently ordered a dismissal of the action brought against the Southern Pacific by the South San Francisco Chamber of Commerce. The action was originally brought to bring South San Francisco within the San Francisco switching limit. The case was heard in February, 1918, and subsequently a supplemental answer questioning the jurisdiction of the commission was filed by the Southern Pacific. This answer was later sustained by the Supreme Court, which held that the Federal government had the sole power over such rates.

Court News

Inexcusable Delay to Live Stock

The Texas Court of Civil Appeals holds that a railroad cannot justify 17 hours' delay in transportation of live stock on the theory that it was complying with the law forbidding the working of a train crew more than 16 hours at a time, since it will be presumed that the railroad company has more than one train crew available—K. C. M. & O. v. Cliett (Tex.), 207 S. W. 166.

Fire from Sparks—Kentucky Rule

The Kentucky Court of Appeals confirms the rule, first handed down in 1890 and never departed from, that if a railroad company in that state equips its locomotives with spark arresters, as required by Ky. St. §782, and operates them with due care, it will not be liable for damages occasioned by fires set from sparks.—Hartford Fire Ins. Co. v. Cincinnati, N. O. & T. P. (Ky.), 206 S. W. 628.

Licensees on Railroad Premises

The Arkansas Supreme Court holds that a person who, without being expressly or impliedly invited to enter a railroad station, entered the building to ascertain if certain friends of his were there was a mere licensee, and could not recover from the company for injuries caused by falling down an open stairway in a baggage office he had entered to ask a porter about his friends.—Rock Island v. Russell (Ark.), 206 S. W. 666.

Twenty-Eight Hour Law

A railroad delivered a shipment of hogs at the proper place according to the car tickets before the expiring of the time to unload under the 28-hour law. The consignees refused to accept the shipment, because the car tickets made by a connecting carrier did not agree with the bills of lading, which called for delivery at another point; and the time for unloading expired before the shipment could be redelivered. Further delay was caused by the refusal of another connecting carrier to accept the animals after the government inspector had ordered them unloaded for rest and feed. The federal district court for the Eastern District of Pennsylvania holds that there was no willful disobedience of the act, or even negligence, and that the carrier was not liable for the penalty.—United States v. Allentown Terminal R. Co., 256 Fed. 855.

United States Supreme Court

Workmen's Compensation for Facial Disfigurement.

The Supreme Court of the United States holds that a State, in administering a Workman's Compensation Law, may take into consideration, in ascertaining the amount of compensation, any substantial physical impairment attributable to the injury, whether it immediately affects earning capacity or not.

The cases in which the question arose involved the constitutionality and validity of the 1916 amendment to the New York Workmen's Compensation Act, section 15, providing that in case of an injury resulting in serious facial or head disfigurement the Commissioner may, in its discretion, award compensation, not to exceed $3,500. The defendants' sole contention was that this would deprive them of their property without due process of law. The court holds that the "due process of law" clause does not require the states to base compulsory compensation solely upon loss of earning power. Whether an award for such disfigurement should be made in combination with or independent of the compensation allowed for the mere inability to work is held a matter of detail for the State to determine. Mr. Justice McReynolds dissenting.—New York Central v. Bianc. Decided November 10, 1919.

Collecting Undercharges in Rates

A railroad delivered to a consignee two boxes of Indian relics shipped to him at Dayton, Ohio, from Los Angeles, Cal., the waybill specifying charges of $15, which the consignee paid on receipt of the goods. By the filed tariff the charge should have been $30. The railroad sued the consignee for the difference. The Supreme Court of the United States holds that under section 6 of the Act to Regulate Commerce, which controls the case, it was unlawful for the carrier to depart from the tariff rates. For the legal charges the carrier had a lien upon the goods and the consignee could become entitled to the goods only upon tender or payment of the legal rate. This may be a hardship on the consignee, but instances of individual hardship cannot change the policy of Congress to secure uniformity in rates. The court followed Louisville & Nashville v. Maxwell, 237 U. S. 94, where this rule was enforced as against a passenger who had bought a ticket from an agent of the company at less than the published rate. It was immaterial that the consignee did not become owner of the goods until after they were delivered to him. And the doctrine of estoppel could not be invoked to avoid the requirement of the act as to equal rates.—Pittsburgh, Cincinnati, Chicago & St. Louis v. Fink. Decided November 10, 1919.

Famous Georgia Railroad Taxation Case

The Supreme Court of the United States has just handed down what is probably the final decision in a litigation which has been before the court since 1874, between the Comptroller General of the State of Georgia and the Central of Georgia Railroad, in respect of taxes on the Augusta & Savannah and other Southwestern roads, leased in perpetuity by the Central of Georgia.

The opinion of the court, by Mr. Justice Holmes, which is substantially as follows, sets forth the course and result of the litigation. At last term it was decided that the Central of Georgia was exempt from liability as lessee of certain roads, 248 U. S. 525, as it had been decided a few terms earlier that it was exempt from taxation upon the fee of the same roads, 236 U. S. 674. A rehearing was granted on the question whether the exemption thus adjudged to exist extends to portions of the railroad let to the Central of Georgia by the Southwestern and the Muscogee railroads, which were assumed to be embraced in the decision, but which were not specially discussed. The consideration of the court was directed especially to the charter of

the Augusta & Waynesboro road granted in 1838 and having features characteristic of the conception of railroads then entertained. It was argued that the charters of the other lessors just named, granted at a later date, even when limiting the corporation's liability to taxation in similar words, should be construed in a different way.

The charters of the Southwestern and the Muscogee roads were not granted until 1845, and while like the earlier ones they provided that the said railways and its appurtenances and all property therewith connected, or the capital stock of the said railroad company, should not be subject to be taxed higher than one-half of one per cent upon its annual net income, they did not contain the provisions that showed the legislature in 1838 to contemplate indifferently a revenue derived from using, from sharing, or from letting the special privileges granted—provisions that were of weight in the decision of the court.

The Supreme Court is satisfied that between 1838 and 1845 there had been no such change in the policy of Georgia as to require the same words to be given a different meaning at the later date from that which the Supreme Court has decided that they had at the former. Circumstances had not changed when express power to let was given in 1852. The Muscogee was merged in the Southwestern under an act of 1856, but the exemption remained superior to legislative change. No real distinction could be made between the charter of the Augusta & Waynesboro and those of the Southwestern and Muscogee roads. The decision of last term, deciding against the state's contention, was therefore adhered to.—Central of Georgia v. Wright. Decided October 27, 1919.

Justices McKenna, Pitney, Brandeis and Clarke dissented, but without written opinion.

Two-Cent Fares—Division of Operating Expenses Between Freight and Passenger Services

When the Duluth, South Shore & Atlantic won its suit restraining the enforcement of the Michigan two-cent fare act of 1911 (repealed this year) the railroad was required to issue to all intrastate passengers receipts by which it agreed to refund, if the act should be held valid, the amount paid in excess of a two-cent fare. Later, the railroad was required to deposit, subject to the court's order, such amounts thereafter collected. The fund now on deposit exceeds $800,000, and the refund coupons are still outstanding. In order to determine the rights of coupon holders and dispose of this fund it was necessary to decide whether the act of 1911 was, as respects this road, confiscatory. The district court found that the two-cent fare would have resulted in a return on intrastate passenger business of less than two per cent during the six years ending June 30, 1917. The State contends that this was error, due partly to the district judge having included in his calculations property and operations which should have been excluded, and partly to his having adopted improper formulas for the division of common charges and expenses as between the freight and passenger services; and that if these specific errors were corrected it would appear that the two-cent fare would have been highly remunerative.

The Supreme Court of the United States has affirmed the decree of the district court. Regarding the formula adopted for dividing charges and expenses common to freight and passenger services, the court says that what method should be pursued in making such division is a very difficult problem to which railroad accountants, the Interstate Commerce Commission, and State railroad commissions have for years given serious attention. The Interstate Commerce Commission, upon its organization July 1, 1887, required the railroads to report operating expenses separately as between these services. The difficulties were so great and the results so widely discredited that the requirement was withdrawn in 1894. It was restored in 1915. In the interval railroad accounting had in this respect made gradual advances. Despite much patient study and the exhibition of great ingenuity no wholly satisfactory method has yet been devised. The variables, many of them due to local conditions, are numerous; and experience teaches that it is much easier to reject formulas claimed to be misleading than to find one apparently adequate. The science of railroad accounting is in this respect in process of development; and it may be long before a formula is devised which can be accepted as satisfactory. The court could not say that the lower court erred in adopting the method it pursued. —Gresbeck v. D. S. S. & A. Decided November 10, 1919.

Foreign Railway News

Colonel C. S. Coe, of St. Augustine, Fla., is reported by the Associated Press as having been appointed by the Jugo-Slav republic to take charge of railroad construction. Colonel Coe served during the war as commander of the Seventeenth Railway Engineers.

Railway Extension in Brazil.—Consul Edward Higgins, Bahia, Brazil, reports that work is to be resumed on the extension of the Estrada de Ferro de Nazareth, the legislature of the State of Bahia having opened a credit for the carrying on of the work. This line has in operation 221 km. (137 miles); 30 km. (19 miles) in course of construction, and 35 km. (22 miles) surveyed. Work on this extension has been suspended since June, 1918, because of the failure of the state to appropriate money for construction.

Deficit on the Swiss Railways

LONDON

An abstract from Modern Transport states that this year's deficit on the Swiss railways is estimated at £8,000,000.

Electrification on Railways in the Silesian Mountains

LONDON.

The London Technical Review gives an extract from the Elektrotechnische Zeitschrift by E. C. Zehme, in which it is stated that as the total available water power (9,400 kw. peak load) was not sufficient to run the railways, a generating station burning a local low grade coal was erected at Mittelsteine to supply single phase alternating current at 15,000 volts, 16¾ cycles.

The total length of the railways served is 500 km. of track, and the grades and curvatures are particularly severe.

Swedish Ferry Line to England

LONDON.

Detailed plans have been prepared, states the Technical Review, for transporting railway cars between England and Sweden. A daily service could be maintained by four boats, each country building two, and working them on the same lines to those now in operation between Sweden and Germany, that is, loaded cars are run on to rails laid on the deck of the ferry boats and landed on completion of the voyage without the goods breaking bulk. It has also been suggested that Norway and Denmark should join in the scheme, as this would considerably improve the return on the expended capital.

British Freight Cars for Belgium

LONDON

The Belgian Minister of Railways, states Modern Transport, has bought from the British Government, 8,750 freight cars, formerly used by the British Army, which are still in France.

Railway Construction in South America

LONDON.

An abstract from Modern Transport states that plans have been prepared, for the construction of the last stages of the Potosi-Sucre Railway, in Bolivia. The total length is 170 kilometers of which 50 are almost ready for service. The sum of 25,000,000 pesos, gold, is to be expended upon the electrification of the first zone of National railways in Chile. The Valparaiso-Santiago railroad is comprised in the zone. Construction upon the Trujillo railway, Honduras, between kilometers 46 and 66 has been completed and opened to public traffic. The Uruguayan Government proposes to extend the track of the Uruguayan Eastern railway from Punta del Este to Maldonado, a distance of five kilometers.

Railway Construction in Chosen

The American Consul General at Seoul, Chosen, reports that the Government General has granted permission for the con-

struction of two broad gage, light railway lines in North Chosen, primarily for the exploitation of the forests along the Yalu and Tumen Rivers, and the development of the mining industry in that region.

One line, the Chosen Forest Railway, will run from Hamheung, South Hamkyong Province, to Huchang, North Pyongan Province. The other railway, the Ryoko Takurin Tetsudo, will consist of two lines, one running from Komusan and the other from Kilju, North Hamkyong Province, to Haisanchin.

The total length of these lines will exceed 200 miles and involve a capitalization of about $12,500,000. The establishment of a paper mill at Hamheung is contemplated.

Railway Developments in Chile

London.

The London Times Engineering supplement states that the Public Works Department of Chile is preparing studies for important constructional work, including new railways, upon which $2,000,000 is to be expended for equipment. The completion of the new railway between the capital, Santiago and Valparaiso by way of Casablanca will be the first to be undertaken. It is estimated that the cost will be approximately 45,000,000 Chilean paper pesos or at the present rate of exchange would be £2,432,-432. This line it is proposed to work by steam, but the existing line between Valparaiso and Santiago will be converted to electrical operation in the near future.

Other work to be carried out includes the proposal of the construction of a line from Larrain Alcalde to Pichilemu, the project for a new reinforced bridge over the Maipo River, on the Paine-Talagante line, and the completion of the various plans and estimates for the railway from Los Angeles to Santa Barbara and Quilleco.

The Ayacucho-Cuzco Railway of Peru

Press despatches from Lima, Peru, report that criticism is being voiced regarding the government resolution of August 20, which stipulates that the gage of the Huncayo-Ayacucho-Cuzco Railway shall be one metre. Some of those interested in the project are inclined to believe that it should be the standard gage of 4 ft. 8½ in., the same that has been used on the Central and Southern Railroads.

It is claimed by others that the cost of construction entailed by the standard gage would be prohibitive. It is recognized that a uniform gage would be desirable, but since this is impossible the adoption of the meter gage would make it possible to link up the Government roads of Bolivia, Chile, Argentina and Uruguay.

The Ayacucho-Cuzco Railroad is one of the most important projects now being pushed by Peru, for it will open up a rich interior region and will also put the capital in railroad communication with the southern part of Peru and make unnecessary the ocean trip from Callao to Mollendo.

Railway Extensions in Morocco

London.

The London Times Trade Supplement states that the railways of the French Protectorate of Morocco extend today over a length of nearly 1,000 kilometres. The system is divided into two sections—respectively the Eastern and Western Moroccan Railways. These lines are all of narrow gage—60 cm.—and were constructed for military purposes, but are now open as commercial railways and for passenger traffic.

The Eastern section begins at Ujda, near the Algerian frontier, and is completed as far as a point between Taza and Fez. The distance from Ujda to Taza is 235 kilometres. Ujda is in turn connected with Algeria by an extension of the West Algerian Railway. Between Taza and Fez the line is nearing completion and should shortly be open to traffic. When trains run between these two towns there will be uninterrupted rail communication between Tunis and Casablanca.

The Western section extends over 622 kilometres. From Rabat-Salé the line runs north and east to Kenitra, Mekinez, and Fez (247 kilometres), and southwards to Casablanca and on to Oued Zem *via* Ber Rechid, with a branch from Ber Rechid to Kaid Tounsi and Ben Guerir. On both Eastern and Western sections trains run regularly. The recent extension of the line to Ben Guerir brings Marrakesh, the southern capital within 70 kilometres of the railhead, and on this section work is already in hand. It is expected that trains will be running to Marrakesh next year.

Over the River Bou Regreg between Rabat and Salé an important road and rail bridge is being erected which will do away with the existing inconvenience of the ferry and will form the connecting link between the lines Salé-Fez and Rabat-Casablanca.

In spite of the narrow gage of these lines they have rendered very important services in the opening up and trade of Morocco. The tariffs for passengers are:—First class, 50 centimes; second class, 30 centimes; and third class, .08 centimes per kilometre, with an allowance of 30 kilos of baggage free. Merchandise is carried at rates varying between 30 centimes and 50 centimes per ton per kilometer, according to classification of goods. These tariffs are the same all over the railways of the French Protectorate. These existing railways are only of a more or less temporary nature and are merely the forerunners of an extensive system of commercial lines, the construction of some of which is already in hand.

Tangier-Fez Line.

By the Franco-German agreement of November, 1911, it was stipulated that the Tangier-Fez line should be the first commercial railway to be constructed in Morocco. It was not, however, until 1914 that the concession of the line was accorded to a Franco-Spanish company. This line will have a total length of 310 kilometres, of which 240 are in the French Protectorate and the remainder in the Spanish with the exception of a few kilometres in the Tangier zone. In the French sphere of influence the greater part of the work has already been tendered for and is making good progress. The small section which falls in the Tangier zone and one of the three sections of the Spanish zone have already been put up to tender, and work will be begun almost immediately.

The importance of the Tangier-Fez railway cannot be exaggerated. It will form, when completed, the northernmost section of a great series of African railways, which will reach in time both the British and French colonies of West Africa, and doubtless extend beyond them in the future. It will connect Tangier, the port of Africa nearest to Europe, by rail with Tunis, and, when the Tunis Tripoli-Egypt rail is built, with Cairo. It will also greatly facilitate communication with South America. But its immediate result will be to connect Europe with the flourishing French Protectorate of Morocco. The entire absence of roads in the Spanish zone still renders overland communication always difficult and often impossible, and the only sure means of reaching the French Protectorate from Tangier is by a 12 hours' sea voyage to Casablanca. That the Spanish Government during its seven years of occupation has not yet built this 50 miles of necessary road through its zone gives little hope for the future of that portion of Morocco which has fallen to Spain's share.

Apart from the Tangier-Fez railway, the concession for the remaining commercial lines has been accorded to a consortium representing the great railway companies of France. The gage will be throughout 1 metre 44 cm. (4 ft. 8½ in.). The lines to be constructed are:

	Kilometres.
Casablanca-Kenitra	145
Kenitra-Petit Jean	85
Kenitra to a junction of the Tangier-Fez in the Gharb district	80
Casablanca Marraketh	240
Fez to Algerian frontier	320

The total length is 870 kilometres, serving all the principal centres and towns of French Morocco. There will be added to this system of broad-gage railways a network of light railways through the great grain-producing and mineral districts, by which produce and ore will find their way to the coast for exportation. It is a highly satisfactory program. It is already in hand and its speedy accomplishment can be confidently looked for.

Electrification of Railway From Stockholm to Gotenburg

London.

An extract from the Board of Trade Journal by the Technical Review states that preparations are now being made by the Swedish Railway Administration for the electrification of the

Stockholm and Gotenburg railway. A government bill providing for a grant for this purpose is to be laid before the Riksdag next session. The power required is estimated at 30,000 kw., and will be obtained from the Trollhattan and Motalastrom Falls at the rate of about 15,000 kw. from each. Transformer stations will be erected at about fourteen places on the line. The expenditure for the complete electrification is estimated at about 60 million kroner net. The work is to be commenced next year, provided that the necessary grants are made by the Riksdag, and should be completed in about three years. The journey between Stockholm and Gothenburg, after the electrification should take less than six hours instead of the present eleven hours.

Railway Notes from South Africa

(Special correspondence from Johannesburg)

August 11.

Now that peace has been declared, it is hoped that normal conditions will be restored at no distant date and that the Administration's long pending requisitions for rolling stock, will be completed in the near future. The resumption of excursion traffic, however, will be out of the question until the majority of the locomotives which are on contract have been delivered. The South African Railway Administration in March last had on order 187 engines. Besides there remain to be delivered 14 large bogie tenders, 414 coaches of various types, 203 of which are being constructed in South Africa, and 3,994 goods vehicles. During the fifteen months preceding June, 1919, there have been put in service 56 new locomotives, 30 new 3 ft. 6 in. coaches, consisting of 17 main-line saloons and 13 suburban coaches; 34 highsided 50-ton steel bogies, 5 bogie goods guard vans, 2 breakdown vans, 6 bogies and 3 short goods guard vans. The locomotive stock of the Union government as at the end of June last consisted of 1,566 locomotives of 3 ft. 6 in. and 52 of 2 ft. gage. The number of coaches in stock at that date was 2,632 of 3 ft. 6 in. and 93 of 2 ft. gage. The total wagon stock as at the end of March, 1919, was as follows:

Class.	8-wheel.	6-wheel.	4-wheel.	Total.
Wagons	10,389	207	16,253	26,849
Vans	203	6	488	697
Miscellaneous	120		497	617
Narrow Gage				515
Cranes				106
	10,712	213	17,238	28,784

One of the most striking features of the commercial development of the Union of South Africa is the rapid rise of the coal industry, the tonnage consigned from the various collieries of the Union for the financial year ended March 31, 1918, totalling 10,433,385 tons as compared with 4,438,385 tons despatched during 1906. The railway revenue derived from this commodity amounted to £3,083,204 for the financial year. The importance of the coal traffic can be gaged from the fact that for the year 1918-19, the percentages of earnings derived under the heads, Passengers and Coal, were respectively 27.55 and 20.18, the figures for the period April 1 to May 31, 1919, being in turn respectively 27.50 and 21.20.

In 1918 all the new lines authorized by Parliament in 1913—the second program of new construction since Union—were completed and it is anticipated that the districts now most in need of railway communication will be given due attention in the near future.

The question of the establishment of a grain elevator system in the Union is at present engaging the attention of the Administration, and an engineer has toured the various grain centres. His report will soon be in the hands of the government.

The question of electrifying certain sections of the Union's railway system has been under contemplation for some time past and is still a live topic.

The housing problem is at present exciting keen interest of railway employees. The 8-hour day or 48-hour week is being gradually introduced.

The establishment of a Conciliation Board is at present in Embryo. It is proposed that the board be constituted of five members nominated by the Minister of Railways and Harbors, one of whom to be chairman, and five members representing various sections of the service, one of the five to be vice-chairman.

Equipment and Supplies

Freight Cars

John R. Walsh, Savannah, Ga., has ordered three 8050-gal. tank cars from the Pennsylvania Tank Car Company.

The Delaware, Lackawanna & Western is figuring on remodeling some 1,900 of its old equipment to steel underframe box cars.

The Mid-Co Gasoline Company, Tulsa, Okla., has ordered ten 10-000-gal. tank cars from the Pennsylvania Tank Car Company.

The Conley Company, Pittsburgh, Pa., has ordered five 8050-gal. tank cars from the Pennsylvania Tank Car Company. This is in addition to 25 recently ordered from the same company.

Iron and Steel

The New York Central is in the market for 150,000 tons of steel rail for 1920 requirements.

Signaling

The Fort Wayne & Northern Indiana Traction Company has ordered from the Union Switch & Signal Company, Swissvale, Pa., a Saxby & Farmer interlocking for Bluffton, Ind.; eight levers.

The Union Pacific has ordered from the General Railway Signal Company two electric interlockings for Omaha, Neb., to take the place of machines installed several years ago, in Towers A and B. The larger machine will have 64 levers, and the other will consist of 37 levers added to a 40-lever machine now in service. The work of installation will be done by the signal company's men.

Miscellaneous

Sophus Berendsen, 15 Broad Street, New York, is inquiring for 300 railroad jacks for export to Denmark.

View of Talcahuano, Chile

Supply Trade News

The Southern Wheel Company, St. Louis, Mo., is considering plans for additions to its plant, to cost approximately $400,000.

The Chesapeake Iron Works, Baltimore, Md., have opened an office in the Woolworth building, New York, in charge of **H. L. Mode.**

The Bucyrus Steam Shovel Company, Evansville, Ind., is building an addition to its plant which will cost approximately $500,000.

K. C. Gardner, who has been appointed manager of sales for the Central district of the **Pressed Steel Car Company** and the **Western Steel Car & Foundry Company,** with offices in the Farmers Bank building, Pittsburgh, Pa., as was announced in our Emergency Bulletin of October 20, entered the employ of the Pressed Steel Car Company in 1901, and was connected with the operating department at McKees Rocks, Pa., until 1911. He was transferred to the New York office, remaining there for a period of eight years, and on January 1, 1919, returned to Pittsburgh as assistant manager of sales, Central district, which position he held until his recent promotion to the position of manager of sales of the same district.

K. C. Gardner

Frank D. Lyman, managing director of the Lyman Tube & Supply Co., Montreal, Que., died in that city recently at the age of 42 years.

Joseph E. Nelson & Sons, Chicago, contracting engineers, have moved their office from 118 N. La Salle street to 3240 S. Michigan boulevard.

The Engineering Service Corporation of Illinois, successor to the W. K. Palmer Company Engineers, has recently moved its offices into new quarters at 15 West Tenth street, Kansas City, Mo.

The **Ralston Steel Car Company,** Columbus, Ohio, has opened an office at 20 E. Jackson boulevard, Chicago, in charge of **Ford S. Clark,** formerly of the Philadelphia office of the concern.

J. M. Nelson, general superintendent of the **Algoma Steel Corporation,** with headquarters at Sault Ste. Marie, Ont., has resigned. **George Scholl,** superintendent of the rolling mills, will succeed Mr. Nelson.

The strike of the employees at the Hammond plant of the **Standard Steel Car Company** has been officially declared off, with the return to work of the blacksmiths. The car workers returned to work some time ago.

General Guy E. Tripp, chairman of the board of the Westinghouse Electric & Manufacturing Company, has been elected a director of the **American International Corporation,** to succeed J. Ogden Armour, resigned.

F. C. Wallace, of Pittsburgh, Pa., has withdrawn his resignation as president of the **Canadian Locomotive Company,** Kingston, Ont., and will continue in office. He has been granted a six-months leave of absence.

Construction work on the $1,500,000 addition to the plant of the **Scullin Steel Company** at St. Louis, Mo., is nearing completion. The addition includes rolling mills for merchant bars, reinforcing rods and structural shapes.

W. H. Scales, chief designing engineer of the **Lackawanna Bridge Company,** with headquarters at Buffalo, N. Y., has resigned to become associated with W. E. Russ, architect, of Indianapolis, Ind., as chief of engineering and construction.

A. W. Swan, of the sales department of the **Canadian Ingersoll-Rand Company,** Sherbrooke, Que., with headquarters in that city, has been appointed assistant secretary of the Engineering Institute of Canada, with office at Montreal, Quebec.

John Kopf, formerly associated with the Bureau of Air Craft Production, with headquarters at Dayton, Ohio, has been appointed manager of the engineering department of the **Duff Manufacturing Co.,** Pittsburgh, Pa., with office in that city.

The Chicago Heights, Ill., plant of the **Chicago Pneumatic Tool Co.** has been purchased by the Giant Truck Corp. Equipment other than the chassis manufacturing machinery of the Chicago Pneumatic Tool Co. has been removed to its Cleveland, Ohio, plant.

The **Roberts & Schaefer Company,** engineers and contractors, Chicago, has just closed a contract with the Saint Clair Terminal Railroad for building a reinforced concrete automatic electric locomotive coaling and sanding plant, for installation at Clairton, Pa.

Louis J. Schneider has been appointed general sales manager of the **Clark Tructractor Company,** Chicago. Mr. Schneider is a graduate of Stevens Institute of Technology, Hoboken, N. J., and is a member of the Society of Automotive Engineers, as well as the American Society of Mechanical Engineers. He has been closely identified for many years with the automotive industry, having served in the engineering department of the Hyatt Roller Bearing Company during 1911, and in the sales department from 1912 to 1916; during the early part of 1917 he was sales manager of the Jackson Rim Company, Jackson, Mich., and later in the same year he became sales manager of the Harrison Radiator Company, Lockport, N. Y., which position he resigned to take charge of the sales department of the Clark Tructractor Company.

L. J. Schneider

R. J. McComb and **J. L. Terry** have been appointed assistants to the president of the **Q & C Company,** New York. Mr. McComb has charge of the Chicago office in the Peoples Gas building, while Mr. Terry has charge of the St. Louis office, in the Railway Exchange building.

The **Keller Pneumatic Tool Company,** Chicago, has opened branch offices in Birmingham, Ala., Jefferson County Bank building, under the management of **H. I. Kahn;** Salt Lake City, Utah, Newhouse building, under the management of the **C. H. Jones Co.;** San Francisco., Cal., Los Angeles, Cal., and Portland, Ore., all under the management of the **Eccles & Smith Co.,** San Francisco.

Frank J. Walsh, mechanical expert with the Galena-Signal Oil Company, New York, has resigned to become secretary of the Douglas Wray Paper Company, Chicago. Previous to his service with the Galena-Signal Oil Company, Mr. Walsh was a division master mechanic on the Chesapeake & Ohio.

George R. Woods has resigned from the Allied Machinery Company of America, New York City, to become manager of the New York office of R. S. Stokvis & Zonen, Ltd., Rotterdam, Holland. Mr. Woods is now in Europe studying industrial and economic conditions and is to return to New York early in November.

Orville A. Pier has been appointed secretary-manager of the **National Association of Railroad Tie Producers,** with office at 205 Security building, St. Louis, Mo. **R. E. Hussey** continues his connection as secretary of the board of directors, with office at 1102 National Bank of Commerce building, St. Louis, Mo.

M. E. Allen has resigned as engineer in charge of sales for the **Central State Bridge Company,** Indianapolis, Ind., to become contracting engineer in charge of sales for the Federal Bridge & Structural Company, Waukesha, Wis., with headquarters in the reopened Chicago office of that concern, at 1228 Peoples Gas building.

The **International Railway Supply Company,** New York, announces that it has incorporated the **International Railway Supply Company of Cuba,** with **Otis R. Hale,** former locomotive superintendent of the United Railways of Havana, as manager. The office of the company in Havana is at Edificio Abreu, Room 501, corner Mercaderes y O'Reilly.

Joseph Beaumont, senior telegraph, telephone and signal engineer, of the Central District Bureau of Valuation, of the Interstate Commerce Commission, with headquarters at Chicago, has resigned to become connected with the **Casale Safety Device Company,** of New York, in an engineering capacity, with the same headquarters. Mr. Beaumont was born at Staffordshire, England, on October 10, 1874, and came to the United States in 1888. In 1892 he entered railway service in the mechanical department of the New York Central, with headquarters at New York City. From that date until 1898 he was successively machinist apprentice and journeyman machinist in the Mott Haven shops and stationary engineer in the Grand Central Station, New York City. The following year he enlisted for the Spanish-American War and served as a first lieutenant until 1899, when he entered the signal department of the Standard Railway Signal Company, now the General Railway Signal Company, Rochester, N. Y. In 1901 he was appointed general foreman in charge of construction and maintenance of all signal and electrical plants on the Buffalo division of the New York Central, with office at Buffalo, N. Y. From 1904 to 1906 he was assistant supervisor of signals and during part of the latter year was promoted to supervisor of signals on the same division with the same headquarters. In 1907 he was appointed principal assistant engineer of sales and installations of the General Railway Signal Company, later becoming supervisor of interlocking on the Atlantic Coast Line, with headquarters at Charleston, S. C. In 1908 Mr. Beaumont was appointed signal engineer on the Panama Railroad and from 1909 to 1910 he was superintendent of telegraph, telephone and signals and electric lighting and power. In 1910 he resigned to become supervisor of interlocking on the Chicago Great Western and in October of the same year became signal engineer, with headquarters at Chicago. In 1914 he was appointed senior signal engineer, Division of Valuation, Interstate Commerce Commission, Central District, with headquarters at Chicago, and in June of the next year was appointed senior telegraph, telephone and signal engineer, which position he held until his recent resignation.

J. Beaumont

The A. Gilbert & Sons Brass Foundry Company, St. Louis, Mo., has recently completed a two-story with basement addition, 25 ft. by 180 ft., to its plant. The basement is to be used for heating plant, wash rooms and lockers. The first floor for metal storage and melting room, and the second floor for office and wood and metal pattern department.

Joseph T. Ryerson & Son Company, Chicago, has purchased a block of property adjoining its plant in that city, with an area of 380,290 sq. ft. A brick foundry building valued at $100,000 located on the property and at present occupied by the Crane Company, Chicago, will be used by the purchaser as the first unit of an addition to their facilities.

J. M. Spangler, southwestern railroad sales engineer for the **National Carbon Company, Inc.,** Cleveland, Ohio, with headquarters at St. Louis, Mo., has been promoted to western manager of the railroad sales department with office at Cleveland. Mr. Spangler was born at Middleburg, Pa., on December 2, 1889. He was educated in the public schools of McConnellsburg, Pa., graduating from high school in 1906 and from the electrical engineering department of Pennsylvania State College in 1911. He began railway work in the signal department of the New York Central Lines in the same year. From 1913 until 1915 he was connected with the Railroad Supply Company, Chicago, as sales representative in the signal department. In 1915 Mr. Spangler was appointed southwestern railroad sales engineer of the National Carbon Company, Inc., which position he held until his recent promotion.

J. M. Spangler

Andrew W. Mellon, president of the Mellon National Bank Pittsburgh, Pa., and a director in the Aluminum Company of America, and **Eversley Childs,** chairman of the Barret Company, president of the Bon Ami Company and a director of the Hamilton Trust Company of Brooklyn, have been elected directors of the **Crucible Steel Company,** Pittsburgh.

Robert Field, central western sales agent for the La Follette Coal, Iron & Railway Company, La Follette, Tenn., with office at Cleveland, Ohio, has resigned to become manager of sales of coke, coal and pig iron for **Fairbank & Company,** Cleveland, with office in that city. The department was formerly in charge of George L. Fairbank, president of the company.

The Roberts & Schaefer Company, Chicago, has closed a contract with the Pere Marquette Railroad for the complete designing and construction of a 250-ton, three-track reinforced concrete automatic electric locomotive coaling and sanding plant at Plymouth, Mich., to replace a timber plant of other make, which was recently destroyed by fire. The contract price is $40,000.

John L. Bender has resigned as sales manager of the Anderson Forge & Machine Company, Detroit, Mich., to be-

come connected with the engineering department of the **C. A. S. Engineering Company**, at Detroit, which has been appointed sales agent of the Pollak Steel Company, Cincinnati, Ohio, as announced in the *Railway Age* of October 3, page 717.

Stockholders of the **Pullman Company**, at an annual meeting November 12, elected **Harold S. Vanderbilt**, of New York, to the directorate. The directors re-elected the retiring officers and approved a contract to manufacture 4,000 automobile bodies for $5,370,000 for the Packard Motor Car Company, Chicago, and also a $2,000,000 contract for phonograph cabinets for the Edison Company.

Russell W. Stovel, who recently returned from France, where, as lieutenant-colonel of engineers, he served as chief of the Terminal Facilities division of the Army Transport Service, has been appointed consulting engineer of **Westinghouse, Church, Kerr & Co., Inc.**, and as a member of that organization will devote his entire time to the company's electrical and mechanical work. Mr. Stovel has had an unusually comprehensive experience in electrical and mechanical problems connected with central power station and steam railroad electrification work, including the fundamental economics involved, the design, construction, equipment and operation. He was graduated from McGill University in 1897 with the degree of electrical engineer and the following year entered the employ of Westinghouse, Church, Kerr & Co.; he soon became an assistant engineer, then successively engineer in charge, mechanical engineer of the company, and finally managing engineer. In 1914, Mr. Stovel left Westinghouse, Church, Kerr & Co., to become managing engineer for Gibbs & Hill, consulting engineers, New York. For this company he had direct charge of the Paoli-Chestnut Hill electrifications of the Pennsylvania Railroad, the Elkhorn grade electrification of the Norfolk & Western, and the electrification of the New York Connecting Railway. While in France, Mr. Stovel occupied the responsible position of chief of Terminal Facilities division, in which capacity he had charge of all matters relating to the procurement, maintenance and operation of all terminal facilities under the jurisdiction of the American Transport Service. Mr. Stovel is a member of the American Institute of Electrical Engineers and of the American Society of the Mechanical Engineers.

R. W. Stovel

O. A. Phenix, associated with the sales department of the **United States Graphite Co.**, Saginaw, Mich., with office at Birmingham, Ala., has been promoted to advertising manager with office at Chicago, succeeding **George A. Cooper**, whose appointment as advertising and export manager of the **Detroit Lubricator Co.**, Detroit, Mich., with office in that city, was announced in the *Railway Age* of September 26 (page 655).

The **Independent Pneumatic Tool Company**, at its general offices, 600 West Jackson boulevard, Chicago, recently held a successful sales meeting at which branch managers and representatives from the North, South, East, West and Canada were in attendance. The meeting was in charge of Vice-President and General Sales Manager R. S. Cooper, other officers of the company in charge being: John D. Hurley, president; F. W. Buchanan, secretary; Adolph Anderson, assistant to president; F. B. Hamerly, works manager; Axel Levedahl, consulting engineer, and R. A. Norling, C. D. **Mudge & Co.**, Chicago, recently have opened at 4425 West 16th street in that city, a new plant for the manufacture principally of motor cars, with a capacity of 6,000 cars a year. The company heretofore has had its motor cars made in a plant at Atchison, Kansas. The new plant is located on the Belt Railway of Chicago and is so located and constructed that additions may be made to it which would treble its present capacity.

Charles J. Symington, who has been elected president of the **T. H. Symington Company**, New York, was born on February 2, 1883, at Baltimore, Md., and was educated at Amherst College. He entered the service of the T. H. Symington Company in 1908 as assistant manager, eastern sales, with headquarters at Baltimore, Md. In 1910 he went to Chicago as general sales agent and in 1912 was appointed vice-president in charge of sales with headquarters in New York. He became president of the Symington Machine Corporation in 1918, with offices in Rochester and Washington, supplying the government with approximately 12,000,000 75 mm. shells; vice-president of the Symington Anderson Company, manufacturing 75 mm. field pieces, and vice-president of the Symington Chicago Corporation, manufacturing 155 mm. shells. On October 22, 1919, he was elected president of the T. H. Symington Company, as noted above.

Paul M. Lincoln, for many years commercial engineer with the **Westinghouse Electric & Manufacturing Company**, has resigned from that organization to enter the consulting engineering field. Mr. Lincoln is an international figure in electrical engineering. It was he who designed and installed the first hydro-electric plant at Niagara Falls, and subsequently directed its operation for a period of six years. He was a pioneer in the high-voltage transmission line field and is today considered an authority on this subject. Among other notable inventions he perfected the Lincoln synchronizer for paralleling large electric alternators for which he received various medals and awards. Mr. Lincoln was elected president of the American Institute of Electrical Engineers in 1914 and has served for years on the board of managers and upon the Transmission Committee of the Institute. In his new capacity Mr. Lincoln will take up for the **Lincoln Manufacturing Company**, Cleveland, Ohio, the problem of motor drive for machinery, involving the determination of the proper type, characteristics and sizes of motors best adapted for direct connection to the various sizes and types of machinery.

P. M. Lincoln

Major C. E. Smith, formerly bridge engineer of the Missouri Pacific and more recently consulting engineer at St. Louis, Mo., has been discharged from the Construction Division of the United States army and has resumed the management of the firm of **C. E. Smith & Co.**, consulting engineers, with headquarters at St. Louis. A Chicago office has been established in the Steger building, in charge of **W. C. Curd**, who was engaged for a number of years in general railway work and was formerly drainage and water service engineer for the Missouri Pacific with office at St. Louis and more recently was connected with the Layne & Bowler Co., Memphis, Tenn., and the Wm. Graver Tank Works, East Chicago, Ill., in the department of water supply and purification. **W. B. Hudson**, assistant bridge engineer of the Missouri Pacific, with office at St. Louis, Mo., has resigned to become associated with C. E. Smith & Co.

Railway Officers

Railroad Administration

Operating

D. A. Gibson has been appointed trainmaster of the Iowa & Dakota division of the Chicago, Milwaukee & St. Paul at Murdo Mackenzie, S. D., with jurisdiction over the line from Chamberlin to Rapid City.

J. H. Johnson, on leave of absence, has resumed his duties as trainmaster on the Northern Pacific, with office at Minneapolis, Minn., succeeding **Frank L. Birdsall,** who has resumed his position as trainmaster at Duluth, Minn.

E. J. Worden, division superintendent on the Chicago, Burlington & Quincy, with headquarters at La Crosse, Wis., has been Transferred to acting superintendent of Aurora division, with headquarters at Aurora, Ill., succeeding **C. D. Peckenpaugh,** who has been assigned to other duties. **F. E. Haines,** assistant superintendent at Ottumwa, Iowa, has been appointed acting superintendent, succeeding Mr. Worden.

W. M. Thurber, superintendent of the Dubuque division of the Chicago, Milwaukee & St. Paul, with headquarters at Dubuque, Iowa, has been appointed superintendent of the Iowa & Dakota division, with headquarters at Mason City, Iowa, succeeding **H. H. Ober,** assigned to other duties. **A. J. Hasenbalg,** trainmaster of the LaCrosse division at Portage, Wis., has been appointed Mr. Thurber's successor and **W. G. Bowen,** Mr. Hasenbalg's successor.

Lieutenant-Colonel E. H. Shaughnessy, at one time general manager and acting director general of the advance section, transportation department of the A. E. F., has returned to the Chicago & North Western as trainmaster of the Galena division at Sterling, Ill., vice **R. J. Hall,** assigned to other service, effective November 1. Colonel Shaughnessy was commissioned a first lieutenant of Engineers May 28, 1917, and assigned to the command of Company E of the 13th Engineers. He was promoted to captain of Engineers on March 21, 1918, and, being detached from the regiment on June 28, reported to the director general of transportation, General W. W. Atterbury. He was promoted to major, Transportation Corps, on September 7, 1918, and to lieutenant-colonel on February 21, 1919. He returned to New York on September 26, 1919, and was released to the reserve October 20. For the time he was in France Colonel Shaughnessy was executive officer of the 13th Engineers in charge of operation while operating a military railway for the French Second Army. He was later general superintendent, eastern division, advance section of the transportation department (this containing the Chateau-Thierry sector) and after the divisions had been withdrawn from that sector was general superintendent western division of the advance section, then assistant general manager, general manager and acting deputy director general, all of the advance section. When G. H. Q. was done away with he went to Tours and acted as general manager of the transportation department, being released when the office was abolished on September 1, 1919. Colonel Shaughnessy on June 9, 1919, was awarded the Distinguished Service Medal for his services in France, being the only one, or at least one of the very few, in the Transportation Corps outside of General Atterbury and Colonel McCrea, to receive that honor. He has also been notified that the French authorities have proposed him for the Legion of Honor.

E. H. Shaughnessy

Engineering and Rolling Stock

A. L. Crew, road foreman on the Atchison, Topeka & Santa Fe, with headquarters at Los Angeles, Cal., has been promoted to general road foreman of engines, with the same headquarters, a newly created position.

F. P. Miller, master mechanic on the Chicago, Milwaukee & St. Paul, with headquarters at Marion, Iowa, has been transferred to Portage, Wis., succeeding M. F. Smith, who has been transferred to Minneapolis, Minn.

Lon Byers, terminal engine inspector on the Atchison, Topeka & Santa Fe at Needles, Cal., has been promoted to road foreman of engines of the first district of the Arizona division, with the same headquarters, succeeding **L. H. Ledger,** who has been transferred to the second district, with the same headquarters, succeeding **C. C. Reynolds,** who has been transferred.

C. C. Reynolds, road foreman on the Atchison, Topeka & Santa Fe, at Needles, Cal., has been transferred to the first and second districts of the Los Angeles division, with headquarters at San Bernardino, Cal., succeeding **J. C. Love,** who has been transferred to the third and fourth districts, with headquarters at Los Angeles, Cal.

Purchasing

G. V. Booth, storekeeper of the Detroit, Toledo & Ironton, has been appointed general storekeeper at Jackson, Ohio.

Special

H. A. Fidler, traffic manager of the Detroit, Toledo & Ironton, has been promoted to general traffic manager, with headquarters at Detroit, Mich; **F. E. Remsburg,** freight claim agent, has been appointed general claim agent at Detroit, Mich., in charge of matters pertaining both to freight claims and personal injuries.

Corporate

Executive, Financial, Legal and Accounting

O. J. Jackson has been appointed auditor of the Savannah & Statesboro, with headquarters at Statesboro, Ga.

J. L. Englehart, chairman of the Commission of the Temiskaming & Northern Ontario, with headquarters at Toronto, Ont., has resigned because of ill health.

Charles T. Airey, freight traffic manager of the Central of Georgia, has been appointed vice-president and traffic manager in charge of all traffic, with headquarters at Savannah, Ga.

Charles R. Capps, traffic assistant to the regional director of the Allegheny region, has been re-elected first vice-president in charge of traffic of the Seaboard Air Line Company, with headquarters at Norfolk, Va., the position he held prior to government control.

H. A. Scandrett, traffic assistant to the regional director of the Central Western region and assistant to the director of traffic and the commerce counsel of the Union Pacific System, with office at Chicago, has been promoted to valuation counsel and commerce counsel of the Union Pacific System, with the same headquarters.

George H. Minor, assistant general solicitor of the Erie, with headquarters at New York City, has been appointed vice-president and secretary succeeding David Bosman, deceased. Mr. Minor was born in 1866 in Deposit, N. Y.; graduated in 1886 from the Deposit Academy and four years later from Hamilton College, Clinton, N. Y. He began railroad service in the legal department of the Erie at New York in 1903, having been graduated from the Law Department of Lake Forest University at Chicago in 1895; admitted to the Illinois bar the same year and to the New York bar the following year. In 1904 he was appointed land and tax agent of the same road at Cleveland, Ohio, serving in that capacity until 1905 when he became assistant general solicitor, the position he held at the time of his recent appointment. Mr. Minor is the author of "The Erie System, Its Organization and Complete History," which was published in 1911.

G. H. Minor

Frank Hedley, vice-president and general manager of the Interborough Rapid Transit Company, New York, has been elected president of that company, succeeding **Theodore P. Shonts,** notice of whose death appeared in the *Railway Age* of September 26. In receiving this appointment, Mr. Hedley has achieved striking success in the work which he began in 1882, at the age of twenty, as mechanic for the Erie at Jersey City, N. J., having only recently arrived in the United States from England, where he was born and where he received no more than a common school education. However, it is believed that much of his ability may be attributed to the fact that he came from a mechanically able family, prominently identified with steam railroad and locomotive engineering in England. His granduncle, William Hedley, was the designer of the first locomotive traction engine ever built.

F. Hedley

Mr. Hedley left the Erie and worked for more than five years in the Manhattan Elevated Shops, going from there to the Kings' County Elevated in Brooklyn as master mechanic. In 1893, he was appointed superintendent of motive power and six months later general superintendent of the Lake Street Elevated in Chicago. The following year the construction of the Northwestern Railroad of Chicago was begun, and although he continued to perform his duties as superintendent of the Lake Street Elevated, he also, throughout the period of construction, about two years, served as a member of the staff of consulting engineers for the Northwestern. His success at Chicago attracted the attention of the Belmont interests in New York, and in 1903 he was offered the position of general superintendent of operation of the Interborough Rapid Transit, an office which he accepted, and it was mainly through his efforts that the carrying capacity of the Interborough was increased from about 250,000 to almost 2,000,000 persons a day. During the years that Mr. Shonts and he served as president and vice-president together, Mr. Hedley was always in close association with Mr. Shonts and he thereby acquired an intimate knowledge of the policies of the company.

George H. Ingalls, traffic manager of the New York Central, Western Lines, with headquarters at Chicago, has been elected vice-president in charge of traffic with headquarters in the Grand Central Terminal, New York city. Mr. Ingalls was born July 28, 1872, at Boston, Mass., and graduated from Harvard University in 1893. He began railroad work that year as clerk in the general manager's office of the Chesapeake & Ohio. In 1895 he became clerk to the general superintendent, Western division of the same road, and in November of 1896 clerk in the office of the president, a position he held until 1900, when he was appointed assistant to the president in charge of coal and coke traffic. From February 1, 1901, to November 1, 1902, he was with the Cleveland, Cincinnati, Chicago & St. Louis at Cincinnati, Ohio, serving as general freight agent. He then became general freight agent of that road, as well as of the Cincinnati Northern and the Dayton & Union, a position he held for four years and left in 1906 to accept the appointment of freight traffic manager, New York Central, Western Lines.

Geo. H. Ingalls

Engineering and Rolling Stock

A. C. MacKenzie, engineer maintenance of way of the Canadian Pacific at Winnipeg, Manitoba, has been transferred to Montreal, succeeding **Frank Lee,** transferred also.

J. R. Mackenzie and **T. E. A. Hall** have been appointed assistant engineers of the Canadian National with headquarters at Toronto; **R. B. Jennings,** appointed division engineer with headquarters at Toronto; **W. H. B. Bevan, S. McIlwain, T. Kearney** and **L. C. Dupuis,** division engineers with headquarters at, respectively, Ottawa, Capreol, Montreal and Quebec. **C. H. N. Connell** has had his title changed from division engineer at Quebec to district engineer, the name of the territory having been so changed.

Obituary

Charles H. Holmes, general auditor of the Wheeling & Lake Erie, died at his home in Cleveland, Ohio, on October 31.

Walter B. Scout, civil engineer of the Pennsylvania, with office at New York, died on November 11 at his home in Elizabeth, N. J.

C. C. Walker, assistant superintendent of transportation of the Chesapeake & Ohio, with headquarters at Richmond, Va., died October 26 at Richmond after an illness of several months.

William H. Killen, land commissioner for the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at St. Paul, Minn., died at Minneapolis on November 5, at the age of 62 years.

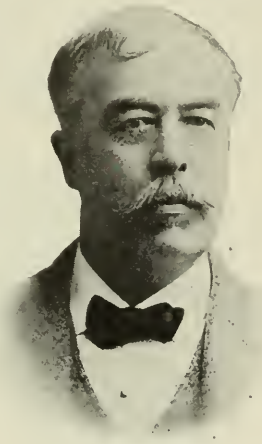
James M. Ashley, who had charge of the construction of the Ann Arbor, between 1878 and 1889, and who designed the first car ferries on the Great Lakes, died at his home in Toledo, Ohio, on November 3, at the age of 65 years.

David S. Wegg, formerly president of the Chicago & Northern Pacific and the Chicago & Calumet Terminal, solicitor for the Chicago, Milwaukee & St. Paul and general solicitor for the Wisconsin Central, died in Chicago, on November 18, at the age of 72 years. Mr. Wegg left railroad service to engage in the private practice of law in 1894.

A. J. Himes, assistant valuation engineer of the New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, died on November 3 in that city. Mr. Himes was valuation engineer until two years ago, when he was forced to retire from active management of the office because of ill health. **W. J. Bergen,** assistant valuation engineer at that time, was appointed, temporarily, valuation engineer, pending the outcome of Mr. Himes' illness. Mr. Bergen will retain the title and office of valuation engineer.

A. W. Giltzow, district superintendent of the Chicago southern district of the Pullman Company, with headquarters at Chicago, died on November 10 in that city. Mr. Giltzow was the oldest employee in the official family of the Pullman Company, having served 47 years. He entered the service in 1872 as an office boy in the Chicago office and held various positions until 1889, when he was appointed district superintendent of the Chicago southern district, which position he held until his death, at the age of 62 years.

Eugene Chamberlain, who recently retired as manager of the equipment clearing house of the New York Central Lines, with office at New York, died September 30 at his home in Mt. Vernon, N. Y., after a long illness. Mr. Chamberlain was in his 70th year. He began railroad service in Ohio with the Wabash. Some time after joining the staff of the New York Central he was appointed master car builder of the Western division, with headquarters at Buffalo. In 1893 he left railroad service to engage in commercial business, but in 1899 became superintendent of equipment of the Brooklyn Rapid Transit and five years later was called back by the New York Central to the position he held at the time of his death. In addition to the above, Mr. Chamberlain was a founder and a senior past president of the Central Railway Club of Buffalo. He was also past president of the New York Railroad Club and for many years active in what was formerly the Master Car Builders' Association and the American Railway Master Mechanics' Association, now known as Section III—Mechanical, American Railroad Association.



E. Chamberlain

Frank B. Montgomery, traffic manager of the International Harvester Company, Chicago, and president and general manager of the Chicago, West Pullman & Southern, the Illinois Southern, the Deering Southwestern and the Oswaco River, died in Chicago on November 24. Mr. Montgomery was born at Parkersburg, W. Va., on October 14, 1864. After considerable experience in the railway field he was appointed traffic manager of the McCormick Harvesting Machine Company in 1900 and from the formation of the International Harvester Company in 1903, until his death, he was president and general manager of the above industrial lines of that company.

John W. Renner, formerly controller of the Pennsylvania Company and the Pittsburgh, Cincinnati, Chicago & St. Louis, with office at Pittsburgh, Pa., died in that city on November 10. Mr. Renner was born at Petersburg, Pa., on January 1, 1845. He began railway work with the Pennsylvania Company as a clerk in 1861 and served in that capacity in different departments of the road for three years. In 1864 he became connected with the Steubenville & Indiana, now part of the Pittsburgh, Cincinnati, Chicago & St. Louis, as a clerk in the office of the general superintendent and in 1865 was promoted to private secretary to the receiver and supply agent. From 1866 to 1870 he was paymaster of the Steubenville & Indiana and the Pittsburgh, Cincinnati & St. Louis. From 1871 to 1874 he was general bookkeeper and chief clerk in the auditor's office of the Pittsburgh, Cincinnati & St. Louis and from 1875 to 1882 auditor of the same road. In 1883 he was appointed assistant controller of the Pittsburgh, Cincinnati & St. Louis and the Pennsylvania Company and in 1891 was appointed controller of the Pittsburgh, Cincinnati, Chicago & St. Louis and the Pennsylvania Company. In 1905 he was also appointed controller of the Vandalia. These positions he held until his retirement in January, 1915, under the pension rules of the company.

Edwin T. Lamb, federal manager of the Atlanta, Birmingham & Atlantic and president of that road prior to government control of the railroads, also federal manager of the Atlanta & West Point and Western Railway of Alabama, the Charleston & West Carolina, the Atlantic Terminal and the Georgia, died at Birmingham, Ala., on November 10 at the age of fifty-six years. Mr. Lamb was born June 29, 1863, at Richmond, Va., and attended a school affiliated with the William and Mary College. He began railway work at Newport News, Va., in 1881 as receiving clerk in the construction department of the Chesapeake & Ohio. He remained with that road for seven years as, respectively, chief clerk at the export pier at Newport News and joint representative of the Chesapeake & Ohio, the United States & Brazil Mail Steamship Company and the Ducal Line. From 1888 until March, 1890, he was agent of the Richmond & Danville, now part of the Southern, at Danville, Va. In March, 1890, he was appointed general forwarding agent of the same road in charge of deep water terminal at West Point, Va. He held that position until 1896 and was, during the same period, joint representative of the Old Dominion Steamship Company, Merchants & Miners Transportation Company, Clyde Steamship Company and the York River Line. In 1896, when the Southern absorbed the Richmond & Danville, he became general agent in charge of deep water terminal of the Southern at Norfolk, Va., during which time he organized and superintended the construction of the new terminal at that point and was also general agent of the Chesapeake Steamship Company. In November, 1906, he was appointed superintendent of the Norfolk division of the Southern, in addition to his other duties. From June 15 until June, 1910, he served as general manager for the receivers of the Norfolk & Southern and was then elected president and general manager of the Norfolk Southern, successor to the Norfolk & Southern. In 1912 he was appointed receiver and general manager of the Atlanta, Birmingham & Atlantic, with headquarters at Atlanta, Ga. In January, four years later, he was appointed president of the same road, a position he held until he was chosen federal manager as stated above.

Playing a Game

A. C. Woodbridge's article on fuel economy, which appears elsewhere in this issue, touches the real heart of the problem of fuel conservation. What interest has a fireman, engineer, hostler or other railroad employee in the abstract problem of saving coal? Unless he is woefully inefficient his wages go on just the same, whether he tries to economize or not; he is only one of a great number of individuals making up the railroad organization and unless he is very different from other humans he has a fair degree of selfishness; he is not deeply concerned in improving the efficiency of operation unless he will profit directly thereby. It must be assumed that in most cases he does not feel that he is a vital factor in the welfare of the corporation at large. The stockholder and bondholder are so far removed that to him they are entirely impersonal. Today he is working for the government, but apparently he regards that also as something vague and impersonal; he does not feel any strong sense of responsibility toward his fellow citizens whom the government represents. But, whatever the obstacle, an educational program directed toward the elimination of waste and the conservation of our national resources, is a plain and obvious duty. Reduce the fuel conservation program to a simple but direct form and couple it with a comprehensive campaign conducted in the spirit of playing a game and results will surely follow. Mr. Woodbridge tells how this has been done in the Allegheny region and gives a hint as to the concrete results which followed. Work performed in the spirit of drudgery is always poorly done. Invest the same task with the spirit of playing a game and it is done immeasurably better and with far less fatigue to the worker. Thus truth is self-evident, and yet for some reason, executives are backward in taking advantage of it or are not rightly constituted to put it into effect. Try the Philadelphia & Reading experiment and see what will happen.

The Coal Strike

One of the many unfortunate effects of the strike of the bituminous coal miners is its effect on export trade. The coal miners went ahead with their preparations for a cessation of coal mining with the reckless disregard of consequences which has of late been only too prevalent in struggles of this kind. They acted with absolute disregard of the welfare of the rest of the American people and have shown no qualms whatever about depriving their neighbors the country over of the fuel to keep from freezing during the winter, or of the tranportation to carry to them the foodstuffs wherewith to keep from starvation. The miners are preventing continuance of the sending of what little fuel we have thus far been able to send to the non-coal-producing countries of Europe. The present labor difficulty has a close resemblance to the labor difficulties abroad, particularly in the United Kingdom. There, while the press and other leaders of thought were emphasizing the necessity of increasing coal production to put England back on her feet industrially, and to make up the shortage of coal in Scandinavia, France and Italy, the Yorkshire coal miners, despite the pleas for them to increase production, struck. They thereby stopped coal production entirely in their district for several weeks, and were even so vindictive that they called out the pumpmen and stood ready to let the mines fill up with water and be destroyed. The ability to export coal is of the greatest advantage in export trade, and it is also essential to the welfare of the world that America should export coal to meet the fuel demands of Europe that Britain now is unable to supply. But export trade, or the welfare of American industry, and the fear that America and Europe may be compelled to close down their industries and freeze were apparently not included among the worries of the bituminous miners.

Railway Supply Exports

The figures showing exports of railway supplies which are compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce and published in our Foreign Railway News column do not yet begin to show the increases that the supply trade has been expecting. As shown by the table below they mounted to high levels in May and June, but have not since retained that level. The lack of a greater quantity of exports, has resulted, of course, from the difficulties of the credit situation, for there have been no changes that take away from the United States the pre-eminent position that it has now occupied for some time as the best source of railway materials for the world. Nor has there been any evidence that the countries of the world that have been unable to secure railway equipment for some four or five years past have as yet made much progress towards having their wants satisfied. India and the United Kingdom are possible exceptions. Large orders for the railways of both these countries have been put on the books of the builders in Britain, although, of course, labor troubles—we refer particularly to the coal strike—may have prevented as large a production of cars and engines there as might have been hoped for. By way of speaking concerning the idea that we have hardly begun as yet to cultivate the world-wide markets that lie before us, particularly in the neutral countries, it is interesting to observe that Japan still remains one of our largest customers. We welcome this Japanese business, but it must be kept in mind that Japan is as likely in the future to be a competitor as a customer. But, be that as it may, and even if the totals of railway supply exports have not reached high figures, there is no reason to feel anything else than optimistic over the situation.

The Esch Railroad Bill

THE PROVISIONS of the Esch railroad bill, as it was passed by the House of Representatives on November 17, are not adapted to encourage the expectation that the legislation for the return of the railroads to private operation which finally will be passed by Congress will solve the railroad problem. At the same time there does not as yet seem to be reason for being pessimistic regarding the final outcome. It is very doubtful whether the bill as passed expressed the real views of even those who voted for it. When it was originally reported from the Committee to the House it contained some very good provisions. It was not as constructive a measure as the situation demands, but its enactment into law would have substantially improved the old system of regulation. There is good reason to believe that many of the members who voted to eliminate some of its important provisions did so to placate certain classes of interests and not with the expectation that as originally passed it would finally become a law.

The Senate doubtless will pass a very different bill after Congress reconvenes. The two bills will then go to conference and the conference committee will report a bill. There is much ground for hoping that the bill reported by the conference committee will be a great improvement over the Esch bill.

Even as it was passed by the House the Esch bill contains a few good provisions. It authorizes the Interstate Commerce Commission to fix minimum as well as maximum rates. It extends for six months the government guarantees of standard return. It reduces to 120 days the time within which the Interstate Commerce Commission must pass upon proposed advances in rates. It gives the Interstate Commerce Commission discretionary authority to remove the restrictions placed by existing laws upon consolidations and agreements by competing railways. It also gives the Interstate Commerce Commission authority to regulate the issuance of railroad securities.

In some respects, however, the bill is very weak, and, indeed, in certain particulars it is no less than vicious. The most serious defect in the laws heretofore enacted for federal and state regulation of railways has been that they have not required, and the regulating authorities have not fixed, rates high enough to enable the railways to earn enough to raise the capital needed to enable them adequately to develop their facilities. The Esch bill as reported from Committee provided that "in reaching its conclusion as to the justness and reasonableness of any rate, fare, charge, classification, regulation of practice, the commission shall take into consideration the interest of the public, the shippers, the reasonable cost of maintenance and operation (including the wages of labor, depreciation and taxes), and a fair return upon the value of the property used or held for the service of transportation."

This provision was intended to give the Interstate Commerce Commission authority and instructions to so regulate rates as not merely to make them non-confiscatory, but as to make them sufficient to enable the railways adequately to develop their facilities. The provision was not well drawn for its purpose, but its adoption would have effected some improvement in the existing law. This provision, however, was stricken from the bill on the floor of the House. If the Esch bill as finally passed by the House should be enacted into law the act to regulate commerce would continue to require merely that rates shall be "just and reasonable."

Under the provision that rates shall be made "just and reasonable" the Interstate Commerce Commission has in the past so regulated rates that the net operating income of the railways and the new investment made in their properties has steadily declined. There is no reason for believing that under this provision the Commission would regulate rates any differently in the future from what it has in the past. Therefore, the enactment of the Esch bill into law would have no tendency whatever to encourage increased investment in railroad securities or a revival of the expansion of railroad facilities. The rate problem is the heart of the railroad problem and the Esch bill would contribute almost nothing toward the solution of the rate problem.

The provisions of the bill which are positively vicious are those relating to the settlement of labor controversies. The House made the most disgraceful surrender to organized labor which has been made since Congress passed the Adamson bill in 1916. The Esch bill provides for Boards of Adjustment and a Board of Railroad Wages and Working Conditions similar to those which now exist under government control. But these boards, which consist equally of officers and employees, have under government control only the power to conduct hearings and make recommendations to the director general, while under the Esch bill their decisions would be appealable to certain commissions which also would be composed equally of railway officers and railway employees. Just what could be done in case it was impossible to get the members of any of these boards and commissions to agree the bill does not specify.

The most extraordinary provision of the bill is one confirming for the future "all decisions of a general character heretofore made by the United States Railroad Administration affecting the questions of wages, hours of service, or conditions of employment," and also decisions applying to individual carriers, which are to remain in effect until superseded either by mutual agreement between the companies and their employees, or by the decision of a board of adjustment or a commission on labor disputes, in accordance with the terms of the bill. *The effect of these provisions is to fix forever as minimum wages and conditions of employment the wages and conditions of employment established by the Railroad Administration.* It would be impossible under them to reduce any wage or to change any condition of employment fixed by the Railroad Administration without the previous assent of the representatives of the employees; and it is needless to say that that assent would never be given. Will the people of the United States endorse a provision whose adoption would make it forever impracticable for any railroad company to reduce wages or change conditions of employment, regardless of what changes in wages or conditions of employment might be made in other lines of industry?

The Esch bill as passed would seem to indicate that the knowledge and thought of members of the House regarding railway matters are today no more advanced than they were ten years ago. Taken at its face value its passage indicates that the members of the House have learned nothing from the country's experience with government regulation or its experience with government operation.

We feel sure, however, as we have already indicated, that the Esch bill does not express the real views of a large majority of the members of the House, and certainly it does not express the views of members of the Senate. The bill which will be passed by the Senate probably will be a better measure.

If Congress should not finally pass a better bill than the Esch bill the immediate results of the return of the railways to private management would be wholly disappointing to the country and the ultimate result very likely would be government ownership; for private management cannot succeed as a permanent policy in the United States without the enactment of legislation which will greatly improve our system of railroad regulation.

Time for Action

THE RAILWAYS NORMALLY REQUIRE somewhat over two million tons of rails for renewals and for new construction. If they are to take up any considerable amount of the deferred work of either maintenance or additions their normal requirements for next year may be fixed at at least three million tons. The maximum production of rails in this country for all purposes, including traction lines and those in foreign countries, does not far exceed that figure. In other words, the indications are that almost the entire rail mill capacity of the country will be needed for the steam roads next year. In fact, with the unsettled labor conditions in that industry, which will undoubtedly reduce the output, the needs of the roads will be greater than the expected output, and the needs of other customers must also be satisfied. With an expected shortage, it would naturally be expected that those in charge of the properties would be making for the necessities of 1920, yet the government has only a small tonnage on order, on which rolling is expected to be completed this year, while it is either placing further orders or lifting the restrictions on the purchase of rails by the railway corporations themselves, although we are now entering on what has been officially announced to be the last month of government control. To prepare to meet this situation as far as possible, a number of the railway corporations are making reservations of space or placing orders with the mills for their requirements, with the proviso that they can be cancelled if the roads are not returned to their owners on January 1. The result is that the mills cannot begin rolling until this uncertainty has been removed.

Rail is a seasonal material in that it can be placed in track to best advantage in most parts of the country only between the months of April and October and particularly in the first three months of this period. Its early delivery is therefore important, for the delay now existing in the placing of orders will result in only a small part of the possible output for 1920 being secured in time to lay it most economically and in but little more than half of the normal requirements being delivered in time to lay it at all next season.

The end of federal control is less than a month off. There would seem to be no further reason for retaining control of the purchase of supplies such as this, unless this control is resolved into action. Continued delay is expensive and unfair to the roads. For this reason the ban on corporate purchasing should be lifted at once.

Prepare for Private Operation

IN HIS ADDRESS at the dinner of the American Railway Guild recently Director General Hines called attention especially to the conditions affecting transportation which will exist when the railways are returned to private operation. He emphasized the fact that before the government took over the roads the traffic had outgrown the facilities and that for various reasons which he mentioned the shortage of facilities has become intensified under government operation. He predicted that traffic will continue to be large for some years to come; and he anticipated that the return to private operation will be immediately followed by sharp competition between roads seeking to get back traffic which they have lost under government control and roads trying to keep that which they have gained.

We publish Mr. Hines' address elsewhere in this issue and we think it ought to be carefully read and pondered by every important railway officer. The description he gives of the conditions which will exist after the railways are returned to their owners undoubtedly is correct. There will be a large amount of traffic and insufficient facilities for handling all of it, regardless of how the railways are operated. The return to private operation will have a powerful tendency to revive strenuous competition. Competition is likely to involve the making of concessions by individual railways to shippers in respect to the loading, unloading and handling of cars. Competition in rendering better service is greatly to be desired, but competition which resulted in the granting of certain kinds of concessions to shippers might result disastrously for the railroads, the shippers and the public. For example, it has been possible to come as near to handling all the available traffic as has been done largely because during the stress of war the co-operation of shippers in loading freight cars heavier than ever before was secured. Already, however, the average load per loaded car has begun to decline. The average load per loaded car in the United States in September, 1918, was 30.2 tons, while in September, 1919, it was only 28.3 tons.

R. H. Aishton, regional director of the Northwestern region, has pointed out that had shippers loaded cars as heavily in September, 1919, as in September, 1918, there would have been equipment available for the loading of 7,437,547 more tons of freight than could be handled during that month.

This decline in loading was not the result of competition, but it shows the tendency of shippers to lose their zeal for heavy loading, and if under private operation the railways begin to grant them concessions in respect to loading there will necessarily be a further decline in the average load per loaded car and, therefore, a further decline in the amount of freight that the railways will handle. Freight car efficiency depends both upon the amount of freight loaded per car and on the miles per day that each car travels. Competition between the railroads is likely to have a tendency to cause them to enforce the demurrage rules less strictly, thereby giving shippers opportunity to delay cars for loading and unloading longer than they have during recent years. The effect of reducing the average miles traveled per car per day would be to reduce still further the amount of freight that could be handled with existing equipment.

It is desirable that there should be some revival of competition in service between railroads. Emulation in operating efficiency and competition in service have contributed greatly to enabling the railways of the United States to render as good service as they have at as low cost as they have. It is largely because the public believes competition will tend to improve service and keep down costs that it is in favor of returning to private operation. But one fact the officers of the railways must not, in the interest of the companies and the public, lose sight of under present conditions and that is that the facilities of the railways are today inadequate to handling the total business, and that any revival of competition which will even temporarily have the effect of reducing the amount of service which the railways can render with each car, locomotive, mile of track and yard, will restrict the total amount of business that they can handle; and a reduction of the total amount of business handled, accompanied, as it probably would be, by congestions and car shortages, would be extremely injurious to private operation, and therefore to the railway companies.

To strike the right balance between competition on the one side and co-ordination of operation on the other will be extremely difficult. It cannot be struck at all without the individual railways delegating control over certain features of operation and service to some body or bodies representing all of them. To any central body or bodies which the railways may create they should delegate sufficient authority to enable the objects sought to be accomplished. Under the old system of regulation it was very difficult to do this because any consolidation or combination of railroads which tended to restrict competition was illegal; and therefore even

if agreements were made it was impossible to enforce them by imposing appropriate penalties. It is entirely probable, however, that any new railroad legislation which may be enacted will modify or repeal the anti-trust and anti-pooling provisions, and that, therefore, the railways, perhaps with the sanction of the Interstate Commerce Commission, will be able not only to make agreements for the purpose of bringing about reasonable co-ordination of their operation, but also to provide and enforce penalties against roads which refuse to live up to the agreements.

The time when the railways will be returned to private operation is not very far distant. It was thought that the American Railroad Association would take some definite action regarding matters of the kind mentioned at its recent meeting in Chicago. It could not do so effectively, however, without the approval of the officers of the railroad corporations, and the officers of the corporations were not ready finally to commit themselves. Fortunately, the operating difficulties of the situation which will be presented after the railways are returned to their owners are becoming daily more generally understood and appreciated, and therefore there seems good reason to hope that provision will be made regarding such matters as the distribution of cars, the joint operation of terminals, the maintenance of consolidated city ticket offices, the limitation of competition in passenger service and so on.

The great danger is that the managements of the individual railroads will be so keen about engaging in competition the results of which they believe will be to their individual advantage that it will be impossible to secure the establishment and maintenance of arrangements for the co-ordination of the operation of the various roads which will be essential to the welfare of all.

New Books

Forest Products, Their Manufacture and Use. By Nelson Courtlandt Brown, professor of Forest Utilization, New York State College of Forestry, Syracuse, N. Y. 472 pages, 120 illustrations, 6 in. by 9 in., bound in cloth. Published by John Wiley & Sons, Inc., New York City.

This book covers a field in which comparatively little has been written heretofore, and gives considerable statistical and general information relative to the quantities of timber available in various forms, and the manner by which it is converted into commercial products, the more important processes and products being thoroughly described and illustrated. Because of the abnormal and more or less temporary conditions prevailing in the timber field at present, the subject is presented from a pre-war basis. Most of the information given was obtained through personal investigation by the author who was also able to secure considerable first-hand data on European timber conditions and processes, etc., having been a trade commissioner with the United States Lumber Trade Commission to Europe.

The following typical chapter headings are indicative of the scope of the book: Wood Pulp and Paper; Tanning Materials; Veneers; Cooperage; Cross Ties; Poles and Piling; Posts; etc. Owing to the magnitude of the subjects, the book is intended for a brief reference treatise preliminary to a more complete book or series of books to be published at some future date.

Our Pig Iron Output.—The United States now produces more than half of the entire pig iron output of the world, according to Commerce Monthly, the magazine of the National Bank of Commerce in New York. Thus, while in 1900 but 13,789,242 gross tons were produced, in 1918 our total output was 39,054,644 tons.

Letters to the Editor

Moving Pictures in Engineering Investigation

PITTSBURGH, PA.

TO THE EDITOR:

The communication of J. C. Marsh on page 292 of the *Railway Age* for August 15, entitled "The Motion Picture Machine as an Engineering Instrument"—recalls an experiment made by the writer on December 12, 1912. In an endeavor to study the deflection of track under loads a moving picture machine was used almost exactly as outlined by Mr. Marsh. The picture showed clearly the deflection of the rail, but on account of the inflammable films used at that time, it was not possible to make measurements of the amount of the deflection by stopping the movement of the film. From the experience obtained in the experiment mentioned above, I believe that with the non-inflammable films which are, or soon will be available, it is probable that the moving pictures will be of considerable value in engineering work.

D. F. CRAWFORD,
Vice-President and General Manager, Locomotive Stoker Company.

Some Railroad Clerks Still Underpaid

DECATUR, ILL.

TO THE EDITOR:

In your editorial on railway wages in the *Railway Age* of August 29, page 387, you state: "The wages of railroad employees already have increased more in proportion than the cost of living, and they are asking for increases which would make their total advances far exceed the increases in the cost of living."

While I do not wish to question your statement as to railroad employees in general, I feel safe in saying that if the employees were considered by classes, as is done by the Railroad Administration in granting wage increases, you will find an entirely different result in some cases. I think your statement is misleading, as it gives the impression that *all* railroad employees are now overpaid, which is not the case, except for some of the large labor organizations which have had strength enough to enforce their demands at the expense of the weaker organizations.

You show in your editorial that three different reports made by investigating committees gave the increase in food prices from June, 1914, to March, 1919, as 77, 80 and 71 per cent. Let us take an approximate average of 76 per cent and compare it with the increase in salaries granted clerks. Since June, 1914, my salary has been increased but 64 per cent, and under government control but 21 per cent, as against a very low estimate of 76 per cent in living expenses. My own case is no different from thousands of others who work in division and general offices. I find that the average percentage of increase in salaries of clerks since June, 1914, was approximately 65 per cent, and since government control about 20 per cent.

In making these averages I have used only the wages of clerks at division offices and the larger freight stations, as they are the men who are vitally affected, being situated as they are in the larger towns, and subject to high living costs.

Clerks at small outlying stations have all received an increase probably larger than the increased cost of living, but the men who live in large cities and towns are the men who are now suffering and cannot get what is justly due them from the Railroad Administration.

A CLERK.

What Will Happen When Railroads Are Returned*

Large Traffic Will Continue, Facilities Will Be Inadequate, and Railway Co-operation Will Be Necessary

By Walker D. Hines
Director General, United States Railroad Administration

As well as I can estimate the situation, I believe we are likely to have a large railroad traffic in this country for some time to come. During the war many of the normal demands of the public had to go unsatisfied; there was much building which had to be postponed and many sorts of activities had to remain in abeyance. The opportunity has now come to satisfy those demands and the building that is beginning to develop, and the other activities which are now getting back to a normal basis, create a demand for a very large railroad traffic. So I think the railroads must be prepared to handle a large business for a considerable period in the future.

Along with that I believe it is true of the railroads generally that it has not been practicable to provide the facilities necessary for the normal increase of business in this country, plus the exceptional increase which comes about by reason of business now making its appearance which has been kept in the background during the period of the war. I am discussing only additions and betterments including equipment which are chargeable to capital account. As far as the actual maintenance of the properties including the equipment is concerned the government is under contract to return the properties in substantially the same condition they were in when the Government took them over, and of course the government will fulfill its contract obligations in this regard.

In the year or two before federal control began, the railroad companies found it very difficult to provide the necessary additional equipment and to provide the usual proportion of additions and betterments. It was partly due to the difficulty of financing, partly due to the scarcity of labor, partly due to the high prices and scarcity of material. When federal control began, during the first year of that federal control what was done in the way of improvements and additional equipment was limited absolutely to what was regarded as necessary to promote the ends of the war and was also limited by the amount of material that was obtainable. The result was that in the year 1918 it was out of the question, under the war conditions, then existing for the Railroad Administration to make up any part of the shortage or provision of facilities which had taken place in the year or two more preceding Federal control.

Facilities Insufficient for Traffic

All that was done, as I view it, was no more than would have been necessary in a normal year in order to keep abreast of normal development of the country. So we entered the year 1919 still behind in the amount of improvements and in the amount of equipment and we had been unable to make up any of the shortage in those respects which had existed when Federal control began. When 1919 began we were than in sight of the end of federal control. Congress was very reluctant to put any more money into the railroads. They questioned very closely any plan for the government to spend any more money in improving the railroads or in acquiring additional equipment. That situation was intensified by the failure of the appropriation which Congress was willing to pass—that is, which the lower House was willing to pass. So that Congress adjourned on March 4 last without any appropriation for the railroad at all and forced a still more stringent restriction on improvement work than had been contemplated before. When the appropriation was finally made in midsummer it was still so limited that it was impracticable to expand the improvement program.

So, as we get to the end of the year 1919, we have not been able to make up any of the shortage in improvements and equipment which had occurred when the federal control began, and have not been able to make any satisfactory provision for 1919 because the nearness of the end of federal control and the absence of appropriations has made that impossible. So that the railroad companies will start in 1920 faced with a very large traffic, not only the normal increase in business, but this abnormal increase due to the resumption of ordinary business after the war, and with a plant which is considerably less ample than it ought to be to handle that business.

I look, therefore, for considerable difficulty to be experienced in handling the business, especially if we have large crops this coming year.

In that connection I want to say that it is my own judgment after observing this thing through federal control, that it will be highly expedient for the railroad companies to join in some common control of their equipment to such an extent as is necessary to make the equipment do the work to the maximum extent.

I think too that the permit system which has been developed during federal control and which has largely eliminated congestion through preventing shipments being loaded until they could be taken care of at destination is an exceedingly valuable aid to the service. I think it will go far to prevent the congestion which has been quite a usual thing in the busy time of the years preceding federal control. But in both of these respects, the pooling of equipment to whatever extent may be necessary, and in the thorough-going exercise of the permit system, I think the railroad companies are going to be confronted with two divergent motives, and I think the railroad companies will have to make some sort of compromise between the two in order to get adequate results. On the one hand there will be the motive to consolidate and unify these operations to whatever extent is necessary to handle the business. On the other hand, there will be the motive of competition.

Intensified Competition May Result

My own judgment is, we are going to see a competitive condition more pronounced than any we have seen for some years prior to federal control.

It seems to be perfectly natural that any railroad which, during federal control, has had increased business due to the relocation of traffic under federal control, is going to fight to the last ditch to hold that traffic and any railroad which, during federal control, has lost its traffic to some other railroad is going to fight to the limit of its power to get back that traffic. My judgment is that this is going to develop an intense competitive spirit, and how that spirit, which is perfectly natural under the circumstances, is going to be reconciled with a really effective joint control of

*From an address delivered at the dinner of the American Railway Guild, Chicago, November 18, 1919.

equipment and really effective supervision over the shipment of traffic, so as to prevent traffic being shipped until it can be taken care of at destination, how those two conflicting interests are going to be reconciled, I cannot see far enough in the stars to tell you. But it seems to me there will be very great difficulty to reconcile those t hings.

We will have a situation in which the railroad on which the traffic originates is perfectly willing to take it, but the railroad to which it is destined will be blocked if it is hauled. But under those circumstances it is going to be very difficult to get the railroad which originates the traffic to refuse to permit it to be loaded, simply on the chance it may result in congestion on some other railroad to which it is destined. Yet, without effective control in that respect, I think we will be confronted with a condition which will be disappointing to the publi and embarrassing to the railroad companies.

Labor Under Government Control

There is another matter I want to speak about, and that is the question of labor. That is a matter particularly where the public has attributed to the fact of government control all the phenomena which were due to the changes brought about by the war. There has been a tendency to charge up to the government the things that were chargeable to the war.

I think the most interesting illustration I have seen of that was last spring, when the press was full of criticism of the government for having increased the wages of railroad employees, the head of one of the big private industries of the country announced that in the last six years his labor cost per ton had increased 119 per cent. Nobody had claimed that the increased cost of running the railroads had been that much. The smaller increase made on the railroads was charged to government control. The larger increase made by this private industry was charged to the war. The smaller increase made on the railroads was an evidence of governmental inefficiency, the larger increase made in this private industry was an evidence of the efficiency of the private industry.

It was a very interesting illustration of that disposition to connect the most obvious aspects of the situation and stop at that. The real difference was that the private industry in question was able, by an increase of from 80 per cent, to 100 per cent in its prices to offset the increased wages, whereas the Railroad Administration, by an increase of 25 per cent in its prices, was not able to offset the increase in its wages. As a matter of fact, as I recently reported to the Senate, the average increase per hour in railroad wages at the present time as compared with December, 1917, has been 56 per cent, and I think that will not compare unfavorably with what has been done by private industries which have suffered the competition incident to war conditions.

The responsibility for dealing with these wage question has been one of the gravest and most difficult that has confronted me. Last summer, when it became evident that the continued increased cost of living was making railroad labor insistent upon very substantial increases in wages, I recommended to the President that he ask congress to provide a special tribunal to deal with those matters because I felt federal control was nearing the end and that it was unfortunate for this temporary railroad administration to undertake to pass upon these matters which would have such a vital bearing upon the situation after federal control was over and which would have such a vital bearing upon the general public interest. The president made that recommendation to Congress, and Congress was unwilling to to take any action. The Senate Committee on Interstate Commerce took the position that the President, through the director general, had ample power to deal with all such questions. Of course, technically, I did have the power, I didn't deny it, but I felt in the public interest it would be better to have a tribunal of a permanent character to deal with the matter rather than have it dealt with by a mere temporary agency. Being confronted with the responsibility, however, I had the task of having to discharge it to the best of my ability and in accordance with my conscience, and the result is that it has been necessary for me from time to time since then to pass upon various of these wage problems which would far more properly have gone to a permanent tribunal representing the public in a much more permanent sense than I could possibly do.

With respect to the labor situation, I do not want to hazard any forecast as to the future, except I do want to make the suggestion that the operating men of the Railroad Administration believe that a great deal has been accomplished by establishing the boards of adjustment which have dealt with the various grievances which have arisen, and the best information I can get and the best opinion I can form is to the effect that it will be decidedly in the interest of tranquillity in the handling of labor matters to perpetuate some agencies of that sort. I understand that the Esch Bill, as it passed the House, contains provisions establishing by law a machinery similar to that which the Railroad Administration has established, and I hope very much the matter will work but in some way so as to provide for dealing with matters of that sort, as I believe it is distinctly in the interest of promoting a common understanding.

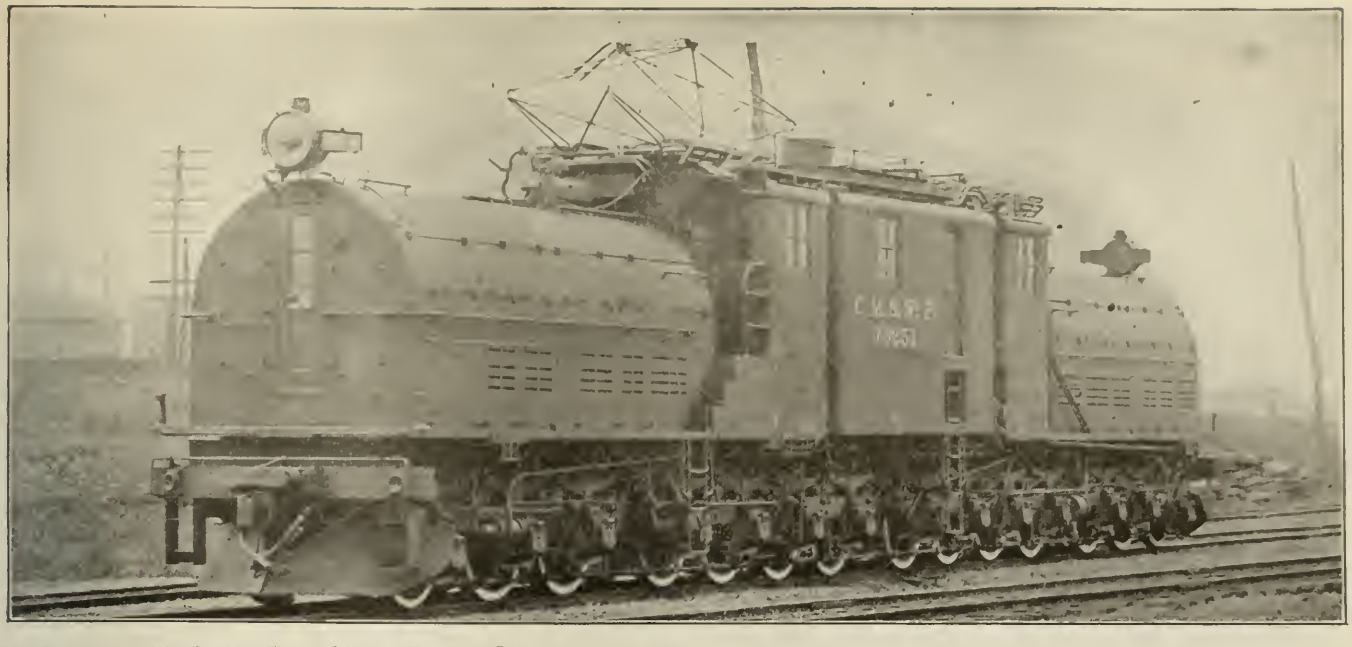
What Will Be Done About Rates?

I anticipate that when the question comes up as to a reasonable basis of rates, there will be a good many elements of doubt. Undoubtedly, the public has come to expect that a very great many economies will be brought about as soon as the railroads go back to private control, and I have no doubt that there will be very strong arguments presented to the Interstate Commerce Commission by shipping interests opposed to the increase in rates to the effect that the increase is not necessary because we are on the point of realizing very important economies, that the railroads were turned back to private control to obtain those economies and that it would be inconsistent to make an increase in rates on the idea that the economies will not be obtained when the whole theory has been that they would be obtained.

I am emphasizing that because I think that is the very practical situation that is going to develop in connection with this rate situation. I am not doing it to be a kill-joy on this pleasant occasion, but simply because I think it is a fact that you might as well face. We never have seen the time when an important rate increase has been adopted, except after the most thorough-going study and with the greatest reductance and after the fullest hearing by anybody who had occasion to object to it. I think you may well be prepared for the most emphatic objections along that line.

Undoubtedly, for the time being, the public is in the most friendly attitude toward the railroad companies, far more friendly than I have ever seen it in my railroad experience, which extends over a great many years, but you must not forget that the public is going to be expectant of great things in improving the service, of great things in economy in operation, and, when it gets right down to the time of facing a rate increase, it is going to go into the matter in pretty much the same way that it has always been gone into in the past.

Railway Statistics of the Dominion of Canada for the year ended June 30, 1918, show a total operating railway mileage of 38,879.



The Locomotive Weighs 265 Tons with 229 Tons on Drivers

Gearless Electric Locomotive for C. M. & St. P.

Five Units of This Type Will Be Used in Passenger Service Over the Cascade Electrified Section

FIVE ELECTRIC LOCOMOTIVES will soon be completed and placed in operation for passenger service on the Othello-Seattle-Tacoma electric zone of the Chicago, Milwaukee & St. Paul. They are of the 3,000-volt, direct current, gearless type. A test of one of the locomotives was described in the October 10 issue of the *Railway Age*.

The original electrification from Harlowton to Avery, 440 miles, has now been operating for a number of years under the bad weather conditions common to the Rocky and Bitter Root mountains. It is significant, therefore, of the success of the original installation, that the same system will now be used to meet the severe grades and snow conditions of the Cascade range.

The motive power now in service on the eastern electrified section consists of 42 locomotives for freight and passenger service and four switchers. Of this original equipment, the freight and passenger locomotives were practically the same and differed from each other only in the gear ratio between motors and driving axles.

The new locomotives are of an entirely different design, built distinctively for passenger service and possess some very interesting mechanical and electrical features. They will be used on the new Cascade electrification strictly for passenger service, and the present passenger engines will be adapted for freight service by changing the gear ratio. The locomotives are of the bi-polar gearless type, with motor armatures mounted directly on the driving axles. In this fundamental feature they follow the design of the gearless locomotives in use on the New York Central. The principal advantage of this method of construction is the simplicity of mechanical design, which eliminates gears, armature and suspension bearings, jack-shafts, side-rods, or other transmitting devices.

The new locomotives weigh 265 tons with 229 tons on drivers. They have 14 axles, 12 of which are driving and two guiding axles. The weight of the armature and wheels is the only dead weight on the track, and this is approximately 9,500 lb. per axle. The total weight on drivers, 458,000 lb., is 86 per cent of the weight of the locomotive, which being distributed among 12 axles, results in a weight of only 38,166 lb. per axle.

One of the most interesting and important features of the locomotives is the design of the leading and trailing trucks and the method of suspension of the cab weight upon them. The successive trucks are coupled together in such a way as to dead lead or break up any lateral oscillation which may be caused by inequalities of the track. The weight of the main cab is so supported on the front and rear trucks that any lateral thrust or kick of the leading or trailing wheel against the track is cushioned by the movement of the main cab, which increases the weight bearing down on the wheel at the point where the thrust occurs, and automatically reacts to prevent any distortion of the track. The result of this design is such as to give particularly good riding qualities at high speed. Exhaustive tests have demonstrated the remarkable riding qualities of the new locomotives at speeds as high as 65 miles an hour, which was the maximum speed permissible on the length of test track available. These tests also indicated that the locomotives will operate at higher speeds with equal success.

The locomotive is designed for handling in normal service a 12-car train, weighing 960 tons trailing, against a grade of two per cent at 25 miles an hour. This performance requires 56,500 lb. tractive effort, which is equivalent to a co-efficient of adhesion of 12.3 per cent of the weight upon driving axles. The wide margin thus provided between the operating tractive co-efficient and the slipping point of the wheels, as well as the ample capacity of the motors, will allow this locomotive to haul trains with as many as 14 cars in emergency. For continuous operation the locomotive is designed to operate at 42,000 lb. tractive effort at a speed of 27 miles an hour.

The total weight supported on driving axles is practically the same as that on the present geared passenger locomotives,

weighing a total of 300 tons. The table gives the principal dimensions, weights and capacity of the gearless locomotives.

Weight electrical equipment	235,000 lb.
Weight mechanical equipment	295,000 lb.
Weight complete locomotive	530,000 lb.
Weight on drivers	458,000 lb.
Weight on guiding axle	36,000 lb.
Weight on each driving axle	38,166 lb.
Number of motors	12
One hour rating	3,240 hp.
Continuous rating	2,760 hp.
Tractive effort—1 hour rating	46,000 lb.
Tractive effort—continuous rating	42,000 lb.
Tractive effort—2 per cent ruling grade with 960-ton train	56,500 lb.
Coefficient of adhesion ruling grade	12.3 per cent
Starting tractive effort—25 per cent coefficient of adhesion	115,000 lb.
Rate of acceleration starting 2 per cent ruling grade	0.48 m.p.h.p.s.
Length inside knuckles	76 ft. 0 in.
Length over cab	68 ft. 0 in.
Total wheel base	67 ft. 0 in.
Rigid wheel base	13 ft. 11 in.
Diameter driving wheels	44 in.
Diameter guiding wheels	36 in.

Motors

The motors are bi-polar, the two fields of each being supported upon the truck springs with full freedom for vertical play of the armature between the pole faces. The armatures are mounted directly on the driving axles. For full speed operation, the 12 motors are connected three in series with 1,000 volts per commutator. Control connections are also provided for operating four, six or twelve motors in series. Additional speed variation is obtained by tapping the motor fields in all combinations.

Regenerative electric braking on down grades is obtained by using four of the motors as generators to supply exciting current for the other eight, which then return power to the trolley. This reduces the size of the motor-generator set required for control, accessories and train lighting, and thereby effects an appreciable reduction in the weight of control equipment.

Secondary Apparatus

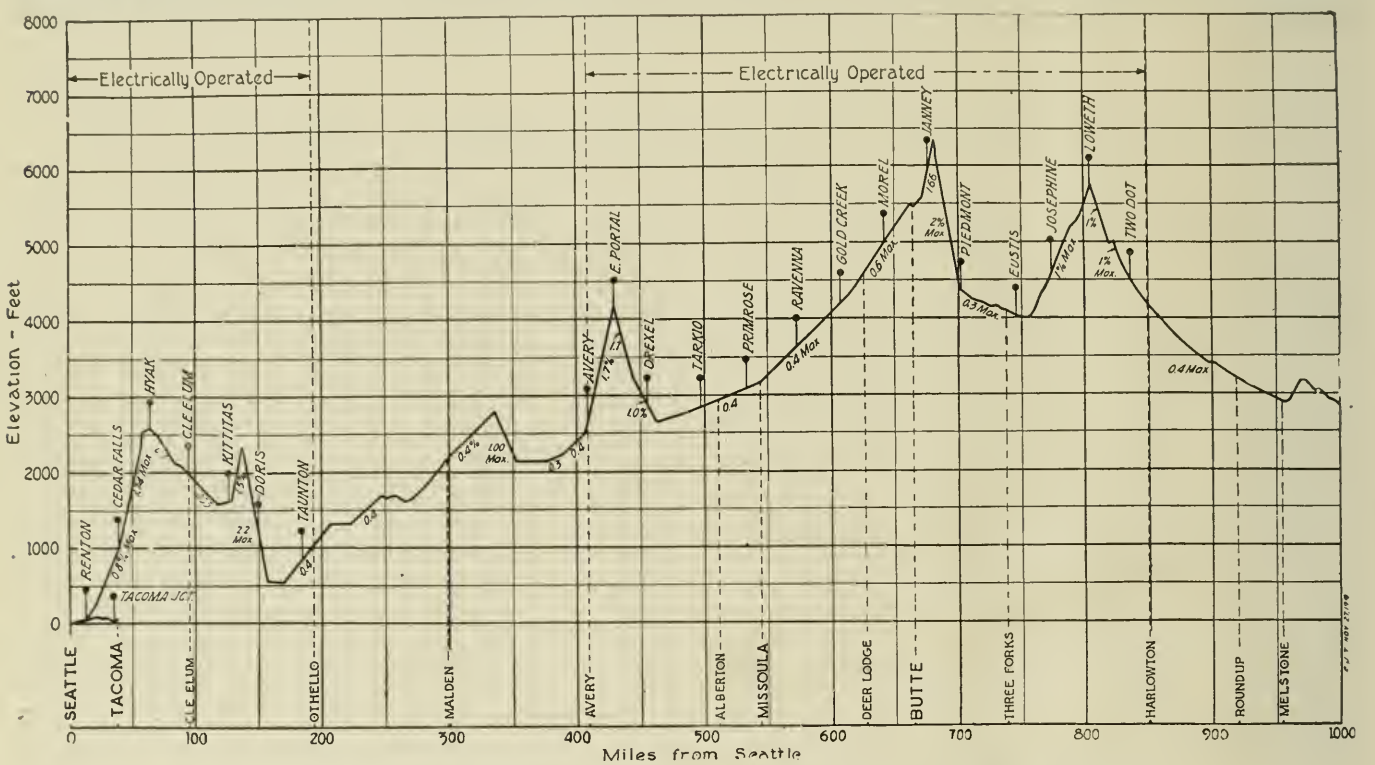
Cooling air for each pair of motors is supplied by a small motor-driven blower. This arrangement avoids the heavy duct losses encountered with a single large blower. The six blower motors may be operated six in series, or in two groups of three in series, thus allowing for two rates of cooling for the main driving motors.

The center cab is occupied by an oil-fired steam boiler for heating passenger trains and with accessories, including tanks for oil and water, circulating pumps, and a motor-driven blower for furnishing forced draft. This center portion of the cab may be lifted out in case the steam boiler is in need of heavy repairs.

In the curved end of one of the cabs is located a small motor-generator set operating in conjunction with an 80-volt storage battery in the other cab, which supply power for operating switches, contactors, lights and accessory apparatus. The battery is, in general, similar to those used on the passenger coaches. In the cab with the storage battery are also the 3,000-volt contactors and grid resisters and an air compressor driven by a 3,000-volt direct current motor. The high speed circuit breaker is placed in the cab which contains the motor-generator set.

Power for train lighting is obtained from the motor-generator set. A switchboard located in the operator's section of one of the cabs is equipped with switches, resisters and meters for controlling the train lighting circuit. The head end system of lighting is in use on the trains over this division. In the other operating cab is a small motor-driven air compressor, operated from the battery circuit, with sufficient capacity for raising the pantograph when first putting the locomotive in operation.

A slider pantograph, similar in construction to those now in use, is mounted on each of the operating cabs. This pantograph has two sliding contacts, giving a total of four on the slider with a double trolley. The pantograph and flexible twin trolley construction enable the locomotive to collect current as high as 2,000 amperes at speeds up to 60 miles an hour without noticeable arcing at the contact points. The second pantograph is held in reserve as a spare. Sand boxes, with pipes leading to each pair of driving wheels, are located directly beneath the pantographs outside of the operating cab.



Profile Showing the Two Electrified Divisions of the Chicago, Milwaukee & St. Paul

Control

The main driving motors are controlled by a reverser handle and two control handles. Within reach of the driver are also the straight air and automatic air brake valves, the sander, the bell ringer, several meters to show what the locomotive is doing, and a number of switches for the headlight, the cab lights, the cab heater, etc. The control handles are mechanically interlocked to prevent incorrect manipulation.

The meters indicate line voltage, speed, line current and field current. The needle of the ammeter which registers line current will swing in either direction and show how much current the motors are using or how much they are regenerating to the trolley. The ammeter which registers field current registers from zero to 400. The meter scale is black from zero to 200 and red from 200 to 400, to indicate to the operator that he must not run continuously with values of field current in excess of 200 amperes.

The diagram shows a profile of the road from Seattle to a point about 1,000 miles east, including the Cascade electrification, the Harlowton-Avery electrification and the intervening 220 miles. The new locomotives will operate over the section between Othello, Seattle and Tacoma, including 17 miles of 2.2 per cent grade from the Columbia river west, and 19 miles of 1.7 per cent grade between Cedar Falls and the summit of the Cascades. The traffic over this division consists of the heavy main line transcontinental passenger trains, "Olympian" and "Columbian," carrying from eight to twelve steel passenger coaches, which will be handled over the maximum grade without helpers. Freight pushers are already in operation on the 2.2 per cent grade, using two of the locomotives from the original electrification. It is expected that electrical operation during the coming winter will assist in overcoming many of the delays which are commonly met with during winter operation in this district.

These locomotives were built by the General Electric Company in the shops at Erie, Pa.

A. F. of L. Opposes Compulsory Arbitration and Return of Railroads

The American Federation of Labor has made public a series of replies by its vice-president, Matthew Woll, to questions put by Will H. Hays, chairman of the Republican National Committee, outlining the attitude of labor toward the present conditions of industrial unrest and various forms of proposed legislation. In reply to a question as to whether the Erdman act should be modified or strengthened or whether a new system for the settlement of industrial controversies should be adopted, Mr. Woll replied that evidently Mr. Hays had overlooked the fact that the Erdman act was repealed in 1913 and that the Newlands act has been substituted in its place. There is nothing particularly wrong with this enactment, he said, but the question might have been better framed had it asked what kind of railroad legislation should not be enacted. In this connection, Mr. Woll says:

"Without venturing into the problem of whether the railroads should be owned and controlled by private interests or by the government, I have no hesitancy in stating that whatever form of ownership or control may ultimately prevail that any and all legislation intended to enforce or promote compulsory arbitration or include anti-strike provisions should be defeated if we are going to be true to the ideals of freedom and democracy so clearly manifested during the war.

"While strained relations between employers and employes are to be deplored, while strikes are not desirable and are favored only as a final means of protest, the wage-earners cannot and will not admit of the right of any person or any legislative body to compel them to remain at work when for any reason whatsoever the conditions of employment become distasteful and unsatisfactory. The right to quit work after all other methods of adjustment have been exhausted is the concrete expression of individual liberty.

"The workers of America are not opposed to voluntary methods of arbitration; they are opposed to compulsory arbitration, which in fact means the fixing of wages, hours, and conditions of work by law. Such a condition and relation of employment is a denial of the rights of free men—the right to freedom of action—the right to freedom of contract. In fact, it is a return to involuntary servitude—industrial serfdom. There is nothing which is fraught with more danger, which results in more rank injustice and injury than compulsory arbitration and compulsory service.

"The Cummins bill now before Congress is the most un-American piece of legislation ever proposed by any one. It not only intends to return the railroads to private interests, but it likewise undertakes to guarantee to the railroad holders an income of 6 per cent on all their investments, whether these investments originally represented legitimate capital or merely water of every shade or color, while during the war the government only paid to the millions of patriotic investors in Liberty and Victory Loan bonds an income ranging from 3 to 4½ per cent interest.

"Besides attempting to place this heavy financial burden on the people, Senator Cummins and those associated with him further propose to turn the railroads back to these private interests with over two million of workers tied hands and feet to the railroads and the railroad interests. It is difficult to conceive a more vicious proposal than that which is now proposed to re-enact and re-establish serfdom and slavery.

"During the war, when the government found it necessary to take the railroads out of the control of private interests, these workmen were free, and as such responded in all their activities in a truly American fashion. Now that the war has ended, it is proposed to return the railroads to these self-same interests from which the government took the control, and in so doing deprive the loyal and patriotic American wage earners of their liberties and freedom. Under the cloak of industrial peace, Senator Cummins would impose involuntary servitude on the railroad workers and give added powers to private railroad interests over the lives of nearly two millions of wage earners.

"It is suggested that the government do not return the railroads to private interests for at least two years from the conclusion of peace, in order that the American people may have an opportunity to consider the many possible solutions of the railroad problem which have been put forward and so that a mature judgment may be reached and justice be done to all concerned."

Regarding profit-sharing, Mr. Woll says:

"Profit-sharing, as thus far proposed and practiced, is nothing more nor less than a sham and a fraud. In a competitive field of industry this method of compensation is not only impracticable, but will ultimately cause more friction and turmoil than any other method of compensation I know of. This method of rewarding labor for services given will not tend to equalize compensation for equal work performed; rather it will throw the question of compensation into a greatly confused state. In a monopolistic or semi-monopolistic enterprise profit-sharing can only serve as a cloak for excess profits under the guise of philanthropy.

"Profit-sharing and like methods of compensation now urged are designed principally to prevent organization of employes into trades unions and to tie the workers to their job as well as to compel them to labor under the most intensive strain of which they are capable, by an appeal to undue selfishness. Its very conception is an impressive indictment of the present questionable method of industry as a whole."

The Plumb plan is not mentioned in the letter.

A. R. A. Committees Present Progress Reports

Work Accomplished in Each Section Since Its Organization and Status of Present Studies Outlined at Chicago Meeting

PROGRESS REPORTS were made by each of the seven sections of the American Railroad Association at a meeting held in Chicago on November 18 and 19. In addition the Executive Committee of the association held meetings on November 17 and 18 and subsequently presented a report to the association outlining briefly the important features which have occupied the attention of the association since its last meeting on November 15, 1916, and the association's historical development. The report deals with the development in car service and car service rules, the co-operation obtained with military authorities during the war, the co-ordination of the various voluntary railroad organizations and the consequent reorganization of the association.

The report of the Executive Committee in addition contained the following facts and recommendations:

The president of the association has been authorized to appoint a committee of four to investigate and recommend a plan covering the preparation and publication of the records of the American railroad men in the war, both at home and abroad. T. C. Powell, director of the Division of Capital Expenditures, United States Railroad Administration; Howard Elliott, president of the New York, New Haven & Hartford; W. W. Atterbury, vice-president of the Pennsylvania Railroad; and Howard G. Kelley, president of the Grand Trunk, have been appointed members of this committee. A report will be promulgated as soon as the committee completes its labors in this connection.

In order to secure uniformity and in the interests of economy the general secretary has been authorized to act as agent in the publication of such tariffs as may be nationwide in application. Up to the present time a storage tariff, a tariff covering penalties for detention of equipment and a demurrage tariff have been filed by the general secretary and arrangements have been made for the filing of rules covering the handling of perishable freight and regulations governing equipment under private ownership. The suggestion has been made, and has been concurred in by the director general, that seven representatives of the corporations be appointed as advisory members of the Executive Committee. The director general communicated with T. DeWitt Cuyler, chairman of the association of Railway Executives, suggesting the appointment of seven corporate officers to become advisory members of the Executive Committee. Mr. Cuyler thereupon nominated and the Executive Committee elected the following as advisory members:

J. H. Hustis, president, Boston & Maine, representing the New England district; W. W. Atterbury, vice-president, Pennsylvania Railroad, representing the Trunk Line district; A. H. Smith, president, New York Central, representing the Central Traffic district; W. H. Finley, president, Chicago & Northwestern, representing the Western district; E. N. Brown, president, St. Louis-San Francisco, representing the Southwestern district; J. Kruttschnitt, president, Southern Pacific, representing the Transcontinental district; C. H. Markham, president, Illinois Central, representing the southern district.

The Executive Committee has authorized Section IV—Traffic to employ a chairman to devote all of his time to the interests of that section. The Executive Committee has also approved the election of C. W. Crawford to succeed George Hodges as chairman of the general committee of Section V—Transportation.

Attention has been directed to the question of securing greater efficiency and economy in the maintenance of way and structures department and the Executive Committee has therefore referred this subject to the general committee of Section II—Engineering, with instructions to have a study made of measures for obtaining higher efficiency and economy in the maintenance of way and structures department and present a plan which will effect the greatest economy and efficiency in the maintenance of way and structures department, both as to the handling of labor and material; also to present suggestions as to the units by which maintenance of way and structures work may be gaged, the recommendations to include suggestions as to improvements in supervisory methods and especially in the direction of educating supervisory forces to the importance of the subject.

The Executive Committee has appropriated the sum of $8,000 per year for two years for the expenditures of the Committee on Stresses in Railroad Track. In addition the committee has approved the appropriation of $7,500 for the continuation of the work of the rail committee beginning June 1, 1919.

Report of Section I—Operating

The Committee on Operating Rules has considered and made a recommendation upon a rule covering the use of dimmers on electric headlights.

The Committee has had referred to it a number of suggested changes in the Standard Code. The suggestions will be considered by the committee when a revision of the code is necessary.

Among the matters now being developed by the committee are the standardization of safety fusees and the standardization of bunting signaling flags.

A Sub-Committee has been appointed for the purpose of recodifying the existing questions and answers to the present Codes of Train Rules, Block Signals and Interlocking Rules.

The Committee on Grade Crossing Protection and Trespassing has given much study to the subjects which it has in hand and is unanimously of the opinion that it is essential and important to obtain National legislation pertaining to trespassing and the control of highway traffic at grade crossings. It has prepared separate statutes covering grade crossing protection and trespassing on railroads. These statutes have been submitted to the several committees of railroad counel for an expression of their views. A conference with the National Association of Railway Commissioners and the American Automobile Association will be held also in order that their advice and co-operation may be obtained.

The committee has recommended to the General Committee the adoption of the Nine Second Whistling Code which provides that in whistling for grade crossings, the two long blasts shall be of two seconds' duration and the two short blasts of one second duration each, with a one second interval between each blast.

The Committee on the Safe Transportation of Explosives and Other Dangerous Articles, which is also the Executive Committee of the Bureau of Explosives, has been active in the safe transportation of explosives and other dangerous articles during the continuance of the war.

The Committee is also making progress in the work of enforcing the requirements of Section III—Mechanical (M. C. B.) in the matter of tank car tests, safety valve tests, etc., which work, by direction of the Executive Committee, was turned over to the Bureau of Explosives in November, 1916.

Report of Section II—Engineering

The report of Section II—Engineering consisted in the presentation of new specifications for track scales, pre-

pared in co-operation with committees of other interested associations and a review of the action taken at the annual meeting of the American Railway Engineering Association. The scale specifications will be published in a later issue.

Report of Section III—Mechanical

The report of the general committee of Section III—Mechanical reviews its own activities and those of the section as a whole from the time of the first meeting of the temporary general committee on February 17, 1919, up to and including the last meeting of the general committee held on September 23 and 24, 1919. With the exception of the action taken at the meeting held on September 23 and 24, reports of these activities have all appeared in various issues of the *Railway Age*.

At the meeting held on September 23 and 24 the following resolution admitting the Master Car and Locomotive Painters' Association as a division of Section III—Mechanical was passed.

Resolved, that the secretary be instructed to notify the general secretary that the general committee of Section III—Mechanical accept the proposal of the Master Car and Locomotive Painters' Association to unite with the Mechanical Section of the American Railroad Association as the "Equipment Painting Division."

Letter Ballots

The recommendations contained in the reports from the following committees were considered at the annual meeting, were referred to letter ballot in accordance with the Rules of Order of this Section, and every recommendation adopted by more than the two-thirds majority required: Standard and Recommended Practice (A. R. M. M.); Standard and Recommended Practice (M. C. B.); Standard Blocking for Cradles of Car Dumping Machines; Loading Rules; Specifications and Tests for Materials (A. R. M. M.); Specifications and Tests for Materials (M. C. B.); Car Wheels; Car Trucks; Couplers; Welding Truck Side Frames, Bolsters and Arch Bars; Car Construction; Train Lighting and Equipment, and Train Brake and Signal Equipment.

The vote on the letter ballots was approved by the General Committee at a meeting held September 23 and 24, 1919, with the following exceptions:

The vote on the recommendation from the Committee on Car Trucks was approved with the exception that the General Committee ruled that the non-standard axle of the Norfolk & Western with 5¼ by 9 in. journals should be permitted on a limit load of 148,000 lb., and shown in the table of non-A. R. A. standard axles, also that in case of repairs on foreign lines, it would be permissible to replace this axle with the 5 by 9 in A. R. A. standard axle, in which case the cars should be re-stenciled to a limit load marking of 132,000 lb.

The recommendation from the Committee on Car Wheels providing that the letter "C" from the legend "M. C. B." should be chipped off when the wheels fail to meet the specifications, was considered, and the committee decided that the letter "C" should only be chipped off when the wheels fail to pass the thermal or drop test, or have some physical defect which impairs their serviceability.

Rules of Interchange

The report of the Committees on Arbitration and The Revision of Passenger Car Rules of Interchange were adopted on the floor of the convention, and the changes recommended in the Rules of Interchange approved by the Executive Committee at a meeting held July 31, 1919. These changes were then approved by the United States Railroad Administration, and the Rules of Interchange revised and issued to become effective November 1, 1919.

In addition, to the above, at a meeting of the General Committee held September 23 and 24, 1919, it was recommended that the labor rates shown in these rules be revised to conform to the rates at present in effect on the railroads under Federal control. This recommendation was approved by the Railroad Administration, and incorporated in the book as revised, effective November 1, 1919.

Loading Rules

At the annual meeting, the recommendations contained in the report of the Committee on Loading Rules were accepted and referred to letter ballot, with the exception of the recommendation for changes in the rule governing the loading of structural material, plates, girders, etc., on open cars (twin or triple loads), which was approved by the Convention and Supplement No. 1 to these Rules issued, effective August 1, 1919. The recommendations submitted to letter ballot were all adopted by more than the two-thirds majority required by the Rules of Order. The recommendations contained in the letter ballot from the Committee on Loading Rules, if approved, will be covered in an additional supplement, to be known as Supplement No. 2.

Tank Car Specifications

At the annual meeting held June 18-25, inclusive, the report of the Committee on Tank Cars was received, subject to action of the General Committee. At a meeting of the General Committee held September 23 and 24, the recommendations from the Committee on Tank Cars for changes in the Tank Car specifications (Standard), were approved, to be incorporated in a reissue of these specifications. In addition, several other proposed changes in the Standard Specifications were received from the Tank Car Committee and approved.

Manual of Standard and Recommended Practice

At a meeting of the General Committee held September 23 and 24, it was decided to issue the Manual of Standard and Recommended Practice of this Section in a separate loose-leaf volume instead of being included in the back of the Proceedings of the Annual Meeting. This will eliminate the reprinting of a great portion of these Standards each year, and will provide a better reference book for the mechanical departments of railroads and manufacturing companies. The Committees on Standard and Recommended Practice and Specifications and Tests for Materials have been designated to supervise the preparation of this manual.

Standard Form of Interchange Agreement

At a meeting of the General Committee held at Atlantic City, September 23 and 24, a standard form of interchange agreement was approved, to be executed by all subscribers to the Rules of Interchange to replace the present method of subscribing to these rules shown in the Rules of Interchange —Rules 128 to 130, inclusive. This form of agreement is shown below.

Agreement Adopting Interchange Rules

The Subscriber hereto adopts and agrees, jointly and severally, with each and all other parties (whether corporations, partnerships or individuals) owning or possessing railroad cars used for the transportation of commodities, which parties have respectively entered into agreements in effect similar to this instrument, that the Subscriber will abide by the Code of Rules governing the condition of, and repairs to, freight cars for the interchange of traffic, as formulated and promulgated by the former Master Car Builders' Association and by the American Railroad Association (Section III—Mechanical) or by either thereof (which rules are designated on the minutes of said Association's proceedings and are commonly known as "Interchange Rules"), and by each of said rules, and as well will abide by each and all decisions and interpretations of the Arbitration Committee provided for by said Code of Rules, until this agreement on the part of the Subscriber shall be terminated by three months' notice in writing filed with the General Secretary (or such other officers as from time to time shall be acting as Secretary) of said Railroad Association, or of such body as shall at the time have succeeded thereto.

Committees of Section III—Mechanical

At the meeting of the General Committee held September 23 and 24, 1919, the standing and special committees for Section III—Mechanical for the coming year were appointed.

Subjects Assigned to Committees

The following subjects have either been assigned to committees or are to be the subjects of individual papers:

1. Investigation of the proper number of crossties to be used on hopper coal cars. Referred to Committee on Car Construction.
2. The proper fibre stress to be employed in the design of helical springs for different diameters of steel wire from ¼-in. to 1½-in. diameter. The ordinary spring table calls for 80,000 lb. throughout for all sizes, but it is well known that this is not the manufacturers' practice, and in fact in many cases it is impossible to obtain a proper spring with the smaller sizes of wire. Referred to Committee on Specifications and Tests for materials.
3. Consideration of adopting the standard half tape sizes for cast iron and rough rolled steel wheels. Referred to Committee on Car Wheels.
4. That in the manufacture of steel wheels the wheels be machined to exact diameters. Referred to Committee on Car Wheels.
5. Repairs to superheater units. Referred to Committee on Superheater Locomotives.
6. Desirability of more water and steam space above the crown sheet. Referred to Committee on Design and Maintenance of Locomotive Boilers.
7. Equated tonnage ratings. Referred to Committee on Train Resistance and Tonnage Rating.
8. Design for coal space of locomotive tenders to allow the coal to flow within easy reach of the fireman, and to permit it to practically all feed into the hoppers of locomotive stokers. Referred to Committee on Mechanical Stokers.
9. Specifications for tank hose. Referred to Committee on Specifications and Tests for Materials.
10. Water glass fittings and mountings. Referred to Committee on Design and Maintenance of Locomotive Boilers.
11. Standard practice for beading tools for boiler tubes or fuse. Referred to Committee on Design and Maintenance of Locomotive Boilers.
12. Proper location of blow-off cocks in locomotive boilers. Referred to Committee on Design and Maintenance of Locomotive Boilers.
13. The comparative merits of hydrostatic and force feed lubrication for locomotive cylinders and steam chests and best method of application. Referred to Committee on Superheater Locomotives.
14. Front end netting and netting door and other draft appliances. Referred to Committee on Fuel Economy and Smoke Prevention.
15. The study of ash pit and coal chute operation including organization and supervision. Roundhouse operations as a whole. Referred to Committee on Engine Terminals, Design and Operation.
16. Modernization of existing old locomotives. Referred to Mr. G. M. Basford, President, Locomotive Feed Water Heater Co., New York, N. Y., with request that he prepare an individual paper on it.
17. Automatic hose connectors for freight and passenger equipment. Referred to Committee on Train Brake and Signal Equipment.
18. A study of locomotive operation from the point of view of a large investment. Referred to Mr. G. M. Basford, President, Locomotive Feed Water Heater Co., New York, N. Y., with request that he prepare an individual paper on it.
19. Electric arc welding in railroad repair shops. Referred to Committee on Autogenous and Electric Welding.
20. Combustion chambers for locomotive boilers; results as to fuel economy; difficulties in maintenance and other points of interest. Referred to Committee on Design and Maintenance of Locomotive Boilers.
21. Modernizing freight equipment. Referred to Committee on Car Construction.
22. Economical diameters of piston valves of superheater locomotives, with recommendation for Standard Practice in connection with various cylinder diameters. Referred to Committee on Superheater Locomotives.
23. What shape of exhaust nozzle will cause the highest vacuum and least back pressure in cylinders. Referred to Committee on Fuel Economy and Smoke Prevention.
24. Automatic coal weighing devices for locomotive tenders. Referred to Mr. J. S. Spurway, Secretary, New South Wales Government Railways and Tramways, Sydney, Australia, with request that he prepare an individual paper on this subject.
25. Snow fighting apparatus. Referred to Mr. C. E. Fuller, S. M. P. & M., Union Pacific R. R., Omaha, Neb., with request that he prepare an individual paper on this subject.
26. Designs, with complete lay-outs, for round houses of various sizes. Referred to Committee on Engine Terminals, Design and Operation.
27. Power Plants for both round house terminals and repair shops and suitable stokers for such power plants. Referred to Committee on Modernization of Stationary Boiler Plants.
28. Ash pit lay-outs for both dry and water pits. Referred to Committee on Engine Terminals, Design and Operation.
29. Adequate lighting of engine terminals for night work. Referred to Committee on Engine Terminals, Design and Operation.
30. Specifications for Mechanical Rubber Goods. Referred to Committee on Specifications and Tests for Materials.

Recommendations

The General Committee asked for approval of its action in handling the affairs of the Section and of the recommendations covered by letter ballots of the Section.

Report of Section IV—Traffic

At a meeting of the Committee on Standard Containers, Packing and Marking, held August 6, 1919, the question of the constantly increasing amounts paid out for lost and damaged freight received earnest consideration, and decision reached that some energetic and corrective measures be taken, whereupon a joint conference was held on August 27, 1919, with corresponding committees of the other sections, at which it was arranged to launch a campaign to better conditions, selecting for this purpose a few commodities or situations particularly susceptible, and in co-operation with the Operating, Transportation, Freight Claim and Accounting Departments, and the public, bring about remedies.

At a meeting of the Committee on Weighing and Inspection of Freight Traffic, held September 11 and 12, 1919, there was received from four different sources suggestions that something should be done to secure more accurate weights on less than carload freight, preferably by inducing shippers to declare on their shipping bills the correct weight so as to save the time taken in weighing over house scales and the consequent delay in loading, and to shippers' teams waiting to deliver their goods, especially in the rush hours. This would result in operating economies and the elimination of a great many freight claims for overcharge in weights. A conference will be held with corresponding committees of the Operating and Freight Claims Sections.

Report of Section V—Transportation

The General Committee has continued negotiations with the National Industrial Traffic League with respect to the National Car Demurrage Rules and recommended several changes in the rules and demurrage rates which have been made effective on all railroads throughout the United States. As a result of these changes there was difficulty in the application of certain rules and to secure uniformity the following curculars have been issued covering interpretations and recommendations formulated after consultation with the Interstate Commerce Commission and the League:

1931	issued November	14, 1918
1932	issued November	19, 1918
1954	issued July	1, 1919
S. V. 11	issued July	16, 1919
1959	issued September	17, 1919

As a result of joint conferences with the Committee on Demurrage and Storage of the League and representatives of the Interstate Commerce Commission, there has been completed a recodification of the National Car Demurrage Rules, the purpose of which is to bring the existing Instructions, Explanations and Interpretations into the rules themselves; to clarify the rules in accordance with lawful practice; to obviate the necessity for future interpretations, so far as may be practicable, and to secure uniformity in their application. The revised rules have received the tentative approval of the Interstate Commerce Commission. They have been submitted to the Railroad Administration, with the recommendation that they be made effective December 1, 1919, through the publication of a joint tariff for the account of all railroads in the United States, including the non-Federal controlled lines. This joint tariff will be issued by J. E. Fairbanks, general secretary.

Attention has been called to the difficulty of members in securing settlement for cars destroyed in Mexico as well as for per diem, repair bills, etc. To expedite the handling of this matter, conferences were held with the representatives of the National Railways of Mexico and the General Committee has submitted for ratification by the corporate officers of railroads, members of the Association, a form of agreement under which the National Railways of Mexico will make satisfactory adjustment.

The Committee on Car Service, acting jointly with the Committee on Records, has prepared a code of rules to govern the handling of cars under authoritative administration and has also prepared a revision of the Code of Per Diem Rules to eliminate so far as possible the large amount of work incident to adjustment of per diem discrepancy claims, etc. Owing to the importance of these subjects, the General Committee has submitted its recommendations to the Executive Committee. In accordance with the Rules of Order, it has also made recommendations to the Executive Committee on the following subjects:

Restoration of per diem settlements between roads under Federal control.

Demands for increase in mileage allowance on private refrigerator cars.

Application, enforcement and proper supervision of demurrage, storage and track storage tariffs.

Senate Committee Report on Steel Strike

Says Strikes Are Relic of Industrial Barbarism But Finds Some Autocracy on Both Sides

THE SENATE COMMITTEE on Education and Labor, which was instructed by a Senate resolution to investigate the steel strike and report to the Senate as to the cause and reason therefor, submitted its report on November 8, in which it finds some occasion for criticism of both parties as having given evidence of a lack of consideration for the great third party, the public. The committee says, however, that the underlying cause of the strike was the determination of the American Federation of Labor to organize the steel workers, and lays considerable emphasis on the fact that the strike resulted from a movement initiated, not by the steel employees themselves, but by an outside organization.

After discussing the events which led up to the calling of the steel strike on September 22 and quoting the correspondence relating to the demands upon the steel companies and the efforts of the President to bring about a postponement of the strike until after the Industrial Conference at Washington, the report of the committee, by Chairman W. S. Kenyon, says in part:

"We may say in passing that the statement in the letter to Mr. Gompers that seven of the organizers and members had been brutally murdered in cold blood during the past few days is false. Many statements in the letter to the President likewise are very greatly exaggerated or false.

"From the foregoing letters it would appear that the responsibility for continuing the strike under these conditions was assumed primarily by Messrs. John Fitzpatrick, M. F. Tighe and W. Z. Foster. None of them except Mr. Tighe were connected with the steel industry. It is not contended that the employees were permitted to pass on the President's request or were even consulted about it. These three organizers apparently were the only ones who were consulted at that time. The sole responsibility, however, for the refusal to postpone the strike at the President's request cannot be entirely charged to the three above mentioned. Five days after the labor leaders' letter to Mr. Gompers there was a meeting of all the 24 responsible leaders of the unions involved, and the testimony of Mr. Gompers and others shows that at the meeting to which several members came prepared to urge acceding to the request for delay all present, including Mr. Gompers, decided that further delay would result in the failure to hold the men from striking. The responsibility should, therefore, at lease be shared by all alike, Mr. Gompers included.

Wages

"The question of wages is not involved in the controversy. Few of the witnesses examined made any complaint as to wages. Some of them did contend that they should have 12-hour pay for 8-hour work, but most of them, while striking for an 8-hour day, claimed only a fair living wage. It is the opinion of the committee that, broadly speaking, the employees of the steel industry at the time of the strike were fairly well satisfied with the wages received, and that such question was not persuasive at all in any consideration of a strike. The average wages in July, 1919, were $6.27 per day. The wages of unskilled labor in 1914 for a 10-hour day were $2; in 1919, for a 10-hour day, $4.62. In July, 1914, the wages were $2.40; in July, 1919, for a 12-hour day the wages were $5.88. The lowest wage paid to grown men is 42 cents an hour for 8 hours, and 63 cents per hour, or time and a half, for all time over 8 hours. The lowest paid wages for unskilled labor amounts to $4.62 per day.

"It may also be said that most of the men speak highly of such homes as are furnished by the company. There is undoubtedly great need of more homes to be sold to the men in order to encourage home owning. They rent these homes at very reasonable prices, and the general condition of these homes seems fairly good.

"We find also little complaint as to lack of safety appliances, as to improved machinery or as to conditions in general outside of the long hours of work. In encouraging and assisting its employees to become owners of its stock; in guarding its employees against accidental injuries; in caring for the sick, and in sanitary precautions generally the work of the United States Steel Corporation at the present time is in the main admirable, and in refreshing contrast to the short-sighted selfishness that still persists in many manufacturing concerns.

Causes of the Strike

"The underlying cause of the strike is the determination of the American Federation of Labor to organize the steel workers in opposition to the known and long-established policy of the steel industry against unionization. The seizing upon this cause by some radicals who are seeking to elevate themselves to power in the American Federation of Labor will be discussed later, but were it not for the attempt to unionize the mills the strike in all probability would not have occurred.

Failure to Postpone Strike

"It would seem that the request of the President of the United States, backed up to a large degree by the request of the president of the American Federation of Labor to postpone the strike, should have been complied with. It is hardly sufficient answer to say that Judge Gary likewise declined to accede to the request of the President of the United States that he confer with the claimed representatives of the laborers of the United States Steel Corporation with relation to the strike. Both parties, it seems to us, are at fault in refusing to heed the request of the President, and evidences upon both sides a lack of that consideration for that great third party, the public, which is always the greatest sufferer in a strike of this character. The refusal of the labor leaders who seem to have been the guiding spirits of this strike to accede to the request of the President, even when backed to a certain degree by the president of the American Federation of Labor, lends weight to the idea that radical leadership, instead of conservative leadership, was taking possession of and guiding this particular strike. We regret that Mr. Gompers did not take a firmer position as to postponement.

I.

"In a hearing of this character it is natural that there be differences of opinion on the part of the committee as to some of them. Some of the most difficult and far-reaching problems of our industrial life come to the front as issues in this strike. Some of these questions will be discussed. The committee, however, present these propositions:

"(*a*) That the laborers in the steel mills had a just complaint relative to the long hours of service on the part of some of them and the right to have that complaint heard by the company.

"(*b*) That they had the right to have the representatives

of their own choosing present grievances to the employers. Some members of the committee believe that more friendly relations would be maintained between employer and employee if the representatives who are chosen to present grievances to the employers were actually working in the industry and that such repersentatives ought not to be from outside of the industry.

"(*c*) That behind this strike there is massed a considerable element of I. W. W.'s, anarchists, revolutionists and Russian soviets, and that some radical men not in harmony with the conservative elements of the American Federation of Labor are attempting to use the strike as a means of elevating themselves to power within the ranks of organized labor.

"A few suggestions as to these findings will be in order. The evidence disclosed that a percentage of the men work 8 hours; a larger percentage 10 hours, and a lesser percentage 12 hours, although there is dispute in the evidence as to this proposition. Judge Gary testifies that 34.8 per cent work 8 hours; 39.40 per cent work 10 hours; 26.52 per cent work 12 hours.

"We believe that a large majority of the men actually working in the mills work 10 and 12 hours per day. While there are spells of rest here and there through these long periods of 10 and 12 hours, yet the fact remains that the general rule is either a 10 or 12 hour day, during which the men are on duty.

"There has been some improvement in the steel industry in this respect, for some years ago a large percentage of the labor worked 10 and 12 hours a day and 7 days in the week. While the claim is made that the 7-day week has been abolished, except in emergencies, and the men who work on Sundays are allowed one week day for rest, the evidence on this point is conflicting.

"We believe where continuous operation is absolutely necessary the men should at least be allowed one day's rest in each week.

"The work in the steel mills is such that men must be constantly in attendance and the work does not stop. To change to an 8-hour day would mean three shifts instead of two. The steel corporation claims that it is impossible to get the men. And, further, that the men want to work more than 8 hours in order to get the additional pay, there being a basic 8-hour day as far as pay is concerned and time and a half for all time over 8 hours.

"It is true some of the workers testified that they wanted to work longer in order to get the increased compensation, but most of them seemed anxious for an 8-hour day with a living wage. The policy of working men 10 and 12 hours per day in the steel mills is, it seems to the committee, an unwise and un-American policy. There are many hundreds of thousands of employees in the steel mills, a considerable portion of whom cannot read, speak or write the English language.

"The 8-hour day is involved in the solution of this question. These non-English-speaking aliens must be Americanized and must learn our language, so the question of a reasonable working day is involved in the question of Americanization. Men cannot work 10 and 12 hours per day and attend classes at night school. It is the general consensus of opinion of the best economic writers and thinkers that the establishment of 8-hour-day systems does not diminish production. Nor do we think the claim made that an 8-hour day is impossible because the workmen cannot be secured for three shifts is tenable. An 8-hour day with a living wage that will enable men to support their families and bring up their children according to the standards of American life ought to be a cardinal part of our industrial policy, and the sooner the principle is recognized the better it will be for the entire country.

"The public also has an interest in the problem of an 8-hour day. Fatigue in human kind is a breeder of unrest and dissatisfaction.

II.

"As to subdivision (*b*) of the findings of the committee, namely, the right of the men to select their own representatives to present their grievances, there should perhaps be an exception made. The representatives selected should be those who believe in the principles of the American government. In the instance of Judge Gary refusing to receive a committee claiming to represent the men in the employment of the company, he could well have objected to receiving a man with the views of Mr. Foster. He did not put his refusal on that ground, but put it rather on the ground that the men did not represent the employees, though himself conceding that 10 to 15 per cent of the mills were probably unionized. It seems to us that even 10 to 15 per cent of the men had the right to select their own representatives and present their grievances to the steel company, and that they should have been heard. Judge Gary could have announced to them, as well as he did afterwards in his letters to the presidents of his subsidiary companies, that he would not deal with representatives of the unions, and that he considered the question one of open and closed shop; likewise, it seems to us unfortunate that Mr. Gary did not answer the letter of Samuel Gompers, the accredited representative of the American Federation of Labor and president thereof. Such things do not tend to harmonize conditions but rather to accentuate them. The proposition under discussion raises the question of collective bargaining, unionism, closed and open shop, and on these propositions there is much controversy.

"The committee is agreed that the principle of collective bargaining is a right of men working in industry. Collective bargaining has generally been recognized as a right of labor. It is apparently one of the effective methods that labor has used to secure its rights. The right of collective bargaining, however, should not be employed for the purpose of discriminating against any class of workmen, whether union or non-union men. Furthermore, the right when exercised should involve full responsibility on either side to abide by the terms of the bargain.

"Judge Gary seems to believe that the question of open and closed shop is involved in the general proposition. There may be two kinds of closed shop as we understand it—a shop closed against non-union men because they do not belong to a union and a shop closed against union men because they do belong to the union. One is a closed shop through the instrumentality of the men themselves who belong to the union and the other is a closed shop through the instrumentality of the employers. Both of such closed shops are un-American. The testimony taken does not disclose either class of closed shop existing in the steel industry. Men have the right in this country to work whether they belong to unions or not, and no body of men has the right to stop other men working because they do not belong to a union. On the other hand, men have the right to join unions and to speak through their unions, and employers have no right to prevent joining unions or to discharge men or make their positions untenable or unpleasant because they have done so. The doctrine of collective bargaining as generally understood is not recogized in the steel mills, and this has caused considerable dissatisfaction upon the part of many of the steel workers. The question of the open and closed shop would not be involved, except indirectly, until in fact there was a substantial unionization of the plants. However, Judge Gary takes the position that the organization and unionization of the plants of necessity results in the closed shop. The difficult proposition in this matter continually arising is this: Does collective bargaining through union

representatives result in a closed shop? If the unions would recognize the right of men to work and be treated as fellow workers, even though they do not belong to the unions, it would not of necessity result in a closed shop. The question is one of great difficulty, and the solution of it is not necessary in the view of the committee in order to present a report of conditions.

"The committee, not being entirely of one mind on the subject, presents the facts and the variety of opinions to the Senate.

III.

"The testimony as introduced and the study the committee has made of the situation lead them to the conclusion that while there were legitimate complaints as to long hours of service, that the strike has been seized upon by some I. W. W.'s, Bolshevists and anarchists to further their own interests, and that their influence in the strike has been powerful.

"The committee is of the opinion that the American Federation of Labor has made a serious mistake and has lost much favorable public opinion which otherwise they would possess by permitting the leadership of this strike movement to pass into the hands of some who heretofore have entertained most radical and dangerous doctrines. If labor is to retain the confidence of that large element of our population which affiliates neither with labor organizations nor capital, it must keep men who entertain and formulate un-American doctrines out of its ranks and join with the employers of labor in eliminating this element from the industrial life of our nation. Unquestionably, the United States Steel Corporation has had the support of a larger and of a wider circle in the country during the strike because of the character of some of the strike leadership. Labor organizations should not place the workingmen in the position of sympathy with un-American doctrines or make them followers of any such leadership. Such practice will result in defeating the accomplishment of their demands.

"Take the case of Mr. William Z. Foster. Mr. Foster is secretary to the committee composed of the 24 international unions managing this strike. His duties were substantially to act as secretary of the strike, to look after the organization of workers and to handle the finances. He is in the office at Pittsburgh and seems to be the general manager of the strike. While it is claimed that he has had little to do with it, it is quite apparent to the committee that he has more to do with it than any other man in its actual management. At the time of his writing "Syndicalism" he was wholly antagonistic to American labor unions, and especially to the American Federation of Labor. Soon after, however, he seems to have come to the conclusion that he could accomplish his aims and purposes better by boring from within, as he expressed it in one letter to Solidarity, the I. W. W. publication. Carrying out his doctrine of "boring from within," he became active in organized labor work and soon became a leader.

"We insert excerpts from his book showing that he believed that nothing was illegal if necessary to carry out his views. He advocated violence in strikes. He charged that the American labor movement was infested with hordes of dishonest officials. The evidence convinces the committee there has been little change of heart on the part of Mr. Foster and that he is now in the full heyday of his power in the 'boring from within' process.

"Such men are dangerous to the country and they are dangerous to the cause of union labor. It is unfair to men who may be struggling for their rights to be represented by such leaders. It prevents them from securing proper hearing for their cause. If Mr. Foster has the real interest of the laboring man at heart he should remove himself from any leadership. His leadership injures instead of helps. If he will not remove himself from leadership the American Federation of Labor should purge itself of such leadership in order to sustain the confidence which the country has had in it under the leadership of Mr. Gompers.

"Labor has done a great work in the war. It has stood nobly by the purposes of this country. It can not now afford to harbor men who in their hearts desire to destroy this Government.

There is inserted here a part of the declaration adopted during the war by the National and International Trade Unions of America and some extracts from articles by Mr. Gompers.

"There is a startling contrast between the words of Foster and these words. This is the language of the man who attempted to secure a postponement of this strike at the request of the President of the United States. The laborers were contending for American principles in contending for an eight-hour day. They cannot put the management of a campaign for American principles into the hands of men who do not believe in American doctrines and hope to succeed.

"There may be, in view of the radical utterances and actions of certain leaders, some warrant for the belief that the strike in the steel industry is a part of a general scheme and purpose on the part of radical leaders to bring about a general industrial revolution. The committee, however, do not go to that extent because they feel there were some real grievances. While Mr. Gompers did not originally participate in counseling or advising the strike, he subsequently indorsed it and put the power of his influence behind it. In view of his standing and patriotism the committee does not believe that he could be a participant in a movement involving such revolution.

IV.

"We have not discussed the 12 demands of the organizers, but only a portion of them. They were undoubtedly to be used as a basis for compromise, and we see no particular need in the discussion of any of them except those heretofore considered.

"Since the strike there has been complaint that the strikers have been denied the right of free speech and that the treatment by the officers has been brutal and that their treatment in the courts does not accord with the high ideals of American democracy. Officials should not hesitate to prevent meetings called together for the purpose of advocating the overthrow of the government. On the other hand, they ought not to be permitted to prevent men meeting and talking over their grievances and presenting to the men their arguments in favor of joining the union or refraining from joining the union. Incidents have been presented to the committee of the use of unnecessary force by police officers. Probably there will always be abuses in times of excitement, but apparently there have been cases of unoffending men and women arrested without reason by the officers, put into jail and in some cases fined by magistrates without warrant or justification. The action in many instances was such as to lead one side of this controversy to the belief that the officers of the law were acting on the side of the steel company. Such a situation is unfortunate and helps to breed discontent.

"As to the complaint of the action of the courts, we are inclined to believe that there is some ground for complaint and that the action of the magisterial courts in the taking of bonds and the forfeiting of bonds, in the arresting of people merely as suspicious characters and sending them to jail therefor, has not in every instance been justifiable. The courts should be very careful that they are not subject to just criticism for curtailing the rights of defendants.

"The foreigners whom the needs of our industries bring

among us cannot be dragooned into love for America and loyalty to its institutions. Public officials should always be ready to receive sympathetic suggestions for the relief of just complaints or violations of or interference with the legal or humane rights of labor, as well as the insistence upon a protection of the property rights of capital and the preservation of law and order.

V.

"We have thus far discussed the situation as pertaining to the employer and the employee. There is a third party, however, to all of this controversy—the great public. There is no place in this country either for industrial despotism or labor despotism. No one should be permitted to unjustly cause the great body of the public to suffer. Strikes are a relic of industrial barbarism, but at present strikes are apparently the only way for labor to secure even its just demands if employers refuse to grant them or to submit them to arbitration. It is not to the credit of our Nation that no way has been devised to settle these disputes outside of strikes. They are destructive and wrecking to the industrial life of the nation. Somebody has to pay the bill and in every instance it is the public. The public has a right to demand that capital shall not arrogate to itself the right to determine in its own way these industrial questions, and it is the same as to labor, and the duty is upon the Congress as representing the people to provide some means for the adjustment of these difficulties. This was done during the war through the War Labor Board and their action was fairly satisfactory.

"Before suggesting remedies the committee desires to make these observations: A large percentage of the strikers are foreigners. By this we mean unnaturalized citizens. Passing now the question of the responsibility for these men being here, it is suggested that, while America welcomes those who come from foreign shores who desre to become Amercan citizens and enjoy the great liberties and opportunities of American life, yet those who come for the purpose of stirring up trouble against this government and attempting to undermine it and overthrow it should be escorted to the water edge and shipped back to the land from which they came. If the laws are now sufficient such characters should be deported at once. If they are not sufficient Congress should immediately enact laws covering this serious situation. Men who try to destroy a government should not be permitted to appeal to that government to protect them in the processes of destruction.

"Another question closely involved is this: There are in this country working in the factories, mines, and mills thousands of men who can not read, speak, or write the American language. Many do not know and can not know the purposes and ideals of this Government. While in the Government, they are not a part of it. These men must be given the benefit of some education. They must be given the opportunity to learn the American language and start on the road to American citizenship.

Remedies

"While the committee was not under the resolution asked to suggest remedies, it feels it would fall short of its duty if it did not make some suggestions to Congress along remedial lines. Some of the suggestions are not directly involved in the steel strike, but they come to the minds of the committee from the evidence that they have taken and conditions they have observed.

"First. That a board or commission somewhat similar to the War Labor Board should be established. This board to have power of compulsory investigation; to have large power in mediation and conciliation and recommendations; not to the extent of compulsory arbitration, but before this board controversies could be heard, investigations made, and decisions rendered. That pending said investigation and decision no strike should be declared provided no employees are discharged for taking part in the controversy and provided further that all opportunity for the employer to take advantage of the delay has been removed; that the principle of collective bargaining and an 8-hour day should be considered by said board, and recommendations made to labor an industry in relation thereto; that the board should be in the nature of a federal industrial commission, seeking at all times not only to settle pending disputes but to help bring about a more harmonious condition between employer and employee.

There is good sense enough among the great body of the American people to bring about an adjustment of these difficulties. The great body of the American people believe in a liberal industrial system, in living wages for men employed in industry; wages that will permite them to raise their families according to the standards of American life and to enjoy recreation from hard, grinding toil; but the American people have no patience and will have none with any leadership that seeks to accomplish its purposes by barbarous methods of freezing or starving the American people. On the other hand, they are as much opposed to an autocracy of capital. Capital must be reasonable likewise. The employer must recognize that there is a new spirit in the world; that labor is not content to be merely a hewer of wood and a drawer of water, and that labor is fighting for a status in industrial life, and it is not concerned merely with wages.

"Why can not capital and labor co-operate and establish between themselves the doctrine of the square deal; cease to be suspicious of one another, join together and act together for the good of each other and for the well-being of the public at large? It is the hope of the world that military warfare has ceased. Have we not reason also to hope and insist that industrial warfare may cease? It can not without a spirit of mutual co-operation between capital and labor.

"Second. That an Americanization bill be passed by the Congress which will provide for the effective education and Americanization of the illiterate foreigners and native illiterates in this country. A bill of this kind has already been reported out of this committee and your committee urges an early adoption of the same by Congress.

"Third. It is observable in the strike districts that the men who own their homes are more contented and more interested in the affairs of the country. One real antidote for unrest in this country is home ownership. The work of the steel companies in building homes has been most commendable. It would not be out of place to suggest that it would be most commendable for the steel companies to use some of their large profits in extending the work of home building.

"Fourth. There should be a change in our naturalization laws which will require the naturalization and some education of all foreigners, at least to the extent of speaking the American language; that they should acquire such knowledge within a period of five years after they arrive, with proper limitations upon further immigration, giving to those already here a certain period of time in which to become naturalized, and if this is not done then deportation should follow.

"Fifth. An effective law should be passed dealing with anarchists, revolutionists, and all who would destroy the American government. There are too many Americans who love their country and are willing to give their life for it and who intend that all the doors of American opportunity shall remain open for the children of to-day and the children of to-morrow to permit a few thousand anarchists, revolutionists, and I. W. W.'s to keep on with their nefarious propaganda to destroy the government."

A Standard Gage Cane Train Backing Into the Mill.

Cuba's Sugar Cane Railways a Large Market*

The Importance and Extent of the Sugar Plantation Lines. Possibilities for Improvements

By John P. Risque

Part II. Locomotive Specialties and Supplies

IT WAS POINTED OUT, in the first article, that certain locomotives on a sugar plantation traveled on main lines in search of cane remote from the mill. In every *ingenio* where such engines are used, they are designated as locomotives for the "*linea principal.*" They are required to conform to regulations which govern the operation of all locomotives on the main lines and as such will be found relatively "up to date." Conditions allowed on an interior or strictly plantation engine cannot "get by" on the main line. Air brake equipment, coupler heights, packing, headlights, etc., are all expected to comply with the main line requirements.

Probably the most popular locomotive specialty in Cuba is the electric headlight. The *administrador* likes them because "they make day out of night" and facilitate night loading of cane. This advantage really seems to outweigh that of the increased safety and consequent efficiency of operation of the entire train and crew which the use of the electric headlight makes possible. Brick arches in some of the recent arrivals are respected as long as the supply of bricks holds out. Injectors and lubricators are pets by their various names, and blow-off cocks might as well be removed as far as the benefits accruing from their use are concerned. Superheaters are numerous and sufficiently abused and neglected to make their use a questionable economy, except where they are properly handled. In these rare cases their comparative showing makes them priceless. Front ends are watched carefully, owing to the frequency and disastrousness of cane fires.

Frequent cause of complaints regarding the introduction of specialties of all kinds from the United States is found in the persistence with which some manufacturers circularize their clients with English literature and instructions which are understood by all but about 95 per cent of the population. Coal, which was burned almost universally up to 1914, has now arrived at the prohibitive price stage and oil is taking its place. Conversions are now being made in large numbers, both on plantation and main lines, and it is expected that all of the locomotives on the island will eventually burn oil.

Cane Cars

This is a study in itself. To the uninitiated a cane car is merely a cane car, even though he recognizes that some have the top hung doors at the end and others at the side. On a plantation, however, the type of car and the name of the prospective builder of the next bunch of cars to be ordered is almost as interesting a topic of discussion as an argument about the qualifications of the next presidential candidate. End dump cars have no partitions. The cane is dumped through the top hung swinging gate or door at the end of the car when it is tipped up on end by the dumping platform at the mill. Side dumpers are partitioned in two or three compartments and are equipped with gates hung on the top rail on the side. As the car is tipped,

*This is the second of these articles on the sugar plantation railways of Cuba. The first appeared in the *Railway Age* of October 17, 1919.

the gates are released by latches at the bottom. In primitive wooden types, stakes only are used, the stakes being released one at a time by an individual stationed at the receiving hopper of the mill, who strikes the catches open with a wooden maul. Cars with no doors are unloaded by chains swung around the load and lifted by a hoist.

Practically all standard gage cane cars are equipped with automatic couplers and some have air brake equipment. Some of the narrow gage cars are of steel and have automatic couplers. Wooden narrow gage cars are mostly link and pin equipped; some have chains and some a home-made car coupling, and practically none have air equipment—nor is it required. Thefts of waste and oil are prevented in some cases by the use of patent journal boxes, whose lids can be locked securely by a socket wrench, and in the other extreme, thousands of journals are ruined annually through negligence and allowing journal box lids to be lost.

Cane Car Capacities

The *"linea principal"* is a transporter of cane in tremendous quantities, not only for plantations that have no rolling stock of their own, but for those which have overtaxed or insufficient and inefficient locomotives and cars. Privately owned cane cars have followed the main line constructional practices and circulars sent to *ingenios* by them in advance of the annual crop, outlining regulations for loading and charges, are effective in the matter of capacities. The average standard gage cane car is built to accommodate from 20 to 30 tons of cane; the narrow gage cars from 7 to 15 tons.

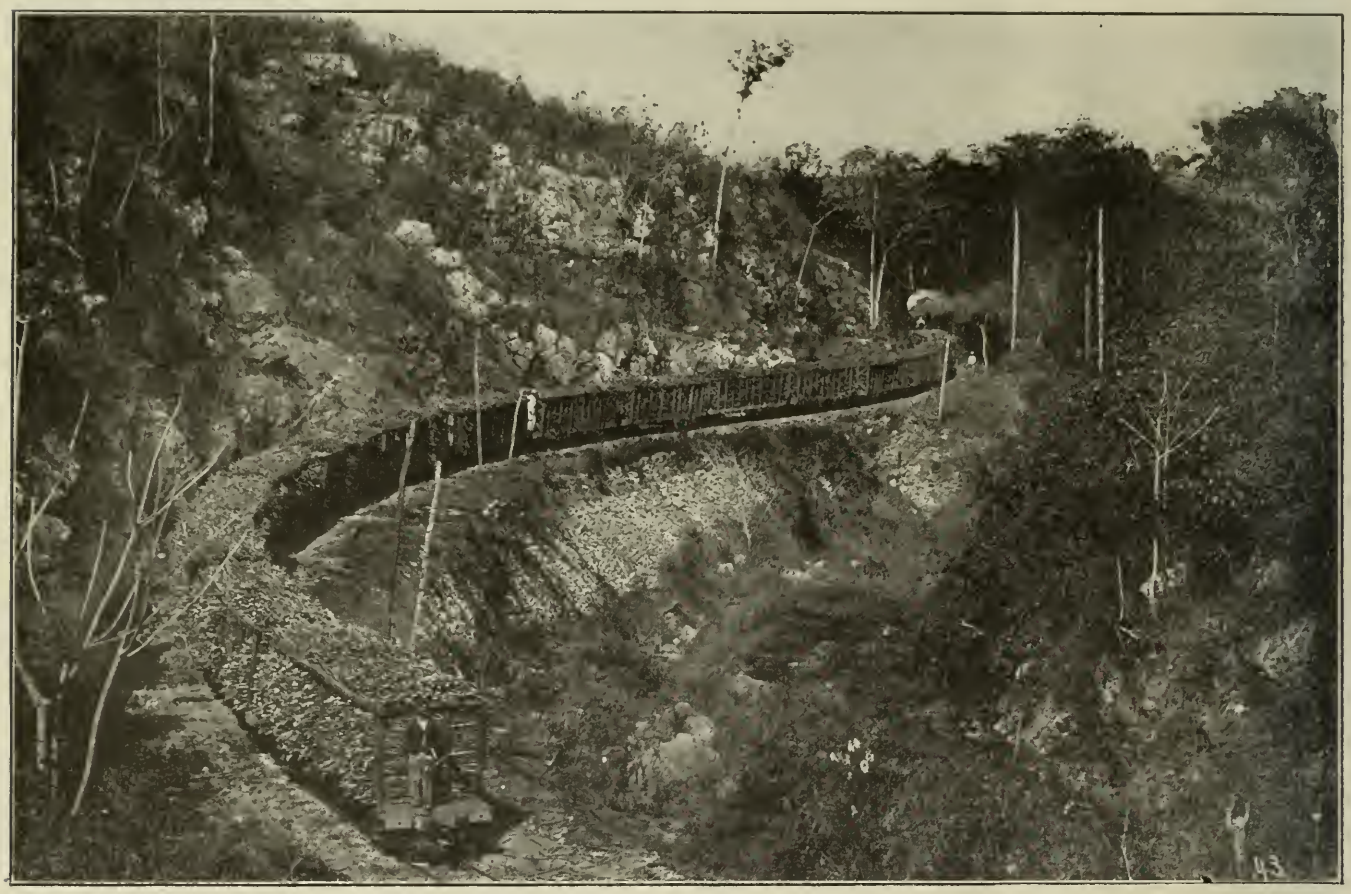
Sugar (box) cars and molasses (tank) cars are found on some plantations, but the main lines have handled a majority of the business.

Owing to the comparative shortness of the season of traffic and the low average speeds of trains, the roadbed of a cane railroad gets but little attention. Second-hand rails of from 50 to 70 lb. are used and are spiked to ties mostly secured from the United States. Stub switches are almost universal and answer the requirements. Bridges are of wood, culverts of corrugated iron or concrete. An overgrowth of weeds on the track is not discouraged in the least and aside from disguising a possible defect in the rails, does not seem to interfere with traffic.

Locomotive Repair Facilities

The average *ingenio* is conspicuously devoid of anything of the kind. A cinder pit or two which facilitates getting underneath the locomotive when the pit is not full of ashes or flooded with water may be found here and there, and it is said that there are one or two mills on the island which have locomotive shops equipped with cranes. If these buildings are not stored with bags of sugar instead of locomotives they are magnificent exceptions to the rule. Compared with the degree of efficiency attained by a cane mill which, extracting every particle of juice from the cane, returns the dry remains of what was once a stalk to the fireboxes of the mill's boilers, the science of the *ingenio's* transportation of its cane is in its infancy and the fact is recognized by competent engineers. This refers particularly to the neglect of locomotives and cars which compares with the treatment accorded binders and reapers by our own farmers; expensive machinery that is left to rust in the open fields from one harvest's end to the beginning of the other.

A large combination of sugar mills and plantations with over 1,200 kilometers of railway, owns 125 locomotives (and more than 4,500 cars), but possesses but one locomotive shop—merely a shed—at a mill where there are 16 locomotives. Plans have been reported under consideration for



A Cane Train En Route to the Mill

a locomotive shop, but demands for other equipment evidently supersede it. At another important mill belonging to this concern the rafters of a leaky wooden roof permit of the jacking up of but one engine at a time. There are seven large engines at that point. Before another locomotive can be jacked up by hand the first one must be rewheeled and moved. The nearest approach to anything like efficiency in the maintenance and repair of these 125 locomotives occurs at a mill where the eight standard gage locomotives can during the repair season be accommodated on temporarily laid tracks in the entrance of the mill whose crane runway is sufficiently extended to permit the lifting of entire locomotives and the handling of parts by the electric crane, whose principal function is intended to serve the mill's engines and other machinery. These "facilities" are more probably the result of accident than foresight.

Driving wheels loaded on flat cars can be seen en route during the repair season, bound for public repair shops located in the various towns. To the cost of having this work done on the outside, must be added the cost of loading, transportation, and unloading, with the assumption of the risk of late or non-deliveries which are known to accompany the performance of contract jobs. A sugar cane company, attracted by the apparent economies of reclaiming locomotive and stationary boiler tubes, sent an engineer to the states to make a thorough study and report on tube welding apparatus. His report resulted in the outright purchase and the installation of an elaborate and costly plant, which, when last seen, was stored with bags of sugar. Tubes are now being safe-ended on most plantations in the primitive manner of the blacksmith and the anvil; they do a good but costly job.

A constant source of irritation and excessive cost, incident to the overhauling of Cuba's cane engines, is the locomotive repair gang's entire dependence upon the mill's general machine shop. Ordinarily, it would appear to one who had not been compelled to struggle with the problem that the array of tools encountered in the shop of the average *ingenio* should be ample to take care of all the work—including that of the locomotives, whether there are two or ten. In some cases, even an engineer might be able to stretch his imagination sufficiently to conclude that the equipment was adequate. The mere physical existence, however, of an elaborately equipped machine shop for the care and repair of the mass of complicated machinery with which a sugar mill is equipped does not mean that the locomotive repairer will get a run for his money, for the mental attitude on this subject, from the standpoint of the manager, is "mill first—other repairs afterwards." Consequently, and obviously, if the machine room becomes crowded with mill work—as it usually does and stays that way—locomotive work gets the traditional Chinaman's chance.

The chief engineer of the mill thinks in terms of rolls and pumps and evaporators. Last minute pressure under threat of incomplete locomotives for the coming crop may direct his mind in temporary favor of the latter. Not infrequently the cost of transporting the cane to the mill is enhanced by the distant trudge in the mud from the repair track to the machine shop, often with heavy parts. One of the easiest calculations to make is that involving the possible tremendous savings in the cost of hauling sugar cane to mills, by the installation of necessary locomotive repair facilities—nothing elaborate, just plain but ample back shop facilities.

Celebrating the Completion of a Record Crop. Locomotives Are Accorded Honors, but Not Adequate Facilities

Labor

Wages and costs have increased in Cuba in the same proportion as they have in all other parts of the industrial world and the wages paid to competent locomotive repairmen and runners are no exception. In fact, the situation was rather aggravated by the exodus of Cuban workmen in great numbers to the well paying munition plants of the United States during the war. Spanish and Cuban workmen are competent, intelligent, and as a rule take pride in their work. On a small plantation a locomotive foreman will run an engine during the crop. On a large plantation he will generally supervise locomotive service during the *Zafra,* and his first-class machinists are engineers of the *"linea principal"* engines, second grade mechanics are runners of interior cane engines and helpers make good firemen for both. The plantation main line engineers are certified by examinations which they are required to pass before they can venture out of the mill yard onto the public lines.

The prevalence of unsatisfactory locomotive results in

many localities due to the principal contentions of this article—lack of facilities for proper repairs—has encouraged the growth of public repair shops which thrive in the various towns of the sugar belt. They take on all kinds of work for which the *ingenio* is unprepared, including general locomotive repairs, as well as the construction of complete boilers and fireboxes, or the attachment and fitting up of new fireboxes from the states—a frequent method of renewing a firebox. These shops are, as a rule, well equipped with modern facilities. Some of them have first-class pattern shops and foundries in connection, and a thorough inspection of Cuba's repair facilities would not be complete if it did not include the visiting of these several busy shops. Some of them are of considerable size and still growing, and are continually adding tools to their equipment.

The Zafra

Like the packers who claim to have capitalized every available product but the squeal from the carcasses of their

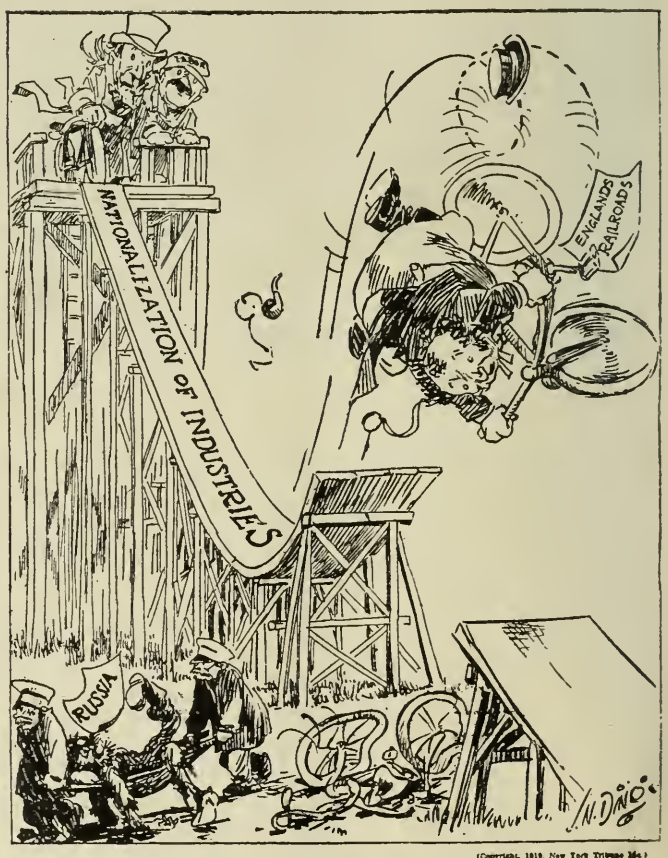
The Stake Opener with His Maul

animals, the cane mills make efficient use of every inch of the stalk which enters their hungry hoppers. In transporting the cane from the fields to the mill, however, there is vast room for improvement; there are "squeals" and other items that could well be saved and utilized. The railways and their equipment are the "ties that bind" the mills to their customers, the *colonos*. The latter are the colonizers—the actual cane growers—some of whom own their own fields, others of whom rent the fields and sell their cane to their favorite mill. Whatever the financial arrangement between the mill and the *colono*, the one is as dependent upon the other as both are dependent upon daylight. The cane railroad is their line of communication, regardless of the distance the *colono* may be from a mill; if the latter's cane is famous for its high yield, a little matter of 60 or 70 kilometers will not interfere in the least with a mill's endeavor to please that particular patron.

Along about December 1, *colonos* commence to notify the mill that their cane is ready to grind and that they want cars—and from that moment the annual cane transportation struggle is on. If the mill depends upon the main lines for locomotive and car service it is generally well served.

Equipment and Track Slightly Out of Date

Its requirements will have generally been considered in advance by all of the machinery of a well organized staff and equipment. When the call comes, trains are ready. If, however, the *"central"* is to fight the battle alone with its own material *rodante* the *colono's* luck will depend upon the *central's* progress in the repairs of its rolling stock previously referred to, or on the delivery from the contract shop.



Seems As If It Might Be a Good Idea for Us to Wait and See How Those Who Have Tried It Like It

Effective Methods of Reducing the Coal Bill

How Transportation Department Officers Are Promoting Fuel Conservation and Improving Operation

By H. C. Woodbridge
Supervisor Fuel Conservation Section, Division of Operation, U. S. Railroad Administration

THE COST OF FUEL placed on locomotives constitutes almost, if not quite, as great a transportation department expenditure as the now disturbing matter of wages. The growing cost of fuel and the national need for making the best possible use of the available supply has led to an appreciation of this fact by operating officers, many of whom formerly gave the problem the most perfunctory consideration, and they are now effectively promoting fuel economy. The methods being used vary considerably. All have for their purpose the enthusing of the whole operating organization to produce effective co-operative effort.

Enginemen, trainmen, despatchers and others experienced in the handling of trains are proud of their ability. Like all Americans, they enjoy fair tests of their skill and are keen enough and broad enough to improve their own methods from the experience of others. Furthermore, being human, commendation does not go amiss with them.

One way in which effective use of these principles has been made is shown by the two bulletins issued by R. T. Morrow, superintendent of the Pittsburgh division of the Pennsylvania. General Notice No. 57 reads as follows:

"During the week ending July 19, 1919, trips were made over the division in through passenger service on the number of shovelsful of coal as shown below:

Train number	Number of cars	Time made up	Number of shovelsful
2	9	..	389
2	10	20	441
601	7	6	323
601	8	8	331

"In freight service trips were made as follows:

Engine number	From	To	Number of cars	Adjusted tons	Number of shovelsful
1197	Pit.	Alt.	46	2490	1127
3641	Pit.	Alt.	50	2520	810
608	Cgh.	Wilmore	54	3210	163
1582	Cgh.	Wilmore	43	3100	163

"Why should a fireman with 46 cars, 2,490 tons, burn 317 shovelsful more coal passing over the same territory than a fireman with 50 cars, 2,520 tons? Likewise, why should a fireman with 43 cars, 3,100 tons, burn as much coal as another fireman with 54 cars, 3,210 tons?

"It is gratifying to note the improvement with stoker-fired locomotives. Recently a number of stoker-fired locomotives have been noticed making but very little smoke. This is indicative of efficient operation of the stoker by the firemen.

"Avoid making black smoke and blowing off at safety valves.

"Never work the locomotive harder than necessary to haul the train at the desired speed.

"Never place more fuel on the fire than is necessary to maintain the required steam pressure.

"The least amount of coal consumed, the least amount of work for the fireman.

"Pull together.

"Team work counts."

General Notice No. 58 presents a comparison of the locomotive fuel consumption per 1,000 gross ton miles in freight service and per passenger train car-mile in passenger service for the roads in the Allegheny region during the month of May, 1919, and closes with the following comment:

"The very satisfactory performance on the Pennsylvania Railroad, Lines East, in both passenger and freight service, as compared with other roads in the Allegheny region, is indicative of the efforts made by our enginemen, firemen and others who have to do with fuel conservation. They are to be congratulated as well as encouraged to still better the results, as we have a few competitors who have shown a better performance. Every effort should be made to continue to improve on the results we have thus far obtained."

These bulletins indicate very clearly that efforts to secure interest and added effort in the promotion of fuel economy need not be stereotyped. Some specific facts typical of everyday occurrences may be presented in such a way that a new interest is created in its significance, with the result that personal pride in accomplishing good work and the competitive spirit are aroused and fostered.

The following extracts from another bulletin issued by a division superintendent are also examples of the effective use of what might be considered unimportant occurrences in every-day railway operation:

"An engineman and fireman on a local passenger train . . . made seven successive eastward trips without permitting steam to blow off at the safety valve. This is a commendable performance.

"A short time ago there was a noticeable improvement in the emission of smoke from freight locomotives, but at present the black smoke of these locomotives seems to be on the increase. We dislike very much for the firemen to lose their reputation and trust an improvement will be effected."

Another bulletin issued by a superintendent is significant, in that it points out the effect of unfavorable operating conditions and of failure to maintain a locomotive in good condition, not in an academic way, but with concrete evidence on which to base the comment. This reads as follows:

"During the week ending August 2, 1919, trips were made over the division (on the same run in each case) in through passenger service on the number of shovelsful of coal as shown below:

Number of cars	Time made up	Number of shovelsful	Pounds of coal
10	..	368	7,728
10	4	385	8,085

"The above is very good work. The difference in the coal consumption was due to making up four minutes. This emphasizes the importance of giving the trains clear distant and home signals whenever possible and avoiding unnecessary slowdowns and stops.

Number of cars	Time made up	Number of shovelsful	Pounds of coal
9	..	311	5,598
9	..	386	8,106

"The difference in coal consumption was due to leaking superheater units, which resulted in the engine not steaming properly. This increased coal consumption emphasizes the importance of maintaining the superheater and otherwise keeping the engine in good steaming condition.

Number of cars	Time made up	Number of shovelsful	Pounds of coal
5	..	198	4,158
5	..	200	4,200

"This illustrates the result of competitive, skillful and co-

operative work on the part of the enginemen and firemen.

"In freight service trips (in the same direction) were made as follows:

Time consumed	Number of cars	Adjusted tons	Number of shovelsful	Pounds of coal
5 hrs. 20 min.	100	2,400	835	15,030
6 hrs. 11 min.	100	2,400	915	16,470

"The tonnage was the same, but the latter train, while it made a good run, met with delay. This emphasizes the fact that a free movement is always in the interest of fuel economy."

Another method which has been used to great advantage is the conducting of competition between divisions on the same system. Such competitions have been carried out between some of the divisions on the western lines of the Baltimore & Ohio, with the result at the end of May, 1919, that Superintendent Stevens of the New Castle division issued a bulletin to all employees of the division congratulating the enginemen and all others who contributed to the excellent showing which had been made during the month of April, and closing thus:

"On the strength of this I have challenged the superintendent of the Chicago division for a fuel contest for the month of June, and in order to have this division ahead of the Chicago division, it will be necessary for all of us to do our utmost to conserve fuel. This applies not only to the men handling the trains, but to sectionmen, mechanical men at terminals, train despatchers, operators and all others.

"I have been assured by both road foremen of engines that there will be no question but that we will beat the Chicago division. However, it will require everyone's efforts to do this. I know that you are as much interested as I am and very anxious to see what you can accomplish."

The challenge was accepted by Superintendent Jackson of the Chicago division. At the close of the contest the fuel accounting on each division was carefully checked by auditors from the general office, and a decision was rendered as follows:

Pounds of Coal

	Per 1,000 G. T. M.	Per passenger car mile	Per switch engine mile
New Castle division	145.6	11.14	95.2
Chicago division	114.7	10.98	125.5

On this basis the Chicago division won, but as regards the amount of coal consumed per unit of work done the New Castle division showed greater improvement during the month in question, as compared with the corresponding month of 1918, than was shown on the Chicago division, the comparison being as follows:

Percentage of Improvement
June, 1919, as compared with June, 1918

	Freight	Passenger	Switching
New Castle division	6.28	22	16
Chicago division	8.52	16	3.6

On this basis the New Castle division saved $1,000 more than was saved on the Chicago division.

Some conception of the interest which was taken in this contest and its effect on locomotive performance may be gained from the results of a trip made on the New Castle division on the last day of the contest. The locomotive was of the Mikado type, stoker-fired, having a tractive effort of 54,600 lbs. The complete trip of 147 miles westward and 60 miles eastward was made on three tons less than one full tank of coal.

	Westbound	Eastbound	Total and average
Locomotive-miles	147	60	207
Gross ton-miles in hundreds	3,776	1,728	5,504
Pounds of coal consumed	23,000	9,000	32,000
Pounds of coal per 1,000 gross ton-miles, actual	60.91	52.08	58.14
Total time on road	9 hrs.	3 hrs. 55 min.	12 hrs. 55 min.
Actual running time	7 hrs. 45 min.	2 hrs. 35 min.	10 hrs. 20 min.
Loaded cars in train	19	64	83
Empty cars in train	79	0	79

The competitive spirit still running high, the Chicago division on July 3 ran an engine of the same class a round trip in tonnage service on one tank of coal, with about 1½ tons remaining on the tender at the end of the round trip of 256 miles. The performance was as follows:

	Westbound	Eastbound	Total and average
Locomotive miles	128	128	256
Actual gross ton-miles in hundreds	3,950	2,778	6,728
Pounds of coal consumed	17,500	17,560	35,000
Pounds of coal per 1,000 gross ton-miles, actual	44.3	63.0	52.02
Scoops fired by hand	7	7	14
Number of times safety valve was raised	1	0	1
Time on road, total	6 hrs. 36 min.	5 hrs. 11 min.	11 hrs. 47 min
Loaded cars handled in train	70	2	72
Empty cars handled in train	1	97	98

Not at all daunted by this exceptional performance, another similar test was arranged by the superintendent of the New Castle division. This is considered one of the best performances ever made by a stoker-filled locomotive. The engine, a Mikado, having a tractive effort of 50,200 lb., stoker-fired, was run a round trip of 294 miles on one tank of coal, producing a gross ton-mileage of 807,300, with three tons remaining on the tender at the completion of the round trip. The data for this round trip is as follows:

	Westbound	Eastbound	Total
Locomotive-miles	147	147	294
Actual gross ton-miles in hundreds	4,364	3,709	8,073
Pounds of coal consumed	16,000	16,000	32,000
Pounds of coal per 100 gross ton-miles	36.66	43.14	39.64
Number of times safety valve was raised	0	0	0
Grates shaken and hook used	0	0	0
Total time on road	8 hrs.	9 hrs.	17 hrs.
Actual running time	6 hrs. 40 min.	7 hrs. 1 min.	13 hrs. 41 min.
Loaded cars handled in train	50	32	82
Empty cars handled in train	2	50	52

A fuel performance contest between the New Castle division and Illinois divisions was conducted during the month of August, and arrangements are being made for other similar competitions between divisions on both the Baltimore & Ohio Eastern and Western Lines.

Relation of Coal Consumption to Other Operating Economies

Philadelphia & Reading officials, impressed by the results of tests which showed that the coal consumption was increased by from 500 to 1,500 lb. for each stop of a full tonnage freight train, in March started an intensive campaign for the purpose of eliminating every unnecessary stop or slow down in freight train movements.

Performances on the various runs were carefully investigated, and in many instances opportunities were found to put into effect adjustments and modifications of operating practices which have resulted in a material improvement.

Many suggestions of value were obtained from engine and train crews, and these suggestions were given such consideration that most satisfactory co-operation developed. Open meetings with engine and train men were addressed by superintendents, chief despatchers and others, and improper practices were brought to light and corrected as a result of these meetings.

Arrangements to start freight trains at opportune times were put into effect, and the crews on many of these trains were given proposed schedules, consisting simply of a series of marks to aim at. The men were allowed "to get over the railroad" on these runs, and some most gratifying movements were made, clearly indicating the possibilities of which the officers have taken advantage.

Suitable bulletins showing the proposed and actual running time of trains aroused interest on the part of all who were concerned in train movement, and the despatchers have been greatly assisted by information and recommendations

sent in by wire from engine and trainmen en route. Commendatory letters from superintendents have encouraged co-operation and individual effort.

That the results obtained were real and decidedly substantial is shown in the table giving the results for the weeks ending June 7 and August 23, of the average time on the road and the cars and tons moved on several typical runs on the Reading division:

That the two periods are fairly comparable is evident from the fact that the freight tonnage movement was only approximately six per cent less in 1919 than in 1918 for the weeks shown. The effect on fuel consumption has been very marked, although an exact comparison of the two periods in this respect is impossible, due to the lack of fuel statistics for last year. Furthermore, the results have demonstrated the fact that whether such efforts in the operating department are directed primarily toward the end of saving fuel or to improve operating conditions, the results are the same. Fuel economy and good operation are synonymous terms.

COMPARISON OF TYPICAL RUNS SHOWING AVERAGE TIME ON THE ROAD AND CARS AND TONS HANDLED.

Between	Distance in Miles		Week Ending June 7				Week Ending August 23			
			Average Time		Average Haul		Average Time		Average Haul	
			Hours	Mins.	Cars	Tons	Hours	Mins.	Cars	Tons

National Agreement for Maintenance of Way Employees

A national agreement covering rules and working conditions for employees represented by the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers has been signed between the director general and the officers of that organization, effective December 16, and to continue in force during the period of federal control. The request for revised rules and working conditions for these employees was made 10 months ago and has since been under consideration by a committee representing the regional directors and the employees and by the Board of Railroad Wages and Working Conditions. It has been understood for months that this agreement would be made effective prior to the end of federal control.

The agreement covers rules upon seniority, discipline, etc., and provides that there will be no change in the agreement during the federal operation until after 30 days' notice has been given by either party. Overtime for regular section laborers and other employees in this classification, except laborers in extra or floating gangs whose employment is seasonal and temporary in character, and certain employees whose positions do not require continuous manual labor, will be paid on the basis of time and one-half after the eighth hour of continuous service, exclusive of the meal period, thus applying the same principle which was established last year for important classes of railroad workers.

Heretofore such maintenance employees have been paid overtime at pro rata rates for the ninth and tenth hour and time and one-half after the tenth hour. Under the agreement laborers in extra or floating gangs whose employment is seasonal or temporary in character will be paid overtime at a prorata rate for the ninth and tenth hour and time and one-half after the tenth hour, whereas employees holding positions not requiring continuous manual laber such as track, bridge and highway crossing watchmen, signalmen at railway non-interlocked crossings, lampmen, engine watchmen at isolated points and pumpers will continue to be paid for their present hours of work a monthly rate equal to their present pay.

The following is the text of the national agreement:

Article I—Scope.

These rules govern the hours of service and working conditions of all employees in the Maintenance of Way Department (not including supervisory forces above the rank of foremen and not including the Signal, Telegraph and Telephone Maintenance Departments), shop and roundhouse laborers (including their gang leaders), transfer and turntable operators, engine watchmen, pumpers and highway crossing watchmen, except the following:

a. Employees provided for in the national agreement with the mechanical crafts, dated September 20, 1919.

b. Clerical forces and other employees provided for in Articles I and II, Supplement No. 7, General Order No. 27.

c. Boarding car and camp employees provided for in Supplement No. 18, to General Order No. 27.

They supersede all rules, practices and working conditions in conflict therewith.

It is understood that this agreement does not annul agreements already in effect with other organizations unless and until a majority of the employers concerned express a desire for a change.

Article II—Seniority.

Section (a) Seniority begins at the time the employee's pay starts.

(b) Rights accruing to employees under their seniority entitle them to consideration for positions in accordance with their relative length of service with the railroad, as hereinafter provided.

(c-1) Seniority rights of all employees are confined to the sub-department in which employed.

(c-2) Except as provided in Section (d) of this article and in Section (h), Article III, when force is reduced the senior men, in the sub-department, on the seniority district, capable of doing the work shall be retained.

(d-1) Seniority rights of laborers, as such, will be restricted to their respective gangs, except that when force is reduced laborers affected may displace laborers junior in service on their seniority district.

(d-2) Seniority rights of laborers to promotion will be restricted to the territory under the jurisdiction of only one supervisor or other corresponding officer, except that for laborers in the Mechanical Department, such rights will be confined to the place where employed.

(e) Seniority rights of employees of higher rank than laborers to new positions or vacancies will be restricted to the territory over which one superintendent, one division engineer, or one master mechanic, has jurisdiction. When force is reduced, foremen will have the right, before displacing other employees, to displace only foremen with the least seniority rights on their respective seniority districts.

(f) employees assigned to temporary service, may, when released, return to the position from which taken, without loss of seniority.

(g) Seniority rosters of employees of each sub-department by seniority districts, will be separately compiled. Copies will be furnished foremen and employees' representatives and be kept at convenient places available for inspection by employees interested.

(h) Seniority rosters will show the name and date of entry of the employees into the service of the railroad, except that names of laborers will not be included and their seniority rights will not apply until they have been in continuous service of the railroad in excess of six (6) months.

(i) Rosters will be revised in January of each year and will be open to correction for a period of sixty (60) days thereafter.

(j) Employees given leave of absence in writing by proper authority of the railroad, for six (6) months or less, will retain their seniority. Employees failing to return before the expiration of their leave of absence will lose their seniority rights, unless an extension has been obtained.

(k) When employees, laid off by reason of force reduction, desire to retain their seniority rights, they must file with the officer of the sub-department notifying them of the reduction, their address, and renew same each sixty (60) days. Failure to renew the address each sixty (60) days or to return to the service within seven (7) days after being so notified, will forfeit all seniority rights.

(l) Employees temporarily transferred by direction of the management, from one seniority district to another, will retain their seniority rights on the district from which transferred.

(m) In case of change in seniority districts, a relative proportion of the total employees affected will be transferred to and their seniority rights adjusted in the revised districts, by the management, with a properly constituted committee representing the employees.

(n) Employees accepting positions, in the exercise of their seniority rights, will do so without causing extra expense to the railroad, except as provided in these rules.

Article III—Promotions.

Section (a) Promotions shall be based on ability, merit and seniority. Ability and merit being sufficient, seniority shall prevail; the management to be the judge.

(b) In transferring employees to fill vacancies or new positions, the provisions of section (a) of this article will apply.

(c) Employees are entitled to promotion, only on the district and in the sub-department, over which their seniority rights prevail.

(d) Employees declining promotion shall not lose their seniority, except to the employee promoted and only in the next higher rank of service.

(e) Employees accepting promotion and failing to qualify within thirty (30) days, may return to their former positions.

(f) New positions and vacancies will be bulletined within thirty (30) days previous to or following the dates such vacancies occur, except that temporary vacancies need not be bulletined until the expiration of thirty (30) days from the date such vacancies occur.

(g) Promotions to new positions or to fill vacancies will be made after bulletin notice has been posted for a period of ten (10) days at the headquarters of the gangs in the sub-department of employees entitled to consideration in filling the positions, during which time employees may file their applications with the official whose name appears on the bulletin. The appointment will be made before the expiration of thirty (30) days from the date the bulletin is posted and the name of the employee selected will then be announced. New positions or vacancies may be filled temporarily, pending permanent appointment.

(h) The general rule of promotion and seniority will not apply to positions of track, bridge and highway crossing watchmen and signalmen at railway (non-interlocked) crossings, but, when practicable, such positions will be filled by incapacitated employees from any department and preference in filling and retaining these positions will be determined by the degree to which incapacitated for other work, seniority in the service of the railroad and ability to perform the work.

Article IV—Discipline and Grievances.

Section (a) Employees disciplined or dimissed will be advised of the cause for such action, in writing, if requested.

(b) An employee disciplined or who feels unjustly treated, shall upon making a written request to the immediate superior within ten (10) days from date of advice, be given a fair and impartial hearing within ten (10) days thereafter and a decision will be rendered within twenty (20) days after completion of hearing. Such employee may select not to exceed three employees to assist at the hearing.

(c) A transcript of an employee's evidence, when taken in writing, will be furnished only to such employee upon verifying and signing them.

(d) A copy of all the evidence taken in writing at the hearing will be promptly made available for use of a properly constituted committee, when required in handling cases on appeal, of which notice has been given in accordance with section (e) of this article.

(e) an employee dissatisfied with a decision will have the right to appeal in succession up to and including the highest official designated by the management to handle such cases, if notice of appeal is given the official rendering the decision within ten (10) days thereafter. The right of the employee to be assisted by duly accredited representatives of the employee is recognized.

(f) If the charge against the employee is not sustained, it shall be stricken from the record. If by reason of such unsustained charge, the employee has been removed from position held reinstatement will be made and payment allowed for the assigned working hours actually lost, while out of the service of the railroad, at not less than the rate of pay of position formerly held on or for the difference in rate of pay earned, if in the service.

(g) Prior to the assertion of grievances as herein provided, and while questions of grievances are pending, there will neither be a shutdown by the employer, nor a suspension of work by the employees.

(h) Employees serving on committees, on sufficient notice, shall be granted leave of absence and free transportation, for the adjustment of differences between the railroad and its employees.

Article V—Hours of Service, Overtime and Calls.

Section (a-1) Except as otherwise provided in these rules eight

(8) consecutive hours, exclusive of the meal period, shall constitute a day's work.

(a-2) For regular operation requiring continuous hours, eight (8) consecutive hours without meal period may be assigned as constituting a day's work, in which case not to exceed twenty minutes shall be allowed in which to eat, without deduction in pay, when the nature of the work permits.

(a-3) Regularly established daily working hours will not be reduced below eight (8) to avoid making force reductions.

When less than eight (8) hours are worked for convenience of employees, or when regularly assigned for service of less than eight (8) hours on Sundays and holidays, or when, due to inclement weather, interruptions occur to regular established work periods preventing eight (8) hours work, only actual hours worked or held on duty will be paid for except as provided in these rules.

(a-4) Except as otherwise provided in these rules only the hours between the beginning and release from duty, exclusive of the meal period, shall be paid for.

(a-5) Except as otherwise provided in these rules time worked on Sundays and the following holidays: New Year's, Washington's Birthday, Decoration Day, Fourth of July, Labor Day, Thanksgiving and Christmas shall be paid for at the pro-rata hourly rate when the entire number of hours constituting the regular week-day assignment are worked.

On roads where an agreement or practice more favorable to the employees is in effect such agreement or practice, in so far as it relates to this section (a-5) may be retained.

(a-6) Except as otherwise provided in these rules when assigned, notified, or called to work on Sundays and on the above specified holidays, a less number of hours than constitutes a day's work within the limits of the regular week-day assignment, employees shall be paid a minimum allowance of two hours at overtime rate for two hours work or less, and at the pro-rata hourly rate after the second hour of each tour of duty. Time worked before or after the limits of the regular week-day assignment shall be paid for on the actual minute basis at the rate of time and one-half time.

On roads where an agreement or practice more favorable to the employees is in effect such agreement or practice, in so far as it relates to this section (a-6) may be retained.

(a-7) Overtime for laborers in extra or floating gangs whose employment is seasonal and temporary in character, when engaged in work not customarily done by regular section gangs, such as ballasting and rail laying including the tie renewals incident thereto, and ditching or in improvement work such as bank widening, grade and line changes, rip rapping and similar work, shall be computed for the ninth and tenth hour of continuous service, exclusive of the meal period, prorata, on the actual minute basis and thereafter at the rate of time and one-half time. Such extra or floating gangs will not be used to displace regular section gangs.

(a-8) Overtime for regular section laborers and other employees except those covered in Sections (a-7) and (a-12) of this article shall be computed after the eighth hour of continuous service, exclusive of the meal period, on the actual minute basis at the rate of time and one-half time.

(a-9) Except as otherwise provided in these rules, employees notified or called to perform work not continuous with the regular work period, will be allowed a minimum of three (3) hours for two (2) hours work or less, and if held on duty in excess of two (2) hours, time and one-half time will be allowed on the minute basis.

(a-10) Except as otherwise provided in these rules, employees will be allowed time and one-half time, on minute basis for service performed continuous with and in advance of regular work period.

(a-11) Employees who have completed their work period for the day and been released from duty, required to return for further service may, if conditions justify, be paid as if on continous duty.

(a-12) Except as otherwise provided in this section, positions not requiring continuous manual labor such as track, bridge and highway crossing watchmen, signal men at railway non-interlocked crossings, lamp men, engine watchmen at isolated points, and pumpers, will be paid a monthly rate to cover all services rendered. This monthly rate shall be based on the present hours and compensation. If present assigned hours are increased or decreased the monthly rate shall be adjusted pro-rata as the hours of service in the new assignment bear to the hours of service in the present assignment, except that hours above ten (10) either in new or present assignment shall be counted as one and one-half in making adjustments. Nothing herein shall be construed to permit the reduction of hours for the employees covered by this section (a-12) below eight (8) hours per day for six (6) days per week. The wages for new positions shall be in conformity with the wages for positions of similar kind, class and hours of service where created.

Exceptions to the foregoing paragraph shall be made for individual positions at busy crossings or other places requiring continuous alertness and application, when agreed to between the management and a committee of employees. For such excepted positions the foregoing paragraph shall not apply.

(b) No assigned hours will be designated for employees, performing intermittent service, requiring them to work, wait or travel, as regulated by train service and the characttr of their work, and where hours cannot be definitely regulated.

(c-1) Employees' time will start and end at designated assembling points for each class of employees.

(c-2) The starting time of the work period for regularly assigned service will be designated by the supervisory officer and will not be changed without first giving employees affected thirty-six (36) hours notice.

(c-3) Employees working single shifts, regularly assigned exclusively to day service, will start work period between 6 a. m. and 8 a. m.

(c-4) Employees working single shifts, regularly assigned exclusively to part day and part night service, will start work period between 3 p. m. and 6 p. m.

(c-5) Employees working single shifts, regularly assigned exclusively to night service, will start work period between 6 p. m. and 9 p. m.

(c-6) For regular operations necessitating working period varying from those fixed for the general force as per sections (c-3), (c-4) and (c-5), the hours of work will be assigned in accordance with the requirements.

(d-1) When a meal period is allowed, it will be between the ending of the fourth hour and beginning of the seventh hour after starting work, unless otherwise agreed upon by the employees and employer.

(d-2) If the meal period is not afforded within the allowed or agreed time limit and is worked, the meal period shall be paid for at the overtime rate and twenty minutes with pay in which to eat shall be afforded at the first opportunity.

(d-3) Unless acceptable to a majority of the employees directly interested, the meal period shall not be less than thirty (30) minutes nor more than one (1) hour.

(e) To compute the hourly rate of monthly rated employees, the number of working days constituting a calendar year, multiply by eight and divide the annual salary by the total hours, exclusive of overtime and disregarding time absent on vacations, sick leave,; holidays, or for any other cause. In determining the hourly rate, fractions less than one-fourth of one cent shall be as one-fourth of one cent; over one-fourth and under one-half, as one-half cent; over one-half and under three-fourths, as three-fourths; over three-fourths as one cent.

(f) Employees required by the management to travel on or off their assigned territory in boarding cars, will be allowed straight time traveling during regular working hours, and for Sundays and holidays during hours established for work-periods on other days. When traveling in boarding cars after work-period hours, the only time allowed will be for actual time traveling after 10 p. m. and before 6 a. m., and at half time rate.

(g) No overtime hours will be worked without authority of a superior officer, except in case of emergency, where advance authority is not obtainable.

(h) Employees whose responsibilities and or supervisory duties require service in excess of the working hours or days assigned for the general force, will be compensated on a monthly rate to cover all services rendered, except that when such employees are required to perform work which is not a part of their responsibilities or supervisory duties, on Sundays, or in excess of the established working hours, such work will be paid for on the bases provided in these rules in addition to the monthly rate. For such employees, now paid on an hourly rate, apply the monthly rate, determined by multiplying the hourly rate by 208. Section foremen required to walk or patrol track

on Sundays shall be paid therefor, on the bases provided in these rules, in addition to the monthly rate.

(i) Employees temporarily or permanently assigned to duties requiring variable hours, working on or traveling over an assigned territory and away from and out of reach of their regular boarding and lodging places or outfit cars, will provide board and lodging at their own expense and will be allowed time at the rate of ten (10) hours per day at pro-rata rates and in addition pay for actual time worked in excess of eight (8) hours on the bases provided in these rules, excluding time traveling or waiting. When working at points accessible to regular boarding and lodging places or outfit cars, the provisions of this rule will not apply.

(j) Regular section laborers required to report at usual starting time and place for the day's work and when conditions prevent work being performed, will be allowed a minimum of three (3) hours. If held on duty over three (3) hours, actual time so held will be paid for.

Employees whose regular assignment is less than three (3) hours, are not covered by this rule. (This paragraph is to cover regular assignments such as care of switch lamps or other duties requiring short periods on Sundays or other days for special purposes.)

(k-1) Where special work is done outside of regular work period and extra compensation agreed upon, overtime will not apply.

(k-2) Employees will not be required to suspend work, after starting any daily assigned work period, for the purpose of absorbing overtime.

(l) Gangs will not be paid off for short periods when proper reduction of expenses can be accomplished by first laying off the junior men.

(m) Employes not in outfit cars will be allowed straight time for actual time traveling by train, by direction of the management, during or outside of regular work period or during overtime hours, either on or off assigned territory, except as otherwise provided for in these rules. Employees will not be allowed time while traveling, in the exercise of seniority rights or between their homes and designated assembling points or for other personal reasons.

(n) In emergency cases, employees taken off their assigned territory to work elsewhere, will be furnished meals and lodging by the railroad, if not accompanied by their outfit cars. This rule not to apply to employees customarily carrying mid-day lunches and not being held away from their assigned territory an unreasonable time beyond the evening meal hour. This rule will also not apply to employees temporarily transferred under Section (1), Article II.

(o) Employees taken away from their regular assigned duties at the request of the management, to attend court or to appear as witnesses for the railroad, will be furnished transportation and will be allowed compensation equal to what would have been earned had such interruption not taken place, and, in addition, necessary actual expenses while away from headquarters. Any fees or mileage accruing will be assigned to the railroad.

(p) An employee working on more than one class of work on any day, will be allowed the rate applicable to the character of work preponderating for the day, except that when temporarily assigned by the proper officer to lower rated positions, when such assignment is not brought about by a reduction of force or request or fault of such employee, the rate of pay will not be reduced.

This rule not to permit using regularly assigned employees of a lower rate of pay, for less than half of a work day period, to avoid payment of higher rates.

(q) The pay of female employees for the same class of work shall be the same as that of men and their working conditions must be healthful and fitted to their needs. The laws enacted for the government of their employment must be observed.

(r) Except as provided in these rules, no compensation will be allowed for work not performed.

Article VI—General.

Section (a) There will be no discrimination on account of membership or non-memebrship in an association of employees. Employees serving on committees will, on sufficient notice, be granted leave of absence and such free transportation as is consistent with the regulations of the railroad, when called for committee work.

(b) Except for temporary service, employees will not be transferred to another division unless they so desire.

(c) It will be the policy to maintain camp cars in good and sanitary condition and to furnish bathing facilities when practicable and desired by the employees and to provide sufficient means of ventilation and air space. All dining and sleeping cars will be screened when necessary. Permanent camp cars used for road service will be equipped with springs consistent with safety and character of car and comfort of employees. It will be the duty of the foreman to see that cars are kept clean. When necessary, in the judgment of the management, kitchen and dining cars will be furnished and equipped with stoves, utensils and dishes, in proper proportion to the number of men to be accommodated.

(d) The railroad will see to it that an adequate supply of water suitable for domestic uses, is made available to employees living in its buildings, camps or outfit cars. Where it must be transported and stored in receptacles, they shall be well adapted to the purpose.

(e) Employees will be allowed, when in the judgment of the management conditions permit, to make week-end trips to their homes. Free transportation will be furnished consistent with the regulations. Any time lost on this account will not be paid for.

(f) The railroads will furnish the employees such general tools as are necessary to perform their work, except such tools as are customarily furnished by skilled workmen.

(g) Employees transferred from one location to another, by direction of the management, will be entitled to move their household effects without payment of freight charges.

(h) Employees transferring from one location to another, in exercising their seniority rights, will be entitled to move their household effects, without payment of freight charges, only once in each twelve (12) months' period.

(i) Any privilege or practices, necessary to meet local conditions and not conflicting with any rules of these articles are not affected.

(j) This schedule of working conditions shall be printed by the railroads and any employee affected thereby shall be provided with a copy on request.

(k) Controversies arising over the application of this schedule of working conditions shall be referred to Railway Board of Adjustment No. 3, in accordance with the provisions of General Order No. 53.

(l) Rates of pay for the employees named herein authorized by Supplements Nos. 7 and 8 to General Order No. 27 including addenda and interpretations thereof, also any new rates which may hereafter be authorized by the director general, shall become part of this agreement and shall remain in effect during Federal operation until changed as provided herein.

It is understood that adjustment made by regional directors, under authority of July 9, 1919, in the rates of pay of certain foremen and assistant foremen covered by this agreement which rates were made to compensate for all services rendered, including overtime, are to be reconsidered by the regional directors and readjustments made, the overtime and other provisions of this agreement to be taken into consideration in making such readjustments and such readjusted rates to be made effective as of the effective date of this agreement.

(m) This schedule of hours of service and working conditions takes effect December 16, 1919, and except as otherwise herein provided, there will be no change in it during Federal operation until after thirty days' notice has been given in writing by either party to the other.

Shipping Delays Abroad.—Undoubtedly the shortage of trucks has of late caused much inconvenience to many sections of the community in South Africa, and it may be some consolation to the sufferers to know that the position elsewhere is worse than it is in this country. According to a recent cable acute congestion exists at the London docks, and it is stated that it will require 5,000 railway trucks to clear the arrears alone. It is pointed out that in pre-war days South African boats of 8,000 tons could enter the Thames, immediately dock, unload, reload, be headed round, and depart on the next voyage within a fortnight, whereas now it takes six weeks. The quays are overloaded owing to the insufficiency of trucks, and the transit sheds are crowded with Government imports.—*S. A. Railways and Harbours Magazine.*

Industrial Conference Without Result

Labor Group Insistent in Demand for Recognition of Unions as Sole Representatives of Labor

THE INDUSTRIAL CONFERENCE of representatives of the public, employers and organized labor, assembled at Washington on October 5 at the call of President Wilson for the purpose of "bettering the whole relationship of capital and labor," was adjourned on October 23 after the labor group had withdrawn from the conference on October 22 dissatisfied with the attitude of the employers' group. The group representing the employers was virtually "locked out" on the following day when the conference was adjourned at the request of the President that the public group remain in session in an effort to carry out the original purposes of the conference. The public group adjourned on October 24 after making a report to the President recommending that a new conference be called. At a special session of the President's cabinet held on October 26 to consider the threatened coal strike, plans were considered for calling another conference. Apparently the only result of the conference, aside from the clarification of the principal issue involved, that of the recognition of the unions, was to widen the breach between capital and labor which it was intended to lessen.

The impasse came on a resolution recognizing the right of employees to organize and to bargain collectively, which the employers' group rejected by a vote of 10 to 4 on the ground that while they were willing to recognize both the right to organize and to bargain collectively, through representatives chosen by the employees, they were unwilling to endorse the interpretations put upon the resolution by the labor representatives that would confine the exercise of collective bargaining to trade and labor unions, and they insisted on the reservation of the right of the employer to refuse to deal with his employees except through representatives chosen by and from among their own number.

In the form in which the resolution was finally put by the employees' group it recognized the right of wage earners to organize without discrimination, to bargain collectively and to be represented by representatives of their own choosing in negotiations with and adjustments with employers. In this form it was approved by both the labor and public groups. The original resolution proposed by the public group had been voted down both by the employers and by the group that had offered it after representatives of the labor group had placed an interpretation on it confining its application to unions. A substitute resolution offered by the employers' group reserving the right to deal with their employees through "shop committees" or the so-called "company unions" which are so bitterly opposed by the big labor organizations was opposed both by the labor and public groups.

The labor representatives made it plain early in the meeting that they regarded the collective bargaining resolution as fundamental and declared that unless they could get it accepted they saw no object in further attendance at the conference, while the representatives of the employers took the position that for them to accept it in the forms in which it was offered and subject to the interpretations which they declared would be put upon it would amount to practical surrender to the trade unions affiliated with the A. F. of L. They laid much stress on the statement that 98 per cent of the industries in the country have less than 1,000 employees each, that the labor unions represent a minority of the workers and that in many businesses better relations can be maintained between employers and employees without the interference of outside representatives of unions.

The Steel Strike Resolution

The conference also voted down by a majority of the employers' and the public groups a resolution introduced by Samuel Gompers, president of the A. F. of L., and chairman of the labor group, providing for an arbitration of the steel strike by a committee appointed by the conference. A substitute resolution was proposed by the public group providing for a return of the steel strikers to work, their reinstatement by their employers and the election by the employees of each plant of their own representatives to confer with the employers; points of difference remaining unsettled to be submitted to arbitration by a committee appointed by the conference whose decision should be final. This had earlier been voted down by all three groups, by the labor group because it repudiated the unions that have called the strike and by the other two apparently because of unwillingness to having the conference used to protect the labor organizations

from the consequences of their action in calling the strike.

The introduction of the steel resolution had threatened to break up the conference almost at the start. It was referred to the general committee of 15, which reported it back to the conference without recommendation, announcing that the representatives of the employers and of the public on the committee had voted against it but that a majority was in favor of reporting it without recommendation. Thomas L. Chadbourne, Jr., then proposed the substitute resolution providing for the election of representatives by the steel employees and after this had been voted down an effort was made to steer the conference into less controversial channels by the discussion of collective bargaining. The issue involved in the refusal of Chairman Gary of the steel corporation to deal with the unions that had called the strike on the ground that they did not represent his employees was nevertheless inextricably involved in the entire discussion. While this was in progress Judge Gary went to New York and after conference with his associates returned with a statement reiterating his former position that he would not compromise on the principles of the open shop involved in his original refusal to deal with the officers of the unions.

Strong Pressure on Employees' Group

For several days the employers' insistence on a reservation of the right to deal with their own men subjected them to strong pressure from members of the public group, which supported the labor group until it learned that the latter had placed an interpretation upon the resolution which inhibited the idea that any body other than a trade or labor union could be included and that it was an invitation to the wage earners of the country to join no other organization. It thereupon proposed a substitute resolution recognizing the right of wage earners to organize "in associations of their own choosing" for collective bargaining. President Gompers of the American Federation of Labor protested against this change of attitude on the part of the public group because of the interpretation of one member of the labor group—who happened to be the secretary of the American Federation of Labor—but when given an opportunity to state the interpretation of the labor group he made no reply. Whereupon the conference by a vote of two groups to one voted against the resolution.

In concluding his speech to the conference before withdrawing, Mr. Gompers announced that the executive council of the federation had decided "to more fully, if possible, bring the moral and financial support of the workers of America to aid the iron and steel workers in their just contention for a conference with a view of collective bargaining."

The Reason for the Break

The fact that the conference was not likely to result in any agreement was strongly indicated by the wary attitude assumed from the start by the groups representing labor and the employers. To prevent a possible combination between either side and the public group, which included several members who would naturally be classified with one or the other of the other two groups, rules were adopted providing that no conclusion should be reached by the conference except by a majority vote of all three groups and that no resolution should be considered until it had first received the assent of one of the groups. No program had been planned in advance and under the rules adopted the conference had some difficulty in getting started.

A large number of resolutions proposing various plans for improving the relations between capital and labor were introduced and referred to various committees, but only one general resolution was adopted and only the strike and collective bargaining resolutions were brought to a vote. Both the labor and the employers' groups submitted statements embodying a series of principles which demonstrated very early the wide difference between the two groups because while the employers laid great emphasis on the desirability of the open shop principle, labor stood squarely on its demand for recognition of the unions as the sole representatives of labor as fundamental.

Railroad Representatives on the Conference

The public group in the conference consisted of 25 members, including three women selected in the name of the President. The employers' group included 17, of which five were selected by the Chamber of Commerce of the United States, three by farmers' organizations, two by the Investment Bankers' Association, five by the National Industrial Conference Board and two railroad executives. The organized labor group included 15 representatives of the A. F. of L. chosen by Mr. Gompers and four representatives of the railroad train service brotherhoods, but the representatives of the miners and the carpenters refused to attend.

B. M. Baruch of New York was elected chairman of the public group; H. A. Wheeler of Chicago, chairman of the employers' group and Mr. Gompers chairman of the labor group. Franklin K. Lane, Secretary of the Interior, was chosen chairman of the conference.

The employers' group included three railroad officers: L. F. Loree, president of the Delaware & Hudson, was one of the nominees of the National Industrial Conference Board; R. H. Aishton, regional director of the North Western region of the Railroad Administration, and C. R. Gray, president of the Western Maryland, were chosen as representatives of the railroads.

The four brotherhoods were represented in the labor group by H. E. Wills, vice-president of the Brotherhood of Locomotive Engineers, with W. S. Stone, grand chief, as alternate; Timothy Shea, acting president of the Brotherhood of Locomotive Firemen and Enginemen, with P. S. McNamara, vice-president, as alternate; L. E. Sheppard, president of the Order of Railway Conductors; and W. G. Lee, president of the Brotherhood of Railroad Trainmen. Bert M. Jewell, acting president of the Railroad Employees' Department of the A. F. of L. was chosen as one of the public group, but J. J. Forrester, president of the Brotherhood of Railway Clerks, was later substituted for him. W. H. Johnston, president of the International Order of Machinists, was a member of the labor group.

No subjects directly relating to the railroads was taken up. Mr. Loree took a prominent part in the opposition of the employers' group to the demands of the labor representatives and at one time during the discussion declared that the conference "had been maneuvering for five or six days on what seems to be rather a political than an economic situation" and that time after time when about to decide a question had been adjourned "in order that back door communications could be received." In this he apparently referred to the directing efforts of B. M. Baruch and Thomas L. Chadbourne of the public group, who were in frequent communication with the White House.

W. G. Lee and L. E. Sheppard spoke in behalf of the collective bargaining resolution, saying the principle had been recognized and had operated successfully in railroad service for 25 years. In reply to this, Homer S. Ferguson, president of the Chamber of Commerce of the United States, pointed out that the railroads had not been able to meet the demands of the labor organizations. "It seems to some of us," he said, "as if the United States had been meeting them for some time, and we do not notice that in the coal miners' district, with thousands of men organized, there is peace and tranquility."

When the American Federation of Labor officials withdrew from the conference the brotherhood executives re-

mained until the close of the day's session, explaining that they did so out of courtesy to the conference but would not return.

W. G. Lee said he hoped the conference would not adjourn until the question had been settled. "I have been hoping," he said, "that I could say to the 190,000 men I am speaking for that their instructions positively to me to do a certain thing by October 1 have been overlooked because of the President calling this conference."

Mr. Gray said he was very glad that the last people in the labor group to leave the conference were the railroad people, "because what has been said here about the relations over a great many years is true. My associate and I, who represent railroad management were classified with the employing group, but it was well known that all our lives we have dealt with organized labor. Now, we have conceived our duty in the employers' group to be one of a democratic gathering. We have all expressed our opinions there, and I have seen material progress made in this employers' group to the common viewpoint which I do not believe others fully appreciate. Now, that progress has been made. It was a deplorable thing that we could not have gone ahead. These gentlemen here never got where they are now in two and one-half weeks, and we did not get where we are in such time, but we have progressed to a proper evolution through all kinds of misunderstanding. We have been in each others' hair in these thirty years, time and again, but we usually got together in the end, as I had hoped this conference could get together in the end, upon some common understanding."

Labor Wants a Voice in Management

On October 15 L. E. Sheppard, president of the Order of Railway Conductors, introduced with the assent of the labor group a resolution proposing an extension of something like the Plumb plan of "tri-partite control" to all industries. The resolution declared the recognition by the conference that the three "equal and essential interests in organized industry," consumers, capital and labor, should share equally in the conduct of the management, and proposed the adoption of national laws requiring "all public service corporations operating under grants of privilege or monopolies," to be managed by boards of directors, one-third of whose members would represent the public, one-third the owners of capital, and one-third the workers employed in the industry.

This differs from the Plumb plan as proposed for application to the railways in that it says nothing about government purchase and Mr. Plumb does not provide for any representation of the owners of capital as such. His board would consist of one-third representing the public, one-third representing the classified employees and one-third representing the official employees, who would, however, not be in any sense representatives of capital. Mr. Sheppard also proposed that in "private industries not based on grants of privilege, franchise or monopoly, one-third of the directors should be elected by the employees."

In a statement issued after the adjournment, Mr. Loree said that the action of organized labor in withdrawing from the conference and "the whole history of the conference preceding it made it perfectly clear that if the American Federation of Labor can bring it about it will be impossible for any man to work in the United States unless he belongs to a trade organization within the A. F. of L."

Statement by B. M. Baruch

After two protracted meetings following the adjournment of the conference proper, Chairman Baruch of the public group on October 25 gave out the following statement:

"The Industrial Conference, as originally constituted, accomplished far more than appears on the surface before it finally was dissolved.

"First—It brought the issues involved home to the entire nation.

"Second—It demonstrated the great difficulties of a solution.

"Third—Its discussions have had the effect of setting the entire people thinking, and from this thought will come the solution.

"Fourth—There was brought home to all participants the intimate relations that exist between the farming interests and all industrial questions.

"Fifth—What was not brought out clearly was that both capital and labor owe to society—which is inclusive of capital and labor—a duty to produce in quantity at the lowest possible cost commensurate with the protection of both capital and labor, all of the 'things' that are necessary to keep up the proper, just, and humane standards of modern life.

"As the result of what transpired at the Conference sessions the people now realize that the industrial problem affects every one in every walk of life. I feel certain that the farmer will attain his proper place in the solution yet to be reached. All of the questions suggested go, not alone to the man and woman who works with his or her hands, but to all salaried people. These include, for instance, firemen, policemen, postal employes, and other workers in governmental, state and municipal lines, as well as the school teachers of the country. It is evident that the teacher has more to do with the upbringing and final moulding of good citizenship than any one else. All workers want not alone proper financial treatment, but recognition of their positions as part of the foundations of society itself. This recognition must come, not as a privilege granted, but as a matter of inherent right.

"The outcome of this conference must be, in my opinion, that there will be manifest an increasing effort on the part of employers to see that, not alone proper wages are paid but that the human rights of the workers are considered. The employer has certain rights which must be rocgnized and protected. Coupled with these rights is the obligation to see that all of his employes are accorded just treatment."

Public Group Reports to President Wilson

Following is part of the report to the President made by the public group:

"The public group, as was intended, differed from the other groups representing labor and capital in one important particular. It had not the homogeneity of interest of either of these groups; it represented rather a cross-section of American life. Among its members were employers of labor, large and small; farmers, capitalists, representatives of labor, socialists and professional students of social and industrial problems. Notwithstanding this diversity of interest and relation, there was manifested throughout an astonishing amount of agreement upon the most vital subjects. This we regard as a most hopeful sign for the future and an evidence of the possibility of a united action in the interest of the entire nation.

"The existence of the steel strike had the effect of focusing interest and attention upon present conflict as against constructive measures and agreement for the future, and made the calm discussion of such constructive measures difficult. Because it was manifestly impossible to dispose of this subject by agreement under the rules of the conference, which required concurrence of at least a majority of each of these three groups, the conference decided to defer action upon the question until the subject of collective bargaining was passed upon.

"After several days of earnest endeavor and numerous attempts at adjustment between the points of view of the several groups the conference failed to agree upon this issue.

"In this connection we deem it important to emphasize the

fact that the conference did not, at any time, reject the principle of the right of workers to organize and to bargain collectively with their employers. Neither the conference as a whole nor any one group in the conference opposed that right. The difficulty that arose and the issue upon which the conference failed to agree was not upon the principle involved, but upon the method of making it effective.

"In our judgment, even this difficulty would not have been insurmountable had the conference approached its task in another way.

"Obviously, the important principle of collective bargaining cannot be sharply separated from other elements in the great problem of the relation of employers and employed. The right of organization, the protection in the exercise of their lawful rights, of those who seek to organize the workers; the careful definition of the various forms of organization through which the right may be exercised, and the machinery necessary for adjusting disputes arising in connection with that right must all be taken into account in their proper relation.

"We believe that the right of workers to organize for the purpose of collective bargaining with their employers, through representatives of their own choosing, cannot be denied or assailed. As representatives of the public we can interpret this right only in the sense that wage earners must be free to choose what organizations or associations, if any, they will join for this purpose.

"In the recognition of the right of workers so organized to be represented by representatives of their own choice difficulties will from time to time arise. We believe that it would be possible for a properly constituted arbitral authority to adjust such difficulties with justice and fairness to all parties concerned.

"The abrupt termination of the conference prevented any discussion in the conference of the important matter of the right of workers to strike and of the methods whereby without destroying or impairing that right the public interest may be adequately conserved and protected. We are deeply impressed by the necessity of setting up some machinery for effecting the speedy adjustment of disputes arising between workers and employers, whether the latter be private individuals or firms, or public and governmental authorities.

"It is impossible to discuss in detail the numerous schemes for affording to workers representation in the regulation of the conditions of labor, the plans for profit sharing, the many forms of shop councils and the like. We respectfully suggest that a very great service could be rendered to the nation, to employers and employes alike if in the Department of Labor there were established a bureau for the purpose of gathering and making available accurate information concerning all such experiments and their results. Such a bureau could give expert advice and assistance to any persons desiring to undertake plans for bettering labor conditions in particular establishments.

"We do not believe that this group can at this time with advantage further proceed with the discussion of the great questions with which we have been dealing. It may well be, however, that a small committee selected by you, composed of persons of varied interests and points of approach, could take up the matter and prepare along some such lines as herein indicated a program which will be of value at the present time.

"Upon the presentation of the report of such a committee steps could be taken to give it practical effect through another conference, representing capital, labor and the public, if in the circumstances then existing it should seem to you to be wise."

La Follette for Continued Government Operation

CONTINUATION for five years of the present federal control of the railroads for the purpose of affording a more complete test of government operation was urged by Senator La Follette in a minority report on the Cummins bill, submitted to the Senate.

Senator La Follette said in part:

"It is very properly urged in the report, submitted by the majority of the committee, that railroad legislation should receive prompt consideration. Uncertainty regarding the status of the railroads, the period of government operation, the character of government control, if the roads are to be returned to the owners, must necessarily result harmfully to the railroads and to the public. Investors are timid about investing in railway securities the value of which may be affected by legislation in the near future. The railroad owners themselves are in doubt as to their relations to their property, and they are entitled to know what their status is to be for the next few years at least. I do not in the slightest degree underestimate the importance of dealing with this question as promptly as may be, but it will not relieve the situation to pass legislation hurriedly if it is wrong in principle, and will only serve to create new difficulties in the railway problem instead of solving those already before us.

"The avowed purpose of the President to return the roads to private control by the first of next January is, as I understand it, the reason why we are urged to pass legislation of this great importance through Congress within the next two or three weeks.

"Any bill attempted to be perfected and passed on this subject within the next 30 days will be a mere experiment, and must necessarily be an illy considered one. The House, which began its consideration of this subject early last summer through its Committee on Interstate and Foreign Commerce, has recently passed a bill which is opposed in all its essential features to this bill.

"As I shall show a little later, the Senate committee bill is revolutionary in character. It proposes to put into practice various doubtful innovations and radical experiments which, if they fail, will wreck the whole complicated scheme, leave the railway situation and its finances in an unsettled and chaotic condition, and involve the business of the country in confusion and disorder. There is no reason why we should be hurried in our consideration of the plan proposed in this bill, but every reason why we should proceed with the greatest caution.

"It is true that upon the legislation, for taking over the railroads, the Senate Committee on Interstate Commerce conducted extended hearings in 1917 and 1918, and upon the subject of government operation in January and February, 1919. Those hearings were, however, very general in character. The bill now before the Senate, with its novel provisions, was not then in existence.

"No general hearings were permitted by the committee upon the bill before the Senate, although representatives of the agricultural interests and others requested such hearings, with a view, as I am advised, of urging the consideration of extending the time of government operation, in order that such operation might be fairly tested under settled peace-time conditions.

"The committee did grant limited hearings on September 23 and 24 to the railway employees upon the provisions of the bill relating to strikes.

"The bill before the Senate was prepared by a sub-committee of five members of the Committee on Interstate Commerce during the extra session of the present Congress. The bill was presented to the full committee for its consideration

September 2, 1919, and was reported to the Senate in its present form October 23. During the time that the bill was under consideration by the sub-committee and the full committee the league of nations and the treaty with Germany were engrossing to a very considerable extent the time of all members of the Senate. It was, therefore, not possible for the committee to consider any plan of dealing with the railroad problem other than that proposed in the pending bill.

"I respectfully submit that the Senate and the Congress cannot discharge its obligation to the public interest without a much broader consideration of the entire subject than is proposed in the committee bill. And especially do I venture to contend that the Senate be not foreclosed from all consideration of the importance of making a fair trial of government operation of our transportation system when normal peace-time conditions shall have been fully restored.

"Long before we entered the war the railway transportation system of the country was on the verge of total collapse through mismanagement and corruption. The railroads from the beginning were grossly overcapitalized, and the public was burdened with constantly increasing rates to pay dividends on watered stocks. Added to this, the railroads were unlawfully permitted to collect from the public a further excessive rate for the accumulation of billions in surplus. Out of these vast sums, thus wrongfully levied upon traffic and pocketed as surplus, the railroads built extensions and made permanent improvements. They then overcapitalized these improvements as a basis for further wrongful exactions from the public.

"Moreover, the managers openly robbed the railroads from the inside. Construction and supply companies were organized by railway officers and managers. From these companies the railroads bought supplies of all kinds at exorbitant prices. Unrestrained greed exacted such profits on purchases by these insiders from themselves that there was always a shortage of funds for properly equipping the roads. This inside graft ate up the revenues of the railroads and furnished a perennial excuse for still further increasing rates upon the public. It goes without saying that a transportation system honeycombed with official graft and dishonesty was certain to be supplied—insofar as supplied at all—with inferior and defective equipment.

"The result was inevitable. When the European war came on, with its stimulus to increased production and traffic, the roads, already short of engines, cars, and all manner of equipment, at once disclosed the rottenness and inefficiency of the whole transportation system. By the summer and fall of 1916—months before we entered the war, to quote Director General McAdoo, 'they had reached such a point that traffic was almost paralyzed, through inability to furnish but a small part of the cars necessary for the transportation of staple articles of commerce.'

"When in 1917 the government was forced to seize the roads it took over a ramshackle and utterly demoralized railway system. The operation of railroads in such a state of disrepair was very expensive and wasteful under the most favorable conditions and excessively so under the extraordinary demands which the war imposed. The government at once found itself compelled to enter upon the enormous undertaking of restoration and up-to-date reconstruction in order to meet the immediate demands of its own and the public needs. And this it was forced to do at war prices for both labor and material.

"But this only partially states the government's handicap. Added to the vast expenditures imposed by the broken-down condition of the railroads, Congress—ever generous with the people's money, in response to corporate demands—authorized contracts with the private owners of the railroads for the use of their worn-out property at an annual rate of compensation so extravagant as to insure a deficit in government operation of the railroads from the outset. This was very satisfactory to the owners and their friends in and out of Congress who were opposed to government operation, lest it might lead on to government ownership.

"An organized assault was at once made upon public ownership of public utilities in general and government ownership and operation of railroads in particular. From the day the railroads were taken over down to this hour, in Congress and out, through the interest press and otherwise, there has been conducted a systematic and powerful propaganda to discredit government operation and the railroads and hasten their return to the private owners and private management with another era of commission 'control.'

"The failure of private ownership and private operation, under commission 'control,' leads logically to government ownership and government operation.

"That has been the natural evolution in the history of all communities. It is inevitable here. It may be delayed, but it will come. The danger is—and it is a great danger—that we are to be involved in another costly and temporizing expedient before it is accepted.

"So strong is the influence of the billions invested in railroads and the interests allied with them, and so great is the prejudice which their combined forces have for the time being manufactured against government operation that Senators and Representatives shrink from advocating a continuance of government operation, even for such time as to give it a thorough trial under normal business conditions.

"In an effort to find a way out and avoid meeting the issue of government operation, which, if ultimately successful, may bring government ownership in the end, we are asked to embark upon a complex experimental scheme of legislation uncertain in its results and open to attack as unconstitutional on more than one side.

"Private ownership and uncontrolled private operation of railway transportation was tried for 40 years. It became intolerable.

"Private ownership with a commission regulation of rates and services was tried for 30 years. It resulted in colossal failure.

"Through it all the public has been the long-suffering victim of a monstrous system of venal exploitation.

"We are now urged to enter upon another protracted period of attempting to combine the conflicting and warring elements of private ownership and public control.

"If our past experience teaches us anything, is it not plain that this means another era of enormous profits for the private owners at the cost of an enormous and unwarranted expense to the public?

"Is it rational to believe that in a few short months a small group of Senators and Representatives—no one of us an expert in railway transportation—has discovered some magic by which the miserable failures of 70 years are to be converted into a marvelous success?

"And when we find that the Senate committee has one plan, that the House committee has developed another plan, which in all essential features is opposed to the Senate bill, does it not raise a serious question as to whether either committee has found the way out?

"Does it not seem the part of wisdom to extend mandatory government operation for a period of five years rather than commit ourselves in haste to either plan?

"When the President issued his proclamation of December 27, 1917, seizing the railroads, which he did under the act of August 29, 1916, he referred to the war with Austria as a reason for taking over the roads as much as to the war with Germany.

"When, therefore, the act of March 21, 1918, fixed the time for termination of the railroad control by the government at one year and nine months following the proclamation of peace by the President, it meant peace with Austria as well as peace with Germany. As the proposed treaty

with Austria has not yet even been laid before the Senate, and will not be acted on for some considerable time, and peace with Germany has not been formally declared, it is evident that there is nothing in the law which can be held to require the President to return the roads for almost two years at the earliest.

"It can be said, however, with force that the interests of the railroads as well as the public require that the status of the railroads should be fixed for a period longer than two years, and for that reason I propose that we extend the government operation of the railways and make the same mandatory for a period of five years.

"Within the next five years the valuation of the roads will have been completed under the act of 1913. Within that time the government will be able to give a practical demonstration of its ability or inability to operate the roads successfully in times of peace as well as war. During that period the making of extensions and betterments will go forward, managers and employees will understand that their positions are secure if their work is efficient, and those who hold or may purchase the securities of the railways will do so in the confidence that their investment is safe. An increase of railway rates will not be necessary. And more than all, within that time the Congress, with all the added knowledge that it may acquire, can deliberately frame railway legislation with a reasonable assurance that it will furnish a solution of this great problem.

"What I am here suggesting I understand to be the position taken by both Mr. McAdoo and Mr. Hines, the two directors general of the railroads under government operation. I know it to be the position of at least two members of the Interstate Commerce Commission, who have so stated in public addresses in the last few weeks.

"I am aware, of course, that the interests which are anxious to discredit government ownership are very desirous that the railroads should be returned to the owners at once without the government having an opportuni ty to show with what success it could operate the railroads under stable business conditions in time of peace. Such interests should not be permitted, however, a controlling voice in this legislation.

"In the report filed for the majority of the committee it is said:

" 'The writer of this report is firmly convinced that when the government assumed the operation of the railways they were, taken as a whole, earning all they should be permitted to earn; but in the inevitable distribution of the earnings among the various railway companies the railways which carried 30 per cent of the traffic were earning so little that they could not, by any economy or good management, sustain themselves. Nevertheless, it is unthinkable that these highways of commerce shall be abandoned, and some system must be devised not only for their continuance but for their betterment and growth. *Government ownership would solve the problem, but it is the judgment of the committee that government operation is attended with so many disadvantages—notably in the increased cost of operation—that this plan must be discarded.*'

"The portion of the language quoted above, which I have put in italics, is every word that is to be found in that report on the subject of government ownership and operation.

"The whole subject is dismissed with a sentence. And the most notable disadvantage of government ownership is disposed of with a passing reference in five words to the increased cost of (government) operation.

"This is the logic of the committee:

"It cost very much more to operate the railroads after the government took them over.

"Ergo government operation is so expensive that it 'must be discarded.'

"This reasoning takes no account of:

"(1) The large outlay required to rehabilitate the wreckage which the government found on its hands on taking the roads over.

"(2) The government took over a transportation system that had practically ceased to function. 'There was not a single serviceable locomotive in (reserve) storage.' A hundred and forty-five thousand freight cars were stalled in a helpless congestion. It required from 2 to 25 days to ship a carload of grain from Iowa to Chicago.

"It cost the government a very large amount of money to set in motion the machinery of this badly stalled transportation system.

"(3) The cost of operation in war was enormously greater than in peace.

"Obviously not a dollar of all these vast expenditures is justly chargeable to government operation. It should be charged to private operation and not to public operation in instituting any comparison of relative costs.

"The only way in which to make a fair comparison between the cost of private operation and government operation of the railroads is to extend the government operation for a reasonable period of time under normal business conditions and compare the cost and efficiency of government operation for such time with a like period under private operation prior to the war.

"In this connection I call attention to the fact that government operation has for several months demonstrated the reasonable certainty of ultimate economic success.

"There is no longer a loss chargeable against the government in operating the railroads as we slowly approach more settled business conditions. The monthly deficit, which has been the object of so much adverse criticism against government operation, has wholly disappeared, and in its place appears a net monthly profit of millions of dollars. I am advised on the most creditable authority that as expenditures are adjusted to normal conditions that government operation can be continued without requiring any increase in existing rates."

The Senator also opposed the provisions for compulsory arbitration and other features of the bill.

Orders of the Regional Directors

IMPROVED CAR HANDLING.—Circular 86 of the Northwestern regional director calls attention to the necessity for the improving of car handling especially in view of the present acute situation in connection with car supply. In addition to this, particular attention should be paid to the prompt delivery of cars to connections, early arrivals at freight houses and team track deliveries, prompt unloading of equipment and movement of "company" material utilizing the full capacity for loading which will result in saving of much equipment for revenue loading.

Detention to Coal Cars.—The Northwestern regional director, file 44-1-198, requests that reports be made by wire from each station, showing all coal in open cars held for unloading in excess of established free time whether under straight or average agreement, in order that there may be accurate and complete information available as to detention of open cars in coal service. This information is to be collected by a division officer and a complete summarized report made by each railroad and mailed daily to the Car Service Section at Washington with one copy to the regional director's office. This report should show by stations the number of consignees holding cars, the number of cars held and the aggregate days held. Action should also be taken to impress upon each delinquent consignee the necessity of cooperation on his part in the prompt release of equipment, in order to assist in remedying the general shortage of cars.

Increase of 14 Per Cent Offered Coal Miners

NEGOTIATIONS BETWEEN THE OFFICIALS of the United Mine Workers and the representatives of the coal operators that have been in Washington in an effort to negotiate a wage scale since November 14 were broken off on Thanksgiving Day after the union leaders had definitely refused to accept a proposition made by Fuel Administrator Garfield for a 14 per cent increase in wages without any increase in the government-fixed prices for coal. Dr. Garfield's proposal was made as representing the average increases, in addition to the wage advances already made, that would be justified by the increased cost of living of 79.8 per cent since 1913 and was submitted to the representatives of the unions and the operators on November 26 after a careful study of the situation and after it had been approved at a meeting of the President's cabinet. It was formally accepted by the operators.

When the conferences were begun on November 14, Secretary of Labor Wilson declared that a 30-hour week and a 60 per cent increase in wages for the miners must be regarded as an impossibility, and that the "stand-pat position of the operators" was also an impossibility. Later he proposed an increase of approximately 31 per cent. The union leaders insisted on their original proposals and on November 20 flatly rejected an offer of 20 per cent made by the operators with the expectation that part at least of the increase in wages would be met by an increase in the prices for coal. On November 21 the union modified its demand to a 40 per cent increase. For several days the fairness of the 31 per cent compromise suggested by Secretary Wilson was discussed pro and con but it was never given an official status and was not accepted by either side. The entire question was discussed at several meetings of the cabinet which were attended by Dr. Garfield and by Director General Hines and on November 26 Dr. Garfield announced the proposal for a 14 per cent increase in wages as one which the government would sanction. This was regarded by the union officials as a repudiation of the 31 per cent proposal made by the Secretary of Labor, which they were then ready to accept, but Dr. Garfield stated that Mr. Wilson had no authority to make such an offer. The fuel administrator's statement was as follows:

"On the 24th instant I announced that the public must not be asked to pay more than it is now paying for coal, unless it is necessary to do so in order to provide reasonable wages to the mine workers and a reasonable profit to the operators. Careful investigation forces me to the conclusion that, in accordance with this and the other principles set forth on the 24th instant, the public ought not to be required to pay any increase in coal prices at this time.

"The prices fixed by the government on coal were calculated to increase production for war purposes. Coal was basic and the increase in production was imperative. The operators are now in receipt of margins which were necessary to affect that increase of production, but which are larger than are required under present conditions. It was estimated that the production needed for 1918 was 600,000,000 tons. The estimate for 1919 is 500,000,000 tons.

"Applying the principles set forth in paragraph 2 of the statement of November 24, when the average increases in wages since 1913 for the various classes of mine workers are deducted from the the increase in the cost of living since that time, we arrive at the amount of additional increase in wages justifiable at the present time.

"I have taken the figures of the bureau of labor statistics for both cost of living and for the weighted average of wage increases. According to these figures the cost of living has risen 79.8 per cent since 1913, and the amount necessary to bring the average wages of mine workers up to this point at the present time is 14 per cent.

"Readjustments heretofore made since 1913 were such as to give certain classes of mine workers an average increase in excess of the increase in the cost of living, and certain others an average increase below the increase in the cost of living. This form of adjustment was made in order to establish or preserve certain relative bases in the mining industry. I do not think this condition, however, ought to result in giving to mine workers, as a whole, and, in consequence, imposing upon the public, a total average increase in excess of the total average increase in the cost of living, because if this course be adopted the result would be that the total increased burden placed upon the mining industry will be far in excess of the increase in the cost of living. If this principle were applied in industries generally, it is obvious that the resulting cost would be passed along to the general public, and the increased wages would increase in a rapid spiral, taking as a minimum, the percentage of increase in the cost of living. In the long run this would add many new and serious burdens to the cost of living of the entire public, and would fall more injuriously upon the working classes than upon any others.

"It seems to me that the reasonable way to deal with this situation is to give to the industry as a whole an average increase commensurate with the increase in the cost of living and then let that amount of increase be apportioned in accordance with the wage bases that are acceptable to the employers and the employes.

"Control of prices by the government will be maintained for the present.

"The present negotiation stands by itself, but it is far from disposing of the fundamental controversy between operators and mine workers. That controversy is bound to be a continuing one as matters now stand. It involves living conditions and conditions in the mines, as well as wages and profits, and the general relation between operators and mine workers. Therefore, to aid in applying the principles which have governed us and which should govern in reaching conclusions in the future, it is urged that a permanent consultative body, with purely advisory powers, be set up, consisting of the Secretary of the Interior as chairman and of an equal number of representatives of the operators and of the mine workers.

"In order that the data necessary for the consideration of this consultive body may at all times be available, it is urged that the Congress make provision for collecting definite and trustworthy information concerning the coal and coke industry and for the tabulation of the same in quarterly reports showing:

"1. Production, distribution, storage and stocks of coal and coke.

"2. The cost of production and distribution and of maintaining suitable stocks, and any other data concerning the industry deemed necessary.

"3. The cost of living in the several coal fields.

"4. The selling prices and profits obtained by the operators, middle-men and retail dealers.

"5. Export requirements and the conditions limiting them.

"The settlement of the present controversy on the wage and price basis above indicated must be considered in the light of the proposal to set up this permanent, consultative body. While it will not have powers of decision, it will hardly seem possible to a reasonable man that in the light of its conclusions demands for exorbitant profits or unreasonable wages can be successfully maintained, or that conditions unfavorable to the American standard of living will be tolerated."

On November 28 a committee representing the operators

sent telegrams urging all operators to post notices at their mines offering a 14 per cent average increase effective at once, in an effort to attract the miners back to work and the government authorities took steps to furnish protection to all who desired to work.

Assistant Attorney General Ames issued the following statement outlining Department of Justice plans:

"All United States attorneys in the bituminous coal fields have been officially advised of the result of the negotiations at Washington and have been given instructions relative to the situations.

"It is, of course, obvious that the time has come when ample protection will be furnished all persons desiring to work in mines.

"All persons, whether miners or operators, making any agreement or arrangement with each other to restrict the supply of coal will be proceeded against as the law provides, and it should be understood that any person who aids or abets in restricting the supply of coal is likewise guilty by the terms of the Lever act.

"Instructions heretofore issued by the War Department are still in force, and under these instructions department commanders will act in proper cases when requested to do so by the State authorities."

Doings of the United States Railroad Administration

The Railway Coal Situation Showing Improvement—Orders Relative to Coal Transportation

WALKER D. HINES, Director General of Railroads, on November 25 authorized the following statement regarding the handling of coal by the Railroad Administration since November 1:

"The railroads had in their possession on November 1, when Fuel Administrator Garfield turned over the distribution of coal to the railroads, about 22,000,000 tons of soft coal, either in railroad storage or in cars. From this supply and the current production, that has been increasing steadily since the strike began, the railroads have been kept in operation, all American flag ships and a limited number of foreign ships have been bunkered, public utilities and absolutely essential industrial plants and institutions of various kinds, such as hospitals, have been kept supplied, and the householder has been kept warm. These uses have prior claim to coal and until coal is again produced in sufficient quantity more than to meet these needs, and unless there are unusual conditions, no supplies will be released to other users.

"In the first week of the strike the average number of cars of bituminous coal loaded daily was 9,305, or 26 per cent of the pre-strike average; in the second week loading was at the rate of 10,608 cars, or 30 per cent of the normal rate, a gain over the first week of 14 per cent. Last week, the third of the strike, production steadily increased and reached nearly 40 per cent of normal. The present week promises so far a still better showing.

"Production now is mainly in the East, in the South and in the Rocky Mountain region. In the central states, where bituminous coal is so largely used, there is little or no present output. The railroads have the difficult and unusual task of moving west a large part of the production of such fields as the Pocahontas and Pennsylvania fields, that normally moves east. The 22,000,000 tons the railroads had on November 1 was as evenly divided as possible over the country, but in the sections where there had been no production, supplies have become depleted and coal from the eastern producing fields has been and is being sent west to fill these needs.

"At the eastern tidewater ports there were on November 1 many thousands of cars of coal assembled for export to foreign countries. These cars were held, when the strike was first begun, as reserve supplies for the railroads, essential industries and limited bunkering of ships. The accumulation of cars of coal at these ports is nothing abnormal, is not interfering with operation, and has not been allowed to increase. It is being held for the protection of essential consumers on the Atlantic seaboard. The export business in coal was in full swing when the strike began, but obviously so long as the coal in cars and the current production are no more than what is needed for the protection of this country, export of coal should not be and will not be allowed. The situation is well in hand and there is and will be no lack of empty cars for the coal mines that are working. The cars of coal hold under load at various points for emergency use are not interfering with regular transportation."

Railroad Facilities Below Demand of Traffic

The railroads of the country are now doing a heavier business for the present season of the year than was ever done in the history of the railroads in normal years, and practically as heavy business as was done at this season in 1918, which exceeded all previous records, according to a statement authorized by the director general, on October 12. They have more cars in actual service, after excluding cars held out of service for repairs, than in 1917 or 1918. While the bad order car situation was greatly embarrassed by the extensive strikes among shopmen in August, the percentage of bad order cars is now rapidly improving. There was an increase of 52,456 cars in serviceable condition between August 16 and October 4 of which 12,110 were added in the one week ending October 4.

While the freight business is practically as heavy as at this time last year, the Railroad Administration in performing that business is deprived of many exceedingly important aids which it was able to utilize last year. One of these is the zoning of coal which last year compelled consumers to take their coal from nearby mines and thereby greatly increased the efficiency of coal transportation. Another is that last year there was much heavier loading of many important commodities than it has been possible to secure this year, and the result is that under existing conditions more cars have to be used for the same amount of traffic. There are various other important respects in which traffic was controlled in the interest of the war last year, so as to get the maximum results out of rail transportation and with the return of peace conditions and the resulting insistence of public sentiment upon release from wartime restrictions, these advantages have been lost.

"The fact that there is still a shortage in rail transportation is due to the condition that the amount of business offering is far in excess of the transportation facilities of the country," the statement says. "This has always been true in this country in times of heavy business in the autumn months, except last year when the matter could be and was

controlled with an iron hand with a view solely to war necessities.

"At the same time railroad facilities have not expanded to the extent required in the public interest. Even prior to the war, railroad facilities were not equal to the demands. During the war the addition of new facilities was greatly restricted by scarcity of material and labor. Since the war, it has been impossible to enter upon or carry out any extensive program for enlargement of railroad capacity, because of the uncertainty as to the status of the railroads. The Railroad Administration was not provided with the money and therefore could not originate or carry out any such program. The railroad companies, in view of the uncertainty, were unwilling to provide the money.

"The result is that the railroad facilities of the country are decidedly below what the traffic demands. Nevertheless the maximum traffic is being handled and this is being done with less shortage of transportation than manifested itself at times in the pre-war period."

Basic data taken from reports of Class 1 Roads under Federal Control

UNITED STATES RAILROAD ADMINISTRATION
Director General of Railroads

PERCENTAGE OF PASSENGER TRAINS ON TIME
Month of August, 1919.

Compiled by
OPERATING STATISTICS SECTION
DIVISION OF OPERATION
Washington, D.C., Sept. 22, 1919.

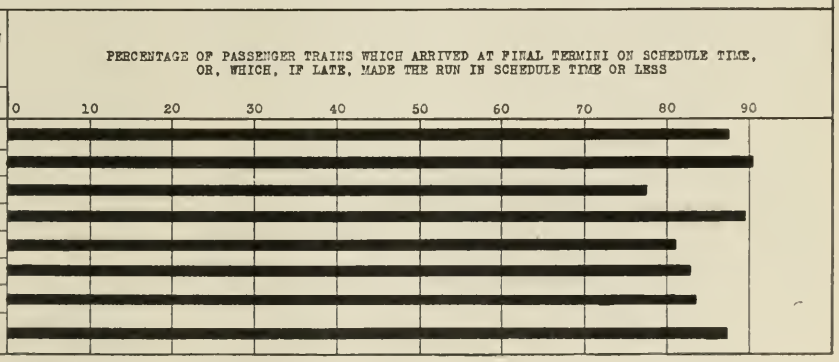
AVERAGE -- ALL REGIONS	156	320 718	279 970	87.3



Trains arriving at final terminal 10 min. late or less are considered on time; second sections considered as scheduled 10 min. behind first section. Trains included in the lower chart are those which arrived at final terminal not later than 10 min. in excess of the number of minutes late leaving the initial terminal.

Suburban trains are excluded. When considering time of departure, delays at initial terminal chargeable to causes other than waiting for connections are considered as part of the running time. Delays at intermediate points waiting for connections are considered as part of the running time.

Trainmen Seek Interpretation of Overtime Proposal

A committee representing the four brotherhoods of train service employees was to confer with Director General Hines on Tuesday, December 2, to ask a more specific interpretation of his recent proposal to allow time and one-half for overtime in freight service, contingent upon the elimination of all arbitraries and special allowances. The committee, which has full power to accept or reject the overtime proposal, was appointed at a conference of the general chairmen of the four brotherhoods at Cleveland, called to consider Mr. Hines' proposal, after the conference had voted to accept his offer of a held-away-from-home-terminal rule providing for payment of wages for time held at other than the home terminal after 16 hours. This was as a substitute for rules proposed by the trainmen and firemen providing for pay after 10 hours. About 180 general chairmen of the firemen's brotherhood held a conference to consider what should be done in connection with their demand for a general wage increase, which has not been acted upon by the Railroad Administration.

Coal Orders

H. A. Garfield, United States Fuel Administrator, on November 22 issued an order directing that coal dumped into barges, scows, boats and other vessels on lakes, rivers and other inland waterways shall be subject to diversion in like manner and to the same extent as bituminous coal loaded in cars of a common carrier under the orders now in effect relating to the diversion of coal in transit, and coal diverted under the authority of this order shall be paid for by the party receiving the same, in accordance with the provision relative to the payment for diverted coal contained in the order of November 12, 1919. The director general of railroads and his representatives are authorized by the order to make such diversions of bituminous coal dumped into barges, scows, boats and other vessels as may from time to time be necessary in the order of priority set forth in the fuel administrator's order of October 31.

In another order the director general or his representatives acting by and under his authority are authorized to make such rules, regulations and orders restricting or prohibiting the use and consumption of bituminous coal for the purpose of producing of manufacturing coke in beehive ovens as may from time to time be necessary.

On November 19 Director General Hines announced that the Fuel Administration had advised that the charge of 15 cents per net ton for rebilling, etc., is not a proper item in settlements for coal diverted on and after October 30, 1919. The right to make this charge which was originally allowed by the order of January 14, 1918, was withdrawn by order dated November 20, 1918, and the order of January 14 as thus amended governed the settlement price for diverted coal

on January 31, 1919, when the regulations of the Fuel Administration were suspended.

Edward Chambers, director of traffic of the Railroad Administration, announced that where coal has been held by the Railroad Administraiton under the order of the fuel administrator and has subsequently been released to a consignee or to the original consignee, the demurrage rules become applicable from the time of such release.

Director Chambers also issued instructions to regional directors on November 12 stating that it has been decided that where coal is taken by the Railroad Administration and subsequently consigned to a consignee, the rate of freight to be charged such consignee should be the published freight rate from the mine at which the coal originated to the destination of such consignee, regardless of any out of route or back haul which may have been involved in the movement while under charge of the Railroad Administration.

Demurrage Rules Recodified

Owing to questions arising as to the application and interpretation of demurrage rules it was determined sometime ago to recodify the rules with a view to improving their form so far as possible and avoiding any questions. As a result this work was undertaken by the American Railroad Association in connection with committees of the National Industrial Traffic League and the results submitted to the Divisions of Traffic and of Public Service of the Railroad Administration, and finally to the Interstate Commerce Commission, which has given its tentative approval, subject to its right and duty to inquire into the legality or reasonableness of any rule or rules which may be the subject of any complaint.

The recodified rules do not involve any increase or decrease in the present rates. The recodified rules have been embodied in General Order 7-A issued by the Director General, revoking General Order 7 together with supplements 1 and 2. The recodified rules will be effective on December 1, 1919.

Miles Per Car Per Day Increasing

As indicative of increased efficiency in the use of freight cars, the average mileage per freight car per day in October, 1919, was 27.3 as compared with 26.7 in September, 1919, according to a statement authorized by the director general. The comparison with October of the two preceding years is as follows:

October, 1919	27.3
October, 1918	26.0
October, 1917	25.9

The comparative progress thus made in October is even better than that made in September, as is shown by the following comparison with September of the two preceding years:

September, 1919	26.7
September, 1918	26.5
September, 1917	26.4

Freight Locomotive and Freight Train Costs

The total cost of freight train service, including locomotive service, per 1,000 gross ton miles, which had been decreasing each month this year, including August, was slightly greater in September than in August, according to the monthly report of the Operating Statistics Section, although less than for September, 1918. For September, 1919, it was 101.1 cents, as compared with 106.2 cents in September, 1918, and as compared with 99.5 in August, 1918. In July, 1919, it was 100.6 cents. Per locomotive mile and per train mile the cost was less than for September of last year, whereas in August the costs were still greater than in the corresponding month of last year. The cost of freight locomotive service per locomotive mile in September was 106.7 cents, as compared with 107.9, a decrease of 1.1. In August it was 103.2 cents, which was an increase of 1.5 per cent, as compared with August, 1918. The cost of freight train service per train mile in September was 156.2, as compared with 158.1, a decrease of 1.2 per cent. In August it was 152.8, an increase over August, 1918, of 2 per cent. The combined figures for all regions and the comparative figures for last year are as follows:

	September 1919	September 1918
Cost of locomotive service per locomotive mile (cents)	106.7	107.9
Locomotive repairs	35.4	35.3
Enginehouse expenses	8.0	8.2
Train Enginemen	20.3	19.1
Locomotive fuel	39.6	41.9
Other locomotive supplies	3.4	3.3
Cost of train service per train mile	156.2	158.1
Enginehouse expenses / Locomotive repairs	49.4	50.2
Locomotive fuel	45.1	48.4
Other locomotive supplies	3.8	3.8
Train Enginemen	23.0	22.0
Trainmen	26.9	25.9
Train supplies and expenses	8.0	7.8
Enginehouse expenses / Locomotive fuel	32.0	33.7
Cost of total train service per 1,000 gross ton miles	101.1	106.2
Locomotive fuel	29.2	32.5
Other locomotive supplies	2.5	2.6
Enginemen and Trainmen	32.3	32.2
Train supplies and expenses	5.2	5.2

Railroad Activities in Connection with Foreign Commerce

Director General Hines has transmitted the following to the Senate in reply to a resolution requesting information in regard to the activities of the Railroad Administration in connection with foreign commerce:

"The Railroad Administration has endeavored to assist in the restoration of the movement of foreign traffic by the application of reasonable rates, rules, and regulations, such as are consistent with present conditions. To assist in determining what properly might be done, it has conferred with and secured data from various departments of the government and worked with them in that manner to co-operate in fostering, promoting, and developing the foreign commerce of the United States. The Railroad Administration is represented on the economic liaison committee organized by the Department of State.

"There is no assigned division or department of the Railroad Administration devoted to the fostering, promoting, and developing of foreign commerce.

"The Railroad Administration is not involved directly in the gathering of data used or the expense incident thereto, but only in the proper transportation of the traffic as developed and offered for shipment within the United States. A great many railroad employees who are generally engaged in the handling of traffic are, to an extent, involved in the handling of import and export traffic; it is an incident of the general business of the carriers. The foreign freight agents employed on the individual railroads are employed in facilitating the transfer, including the necessary customhouse business, of traffic between the ocean carriers and the inland rail carriers, their functions being performance of service rather than primarily the fostering, promoting, and development of foreign commerce. They are a part of the organization maintained by the railroad corporations prior to federal control, which will doubtless be maintained by such corporations after the termination of federal control."

Division of Capital Expenditures

A revised form, No. 12, has been issued, making slight changes in the "Completion" report. The purpose of this change is to show the expenditures made for work actually done during federal control, the credits to capital account for property retired and replaced during federal control, and the net charge or credit to capital account during federal control. No change is made in the manner of reporting the completion or work involving a capital charge of $1,000 or less.

General News Department

The American Concrete Pipe Association will hold its annual convention in the Great Northern Hotel, Chicago, on February 20 and 21. The general sessions of the convention will be held in the lecture rooms of the Western Society of Engineers.

Resolutions favoring the Plumb plan and denouncing Judge Anderson for issuing the anti-strike injunction were adopted at a meeting of general chairmen of the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers held in St. Louis on November 14.

A bill to establish uniformity in railroad safety work and to create a Safety First Division under the Interstate Commerce Commission, for the purpose of organizing and supervising safety committees composed of officers and employees was introduced in the House on November 12.

A mail aviator, flying from Bellefonte, Pa., to New York, was found dead on the ground near Dover, N. J., on October 30. It is supposed that he crashed into a tree while flying in a fog. Another aerial mail carrier fell, with his machine, near Baltimore, Md., on October 14, and was burned to death. In this case four bags of mail were destroyed.

Near Marcel, Cal., on the San Joaquin division of the Southern Pacific, traffic was suspended from October 25 to October 31 because of a blocked tunnel. Tunnel carpenters were at work and a small amount of earth which rolled down derailed the locomotive of a freight train. The derailed locomotive knocked down several tunnel posts, precipitating a slide of considerable magnitude.

Engineering Council has issued a call to engineers for support in order to continue its work. The member societies contributed $25,000 for the support of Engineering Council during 1919, while it is estimated that $50,000 will be needed for $1920. Aside from the possible appropriations of the member societies it is expected that $30,000 additional will be needed and the call which has been issued is for that amount.

Engineering Council has issued a statement regarding the activities of the engineering society's employment bureau which shows that in the interval from December 1, 1918, to September 30, 1919, 17,083 men were interviewed and that 4,858 registered with the bureau; and over 1,000 men are reported placed. This was accomplished at an expenditure of $10,600. The number of engineers visiting the bureau now averages from 60 to 70 a day.

The Chicago, Burlington & Quincy is negotiating with Chicago municipal authorities for the right to operate its own telephone system for its Chicago terminal, connecting the general office building with the freight houses and other points, and an ordinance granting this authority is being sought. The road has an agreement with the old Illinois Tunnel Company allowing the use of the tunnels for telephone wire, but there is opposition from the city authorities and the Chicago Telephone Company.

The Committee of Engineering Council on curricula of engineering schools has reported with reference to a suggestion that the engineering course in the colleges be extended to six years, that it does not favor the substitution of a six-year course for the present four-year course generally in the engineering colleges, although it calls attention to the fact that the longer course is now offered at a number of colleges. The committee strongly urges the extension of facilities for vocational training throughout the United States and particularly in the industrial centers.

Speaking by telephone between a moving railroad train and an instrument in a station office was the subject of a demonstration by W. W. Macfarlane on the Philadelphia & Reading near Wayne Junction, Philadelphia, on November 25, in the presence of M. H. Clapp, W. P. Borland and G. E. Ellis, representing the United States Railroad Administration. Mr. Macfarlane uses the rails of the track as a part of his electrical conductor, and he talked with a person on another train, two or three miles away, on the same track.

The "Public Ownership Conference" held in Chicago on November 15, 16 and 17, failed to endorse by vote the Plumb plan, but passed a joint resolution urging the government to retain control of the railroads for two years more. The resolution was introduced by Timothy Shea, president of the firemen's union, Warren S. Stone, president of the Brotherhood of Locomotive Engineers, and Glenn E. Plumb, special attorney of the railway brotherhoods. It provides for the union of the Public Ownership League with the Plumb plan. The resolution stipulates that reservations may be made to the Plumb plan as "they may be needed."

The Development Committee of the American Society of Civil Engineers has submitted its final report to the Board of Directors of the society and the committee has been discharged. The three representatives of the committee on the Joint Conference Committee (co-operating with members of similar committees of the other three national engineering societies) have been continued, reporting directly to the Board of Direction. The report of the Development Committee is being printed and will be distributed to the members in the near future. It will also come up for discussion at the annual meeting of the society in January.

Fuel conservation measures on the Chicago Great Western resulted in such substantial savings during the early months of 1919 that W. L. Park, federal manager, has addressed a letter of commendation to all enginemen as well as others who contributed less directly in securing such a satisfactory record. A comparison of the fuel performance for January, February and March, 1919, with the same months of the previous year showed a decrease in coal per 1,000 gross ton miles in freight service equal to 10.7 lb., or 4.1 per cent, equivalent to a monetary saving of $13,956. In passenger service, based on pounds of coal per passenger train car mile, there was a decrease of 3.1 lb., or 12.9 per cent, amounting in money to $23,650, or a total saving in freight and passenger service of $37,606 for the three months.

Ticket Frauds

Sleeping car conductors and porters employed by the Canadian Pacific Railway, to the number of six or more, have been tried and convicted in court at Winnipeg, Manitoba, on charges of accepting secret commissions from passengers. Fines of from $100 to $600 and jail sentences of ten days to six months have been imposed. The term "secret commissions" seems to mean the carrying of passengers, for a personal consideration, without requiring the presentation of tickets.

Three Milwaukee (Wis.) business men and two conductors on the Chicago, North Shore & Milwaukee Electric have been arrested in Milwaukee charged with a ticket selling swindle, which is alleged to have netted them over $30,000 a year for several years. The conductors are said to have obtained a supply of ten-cent tickets from one town to the next, which they cancelled instead of the Chicago-Milwaukee tickets presented by the passengers. These latter are said to have been bought by the business men from the conductors at 25 cents each and later sold to a selected list of customers at $1.50 each, the regular price being $2.32.

Railroad Reserve Force Proposed

A bill introduced by Senator Thomas of Colorado just before the Senate adjourned on November 19 provides for the creation of a railroad army reserve force of 200,000 men to be trained at land grant agricultural colleges for service on the railroads in times of emergency. Men between 18 and 30 years of age will be eligible for enlistment, but not for re-enlistment. The term of enlistment would be for 10 years with a provision for 12 months' training for work as train operatives, hostlers or telegraph operators and during the training period the men would receive regular army pay. If in time of emergency they were put to work on railroads they would receive the usual railroad pay, but would be barred from having any connection with a labor union.

Railroad Y. M. C. A. Extension Program

The Railroad Y. M. C. A. officers and secretaries have held regional conferences for the planning of a greater intensification and extension of the work during the coming months. It will be recalled that this organization held a continental membership drive last May, which netted an increase in membership of between 48,000 and 49,000, greatly exceeding the goal, which was 40,000 new members. In inaugurating an enlargement and extension of the work it has been decided to set aside different weeks during the fall and winter during which special efforts will be made to plan for and extend the work in different directions.

The Railroad Y. M. C. A. officers and secretaries for the Allegheny region met at Pittsburgh September 25; those for the Western and Northwestern regions at Chicago, September 26; Southwestern region, Kansas City, September 29; Eastern region, Albany, N. Y., October 3; Pocohontas and Southern regions, Richmond, Va., on October 6, and a conference will be held in Canada at a date which has not yet been decided upon. Members of the boards of management of the different associations attended these conferences in considerable numbers and the meeting were notable because of the activity of the railroad men.

The resolutions which have been passed embody a program for laying special stress on the launching and emphasis of activities in religious work during the week of October 12-18; on boys' work, October 26-November 1; educational work, November 9-15; health and happiness, November 30-December 6; citizenship and social, December 14-20; thrift, January 17-24; membership, April 12-19.

Road Building Dependent on Railroad Facilities

The Agricultural Department estimates that the amount of money that can be profitably expended in 1920 for hard surface highways in the United States is $633,000,000; but this is contingent upon the quantity of materials that the present limited railway facilities can transport. A circular issued by the Bureau of Public Roads of the Department of Agriculture urges that the shipping of such materials be started earlier than usual and that as great a mileage of road work be placed under contract during December and January as possible. Unless the available open top cars, many of which normally lie idle in the late winter, are utilized in that slack season, the work which can be done will necessarily be curtailed for lack of materials.

The total proposed expenditures for 1920 amount to more than four times the amount that has been expended during any previous year for like purposes. Therefore, there must be a tremendous increase not only in the materials, supplies and shipping facilities, but also in the labor supply, and also an enlargement of contractors' organizations. First of all, Thomas H. MacDonald, chief of the bureau, says, the attention of all state, county and city roadbuilding interests should be directed toward overcoming the car shortage. It has been customary to wait until contractors' organizations were ready to begin work before starting the shipment of material. Under these conditions many thousands of open top cars lie idle during the latter part of February, all of March and the earlier part of April. During the past spring, the circular says, the number of open top cars that were idle was more than 250,000, but by awarding contracts as early as possible, contractors will be able to ascertain their material requirements at different points and so will be in a position to place orders dependent upon railway transportation a considerable time in advance, and while the placing of material in storage involves some expense it will be small compared to the loss that will result if contractors are not in a position to go ahead with the work because of lack of materials.

The Prince of Wales on the C. P. R.

The 10-car train prepared by the Canadian Pacific for the use of the Prince of Wales on his trip across Canada from the Atlantic to the Pacific has already been described briefly in *Railway Age*. The Prince's journey in this train covered a distance of more than 10,000 miles, four-fifths of which was over Canadian Pacific lines; and the London Times, whose correspondent accompanied the Prince, devotes a column, on the termination of the journey, to a sketch of the life of the party on the train. The party, including reporters, numbered, all of the time, about 100 persons; and this account gives the railroad credit for maintaining the most perfect convenience at all times. Many side journeys were made, and the trip lasted about two months. On Lake Kootenay, in British Columbia, the whole train was transferred from one landing to another on floats. The train had a telephone line from one end to the other and had a medical dispensary, a workroom for a tailor and one for a photographer. News bulletins were received by telegraph four times each day. "Fishpoles" were at hand to connect with the telegraph or telephone line at the side of the road in case of need. The railway company had, altogether, a corps of about 60 employees to attend to the wants of the passengers. The cooks, waiters, etc., were picked men, most of them having had practice in English households. On a number of occasions the party left the train and lodged in a hotel, and then the baggage master had to see to sending out and getting back a good part of the 250 pieces of baggage on the train. The railway police on the train were Scotchmen and Irishmen who had seen service in the British army.

In addition to commending the men for efficiency, as the term is usually employed, the reporter credits them with a high degree of personal devotion to the Prince and an equally praiseworthy spirit of loyalty to the railway company.

Coal Production

Production of bituminous coal during the third week of the strike (November 16-22) was 44.8 per cent of normal, according to the weekly bulletin compiled by the United States Geological Survey. During the first week, before the strike order was withdrawn, it had been 29.6 per cent, and during the second week, 33.3 per cent. The third week's output, including lignite and coal made into coke, was 5,416,000 net tons. Compared with the week before, this was an increase of 1,390,000 tons. The average production during the four weeks ended October 25, which may be regarded as normal, was 12,089,000 tons.

The Central Interstate Wage Conference was reopened in Washington on the afternoon of November 14. It continued in session throughout the week of the 16th to the 22nd. During that period men returned to the mines in considerable numbers in West Virginia, Southeastern Kentucky and Tennessee, Alabama, Colorado and Wyoming. In the great central competitive field, from western Pennsylvania to Illinois, and in the tier of states immediately west of the Mississippi from Iowa south to Oklahoma, the situation underwent no change. In all that territory the only coal mined was an insignificant tonnage from scattered wagon mines and steam-shovel pits.

The anthracite industry responded to the stimulus of active demand caused by the soft coal strike with the largest production of the year. The week's output is estimated at 2,018,000 net tons, an increase over the week before of 192,000 tons, or 10.5 per cent. The highest rate of production ever maintained by the anthracite mines for an extended period was during the summer of 1918, when war-time demand for the steam sizes of anthracite carried the output to an average of 2,080,000 tons for a full-time week. The fact that the mines are now producing within 60,000 tons of that maximum indicates that but little more can be expected of them to fill the deficit caused by the bituminous strike.

REVENUES AND EXPENSES OF RAILWAYS

SEVEN MONTHS OF CALENDAR YEAR 1919

Name of road.	Average mileage operated during period.	Operating revenues			Maintenance of		Operating expenses				Operating ratio.	Net from railway operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.

Traffic News

The Boston & Albany is preparing to follow the Boston & Maine with the announcement of a new freight tariff, to go into effect in December, making general advances of 25 per cent.

Milton J. Vandewalker, traffic manager of the American Ship Building Company, Cleveland, Ohio, has been appointed traffic manager of the Detroit Shipbuilding Company, with office at Detroit, Mich., a subsidiary of the former.

In order to throw some light on the present prices of sugar, Russell J. Poole, food director of the City of Chicago, has compiled the history of Illinois Central Box Car No. 33093 for the month ending November 15. The car, according to Mr. Poole, containing 54,250 lb. of sugar, has been moved from place to place during this period and in the meantime its cost has been swelled by the sum of $2,466. The car was originally consigned by the Godchaux Sugar Company, Nashville, Tenn., to J. P. Hadesman & Company, Chicago, but was resold by brokers four times, and finally reached the Washburne-Crosby Milling Company in Minneapolis, Minn. From Nashville the car was moved to Paducah, Ky., increasing its "value" in freight charges approximately $162. From there it was moved to Omaha, Neb., increasing its value (cost) approximately $187. Subsequently it was moved back to Chicago, for which the freight charges were approximately $201, and it then proceeded to Minneapolis, for which movement there were freight charges of $200 more. The total cost of the trip according to this compilation is approximately $2,466. Mr. Poole suggests that the Railroad Administration and the attorney general cooperate to stop such repeated reconsignments. "Meantime," says Mr. Poole, "so far as we know, the car is still rolling."

Preparing for Christmas

Believing that the movement of mail, parcel post and express shipments will be extraordinary during the holiday season this year and that there is every indication of an unusually large passenger traffic, R. H. Aishton, regional director of the Northwestern region, has promulgated nine suggestions for the handling of this traffic, embodying them in a statement which has been sent to railroad officers in his district. Mr. Aishton suggests that:

(1) Requirements of business to be carefully estimated in advance and equipment and power provided sufficient to avoid overcrowding of delayed movement of trains.

(2) Repairs to all passenger train cars to be expedited and all such cars fit for use held out of shop in the meantime.

(3) Special attention to be given to the inspection, cleaning and general preparation of cars for service during the holiday season.

Cooperation between individual roads with common use of equipment, including through routing of cars to avoid transfers which would cause delay or be inconvenient to passengers. Cooperation with Pullman Company, with the purpose of making best possible use of available sleeping cars.

(5) Temporary increase of facilities for storage and handling of baggage, mail and express to avoid congestion which has occurred in past years, use conveniently located freight houses and other buildings.

(6) Provide additional employees in ticket offices, baggage and parcel rooms, information bureaus, etc., and, if necessary, increase the number of depot passenger representatives.

(7) Change ticket office hours during the period of heavy sales, opening offices at night, if necessary.

(8) Arrange for publicity necessary to induce passengers to buy tickets in advance, thus avoiding congestion and permitting advance estimate of train and equipment required. The passenger traffic committee will suggest a form of poster to be used for this purpose in depots and ticket offices, and will also prescribe rules to govern advertising which will include instructions to passengers.

(9) Careful attention to supplies and the provision of necessary additional help on dining cars and in restaurants, lunch rooms, etc.

Foreign Railway News

Railwaymen in France to Strike

LONDON.

Extremists in France are taking advantage of the absence of the leaders of the General Federation of Labor, who are in Washington, by carrying on an active strike propaganda. The Paris Section of the State railways is taking the lead and notices were distributed on November 6, among all services ordering work to cease on November 7 on the left bank of the Seine. The political object of this threatened strike is clear from the following order of the day: "The railwaymen of the Champ de Mars decide to leave work at 3 p. m. on Friday, November 7, as a protest, first, against the delays in the amnesty and, second, against intervention in Russia."

Frank H. Clark, consulting engineer of New York City, has gone to Peking to act as technical adviser to the Ministry of Communications of the Republic of China. Mr. Clark recently resigned as general superintendent of motive power of the Baltimore & Ohio to open offices in New York City and undertake engineering investigations, report upon railway conditions and operations and cooperate in the preparation of plans and specifications for railway equipment and materials as well as to advise export firms, foreign railways and other concerns purchasing equipment or materials from United States manufacturers. He was associated with David L. Barnes, consulting engineer of Chicago, for four years and later entered the service of the Chicago, Burlington & Quincy, where he held successively the positions of chief draftsman, mechanical engineer, superintendent of motive power and general superintendent of motive power. Resigning from that company in 1910, he joined the staff of the Baltimore & Ohio as general superintendent of motive power, a position he held for eight years. Mr. Clark is a member and has served as president of the American Railway Master Mechanics' Association and the Master Car Builders' Association.

F. H. Clark

Germany's Passenger Service Ceases

On Tuesday, November 4, the whole passenger service throughout Germany ceased for 11 days, and after that period there will be only absolutely necessary passenger trains. In the industrial regions the workers' trains will not be taken off, and in and around the cities a restricted local service will be kept up, but that is all. The telegraphic and postal service is in a chaotic condition and the telephone service is impossible. Stations throughout the country are congested with goods traffic and the canal services are almost at a standstill. The mails will have to be forwarded by goods train, and the only travel service in Germany will be its Zeppelin service running between Berlin and Friedrichshafen. The stoppage of passenger traffic is officially explained as being necessary in order to secure adequate

distribution of coal and potatoes. As, however, the occupation troops must be in a position to occupy the plebiscite areas as provided by the Peace Treaty, and the moving of considerable bodies of troops is attended with difficulty, some connect the government's decree with the forthcoming troop movements. Other people think the desire to avoid trouble round about November 9, the anniversary of the revolution, has something to do with this measure.

Deficit on Prussian Railways

The deficit on Prussian railways for 1919, so far as can be ascertained, amounts to approximately $155,000,000, of which $40,000,000 has been expended in indemnities for railway thefts. It is estimated that the total working expenses for the year will amount to about $1,700,000,000.—*Modern Transport.*

Recuperation in Belgium

The coal mines of Belgium were not damaged by the Germans, and although they need new hoisting cables and other important repairs, they are now turning out 84 per cent of their pre-war deliveries. This statement is from a circular which has been issued by the Chamber of Commerce of the United States, in connection with the International Trade Conference. Belgium is already exporting coal to France, Italy, Holland and Switzerland, a total of about 400,000 tons a month. Iron works suffered seriously from the war; of 52 blast furnaces, 9 are now working. In the textile field there is a good deal of activity and about a million spindles are now resuming operations. The railroads are being rapidly restored. Germany has replaced a large part of the cars and locomotives which were taken away, and slow freight is now moving almost normally. On the main railroads passenger traffic is already quite as intensive and as rapid as before the war. Conflicts between labor and capital in Belgium have been settled, in general, quite peaceably; employers have increased rates of pay, and the workingmen, realizing the serious state of the country, have not pushed their claims to the extreme. Belgium still needs machines and raw materials, and must have capital.

English Railwaymen Want More Holidays And More Free Passes

London.

According to an article published in the Morning Post, at a special meeting of the Associated Society of Locomotive Engineers and Firemen at Leeds the Executive Committee was instructed to demand 7 shillings and 6 pence per week special rent allowance to all members to be paid in addition to wages. The following resolutions were passed:

1. That 14 days' holiday be allowed annually with full pay after six months' service; an extra day to be allowed for each bank holiday worked; six free passes to be available annually to any part of the United Kingdom, for each man, his wife and family.

2. That enginemen, motormen, assistant drivers, firemen and electric trainmen who from ill health or defective eyesight brought about by their employment are taken off the footplate (electric or steam) shall be paid not less than the rate they were receiving when taken off the footplate.

A definite stand was also to be taken against the question of lodging away from home, and to refuse to undertake journeys which involve this practice. It was also agreed that members' contributions should be increased by 2 pence per week.

England's Railroad Deficit

London.

The Times Trade Supplement states that official statements in connection with railway receipts and expenditure have by no means established the existence of any such large deficit as was paraded to make a vase for the setting up of a Ministry of Transport. It is known for example that receipts from freight traffic during the war period, even if the Government traffics are excluded, have been higher than for the year 1913. The increase in freight traffic revenue for the year 1918, as compared with the year 1913, was nearly 20,000,000, and for the years 1916 and 1917 was considerably in excess of that figure. There is a general belief that if Government traffics were allowed for, the estimated deficit on working during the war period, even after allowing for claims to be made by railway companies for arrears of maintenance would be almost extinguished. Under present condition, with a heavy falling off in Government traffic which has not yet been replaced by the demand for ordinary freight traffic with the new claims on revenues to meet the higher wages bill, it is difficult to see how a deficit on working can be avoided. Whether it will require an average increase in freight rates of anything like 50 per cent is quite another matter and it will be the business of the Advistory Committee, on which important commercial interests are represented, to see that no undue burden is imposed on British trade.

Electrification System Proposed to Be Adopted on French Railways

London.

The following is an abstract taken from "Le Genie Civil" of August 30, regarding the conclusion arrived at by the French Commission to America in connection with the choice of a system of electric traction:

In view of the remarkable results obtained by the Chicago, Milwaukee & St. Paul Railway, with 3,000 volt direct current, M. Mauduit, Professor at the Faculty of Science of Nancy, France, does not hesitate in finally deciding in favor of the adoption of this system, which he considers to be the only one at present realy efficient for main-line electric traction. Single-phase current, which at first sight offers the advantage of lending itself to a great variety of combinations, may some day achieve satisfactory working, but it is beyond doubt that the present practice is far from this desirable state of efficiency.

The drawback to continuous current is that it is more costly in initial outlay, on account of the rotary sub-stations which transform the 50-period three-phase current generally generated in power stations. However, one must bear in mind that in order to realize a saving in this direction with single-phase current, it is necessary to generate this single phase current under low frequency (16 periods) by means of special generating sets, failing which, if one wishes to utilize the current normally produced by the power stations (50 periods three phase current) it is necessary to resort to rotary transformers, both with the single-phase and the direct currents. From this standpoint continuous current offers the advantage of lending itself to the utilization of current from any power station, under the same conditions.

With regard to working expenses, M. Mauduit, does not consider that the difference between the two systems will be considerable and that it will count in the choice of a system.

The almost complete absence of perturbations on the telephone and telegraph lines forms, as regards continuous current, a very considerable superiority over the other systems.

Three-phase current which in America is only of insignificant local use has not been mentioned, as M. Mauduit is of the opinion that it should be rejected, especialy in view of the complexity and high price of the installation and upkeep of its two contact lines.

From an economic point of view, the documents which we have brought from America are far less complete and less precise than the technical information. On the other hand, it is necessary, in order to draw conclusions from the American experience as to the economic future of European electric traction, to introduce considerable modifications in the figures, on account of the two main constants which differentiate the American working from the European working.

The coupling used in America has a tensile strength of about 135 tons and one may allow for a tensile stress up to 40 tons; in Europe, there are two types of couplings, the tensile strength of which is 35 and 55 tons respectively, while the tensile stress allowed is limited to 10 tons except in Switzerland where it is 12 to 15 tons.

American passenger cars and goods wagons are fitted with compressed air brakes. The result is that they use engines two to three times more powerful, goods trains two to three times longer and heavier than in Europe, and that the attendants on goods trains are comparatively less numerous, which completely alters the figures in connection with working.

Exact calculation made by companies, and particularly the

results obtained with the first electrifications carried out and the taking into account the actual price of coal, will alone show under what conditions electric traction will be more economical than steam traction. It is already known, anyhow, that the saving will be greater on lines with long gradients and heavy traffic, and it is probable that, as regards liens deviating too much from these conditions, electric traction will be more costly than steam traction.

However, the ever increasing necessity to economize coal, and the great side-advantages well known to derive from electrification, make it necessary to proceed as rapidly as possible with the initial work of a progressive electrification of the most interesting lines of our Paris-Orleans, Paris-Lyon-Mediterranean, and Midi systems.

Coal Shortage in Argentina Results in Use of Corn as Fuel

In the Argentine Republic all the coal consumed on the railways and by power companies, etc., used to be imported from England, says an article in the Railway Gazette (London). Soon after the outbreak of war, however, the necessity for the employment of ships for other purposes reduced the supply of coal and, as time passed, the quantity decreased until at last practically no coal was introduced.

It had always been customary for the railways in the far northern part of the country, where forests of hard wood abound, to burn wood in locomotives, and the use of this class of fuel was rapidly adopted by all the railways, and also by the factories and electric-power companies in the large towns, as well as by private householders. As a result, the price of wood fuel largely increased and it soon became evident that the railways could not haul to the south sufficient wood to supply themselves and other consumers.

The British Government sent to the Argentine a certain number of ships to bring back wheat to Europe, but practically none to carry maize, of which a very large amount is grown in the Republic. Since it was not being exported, the farmers could not sell any, and they consequently became holders of large stocks of corn (maize), which they could not turn into cash. At the time the shortage in wood fuel was becoming pronounced, and it was suggested that corn might be burnt in its stead.

The farmers put forward their stocks at about $15 a ton, delivered at rail side. Experiments were made, and it was found that maize would burn freely and had practically the same calorific value as hard wood. It gave good results in the stationary boilers of power houses, and some was used in locomotives. Thousands of tons were burnt each month in the power houses of the railways, and in those established by public companies in the large towns to furnish electricity for lighting, power, electric tramways and railways.

It was burnt sometimes in the form of grain, but more often on the cob. Firebars had to be placed about ½ in. apart, otherwise the grain fell through into the ash pit or ash pan. This closing up of the bars was particularly necessary when maize was used on locomotives. In such cases it was burnt mostly on shunting engines.

The relative calorific values of maize and coal are found to be in practice, as 2.5 to 1; similar values for hard wood and coal vary between 2.1 of wood to 1 of coal, and 2.5 of wood to 1 of coal. The coal referred to is the best Welsh steam coal. The hard wood varies much according to the class of the trees from which it is cut, and the length of time it has been cut. Some of the new, green wood rushed forward directly after cutting, in a wet season, contained as much as 40 per cent by weight of moisture.

If maize is ground down until the particles are about the size of those of a medium sand, and it is then blown, by a fan, into a heated combustion chamber, it immediately bursts into flame, and is much more economically consumed. Some power companies laid down the necessary plant for dealing with it in this manner, and obtained results which showed the maize fuel to have a calorific value, relative to steam coal, of 2 to 1.

A large quantity of maize is still being burnt in the Argentine Republic, but the fuel question is a little easier, due to the fact that oil in reasonable quantities is now arriving from the Mexican and other oil fields.

Equipment and Supplies

Locomotive Deliveries, Week Ended November 8

The following new locomotives were shipped during the week ended November 8:

Works	Road	Number	Type
Baldwin	P. & R.	3	USRA Consol.
	L. V.	1	Santa Fe.
	C. C. & O.	1	USRA Mallet.
		5	
Total		5	

Locomotives

The Fore River Railroad has ordered one 0-6-0 locomotive from the American Locomotive Company.

The South Manchurian Railway has ordered six 0-8-0 locomotives from the Baldwin Locomotive Works.

Perrin & Marshall, 2 Rector street, New York, will be in the market shortly for two 40-ton switching locomotives.

The Detroit Edison Company, Detroit, Mich., has ordered two 0-6-0 switching locomotives from the Baldwin Locomotive Works.

The Shantung Railway (China) has ordered through Mitsui & Co., 65 Broadway, New York, seven consolidation locomotives from the American Locomotive Company.

The Pennsylvania Equipment Company, 1420 Chestnut street, Philadelphia, Pa., is in the market for three standard gage six-wheel switching engines, weighing about 70 tons.

The United Fruit Company is in the market for a number of three to six-ton fuel oil locomotives of 24 in., 30 in., 36 in. and 42 in gage, for use on its lines in Central America.

Freight Cars

The Great Northern is asking prices on 1,000 30-ton wooden stock cars.

The Chesapeake & Ohio is repairing 250 freight cars and may repair several thousand additional cars.

The Sterling Coal Company, Daniel Boone, Ky., has ordered 49 mine cars from the American Car & Foundry Company.

Thomas W. Simmons & Company, 4 John street, New York City, is inquiring for 100 steel box cars for export to China.

George H. Carey, 1 Broadway, New York, is in the market for 200 second-hand, all-steel gondola cars of 100,000-lb. capacity.

The Hyman Pickle Company, Louisville, Ky., has ordered one 40-ton flat car from the American Car & Foundry Company.

The Federal Ship Building Company, Kearney, N. J., is inquiring for 20 low-side gondolas and 10 flat cars of 50-tons capacity.

The Manhattan Oil Company, Minneapolis, Minn., is in the market for 100 8,000-gal. capacity and 100 10,000-gal. capacity tank cars.

The Aracoma Coal Company, Huntington, W. Va., has ordered 50 composite mine cars from the American Car & Foundry Company.

The Lidgerwood Manufacturing Company, 96 Liberty street, New York, is in the market for 100 50-ton ballast cars for the South Manchurian Railway.

The Belgian Government has bought 1,000 30-ton gondola cars from the American Government, 2,000 Belgian standard

type cars from the British and 5,000 from Belgian manufacturers.

The V. V. Lebedjeff Engineering & Supply Company, 227 Fulton street, New York, is inquiring for 60 second-hand flat cars with steel underframes; 40 of these cars to be of standard gage and 60,000-lb. capacity, and 20 of 36-in. gage and 50,000-lb. capacity, for export to the West Indies.

Passenger Cars

The Pennsylvania Equipment Company, 1420 Chestnut street, Philadelphia, Pa., is in the market for a second-hand standard gage baggage car.

The Madrid, Zarogossa & Alecarte Railway, Madrid, Spain, has ordered 20 second-class and 30 first-class passenger coaches from the American Car & Foundry Company.

Iron and Steel

George H. Carey, 1 Broadway, New York, is in the market for 150 tons of 20-lb. relaying rails with the necessary bars.

The V. V. Lebedjeff Engineering & Supply Company, 227 Fulton street, New York, is in the market for 2,000 tons of 12-lb. rails for export to the West Indies.

Signaling

The Canadian Pacific is installing automatic block signals on its line between Galt, Ont., and Woodstock, 30 miles; the General Railway Signal Company's signals arranged on the "absolute permissive" plan.

Miscellaneous

The Government of Netherlands, through its New York office, has ordered 4,000 forged wheels and axles for the Java State Railways from the Forged Steel Wheel Company, and 18,000 tons of 50 lb. and 70 lb. rails with angle bars, tie plates and clips (2,000 tons) from the U. S. Steel Corporation and the Consolidated Steel Company.

Perin & Marshall, 2 Rector street, New York consulting engineers for the Lung Yen Mining Administration of China, are in the market for four 3,000 cu. ft. 8 wheel type self-dumping cinder cars of standard gage; also for a 15-ton steam locomotive crane with 45 ft. boom, and additional 20 ft. removable extension piece in center, with a ¾ cu. yd. clam shell bucket, a 45-in. lifting magnet and 7½ kilowatt engine driven generating set, standard to be same as on the Pekin-Kalyon Railway, on which the crane will be located.

R. S. Willis, 11 Broadway, New York, has ordered from the Consolidated Steel Company 2,400 steel wheels and 1,200 axles, also an additional 200 wheels and 1,000 axles for use on railroads in Spain. Orders have also been given to the Railway Steel Spring Company for 11,700 steel springs and to the Niles-Bement Pond Company for a 48-in. hydraulic press of 200 tons' capacity, a Niles No. 2 automatically-driven axle lathe, a 48-in. standard car wheel borer, and a No. 2 extra heavy car wheel lathe, all for export to Spain.

Big Engine Menaces Town.—The throbs of a 2,000-h.p. engine are the cause of heart throbs and consternation in Sisterville, W. Va. Residents fear a part of the city will tumble down as a result of the vibrations. The engine in question belongs to the West Virginia Light Heat and Power Company, furnishing electricity to four municipalities. Council has condemned the engine and citizens in addition have appealed to the Public Service Commission. The engine was built a number of years ago, but was not used because of its great size, but recently the smaller engines have become disabled, and it has become necessary to use the larger one.

Supply Trade News

Henry C. Frick, a director of the U. S. Steel Corporation, also of the Pennsylvania Railroad, and the Atchison, Topeka & Santa Fe, died on December 2, at his home in New York.

The plant of the **E. A. Kinsey Company**, Cincinnati, Ohio, manufacturers of railway and contractors' supplies, was damaged by fire on November 21 to the estimated extent of $100,000.

The Kalamazoo Railway Supply Company, Kalamazoo, Mich., has increased its capital stock from $150,000 to $300,000 and plans the erection of an addition to its plant 100 ft. by 310 ft., to cost $10,000.

The International Steel Tube Company has been incorporated under the laws of Delaware with a capital of $2,500,000, of which $1,000,000 is preferred and $1,500,000 common stock, and is planning the immediate construction of the first unit of a seamless tube plant at Cleveland, Ohio. William P. Day, president of the International Steel Tie Company, is president, and Thomas Parrock, former superintendent of the Republic Steel Company, Youngstown, Ohio, is vice-president of the new concern.

H. W. Ross has been elected vice-president of **Templeton, Kenly & Co., Ltd.**, Chicago, manufacturers of Simplex jacks, and assumed his duties with that company on September 29.

H. W. Ross

In 1916 Mr. Ross was designated as engineer in charge of installing a bureau of standards for the Quartermaster Corps, U. S. A., for the purpose of testing and selecting various motor machine shop tools and accessory equipment for the United States Government. In 1917 he was called to Washington, D. C., to purchase machinery, tools and auto accessories for use of the Motor Transport Corps in France, on August 1, 1917, receiving his commission as captain, later being promoted to major. He went overseas, where he was connected with the Motor Transport Corps in an engineering and purchasing capacity. He was later sent to Spain and Portugal in connection with the General Purchasing Board. After the close of hostilities Major Ross was selected as officer in charge of sales of Motor Transport Corps equipment in connection with the United States Liquidation Commission, and he had charge of the appraisal and selling of the vast quantity of motor cars, trucks, motorcycles and machinery that the government had accumulated in France. Major Ross returned to the United States on September 15, and at his request was mustered out of the service soon thereafter. Mr. Ross' new work covers the general sales management of Simplex jacks, and he will give particular attention to the Simplex pole pulling and pole straightening and special emergency jacks used by steam and electric railways and other public utility companies.

M. J. Keane, manager of the steam goods branch of the Canadian Fairbanks-Morse Company, with headquarters at Toronto, Ont., has resigned and organized the **Valve Engineering Company**, with office at 160 King street West, Toronto. The new concern will act as agents for the Pennsylvania Flexible Metal Hose Company, the Penberthy Injector

Company, Spands & Witwyte, manufacturers of pressure packing for steam and gas engines, and other power plant equipment companies.

Robert C. McCarter, consulting engineer to all the European Westinghouse companies and president and managing director of the Russian Westinghouse Company, with office at New York City, and **William Cooper,** consulting engineer, who prior to the establishment of his office in New York, in 1917, was European manager and chief engineer for Robert W. Hunt & Co., have formed a partnership and will act as consulting engineers under the firm name of **McCarter & Cooper,** with office at 165 Broadway, New York City.

Major C. G. Carothers, who served in the U. S. Army as captain and major from September, 1917, to September, 1919, has been appointed Chicago railroad representative of the **B. F. Goodrich Rubber Company,** with headquarters at Akron, Ohio, succeeding **F. O. Slutz,** promoted. Major Carothers was born on August 31, 1881, at Mattoon, Ill., and was educated in the grade and high schools of his native town. He served an apprenticeship as machinist at Mattoon on the Cleveland, Cincinnati, Chicago & St. Louis, and then worked for a number of western railroads. He subsequently attended Purdue University, Lafayette, Ind., and was graduated as a railway mechanical engineer in 1912. From August of that year to August, 1914, he was mechanical engineer with the Falls Hollow Staybolt Company, Cuyahoga Falls, Ohio. He then served to September, 1917, as senior mechanical engineer with the Interstate Commerce Commission, Division of Valuation, Southern District, with headquarters at Chattanooga, Tenn. In July, 1917, he received a commission as captain in the Engineers Reserve Corps, and was called to active service the following September to attend the Second Engineer Officers' Training Camp, American University, Washington, D. C. He subsequently was attached to the 301st Engineers of the 76th Division at Camp Devens, Ayer, Mass., and in January, 1918, was sent to France, to report to the general superintendent of motive power, Colonel H. H. Maxfield, of the Railway Transportation Corps. He subsequently served in the railroad yard at Is-sur-Tille as master mechanic and built a shop there, also one at Villa-le-Sec, the advance section ammunition depot. He later served as superintendent of motive power of the 13th Grand Division, with headquarters at Is-sur-Tille.

C. G. Carothers

The **Detroit Star Grinding Wheel Company** has been formed by merging the business of the Detroit Grinding Wheel Company and the Star Corundum Wheel Company, both of Detroit, Mich. The officers of the new company are: **John R. Kempf,** president; **J. T. Wing,** vice-president; **F. H. Whelden,** secretary and treasurer. **Edward N. Dodge,** formerly with the Norton Company, Worcester, Mass., has been appointed general sales manager. The company's plant and offices will be at 241-61 Cavalry avenue, Detroit, Mich.

Earl E. Eby, sales manager of the industrial bearings division of the **Hyatt Roller Bearing Company,** New York City, has been appointed to the board of directors of **Hyatt, Ltd.,** London, a new company formed to market the Hyatt bearings in Europe. Mr. Eby will devote his entire time to this work, with headquarters in New York. **G. O. Helmstaedter,** Chicago district manager of the Hyatt Roller Bearing Company, has been promoted to sales manager to succeed Mr. Eby, with office at New York. W. B. Wachtler, formerly of the New York office, has been appointed to succeed Mr. Helmstaedter at Chicago.

H. A. Jackson, president of the **Chicago Pneumatic Tool Company,** has addressed a letter to shareholders stating that the proceeds of the new stock issue of $6,448,800 will be used as follows: redemption of bonds now outstanding, $3,086,300; extension of plant and of sales and service branches, $1,775,000; additional working capital, $1,587,800. The authorized stock at present is $7,500,000, of which the amount issued and outstanding is $6,448,000. It is proposed to increase the authorized capital stock to $13,000,000 and to offer at par to each stock holder of the company an amount of new stock equal to the present holdings. Mr. Jackson stated: "As a result of the increase, earnings will be substantially increased, the company will be free from all fixed charges, including sinking fund requirements, and there will be no capital liabilities other than the capital stock aggregating 128,976 shares. Assuming the same rate of earnings for the remainder of the current calendar year as has been experienced in the past nine months, the earning per share will be $35.55."

Charles S. Pflasterer, manager of the caustic soda primary battery department of the **National Carbon Company, Inc.,** Cleveland, Ohio, with office in that city, has been appointed eastern manager of the railroad sales department with the same headquarters. Mr. Pflasterer was born in Allegheny, Pa., in 1875. After spending two years in the steel mills at Braddock, Pa., he became connected with the Union Switch & Signal Company, Swissvale, Pa., in 1891 as a laborer. In 1893 he entered the employ of the Johnson Railroad Signal Company, Chicago, and from 1894 to 1901 was connected successively with various signal companies, the Chicago & Eastern Illinois, the Cleveland, Cincinnati, Chicago & St. Louis, the Chicago Elevated Railways and the Chicago Great Western. In 1901 he was appointed interlocking foreman on the Union Pacific at Omaha, Neb. From 1901 to 1908 he was successively signal foreman, general signal foreman, superintendent of construction, general signal inspector and assistant signal engineer and in 1900 was appointed assistant signal engineer of the Oregon Short Line, with headquarters at Ogden, Utah. In 1911 he became connected with the National Carbon Company, Inc., in charge of the caustic soda primary battery department, which position he held until his recent appointment.

C. S. Pflasterer

The Pollak Steel Company, Cincinnati, Ohio, with plants located at Cincinnati and South Chicago, Ill., manufacturers of railroad car axles, locomotive forgings and heavy forgings for marine and machine builders, announce that it has recently added to its South Chicago plant a large extension for the manufacture of drop forgings for the automobile, tractor and agricultural implement trade and has added to its Cincinnati plant a large extension for the manufacture of automobile parts. The Pollak Steel Company has just closed negotiations with the Interstate Iron & Steel Company, Chicago, which was desirous of carrying out its policy of concentration in the Chicago district, for the purchase of its rolling mill property at Marion, Ohio. The Marion mill is in full operation and this adds to the Pollak product the manufacture of shapes, angles, bars, as well as concrete reinforcing bars for the building trade, agricultural implement

manufacturers, tractor and automobile trade. In addition to its manufacture of specialties, such as automobile parts and drop forgings, which cannot be measured on a tonnage basis, this now gives the Pollak company a capacity of both forged and rolled products of approximately 300,000 tons a year.

Dr. M. E. Pennington has joined the staff of the American Balsa Company, Inc., New York, manufacturers of Balsa wood products, including insulation material. She will be in charge of its research and development work. Dr. Pennington graduated at the University of Pennsylvania, where she specialized in chemistry and received the degree of Ph. D. Dr. Pennington had charge of the chemical department of Women's Medical College of Pennsylvania and later of the City Bacteriological Laboratory of the Department of Health and Charities of the City of Philadelphia; she then established her own clinical laboratory, making a specialty of doing scientific research work in connection with medical research work of practicing physicians. Since 1905 she has been employed by the U. S. Department of Agriculture, having entered the service on part time, doing special research work, and later took up the preservation of foods by better handling methods, especially the application of refrigeration to all phases of the distribution of foodstuffs. Dr. Pennington gradually gave up her various other interests and has devoted herself entirely to that line of work under the auspices of the Department of Agriculture since 1907, when the Research Laboratory formally was established as an organization of the department. Dr. Pennington is the author of a number of articles which have appeared in the technical press and elsewhere, dealing with chemistry, bacteriology and botany. Since her connection with the Department of Agriculture a number of articles by Dr. Pennington on the preservation of foodstuffs by low temperatures, the effect of better methods of handling perishables, also on refrigerator cars, have appeared in the *Railway Age*.

Thomas H. Symington, who has been elected chairman of the board of the **T. H. Symington Company,** New York, was born on May 14, 1869, at Baltimore, Md., and educated at Lehigh University. In 1885 he served as an apprentice at the Mt. Clare shop of the Baltimore & Ohio and subsequently was consecutively journeyman-machinist, inspector of engines and inspector of materials on the same road. From August to November, 1893, he was draftsman at the Richmond Locomotive Works and then for two years was general outside inspector of the same works. From November, 1895, to June, 1898, he was assistant superintendent of the Richmond Locomotive and Machine Works and then to April, 1901, was superintendent of motive power on the Atlantic Coast Line. He then organized and became president of the T. H. Symington Company, with a plant at Corning, N. Y. In 1908 he reorganized the company and built one of the largest malleable iron plants in the country at Rochester. In 1916 he organized the Symington Machine Corporation, Rochester, for handling large shell contracts for Great Britain and Russia. Two years later he extended the operations of the machine company to handle government orders for shells and he organized and operated additional plants, including The Symington Anderson Company, to manufacture 75 mm. French model 1897 field pieces; also organized the Symington Forge Corporation to manufacture 75 mm. shell forgings and the Symington Chicago Corporation to manufacture 155 mm. shell forgings and machine shells. He was appointed assistant chief of ordnance in September, 1918, and since November of the same year, when he resigned his commission from the army, has served as president of the T. H. Symington Company, malleable iron foundrymen and manufacturers of railroad equipment, with headquarters at New York.

Trade Publications

Concrete and Highway Grade Crossings.—The Portland Cement Association, Chicago, has issued an eight-page pamphlet containing a report on the use of concrete slabs for paving highway crossings on railways. The report is illustrated by numerous photographs of actual installations of this nature.

Financial and Construction

Railway Financial News

Boston & Maine.—Judge Morton, in the United States District Court at Boston, has signed a formal decree terminating the receivership of this road on December 1. James H. Hustis was appointed receiver of the Boston & Maine on August 29, 1916.

Following the discharge of the receiver, the Boston & Maine and its seven leased lines were consolidated. The government has turned over approximately $20,000,000 to meet the claims of the bondholders.

Chicago, Rock Island & Pacific.—At a meeting on November 18, the directors deferred dividend action until December, when semi-annual dividends will be considered, the last returns having been made in July.

Cleveland, Cincinnati, Chicago & St. Louis.—This company has applied to the Illinois Public Utilities Commission for permission to issue $20,000,000 of refunding and improvement mortgage bonds.

Pennsylvania.—The quarterly dividend of 1½ per cent on the stock of this company was paid on November 29 to 113,881 stockholders. Although this is the largest number ever recorded only 1,709 of the checks went abroad.

San Francisco-Oakland Terminal Railway.—The Railroad Commission of California has authorized this company to issue two notes to the Realty Syndicate Company, one for $247,000. the other for $33,630. To secure the payment of the larger note, the company is to deposit 370 of its general lien mortgage bonds and as security for the smaller note, 50 of the bonds are to be deposited. The commission has also authorized the company to issue its 6 per cent demand notes, not to exceed the sum of $169,520 to renew notes for a balance of $169,520 due on notes amounting to $218,460 issued to various banks. The company reports that it has paid $48,940 of the original notes. These notes are to be procured by the deposit of $257,000 face value of the company's general lien mortgage bonds.

Southern Railway.—Walter Kerr, president of the New York Life Insurance & Trust Company has been elected a director to succeed A. D. Julliard, deceased.

Spokane & Inland Empire.—This road has been ordered sold under foreclosure on November 1 by order of the United States District Court at Spokane.

Timpson & Henderson.—D. R. Harris, Mayor of Henderson, Texas, has been appointed receiver for this line, which is 35 miles in length.

Twin Mountain & Potomac—John J. Baker of Keyser, W. Va., has been appointed receiver for this road which operates between Keyser, W. Va., and Twin Mountain, 27 miles.

Railway Construction

California Southern.—The rapid increase in the development of the Palo Verde Valley, Cal., and the corresponding need for railroad service have been cited by the California Southern Railroad Company as reason for its application to the Railroad Commission of the State of California for authority to make an eight-mile extension of its lines southwest of its present terminus at Blythe, Riverside county, Cal. The commissioners were also asked to authorize the issuance of bonds to the extent of $135,000 to meet the cost of making this extension.

The Erie Railroad has given a contract to Baldwin & Welcomer, Union City, Pa., to build a brick machine shop at Monmouth street, Jersey City, N. J.

Railway Officers

Railroad Administration

Federal and General Managers

Lyman Delano, federal manager of the Atlantic Coast Line, the Savannah Union Station and the Winston-Salem Southbound, has had his jurisdiction extended over the Charleston & Western Carolina and the Georgia; **T. F. Darden,** assistant to Mr. Delano as federal manager of the Atlantic Coast Line, with headquarters at Wilmington, N. C., has been appointed assistant federal manager of the Charleston & Western Carolina and the Georgia; **W. L. Mapother,** federal manager of the Louisville & Nashville and four other roads under the direction of B. L. Winchell, regional director of the Southern region, has had jurisdiction extended over the Atlanta & West Point and the Western Railroad of Alabama. These extensions of jurisdiction have been occasioned by the death of Federal Manager **Edwin T. Lamb,** whose death occurred November 9.

Operating

F. M. Doar, chairman board of control of the Augusta Union Station, has been appointed superintendent of the Charleston & Western Carolina.

A. W. Anderson, general superintendent of the Augusta & Summerville, the Augusta Union Station and the Georgia, with headquarters at Augusta, Ga., has been appointed general manager of the Georgia and the Charleston & Western Carolina.

S. T. Grimshaw, trainmaster of the Seaboard Air Line at Monroe, S. C., has been appointed assistant general manager of the Macon, Dublin & Savannah, with headquarters at Macon, Ga., succeeding **J. A. Streyer,** resigned to accept service elsewhere.

James C. McCullough, whose promotion to general superintendent of the Central System of the Pennsylvania Lines with headquarters at Pittsburgh, Pa., was announced in the *Railway Age* of September 12 (page 490), was born in Deersville, Ohio, on August 31, 1865. He entered railway service in 1881 as a tinner's helper, on the Pittsburgh division of the Pittsburgh, Cincinnati, Chicago & St. Louis. From 1881 until 1898 he was successively bolt machine operator, machinist's helper, fireman and engineman at Pittsburgh. In April, 1898, he was appointed assistant road foreman of engines on the Pittsburgh division and in 1901 was promoted to road foreman of engines and trainmaster on the Marietta division. On January 1, 1902, he was made trainmaster of the Pittsburgh division and in 1910 superintendent of the Marietta division. In January, 1912, he was transferred to the Richmond division and in 1914, to the Pittsburgh division, which position he held until his recent promotion.

Financial, Legal and Accounting

W. H. Vincent, auditor of the Georgia and assistant secretary and auditor of the Elberton & Eastern, with headquarters at Augusta, Ga., has been appointed federal auditor of the Georgia and the Charleston & Western Carolina. **W. S. Morris,** federal treasurer of the Georgia, has also been appointed federal treasurer of the Charleston & Western Carolina.

La Rue Brown, whose appointment as general solicitor of the Railroad Administration was announced in the *Emergency Bulletin of the Railway Age* of Nov. 11, was born in Louisville, Ky., and graduated from Phillips Exeter Academy, the academic department of Harvard and Harvard Law School. After practising law, he became chairman of the Minimum Wage Commission of Massachusetts and in 1913 became special counsel for the Massachusetts Public Service Commission in connection with matters relating to the financing of the New York New Haven & Hartford Railroad. From 1914 to 1918 he was chiefly engaged as special counsel for the United States in various anti-trust suits, including that against the United Shoe Machinery Company, and was also engaged with proceedings under the Panama canal act, relating to the control of water carriers by competitors.

Traffic

Ernest Williams, assistant general freight and passenger agent of the Georgia, with headquarters at Augusta, Ga., has been appointed general freight and passenger agent of that road and of the Charleston & Western Carolina. **D. H. Crenshaw,** division claim agent of the Georgia at Augusta, Ga., has been appointed freight claim agent of both roads.

Engineering and Rolling Stock

L. G. Morphy, designing engineer of the Boston & Albany, has had his title changed to principal assistant engineer with duties to remain unchanged.

J. E. Willoughby, chief engineer of the Atlantic Coast Line at Wilmington, N. C., has been appointed chief engineer of the Georgia and the Charleston & Western Carolina.

S. L. Church, division engineer of the Conemaugh division of the Pennsylvania at Pittsburgh, Pa., has been transferred to the Maryland division, succeeding **J. O. Hackenberg,** appointed principal assistant engineer at Wilmington, Del.; **N. B. Pitcairn,** main line supervisor at Perrysville, Md., has been appointed Mr. Church's successor.

Purchasing

F. H. Fechtig, purchasing agent of the Atlantic Coast Line at Wilmington, N. C., has been appointed purchasing agent of the Georgia and the Charleston & Western Carolina.

Corporate

Traffic

C. A. Blood, has resigned as federal traffic manager of the Lehigh Valley and has been appointed corporate traffic manager with headquarters in New York City.

H. C. Franks has been appointed general agent of the San Antonio & Aransas Pass with office at San Antonio, Texas. He will represent the corporation in matters pertaining to freight and passenger traffic.

F. H. Glendenning has been appointed foreign freight agent of the Canadian Pacific at Vancouver, B. C.; **C. S. Gowans,** foreign freight agent at Montreal, and **H. W. Gillis** has been appointed assistant to Mr. Gowans.

W. R. Smith, general manager and chief engineer of the Edmonton, Dunvegan & British Columbia, the Alberta & Great Waterways and the Central Canada, with office at Edmonton, Alberta, has also been appointed traffic manager, succeeding **C. Dowling,** who has resigned.

Obituary

Lewis S. Smith, federal treasurer of the Texas & Pacific, and acting federal treasurer of the Trans-Mississippi Terminal, notice of whose death appeared in the *Railway Age Emergency Bulletin* of October 13, began railroad work in 1877 in the treasury department of the International & Great Northern at Palestine, Texas. He entered the employ of the Texas & Pacific in 1886 in the capacity of paymaster. In 1890 he was appointed treasurer of the same road and in July, 1918, after the road had been taken over by the government he was made federal treasurer. The following year he was appointed acting federal treasurer of the Trans-Mississippi Terminal. Prior to joining the staff of Texas & Pacific, he was connected with the Missouri Pacific with offices at St. Louis.

EDITORIAL

Railway Age

Table of Contents will be found on Page 5 of the Advertising Section

n most parts of the country the track is going into the vinter saturated with water from the recent general rains. This will lead to more than the usual amount of heaving and rough track, particularly since less than the normal amount of ditching and other drainage work has been done during the last hree or four years. This condition is arising at a time vhen the track structure itself has been weakened by in-dequate renewals of rails, ties and ballast. It is now too ate to make amends for the deficiencies of the past. The roblem is to see that sufficient supervision and inspection re provided to detect and correct any weaknesses promptly nd before they become serious. This will call for added are by all responsible for the safety of track.

Increased Precautions Will Be Necessary

ate in November formal ceremonies attended the opening of ie San Diego & Arizona, a 148-mile line extending eastward from San Diego, Cal., to a connection with the Southern Pacific at El Centro. This line, which was described in the *Railway Age* of April 11, page 931, is one involving somewhat more nan ordinary construction difficulties. However, there would e little remarkable about the completion of such a railroad ut for the fact that the building of new main line railoads in the United States has become almost an extinct ursuit. Annual statistics still disclose that some mileages f new railways are being built each year, but analysis shows nat these are concerned, for the most part, with branch line xtensions, lumber spurs and oil and coal field developments. Repeated reference has been made in these columns to the lmost total cessation of extensive railway development in his country and the completion of the San Diego & Arizona the exception which proves the rule.

Recent Railway Extensions (Rarae Aves.)

ne of the changes which the Railroad Administration made passenger traffic conditions was the establishment of consolidated ticket offices. The corporations themselves had had consolidated ticket offices in some cities for a number of years and where such an office is well located, with ample attndants to take care of the peak load, it is generally consided satisfactory. It is undoubtedly a convenience to be ble to choose between two or more alternative routes and ecure railroad and Pullman tickets on any one of these utes at the same office. As in nearly every other busiess, however, it has been found increasingly difficult to et clerks who come directly in contact with the public who e polite, alert and intelligent. The arrangement of the nsolidated ticket offices in the larger cities is such that one erk or ticket agent is assigned to a specified section of the ounter; in a large office there may be 10 or 15 such sections. ne difficulty which has developed is the tendency of a lazy indifferent ticket seller to be absent from his section of e counter, or to appear to be engaged in other work, so that an undue amount of work is done by the two or three more ambitious and alert ticket sellers and an unnecessary delay results. If there was an incentive for the ticket seller to sell as many tickets as he could, the service to the public would probably be considerably improved, and a source of waste time and possibly of waste money in salaries of ticket sellers would be eliminated. Might it not be possible to grade the salary of ticket sellers so as to give the ambitious clerk a somewhat higher average monthly income than the indifferent clerk? Of course, there are difficulties in the way of such a scheme; a clerk who had the hard luck to sell an undue proportion of short trip tickets might feel himself aggrieved, but if the salary was fixed on a three-month's average, it would seem that the more efficient man would be properly rewarded. If consolidated ticket offices are to be continued after the corporations resume operation of their roads some such plan as this might be worth consideration.

Service at Consolidated Ticket Offices

Travelers who during the past year or two have been able to make their accustomed railroad journeys only by occasionally—or frequently—standing in the aisle of a day coach for from ten to a hundred miles ought, perhaps, to congratulate themselves that they had an American day coach to stand in. In England, where nearly every passenger-carrying unit classed as "coaching stock" is a compartment car, and where, consequently, the standing-up arrangement is nearly or quite out of the question, passengers by the hundreds during the past summer have been paying a shilling each for the advance reservation of seats; this merely for the clerical work incident to reservation, not for extra breathing space or luxury of fittings as in the case of a Pullman car. On many occasions it was necessary to take this precaution a sufficient time in advance, or else stay at home. A Saturday express of the Great Western from London to the seashore was reported as having its six hundred seats booked three weeks ahead! There were not enough cars and locomotives to carry all the people who wished to travel, and no other solution of the problem was possible. The same arrangement was in vogue to some extent in France. And the practice has its attractive features. Unless passengers can get into the habit of carrying a camp chair under the arm, there are still situations in America (in the vicinity of our large cities) in which some way of economizing seats is desirable. Charging for making reservations is not necessarily unreasonable, even when cars are not desperately scarce. The idea of penalizing a railroad when it fails to do its best to provide a seat for each passenger, a familiar proposition with demagogues in legislatures, is not without its friends among level-headed people. When the demand exceeds the supply, *or is nearing that point*, a stiffening of the charge is legitimate. It would not be long, to be sure, before some legislator would arise to condemn all railroad management sas extortioners; but the principle is sound, nevertheless. Twenty-five cents would be too high, as a permanent rate; and the required advance notice of three weeks would be a good deal

Reserving Seats in Day Coaches

shortened as the restoration of normal conditions became possible; but any experienced passenger who—when willingly or unwillingly deprived of Pullman accommodations—has had to put up with disagreeable conditions in a day coach, would no doubt be glad to see some such experiment tried.

Relation Between Purchasing and Stores Depts.
