I do not trouble you with the problem of helping the weak roads, or with any discussion of the wage question; and you may say that I am not a thoroughgoing reformer; but is it not true that the freight rate question is fundamental? And that something must be done about it even if we shirk the duty of tackling these other puzzles?

New Englander.

Plumb's Soviet Plan of Railroad Management

A Discussion of the Scheme for Employees' Operation—Public Could Be "Exploited" Without Limit

Probably no other subject has excited more interest in the United States recently than the "Plumb Plan" of having the public buy the railroads and turn them over entirely to their employees to run. The public has much difficulty in understanding just what this plan is and how it would work.

This is not surprising. The public's difficulty in understanding the plan is mainly due to the fact that it is absolutely novel in the history of industry and politics in America; and the public, like the individual, finds it hard to comprehend a thing entirely different from anything ever presented to its mind before. The same entire novelty which makes it difficult for the public to understand the plan renders it difficult for the public to visualize in detail just how the plan would work, and all the effects it would produce.

To say that the plan is absolutely novel is but another way of saying it is revolutionary; and the very fact that it is revolutionary should make the public scrutinize it long and carefully before seriously considering its adoption. Revolutions, whether in politics or industry, are not always undesirable. Sometimes they are necessary for the public good. But evolution is always preferable to revolution if needed changes can be brought about in that way. Evolution is accomplished by carefully taking one step at a time; and the man who does that usually knows where he is going and is tolerably sure not to break his neck. Revolution always is a leap in the dark, and the people who try to make progress by taking leaps in the dark, like the individual who tries to make progress that way, stands just as good a chance in doing so of breaking its neck as it does of getting where it wants to go.

The Russians recently have been taking a series of leaps in the dark similar to that the Plumb Plan proposes in their desire to make political and industrial progress. The result is that they are now living under a Government which avows that it is an "autocracy of the proletariat"; that practically all the people of real intelligence and ability have been killed or driven out of the country; that fully 95 per cent of their manufacturing and other industries are shut down, and that millions of the "proletariat" for whose supposed benefit the revolution has been accomplished and the present autocracy has been established have starved and frozen to death, while practically all the rest are hungry and half-naked.

Up to the present time Anglo-Saxon peoples have preferred to make progress by evolution rather than by revolution; and it is due to this fact that today they have the freest and most truly democratic governments, the most efficient and highly productive industries, and the best paid and most prosperous working people in the world.

Is the Plumb Plan Socialistic?

When the spokesmen of the labor brotherhoods were presenting their arguments for their plan before the House Committee on Interstate Commerce, some members of the committee raised the question whether their plan was not socialistic. Glenn E. Plumb, the author of the plan, and other spokesmen of the brotherhoods contended that it is not socialistic. Socialism, they pointed out, proposes not only the public ownership, but also the public *management* of all the facilities used in the production, distribution and exchange of commodities. The Plumb plan, on the other hand, proposes, like socialism, that the public shall acquire the railroads (and other industries), but, unlike socialism, that the railroads shall not be managed by the public, but shall be turned over to a "tripartite" board to manage. This board would consist of five directors appointed by the President of the United States to represent the public, five elected by the "official employees"—that is, the officers—of the railways, and five elected by the "classified employees"—that is, by those now known simply as "employees." Manifestly, however, this would be management by the employees, since the "official employees" would, under this scheme, have no interest distinct from that of the "classified employees."

The difference between socialism and this plan is, then, very clear. Under socialism the railways and other industries would be owned by the public and managed by persons who would represent the public, and who, therefore, presumably would try to manage the industries in the interest of the public. They might not, and probably would not succeed in managing them for the best interests of the public, this being due to various reasons which are generally accepted in this country as conclusive arguments against socialism. But at least the managers would have some motives under socialism for trying to manage the industries in the interest of the public.

Under the "Plumb plan," on the other hand, while the public would *own* the railroads, they would be managed by a board of directors two-thirds of whose members would represent the employees; whose continuance in their positions would depend absolutely upon their success in satisfying the employees; and who, therefore, would be impelled by the strongest of motives to try to promote, not the interests of the public, but the interests of the employees at the expense of the public.

How completely control over the management of the railroads would be transferred, under this plan, to the employees, is not shown by mere reference to the so-called "tripartite" board which would be given general direction of management. The details of the plan are set forth in the Sims bill, which has been introduced in Congress; and it contains several important provisions which must be taken into account before the objects at which the brotherhoods really are aiming can be completely comprehended. Section 3 of this bill provides that the board of directors shall divide the railways of the country into districts. In each of these districts it shall constitute a "district railway council." It is important to note how these councils are to be chosen. One-third of their members are to be appointed by the "tripartite" board of directors; and as two-thirds of the members of this board will be employees, the board is pretty sure to appoint employees to the district councils. Another one-third of the members of the district councils will be elected by the "classified employees within their district," and the remaining one-third will be elected by the "official employees within said district." The result will be that *all* the members of the district councils will be employees. Now the board of directors may delegate to the district councils any powers it may choose to, "and the district railway council shall, upon such delegation, have and exercise within its district all of the powers and duties of the board of directors as may be delegated to it." Thus, the actual management of the roads in each district could be and probably would be delegated to the district council, and upon this council the public, although the owner of the railroads, would have no representation at all!

The labor leaders are fully justified in saying that this plan is not socialistic. It is even worse than socialistic. Hav-

ing provided that the public shall burden itself with a huge debt by buying the railroads, it provides that the public shall turn them over to the management of a particular class of the people for management under conditions which would enable this particular class to "exploit" the public without limit. The socialist is unselfish and modest in his demands, compared with the railway labor brotherhoods.

Power to "Exploit" the Public

That the railway employees would have the *power* to hold up the public without limit as long as this plan was in operation can hardly be denied. The plan provides that all salaries and wages shall be fixed by a central board of wages and working conditions, one-half of whose members shall be chosen by the "official employees" and one-half by the "classified employees." Its decisions are to be final, unless a majority decision cannot be reached, in which case there is to be appeal to the board of directors.

Now, there is nothing in human experience, and certainly nothing in recent experience in the railway field in the United States, to indicate that the time ever will come when any class of persons will be satisfied with its income, whether derived from wages or any other source. In the years 1916 and 1917 the railway employees of the United States received advances in wages amounting to $350,000,000. In 1918 they received advances amounting to $1,000,000,000 a year. And now they are asking for advances amounting to $800,000,000 a year. Of course, they give what to them appear perfectly valid reasons why all these advances in their wages should be made. And they could convince themselves just as completely under the Plumb plan that their incomes ought to be still further and further increased as they can now. That is merely human. So we may be sure that under the "Plumb Plan" the "classified employees" would continue their perennial movements for higher incomes. And why should not the "official employees" want their incomes increased, too? And if they did, why should not the representatives of both classes on the central wage board agree to raise salaries and wages again and again until only the sky was the limit of railway wages and salaries? The central wage board, under the Sims bill, clearly would have legal *power* to fix $10,000, or even $50,000 a year as the minimum wage of a railway employee, if it was disposed to do so, and the public would have to pay it. If the railway salary and wage bill was not paid from earnings derived from freight and passenger rates, it would have to be paid from taxes, for the Sims bill expressly says (Article 2, section 5), that "all costs upon operation and charges upon the capital employed * * * shall be guaranteed by the Federal Government."

What Protection Would the Public Have?

There is no denying the fact that under this plan the "official employees" could, by acting in collusion, legally raise their salaries and wages without limit, and that, under the plan, the public would have to pay the bill. But, say the advocates of the plan, the "official employees" would have a strong incentive not to permit salaries and wages to be raised unduly. One of the features of the plan is that any surplus earned in excess of the amount required to pay operating expenses and interest on the bonds issued by the Government to buy the roads is to be divided equally between the public and the employees. The half of the surplus going to the employees is to be distributed among them in proportion to their salaries and wages, except that the "official employees" are to receive twice as much of it in proportion to their salaries as the "classified employees" are to receive in proportion to their wages.

Now, say the advocates of the Plumb plan, the "official employees" will necessarily refuse to consent to any unreasonable advances in wages and salaries, because the result would be to deprive them of part or all of their large "dividends" from the surplus. And this is absolutely the only form of protection which, under the Sims Plumb Plan bill, the public would have from excessive advances in railway salaries and wages. Of what value would this protection be? In order to answer this question we must consider, first, what would be the position of railway officers under the Plumb plan, and second, what chance there would be of the railways earning a surplus.

Position of Railway Officers Under the Plumb Plan

Under private ownership and operation of railways the president of a railway represents the owners and operates the property for them, subject to government regulation. The other officers work under the direction of the president, and supervise the work of the employees. Under Government operation the officers occupy much the same position, except that they represent the Government instead of private corporations. Under the Plumb plan the officers would work under the general direction of a board, one-third of whose members represented themselves (the officers), one-third the employees and one-third the public. Suppose that the officers did not hold out against an unreasonable advance in salaries and wages. There would be appeal to the board of directors, and as one-third of the directors would be politicians and one-third representatives of the classified employees with their large voting power, there would be a strong chance that the politicians and labor men on the board would agree to make the advance in wages. Suppose, on the other hand, that the politicians sided with the officers against the advance. The result probably would be a strike by the employees, for it is a notable feature of the Plumb plan that although it practically provides for employees' management of the railroads, it does not in any way provide against the employees striking against their own management.

As a matter of fact, however, there would be little chance of the "official employees" ever holding out strongly against an attempt by the "classified employees" to raise salaries and wages. The officers would depend for their appointments and promotions upon, and have to work under, a board of directors and district councils on which the "classified employees" would be as largely represented as the officers. Therefore, no officer would long be able to hold his place, much less secure promotion, unless he was able to find favor in the eyes of the employees, and the surest way to lose their favor would be vigorously to oppose their wage demands. The officers who have been trained and developed under corporate management and who have been used to showing independence and fearlessly exercising authority over the employees would rapidly be weeded out, and soon the entire official personnel would consist of men who owed their positions, not to their ability and experience as railroad operatives, but to their success in the game of labor politics.

A member of the House Committee on Interstate Commerce asked one of the spokesmen of the brotherhoods the other day whether it was not a fact that practically all the leading railroad men of the country had risen from the ranks. The witness answered that it was, and that labor wanted this to be true in future, but that labor intended to have something to say in future about who should rise. This shows the way the brotherhood leaders' minds are working. Doubtless they intend to vault into the seats of the managers if they succeed in ousting the present incumbents; as they certainly will if the Plumb plan is adopted. Officers practically dependent for their jobs on the employees will not resist the demands of the employees for raises in their pay.

Furthermore, their prospective shares in the possible surplus would afford the officers no real incentive to oppose advances in wages, provided these were going to be accompanied by advances in their own salaries; and there would be no reason why they could not, by acting in collusion with the employees, get an increase in salary every time there was

an increase in wages. Now, there are very few men who would not take a raise in salary in preference to a chance to share in a surplus which might not, and probably would not, be earned.

Deficit or Surplus?

It is one of the curious features of the hearings on the Plumb plan at Washington, that the advocates of that plan have refused to recognize the fact that, under their scheme, a deficit might be incurred in the operation of the railways, and have talked glibly throughout about what would be done with the "surplus." The most cursory examination of the statistics showing the results of current railway operations is all that is necessary, however, to convince any rational person that, in the absence of a large advance in passenger and freight rates, there would not be the remotest chance of a surplus being earned under the Plumb plan.

Railway earnings are now running at the rate of about $5,000,000,000 a year. Operating expenses are running at the rate of about $4,500,000,000 a year. This leaves net earnings of only about $500,000,000. The advocates of the Plumb plan claim the public could buy the railroads for $12,000,000,000 in 4 per cent bonds. Even on this basis, however, the interest on the bonds would be almost $500,000,000 a year, leaving no surplus worth talking about. But this is not all that must be considered. The employees are demanding that whether the Plumb plan is adopted or not, they shall be given new advances in wages amounting to $800,000,000 a year. These advances in wages would make the operating expenses alone exceed the present total earnings; cause an *operating* deficit of $300,000,000 a year—in other words, leave $300,000,000 *less than nothing* with which to pay interest on the bonds issued by the public to buy the roads.

If we add this operating deficit of $300,000,000 a year to the $500,000,000 a year interest on railroad bonds, which the Government would have to issue to buy the roads even on the basis the advocates of the Plumb plan say it could, the employees, in the absence of an advance in freight and passenger rates, would start operating the railroads with a total deficit of $800,000,000 a year. A fine chance they would have of ever earning a surplus to be divided between the employees and the public if they started with a deficit of $800,000,000 a year!

As a matter of fact, the deficit with which they would begin operations unquestionably would be much larger than this. It is simply nonsense to talk about the Government being able to buy the railroads for $12,000,000,000 in 4 per cent bonds. In order to buy them it would have to issue at least $18,000,000,000 in 5 per cent bonds. This, then, would make the total interest the Government would have to pay on its railroad debt $900,000,000 a year, and since the operating deficit would be $300,000,000 a year the total deficit would be at least $1,200,000,000 a year. The only way in which the employees' management could be given a chance to earn a surplus would be to make a very large advance in rates; and yet the advocates of the Plumb plan are contending that the adoption of their scheme would result in a reduction in rates.

It cannot be too often emphasized that while the advocates of the Plumb plan generously propose that in case, under the employees' management, a surplus should be earned, the employees would divide it with the public, they at the same time most ungenerously propose that if a deficit should be incurred under their management the public should pay it all. Their proposition to the public is: "Heads, we both win; tails, you do all the losing."

Effect of Plumb Plan Upon the States

There is still another point that should be considered in connection with the possible surplus or deficit. The railroads pay now about $200,000,000 a year in taxes. Part of this goes to the Federal Government, but most of it goes to the State governments. It constitutes one of the largest parts of the revenues of the States. Under the Plumb plan all the taxes now paid by the railroads, whether to the State or Federal governments, would be wiped out. The Sims bill expressly provides that all the earnings of the railroads shall be used for the payment of operating expenses, for the payment of interest on the bonds issued by the Government to buy them; for the creation of a sinking fund for the retirement of the bonds and for the creation of the "surplus" which is to be divided between the Federal Government and the employees. It even specifies what the Federal Government must do with the part of the surplus going into its treasury. The State governments doubtless will be especially interested in the parts of the plan which would at once deprive them of all power to tax railroad property or earnings.

This, however, is not all that the Plumb plan would do to the States. It would wipe out every vestige of State regulation of railroads. All the regulating of rates or operation is to be done by the Federal Government, for the Sims bill says that "the corporation shall be subject to the full regulatory powers of the Federal Government as expressed through the interstate commerce act," while nowhere does it provide for any regulation by the States. There is a provision in Section 4 that "when the board of directors delegates to any local authority or State or subdivision thereof * * * any of its powers under this section, it shall be lawful for such local authority or state or subdivision thereof to exercise any or all of the powers of the board of directors so delegated to it." In other words, the board of directors in respect to the operation of the railroads would be superior to the States themselves and they could exercise only such powers as the board might delegate to them. This, we believe, is the first case in the history of the United States where anybody ever had the impudence to suggest that the Federal Government should create a corporation which should not only be entirely above State regulation, but should be so far above it as to have authority to use the States as its agents.

Provision of "Working Capital"

One of the interesting features of the Sims bill is the care taken throughout to insure that the public shall furnish all the money that must be raised to enable the railroad employees to run the railroads. The public, of course, is to buy the railroads by an issue of bonds, the interest on which is to be guaranteed by the public and paid by it if the railroads fail to earn it. The roads are then, according to the terms of the bill, to be "leased" to a so-called "National Railways Operating Corporation," and, in the language of the bill, "The board of directors, official employees and classified employees hereinafter described shall be and constitute said corporation." Now, a corporation cannot do business, or even start business without some working capital—in other words, some ready money with which to meet current bills. It might be assumed that the "National Railways Operating Corporation" would at least furnish its own working capital. But this assumption would be incorrect. After having bought the railroads and turned them over to the employees the public must also furnish them the several hundred millions of dollars of working capital with which to do business; for the Sims bill says, "That the corporation shall be required to utilize said railway lines and properties and their equipment *and the working capital which shall be put at its command* in such manner," etc. If the working capital should be dissipated, the public would have no way of getting it back any more than it would have any way of recovering any losses that might be incurred through failure adequately to maintain the properties or through deficits. The proposition of the Plumb plan advocates is simply that the public shall furnish all the capital for the enterprise and take all the risks of loss; and if there are any profits—which the employees will have every opportunity and the strongest of in-

centives for preventing—the public will be given half of them.

That is, it will be given them in a purely Pickwickian sense. For, while the bill does not provide what the employees shall do with their half of the surplus, if there is one, it provides in detail what the public must do with its half of the surplus, if there is one. The public's part of the fund is required to be used "(1) to pay for extensions and betterments * * * before capital funds shall become available therefor, and (2) accumulations thereof in excess of $500,000,000 shall be automatically transferred to sinking fund." The sinking fund would be used to pay off the bonded debt. The reduction of the bonded debt would increase the surplus if there was one. And the employees would get one-half of the resulting increase in the surplus!

An Attack Upon Present System of Industry

There should be no mistaking the significance of the propaganda for the Plumb plan in its relation to private property in general. Questions which were asked and the answers which were made to them while witnesses supporting the Plumb plan were testifying before the House Committee on Interstate Commerce made clear that the Plumb plan for employees' management of the railroads is practically a reproduction of the Soviet plan of government and industry which was first adopted in Russia under the Bolshevik regime.

It is primarily an attack upon profits with the object of preventing industries of all kinds from earning profits in future in order to enable the workers to get in one form or another the earnings of industry which otherwise in the form of profits would go to the capitalists. It is therefore necessarily an attack upon all forms of private property, whether property in railroads, manufacturing plants, or farms. Under the present system of industry in America all property is managed for the purpose of making profits. If the opportunity to make profits is destroyed then the value of the property to the owner is destroyed. In England those who are advocating the nationalization of the railroads and the coal mines and their transfer to the employees for management are also advocating the nationalization of all farm land and its transfer to the farm laborers for management. The logical extension of the Plumb Soviet Plan to other industries themselves would result in the Government buying all the farms in the country and turning them over to the farm hands to run in their own interest. The advocates of the Plumb plan claim that some farmers are supporting it. No farm owner will support it who realizes that its logical extension would mean the nationalization not only of the railroads, the steel industry and the packing industry, but also the farming industry.

Do Railroad Employees Really Back This Plan?

The advocates of the Plumb plan claim that it has the backing of practically all the organized railway employees of the United States. The skilled employees of the railways always have been regarded as an unusually intelligent class of working men. Mr. Plumb's attempt to transplant the Russian Soviet plan to America is so grotesque and at the same time so revolutionary that it is hard to believe his scheme can possibly have the backing of as many railroad employees as he claims. If it has, this must be due to the fact that many of them do not understand what the plan really is. As a matter of fact, no complete referendum of the organized railroad employees has ever been taken on the Plumb plan, and there is reason to believe that if a referendum were taken under conditions which gave the men an opportunity to express their true views a very large part of them would go on record against the Plumb plan.

When the advocates of the Plumb plan began presenting it to the House Committee on Interstate Commerce they took a very truculent tone. They said, in effect, that the brotherhoods did not intend to permit the railroads to be returned to private management, and that they would adopt whatever measures were necessary to secure adoption of the plan of employees' management. The members of the House Committee, the press and the public at once assumed—and no doubt correctly—that what the brotherhoods' spokesmen meant was that they would go the length of calling a nation-wide railroad strike in order to force adoption of the Plumb plan, if they could not get it adopted in any other way.

Will the Brotherhoods Strike for the Plumb Plan?

Doubtless to the great surprise of the brotherhood leaders, Congress and the public did not betray the slightest symptom of becoming scared. On the contrary, there was an outburst of public sentiment against the brotherhoods. Denunciations of their leaders' attitude were published in newspapers throughout the country, and delivered by members of the house committee and other members of Congress.

Since then the brotherhood leaders apparently have been taking the back track. They have been denying that they intend to call a strike to force the Plumb plan upon the country.

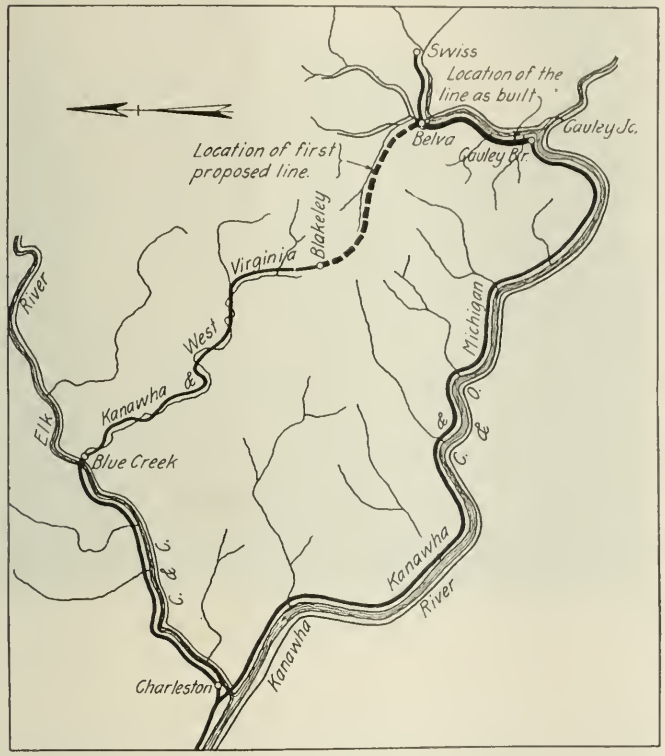
The nation should not let itself be lulled into a sense of security by the tone the brotherhood leaders are now taking. In 1916, when it was repeatedly charged that they intended to call a nation-wide strike if their demands were not granted without arbitration, they as repeatedly declared that there would be no strike. *They said then, as they say now, that they expected to win without a strike.* But when the railway presidents absolutely and finally refused to grant their demands without arbitration, the heads of the brotherhoods did issue the order for a strike; and they refused to recall the order until Congress, under whip and spur, with the brotherhood leaders holding a stop-watch on it, had passed the Adamson basic eight-hour day law.

The brotherhood leaders now say that they expect to secure adoption of the Plumb plan without a strike. But it is perfectly apparent that they are engaged now in stirring up all the labor troubles on the railroads they can, with the purpose not merely of getting higher wages, but also of making it as difficult as possible to return the railroads to private operation. Should they succeed in preventing a return to private operation, they would regard this as the first great victory in the campaign for the Plumb plan. They would then go on with their propaganda for it with redoubled energy; and if they finally found that propaganda alone was not sufficient, there can be no serious question in the mind of any person familiar with their past history that they would call a strike if they had the slightest hope that they could thereby "put over" the Plumb plan. The present leaders of the brotherhoods have supreme confidence in their ability to get anything they want by means of strikes and threats of strikes; and as long as they have this confidence, and it continues to be perfectly lawful for them to call strikes at any time they want to, and upon any pretext that appeals to them, the country will continue to have hanging over it the menace of great railroad strikes. Because of this supreme confidence of the brotherhood leaders in the omnipotence of the strike, it now appears almost certain that sooner or later a general railroad strike will occur in the United States no matter what system of management the railroads have, and since it appears almost certain that such a strike will come, probably the best thing for the country would be to have it soon and get it over. If it must have it sooner or later, as now appears almost certain, probably we had just as well have it for the purpose of "putting over" the Plumb plan as for any other purpose.

The Kanawha & West Virginia Builds a New Line

Its Construction Involved Exceptionally Heavy Grading. Rock of Varying Formations Encountered

In September, 1916, the Kanawha & Michigan Railway acquired the Kanawha & West Virginia Railroad, consisting of 34 miles of line running from Charleston along Elk river and Blue creek in Kanawha county, W. Va., to Blakeley and four miles of line on the Gauley river in Nicholas county, W. Va., between Belva and Swiss. The



Relation of the Gauley & Eastern to the Kanawha & Michigan and the Kanawha & West Virginia

Kanawha & West Virginia also had various other surveys and rights-of-way in the Kanawha coal district of West Virginia. It was the original intention of the Kanawha & West Virginia to build a line along the Gauley river between Belva and Blakeley, connecting its existing lines, as shown on the map. To do this would have required the construction of 11 miles of line through very rough country with a tunnel 950 ft. long and three miles of 1.8 per cent grade, uncompensated, ascending to the tunnel on each side, with several 10-deg. curves on these grades.

To avoid building this line, expensive in construction, operation and maintenance, it was decided to construct the Gauley & Eastern Railway along the west bank of Gauley river, from Gauley Bridge, the southern terminus of the Kanawha & Michigan in Fayette county, W. Va., to Belva, a distance of 5.6 miles. The Gauley river along this line is about 650 ft. above sea level and the tops of the mountains are about 1,100 ft. above the river. The railroad grade is from 20 to 30 ft. above low water and is practically out of reach of high water. The line and grade on this work conforms to the standards of the Kanawha & Michigan and the Kanawha & West Virginia which it connects. It opens new coal fields and timber lands in this section, the coal consisting of the Eagle, No. 2 gas and Coalburg seams, Kanawha measures.

This line has a grade of 0.3 per cent, compensated against loaded traffic and 0.5 per cent compensated against empty movement. The ruling grade against northbound or loaded movement is 5,242 ft. long and that against southbound or empty movement 3,800 ft. long. The maximum curvature is 6 deg. and there is only one curve that sharp. The total length of line on curves is 14,897 ft. with a total central angle of 410 deg. There are three timber trestles on the line, 30 ft., 120 ft., and 105 ft. long, respectively, with an average height of about 20 ft. There is also an under crossing with the Gauley branch of the Chesapeake & Ohio at Belva. These bridges were built of timber as it was impossible to secure steel for them because of the war. Two concrete pipe culverts of 5-ft. and 4-ft. diameter were placed under the railroad and an adjacent county road. Numerous smaller culverts of cast iron pipe 12 in. to 24 in. in diameter were also installed.

The most complicated problems in the construction of the line were experienced in the grading. Because of the cliffs it was impossible, in some places, to get a loading track ahead of the shovel without great expense. In a few of these places, it became necessary to make a cast-over cut, using a short jack-arm on the shovel and then cutting the shovel back and load-

A Shovel Making a Cast-Over Cut

ing the full cut for use on the various banks. The blasting down of the cliffs formed an interesting part of the work. At one point between stations 41 and 46, shown in one of the photographs, the entire face of the cliff was blown down at one time. This shot consisted of 17 holes about 60 ft. deep and 9,000 lb. of 40 per cent dynamite was used. The shooting was so planned that practically no rock was thrown in the river except that which it was desired to place there. Some waste occurred where the cast-over cuts had to be made first, but not in appreciable quantities.

The grading of this new line involved some exceptionally heavy and difficult work. About three miles of the line is located close to the river bank, where it was necessary to shoot down and remove cliffs ranging from 60 to 100 ft. above grade. Great difficulty was experienced in shooting this material as a variety of formations were found, including soft and brittle shale and exceedingly hard sandstone, this condition leading to considerable overbreakage. It was also found

necessary to vary the quantity of explosives in the shots to get good results.

A much-traveled county road parallels the river on this location and 3½ miles of this road had to be abandoned and reconstructed on the same grade with the railroad. Construction was delayed to some extent by two floods occurring in the river and damaging the new banks at points where they had not yet been protected with rock and riprap.

At several points trouble was experienced from slides. In some cases the dirt and small rock came off the top of the

Looking Up the River from Station 33

cliffs. In one instance, at the upper end of the line at Belva, there was a cut with a maximum depth of about 40 ft. on the upper slope line which consisted of a soft yellow clay, very porous, with about 30 per cent of boulders and loose rock in it overlying a stratum of hard blue clay, impervious to water. The top of the blue clay was 6 to 10 ft. above grade and the water penetrating through the top formation to the blue clay, caused the top to break and slide off in large quantities with the result that three times the estimated yardage was moved from this slide. After the removal of this material it was found that a break had occurred about 500 ft. up the mountain side and the entire section seemed to be moving toward the track. Holes were drilled about 75 ft. back from the top of the slope through the formation to rock about 20 ft. below grade and these were shot, as finished, the idea being to permit the water to escape through the strata underneath. These holes were 120 ft. to 130 ft. deep, about 75 ft. apart and 190 ft. from the center line and have apparently given relief.

An interesting feature of the job was the installing of the contractors, equipment at the Belva end of the job. This

Moving Narrow Gage Equipment Up a 20-Per Cent Grade at Belva

equipment consisted of a standard gage grading shovel and three dinkey engines, with cars and spreader of 3 ft. gage. The shovel was taken about 1,000 ft. through a corn field, then down through Twenty-Mile creek and up a 20 per cent grade about 200 ft. long to the county road at the point where it was to be cut in. The engines and cars were then brought over and pulled up the grade by the shovel, using a block and tackle attached to trees.

Drilling from a Trestle in Preparation for a Big Shot Between Stations 41 and 46. This Entire Cliff Was Shot Down at One Time

The Gauley river furnished an excellent water supply for boilers during construction and coal was secured in the immediate vicinity. The drilling was done on the cliffs and through all the heavy work with 4-in. Cyclone gasolene drills and on the smaller cuts with tripod steam drills. All the steam shovels on the job were equipped with air pumps and furnished air for the drilling necessary in large rocks and slabs in front of shovel which it was necessary to break with explosives before they could be handled by the shovel. Approximately 132,000 lb. of dynamite and a small quantity of black powder were used in the job.

Considerable difficulty was experienced by both the contractors and the railway company during the latter part of 1917 and during 1918 in securing sufficient labor and material to carry on the work properly. The fact that a large number of coal mines, all running to capacity, are located in the immediate vicinity made the labor problem especially acute at times. The line promises, however, to be capable of operation with normal maintenance expense as most of the slides have been stopped and the fills are very solid and not likely to wash.

The grading and bridge work was started about September 1, 1917, and the line was completed in June, 1919. The grading work was done by J. B. Lindsey, of Middleport, Ohio, and C. W. Marshall, of Kansas City, Mo., and some of the county road work was done by A. Keathly, of Huntington, W. Va. A total of 357,282 cu. yd. of excavation was moved, about 80 per cent being rock, at a cost of $1.05 per yd., not classified. The track was laid with 8-ft. and 8½-ft. white oak ties and 90-lb. A. S. C. E. relay rail which had been re-sawed at the Kanawha & Michigan plant at Hobson, Ohio. The track was ballasted with pit-run gravel and some slag and cinders.

We are indebted to C. M. McVay, division engineer, of the Kanawha & Michigan, at Charleston, W. Va., for the information given above.

An Efficiency Engineer's Views on the Electrification of Railways

The following is taken from a written discussion by Harrington Emerson on the paper by W. B. Potter and S. T. Dodd, presented before the Western Railway Club, and abstracted in the *Railway Age* of May 9, 1919, page 1157:

"In the March, 1907, number of the *Railway Age* I wrote a paper whose title was: 'The Steam Locomotive More Economical Than Electric Equipment for Standard Railroad Operation.' My paper was called out by the interesting, suggestive and brilliant joint study by Majors Lewis B. Stillwell and Henry St. Clair Putnam as to the economies to be effected by the substitution of electric for steam operation.

"Twelve years have passed. I see no reason to modify convictions then expressed. Here and there under special conditions electric traction has been installed in subways, for street car service, for interurban service and here and there on mountain divisions. Electric service has been successful in all respects except one; financial. The old horse car lines made money, the electric lines are on the edge of bankruptcy.

"What are the principles underlying costs of railroad operation? Just 20 years ago James J. Hill said to me that I could write the formula for successful railroad operation on my thumb nail. He said: 'Receipts are by the ton and passenger mile, expenses are by the train mile.' He gave me 20 years to better the formula. I was continuously in railroad work for the next 20 years and continuously I tested his formula and ultimately found it wanting.

"Steam railroad receipts are indeed largely by the ton mile and the passenger mile, but expenses are not by the train mile.

"Expenses are: (1) The terminal cost of collecting and starting the traffic. (2) The terminal cost of delivery and distributing the traffic. (3) The train mile *hour* cost.

"An investigation made about 15 years ago showed that the value of the terminals of the Lake Shore in Chicago alone nearly equalled all the other investment in track and equipment. The enormous cost of New York terminal facilities is well known. Mr. Fisher 12 years ago demonstrated that terminal expenses increased by the square of the population, and that on this account all our roads serving great cities were financially doomed. Subways and urban trolleys do not have terminal expenses. They usually occupy free of charge the most costly sites in the world. Electrification does not help the terminal situation, it aggravates it, since it tempts into the centers of cities terminals that under steam conditions would have remained in cheaper suburbs.

"But it is the third division of expense that is more largely responsible for steam railroad collapse and that stands in the way of electrification. Expenses are not by the 'train mile, they are by the train mile hour.'

"All railroad expenses fall into one of the three groups of materials, salaries, investment maintenance. In 1914 per average locomotive day these expenses were:

For Materials	$ 33.00
For Personnel	55.00
For Investment	77.00
Total	$165.00

"The investment charges amount to 10 per cent on the valuation and this without adequate provision for obsolescence and unremunerative betterments. The seven capital charges are: (1) Taxes. (2) Insurance. (3) Rentals. (4) Obsolescence. (5) Unremunerative Betterments. (6) Interest. (7) Dividends. Personnel is almost wholly an hourly charge. Materials even are partly an hourly charge, both in storehouse and in use. Investment maintenance charges are wholly by the hour.

"Present railroad equipment works notoriously very few hours a day. Main tracks are occupied by moving trains about one per cent of the time, locomotives average less than three hours working service a day, cars are moving scarcely two hours a day. Pipe lines have a double advantage over railroads. They are occupied continuously by moving loads and the container does not move, there is no dead weight.

"Fifteen years ago some of my clients wanted to build a standard gage road in Alaska. I proved to them that a two foot gage could carry annually 20 times as much freight as their enterprise could provide. No wonder some of the cheaply built narrow gage roads in Alaska paid in three months their total cost of constructions as well as of operation. Charges per hour were low.

"Electrification will heavily increase investment maintenance charges, not lessen them. This is the fatal objection to electrification. It is doubtful whether in a new country, on a new enterprise, let us say the Cape to Cairo project in Africa, electric operation would not require a heavier investment per mile than steam, thus offsetting any other highly problematical savings. In our country electrification means an immense scrapping of existing equipment and an immense capital investment in new equipment. As an economical or financial proposition electrical operation is out of the question.

"It is a great pity that our two government directors-general of the Railroad Administration, as well as the Interstate Commerce Commission, have failed to realize the necessity of separate terminal charges or the effect of the hour on operating costs.

"We cannot today on the railroads reduce the gage of

our tracks or substitute little rapidly moving cars for big ones, and make them deliver twice as many ton miles per hour but the motor trucks are for short distances doing this very thing. Their terminal accommodations cost less and are greater, they work more hours each day.

"We can at least avoid giving the coup de grace to our railroads already staggering under the wound of government operation, by carefully avoiding a still further increase in the hourly investment cost which is already between 40 and 50 per cent of the total hourly cost. Under the best operations of steam and of electric roads what economies are there in materials and in labor to offset the increased hour charge due to larger investment for the same service?"

Plumb Calls Conference on Railroad Control

A CONFERENCE of "leaders of national thought," invited by Glenn E. Plumb, counsel for the organized railway employees, to discuss the railroad problem with the labor leaders at Washington, met on August 9 and adjourned on August 11, leaving its activities in the hands of an executive committee. Three sub-committees, to be composed of "experts of national reputation in their several fields," are in process of formation, to study the engineering or technical, the legal, and the economic aspects of the railroad situation in America. These committees are to report to a general conference to be held in Washington on October 6. According to the official press notice:

"While this conference of liberal thought was called before the mind of President Wilson became known on the question of a constructive policy to be pursued toward the present acute state of industrial unrest throughout the country, it falls naturally into line with his desires as since expressed, and is in this sense an interesting example of America's quickness in action.

"While no definite action toward that end was taken, the question of conferring with President Wilson, in the spirit of this statement, was discussed. It is unavoidable that a meeting with the President will be sought at an early date, when the essential principles of the Plumb plan will be presented and the state of facts outlined which lends such power to the proposals of the brotherhoods for the nationalization of the railroads."

Judge Walter Clark, chief justice of the Supreme Court of North Carolina, was elected temporary chairman. Among those who attended the preliminary conference were Gov. Henry J. Allen, of Kansas; Prof. Edward Bemis, of New York; Ex-Gov. E. F. Dunne, of Chicago; Frederick C. Howe, Commissioner of Immigration of the port of New York; Frank P. Walsh, formerly joint chairman of the National War Labor Board; J. A. H. Hopkins, chairman of the executive committee of the committee of 48, and Morris L. Cook, consulting engineer, of Philadelphia. This group met with A. B. Garretson, adviser of the Order of Railway Conductors; James J. Forrester, grand president, Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees, and other officials of the railroad labor organizations now assembled in Washington.

The first session of the conference was devoted to a presentation of the theory of the brotherhoods' railroad plan by Glenn E. Plumb.

The conference apparently restrained any impatience it may have felt to endorse the Plumb plan at its first session, but on Sunday Chairman Clark issued a statement, saying in part:

"As a result of our deliberation upon the existing railroad situation and the various suggestions for dealing therewith, the conference declares that the following principles should control the action of the government with respect to this most important question:

"The government has resting upon it the duty and obligation to conserve and further the interest of the people as a body, particularly with respect to the conditions of their livelihood. Distribution of the products of the nation's industry and agriculture is, therefore, not only a proper but an imperative function of the government which the people have a right to insist shall be properly fulfilled. It is therefore incumbent upon the government to provide transportation (as the principal factor in distribution) at actual cost, thus insuring means whereby the products of one region may, with only the addition of actual cost of transportation, be brought to the consumers in another territory. Any plan proposed for the solution of the railroad problem must, therefore, meet the test that it will provide transportation at actual cost.

"The existing state of industrial warfare is more costly to the consuming public than to the workers or to the owners of capital. Any plan for the solution of the railroad problem which seeks the endorsement of the public should provide for a share by the workers in the management and in the profits arising from increased efficiency. We therefore welcome any well-considered movement toward democratization of the railroads as being in the interest not only of the workers but even more in the interest of the public.

"Several plans have been presented to the Congress of the United States for the future ownership and operation of the railroads. Some of these plans have been presented by the representatives of railroad security owners and other property-owning groups. One plan has been presented by the representatives of the railroad employees. These plans must be tested and analyzed in the light of the principles already enunciated. In order that this may be done in the orderly manner which befits a question of such transcendent importance to the American people, we have determined to call a national conference to meet in Washington on Monday, October 6, 1919, and we have further decided to appoint special committees to analyze the several proposals which have been offered for the solution of the railroad problem, to report their findings at that national conference."

This was followed by another statement by Edward Keating, manager of the Plumb Plan League, in which he said: "All that the railway brotherhoods asked was a fair and exhaustive examination of the railroad situation in America, and a full consideration by the country of the proposals which they advance for dealing with this situation. If the true facts of the case can be spread before the country, the brotherhoods rely on the soundness of the principles embodied in their plan to win the support of public opinion."

Hauling Freight on Electric Railways

An electric sheep train on the Ogden, Logan & Idaho. The big sheep raisers use trains of this kind for shipping their animals to market, and for shipping flocks from one grazing region to another.

Possibilities for Supply Manufacturers Abroad

Local Industries in Europe Will Have Difficulty in Meeting Demands for Railway Material

By Robert E. Thayer,
European Editor of the *Railway Age*

London, July 25, 1919.

THE SITUATION IN ENGLAND, France and Belgium regarding the sale of American railway supplies is somewhat complicated. In all of these three countries, the governments have at the present time, a lot to say as to where the purchases of railway materials shall be placed. Naturally it is their desire to place orders with the home industries, not only to give them ample business and thus provide employment for their own countrymen, but also on account of the fact that they want to keep the money in their own countries. In some cases orders have been placed with the home industries even though both the deliveries and prices of American companies have really been more attractive.

It may be stated generally that American industries can only hope for business from these countries when, first, the local industries have been amply provided with orders and cannot fill additional orders in the time desired, and when there are no local industries to provide the desired material. The credit facilities also enter very largely into the situation.

There is a vast amount of railroad work to be done in all of these countries in order to rehabilitate the railways and to reconstruct their devastated portions. American manufacturers who have gone to Europe since the war expecting to receive large orders have been quite disappointed in not being able to do a larger amount of business, but the reason that they have not done more business is that these countries have not really been able to adequately determine the amount of business that can be done by their own industries. In other words the market was not ripe. There is but little question, however, that as time goes on these countries will be obliged to go to America for railway material which they must have, and which they are not sufficiently well equipped industrially to supply. The local industries will have more than they can do to provide material for their own countries soon enough to rehabilitate the railways as promptly as they should. In fact it is believed that business will be handed to American industries on a "silver platter," due to the fact that European countries will not be able to supply all of their own immediate needs.

The labor situation in England and France particularly is in a decidedly unrestful state. The reaction of the four long years of war has by no means spent itself. Labor has become extremely independent, and to a large extent has got beyond the control of the labor leaders. Out of work gratuities, particularly to the demobilized men, has had a serious effect, and it has been difficult to get the men back into their peace-time pursuits. The attitude of labor in England in the mining industry is having untold serious effect on the industry of that country. Some of the miners have bolted from their leaders and have struck in protest of the action of the Government regarding the mines, and at the present time the consequences of their action appear to be very serious. With the cost of coal increasing six shillings per ton or about $1.50, and with the decreased output on account of a seven hour day, the English industries will find it more difficult to compete with American prices. The miners and labor in general are trying to force the government into the general nationalization of the national resources and public utilities, and the movement is so strong that the government at the present time has hesitated to take any direct stand in the matter. It undoubtedly realizes the disastrous effect of general nationalization, but at the same time hesitates to take a positive stand against it for fear of the consequences that may follow. Public opinion does not seem to have the same effect upon the laboring classes in England that is has had in the States

Situation in Belgium

It is difficult to enumerate the kinds of material which these countries will be obliged to purchase from outside sources. Belgium of course is in bad shape and will need practically everything in the railway line. At the present time it needs rails and structural steel. It was only about a month ago that its blast furnaces resumed operation. It needs rolling stock, shop equipment and signals. The rolling stock is in a deplorable state, and had it not been for the German cars and locomotives obtained from Germany on the signing of the Armistice, Belgium's railways would have had extreme difficulty in maintaining proper train service. It is the desire of the Belgian State Railways to return these German cars and locomotives and buy new, and under the terms of Peace they are given the opportunity of either accepting the German equipment, deducting its value from the amount of indemnity due Belgium, or else returning the German equipment and buying new with cash derived from the indemnity. It has not been decided yet what will be done, but the policy followed will undoubtedly be, provided proper credits can be established until the indemnity is paid, to buy new equipment. It has been stated that if this is not done, it will take the Belgian railways 30 years to get their power and rolling stock back to its pre-war condition. If the Belgian railways decide to return the German equipment and take the money for new equipment, an extensive standardization program will be formulated. This would be of great advantage to American industries, for a large amount of equipment will be required and better prices can be made and better deliveries ensured.

A vast amount of work will have to be done on the signal system of the Belgian railways. Plans are now being formulated for a system which is reported to be a combination of English and American practices and which will be simpler than that previously used in that country. There are rumors that automatic signaling is being considered, but no direct information has been obtainable, nor is it believed that any definite decision has been made in this matter. The work of reconstruction of the signal system will take about two years, and while every attempt is being made to place business with Belgian industries, it is believed that the demand for this equipment will be so great that it will be impossible for them to supply the necessary equipment.

The shop equipment of the Belgian railways is in a deplorable state. It is such that, at the present time, the shops are working from one-third to one-half their pre-war capacity. This has necessitated contracting locomotive repairs to Belgian locomotive builders, which at the same time will retard the output of new locomotives from these companies.

Regardless of the fact that Belgian railway shops need large quantities of machine tools, the situation as it stands today does not present a very encouraging outlook for Ameri-

can machine tool builders. The American government has arranged with the Belgian government through a Belgian combine for the sale of the surplus machine tools purchased for war purposes. The prices are to be those of 1914 with an increase of about 55 per cent., delivered at Belgian ports, and a credit for three years has been established to facilitate the Belgian finances. With the quantities of tools thus made available to Belgium at such advantageous prices, American manufacturers can only hope to obtain orders for special types of machines required in railway shops, and then only those which cannot be provided by the local Belgian companies.

Situation in France

The requirements of France, while not relatively as serious as those of Belgium, are believed to be so vast that it will be impossible for the French manufacturers to meet the demands of reconstruction in the devastated areas, the rehabilitation of all railways in general, and new work in the added territory of Alsace-Lorraine. It has been estimated that an expenditure of $971,000,000 will be required to finance this work. As in Belgium, the railways in the devastated areas, namely the Nord and the Est, have had to rely on German equipment to meet their needs, and this will be undoubtedly returned if proper financial arrangements can be made for the purchase of new equipment. The locomotives and cars brought over by the American Expeditionary Forces have also assisted greatly in relieving the equipment situation. These will stay in France, but with it all, there appears to still be a great demand for new equipment. Standardization programmes are being developed, which have been mentioned previously in these columns, and a large number of locomotives have been ordered to existing designs to meet the more immediate needs, but with the labor situation as it is today in France, there is a grave question as to whether the expectations of the companies delivering this new equipment in the time required will be met.

There is a large amount of work to be done in rehabilitating lines and shops. The opportunities for American manufacturers will depend upon the capacity of the French industries to supply these needs, and further upon the service the Americans give in comparison to that which can be obtained from other outside countries. During the war French railway men had a great opportunity of learning more about American railway practices, and while it seems to be the opinion of most of the railway men who served with our forces in France that but little of American practices will be absorbed by the French railways, there have been indications that this is not strictly the case. The Paris-Lyon-Mediterranean was much impressed by the telephone despatching system used by the American forces in France and is to instal that system on its lines between Dijon and Lyons. Furthermore, that road is becoming much interested in automatic signals, and it is believed that a trial will be made of them to determine their value to French railways. The engineers of that road are now making a careful study of this problem.

The locomotive design of France is approaching more and more American lines. The compound locomotive is giving place to the high degree superheater simple type of locomotive. The standard locomotives which are being designed will be simple engines. The conditions have so changed in France, particularly as regards labor, that more of the labor-saving methods which are common in America will find favor there.

The machine tool situation is somewhat the same as in Belgium. Arrangements have been made with the American government for the sale of the machine tools brought into France for the use of the American military forces, at very favorable prices, which have been reported as being 1917 prices less 25 per cent. Here again, the American machine tool manufacturers will find little encouragement, but it is understood that regardless of this arrangement, many inquiries are being received for special types of American machine tools.

Freight cars of larger capacity than have generally been used in France are coming into greater favor and undoubtedly with the increased cost of labor, greater efforts will be made to secure better train loads than have been the practice in the past. The use of the continuously braked freight train is being considered, and also the automatic coupler, but the latter presents considerable difficulties due to the interchangeability with the present type of coupling.

Situation in England

The situation in England is chiefly a matter of rehabilitation. During the war maintenance has been sadly neglected. Very little has been done pending the action of the government on the Transport Bill. There is a great need for equipment of all kinds, both track and rolling stock. New locomotives are required, and it is believed that cars of greater tonnage will be built. Sir Eric Geddes, Minister designate of railways, in speaking before the House of Lords on the Transport Bill, spoke of the advantages to be obtained with freight cars of greater capacity than are generally used in England, stating that locomotives can be loaded to greater capacity without increasing the length of trains which are now limited by the length of sidings. He called attention to the fact that about half the freight cars in England, or approximately 700,000, were privately owned, of which 500,000 were under 12 tons capacity. It is believed that English railways can use freight cars of 45 tons capacity to very good advantage. A tremendous lot of work must necessarily be done for the transportation facilities are in a bad way. The congestion at ports and industrial centers is bad, due primarily to the lack of equipment. Contrary to the conditions in the United States there was very little change in the amount of traffic hauled after the signing of the Armistice. The greatest problem presented to the railway men in England was that of readjusting themselves to the change in the flow of traffic. This has been occasioned somewhat by the unadjusted freight rates between different ports in the country, the rates of the coastwise vessels having risen to such an extent that the railroads were overtaxed in handling coastwise business, as their rates had not been changed. Any definite action on rehabilitation will be held in abeyance until the disposition of the Transport Bill which is now before the Houses of Parliament.

General Remarks

Thus in all three of the countries under discussion, it will be seen that the work of rebuilding and rehabilitation of the railways is so vast that it is hardly possible for their local industries to provide their needs, and this presents the opportunity for American railway supply manufacturers. The greatest field, however, for our companies would appear to be with the countries which before the war went to the European countries for their railway supplies. This does not mean that the European markets should be neglected. In fact many of the South American railway companies and those in other portions of the world, are financed from Europe, and orders would naturally come from there. Those of the American companies which have opened offices or established connections in Europe, will undoubtedly derive benefit from this extension of their business.

In seeking trade from European countries, or in fact any country, American manufacturers must realize that they will be obliged to conform to the desires of the countries with which they are dealing, in the matter of design, except in the case of some minor or special apparatus. It is difficult for American manufacturers to sell their standard products

except where such happen to meet the desires of the railways with which they are doing business. The railways in England, France and Belgium, go into the study of designs a great deal more than is common with the railways in America. They have an extensive staff of engineers who study design from their own point of view, with the result that in these countries the designs of the railways are far more varied than on the railways in America. With the trend towards standardization in all of these countries, however, a much more common product will be evolved, which means that a large number of articles of the same design will be purchased. This will be favorable to American manufacturers who desire business from these countries, as it will enable them to do business on a larger scale and pay them to adapt themselves to the requirements of their foreign customers.

The railways do not look with favor upon the service facilities which American railway supply manufacturers so ably render in the States. Furthermore, in the contemplation of new designs or in the adoption of new practices, the assistance of the supply companies is not sought anywhere near to the same extent as in the States. After a design is once made, bids are asked for manufacture to that specific design, with the result that the manufacturers act more as manufacturers than as engineers, and the business usually goes to the lowest bidder. This makes it quite difficult for the high grade supply companies to make the showing and reputation as engineers that is common in the States. It is this peculiarity which is difficult for the American manufacturers to understand, but it is nevertheless important that it be carefully considered. Any attempt by American manufacturers to force American designs on foreign railways is liable to meet with opposition except where these designs are in accordance with their own ideas. It may be possible to do it if the roads in question need the material so badly that they are obliged to take what they can get, but it will react against the manufacturers when future orders are contemplated. Furthermore, the methods of doing business in foreign countries are quite different from American methods, and it is necessary for the American manufacturers to consider the foreign methods and work in accordance with them if they hope to become firmly established in the country in question.

One enthusiastic Paris representative of a large American concern was heard to state: "In order for Americans to obtain business in France it would be necessary first to teach American business methods to the French." A French man commenting on this remark stated that: "Before he did that it would be necessary to make English the national language of France." Too much emphasis cannot therefore be placed on the importance of American manufacturers adapting themselves to the physiological conditions and the peculiar characteristics of the countries in which they hope to do business. As has been repeatedly pointed out it was this adaptability that so enabled the German nation to develop its extensive export trade. Now that Peace is signed and the gates are open to Geman industry, America must "watch its step" if it is to hold the export business which has and will automatically come to it as the nation best equipped at the present time to supply the needs of the rest of the world.

British trade with Brazil.—The Brazilian commercial delegates who are shortly to tour the commercial centers of Great Britain under the auspices of the Federation of British Industries were expected to arrive in England before the end of June. They include Dr. Pandia Calogeras, the ex-Minister of Finance, Agriculture and Commerce, and other eminent Brazilians. Arrangements have been made for them to visit important works in a number of different cities.

An Analysis of the Plumb Plan

Characterizing the Plumb plan as "the most vicious piece of legislation" that has been presented to Congress since he has been in the Senate, Senator Atlee Pomerene of Ohio has addressed a letter to a committee representing the Hocking Valley System Federation No. 51, affiliated with the American Federation of Labor, in reply to a letter from the committee calling attention to the plan as evidence of their interest in behalf of "the masses of the people." The Senator said in part:

In your deliberations whom did you consult who was representative of "the masses of the people" as contradistinguished from those who were personally interested in the plan, and, if you consulted such persons, did "the masses" choose them or did you choose them, and what did they say either for or against it?

You tell me that you studied this for a matter of nine or ten weeks, and on the 23d day of July (Wednesday) you concluded your task, and on the following Monday these recommendations were presented to a called meeting of representatives and delegates, who unanimously adopted the committee's report.

Who were these representatives and delegates who were able at one sitting to understand the Plumb plan and advise as to what should be done in the interest of "the masses of the people"? Were they chosen by "the masses" to represent them?

You write me that the Plumb plan is the only "ultimate solution of the 'railroad problem' that has as yet been presented to your honorable body."

Many proposed plans are pending before the Interstate Commerce Committee of the Senate, and all of them are being carefully studied with a view of the best possible solution of the situation.

Did your committee or "the representatives and delegates who unanimously adopted the Plumb plan in its entirety" examine these plans, or any of them, before passing judgment upon them?

Now, let us go a step further. The railroads of this country, in round numbers, are valued at $20,000,000,000. They are the web and woof of America's industrial, commercial, and social life. Under the Plumb plan it is proposed to take this property by purchase or condemnation from its stockholders, among whom are thousands, not to say millions, of the plain people of the country—old and young, the widows and the orphans—and to pay for them in cash payments or by the issuance to such owners of United States Government bonds. In other words, they shall be paid for by the people's cash or by their obligations. They are then to be managed and operated by the national railway operating corporation for 100 years, which shall have a board of directors to be composed of 15 men, five of whom shall be selected by the classified employees of the railways, five by their official employees, and five to be appointed by the President, not more than three of them to belong to one political party.

Suffice it to say that you and I both understand—even if we are not willing to admit it—that the 10 railway directors will have interests which will be at variance with the interests of the traveling and shipping public, who pay the bill; and while the other five appointed by the President are said to represent the public, which perhaps embraces about 100,000,000 people—I mean the people other than those who will be directly or indirectly interested either as the classified and official railway employees or their families—they will owe their appointment to a political power and, it is my judgment, may be influenced by the political purposes of the party in control of the Government.

Are you quite sure that when the Plumb plan was devised it was in the interest of "the masses"? If so, how does it happen that the bill is presented by the brotherhoods alone

and their associates? Why were not the interests of the general public consulted?

If the Plumb plan is sound economically and is for the interests of "the masses," why do you not suggest that similar legislation be adopted whereby all public utilities, including water works, electric light plans, gas and heating plants, be purchased and turned over to their employees and operatives, respectively?

If it is sound and in the interest of *the masses*, why do you not suggest that all the coal mines, iron and copper mines, be purchased by the government and turned over to the operatives in the same way?

Why do you not suggest that all the manufacturing and industrial plants of the country be purchased with government funds or by the issuance of government bonds and turned over to their operatives in the same way?

Why do you not advise that all the stores be purchased and turned over to their operatives in the same way?

Why do you not recommend that all the banks of the country be acquired by the government and turned over to their operatives?

Why do you not ask, in the interest of "the masses," that the government purchase all the farms of the country and turn them over to the employees on the farms?

And, lastly, may I suggest that if one man should happen to own two houses, one of which he rents, why do you not ask that the second house shall be bought by the government and turned over to the renter?

Where is this going to end?

My friends, permit me to say the Plumb plan has nothing akin to it outside Bolshevik Russia.

It is worse than socialism.

Socialism contemplates the public ownership of property to be controlled and operated by the public for the public. The Plumb plan contemplates the public ownership of the railroads for a class. As neither class of these employees will have any stock, their interests will be one and the same as against the public. In other words, $20,000,000,000 worth of property bought by money belonging to 110,000,000 people is to be turned over to 2,000,000 railroad men, representing, perhaps, including their families, 10,000,000.

Does this seem to be for the benefit of "the masses"?

Mr. Plumb in his testimony before the Senate Committee on Interstate Commerce in February assumed that the capital invested amounted to $18,000,000,000 approximately. In his testimony last week before the Interstate Commerce Committee of the House he estimated that all the present owners would get for their property is $13,000,000,000. So, according to his own testimony, Mr. Plumb's plan, if enacted into law, will substantially confiscate $5,000,000,000 worth of property belonging to private owners.

And what would be the result if it fails?

Invoking the principle of brotherhood—a name I love—do you not feel you ought to be consistent, and while asking for this investment of the public funds for your benefit to likewise ask for the benefit of a proportionally equal amount of government funds for every other business enterprise in the United States, and turn that over to the employees of those several enterprises?

Does not the principle of fraternity suggest this?

And by the time we get through with it there will be $240,000,000,000 of government bonds issued and on the market.

My friends, this Plumb plan spells ruin for beloved America.

In the past few years a good many people have urged federal ownership and control of the railroads, the telegraphs, and the telephones. In view of recent experiences most of them who have had no selfish purpose to serve have changed their views.

Government control of these utilities has been so complete that it does not differ materially from actual government ownership, and there is no such radical difference between the present government control and operation and that provided for in the Plumb plan as to warrant anyone in saying that while the former has been a failure the latter will be a success.

From the standpoint of operation every user of the railroads, telegraphs, and telephones knows that the service has been worse than during the private control, excepting only the condition of the railroads during the last two months of private control, which was due to war conditions.

Do you really believe that under the Plumb plan you can turn this deficit under government control either into a surplus for the account of the government or the public or into better service for the country?

I do not believe it can be done except by one increase after another in transportation rates.

Permit me to make another suggestion: Since government control was begun the wages to the employees have been increased about $1,000,000,000. The director general, on July 31, 1919, informed the President that additional increases were demanded which would aggregate, if granted, about $800,000,000 more per year.

I have no knowledge as to whether the conditions are such as to justify this increase or not, and I express no opinion with regard to it. I want the railroad men and all laboring men to be liberally paid, whether under public or private control.

But this is only an incident to the larger question to which I want to call your attention. If the conditions are such that this increase is justified, then I am for it. I await the proof before I shall decide it.

But when your representatives come to Washington and not only ask this increase but demand that the Congress of the United States shall buy these properties at a cost to the government of $18,000,000,000 or $20,000,000,000 and turn them over to the national railways operating corporation for management and operation I want to say to you as one American to another it is neither fair nor American for them to insinuate revolution, as they have before the Interstate Commerce Committee of the House, unless their demands are granted.

And let me suggest that the people at large have not expressed any desire for this plan, but members of your brotherhoods—I do not mean the chiefs—have been in Washington making their threats as to what would happen unless this legislation is enacted. As one Senator I shall always be open to conviction, but I never yet have yielded to a threat, and I never will.

Of course, I know that you do not approve these methods. Law-abiding citizens, real Americans, never do approve them. It is only men of the Bolshevik type of mind that ever resort to them.

Among the threats that have been made are threats of a nation-wide strike. I do not mean to suggest that the chiefs of the brotherhoods have suggested a nation-wide strike, but some of the members of the brotherhoods have made these threats here in Washington to Senators. I am sure that you do not give any countenance to strikes under present conditions.

I believe in the right of the laboring man to use the instrument of the strike under proper circumstances, but I do not believe the occasion is here or ever has been here or ever will be here which will justify a nation-wide strike, with all the distress it will bring, not only on the public at large but on the strikers and their families.

With a general strike on in this country, tying up all the railroads, the products of the mine and the farm and the factory could not be moved to the centers of population and in one week's time the people of our great cities would be starved, and in winter frozen. The people of these centers

of population include the wives, the children, and the babes of railway men as well as others. It is too shocking a situation to even contemplate.

A sub-committee of the Interstate Commerce Committee, of which I am a member, has been engaged for a number of weeks in preparing a bill providing for the reorganization and regulation of the railroads to present to the full committee for its consideration. I hope it will appeal to the sober sense of the public. I can give no assurances as to whether it will be approved or disapproved, but of this I am convinced, that the American public never will approve the Plumb plan or anything akin to it.

The Plumb plan is the most vicious piece of legislation that has been presented to Congress since I have been in the Senate. I would feel that I was contributing to the ruin, not only to the transportation system of the country, but to its financial and industrial breakdown, if I voted for it. It would lead not only to the ruin of the whole people but to every railroad man as well.

Notwithstanding the statement in your letter to the effect that this plan was unanimously adopted at a meeting of the representatives and delegates to whom it was submitted by you, I venture the assertion that when they understand it the vast majority of them will oppose it.

Much has been said by the brotherhood chiefs and their counsel in the last few days here in Washington about the democratization of industry, and the Plumb plan is referred to as the means of democratizing transportation. A careful study of the bill will show that it is not democracy in transportation for which it provides, but autocracy in transportation.

Mr. Plumb the other day referred to the Wall Street control of the railroads. That was true in the past. It is not true now. Wall Street has many vicious things to its credit in years gone by, but the captains of finance have never demanded $20,000,000,000 of the American people's money at one time!

The Plumb plan out-Harrimans Harriman in his palmiest days!

The public does not want to be skinned, but if it must be skinned it will make little difference whether it is by Wall Street or by the methods provided for in the proposed Plumb plan.

It was my pleasure in 1916 to support your claims for the Adamson law, because I believed that you were entitled to better working hours and to better compensation, and so long as I am in public life it will be my pleasure to do whatever can be reasonably done to advance the interests of labor, but bear in mind that it is not "every one who cries unto me, 'Lord, Lord,' shall enter the kingdom of heaven," and it is not every man who comes around declaiming in favor of labor who is labor's friend.

I am sure that a sober second thought will persuade you that this bill ought to be defeated.

Andrew Carnegie

Andrew Carnegie

ANDREW CARNEGIE, the retired steel manufacturer and great philanthropist, who has just died was superintendent of the Pittsburgh Division of the Pennsylvania from 1859 to 1865. He began his railroad work as a telegraph operator on the Pennsylvania. Thomas A. Scott, who was later president of the Pennsylvania and was superintendent of the Pittsburgh Division before Carnegie was the man to whom young Carnegie owed his start in the steel business. Later in life a difference arose between the two men and from about the time of the panic of 1873 until the time when Mr. Carnegie sold his vast steel interests to the United States Steel Corporation, he persistently fought the Pennsylvania Railroad, or, as Mr. Carnegie, himself, would have put it, the Pennsylvania fought him.

As a steel man and as a great philanthropist, Andrew Carnegie's history has been and is being discussed in newspapers all over the world; but, interestingly enough, it was his threat to enter the railroad field on a large scale which was probably the deciding factor in the decision of J. P. Morgan and the varied interests which he represented to eliminate Andrew Carnegie from the steel business by buying his steel mills at Mr. Carnegie's own price. Of course, the history of the formation of the United States Steel Corporation is far more complex than merely the decision of the Morgan banking house to buy out Mr. Carnegie.

Mr. Carnegie's career as a steel manufacturer was during the period when railroad rebates were demanded and given. With his great resources, Mr. Carnegie had an advantage in this game which he used with ruthlessness and success. He built the Bessemer & Lake Erie partly as a legitimate railroad project—he could bring ore from the Lakes south on it and could give it coal northbound—and partly as a club to hold over the Pennsylvania Lines West in his demands for lower freight rates than his competitors. At one time he threatened to build a canal from Lake Erie to the Ohio river, and quite possibly would have carried out his threat had there been water enough to fill the upper levels; but the cost of pumping water up to these levels would have been prohibitive.

When the Goulds turned an eye toward Pittsburgh in George Gould's attempt at connecting up a trans-continental Gould system, Mr. Carnegie agreed to give the projected Wabash-Pittsburgh Terminal a third of his tonnage out of Pittsburgh. As a matter of fact, the Wabash-Pittsburgh Terminal was never in a position to take advantage of this contract and its terms were never carried out.

When Alexander Johnston Cassatt decided to take a firm stand against all rebating by the Pennsylvania system, Andrew Carnegie threatened to build a railroad from Pittsburgh to Baltimore. Although Morgan & Company were not the bankers for the Pennsylvania Railroad, other important in-

terests of theirs were vitally affected by the continuous state of warfare which Mr. Carnegie maintained in the steel industry, and this threat to bring chaos into the eastern trunk line situation gave the bankers an additional and potent incentive to eliminate for once and all the too aggressive steel manufacturer. The result was the formation of the United States Steel Corporation and the retirement of Mr. Carnegie from the business of making money and the beginning of his long career as a discriminating, broad-minded philanthropist.

He was one of America's very great citizens.

Doings of the Railroad Administration

WASHINGTON, D. C.

DIRECTOR GENERAL HINES announced on August 8 that the Railroad Administration has sent inquiries to a number of steel companies asking each at what price it is ready to supply 100,000 tons of steel rail. Inquiries relate separately to Bessemer rail and open hearth rail. Replies to the inquiries have been requested by August 16. A decision as to the amount of rail to be purchased will be reached following the receipt of the proposals.

This will be the second rail order placed by the Railroad Administration since the railroads were taken over a year and a half ago. Orders for 200,000 tons were placed in May.

Railroads to Co-operate with Vocational Education Board

W. T. Tyler, director of the Division of Operation, and W. S. Carter, director of the Division of Labor, have issued the following joint circular authorizing co-operation by the railroads in the establishment of part-time schools for railroad apprentices and others:

"The Federal Government has created under the provisions of an act of Congress, approved February 23, 1917, a Federal Board for Vocational Education.

"The purpose of this act is to provide for the promotion of vocational education in the trades and industries and in agriculture in co-operation with the various states, and an appropriation by the Federal Government is available for such work.

"The value of vocational training for mechanics and apprentices in railroad shops has been recognized by many railroads which have established schools for the training of such men. It is the desire of the Railroad Administration not only to assist and encourage such training where established, but also to extend the system to roads which have not established such schools, and it is believed that this can be best accomplished by co-operation between the United States Railroad Administration and the Federal Board for Vocational Education in extending this work.

"It is therefore desired that the different railroads under control of the United States Railroad Administration co-operate with the Federal Board for Vocational Education in the establishment of part-time schools for railroad shop apprentices and others who come within the scope of the act. Where it is found necessary in order to facilitate this work, railroads will be authorized on request, to fit up suitable study or class rooms at the different shops where such schools may be held. Where such schools are established, railroads will be authorized to pay apprentices at their usual rate for the time spent in attending such schools.

"Apprentices on roads where such schools are established will be required to attend not less than 208 hours per year.

"Complete information concerning the establishment of these schools in co-operation with the Federal Board for Vocational Education may be obtained either from the board direct or from the assistant director, Division of Operation, in charge of the Mechanical Department.

"In the preparation of a course of study, due attention must be given to meet the needs of railway shop employees, and such subjects as shop practice involving the manipulation of machines used in general repair and construction work and to related science, mathematics and drawings should be fully provided for.

"To provide uniformity as far as practicable in these courses of study, the subjects embraced therein should be submitted to the assistant director, Division of Operation, in charge of the Mechanical Department, for approval."

Distribution of Stock Cars

The Car Service Section has issued the following rules to govern the distribution of stock cars on all railroads:

1. The distribution of privately owned stock cars as between railroads and as between stations on each railroad will be authorized by the owners of such cars.

2. Such privately owned stock cars as are placed for loading by direction of the owner shall count against the daily allotment of cars to the shipper.

3. The owners of so-called private stock cars will give distribution to all their equipment before calling upon the railroads for assistance in filling orders for stock cars for their shippers or for their account.

4. If the number of privately owned stock cars placed for a shipper equals or exceeds that shipper's pro rata share of the available supply, he shall not be entitled in addition to any railroad-owned stock cars.

5. If the number of privately owned stock cars placed for a shipper is less than his pro rata share based on his daily ability to load and ship, he is entitled to be allotted railroad-owned equipment in addition thereto to make up his pro rata share.

6. The railroad will distribute available railroad-owned stock cars on a pro rata basis which shall take into consideration the ability of the shipper to load and ship.

Railways and the Peace Treaty.—Articles 365 to 374 of the Peace Treaty are specially devoted to railways. Provision is made regarding rates and facilities for merchandise traffic between the Allied and Associated countries on the one hand and Germany on the other, and the Berne conventions of 1890, 1893, 1895, 1898 and 1906, dealing with the transportation of goods are renewed. Germany is also bound by any new Berne Convention which may be concluded within the next five years, and is required to co-operate in the establishment of such through passenger services as are required by the Allied and Associated Powers. Through emigrant traffic to or from Associated and Allied ports must not be impeded or delayed by any "technical, fiscal or administrative measures." Under an important technical provision, German goods wagons must be equipped so as to prevent "hampering the action of the continuous brake which may be adopted" by the Allied and Associated Powers within the next 10 years, and the wagons of these countries must be accepted on the German railways. Germany undertakes to accept within 10 years the denunciation of the Gothard Convention of 1909, which the Swiss Government has already declared its desire to abrogate. The Treaty contains provisions relative to the handing over of the railways and rolling-stock which Germany is called on to surrender under the Peace terms, and provision is also made for contingencies arising out of the construction of new railways which traverse new frontiers established by the Peace conditions. —Railway Gazette, London.

British Investments in Argentina. It is known, says the National Bank of Commerce, that British capital in railways in Argentina amounts to $1,138,756,484. This represents about ten times the railway investments of any other foreign country in Argentina.

Plumb Plan Hearing Before House Committee

Glenn E. Plumb and A. B. Garretson Sharply Questioned by Congressmen—Revolutionary Talk Soft-pedalled

WASHINGTON, D. C.

THE PLUMB PLAN has had its day in court and has relapsed into a state of propaganda. Six days of hearings before the House committee on interstate and foreign commerce were brought to a close on Tuesday, and the committee, after a brief speech by the chairman complimenting the advocates of the plan on their forensic ability, returned its attention to other phases of its search for a solution of the railroad problem, leaving the proposed sovietization of the railroads in the able and willing hands of the Plumb plan press and lecture bureau, the 14 railroad labor organizations and the American Federation of Labor, who can doubtless keep it before the public for some time to come, but who failed miserably in their first efforts to enlist support in Congress.

Glenn E. Plumb, counsel for the organized railroad employees and the author of the plan, was the principal witness before the committee. He presented a long, prepared statement, some extracts from which were published last week, on his plan, and his version of various other plans, and was subjected to a most critical examination for three days by members of the committee. He was followed by A. B. Garretson, former president of the Order of Railway Conductors, after which he returned with a series of "charges" against the railroads which he had promised in his opening statement. After having begun the hearing with thinly veiled threats of what would happen to Congressmen who fail to support the plan and of a "revolution" in the country if it is not adopted, the labor leaders toward the close adopted a less belligerent attitude. As the members of the committee plainly showed their indignation, Mr. Plumb gradually softened his interpretation of the word "revolution," and insisted that the ideas of force or threats have no part in the Plumb plan campaign, but that it is to be carried on entirely by "appeal to reason." He defined "revolution" at various times as meaning the peaceful use of the ballot, that the employees would "cease to serve"; that they would "object for all they are worth" if their plan is not adopted, or as "raising hell generally." The employees would not strike to gain the Plumb plan, he declared, but they might strike for higher wages to meet the increased cost of living, but if the plan should be adopted they would manage to get along some way until they could show a surplus from the operation of the railroads. He admitted that he would not expect Congress to adopt his plan at once, nor until after the majority of the public has indicated its support of the plan, but he declared that sentiment for it is "spreading like wildfire."

G. E. Plumb

He suggested that the present government control of the railroads be continued for a time, but with a reduction in the guaranty to the railroads so the owners will share in the deficit. Nearly all the members of the committee questioned Mr. Plumb, and with one exception indicated marked hostility to his plan in nearly all its aspects. Representative Sims, who introduced the bill by request, made a 20-minute speech to say he was not committed to the bill, but approved some parts of it, and reserved his judgment as to the plan as a whole.

Following his prepared statement, Mr. Plumb discussed the provisions of his bill section by section.

In reply to Mr. Sims, Mr. Plumb said it is not proposed to take over the railroads subject to any liens, but to take over the entire property, and that the Government would have nothing to do with the division of the purchase price as between stock and bond holders. Mr. Plumb said his plan provided for a complete amortization of capital through the sinking fund, and new capital improvements would be paid for out of surplus or new issues of bonds. He thought the surplus as it increased would be more than sufficient because the unification and pooling of facilities would make many capital expenditures unnecessary and ordinary maintenance and renewals would be all that would be required for many years. By that time the surplus fund would have accumulated so that no new capital would be necessary. He suggested that Government arsenals and other plants could furnish many supplies needed by the railways without profit and at a lower cost than if they were purchased from private concerns, and he readily adopted a suggestion by Mr. Sims that the Government might furnish food and other supplies to the employees at cost plus the cost of distribution.

When some one referred to the employees' proposed wage dividend as a "profit" Mr. Plumb preferred to define it as "a benefit in excess of their wages," which would result only from increased efficiency and without which efficiency could not be created.

Plumb Values the Railroads

Representative Barkley asked Mr. Plumb's opinion of the cost of the railroads as determined by his ideas of value. Not to exceed 12 billion dollars, and probably not more than 10 billion, represents money actually contributed to the public service by the corporations, Mr. Plumb replied. When Mr. Barkley expressed an idea that this might be a little rough on

the holders of securities that had paid par or more for them, Mr. Plumb said he was not interested in what they paid, for that was a private transaction in which the public had no concern.

"But what would become of the extra six billion," asked Mr. Barkley.

"It isn't in existence now," calmly replied Mr. Plumb. "The security owners would receive just about what they could get in the market today."

"Why do you double the wage dividend of the officials?" Mr. Barkley asked.

"Because our plan is so totally unsocialistic that we believe in recognizing that responsibility is entitled to a higher rate of reward or incentive." He would not say that the lower grade of officers should receive higher pay than the higher grade of employees.

In reply to Chairman Esch, Mr. Plumb said that while the organizations desire as prompt action by Congress as is consistent with a thorough study of the plan and did not desire forced action, but proposed to get every possible influence behind the bill, they realized that it would take some time. He insisted, however, that events move more rapidly now than formerly.

"But some railway employees are showing impatience and are striking," said Mr. Esch. "Would that be such a method as you suggest?"

"Not to secure the adoption of the plan," said Mr. Plumb, "but these disturbances have no relation to the plan. They have been brewing for months. The fact that they have occurred simultaneously with the presentation of this plan is merely due to your invitation to us to appear this week. Otherwise the bill might not have been introduced until October."

A. B. Garretson

Railroads Should Not Be Returned

Mr. Esch asked if Mr. Plumb was still in favor of a five-year extension of Federal control of the railrods, which he had advocated before the Senate committee in February.

"I do not believe now that five years or two years would be necessary," replied Mr. Plumb. "I believe there should be an extension unless there can be very prompt action, but not under the terms of the present Federal control act. We should require the owners of the railroads to share the deficit. When I spoke of a five-year extension I did not think public opinion could be brought to the point of accepting our plan within two years, but now I believe less time will be required. We are making every effort to get the approval of public opinion and hope to be able to accelerate it to some extent. I would not be surprised at almost any social development in America within 60 or 90 days."

"Do you realize the temper of the House and of the Senate and the inclination and purpose of this committee?"

"Yes, but I believe they have been greatly enlightened by the developments of the past two weeks. I have been amazed at the lack of information on the part of the Senators and Congressmen with whom I have talked during the past three months as to what has been going on. I never expected to reach the present issue in less than a year or two years, but I have been overwhelmed by the force of the sentiment of the men."

"Do you think it should force Congress to speedy legislation?"

"I think it should force Congress to a speedy consideration of these questions, perhaps to the extent of laying aside all other questions."

When Mr. Esch said the committee had been doing that for four weeks, Mr. Plumb asserted that he didn't believe the committee "had been brought into contact with the people before this week."

"Do you believe, from knowledge you have gathered recently, that you can affirm that a majority of the people of the United States will stand for the doctrine of government ownership of the railroads?" asked Mr. Esch.

"At this time I would not say so, but I feel absolutely assured that the great majority are so dissatisfied with their present condition and so turned away from their past condition that they are rapidly coming to the support of this plan, and that when given an opportunity for education they will demand it. I wouldn't ask Congress to pass it ahead of that event."

Mr. Esch asked if the organizations would favor a national referendum to ascertain the sentiment of the country.

"There are other ways; for instance, if you find through the press and from the volume of communications honestly sent to you that the great mass of the people want this plan then I think that you can consider that you have the sentiment of the country," said Mr. Plumb. He admitted that this could not be accomplished without propaganda, but he asked the committee to distinguish between the "manufactured or purchased propaganda" in favor of selfish interests represented by form letters to Congress and "spontaneous propaganda."

"Ours does not have to be purchased," Mr. Plumb said. "It is offered to us."

When Mr. Esch suggested that the committee would probably received propaganda both for and against the plan, and mentioned the farmers as possibly being opposed to it, Mr. Plumb said the committee should listen to both sides and find out which propaganda represented the people.

"I think you will find the farmers do want the plan," he said.

"What information we have received would indicate that they do not," said Mr. Esch.

When Mr. Esch pointed out that the railroads pay about $214,000,000 in taxes to State and local governments, and that many States rely to a large extent on railroad taxation, Mr. Plumb suggested that to avoid hardship the taxes might

be continued, but should be gradually reduced at the rate of 10 per cent a year.

The "Temper of the People"

Representative Barkley asked Mr. Plumb to reveal to the committee just what he had in mind as to the temper of the people. Mr. Plumb said he had come to Washington in May expecting to spend some time in the preparation of his bill, and a brief on it, but that he had not been able to keep up with the demand on him to make speeches in all parts of the country, and that in advance of any newspaper publicity his office had been overwhelmed with demands for copies of the circulars and pamphlets.

"I didn't think it was possible to interest the public so much," he declared. "It is spreading like wildfire. We are being flooded with letters from employees and even officials and security owners, saying they believe this is the only plan that affords them any safety. I wouldn't be surprised to see the majority of the people rise and demand this plan by any means in their power." He spoke of addressing a meeting at St. Louis, after which some of the men came to him and declared that if they couldn't get the Plumb plan or something like it there would be a revolution. Mr. Barkley was curious as to what he understood to be meant by the word "revolution."

"Those men feel, along with millions of others," replied Mr. Plumb, "that they have reached a point of diminishing returns which they cannot stand any more, and that rather than stand any more they will cease to serve. If we don't work this problem out quickly we will have no opportunity to work it out."

"Do you believe that the passage of this bill will to any appreciable degree solve the cost-of-living problem as to all the people?" asked Mr. Barkley.

"It will do more than anything else. We are confronted now with a demand for $700,000,000 more rates or an appropriation. Either one will increase the cost of living, especially if you increase rates. If this plan is adopted we can assure the public immediately that there will be no increase in rates, and if we can save the difference between what we are paying the railroads and what we ought to pay in the interest charges we will have a surplus to start with, and if we get rid of the friction between officers and employees and give a motive for efficiency, and unify the railroads, we ought to be able to give a 5 per cent reduction very shortly."

Mr. Plumb frequently referred to the profit on the cost of transportation and the profit on wages. When Mr. Barkley asked what this meant he said that commodities are subject to several freight movements, and each one who handles them figures his profit as a percentage on the cost to him, which includes labor and freight. He said Congress might pass a law declaring that transportation cost shall not be made an element of profit. "We have got to a basis where we calculate profit on the cost of production, not on the investment," he said.

Representative Sweet asked why, if the government was to own the roads, it was not given authority to operate them.

"Because we do not believe this great industry can be operated by a political autocracy. If we leave operation in the hands of political appointees we would place the railway system in the hands of politicians and that, we submit, cannot safely be done. Business should be left to individual initiative, and we now restore it to the individual."

Mr. Sweet read some extracts from statements made by W. G. Lee before the wage board and asked about the various demands made for increases in wages. Mr. Plumb professed ignorance, saying he had nothing to do with the wage demands and had not been consulted.

An example of "spontaneous propaganda" was called to the attention of Mr. Plumb and members of the committee, when the hearing was resumed on Friday, by Representative Webster, who had previously asserted that he did not propose to be intimidated by threats. Mr. Webster produced a pile of letters he had received from his district from members of the Brotherhood of Railway Carmen and the Brotherhood of Railway Clerks, printed in imitation of typewriting and all alike, declaring "that under government control of the railroads wages have been increased, the work day shortened and our working conditions improved, that labor and the family have had more of the necessities of life," and that "therefore he who obstructs the government in this policy of control or ownership, becomes our direct enemy and shall so be posted, and a record of his action shall be kept for future reference, and it shall be our pledged policy to remove him from whatever political line of trust the public has given into his keeping. * * * He who strives to object or demean labor, or in any political way detract from the equality of labor, shall be posted throughout the length and breath of this fair land, as an undesirable."

Mr. Plumb was asked whether he had anything to do with the censoring or preparation of propaganda letters to Congressmen. He denied that he did, saying they represented the "spontaneous combustion of the men outside."

Mr. Webster wanted to know if he endorsed such letters as part of the educational campaign. He would not say that he would endorse the form of the letter, but referred to it as an illustration of his statement that the situation is geting beyond control. He said any one had a right to write to his Congressman, and in certain instances, as when an issue arises which has not been submitted to the people at the polls, he thought threats were justified, as they meant nothing more than a declaration that the writer would not vote for the Congressman and would try to defeat him and that such letters need not worry any one unless supported by a majority of the public. He at first said he would not have advised a threat of posting a man, and later said if the letter had been submitted to him he would have advised an entirely different letter.

"Is it to be understood that your campaign of education and enlightenment is to be carried on by threats?" asked Mr. Webster.

"That is not our plan. We have tried to appeal to reason. We are presenting to this committee the best reasons we can and we are presenting the same reasons to the public through every means at our command, the press, the labor press, the magazines, our own publications and from the lecture platform, and you won't find any threats in any of our matter. But such reactions as this are inevitable, and are bound to come to you. That we can't control. It is not the method the leaders desire to have followed out, but you must make allowance for this tremendous unrest."

Representative Rayburn asked if the Plumb plan does not provide for a "soviet system." Mr. Plumb said he did not know very much about Russian affairs. Mr. Rayburn asked how the average railway employee could be expected to understand the provisions of the bill when Mr. Stone and Mr. Morrison had admitted they did not. He said he had received 200 identical letters from railway employees in his district demanding that he vote for government ownership and operation. Mr. Plumb said the employees understood the principles of the bill if not its provisions, and that "one of the major organizations" had endorsed government ownership and operation before the Plumb plan was proposed, but that later all had adopted it, at their various conventions held in May, June and July. Mr. Rayburn asked if it was not a little out of proportion to have 10 members of the proposed board of directors represent the 2,000,000 employees and only 5 to represent all the rest of the people. Mr. Plumb objected to grouping the managing officials with the employees.

"Would you consider it fair to the workers in other industries to socialize only the railway industry?"

"The employees of other industries haven't asked for it,"

replied Mr. Plumb. "I don't believe it would be wise to apply the plan to all industries at once, but I do believe it would be well to apply it to the railroads which are purely governmental in their functions."

Rates Not to Be Reduced Immediately

In reply to questions, Mr. Plumb said he would not say that rates would be reduced immediately, but thought it could be done in a year. When asked how, he said $500,000,000 would be saved by the difference between the fixed charges on the reduced capitalization and the amount now guaranteed by the railroads. No one called his attention to the fact that he was comparing his fixed charges with a guarantee, only a small part of which is being earned now and a large part of which has not been paid. He also spoke of the gains to result from the increased efficiency when the men are working for themselves instead of for the Government, and said that the railroads had steadily reduced their cost of operation up to five or six years ago, when they began the policy of increasing rates. Now, he said, any further increases in rates will not result in increased revenue.

When Mr. Rayburn remarked that "we need not be alarmed because a few people say we will have a revolution," Mr. Plumb said he had not referred to any overthrow of the government, but merely to an "overturning of the industrial system."

Representative Winslow sought to find out something about the financing of the Plumb Plan League, but did not learn much. Mr. Plumb said that individual members paid $1 a year dues and lodges paid $10, and that there had been 1,500,000 telegraphic requests for copies of the literature, but that the membership blanks had only recently gone out, and the applications had just begun to pour in during the week before the hearing. At that time, he said, the rate at which they had come in would indicate an annual income of about $125,000, but that he expected it might reach $500,000 within a year, and it might even go as high as $6,000,000. This, he said, was to be used for "publicity, pure and simple."

"Pitiless publicity?" asked Mr. Winslow.

"No more pitiless than my examination before this committee," said Mr. Plumb.

In reply to a question as to whether any shippers' organizations had endorsed the plan, Mr. Plumb replied in the negative, saying that the intermediate shipper is not interested in the amount of the rate because he passes it on to the consumer. Mr. Winslow asked how the railway dollar would be distributed under the Plumb plan. Mr. Plumb estimated 70 per cent for operating expenses, as compared with 88.7 per cent during the first six months of 1919, 20 per cent for fixed charges and 10 per cent for surplus to be divided between the employees and the government. The 1 per cent for the sinking fund would come out of operating revenues if they were sufficient. Otherwise it would be set aside from any funds in the Treasury. Mr. Plumb said he would not set aside any contingent fund for lean years and admitted that any deficit would have to be provided for by an increase in rates. Later, in asserting that the employees could not raise their wages until after they had earned a surplus, he said that if there was a deficit caused by wage increases the charter would be forfeited.

To meet the skepticism of many members of the committee as to how the government could expect to acquire the railways with 4 per cent bonds, Mr. Plumb declared that the "investment fund" is practically a fixed amount, and the present owners of railway securities would practically have no other place to put their money, and so would be glad to take 4 per cent government bonds. He asserted that these bonds would have even better security than Liberty Bonds, because in addition to the security of the taxing power they would have the security of earning power. Most railroad stock issues have been illegal, Mr. Plumb said, as in violation of State laws prohibiting the issuance of stock in excess of property and therefore he would have no hesitation about taking over the properties at a price which would allow no reimbursement for a large part of the security issues. He repeated his declaration that they had never represented value, and that his proposed method of valuation would about equal the present depressed market value.

Representative Sanders asked if the Plumb plan was not a "soviet plan" instead of a government ownership plan.

"I don't know what a soviet plan is," replied Mr. Plumb, "but I don't believe the popular misconception of it."

A Definition of "Revolution"

Mr. Sanders pressed Mr. Plumb as to the meaning to be attributed to the word "revolution" as used by the man who said there would be a revolution unless the Plumb plan or something like it were adopted. In reply to Mr. Barkley the day before Mr. Plumb had said he understood the word to mean that the men would "cease to serve." Mr. Plumb at first answered Mr. Sanders by saying revolution meant "a change in the existing order, an overturning of the industrial system."

"But that is what the Plumb plan does," insisted the Congressman. "What is the alternative?"

"Well, I wouldn't wonder if he meant that those who do not agree with his ideas shall be removed from office, by the use of the ballot," said Mr. Plumb.

"That is not revolution," insisted Mr. Sanders. "Tell us what that man's message to us means."

Mr. Plumb tried again: "It means that they are going to get liberty through constitutional and lawful forces if they can and I hope it will come that way, but if the powers of reaction prevent it, it will come in some other way."

"What other way?"

"In the way it has always come throughout history."

"Yesterday you interpreted the word to mean strike," said Mr. Sanders, "but today you interpret it differently."

On the following day Mr. Plumb volunteered a new definition of the word "revolution" by quoting from a speech by a Congressman to the students at Yale, advising them to "spread the gospel and raise hell generally." "That is about what these men mean," he said. "They mean they will object for all they are worth. It doesn't mean any overturning of the government."

Answering questions by Mr. Sanders as to the prospects of net profits, Mr. Plumb said of course they would depend entirely upon the perfection of the organization for efficiency and naturally 100 per cent efficiency could not be expected during the first year, but he thought the difference between the proposed rate of interest and the present guaranty to the railroads would produce some surplus for the first year. He said the employees had proposed to the Railroad Administration a plan for a "scientific scheme for efficiency" to be tried out on one or two divisions, but had not been given the opportunity.

When he suggested that the surplus for the first or second year might be anywhere from $50,000,000 to $400,000,000, Mr. Sanders wanted to know if the employees and officials would not be much more interested in trying to get their pay increased than in the share of a surplus. This Mr. Plumb denied by contending that neither the officials nor the employees would let the other have an increase in pay that would produce a deficit because that would result in a forfeiture of the lease and that the double dividend rate of the officials would keep them from combining with the employees.

"But would not the Interstate Commerce Commission increase rates to provide for an increase in wages?"

"The Interstate Commerce Commission has held that an increase in wages is not sufficient ground for increased rates," replied Mr. Plumb.

When Mr. Plumb said that the power of capital would be

removed from the situation, Representative Montague asked if labor would not reserve its power to strike.

"No law can be devised that will deprive them of the inherent right of revolt," declared Mr. Plumb.

"Has there ever been any repression of the railroad employees to prevent their rising to the highest offices?" asked Mr. Montague.

"There has been no great repression," Mr. Plumb admitted, "but the kind of initiative that has been rewarded has been the kind that has been able to extort the greatest profits from labor, not the kind that increases their efficiency. The officers who have come up from the ranks have been able men, but they have not come up by the impulse of the employees, but by the selection of the autocrat."

"I wish you could satisfy me that your 10 members of the board of directors could be removed from the possibility of autocracy," concluded Mr. Montague.

Representative De Walt insisted that the railroads are now owned by the public by reason of the large indirect investments of the savings of the people in railroad securities, and that both capital and labor should receive a fair return and no more. Mr. Plumb insisted that capital would get a return it would be satisfied with because of the great security afforded by his 4 per cent bonds. Mr. De Walt also pointed out the possibility of a political crisis under which the Presidirectorate men who would side with one of the other two dent might appoint as the five public representatives on the elements of the directorate and thus give it complete control of the organization. Mr. Plumb could see no ground for fear of such a possibility.

"Are you sure you are voicing the sentiments of those you represent when you say that you intend to gain your purpose only by legal or legitimate methods?" asked Mr. De Walt.

"I am sure," replied Mr. Plumb. "No one has said we intend to enforce this legislation by a strike. There has been a great deal of misrepresentation in the newspapers. The only mention of a strike has been in connection with wages. We would be blind to our own interests if we tried to get legislation by threats."

"You never said anything truer than that in your life," declared Mr. De Walt.

"But when we say there will be trouble if something isn't done we are merely stating a fact to emphasize the necessity of finding a solution because of the feeling of unrest and discontent over the country," continued Mr. Plumb.

After having been questioned by the committee regarding his plan, Mr. Plumb completed on Monday his prepared statement, making an attack on his version of the plans of the railway executives, the National Association of Owners of Railway Securities and the United States Chamber of Commerce. His principal argument was based on his assertion that these plans provide for a guaranty based on property investment, and he declared that for Congress to adopt any of them would legalize the book property accounts. To attack the property accounts he read quotations from old decisions of the Interstate Commerce Commission calling attention to the defects in the property accounts, but he did not read some of the commission's later expressions in which the commission treated of them as possessing considerable practical value. He asserted that while the bill left the decision to the courts his construction of the law would allow no value for securities issued without investment, unearned increment, surplus but back into the property or grants, aids, gifts and donations. Mr. Montague remarked that if the courts fail to sustain his position it might cost more to acquire the roads than he had estimated. Mr. Plumb admitted this, saying the railroads were left free to make their claims before the courts.

Before closing Mr. Plumb referred again to the threatening letters received by Mr. Webster, and read a telegram from the secretary of the railroad section of the Central Labor Council of Spokane, saying the letters had been sent before the Plumb plan had been adopted, and had no connection with it. Mr. Webster replied that they had all been received since he became a member of Congress in March, that the Plumb plan was made public in February, and that he knew of no other plan for Government ownership. Mr. Plumb said he had never seen the letters and that they represented no effort to coerce any one to support the plan.

A. B. Garretson, former president of the Order of Railroad Conductors, made general arguments in favor of the Plumb plan and its so-called "democratic" features, and described eloquently the State of unrest which it purports to be intended to relieve. He carefully refrained from making any threats and avoided the word "revolution" but he declared that unless something is done to relieve the conditions which cause the unrest it is "bound to find a channel of expression which is the last thing the average citizen wants to see." "The recent sporadic strikes," he said, "are only rumblings. Nine-tenths of the energy of the labor leaders is now given to sitting on the lid. We don't want to overturn the government, but we want the government to function. Unless relief is found from the unreasonable pressure of living conditions we are bound to have trouble."

Mr. Garretson declared that distribution is a national function, and that transportation should be furnished to the people at cost. Mr. Merritt pointed out that he was assuming that transportation under government ownership would be furnished at a lower cost. This must follow, Mr. Garretson said, because there would be no "profit." He denied that the experience with government ownership in other countries was evidence against his assumption. The plan does not provide for government operation, he said, because he thought operation would be more efficient under the system proposed. Asked about the application of the plan to other industries, Mr. Garretson said he believed that the employees were entitled to a voice in the management in any industry.

Mr. Sims got Mr. Garretson to admit very readily that the power of the government to issue tax-free bonds made it possible to market them at a lower interest rate than would otherwise be possible. Mr. Sims said that the first Liberty bonds issued at 3½ per cent are selling at near par, and thought this presented a great economic advantage.

"If the Government owned the railroads we wouldn't have any interests lobbying for higher rates and reduced taxes," said Mr. Sims.

"And I suppose we wouldn't have anybody lobbying to get their wages raised," added Mr. Montague.

No "Political Pull"

Mr. Garretson said the plan was intended to be "fixed so that no one would have any political pull," "but when it was suggested that there might be an opportunity for some political influence on the President regarding the appointment of directors, he said there should be a distinction between organized opposition to or influence for a man for political reasons and for other reasons. He said the opposition of railroad men to Mr. Hughes in 1916 was "an act of citizenship," not an act of railway employees, and that the brotherhoods had certain ideas and expressed them as to whom should be appointed director general after Mr. McAdoo's resignation, but that Mr. Hines was not the man they championed. It is understood that Commissioner McChord is the man referred to. Mr. Garretson insisted that there was nothing political about their action in that case. He added that he had nothing but the kindliest feelings for Mr. Hines and the highest regard for his ability.

References to the political power of the employees impelled Mr. Garretson to make a statement regarding the occasion when Congress passed the Adamson law to head off a brotherhood strike. "The four brotherhoods in being forced into Congress on that occasion," he said, "were unwilling partici-

pants. Only the power and request of the President ever got us there. We went there on his demand to settle a question which we desired to settle in our own way. No Senator or Representative overheard a demand from any of the brotherhoods as to what they should do. I told them why I would not defer the strike, and after I had given my reasons no one asked me to."

Wage demands will come under any plan that has been proposed for dealing with the railroads, Mr. Garretson said, as long as wages do not keep pace with the increased cost of living. He declared that in 1913 the freight conductor received an average of $4.10 per day and his rate is now $5.40, an increase of 32 per cent as compared with an increase in the cost of living of 82 per cent. Representative Webster pointed out that these figures represent basic rates and asked what the average monthly pay check has been. Mr. Garretson avoided answering this question, but said that in 1913 the conductors probably averaged 100 miles per day for 30 days, or $125.40 per month, whereas under the present rate the average on the same basis would be $162, but he declined to give any figures for actual earnings.

Mr. Garretson said that the wage system is only one factor in the cost of living because if every man were given $100 a day he would lose because of the percentage of profit on the cost of production exacted by capital. Limitation of profits, therefore, he insisted, is the only solution, because the fixing of wages unless the price of every commodity is also fixed, simply constitutes individual serfdom for the employees, whereas if prices are fixed without wages being fixed the financial interests would become the serfs.

Representative Sanders asked whether the final decision of the board of directors on the wage question would be binding on the employees. Mr. Garretson replied that it would be if they remained in service, but that their inalienable right to strike could not be taken away. However, he insisted that this would become of less importance under the plan, in which each man would be a partner in the enterprise. Asked if he thought there would be a profit on the first year's operations under the plan, Mr. Garretson said frankly that he doubted if there would be the first year, but he thought that by the second year the results of the practical working of the plan would be shown. Mr. Sanders insisted that with the prospect of a deficit the employees would have a far greater interest in the amount of their wages than in any possibility of a dividend, and he thought Mr. Plumb's suggestion that a deficit would be cause for forfeiture of the lease was not borne out by the provisions of the bill. Mr. Garretson insisted that the difference in the interest of the officers and the employees would be an effective check. Mr. Sanders asked if the labor organizations had any suggestions for legislation, in the event the Plumb plan is not accepted. Mr. Garretson replied that they were concentrating on this issue, and thought they had no program for any other legislation at this time.

Representative Watson made the point that the railroad employees have been able to save money to put into Liberty Bonds, but Mr. Garretson replied that every dollar came from the increase in wages they have received under Government control.

Referring to Representative Sims' repeated assertions that the ability of the Government to issue tax-free bonds at a low rate of interest and the elimination of the element of taxation from the cost of transportation represented a great economic advantage, Representative Webster asked Mr. Garretson if the expenses of government for which the taxes are now required would not have to be paid by somebody in some other way. Mr. Garretson seemed to think there would be some saving somewhere, but insisted that the saving in freight rates was of greater importance. Representative Webster also pointed out that there are probably 22,000,000 male adults in the United States, of which under the Plumb plan 20,000,000 would be represented by five members of the board of directors, while 2,000,000 would be represented by ten members. "Isn't your board a little one-sided?" he asked. Mr. Garretson replied with a trace of irritation that if it is one-sided it is time that the employees had their day in court after the other side had been in control for fifty centuries. Representative Barkley said at the rate of 1 per cent a year it would take 100 years to retire the capitalization of the roads even at Mr. Plumb's reduced valuation, and asked what would happen if the earnings were not sufficient to pay the 1 per cent into the sinking fund. Mr. Garretson replied that the surplus earnings would result in a more rapid extinction of the capitalization, but that it is unthinkable that if an operating deficit should grow sufficient to interfere with operation that the Interstate Commerce Commission would not increase rates.

Mr. Plumb's Charges

In opening his statement before the committee on August 7, Mr. Plumb said:

"During this week and since your honorable committee requested me to appear in order to present the case of organized labor with respect to its bill, there has come into the possession of the railroad brotherhoods and ten affiliated railway labor organizations a state of facts never spread before the American people or submitted to the jury of public opinion. These facts tend to show that the wrecking and looting of the New York, New Haven & Hartford, the Chicago & Alton, the Rock Island system, and the 'Frisco Lines are not sporadic examples of the highway robbery to which the American nation has been subjected as to its public transportation highways. Leading directly from Wall Street and from the banking houses controlled directly by the Morgan and Rockefeller groups, these facts show that there has proceeded a systematized plundering of virtually all of the transportation highways of the United States."

On August 12, after the completion of Mr. Garretson's testimony, Mr. Plumb presented his promised statement, in which the "new" and startling information had flattened out to the following stripped of some of the verbiage:

"That the property investment accounts of the railway lines are wholly unreliable.

"That in the five railway valuations first completed and published by the Interstate Commerce Commission the cost of reconstruction new, including the increased value of lands and real estate, is but 50 per cent. of the aggregate property investment accounts.

"That the nearly completed survey of the entire transportation area of the United States contained in the reports of the valuation division, so far as that work has now progressed, confirms the results disclosed by the valuation of these five roads.

"That where the cost of reproduction now approximates the investment account, it will be found in most instances that this approximation is due to the fact that vast expenditures have been made out of surplus and excessive earnings, expended on or ploughed into the property.

"That President Underwood of the Erie Railroad, in an interview recently given to the New York World, stated that the expense of operation under government control had been greatly increased by the employment for political purposes of unnecessary employees, and that this increase in payroll expense had been made for the purpose of building a political machine. I charge that investigation will disclose that if there has been wastefulness of money in swelling the payrolls, it has been at the instance of railway managements to make the expense account under government control appear extravagant and wasteful.

"That at the time the government took control of the operation of the railroads they were in such depleted condition as to maintenance and repairs of both roadbed and rolling stock that it has required hundreds of millions of dollars advanced

by the government to place them in effective operating condition. That in the making of such expenditures the railroads operated and controlled by men under the influence of Wall Street directorates have spent vast sums in unusual expenditures for maintenance and supplies; that such unusual expenditures have been made for the purpose of placing these properties in perfect operating condition and furnishing them with supplies for a long period of operation ahead, such supplies having been paid for out of government money at exorbitant prices.

"That the Interstate Commerce Commission was six years ago directed by Congress in the valuation act to ascertain and report the value of all aids, gifts and grants made to railway corporations. This work has not been done.

"That the records disclose that an area of land exceeding 190,000,000 acres, has been given by the United States Government and by the various state governments to railroads to aid in the construction of national highways; that of the grants made 113,000,000 acres had been patented and 35,000,000 acres had been forfeited prior to June 30, 1910, and that of the remainder the greater part is still available. That the values of the grants so made have either been appropriated to the private property of the railway promoters or capitalized.

"That from 1900 to 1910, the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St. Paul, the Chicago & Northwestern, the Great Northern, the Illinois Central, and the Southern Pacific railroads gave away in bonuses to their stockholders more than $250,000,000; that the actual dividend disbursements on this excess capital for the year 1913 alone, amounted to more than $11,000,000.

"That from 1900 to 1910, 8 eastern railroads alone issued new stock for $101,000,000 less than its market value, or gave away this enormous amount in bonuses to stockholders; that the dividends paid on these fictitious stock issues in 1913 alone amounted to over $4,317,000.

"That during the same period 18 representative railroads operating in all parts of the United States as a whole, gave away stock bonuses aggregating $450,414,000.

"That these railroads are now controlled in whole or in part by the Morgan interests, the Rockefeller interests, and the Gould interests; that this control is made manifest by the interlocking directorates of the financial institutions directed by these interests, who through their directorates control the operations of these railways.

"That in the attempt of these interests to secure the adoption of any plan whereby the property investment accounts of these railways shall be recognized by law as the basis for ratemaking they are conducting a political conspiracy to procure from this government a validation of all of the illegal acts heretofore consummated by these railroad corporations, and to make into a binding obligation upon the public the exploitation through which these public highways have passed under their direction and control.

"On behalf of all of the employees of these systems of transportation and the public, we demand that Congress shall make a due and thorough investigation of the charges herein set forth, so that the American people may know to what extent it is sought to subject them to exploitation under the plans proposed to this committee of Congress, plans which would make lawful the fixing of rates based on the now unlawful aggregate property investment accounts of these systems."

Chairman Esch, in a few brief questions, indicated a belief that most of the subject matter of the charges had been thoroughly investigated by the Interstate Commerce Commission and that to spend any further time on them would be to travel over old ground. No other member of the committee asked any questions.

Plans for protection of transportation from interruption through labor disputes were presented to the committee in a statement by Stephen C. Mason, president of the National Association of Manufacturers.

Asserting that no program of railroad regulation is complete that does not protect the paramount public interest in uninterrupted transportation by rail, proposal was made that appropriate legislation be enacted to provide, first, whenever in the opinion of the President of the United States a dispute over hours, wages or working conditions threatens the interruption of a carrier essential to civil or military governmental needs or the free movement of commerce between the states or with foreign nations, he shall appoint a commission to investigate and decide upon the merits of the controversy, and until such finding is made any strike or lockout shall be unlawful; second, that, under the authority established by the decision of the Supreme Court in the Adamson case, whenever a labor dispute threatens the operation of an instrumentality of interstate commerce, the President shall have the power to appoint a commission which would write a contract for the parties in dispute, to be binding upon them until they reach a voluntary agreement by themselves, in which event their agreement would supersede that of the commission. Through this method, he said, freedom of contract would be left unimpaired unless and until the parties are unwilling or unable to agree, in which event the supreme interest of the public is asserted through its representatives.

The people of the country, Mr. Mason asserted, are now confronted with the proposition that they must either assent through their representatives, in social self-defense, to the control of Congress over commerce between the states or submit to its control and regulation by organized railway labor under the threat, by concerted action, of paralyzing that commerce upon which the life of the nation depends.

Urging that a declaration of a great constructive policy of transportation would clarify public thought and stimulate aggressive business activity, Mr. Mason asserted the belief of the members of the National Association of Manufacturers that the railroads should be returned to their owners; that Congress should, during the period of government administration, provide adequately for upkeep, betterment and expansion; that the rule of rate-making should be clearly defined by statute; that consolidation and co-operation among lines be authorized in the same manner as under present operation and administration; that the duties and functions of the Interstate Commerce Commission be modified and a Transportation Board be established.

It is the duty of Congress, he maintained, now to exert its full authority to define in the interest of the public the limits to which employers or employees, capital or labor, may go in threatening the facilities of commerce as a means of compelling the acceptance of economic demands or political policies.

National Grange Opposes Plumb Plan

Thomas C. Atkeson, Washington representative of the National Grange, has filed a statement with the House committee, saying in part:

"The National Grange is opposed to government ownership of the railroads, especially opposed to this plan, the so-called Plumb plan, which seeks not only to have the government acquire the railroads, but then turn them over to be operated by a management in which the men who draw wages will name two-thirds of the directors.

"If the railroad wage and salary workers can force this bill through Congress they can control the appointment of the other third of the management, and thus control it all. The government, or the public, will then pay the interest, the maintenance charges and whatever wages and rates are asked, as well as any deficit which may result.

"This matter is of such fundamental importance as a question of orderly government that I trust all farmers and farmer organizations, as well as all good citizens who respect

and appreciate our democratic form of government, will unite in opposition to this or any similar plan."

Plumb Plan Criticized in Congress

The Plumb plan, and more particularly the matter of its presentation, has aroused intense criticism in both houses of Congress and several speeches criticizing it most severely have been made. If any of the members of Congress are in favor of the plan they have been careful not to make the fact public within the last week. Representative Blanton of Texas, speaking in the House on August 8, declared that the brotherhoods caused the Adamson law to be passed by threats of strike, and are now repeating their threats to secure the adoption of the Plumb plan and another large increase in wages. This led to a general discussion of the events that led up to the passing of the Adamson law, in which several Representatives took the side of the brotherhoods in defending them against the charge that Congress was "held up" on that occasion, but they did not go so far as to say anything for the Plumb plan. Representative Black of Texas criticized the course of the brotherhoods on that occasion and declared himself in favor of a commission with full power to settle the differences which arise between the railroads and their employees.

In the Senate on August 11 Senator Myers of Montana declared that one of the greatest crises that ever confronted the people of the United States now confronts them. "I am not in favor of any increase in wages for railroad employees at this time," he said. "The railroads are being operated by the government at a tremendous loss and I think under those circumstances it would be wholly unjustifiable to increase the pay of railroad employees. That demand is also accompanied simultaneously with a demand that the industries of this country be sovietized and a vast propaganda has been started to back up this demand. It is also accompanied by threats of revolution, of force and of serious and dire disaster to the people if the demand is not granted by Congress. The Plumb plan is simply a bold, bald, naked attempt to sovietize the railroads of this country. If the railroads were sovietized it would merely be an entering wedge to conducting the industries of this country for the benefit of a favored few. The employees would fix their own wages; they would have the power to fix rates for passenger travel, to fix all freight rates and to regulate the amount of money to be taken from the people for the operation of the railroads. They would be absolute monarchs. The American public would be thoroughly Russianized. I am sorry to say it falls to the leaders of the railroad brotherhoods to present to the people of this country a concrete test of Bolshevism against Americanism."

Heat Treatment As Applied To Railway Materials*

By C. B. Bronson

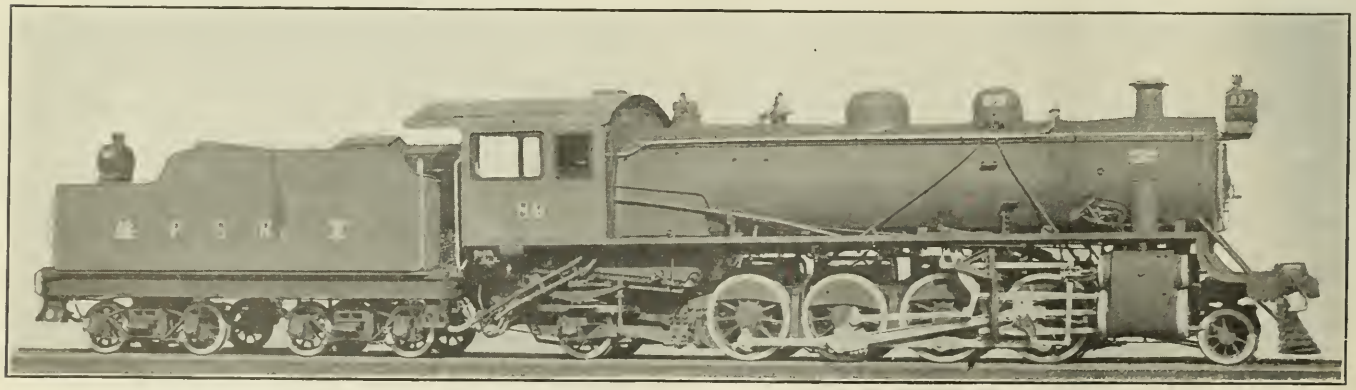
THE RAPID PROGRESS and advancement made in the science of heat treatment of steel during the war and subsequent thereto is of especial interest to railway officers, engineers and investigators. The knowledge gained from the recent developments in this art will be valuable to metallurgists and engineers in the design, specifications and treatment of steel for superior service. Railway people must search constantly for the highest grade of steel to meet the increasing demands of traffic and operation, which necessitates larger structures, larger power units, and high speeds.

The fundamental basis for successful heat treatment is sound steel. This implies not only structural soundness and freedom from blow holes, pipes, and inclusions, but chemical and physical homogeneity as well. Perhaps this seems axiomatic to all of us, yet a number of violations are frequently encountered, when investigations are made of service failures. Heat treatment of unsound steel probably does more harm that good, for even the best steel is put to a severe test during the quenching operation, while unsound or segregated metal may be easily fractured or weakened. Much discussion has appeared recently on the "notch effect" in rotating shafts and other parts, which brings out the fact that internal or external defects are in effect notches, or potential sources of failure, and may develop into such after a relatively short period of service. The question of soundness in steel cannot be too strongly emphasized.

Of the great number of steel materials used on railroads, perhaps none has been more widely discussed than the rail. The development of the rail section is an intensely interesting story of evolution and improvement, and it is therefore only natural that many researches have been conducted to improve its quality by heat treatment. Most of the work attempted has been experimental in nature on short length pieces, and not on full length rails. Many influences have retarded development of the latter, chief of which is the outlay and expenditure required to produce large tonnages, especially when it is recalled that present rail mills produce from one to three thousand tons of untreated rails daily. Furthermore, there is the question of higher cost, as well as the relative efficiency and reliability of treated versus untreated rails.

Probably for general service requirements, where properly designed sections are used, it will be a long time before the

*Abstracted from a paper presented at the June meeting of the New York chapter, American Steel Treaters' Society.



Mikado Locomotive Recently Built by the American Locomotive Company for the Pekin-Kalgan Railway of China

This locomotive has 20 by 28 in. cylinders; a weight on drivers of 139,000; a total weight in working order, engine only, of 187,500 lb.; a tractive effort of 34,300 lb. It is of standard gage and is superheated.

present efficient plain carbon basic open hearth steel rails will be replaced as standard for most of the roads in this country. Basic open hearth rail, under our present elongation and exhausted ductility test, making it possible to obtain nearly all the ductility due to the chemical composition, is a wonderfully efficient product with a low rate of failure, and moderate rate of wear.

The simplest process for heat treatment of rail steel, of course, is the air-cooling method introduced by one manufacturer. This consists of an air blast blown from numerous small openings in a straight pipe, and directed against the top surface of the rail head; the blast being maintained for about two minutes, after which the rail is allowed to anneal in air. The head surface metal becomes sorbitic for a depth of about one inch, and shows a Brinnell hardness of 300-350; elastic limit, 90,000 lb.; tensile strength, 140,000 lb.; and 8 per cent elongation. The balance of the head metal is pearlitic in structure with a Brinnell hardness of 240; elastic limit, 60,000 lb.; tensile strength, 125,000 lb.; and 10 per cent elongation. The carbon runs from 0.50 to 0.65 in this steel which is made from Mayari ores.

A number of patents have been issued to one company covering a combined oil and water treatment. The treatment consists in passing the finished hot rails, head down, into a series of quenching vats so constructed and regulated that the head only is treated in the first oil bath; passing them to the second vat where the head is immersed in water and the web in oil. In the third vat, both head and web are in water which completes the treatment. One modification of the process provides a spray to force the water against the rail head, instead of merely drawing it through the bath. A troostitic structure is obtained on three sides of the head, which tapers off into martensite for the balance of the head section. Drop and hammer tests on rails so treated indicate great toughness and ability to withstand severe shocks without failure.

The composition, and physical properties obtained after treatment are about as follows:

Carbon	0.40	Tensile strength	190,000 lb
Manganese	0.50	Elongation—2 in.	11 per cent
Silicon	0.25	Red. of area	30 per cent
Sulphur—max.	0.04	Brinnell—head	420 per cent
Phosphorus—max.	0.04	Brinnell—web and flange	200 per cent
Elastic limit	120,000 lb.		

One manufacturer found it necessary to redesign the standard section to heat-treat successfully rails made of Mayari steel. A section, similar to the present "B" type 100-lb. rail was used as a basis, and to this was added 21 lb. by providing very generous fillets between head, web and base and also increasing the thickness of the latter. The mechanical properties were apparently not given precedence in the design, as they are low for this weight of rail. The design was adopted to obtain uniform physical properties, provide relief and reduction of cooling stresses, and to utilize a set of rolls which were on hand.

The treatment used was experimental, and therefore the details are not generally known.

The composition and physical properties obtained after treatment were as follows:

Carbon	0.33	Elastic limit	115,000 lb.
Manganese	0.33	Tensile strength	140,000 lb.
Nickel	1.30	Elongation 2 in.	8 per cent
Chromium	0.50	Red. of area	15 per cent

Under the drop the test pieces withstood from 6 to 12 blows before fracture, when a 2,000-lb. tup was dropped 25 ft. on supports 3 ft. apart.

One or two of the eastern roads with very heavy traffic conditions secured several of these rails, and will probably be in a position in the very near future to report upon the success of the experiment.

The only alloy heat treated rails which have been made and purchased in large numbers are manganese steel rails. Those of early manufacture developed breakages with great frequency but this difficulty has since been overcome as a number of changes in manufacture were introduced. The New York Central purchased several hundred tons of these rails four years ago, and since that time they have carried over 100,000,000 tons of traffic without one failure and at a remarkably low rate of wear—an exceptionally good record. From present indications, they should outlast plain carbon steel rails in the ratio of ten to one.

The wonderful toughness inherent in manganese steel makes its use particularly inviting for rails on curves. Our present practice is to place them on the high side of curves with plain carbon rails opposite, generally reversed, curve worn high rails which make the best combination. The susceptibility to flow prohibits their use on the low side of curves, especially where the tendency to widen and flatten under the wheels of present improper contour is very great.

The 6-in., 105-lb. Dudley type rail is the only one which the New York Central has had rolled in manganese steel. This is a broad head, stiff section, possessing high mechanical properties which are necessary when using metal with such low elastic limits. Any road contemplating the purchase of manganese rails is advised against ordering them rolled in light sections, for the combination of the low elastic limit and deficient mechanical properties make it easy for them to acquire permanent sets in service, creating rough riding track, and may eventually be the cause of derailments. Manganese rails injured by truck derailments from causes other than roughness of track, are badly bent out of shape, although they remain unbroken. It is necesary to scrap the rails, as they can not be straightened by any known method.

The manufacture of manganese rails calls for several departures from the ordinary practice in the mill. Hot tops must be placed on the ingot molds to reduce the pipe and fill the cavity due to shrinkage, while great care is required in heating and soaking the ingots in the pits for proper rolling. The rails are rolled in the usual manner, and after sawing, are quenched at 1050 deg. C. by plunging them immediately into a cold water bath. They are then drawn through the bath by means of dogs on endless chains. The quenching is necessary for suppressing the transformation range, and to retain the structure in the austenitic condition, as otherwise the rails would be as brittle as glass.

The composition specified for rail steel is as follows:

Carbon	1.00 to 1.35	Phosphorus, max.	0.10
Manganese	10.50 to 15.00	Sulphur	Not specified

Tests for the physical properties are made by the usual drop test; the toughness and tenacity of the material being so great that several blows of the 2,000-lb. tup falling 20 ft. are required to exhaust the ductility, which frequently runs as high as 25 to 30 per cent per in. A load deflection test is made upon a full length rail supported at the ends and loaded by means of a scale pan at the center. Elastic limits found in this manner are close to 55,000 lb. per sq. in., which is a more reliable index than can be secured from tensile test specimens burned out of the rail section and ground to size. The results are always high by the latter method and therefore are not used.

The return of normal conditions should see an increasing amount of manganese steel rails placed in service, for there is no question about their superiority for overcoming curve wear to which our present rails quickly succumb.

It is well to mention, in passing, the successful use of manganese steel for frogs, crossings, and switch point tips. Their resistance to wear is similar to that of manganese rails, and they are used quite extensively. The tendency to breakage, however, is somewhat greater in the cast steel parts than for rolled rails.

Two heat treated track materials purchased in large quan-

tities, are rail splice bars, and track bolts. Splice bars are made to the following chemical and physical requirements:

Carbon	0.45 to 0.55	Elastic limit	65,000 to 72,000
Manganese	0.30 to 0.50	Elong. in 2 in.	12 per cent min.
Phosphorus, max.	0.04		

In manufacture, the bars are sheared to length, reheated to about 800 deg. C., hot punched and quenched at 700 deg. C., or over, then subsequently reheated or withdrawn from the oil bath for tempering. The high elastic limits obtained place them on the same level as rail steel so far as physical strength is concerned, and increase their resistance against permanent sets, and sagging at the joints.

Track bolts when heat-treated show elastic limits of 70,000 lb. and over when made of about 0.30 carbon steel. These high limits provide additional strength against stretching when tightened with the trackman's wrench, and becoming loose due to the transmission of stress at the rail ends, and the impacts from wheel loads. The usual process for heat treating consists in rolling the threads hot, then allowing the bolts to drop into a bath of oil and finally discharged into a hopper from an endless chain. Heat treated bolts are in extensive use and giving satisfactory service.

Orders of the Regional Directors

TWO-DAY-FREE-PER-DIEM-ALLOWANCE. — Circular 235 of the Southwestern regional director contains regulations covering the free-time allowance in the freight-car clause (section 6) of the Short Line contract.

Capital Expenditures for Replacing Fire Losses.—Circular 237 of the Southwestern regional director states that as only the smaller railroad structures destroyed by fire can be rebuilt before January 1, 1920, it does not seem necessary to rebuild or restore any buildings so destroyed, except where necessary for safety or the protection of the public; or where delay in restoration might work a serious hardship upon employees. In each case in which it is determined that one or more of the above conditions will require rebuilding or restoration, the proper form should be submitted to the regional director's office for any capital expenditure in excess of $1,000. If it is decided not to rebuild or restore the building, the procedure should be in accordance with the fourth paragraph of the director general's Circular 67 of December 5, 1918.

Embargo Notices.—The Southwestern regional director in Order 229 instructs that in cases where cars are partially loaded, but bill-of-lading has not yet been signed, at the time the agent receives notice of an embargo, shippers are to be permitted to complete the loading. The agent will forward these cars, making suitable notation on the way-bills.

Use of Telegraph Wires by Express Agents.—Circular 236 of the Southwestern regional director, canceling Circular 205 deals with Article 14 of the Agreement with the American Railway Express Company, concerning telegraph and telephone messages. Where the telegraph lines are operated by the railroads the messages of the express company can properly be transmitted without charge, as provided in the agreement; but it is not proper for an agent of the express company at a point on one railroad to send a message over railroad wires to a representative at a point on a second railroad, the word "railroad" meaning any road operated as a unit under the supervision of a single federal manager.

Numbering Railroad Messages.—The Southwestern regional director in Order 228 prescribes a method of numbering messages sent over railroad wires:

1. Allow one number for the first three lines of messages and an extra number for each three additional lines, the address and signature not to be counted. If a message contains six lines, two numbers should be allowed; if a message contains eleven lines, four numbers, etc. Joint messages addressed to two or more persons are to be allotted numbers as if they were separate messages.

2. The preceding rule is based on a typewritten message and assumes ten words per line. In other words, it is proposed to have one number for each thirty words.

3. In counting figures the same general plan should be followed. In the case of irregular forms where figures are not conveniently arranged in lines, the assumption of five figures per word will be satisfactory. In case an operator is spending considerable periods of time in sending and receiving forms, the assumption of forty numbers per hour will be satisfactory.

Freight Car Distribution—Circular 27.—The Southwestern regional director in Circular 234 states that the provisions of Division of Operation Circular 27 with respect to returning cars to owners for repairs appear to have been more broadly construed than was intended. Cars have been sent long distances home for comparatively light repairs. The purpose of this circular was to put into effect former M. C. B. requirements for the return of cars to owning lines for repairs and in addition the circular was intended to provide a means for the owners to get their cars home when desired for rebuilding or for the application of betterments. It was not desired that the cars should be sent home involving an intermediate line haul except for "rebuilding or for the application of betterments" as provided in paragraph C of the circular, in which case arrangements should be made for this movement in accordance with paragraph 6.

Roadmasters' Convention.—A. T. Hardin, regional director, Eastern region, by Circular 102-42, promulgates a letter from the director of the Division of Operation recommending that members of the Roadmasters' and Maintenance of Way Association be allowed to attend the convention of the association, at Chicago, September 16-19, so far as practicable. Roadmasters and supervisors who are not members may also be encouraged to go, where that is their wish and they can be spared. Some of the higher officers of the maintenance of way department might also attend with profit. Men who attend the convention should take notes so as to report their observations when they return home.

Transportation of Liquors.—The regional director, Eastern region, by circular 600-190, supplements previous instructions regarding the transportation of intoxicating beverages, with advice that such goods may be legally transported from one bonded warehouse to another; in such cases the liquor remains in the custody of the government; the Internal Revenue Department will not release liquors for unlawful purposes.

Passenger Traffic on Labor Day.—A. T. Hardin, regional director, Eastern region, by circular 1600-204, promulgates instructions from the director of the Division of Traffic reminding federal managers to take all suitable measures for moving a large passenger traffic on Labor Day. Special care must be taken in handling baggage as many families will be returning from the summer resorts. It is not expected that troop movements will interfere materially wih Labor Day traffic.

Color of Locomotives. "Speaking of Chinese railroads reminds me of the failure of an American manufacturer to obtain a contract for locomotives because his European competitors made a more careful study of Chinese peculiarities," writes Lynn W. Meekins in the Scientific American. "One locomotive was ordered from each of the competing companies. In every respect save one the American product was unmistakably superior. However, it had been painted black before shipment from the works, and on the way across the Pacific it became more or less rusted. Its appearance, therefore, was far less attractive than that of the European locomotives, which were painted in accordance with Chinese preference, and had been touched up by the manufacturers' agents after arriving in China. Don't get your colors mixed if you want to sell goods to the Chinese."

Carolina, Clinchfield & Ohio Freight Locomotives

Built to the Roads' Specifications, Permitting the Use of Exceptionally Liberal Clearances

DURING THE EARLY part of the summer, the Carolina, Clinchfield & Ohio received eight heavy 2-8-2 type locomotives and seven heavy 2-8-8-2 type Mallet locomotives from the Baldwin Locomotive Works. The order for these locomotives was placed with the builders in the spring of 1917 and they have been built to specifications prepared by the railroad company.

The Mikado type locomotives are for use in handling the heavy merchandise business from Elkhorn City, Ky., to Spartanburg, S. C., and have proved highly satisfactory in this service. The character of the Carolina, Clinchfield & Ohio, with its long easy grade, provides ideal conditions for the operation of Mallet type locomotives and heavy tonnage trains and the new Mallets are handling coal traffic originating at the mines of Virginia for delivery to the railroads and industries of the south.

On account of the generous clearances which were provided when this line was built, it has been possible to employ large limiting dimensions in the design of these locomotives. For the Mikado type the clearance width is 11 ft., while for the Mallet type locomotives the clearance width is 11 ft. 6 in., and the maximum height for both designs is 16 ft. 8 in. The liberal width clearance has allowed considerable latitude in the design of details to avoid cramping on both locomotives and on the Mallet type has permitted the use of low-pressure cylinders of sufficient size to prevent the necessity of using a high boiler pressure. On the Mikado type the spread of the cylinders is 91 in., while on the Mallet type it is 90 in., in both cases permitting the design of crankpins of good proportions.

The Mikado type locomotive, which develops a tractive effort of 56,000 lb., has a total weight of 311,400 lb., of which 230,000 lb. is on the drivers. The cylinders are 27 in. in diameter, and have a stroke of 30 in. Reference to the table comparing the C. C. & O. locomotives with the Railroad Administration designs of the same type shows that the Mikado type has 4,000 lb. less tractive effort than the Standard heavy Mikado and has 13,600 lb. less weight in working order. The reduction in tractive effort is due to the shorter piston stroke of 30 in.

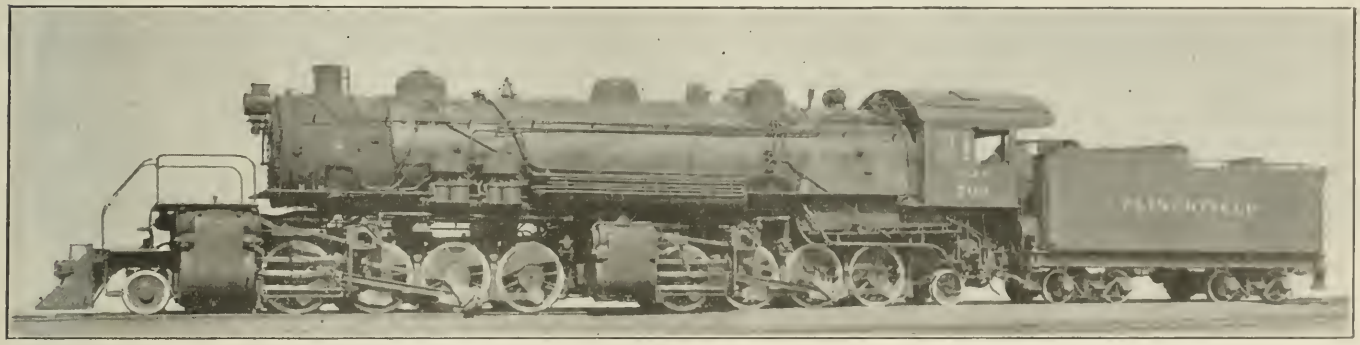
COMPARISON OF C. C. & O. AND U. S. R. A. LOCOMOTIVES

	Mikado		Mallet	
	C. C. & O.	U. S. R. A.	C. C. & O.	U. S. R. A.
Tractive effort, lb.	56,000	60,000	{103,560* / 111,300†}	{101,570* / 109,840†}
Weight, total, lb.	311,400	325,000	523,600	531,000
Weight on drivers, lb.	230,000	240,000	467,000	478,000

Cyl's, dia. and stroke, in.	27 by 30	27 by 32	28 and 42 by 32	25 and 39 by 32
Diameter of drivers, in.	63	63	57	57
Boiler pressure, lb. per sq. in.	190	190	200	240
Evaporating heating surface, sq. ft.	4,128	4,297	6,125	6,120
Superheating surface ,sq. ft.	1,035	993	1,510	1,475
Grate area, sq. ft.	78	70.8	96	96
Weight on drivers ÷ tractive effort	4.1	4.0	4.5*	4.7*
Tractive effort × dia drivers ÷ equiv. heat. surface	621.0	653.2	704.0*	695.0*
Equiv. heat. surface ÷ grate area	72.8	81.7	87.5	86.6

* Baldwin Locomotive Works' formula for tractive effort.
† American Locomotive Company's formula for tractive effort.

The Mallet locomotive has a tractive effort about 2,000 lb. greater than the U. S. R. A. heavy Mallet type, with a weight in working order of 523,600 lb. and 467,000 lb. on the drivers, these weights being 4,700 lb. and 11,000 lb. less respectively than the weights of the standard locomotive. The cylinders are 28 in. and 42 in. in diameter by 32 in. stroke, and the boiler carries a working pressure of 200 lb. per sq. in. as compared with the smaller cylinders and boiler pressure of 240 lb. used on the standard locomotive.

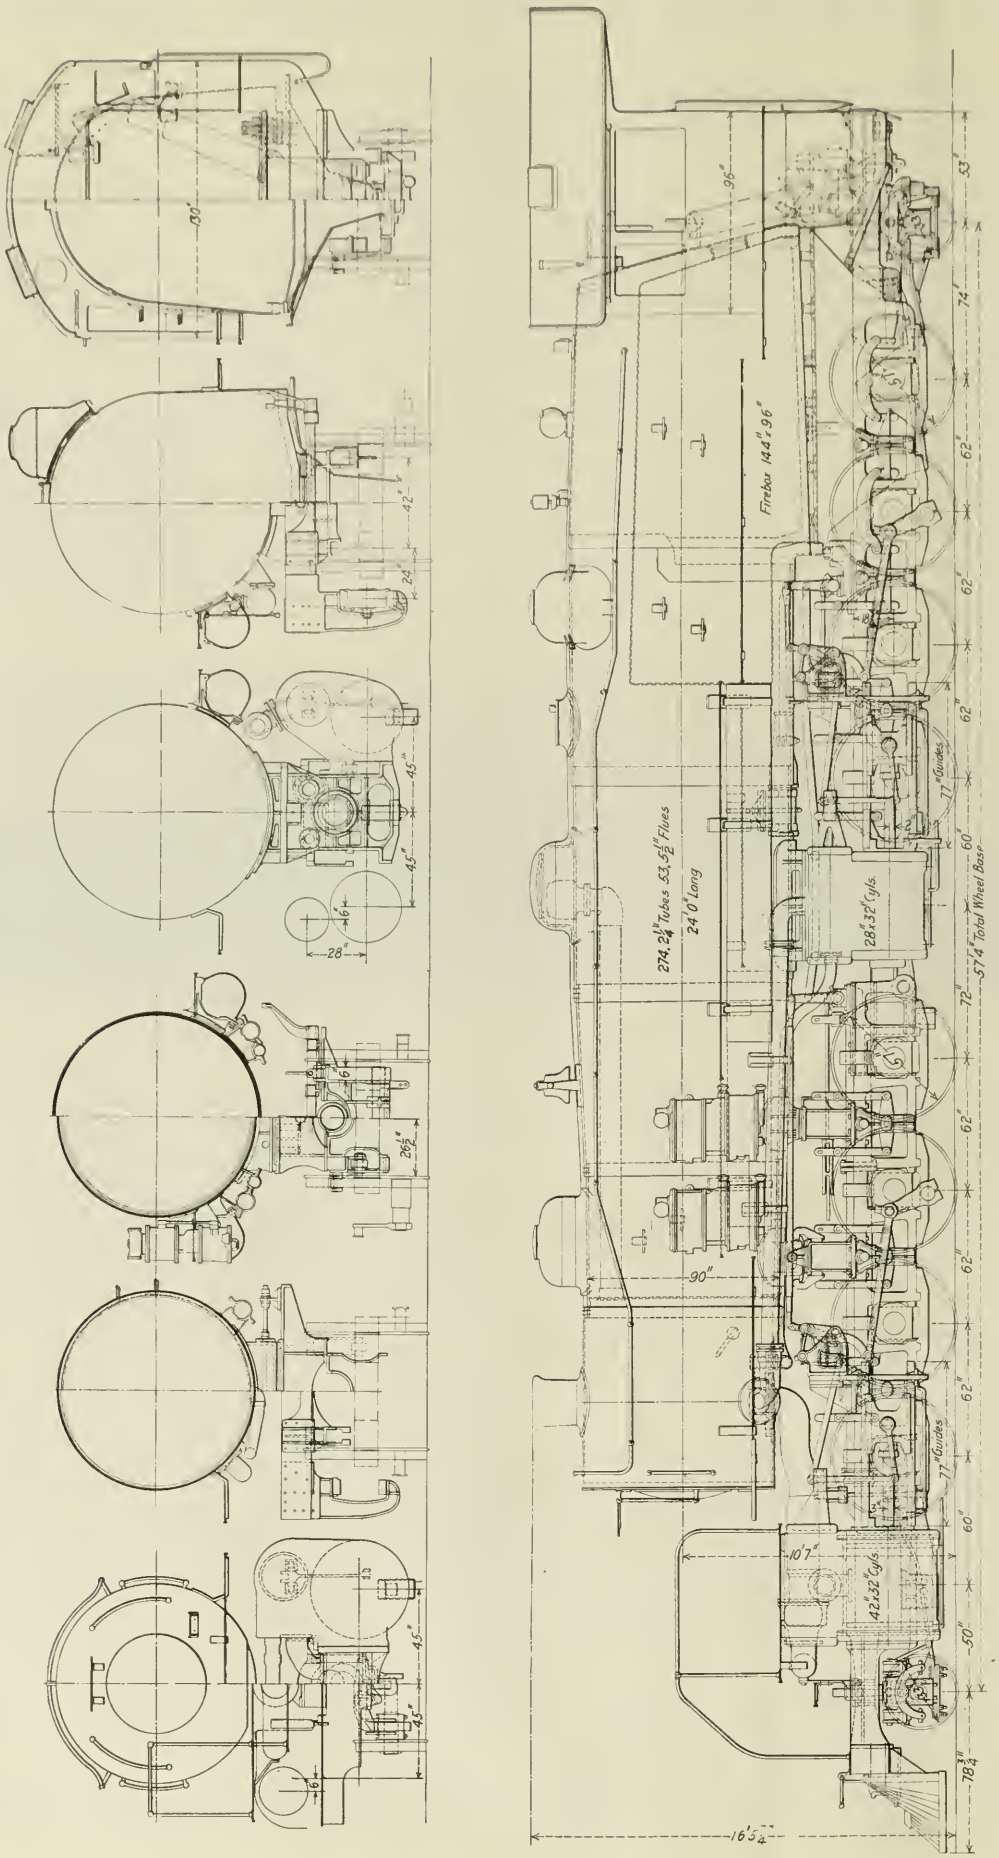


C. C. & O. 2-8-8-2 Type Locomotive

The boilers of the Mikado locomotives are of the straight type with three barrel courses, telescopically arranged, with an outside diameter at the front course of 82 in. The firebox has a throat-sheet approximately 2 ft. deep below the forward end of the arch tubes. The tubes and flues are 21 ft. long and no combustion chamber is included. Comparing the boiler with that of the standard heavy Mikado type, it will be found that a larger grate area has been obtained by designing the firebox approximately 12 in. wider. On the other hand the number of tubes is 38 less and they are two feet longer, while the firebox heating surface is reduced by the omission of a combustion chamber. The net result is a reduction in total heating surface, as shown in the table, and a less effective heating surface distribution on the basis of the principles most generally accepted in boiler design.

The boiler of the Mallet type locomotive is of the conical type with a diameter outside of the first ring of 90 in. The boilers of these locomotives have a firebox 144 in. long, and a barrel combustion chamber extends forward 66 in. from the throat-sheet. The tubes and flues are 24 ft. long. The boilers of these locomotives are quite closely comparable in their proportions with those of the standard Mallet type locomotives.

On both types of C. C. & O. locomotives the inside fireboxes are welded throughout, no riveted joints being employed. The joints are butt welds located on the straight por-



Elevation and Sections of the Carolina, Clinchfield & Ohio Mallet Type Locomotive

tions of the sheets well back from the corners. The tubes and flues are also welded in the back tube sheets. All of the locomotives are equipped with Duplex stokers and Franklin grate shakers.

Both types of locomotives have vanadium cast steel frames and heat-treated, hollow-bored axles. The journals are the same on both types, the main having a diameter 11½ in. while the others are 11 in. in diameter. They are all 13 in. in length. The Mikado locomotive is equipped with the Commonwealth rear cradle casting and the K. W. trailing truck. The frames of the two units on the Mallet type are fitted with the Baldwin flexible type articulated connection.

They are equipped with Baker valve gears, controlled on the Mallet locomotives with the Ragonnet power reverse gear, and on the Mikado locomotive with the Lewis power reverse gear. The Mallet locomotives are equipped with reducing and intercepting valves and have auxiliary high-pressure exhaust nozzles discharging into the stack. Both locomotives are fitted with outside connected throttles.

The principal data and dimensions of the two types are as follows:

	Mikado	Mallet

Mikado Type Locomotive Built for the C. C. & O.

Misfits Under State Control.—In a very large concern, as any state-controlled undertaking is bound to be, it is exceedingly difficult to prevent square men from being forced into round holes. Certain positions are paid at certain rates based originally on the relative importance of each position. In course of time this pay became stereotyped, and cannot well be altered without dislocating the whole machine. What are the consequences? Owing to long and faithful service in one department in which he has become singularly efficient, a man is entitled to better pay; owing, however, to there being no vacancy in his department he cannot be advanced therein. In some other department, more or less (often less) in touch with his office, there happens to be a vacancy which, if he be appointed to it, would give him the extra emoluments to which he is justly entitled. It therefore saves the higher authorities much trouble and worry to fill the vacancy accordingly, although the newcomer is absolutely strange to the work. This occurs even in the Army, and the action vulgarly called "kicking a man upstairs" is often the only way to remove a man from a position in which he has been an utter failure—or to give his duty to another man who has well earned it. It is, indeed, difficult to see how this necessary evil can be avoided entirely, although gross cases might often be avoided by a little more tact, or by taking of a little more trouble in assorting. Favoritism and nepotism, also, are all too often to blame in these matters.—*Railway Gazette, London.*

Railroad Administration to Consider Wage Demands

Shop Employees Gradually Return to Work and Other Organizations Prepare Specific Proposals

WASHINGTON, D. C.

THE NEW CYCLE of general advances in railroad wages seems to have been definitely opened.

The committee of 100 representing the six shop craft unions comprised in the Railway Employees' Department of the American Federation of Labor was expected to resume negotiations this week with Director General Hines and his assistants in the Railroad Administration on their demands for increased wages on which the Board of Railroad Wages and Working Conditions on July 16 submitted to Mr. Hines a divided report. Large numbers of the shop employees had gone on strike on August 1 and following days because Mr. Hines had not rendered a decision on their demands, but instead had written a letter to the President recommending legislation for the creation of a special wage tribunal. They returned to work gradually after the President had instructed Mr. Hines to deal with them only on condition they called off the unauthorized strike.

The Railroad Administration is now confronted also with a general demand by all of the 14 organizations of railroad employees for increases in pay "to at least re-establish the pre-war purchasing power of their wage," but the specific demands have in most cases not yet been presented. The case of the shop employees was fully heard by the wage board during March and April, and is now before the director general for decision, the three labor members of the board having recommended an increase from 68 to 80 cents an hour for the principal classes and the three official members having recommended no increase at this time. The demands of the Brotherhood of Railroad Trainmen have also been given their hearing before the board.

The Brotherhood of Railway Clerks, Freight Handlers, Station, Express and Steamship Employees, claiming to represent 450,000 men, had announced through its president, J. J. Forrester, that strike votes would be sent out at once to enforce its demand for an increase of 20 cents an hour and a 44-hour week.

Mr. Hines has estimated that to grant the increases recommended by the shop employees would require a general increase to all employees that would amount to approximately $800,000,000 a year on the same basis. Neither he nor the President has indicated definitely the extent by which it is proposed to meet the resulting increase in expenses from rates or by a request for a further Congressional appropriation. It has been estimated in the Railroad Administration that without any further increases in rates the situation called for at least a 10 per cent increase in rates and an addition of $800,000,000 a year to expenses would amount to an additional 23 per cent in freight revenues. The employees have suggested that the increased wages be paid for first by an appropriation pending an investigation by the rate-making body as to what increases, if any, should be made in rates.

Strikers Ordered Back to Work

Congress having declined to take from President Wilson and Director General Hines the responsibility for dealing with the wage demands being pressed by the organized railroad employees, the President on August 7 directed Mr. Hines to take up and consider on their merits the demands of the shop employees as soon as they should recognize the authority of their central officers and return to work. Mr. Hines thereupon addressed a letter to B. M. Jewell, acting president of the Railway Employees' Department of the American Federation of Labor, enclosing a copy of the President's letter and saying: "It is obvious that it is of the highest importance, not only in the interest of the public, but in the interest of the employees themselves, that they shall immediately return to work. The situation having been clarified by the definite indication that Congress does not wish to take action in the premises, the Railroad Administration stands ready to take up the wage question on its merits with the duly accreditted international officers and their authorized committee as soon as the employees return to work."

About midnight Mr. Jewell sent a message to the officers and members of the six shop craft unions ordering those out on strike to return to work and saying that the failure of the membership to comply with his instructions would have a detrimental effect on the entire labor movement.

Senate Committee Says President Has Plenary Authority

As stated briefly in last week's issue, the Senate committee on interstate commerce at its meeting on August 6 had decided not to accept the President's recommendation for the creation of a special wage tribunal and authorized Chairman Cummins to write a letter to the President, saying he already had full authority. This action was unanimous, representing the opinions of the Democrats and Republicans alike. The letter was delivered to the President on the following day. Senator Cummins said the committee recognized the gravity of the situation and desired to co-operate in bringing about the proper solution, but felt that Congress has already given the President "complete and plenary authority, and that additional legislation could add nothing to his power in the premises. The letter continued.

"The director general can fix the wages of all men employed in the transportation service, and it seems to be clear that it is for him to say whether the compensation of these men should or should not be increased. He has all the available information which can possibly be secured, and it is the view of the committee that he should act in accordance with the public interest and his own judgment. He can be advised upon the subject by any board or tribunal which you may select for that purpose.

"The director general has also the absolute right to initiate rates for transportation and can advance or lower them as he may think necessary or wise to meet the requirements of the transportation systems in his charge, and, moreover, he can put the new rates into effect whenever, in his judgment, they should become effective.

"At the present time the Interstate Commerce Commission has not the authority to suspend for examination or approval the rates initiated by the director general; but even if the act which lately passed the Senate and which has not yet passed the House shall become a law and the authority of the Interstate Commerce Commission to suspend rates be restored, it will still be true that the director general must initiate the rates and it is entirely impossible to believe that the commission would suspend rates that are necessary in order to pay any increased wages of railway operatives.

"The committee is now diligently engaged in the preparation of a bill for the general reorganization of our system of regulation and control. One common phase of the many plans which have been submitted relates to the further direction which ought to be given to the Interstate Commerce Commission for its guidance in determining the reasonableness of rates. Upon that phase of the subject diverse opinions have

been developed, and it is thought to be unwise to bring forward for action by Congress any further legislation in that respect until it can be associated with the general plan of reorganization.

"If the committee felt that there was any lack of power on your part or on the part of the director general it would be quick to act; but inasmuch as it can perceive no want of authority, it has reached the conclusion that no additional legislation is required to meet the particular emergency which you have pointed out."

Action on the part of the President came later in the day, when Mr. Hines called at the White House and informed him regarding the number of men that had gone on strike regardless of the instructions of the officers of their national organization in Washington and showed him the statement signed by the 14 railroad labor organizations which he had received on August 4. The House had taken no action on the President's recommendations pending receipt of a draft of a bill which Mr. Hines was having prepared, but President Wilson accepted the decision of the Senate committee as final and wrote Mr. Hines a letter saying that Senator Cummins' letter had set him free to deal as he thought best with the wage question.

"I thought it my duty to lay the question in its present pressing form before the committee of the Senate," he said, "because I thought that I should not act upon this matter within the brief interval of Government control remaining, without their acquiescence and approval. Senator Cummins' letter, which speaks the unanimous judgment of the committee, leaves me free and indeed imposes upon me the duty to act."

The letter then referred to the proceedings before the Board of Railroad Wages and Working Conditions, saying: "The board having now apprised us of its inability, at any rate for the time being, to agree upon recommendations, it is clearly our duty to proceed with the matter in the hope of disposing of it."

"You are therefore authorized to say to the railroad shop employees that the question of wages they have raised will be taken up and considered on its merits by the director general in conference with their duly accredited representatives. I hope that you will make it clear to the men concerned that the Railroad Administration cannot deal with problems of this sort, or with any problems affecting the men, except through the duly chosen international officers of the regularly constituted organizations and their authorized committee. Matters of so various a nature and affecting so many men cannot be dealt with except in this way. Any action which brings the authority of the authorized representatives of the organizations into question or discredits it must interfere with, if not prevent action altogether. The chief obstacle to a decision has been created by the men themselves. They have gone out on strike and repudiated the authority of their officers at the very moment when they were urging action in regard to their interests.

"You will remember that a conference between yourself and the authorized representatives of the men was arranged, at the instance of these representatives, for July 26 to discuss the wage question and the question of a national agreement, but before this conference took place or could take place, local bodies of railway shopmen took action looking toward a strike on the first of August. As a result of this action, various strikes actually took place before there was an opportunity to act in a satisfactory or conclusive way with respect to the wages. In the presence of these strikes and the repudiation of the authority of the representatives of the organization concerned, there can be no consideration of the matter in controversy. Until the employees return to work and again recognize the authority of their own organizations, the whole matter must be at a stand still.

"When federal control of the railroads began, the Railroad Administration accepted existing agreements between the shopmen's organizations and the several railroad companies, and by agreement machinery was created for handling the grievances of the shopmen's organizations of all the railways, whether they had theretofore had the benefit of definite agreements or not. There can be no question, therefore, of the readiness of the Government to deal in a spirit of fairness and by regular methods with any matters the men may bring to their attention.

"Concerted and very careful consideration is being given by the entire Government to the question of reducing the high cost of living. I need hardly point out how intimately and directly this matter affects every individual in the nation, and if transportation is interrupted, it will be impossible to solve it. This is a time when every employee of the railways should help to make the processes of transportation more easy and economical rather than less, and the employees who are on strike are deliberately delaying a settlement of their wage problem and of their standard of living. They should promptly return to work, and I hope that you will urge upon their representatives the immediate necessity for their doing so."

The refusal of the Senate committee to take over the responsibility for dealing with the wage question and the related qustion of rate advances leaves the responsibility for a decision with Mr. Hines, where it was before, but it leaves him in a stronger position. If he had granted additional wages and had attempted to offset them with further increases in rates under the broad powers conferred on the President and the director general during the war he would undoubtedly have been subjected to violent criticism in Congress, and he would have had no assurance that his rates would have been allowed to remain in effect whether or not the Cummins bill is passed. Congress and others may yet criticize whatever he does, but at any rate he has been given such clear instructions to go ahead and use his judgment that it is believed the commission could hardly fail to recognize his wages in relation to a rate increase. Nor can Congress accuse him of acting without authority if he goes before it with another request for an appropriation, although there would probably be some discussion as to whether any further increase in wages at this time should be charged to the taxpayers, as a part of the cost of the war, instead of to the patrons of the railways, as a part of the cost of transportation.

Director General Hines has authorized the following:

"The shop men who have been on unauthorized strikes in various parts of the country are rapidly returning to work and already conditions are practically normal in most parts of the country. It is anticipated that at a comparatively early date the strikes will have entirely terminated whereupon the Railroad Administration will promptly take up and deal with the wage questions now pending.

"Ever since it was made clear by the action of the Senate committee that Congress does not wish to deal with the grave wage problems now pending, and the rate problem which is also inextricably involved, and also will offer no objection to the Railroad Administration exercising the powers conferred by the federal control act to deal at this late date in federal control with this great subject (the issue involving hundreds of millions of dollars) I have been giving my continuing attention to the study of the matter with a view to making a just and reasonable exercise of the heavy responsibility which thus rests upon me.

"In this connection I would like to make it clear to the public and the railroad employees alike that the situation now existing could not have been dealt with until this time.

"It is true that in February, 1919, the shopmen submitted their proposals to the Board of Railroad Wages & Working Conditions, but when this was done it was clearly understood that since the original proposals of the shop employees had been dealt with in July, 1918, while other classes of em-

ployees making similar proposals had received no consideration at all, these other classes of employees must first be dealt with. Another circumstance of importance was that the shopmen were also pressing proposals for uniform rules and working conditions involving a great many points of difference and difficulty. The result was that despite the most earnest desire on the part of all the members of the wage board to deal promptly with these matters, no members of the board, either the labor members or the management members, were in position to submit their final suggestions until July 16, before which time the date of July 28 had been fixed upon by agreement with the representatives of the shop employees for a discussion of the rules and working conditions and wage matters.

"By July 16 the situation had assumed a wholly different shape. Practically every class of railroad employees had come forward urging either an increase in wages or a reduction in the cost of living.

"Therefore by the time the conference with the shop representatives took place on July 28 the Railroad Administration was confronted with a situation involving practically all of the 2,000,000 railroad employees and necessarily had to obtain a clear understanding as to the powers it ought to exercise in this regard so near the termination of federal control. I therefore proposed to the President, and he forwarded to the Interstate Commerce Committees of the Senate and House, the recommendation that Congress establish a wage board to deal with these matters and provide that the Interstate Commerce Commission should make such rates as might be necessary to meet any wage increases so made. When the Senate Committee unanimously decided against this course and indicated its view that the matter could properly be handled through the powers created by the federal control act, the situation was clarified in such a way as to admit of my assuming the responsibility incident to such far reaching action."

Director General Hines has sent a reply to a telegram from James Hamilton Lewis of Chicago, saying that he cannot consistently comply with the suggestion to deal directly with the local representatives of the striking shopmen in Chicago. The Railroad Administration, he says, cannot deal with these problems except through the duly chosen international officers of the regularly constituted organizations and their authorized committee. The Railroad Administration has pursued a consistent policy in this respect and has dealt with these duly chosen representatives from the beginning of federal control. The strikes which have taken place have not been authorized according to the laws of the shopmen's organizations with which at all times the Railroad Administration has dealt and these strikes have had the effect of repudiating the established organizations and of bringing the consideration of the matter to a standstill.

Shop Employees Return to Work

Reports began to arrive on Friday from all over the country that the striking shopmen were returning to work, although some of the men, including the employees of the Washington Terminal Company, refused to do so until their demands had been met. The strike had been in progress long enough to hamper the work of many of the roads considerably, and to interfere with the vigorous efforts that had been ordered to reduce the number of bad order cars that had accumulating during the spring months. On some roads it had been necessary to curtail some train service. Union officials in Washington said that about 40,000 men had walked out, although local officials of the unions had claimed from 100,000 to 250,000 had gone out.

In connection with the new wage demands it is understood that Mr. Hines considers the two main points to be ascertained are: First, how much the cost of living has increased as compared with the increases in wages allowed last year, and by supplemental orders during the first part of this year, and, second, comparisons with wages being paid in other industries for similar or comparable classes of work.

Fourteen Organizations Demand More Wages

The statement presented to Mr. Hines on August 4, by the 14 organizations, as briefly noted in last week's issue, is as follows:

"After having given careful thought to all that was said at our conference with you and your associates August 4, 1919, we present the following for your consideration:

"Railroad employees have loyally co-operated in the operation of the railroads and are entitled to compensation which will at least re-establish the pre-war purchasing powers of their wage.

"We do not agree that rates of pay to employees and transportation charges are in any way so related. Minimum rates of pay should be sufficient to guarantee to the most unskilled employee an adequate living wage, with such additional amounts as will meet the necessities incident to old age, injury, sickness, and death, and higher rates based upon the skill, responsibility, and hazard required and involved. Also these wage rates should be such as will compare favorably to the wages paid for similar service in other industries.

"Transportation rates should be sufficient to guarantee:

"First—To all employees this just and equitable wage.

"Second—Maintain the properties in condition to render adequate service to the public.

"Third—Equitable returns upon the money actually invested.

"We cannot approve of the plan proposed by you for a congressional committee, for the reason that it means months of delay at a time when the questions involved require immediate settlement.

"You already have in the Board of Railroad Wages and Working Conditions the necessary machinery to dispose of these questions, and we ask that their function be restored and they be allowed to pass upon the questions submitted to them and that their findings be placed before the representatives of the recognized organizations for their consideration and be mutually agreed upon before being issued.

"The moneys with which to pay these increases should, in our opinion, be raised by an appropriation by Congress. This appropriation should be of a sufficient amount temporarily to take care of immediate deficits. In the meantime let the proper rate making body make a careful study as to what, if any, increases should be made in passenger and freight rates, prompt action in this regard being both essential and desirable. This will only give temporary relief and must be accompanied, or immediately followed, by a determined effort not only to prevent a further increase in the cost of living, but to secure a reduction therein.

"Any permanent solution of the railroad problem must necessarily remove the element of returns to capital as the sole purpose of operation. Therefore, we ask that you urge upon the President the necessity for the prompt passage by Congress of the required appropriation bill to meet the emergency now existing.

"Also that you indorse the Sims bill (H. R. 8157) now before the House of Representatives, and recommend to the President that he use all his influence to secure its immediate passage by Congress as the permanent solution.

"The Sims bill, if enacted into law, will give to the Interstate Commerce Commission its original authority over transportation rates, and employees cannot hope for increases in rates of pay except as they result from economy and efficiency in operation due to their own collective effects. Any increases to employees under this bill guarantees to the public equal benefits in reduction of transportation charges.

"Capital will be fully reimbursed for all money actually invested. Therefore no one can possibly suffer by the enactment

of this bill, unless it be the employees themselves, and they are willing to risk their future."

President Wilson's Address

In his address to Congress on August 8, in which he urged an active campaign to reduce the cost of living, the President referred to the wage question and the "vicious circle" as follows:

"It is a matter of familiar knowledge, also, that a process has set in which is likely, unless something is done, to push prices and rents and the whole cost of living higher and yet higher, in a vicious cycle to which there is no logical or natural end. With the increase in the prices of the necessaries of life come demands for increases in wages—demands which are justified if there be no other way of enabling men to live. Upon the increase of wages there follows close an increase in the price of the products whose producers have been accorded the increase—not a proportionate increase, for the manufacturer does not content himself with that, but an increase considerably greater than the added wage cost and for which the added wage cost is oftentimes hardly more than an excuse. The laborers who do not get an increase in pay when they demand it are likely to strike, and the strike only makes matters worse. It checks production, if it affects the railways it prevents distribution and strips the markets, so that there is presently nothing to buy, and there is another excessive addition to prices resulting from the scarcity."

He also referred very pointedly to the present situation in the railroad field when he said:

"I believe, too, that the more extreme leaders of organized labor will presently yield to a sober second thought and, like the great mass of their associates, they will think and act like true Americans. They will see that strikes undertaken at this critical time are certain to make matters worse, not better—worse for them and for everybody else. The worst thing, the most fatal thing that can be done now is to stop or interrupt production or interfere with the distribution of goods by the railways and the shipping of the country. We are all involved in the distressing results of the high cost of living and we must unite, not divide, to correct it. There are many things that ought to be corrected in the relations between capital and labor, in respect of wages and conditions of labor and other things even more far-reaching, and I, for one, am ready to go into conference about these matters with any group of my fellow countrymen who know what they are talking about and are willing to remedy existing conditions by frank counsel rather than by violent contest. No remedy is possible while men are in a temper, and there can be no settlement which does not have as its motive and standard the general interest. Threats and undue insistence upon the interest of a single class make settlement impossible. I believe, as I have hitherto had occasion to say to the Congress, that the industry and life of our people and of the world will suffer irreparable damage if employers and workmen are to go on in a perpetual contest, as antagonists. They must, on one plan or another, be effectively associated. Have we not steadiness and self-possession and business sense enough to work out that result? Undoubtedly we have, and we shall work it out."

Labor Leaders Deny Intimidation

Whether or not it was influenced by the President's statements regarding strikes or whether it was considered that the impressions created by the various previous statements made by the labor leaders had had their effect, the executives of the 14 labor organizations embraced in the Plumb Plan League issued a statement on August 9 denying any purpose of intimidation.

"To prevent any misunderstanding as to the policy of the organized railroad employes," said the statement, "we united in a definite assertion that we have no desire and have had none to impress upon the public, by violence or by threat, our proposal that the railroads be nationalized under 'tripartite control.'

"Two distinctly separate considerations now confront the the people, the wage requirements of the railroad employes and the Sims bill (embodying the railway employes' plan for reorganization of the railroads).

"In the matter of wages we have submitted an eminently just proposition. We have said that if we are to continue to live as Americans should live, and are to care for our families as American families should be cared for, the profiteers must be restrained and our wages increased. Every fair-minded man, and every intelligent housewife, will recognize the reasonableness of this request. If Congress and the President cannot meet this request, it is still a living question and we shall have to try to find another solution.

"This, however, bears in no way upon our sponsorship of the Sims bill. We do hold to our conviction that the railroad employes are in no mood to consign themselves finally to the autocratic control of financial dictators, but in proposing the elimination of capital and the tripartite directorate, we have no purpose of intimidation. We appeal to the statesmanship of America and to the common sense of American manhood and womanhood. We believe in the native ability of American labor. What we ask is the Americanization of the railroads."

Rumors regarding plans of the labor leaders to threaten strikes either as an incentive to Congress to look with favor upon the Plumb plan or in connection with wage demands have been current for several months. As long ago as July 10 the following was distributed confidentially among the members of a prominent business association in a circular letter based on the association's advice from Washington:

"The bill above mentioned will be introduced in both houses of Congress simultaneously and almost immediately thereafter national propaganda in favor of the bill will appear. Paid lecturers will be sent into all parts of the country, invading even the smallest villages. There will be also a well-organized publicity bureau, which will flood the newspapers of the country with material favoring the bill.

"In the event that the Plumb plan is not given the fullest consideration by Congress, and if Congress permits the return of the roads on January first next instead of permitting the question to lie open so that it can be made an issue in the presidential campaign, there is said to be an understanding among the leaders of the brotherhoods that a general strike shall be called for January 1. The strike will occur in any case unless there is assurance of wage increases.

"Ample funds have been secured for the organization behind the Plumb Plan, and it has the full power of labor at the Capitol. It seems therefore certain that the railroad issue will be thrown bodily into politics. It is the Plumb contention that it ought to be in politics, and that no decision should be made as to the roads until the people have had a chance to register their opinion.

"This confidential information is given members of this Association in order that they may anticipate possible transportation difficulties at a later date in the handling of their transcontinental and interstate business."

Senator Smoot has made a protest in the Senate against the appointment of former Representative Edward Keating as "business manager" of the Plumb Plan League, at the same time that he is drawing a salary of $7,500 from the Government as a member of a commission created by Congress for the purpose of reclassifying the salaries of Government employees. Mr. Keating was quoted in the newspapers as saying he did not intend to devote much time to the league until after January 1, when his work for the Government would be completed.

The latest reports on the number of shopmen on strike throughout the United States show a decided improve-

ment in the situation. In the East, Southwest and West, where the largest numbers of men have walked out, the situation seems to be clearing, with many men returning to work and traffic as a consequence gradually returning to normal. However, the situation in Boston and Atlanta, Ga., and especially in Chicago remains practically the same with both freight and passenger traffic seriously impeded by the gradual withdrawal of engines and cars needing repairs.

The striking shopmen on the Seaboard Air Line have practically all returned to their work as have the shop and car men on the Norfolk Southern. Approximately 3,000 men employed by the Baltimore & Ohio in the Baltimore shops have returned to their work and at Columbus and Cleveland conditions are rapidly approaching normal. The Louisville & Nashville also reports that large numbers of men are returning to work.

In the Central Western region there is little change from last week, in the number of men at work. Approximately 3,800 men employed on the Chicago, Rock Island & Pacific System have returned to their work and the conditions at Denver, Colo., where practically all of the shopmen have been on strike are again normal. The Chicago & Alton has reported that approximately 550 men have returned to the shops of that road. The situation on the other lines in the Central Western region is practically the same as previously reported, but the total number of men out has decreased, as a result of the defections in the ranks of the strikers, to approximately 13,000. Freight has been kept moving through this region despite difficulties; and with the return of some of the men conditions are gradually returning to normal. It was not found necessary to curtail passenger train service. The strike was most seriously felt in the grain states where the movement of grain to the markets, already partially crippled by a shortage of cars, was further curtailed by the necessity for taking cars out of service.

Northwestern regional officers handling the strike situation have prepared the following summary of conditions in the West which gives the situation on these roads, on Tuesday, August 12.

Atchison, Topeka & Santa Fe.—No men have returned to work. No accumulation. Passenger and freight business being handled. Approximately 1,100 men on strike.

Baltimore & Ohio, Chicago Terminal.—No men have returned to work. Nine engines out of service. No accumulation. Freight and passenger business being moved.

Chicago Belt.—Four car inspectors returned to work. No other change in labor situation. Handled 2,600 cars August 11. Have moved all business offered, and delivered everything that connections can take. No accumulation that interferes with operation. Expect to return three engines that have been out of service. Approximately 260 men out.

Chesapeake & Ohio of Indiana.—No men have returned to work. Have made some deliveries of freight and also received some.

Chicago & Eastern Illinois.—Freight and passenger business slowing up. All men (2,800) remain out.

Chicago & Alton.—No change in labor situation at Chicago. At a number of the terminals on the line all of the men have reported back for work, making total of 550 men returned. Passenger business being handled, and some freight.

Chicago & North Western.—No men have returned to work. Understand that all men at points other than Chicago have returned to work with one exception. More suburban trains have been taken off. Accumulation of freight for points west of Clinton, Iowa, have been somewhat reduced. Expect improvment on Iowa business today.

Chicago and Western Indiana.—No men have returned. Handling all business. Approximately 150 men out.

Chicago, Burlington & Quincy. No men have returned. Handling all business. Freight busines very heavy, and being moved with practically no delay. Total shopmen out, 500.

Chicago Great Western.—No men have returned to work. Freight and passenger business being moved without delay.

Chicago, Indianapolis & Louisville.—Ten men employed in Chicago roundhouse. All men at Lafayette, Ind., have returned to work. All freight and passenger business being moved.

Chicago Junction.—Ten car men have returned to work, leaving 270 men still on strike. No accumulation for any connection. Received 1,162 cars of live stock; 929 sent before 8 a. m. (Stock receipts last year for the same day 1,077).

Chicago, Milwaukee & St. Paul.—No men have returned to work. Freight and passenger business being moved with very little delay. Approximately 7,750 men out.

Chicago, Rock Island & Pacific.—Approximately 3,800 men have returned to work. Freight and passenger business being moved with very little delay.

Elgin, Joliet & Eastern.—No men have returned to work. Are moving some freight business, but not much improvement over day before yesterday. Total of 2,310 men still on strike.

Erie.—No men have returned to work. Passenger business on time. Moving very heavy freight business with very little delay.

Grand Trunk.—No men have returned. No accumulation. Freight and passenger business being moved.

Illinois Central.—No men have returned. No accumulation. Everything being moved.

Indiana Harbor Belt.—No men have returned to work, 550 still being on strike. 4,010 cars handled August 11. No accumulation for connections.

Michigan Central.—Twelve car repairers at Randolph St., Chicago, left the service yesterday. Both freight and passenger business being handled without delay.

Minneapolis, St. Paul & Salt Ste. Marie.—No men have returned to work. No accumulation. Passenger and freight business being moved. Approximately 1,540 men still out.

New York Central.—Twenty-three men returned to work yesterday, making a total of 53 men who have returned. Passenger and freight business being handled, and there is no accumulation.

New York, Chicago & St. Louis.—No men have returned to work. Passenger and freight business being moved without delay.

Pittsburgh, Cincinnati, Chicago & St. Louis and the Pittsburgh, Fort Wayne & Chicago.—No men have returned. Handled about 800 cars, mostly empties, which cannot be moved on account of conditions east of here. On Fort Wayne, business is being moved currently. No accumulation.

Pere Marquette.—Practically no change in labor situation. Business is being handled currently.

Wabash.—No men have returned to work. Passenger business being moved, and some freight business.

Car Interchange Bureau, Chicago.—Forty-two men who left service August 9 have returned to work.

The Chicago & North Western took off 21 Chicago suburban trains. This road reported serious difficulty also in handling its heavy grain, ore and coal traffic; and in many places, especially in the ore and coal regions the freight movement was practically stopped by the shortage of cars. However, food, ice, milk and some non-perishable freight was moved daily, officers in many cases performing the work previously done by the striking men.

The situation in New England remains very uncertain. About 13,000 men went out altogether, and it is estimated that 1,000 of these have been re-employed. The strike at once imposed serious restrictions on all traffic as the roundhouse men, terminal car inspectors and other workmen connected immediately with train operation, very generally left their jobs. Large numbers of suburban runs were discontinued by the New York, New Haven & Hartford, both in the New York and the Boston territories. Most of the dining cars were taken off and many sleeping cars, the shortage of locomotives being the most immediate difficulty. As we go to press, it is estimated the New England roads are moving about 65 per cent of their normal freight traffic.

The passenger traffic of the New Haven has been heavy for several months and the pressure is now severe on both through and suburban trains. For distances within a few

miles, suburban passengers have to a considerable extent made their way to and from their places of business by other conveyances, but the suburban trains have been able to carry their passengers by packing 100 or more in each car. The New Haven reported the total number of trains taken off as 102, including both long distance and short distance runs. In many cases six-car trains had to take the place of two ten-car trains.

On the Harlem River branch of this road, 11 miles long, from New Rochelle, N. Y., to a connection with the New York city railroads at Harlem River, normally run about 20 local passenger trains each way. All local passenger traffic was discontinued on Sunday the 10th. The passenger traffic on this branch is largely coast resort and week-end traffic. On Monday a part of these trains were restored. Between Providence, R. I., and Fall River, Mass., the local electric trains were discontinued, and later a part of the service was resumed with steam locomotives. The shopmen on the New Haven and the Boston & Maine are understood to be still discussing the appeal of President Wilson and the orders or appeals of their leaders; and they are expected to have some definite answer for the Railroad Administration by today (Friday).

Embargoes on all freight but live stock and perishables were placed last week by the New Haven, the Boston & Maine and the Boston & Albany; but this week these were modified so as to allow agents to accept food, feed, railroad coal and a few other commodities. Of freight of all kinds about 2,000 cars are being moved into New England daily, even under strike conditions.

Practically no change was reported in the status of the shop men's strike in the Central Western and Northwestern regions on Wednesday, August 13. In the Central Western region the latest reports indicate that a total of approximately 4,900 men have returned to work on the lines of the Chicago, Rock Island & Pacific and that approximately 4,100 still remain out. Unconfirmed reports also indicated that the striking shop men on the Wabash would return to work. Traffic conditions in this region are gradually improving and no further serious trouble is expected as a result of the shop men's walkout.

In the Northwestern region the latest reports indicated that small groups of shop men at minor points in the region were returning to their work; however, the majority of the men are standing firm in their request for wage increases.

Due to the splendid work on the part of superintendents, trainmasters, and other subordinate executives in both of these regions, the movement of freight and perishables has been maintained throughout the strike, although seriously curtailed at many points.

House Committee Hearings on Railroad Regulation

LEWIS H. HANEY, director and chief economist of the bureau of research and publicity, of the Southern Wholesale Grocers' Association, testified before the House committee on interstate and foreign commerce on August 11, proposing amendments to the Esch-Pomerene bill to extend the jurisdiction of the Interstate Commerce Commission over private car lines. Mr. Haney asserted that through ownership of refrigerator cars, packers enjoy many special privileges which are discriminatory against the wholesale grocers, who, he said, have been the first to feel the growth of the "great food trust which has been more in evidence during the war." The packers, he said, have come to dominate the meat business and are now extending their control over the chief items of canned foods and hold themselves out as distributors of full lines of food products and they have been able to make these inroads on the food distribution business through their special advantages in transportation. Among these he mentioned the special service given refrigerator cars, the practice of including packing house products and other food products that do not require special service in peddler and refrigerator cars, which furnish to the packer a storehouse on wheels and give him a great advantage in competition with the wholesale grocer. He read a long list of food products which are so handled. He also mentioned the large organization of the packers which keep check on the movements of the cars and obtain especially prompt handling, whereas the jobber does not have refrigerator car service and cannot get the schedule package cars unless sufficient tonnage is available. The packers are thereby enabled to give more frequent service and to supply goods in better condition to the retailer. The railroads, he said, take the position that they cannot furnish special types of cars such as refrigerator and tank cars, but it is inconsistent with their function as a common carrier that 90 per cent of the refrigerator cars should be owned and controlled by the packers as this operates against the providing of an adequate supply of such equipment. He proposed that the commission's jurisdiction be extended over all cars, irrespective of ownership so that under the provisions of the Esch bill the commission could require the furnishing of an adequate supply of cars and also that special cars should not be used for freight not requiring special service unless made available to all shippers on equal terms.

Martin H. Decker, formerly of the New York Public Service Commission, testified before the committee on August 12, supporting in general the provisions of the Esch-Pomerene bill but expressing opposition against giving the commission jurisdiction over port to port rates. He also proposed that the commission's powers over car service be exercised in ordinary times instead of merely in times of emergency, the establishment of six regional commissions, and an extension of a plan similar to that of the farm loan bank act to the railroads. Mr. Decker said he thought nearly all the people are convinced that continued government ownership under any theory would mean wretched service and enormous deficits and he urged that the railroads be returned free of any government orders put in effect during the period of government control which would prevent the free exercise of judgment of their officers in order that "this railroad game may be started over again with a new pack of cards."

B. Gilham, traffic manager of the Macon, Ga., Chamber of Commerce, supported the Esch-Pomerene bill in general and urged the committee to disregard for the present the various new plans for dealing with the railroads, but to make every effort to get back to something like pre-war conditions before plans contemplating radical changes are taken up. Mr. Gilham said that most people familiar with the situation were convinced that a substantial increase in railroad rates would have been necessary even if there had been no war.

Luther M. Walter, counsel for the National Association of Owners of Railroad Securities, and Samuel H. Beach, president of the Savings Banks Association of the State of New York, were expected to testify before the committee later in the week on the Warfield plan. On Wednesday, a report by the House committee on interstate and foreign commerce recommending the passage of the Cummins bill was filed by Representative Sanders for the committee.

Although lines of the Great Northern, the Chicago, Milwaukee & St. Paul and the Northern Pacific pass through or near areas recently burned over by huge forest fires in the states of Idaho and Montana, practically no loss was sustained by the railroads as a result of these fires. In Montana 45,064 acres were burned over and approximately 135,189,000 ft. b. m. of lumber was destroyed, and in Idaho 41,140 acres were burned over, destroying approximately 126,122,000 ft. of lumber. Though no damage was done to the railroads, the fire in many places came within two miles of the tracks.

General News Department

The Governor of West Virginia, John J. Cornwell, has sent letters to the governors of other states calling attention to the loss of revenues from taxation which would fall on the states if the Plumb plan of railroad operation should be adopted. He estimates that federal ownership would mean, to West Virginia, a loss of $3,000,000 in taxes yearly.

Wages of street car employees are to be increased 12 per cent on a dozen railroads, city and interurban, in accordance with an award by the War Labor Board, announced last Tuesday. William Howard Taft, head of this board, says that the cost of living was the element that decided the board in its decision; the ability or the inability of the employers to pay the wages prescribed was not considered.

Tentative valuation reports have been issued by the Bureau of Valuation of the Interstate Commerce Commission on the New Mexico Midland, the Ray & Gila Valley, the Quincy Western, the Tonopah & Tidewater, the Bowdon Railway, the Georgia Southern & Florida, the Georgia Northern, the Death Valley, the Dover & Southbound, the Carolina Railroad, the Hampton & Branchville, the Arizona Southern and the Sylvania Central.

A "Red" July is the term used by H. M. Mayo, Superintendent of Safety of the Southern Pacific and other lines in Texas, in his comment on the accident record of that month, showing fatal accidents to five valued employees, killed in the performance of their duties. In his Bulletin, No. 24, describing these accidents, he says: "This series of unfortunate casualties illustrates what the management has been earnestly endeavoring to impress upon its employees—the urgent necessity for individual caution. The exercise of proper forethought would probably have prevented these accidents. They were each avoidable, but the avoidance was in the employe. The only criticism we can offer is, that the element of individual safety was disregarded or, unfortunately omitted. Men learn through the misfortune or experiences of others. May we not hope that the sad lessons contained in the above, may be heeded by our men generally. Sometimes a man dies that those that come after him may live. If this be so here, then you who live have an obligation which you may not side-step with justice to those who have 'passed.'"

Illinois Manufacturers' Association Meeting Will Consider Railroad Problem

The Illinois Manufacturers' Association has issued a call for a meeting of representatives of all classes of industry interested in the solution of the present railway problem, including manufacturers, farmers, railroad men and industrial interests, on September 8 and 9 at the Congress Hotel, Chicago. It is expected, however, that the meeting will be so large as to necessitate transferring the conference to the Auditorium.

Addresses on the Plumb plan and other proposed solutions of the railroad problem will be given by representatives in various fields. A permanent organization to combat all such Socialistic moves as the Plumb plan will probably eventuate as a result of the conference.

A National "Drive" for Safety

Walker D. Hines, director general of railroads, announces that a "National Railroad Accident Prevention Drive" will be started on October 18 at 12:01 a. m. and will be continued until October 31 at midnight, to be conducted under the supervision of the Safety Section. A circular, sent to the regional directors, calls for their co-operation. All officers and employees are expected to give their hearty support.

This section follows the very satisfactory results of certain "no accident campaigns" already carried out. The results of these campaigns are summarized as follows:

Region	Tot. Num. of Employees	Casualties 1919	Casualties 1918
Southern, Jan. 19-25	230,000	77	466
Southwestern, May 1-31	174,884	646	1,475
Central Western, June 22-29	327,000	100	456
Northwestern June 22-29	274,234	119	481

In the Southern region 28 out of 45 railroads reported no accidents; in the Southwestern region 12 roads were in this class, and in the Central-Western 47 out of 67 showed clear records. In the Northwestern region this was true of 50 out of 63.

Chamber of Commerce Opposes Government Ownership

The board of directors of the Chamber of Commerce of the United States has issued a formal statement regarding the demand of railroad labor organizations for government ownership. "To increase the present public debt from 30 billion dollars to 50 billion dollars in order to acquire the roads," it says, "would severely strain the credit of the nation and depress the value of the Liberty and Victory bonds held by millions of people. The public as a whole through the government would be asked to assume the burden and financial risks of railway capital, while the roads would be run by and for the managers and employees. The suggestion of possible reduction of costs of transportation and betterment of service under such a system is purely theoretical and has not been established in practice by the government operation of the railroads. On the contrary, in this country as elsewhere the very opposite results have been shown.

"Government ownership means a retarded development of the railroads. Because of the war the country is sadly behindhand in railroad construction. Additional facilities must be added at once and enormous railway extension must be made during the next few years to meet the actual demands of our country's growth. This calls for the highest type of individual initiative and enterprise. Politics must be kept out of the railroad business. To make the railroads public property and those who operate them government employees is to throw the railroads into the arena of party politics. In such an event there would be serious danger of autocratic control of the government by government employees.

"The overwhelming trend of public sentiment throughout the United States is opposed to government ownership of the railroads. The Chamber of Commerce of the United States believes in the maintenance of that most vital principle of our American institutions—private initiative."

Track Supply Association Exhibit

Fifty firms have already arranged for space in the exhibit of the Track Supply Association which will be presented at the Auditorium Hotel, Chicago, at the time of the thirty-seventh annual convention of the Roadmasters' and Maintenance of Way Association on September 16-19 inclusive. This is the largest number of firms which have ever arranged for exhibits at this early date.

The following is a list of those companies which have already arranged to exhibit.

List of Exhibitors of the Track Supply Association

Air Reduction Sales Company New York.
American Hoist & Derrick Company, St. Paul, Minn.
American Steel & Wire Company, New York.
American Valve & Meter Company, Cincinnati, Ohio.
Anchor Company, New York.
Balkwell Manganese Crossing Company, Cleveland, Ohio.
Bethlehem Steel Company, Bethlehem, Pa.

Carbic Mfg. Company, Duluth, Minn.
Chicago Malleable Castings Company, Chicago.
Crerar, Adams & Company, Chicago.
Dressel Railway Lamp Works, New York.
Duff Mfg. Company, Pittsburgh, Pa.
Fairbanks, Morse & Co., Chicago, Ill.
Fairmont Gas Engine & Railway Motor Car Company, Fairmont, Minn.
Hauck Mfg. Company, New York.
Hayes Track Appliance Company, Richmond, Ind
Ingersoll-Rand Company, New York.
Kalamazoo Railway Supply Company, Kalamazoo, Mich.
Lackawanna Steel Company, Buffalo, N. Y.
Lundie Engineering Corporation, New York.
Luther Grinder Mfg. Company, Milwaukee, Wis.
Madden Company, Chicago, Ill.
Milburn Company, Alexander, Baltimore, Md.
Mudge & Company, Chicago, Ill.
National Lock Washer Company, Newark, N. J.
National Malleable Castings Company, Cleveland, Ohio.
Oxweld Railroad Service Company, Chicago, Ill.
P. & M. Company, Chicago, Ill.
Pocket List of Railroad Officials, New York.
Positive Rail Anchor Company, Marion, Ind.
Q. & C. Company, New York.
Rail Joint Company, New York.
Railroad Supply Company, Chicago.
Railway Review, Chicago.
Ramapo Iron Works, Hillburn, N. Y.
Reading Specialties Company, Reading, Pa.
Rodger Ballast Car Company, Chicago.
Simmons-Boardman Publishing Company, New York.
Sellers Mfg. Company, Chicago.
Southern Railway Supply & Equipment Company, St. Louis, Mo.
Track Specialties Company, New York.
Union Switch & Signal Company, Swissvale, Pa.
United States Switch Company, Eau Claire, Wis.
Verona Tool Works, Pittsburgh, Pa.
Wharton, William, Jr., Company, Inc., Easton, Pa.
Wyoming Shovel Works, Wyoming, Pa.

Automobile Accidents at Grade Crossings

The large number of automobile accidents at grade crossings has brought forth the following interesting comment by R. J. Clancy, assistant to the general manager of the Southern Pacific, the Western Pacific and the Tidewater Southern:

"When running at maximum permissible speed on unrestricted track, the average passenger train obstructs a crossing less than seven seconds, yet, judging from crossing accidents, there are many drivers of automobiles who misjudge the speed of passenger trains or are too impatient to wait that long and as a consequence run into or are struck by trains, resulting in serious injury or death.

"During the first six months of 1919, 18 people were killed, 81 were injured and 233 automobiles were damaged or destroyed in grade crossing accidents, compared with 26 killed and 110 injured during a corresponding period in 1918, a decrease in 1919 of 30.8 per cent in the number killed and of about 36 per cent in the number injured, which, in view of the increase in the number of automobiles in 1919 over 1918, indicates that some progress is being effected in the prevention of such accidents.

"Of these 233, 30 stalled on the crossing and were struck by trains; 111 attempted to cross almost immediately in front of and were struck by trains; 59 ran into trains; 1 skidded into train; 19 ran into and broke down crossing gates lowered to protect them from passing trains; 3 ran into and injured crossing flagmen; 4 ran into cattleguards or crossing signs; and 6 ran over end of track or were not sufficiently into clear. In the two latter instances the accidents resulted in attempts to escape being struck by train after it was observed that the crossing could not be effected.

"Most of these accidents involved passenger trains, which would seem to indicate either that some automobile drivers do not exercise necessary precaution or they misjudge the speed of passenger trains and fail to realize that on unrestricted track a passenger train running at maximum permissible speed covers half a mile in three-fifths of a minute. This is short time to get out of the way, especially if necessary to shift gears or if anything goes wrong with the mechanism of a machine. On single track by waiting about three-fifths of a minute for train to approach and pass all danger would be eliminated, and there certainly can be few if any instances where the circumstances occasioning haste are so compelling as not to permit of a life-saving wait of a fraction of a minute.

"In some instances drivers of automobiles raced with trains and were either struck on the crossing or ran into the train, evidently failing to realize that the speed of their machine, though thought greater than that of the train was in reality considerably less, as is usually the case. That misjudgment of the speed of passenger trains enters into such accidents appears quite clear from the fact that accidents of this character involving freight trains are relatively much less.

"Abatement of such accidents is not a question of obstructed vision, for accidents are occurring where vision is unobstructed in no less proportion than where restricted. It is not a question of flagmen, gates, or warning signals at crossings, for our flagmen have been run down and injured, our gates run into and broken, and warning signals have been disregarded. It is purely a question of drivers of automobiles exercising reasonable judgment and precaution."

Car Shortage in Western Territory

A shortage of freight cars with which to move grain and coal in western territories has become serious according to protests made to the Railroad Administration by numerous organizations of producers and shippers. The situation is especially acute in central and southern Illinois, central Iowa and in producing regions east of the Missouri river.

Grain dealers in Springfield, Ill. and other points in central Illinois recently informed the Railroad Administration that disaster was impending unless cars could be had for loading immediately. According to these protests the activities of threshing crews in these districts have ceased because of the congested elevators and the car movement is slow with no prospect of relief. Aid has been promised by the Railroad Administration and every effort is being made to relieve the congestion as soon as possible. Practically the same conditions prevail in Ohio, central Iowa and other producing points in the middle west.

Officers of the Railroad Administration reply that the car shortage this year is much the same as has been reported every year during the corresponding season. In answer to the charge that new cars are lying idle in yards because of the disagreement between railroads and the administration over the purchase of these cars, it is stated that they are being stenciled as rapidly as possible and placed in service. Approximately 10,000 cars of this type have been promised to the Northwestern region to relieve the situation in that district. Every effort is also being made in the Central Western region to obtain cars for the congested districts and it is expected that within a short time the loadings in that region will relieve the country elevators.

Anthracite Shipments for July, 1919

The shipments of anthracite for July as reported to the Anthracite Bureau of Information at Philadelphia, show a substantial increase over the preceding month and exceeded a total of 6,000,000 tons for the first time since October, 1918. The tonnage sent out last month amounted to 6,052,334 tons, an increase over June of 432,743 tons, or 7.7 per cent. Compared with July, 1918, when production was abnormally stimulated by war conditions, the shipments last month showed a decrease of 1,032,441 tons. A large part of this decrease, however, was in the production of steam sizes from washeries that are not in operation this year. Washery production in 1918 averaged 550,000 tons a month, whereas in recent normal years the washery output has amounted to between 150,000 and 250,000 tons a month. Compared with July, 1916, the latest normal year in anthracite production, the shipments last month showed an increase of 619,456 tons. The shipments for the first four months of this coal year, beginning April 1, have amounted to 22,608,555 tons, as compared with 21,146,536 tons for the corresponding period in 1916, an increase of nearly one and a half million tons.

Telephones in England. In 1918 there were approximately 130 telephones per 1,000 inhabitants in the United States and only 19 per 1,000 inhabitants in the United Kingdom

REVENUES AND EXPENSES OF RAILWAYS

Traffic News

The grain elevator at Port Colburne, Ont., owned by the Canadian Government, was destroyed by fire on August 9, with the loss of 8 lives. The capacity of the elevator was 2,000,000 bushels; estimated loss $1,800,000.

The executive committee of the National Industrial Traffic League will appear before the House committee on interstate and foreign commerce in behalf of the principles embodied in the Esch-Pomerene bill and to urge the passage of the Cummins bill restoring rate making power to the Interstate Commerce Commission.

The Traffic Club of Cleveland, (Ohio), has endorsed the resolutions with respect to the solution of the railroad problem which were recently adopted by the traffic clubs of Chicago, except as to those clauses of the Chicago resolutions which recommend that the Esch-Pomerene bill be amended so that the Interstate Commerce Commission will not have jurisdiction over traffic wholly water-borne.

Car loading reports compiled for the Central Western region during the month of July show that 57,706 cars of grain were loaded as compared with 58,842 cars during the corresponding month last year, or a decrease of 1.9 per cent. During the month of July the lines serving this region also loaded 80,579 cars of coal as compared with 123,002 cars during the corresponding period last year, a decrease of 34.5 per cent. During the same period 41,443 cars of live stock were loaded as compared to 42,600 cars during the corresponding month last year making a decrease of 2.7 per cent.

The National Lumber Manufacturers' Association, composed of 12 regional lumber manufacturing groups and comprising practically the entire lumber manufacturing industry, recently sent a statement to the House Committee on Interstate and Foreign Commerce advocating the passage of the Cummins' bill, providing for the return to the Interstate Commerce Commission of the power over freight rates which it possessed prior to government control. The statement also advocates the considering of this measure apart from any general plan for the solution of the railway problem which may be adopted.

Many rates, obsolete and no longer in use, are included in various individual and agency freight tariffs and should properly be canceled, according to the Kansas City (Mo.) District Freight Traffic Committee. Accordingly consideration is to be given to the cancelation of 572 of these obsolete rates by this committee on September 2. An investigation has recently been conducted and it was found that this number of tariffs have not been in use for the past 12 months, and that there is no apparent prospective use for them in the future. However, the applications seeking authority to cancel any or all of these rates will provide that they are to be restored by publication on one day's notice (subject to any advances or reductions which may be made in the meantime) should any movement develop thereunder within one year from the date of cancelation.

J. H. Dyer, general manager of the Southern Pacific and the Western Pacific, has issued an appeal to shippers to resume at once the full loading of cars, so as to enable the carrier to move the crops. Peace products exceed those of the war period, and the world is in need of all these commodities just as badly as it needed the crops last year, or the year before. Shippers are relaxing their efforts, believing apparently that the railroads have a surplus of cars. This is not the fact. New cars have not been available during the war. The demands of peace equal, if not exceed the necessities of war. About 500,000 tons of barley is being moved out of California now. The fruit crop is one of the heaviest in history; and 28,000 cars will be needed to move the wine grapes. In the month of June Mr. Dyer found that if all freight cars had been loaded to 10 per cent above their marked capacity, the traffic of the month could have been carried in 2,000 fewer cars than were actually used.

According to the Railroad Administration a report on overseas traffic to the Director General of Railroads, 6,223 cars of commercial export freight were received at North Atlantic ports for the week ended August 6, 1919, as compared with 1,345 cars for the same week in 1918. This shows an increase of 4,878 cars or 363 per cent for the first week of August, 1919, as against the corresponding period last year. The deliveries to ships for the week ended August 6, 1919, increased 5,291 cars or 354 per cent. On August 6, 1919, there were 10,013,658 bushels of grain in elevators at North Atlantic ports or 50.7 per cent. of the total elevator capacity. During the week there were received 4,854,894 bushels of grain, while 5,509,240 bushels of grain were cleared. This shows an excess of deliveries over receipts of 654,346 bushels. At South Atlantic and Gulf ports there were 4,408,104 bushels of grain in elevators as of August 5, representing 36.7 per cent of the total elevator capacity, as against 31.5 per cent of capacity for the previous week.

Prince of Wales in Canada

The Canadian Pacific, which is preparing a special train for the use of His Royal Highness, the Prince of Wales, in his tour through Canada, announces the Prince's probable itinerary from August 21 to October 30. He will occupy the private car "Killarney" of Lord Shaughnessy, chairman of the Canadian Pacific. The other cars in the train will be the "Cromarty," the private car of Commander J. K. L. Ross; the compartment car "Empire," and the dining car "Canada"; sleeping cars "Carnavan" and "Chester," tourist car "Chinook" and two baggage cars. The condensed itinerary is as follows:

Quebec, August 21-24
Toronto, August 27
Ottawa, September 1
North Bay, September 1
Cobalt, September 2
Timmens, September 3
Sault Ste. Marie, September 4
Nipigon
Port Arthur, September 8
Winnipeg, September 9
Saskatoon, September 11
Edmonton, September 12
Calgary, September 13
Banff, September 17
Lake Louise
Field
Revelstoke, September 20
Vancouver, September 22
Victoria, September 23
Vancouver, September 29
New Westminster
Kettle Valley R. R.
Penticton, September 29
Nelson, October 1
Lake Kootenay
Crow's Nest Pass
Macleod, October 2
Medicine Hat, October 3
Moose Jaw, October 4
Regina, October 4 (duck shooting)
Qu'Appelle, October 10
Portage La Prairie, October 10
Winnipeg, October 10
Fort William, October 11
Biscotasing (moose hunting)
Toronto
Hamilton, October 18
Niagara Falls, October 20
Brantford, October 20
Stratford, October 21
Woodstock, October 22
Chatham, October 22
London, October 22
Windsor, October 23
Galt, October 22
Toronto, October 25
Kingston, October 27
Brockville, October 27
Montreal, October 27
Ottawa, October 31

The length of the journey outlined is about 8,800 miles. In deference to the implied wish of the King that there should be no undue ostentation during any part of the trip, the cars, with the exception of the two first named, will be ordinary Canadian Pacific stock; though some of them will be brand new and as spotless and beautiful as the car-builders can make them.

Division of Labor on the P. R. R.

"Pick handle" Mulcahey, who has been a frequent visitor to the Curb Market since the Director-General took over operation of the railroads, made one of his regular trips yesterday from Jersey City, where he is a car inspector for the Pennsylvania Railroad.

Having in mind the inspector's advanced age and rapidly failing strength, his broker remarked:

"Mul, you're getting pretty old and feeble, aren't you, to be bending over and hammering wheels all day."

"Shure, me hearin' is still good," replied Mul.

"Your hearing?" What's that to do with hammering wheels?"

"Uncle Sam showed 'em how to run the railroads. I've got a helper now to do the hammerin'."

"What do you do?"

"I do the listenin'," answered Mul.—*Wall Street Journal.*

Commission and Court News

Interstate Commerce Commission

Wasteful Service by Tap Lines

The commission, in a decision issued June 30, 1919, on two cases submitted May 1, 1918, condemns certain tariffs by which short railroads, called "tap lines," carrying lumber shipped by affiliated mills, were allowed proportions of through freight rates based on long hauls, made for the very purpose of increasing the short line's proportion, when the actual necessary haul was only about one mile. The "tap lines" involved were the Prescott & Northwestern and the Ouachita & Northwestern, situated in Arkansas and Louisiana; and the trunk line was the Missouri Pacific. The decision is by Commissioner Eastman.

The first case had to do with shipments from a mill at Prescott, Ark., about 48 miles north of Texarkana. The mill is about one mile from the Missouri Pacific; but the lumber was shipped 29 miles northwest to Tokio, then a short distance southwest by the Memphis, Dallas & Gulf and there delivered, at Nashville, Ark., to a branch of the Missouri Pacific; and then (if the car were destined northward) it was hauled by the Missouri Pacific back through Prescott to destination. The total side-line haul was 76 miles, constituting a waste of 75 miles.

The other case was that of the Ouachita & Northwestern, which had mills at Clarks, La., on the Missouri Pacific and at Standard, La., 10½ miles south of Clarks. In this case the tap line had a track parallel to the Missouri Pacific between Clarks and Standard; and the custom was to send all shipments over this "tap line" when thereby a ten-mile haul could be secured; shipments from Clarks going northward were hauled about 21 miles unnecessarily, and those going southward from Standard were hauled a similar unnecessary distance.

According to decisions of the commission in "tap line" cases heretofore considered, the proper allowance to the tap line for a haul of one mile is held to be $2.50 a car, whereas on the 76-mile haul a carload of 30 tons gave the tap line $21; and on the 10½-mile haul $18 was taken.

It appears that while the Missouri Pacific is in the hands of the Government, the wasteful practices here described are suspended; but the tariffs are still in force, and so the commission deems it proper to issue this decision, preparatory to the discontinuance of federal control.

The decision holds that a "tap line" is entitled only to just compensation for the actual and reasonably necessary services performed by it; and the distances must be measured by the direct route of the movement toward the final destination.

As to the 10½-mile side line between Clarks and Standard, no objection is made to the sending of lumber over that line if it is in the direction of its final destination; as for example, shipments from Clarks, going south, or from Standard, going north.

Court News

Injury to Passenger by Baggage in Aisle

A railroad permitted baggage to remain in the aisle of a car, which was so crowded that many passengers were standing in the aisle. A woman, making her way through the crowd, fell over the baggage and was injured. It did not appear that the railroad was unable to place the baggage where it would not endanger passengers. The Minnesota Supreme Court holds that it could not say that it conclusively appeared that the railroad was free from negligence, although the amount of travel on this day was so unprecedented that it could not have been foreseen or properly provided for.—Pletzky vs. Great Northern (Minn.) 169 N. W. 715. Decided December 13, 1918.

Foreign Railway News

French Plan Two Railroads in Vosges Mountains

A Havas despatch from Paris, dated August 10, says that Albert Claveille, minister of public works, has introduced a bill in the Chamber of Deputies providing for the construction of two new railroads through the Vosges Mountains.

Franco-Spanish Railroad

The first section of the Trans-Pyrennean Railroad, between Ripoll and Ribas, about five miles south of the Franco-Spanish border, was inaugurated recently. The ceremony was attended by Francisco Cambo, former Minister of Public Works, and Senor Cayera, representing the Spanish Ministry of Development, and the French Deputy Emmanuel Brousse.

South Australian Railway Extension

The Railways Commissioner of South Australia at Adelaide advertised for bids to be received not later than May 20 for the construction of a line of 5 ft. 3 in. gage railway from Long Plains to Snowtown, South Australia, a distance of 41 miles. The work is to be completed within 18 months from the date of contract.

Although the time was too short for American railway contractors to bid on the actual construction of the line, Commerce Reports suggests that American manufacturers of railway supplies and equipment should send their catalogues and export price lists to C. J. Boykett, Secretary, Railways Commissioner, Adelaide, South Australia.

British Railroad Owners Organize

Press despatches to the Journal of Commerce, New York, report that the various associations of English railway stockholders are merging into the English Railway Stockholders' Protective Association, which will be maintained by nominal subscriptions on a pro rata basis according to members' holdings. The association will take an unbiased stand, neither in favor of nor against nationalization, its purpose being the safeguarding of stockholders' interests in the final settlement of matters arising from Government control.

The main questions to be dealt with are the depreciation of road and rolling stock and the greatly enhanced costs of operation.

The total holdings of railway stocks in the United Kingdom represent a face value of 1,350,000,000 distributed among 1,500,000 stockholders.

Exports of Locomotives in June

Exports of locomotives in June were considerably less than in May, but slightly greater than the totals for April. The exports in June totaled 78 of a value of $2,356,909, of which over half in point of value were consigned to Russia in Asia. The figures as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Number	Dollars
France	3	82,184
Russia in Europe	20	265,065
Spain	1	6,800
Canada	11	68,510
Cuba	2	29,650
Brazil	6	331,450
China	4	200,400
British India	1	22,850
Russia in Asia	30	1,350,000
Total	78	2,356,909

Exports of Cars in June

Exports of freight cars in June were double those of May and several times in excess of those of any previous month of 1919. The June exports totaled 5,055, valued at $13,675,186, as compared with 3,008 freight cars exported in May, valued

at $6,268,078. The totals in detail, as well as figures of passenger car exports, compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce, are as follows:

Countries	Passenger Number	Passenger Dollars	Freight and other Number	Freight and other Dollars
France	..	..	3,549	11,085,700
Italy	..	..	1,050	1,801,800
Russia in Europe	..	..	200	320,000
Canada	7	168,329	121	104,159
Mexico	..	..	29	16,905
Cuba	4	5,600	4	10,982
China	..	..	100	325,000
British India	..	..	2	10,640
Total	11	173,929	5,055	13,675,186

Railway Electrification in Switzerland

The Engineer of London states that Swiss engineering experts are pressing for the immediate electrification of the railways. The Swiss Minister of the railways has stated that it is not wise to wait the return of normal conditions before electrifying the Swiss railways, because the coal scarcity will probably last for many years. There is available in Switzerland about 4,000,000 hp. electric energy calculated on a basis of an average working day of fifteen hours. On January 1, 1914, not more than about 500,000 hp. were actually used. The new power stations built or in process of construction from January 1, 1914, to December 31, 1918, would supply another 200,000 hp. Thus there were at the beginning of this year about four-fifths of the total available water supply still undeveloped. The electrification of the Gothard railway is still going on, an extra credit of 4,500,000 francs having been voted for it by the Swiss Parliament. The line between Berne and Brigue is already worked by electricity.

Exports of Car Wheels and Axles in June

Exports of car wheels and axles in June were more than 3½ times as large as in May and nearly three times as large as in April, the best previous month this year. The June exports totaled $2,740,479, as compared with $769,733 in May and $946,304 in April. Of the June total over half represented shipments to Italy, while large shipments were made also to Japan, Russia, in Asia and France. The detailed figures as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Dollars	Countries	Dollars
France	261,920	Peru	5,059
Italy	1,368,778	Uruguay	1,825
Netherlands	2,523	Venezuela	160
Canada	10,559	China	1,644
Panama	7,990	Japanese China	164,874
Mexico	18,714	British India	15,250
Jamaica	230	Dutch East Indies	1,985
Other British West Indies	420	Japan	486,910
Cuba	8,647	Russia in Asia	356,647
French West Indies	704	Australia	16,085
Dominican Republic	71	Philippine Islands	1,309
Argentina	243	British South Africa	500
Bolivia	252		
Brazil	238	Total	2,740,479
Chile	7,551		

Railway Problem Disturbing Chile

The reported resignation of the Minister of Public Works is the first news received in this country of the recent Cabinet crisis which has taken place in Chile, says Osgood Hardy in an article in the Latin-American section of the New York Sun. It is rather difficult at this distance to know just what is the crux of the situation, but according to the meagre reports that have arrived this action was due to differences with other members of the Cabinet over plans for solving some of the problems of railway administration. These have arisen from a congestion of traffic which the railroads are suffering, a congestion so severe that the Government has been compelled to place an embargo on the export of foodstuffs.

During the war Chile was unable to secure the materials necessary to keep her railroads in good condition, and now that steel can once more be obtained, she is considering various means of rehabilitating her lines. Disagreements as to the best methods of bringing this about have caused what seems to be a ministerial crisis which may result in the resignation of the entire Chilean Cabinet, for as the greater part of Chile's railways are operated by the Government, railroad troubles are immediately reflected in Government circles.

Shortage of German Rolling Stock

The Technical Supplement to the Review of the Foreign Press (London) publishes an extract from the Kolnische Zeitung of June 15, giving an account of the causes for the shortage of German rolling-stock.

"In the Ruhr district there are renewed complaints as to the 'shortage of wagons.' This expression is generally used to express a state of things for which it is not really appropriate. There seems rather to be a shortage of locomotives to bring the wagons to the places where they are required rather than a shortage of wagons themselves. The terms of the armistice, requiring the surrender of so many locomotives, are responsible for this.

"The Prussian Railway Administration meanwhile has given orders for 2,463 new locomotives, and the engine works are doing their best to deliver them. On the whole they have executed the orders satisfactorily. The reason why the stock of locomotives is not increasing is explained by the bad condition of the old engines, the result being that every week as many come to be repaired as have been sent out from the repairing shops. There is an incontestable shortage of passenger carriages. The Railway Administration has consequently ordered 2,896 coaches and 45,000 freight cars. The total orders given amount to 2,000,000,000 marks. But even by these orders the stock of locomotives and wagons is brought to its proper level, the whole difficulty is by no means solved. There is not a trained personnel available to enable such a stock of wagons to be utilized as fully as necessary. This problem is rendered more acute by the eight-hour day difficulty, while the abolition of piece-work delays the repairs to the rolling stock. Then there are the constant interruptions to work by elections, meetings and councils. The unsatisfactory state of things in the railway world is another of the 'achievements' of the Revolution."

Condition of Russian Railways

The Technical Supplement to the Review of the Foreign Press (London) publishes an extract from an article by L. Kaplan published in the Wirtschaftdiens of May 16, in which Mr. Kaplan described the present condition of Russian Railways.

"At the outbreak of war Russia possessed about 83,000 km. of railway line, of which 7,500 km. were in Finland and Poland. There was 30,000 locomotives and 570,000 wagons, or 1 locomotive and 19 wagons to each 2.5 km. of line. According to the statistics published by the transport Commissioner in the Severnaya Communa (January 17), there were on December 1, 1918, only 6,200 locomotives and 120,000 wagons in a serviceable condition, while a further 3,600 locomotives and 145,000 wagons were in need of repair. In the following three months these numbers were considerably reduced, and when Krasin, the new transport commissioner, entered office it transpised that the railways in Russia in Europe possessed only 4,000 locomotives and 95,000 wagons for 60,000 km. of line, or one locomotive and 19.5 wagons for each 15 km. The uninterrupted military operations are using up this small remainder, and unless the general situation changes by July 1, an entire cessation of railway traffic in Russia in Europe may be anticipated owing to the complete destruction of all the rolling-stock.

"Russia is not without means of re-establishing her railway system, or at all events of repairing it in part; but M. Kaplan relates that he has recently visited the railway shops in Moscow, Kursk, Kharkoff, and Melitpol, and found hardly any work going on. In 1914, Russia produced about 800 locomotives in her own shops, but in 1917 this number fell to 170, and in 1918 to about 20. Repairs have completely ceased owing to the lack of suitable tools, material and skilled workmen. The three largest repairing shops during the last four months of 1918 only put 44 locomotives in working order; while in January and February of this year all the shops in Russia only repaired 40 engines, while no repairs of the wagons took place."

Exports of Railway Track Material in June

The exports of rails and switches, frogs, etc., in June were not as great as in May. Of rails, 67,028 tons, valued at $4,208,872, were exported in June, as compared with exports in May of 76,134 tons, valued at $4,902,970. The exports of switches, frogs, etc., in June totaled $1,359,725, as compared with $1,881,626 in May.

Japanese China and Japan were the largest customers in June, and large shipments were made to France and Belgium.

The figures in detail as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Spikes Pounds	Spikes Dollars	Steel Rails Tons	Steel Rails Dollars	Switches, frogs, splice bars, etc. Dollars

Sale of War Department's Surplus Material

The Director of Sales, of the War Department, announces that the Surplus Property division of the office of the director of purchase and storage, War Department, is offering for sale under sealed proposals 46,037 lanterns, located at Jeffersonville, Ind., bids for which will be opened on August 27, by the surplus property officer, Jeffersonville. These lanterns are 11 inches in height and hold ½ pint of oil. No bid for less than 180 lanterns will be considered.

Bids are also wanted as follows: For 15,492 new shovels located at Chicago, bids for which will be opened by the surplus property officer at Chicago, on August 29. These shovels are of three types, 996 "D" handle, round blade; 7,700 long-handle, square blade, and 6,796 long-handle, round blade. All are unpolished. No bid for less than 10 dozen of one style will be considered.

For 38,283 axe handles located at Lewistown, Pa., bids for which will be opened by the surplus property officer at Philadelphia, Pa., on September 2. These are all new and are 36 inches long. No bids for less than 100 dozen will be considered.

For 19,863,697 brass rivets located in warehouses at Boston, Mass., bids for which will be opened by the surplus property officer at Boston on September 3. These rivets consist of three lots as follows: 12,531,877, 4-16 inches long; 5,377,820, 5-16 inches long, and 1,954,000, 6-16 inches long. They are packed a thousand to a container and no bid for less than 50,000 rivets will be considered.

Passenger Cars

THE BUTLER COUNTY has ordered a Unit car from the Unit Railway Car Company, Boston, Mass., for September 1 delivery.

Mallet Locomotive Recently Built by the American Locomotive Company for the Pekin-Kalgan Railway of China

This locomotive has 20 and 32 by 26 in. cylinders; a weight on drivers of 241,000 lb., a total weight in working order, engine only, of 293,000 lb., and a tractive effort of 66,500 working simple and 55,000 compound. It is of standard gage and is superheated.

Supply Trade News

George J. Lynch has been appointed sales manager for the **Youngstown Steel Car Company**, with headquarters at Youngstown, Ohio.

The **Condron Company**, engineers, Chicago, has opened a branch office in the Central Saving & Trust Building, Akron, Ohio, in charge of **C. L. Post**, vice-president.

J. L. Canby has been appointed district manager of sales of the **Chicago Pneumatic Tool Company**, Chicago, with offices at Chicago, succeeding **Nelson B. Gatch**, who has been transferred to the New York office.

A. E. Braun, president of the Farmers Deposit National Bank, Pittsburgh, Pa., has been elected a director of the **Pressed Steel Car Co.**, New York, to fill the vacancy caused by the death of T. H. Given.

F. O. Slutz has been appointed manager of the railway sales department of the **B. F. Goodrich Rubber Company**, Akron, Ohio, succeeding **C. M. Woodruff**, who has resigned to accept a position with the Akron Board of Education. Mr. Slutz was born on April 29, 1883, and received a high school education. He entered the service of the B. F. Goodrich Rubber Company, on October 24, 1901. In 1909, he served as a clerk in the pneumatic tire sales department and the following year was transferred to the railway sales department, where he served in various positions, giving most of his attention in recent years to railway sales work exclusively, until his appointment, effective July 1, as manager of the same department. Mr. Slutz will have his headquarters at Akron, Ohio.

F. O. Slutz

James M. Monroe has resigned as representative of the Southeastern territory of the **Hunt-Spiller Manufacturing Corporation**, Boston, Mass., to become vice-president of the **Harry Vissering Company**, Chicago, and vice-president of the **Charles R. Long, Jr., Company**, Louisville, Ky.

The **Light Railway Equipment Company**, Philadelphia, Pa., manufacturers of frogs, switches, portable track, cars and electric locomotives, has been taken over and is now controlled by the **L. B. Foster Company**, Pittsburgh, Pa. **B. H. Behrens** has been made general manager of sales with offices at Pittsburgh and **H. A. Ellis** has been appointed general manager of a recently completed factory at Holmes, Pa. Branch offices have been opened in the Commercial Trust Building, Philadelphia, and the Tribune Building, New York.

The Chicago Pneumatic Tool Company, Chicago, is now erecting a 10-story office building at 6-8 East Forty-fourth street, New York, in which will be housed its general offices now at Chicago. The new building will be completed early in 1920. The structure will be of steel, brick and limestone construction and will be occupied solely by the offices of the company. The ground floor will contain a permanent exhibition room and display of its pneumatic and electric drills and other tools, gas engines, air compressors, etc. A completely equipped service station will also be maintained. The six American plants and 26 sales and service branches will be directed from New York. A sales and service organization will be maintained in Chicago on a more extensive scale than formerly.

Alexander Chapman, assistant district sales manager of the Rail Joint Company, with headquarters at Chicago, has been promoted to district sales manager with the same headquarters, succeeding Geo. C. Isbester, who has resigned to go with another company. Mr. Chapman was born in 1880 at Jersey City, N. J., and received his education in the Stevens Preparatory School and the Stevens Institute at Hoboken, N. J., from which institution he graduated in 1902. He entered the engineering department of the Rail Joint Company at Newark, N. J., in the following year. After a short time in that department he entered the mills of the company as an inspector and served in that capacity at Delaware, N. J., Buffalo, N. Y., and Columbus, Ohio, returning to the headquarters office in 1908 to take a position in the order department. In 1914, he was transferred to the Chicago office as assistant district sales manager, in which position he remained until his recent promotion to district sales manager.

A. Chapman

Trade Publications

STROMBERG AUTOMATIC TIME SYSTEM.—The Stromberg Electric Company, Chicago, Ill., has issued a folder describing its automatic time systems, in which a master clock controls various pieces of secondary equipment, such as secondary clock for indicating time in various places, in-and-out time-recorder for recording time of arrival and departure of each employee, program instrument for automatically blowing whistles, ringing bells, etc., office time stamp for stamping time and date of receipt of letters and other similar devices.

OWEN BUCKETS.—Two booklets descriptive of the character and use of the material handling equipment manufactured by the Owen Bucket Company were recently issued by that company. The first of these, entitled "Owen Buckets," is a general explanation of the detailed parts of this bucket, followed by a general drawing and table of each class of bucket in turn, together with a folder illustrative of the character of work for which the bucket described is most suitable. The second booklet, "Owen Buckets in Operation," consists essentially of illustrations of the manner in which these buckets have been placed in practical use in excavating, handling materials and dredging, with a short exposition of the manner of using in each class of work.

Reinstating the Commissions. The Cummins bill to restore the rate-making powers of the Interstate Commerce Commission does not have the weight of the best opinion behind it; and to provide that each state commission is to enjoy its former authority over intrastate rates will make the law potentially a nuisance. It is unfair and absurd that the state commissions, with their well-proved partiality and narrowness of outlook, should be allowed to confer benefits upon their respective communities and thus add to the deficit which the national government must pay. So long as the government is running the railroads, it should say to what extent it will subsidize shippers. The Director-General can be trusted to exercise public-spirited discretion.—*Springfield (Mass.) Republican.*

Railway Financial News

Atlanta Terminal.—The Georgia Railroad Commission has authorized this company to issue $1,200,000 new mortgage bonds to retire outstanding bonds and outstanding certificates of indebtedness. The total authorized (by the company) issue of these new bonds is $2,500,000.

Delaware & Hudson.—L. F. Loree, president, has issued a statement outlining the financial transactions and the financing of his road since 1900 in answer to the charge made by Glenn E. Plumb before the House Interstate Commerce Committee on Tuesday that the Delaware & Hudson, among other roads, had issued much new stock between 1900 and 1910 at less than its market value, or had given it away as bonuses to its stockholders.

"At the beginning of 1900," says the statement, "the authorized and outstanding capital stock was $35,000,000. In 1904 the company authorized an increase in its capital stock of $10,000,000, of which $7,000,000 was offered to stockholders of record March 19, 1904, at $135 a share, each stockholder having the right to subscribe for one share of new stock for every five shares owned. The balance of $3,000,000 of authorized stock is still unissued.

"This $7,000,000 of capital stock was issued to retire $5,000,000 of New York Canada bonds maturing May 1, 1904, to defray the cost of standard gaging the Chateaugay & Lake Placid Railway and to reimburse the treasury for advances for construction work. At the subscription price $9,450,000 was realized on its sale.

"The average market price of the Delaware & Hudson stock in March, 1904, was $152.45. The lowest price in that month was $149, on March 12.

"In May, 1905, the company authorized an increase in its capital stock of $5,000,000 for the purpose of exchanging same prior to April 1, 1916, for Albany & Susquehanna Railroad 3½ per cent bonds, due in 1946, at the rate of five shares for each $1,000 bond. There has been exchanged thereunder $1,778,000 of this issue for $3,556,000 of Albany & Susquehanna bonds, the balance, $3,222,000, remaining unissued.

"In January, 1906, the company authorized an increase of $7,000,000 in its capital stock for the purpose of exchanging same for its issue of $14,000,000 of 4 per cent convertible debentures, due June 15, 1916, at the rate of five shares for each $1,000 debenture; $13,500 of capital stock was issued under this authority in exchange for $27,000 of these bonds, the balance of the authorized increase, $6,986,500, still remaining unissued.

"Capital stock of the company was retired and cancelled between the years 1900 and 1910, by the operation of the sinking fund, as follows:

Year	Shares	Par Val.	Year	Shares	Par Val.
1900	2,000	$200,000	1905	500	$50,000
1901	1,543	154,300	1906	2,285	228,500
1902	1,386	138,600			
1903	1,000	100,000		12,885	$1,288,500
1904	4,171	417,100			

"To those who can intelligently interpret financial transactions the financing of the Delaware & Hudson Company through capital stock during the eleven years from 1900-1910 must appear most fortunate."

Georgia Coast & Piedmont.—The United States District Court has given permission to Gordon & Friedman to withdraw their bid for the Georgia Coast & Piedmont. The road was offered for sale recently as a going concern. Gordon & Friedman bid for it with the intention of scrapping it. This, under the terms the sale, they could not do.

Waycross & Western.—The Georgia Railroad Commission has authorized this company to issue $147,000 five-year six per cent notes and $50,000 stock.

Railway Construction

Canadian Pacific.—Bids have been asked for grading work on lines in western Canada, as follows: From Wymark, Sask. (mileage 15.8 Vanguard subdivision), east for 25 miles; from Lanigan, Sask., north 50 miles; from Rosetown, Sask., south 25 miles; from Vidora, Sask. (mileage 56.6 Govenlock subdivision), south-easterly 30 miles; from Milden, Sask. (mileage 22.3 Kerrobert subdivision), west 34 miles. In addition bids have been asked for grading from Russel, Man., north for 12 miles and a contract has been let to the John Stewart Construction Company for grading a line from Acme, Alta., to Drumheller, 37 miles.

Plans for the construction of a new station at Three Rivers, Que., have been completed. The building as designed will be of the French Chateau style and of fireproof construction, faced on the exterior with warm brick and cut stone dressing of limestone. The floors will be of marble and terrazo tile, the walls treated with marble wainscot and caen stone or marble above. The wood finish throughout will be of Canadian oak.

Chicago & North Western.—Work on the elimination of two grade crossings by the construction of one mile of new highway east of the Chicago & North Western tracks, four miles south of Racine, Wis., will be started soon. The work will also involve some incidental changes to the Chicago & Milwaukee electric line. The approximate cost is $25,000.

Chicago & North Western.—The Railway Commission of Wisconsin passed an order on July 11, 1919, which calls for the elevation of 2-4 miles of the main line from Solma to North streets, Kenosha, and on the Kenosha division from the main line junction to Fremont street, a distance of .26 miles. The work will involve 15 subways on the main line, and 1 subway on the Kenosha division. All the work inside of the right-of-way will be paid for by the railroad except changes in public utilities while the city will pay for all pavement and street improvements and sewers outside of the right-of-way and assume the responsibility for all changes in property. The estimated cost of the work is $2,650,000.

The Chicago & North Western has entered into a contract with the city of Kenosha, Wis., for the division of the cost of the Main street improvement project, which will include a 200-ft. viaduct and a 140-ft. bascule bridge. As the viaduct extends over the industrial tracks of the Chicago & North Western, its share of the cost of the improvement will amount to $40,000, while the cost to the city will be $310,000.

Northern Pacific.—This road has completed and placed in operation a branch line extending from Hesper, Mont., seven miles north of Laurel, 41 miles to Rapelje, serving the Lake Basin country.

Texas Roads.—Plans are being made to build a line from New Castle, Tex., south for about 150 miles. Hammon & Kell, Wichita Falls, are interested and Colonel J. R. Holman is the chief engineer. Grading contracts are reported let for work on 45 miles near Ranger. The Missouri, Kansas & Texas is contemplating the sale to Hammon & Kell, of the Wichita Falls & Southern, which operates from New Castle north to Wichita Falls, 53 miles, to form a north extension of the proposed new line.

Wisconsin Southern Railroad Company.—This company is planning to construct its railway over that part of its chartered line from Milwaukee to a connection with roads reaching Chicago and the belt lines around Chicago. The company has extensive charter rights in counties northeast from Madison, Wis., to Sturgeon Bay and also with counties northwest from the state line between Illinois and Wisconsin, through Kenosha, Racine, Milwaukee to Marshfield. The company is capitalized for 50,000 shares of stock at $100 each, of which 35,000 shares are preferred and 15,000 shares are common stock. Charles B. Smith, of Fond du Lac, Wis., is president of the company.

Railway Officers

Railroad Administration

Executive, Financial, Legal and Accounting

A. F. Dodd has been appointed treasurer and auditor for the receivers of the Denver & Salt Lake, with headquarters at Denver, Colo., succeeding **J. R. McCoy,** who has been granted a leave of absence on account of illness and who, upon his return to service, will be assigned to other duties.

Operating

M. E. Welch, trainmaster on the New York Central lines east, at Buffalo, N. Y., has been appointed assistant superintendent of the Buffalo division, with headquarters at Buffalo.

H. L. Wright has been promoted to general inspector of the operating department of the Mobile & Ohio and the Southern Railroad in Mississippi, with headquarters at Mobile, Ala., performing such duties as may be assigned to him by the general superintendent; **V. J. Thompson** has been appointed supervisor of safety, with headquarters at Mobile, Ala., vice **Mr. Wright.**

John M. Davis, manager of the New York properties of the Baltimore & Ohio, including the Staten Island lines, with headquarters at New York, has resigned to become president of the Rock Hill Iron & Coal Company and associated corporations, including the East Broad Top Railroad and Coal Company, with office at New York, effective September 1. Mr. Davis was born on November 5, 1871, and began railway work in 1888 as a freight trainman on the San Antonio & Aransas Pass. From September, 1891, to July, 1898, he served consecutively as stenographer to the superintendent of the Gulf, Colorado & Santa Fe; chief clerk to the superintendent of the Mexican Central; clerk in the general manager's office of the Great Northern, and assistant superintendent of the Great Northern. In 1898, he was made superintendent of the Breckenridge and Montana divisions of the Great Northern, and left that road in 1900, to go to the Erie as superintendent at Scranton, Pa. Two years later he was appointed superintendent of the Union Steamboat Line of the Erie, at Buffalo, N. Y., and from August, 1902, to May, 1903, was superintendent of the Allegheny division of the Erie. He then returned to the Great Northern, where he served as superpromoted to assistant general superintendent of the Central district. In 1907, he went to the Oregon Short Line as assistant general superintendent, with headquarters at Salt Lake City, Utah, and was subsequently made acting general superintendent and later general superintendent. In 1910, he was appointed general superintendent of the Central district of the Southern Pacific, with headquarters at San Francisco, Cal. He entered the service of the Baltimore & Ohio on January 1, 1914, as assistant general manager at Cincinnati, Ohio, of the Baltimore & Ohio Southwestern-Cincinnati, Hamilton & Dayton, and later in the same year, was promoted to general manager of these lines. In July, 1916, he was appointed vice-president in charge of operation and maintenance of the Baltimore & Ohio System, with headquarters at Baltimore, Md., and held that position until July 1, 1918, when, under federal control of the railroads, he was appointed manager of the New York properties of the Baltimore & Ohio, including the Staten Island lines, as above noted.

J. M. Davis

Engineering and Rolling Stock

Colonel Frederick Mears has been appointed by the President as chairman and chief engineer of the Alaskan Engineering Commission, in charge of the construction of the government railroad in Alaska. Colonel Mears was formerly a member of this commission but retired to return to active duty with the army during the war. He was with General Goethals during the construction of the Panama Canal and the Panama Railroad, and has been connected with the management of the American railroad lines in France. **William C. Edes,** heretofore chairman, has been appointed consulting engineer to the commission.

Traffic

W. B. Ferguson has been appointed chief of the tariff bureau of the Cleveland, Cincinnati, Chicago & St. Louis and the Louisville & Jeffersonville Bridge, with headquarters at Cincinnati, Ohio, succeeding **Walter Nichols,** deceased.

C. E. Hochstedler, chief of the tariff bureau of the Detroit, Toledo & Ironton, at Detroit, Mich., has been appointed assistant general freight agent, with headquarters at Detroit, vice **J. A. Scheuerman,** resigned to accept service elsewhere, and the position of chief of tariff bureau has been abolished and **W. G. Howard** has been appointed commercial agent, with headquarters at Detroit, Mich.

Colonel Hal S. Ray, formerly assistant general passenger agent of the Chicago, Rock Island & Pacific, with headquarters at Des Moines, Ia., and for the last two years in military service as assistant chief of the inland traffic service of the war department, and on the general staff of the American Expeditionary Forces abroad, has received his discharge from the army and resumed his former position at Des Moines.

Charles D. Quinn, whose appointment as assistant general freight agent of the Louisville & Nashville, with headquarters at Louisville, Ky., has already been announced in these columns, was born on December 29, 1874, at Louisville, and was educated in the high school of his native town. He began railway work on March 16, 1896, with the Louisville & Nashville as stenographer to the assistant general freight agent. He subsequently served in the soliciting department, and then was consecutively rate clerk, chief rate clerk, assistant chief clerk and chief clerk until his recent appointment as assistant general freight agent of the same road.

Purchasing

J. D. East has been appointed division storekeeper on the Baltimore & Ohio Eastern Lines, with headquarters at Keyser, W. Va., vice **C. S. Filler,** resigned.

G. H. Greer, storekeeper on the Yazoo & Mississippi Valley, with headquarters at Vicksburg, Miss., has been appointed storekeeper for the Gulf, Mobile & Northern, with headquarters at Mobile, Ala., vice **R. C. Brown,** resigned.

Obituary

John S. Shaughnessy, formerly purchasing agent for the Minneapolis, St. Paul & Sault Ste. Marie, and more recently connected with the construction department of the Canadian Pacific, died at his home in Chicago on August 10, after an illness extending over a year. He was 55 years old. Mr. Shaughnessy was a brother of Lord Shaughnessy, chairman of the board of directors of the Canadian Pacific.

Labor Unions in France. Before the war the French Labor Confederation had about 300,000 members. At the present time their membership has increased to about 1,500,000.

Financial Showing Improving

During the months of April, May and June the Railroad Administration steadily and substantially reduced the rate at which it was incurring a deficit. The financial showing made in June was relatively the best up to that time this year. In January the net operating income earned was 33 per cent of the guaranteed standard return of the companies; in February, it was only 21 per cent, and in March it was less than 16 per cent. It looked then as if the deficit for the year would be $750,000,000. In April, however, net operating income was 39 per cent of the guaranteed return; in May it was 51 per cent; and in June it was 64 per cent. The improvement is partly due to some revival of business since March, but more largely to the energetic measures which have been adopted by the Administration and the operating officers to effect economies. The ratio of expenses to earnings in February and March was over 92 per cent. It was reduced in each of the months of April, May and June, and in June was less than 84 per cent. If the Railroad Administration should do relatively as well during the last six months of the year as it did in April, May and June its total deficit for the year would be just about $500,000,000, while if it should do relatively as well in the last six months of the year as it did in June its total deficit for the year would be only about $415,000,000, of which about $243,000,000 was actually incurred in the first six months of the year. Of course, the recent strikes will have an adverse effect upon the operating and financial results; and if further advances in wages are granted they will cause the deficit to begin to increase at an accelerated rate again.

Improving the "On Time" Record

The railroads of the Southern region under the direction and stimulus of Regional Director B. L. Winchell are engaged in a form of rivalry which deserves to be recommended for imitation to the railroads of other regions. This is a rivalry for increasing the number of trains that arrive at destination on time. One of the criticisms which long have been made, and justly made, against the operation of the railroads of the United States, has been that they have had many late passenger trains. This is one respect in which before the war their service was inferior to that of most of the railways of Great Britain, France and Germany. The railways of what is now the Southern region bore the reputation of having a relatively larger number of late trains than those of almost any other section, although whether they deserved the reputation cannot be shown. In June, of 50,949 trains operated in the Southern region 94.4 per cent either were on time or made up time after having been received late from connections. The number of trains which actually arrived on time at their final terminals was 92 per cent of the total. A still better record was made in May, when 95.3 per cent of all passenger trains either arrived at their final terminals on time or after having made up time which had been lost on connecting lines. The best record made by any road in June was that of the Illinois Central, whose "batting" average was 96.6 per cent. The Southern railroad, operating one-third of all the trains handled on the larger roads in the region, had a record of 95.6 per cent of trains, which either were on time or made up time lost by connections, and of 92.6 per cent of trains which were on time at the final terminals. One of the very most important features of good passenger service is trains that maintain their schedules. The Southern region has started a form of rivalry which should not only be imitated in other regions now, but continued after the railroads are returned to private operation.

Justice for the Technical Men

Attention is directed to the report appearing on another page of this issue on the adjustment of salaries for subordinate engineering positions recently authorized in the Northwestern region. This was prepared in the form of a classification of duties and responsibilities for the various positions, together with maximum and minimum rates of compensation for each grade. It is the work of a committee of three chief engineers, who are to be commended for the fairness, clearness and logical arrangement of the schedule. This is the first real recognition accorded the technical employees. They were not mentioned in any of the supplements to Order No. 27, and while the officers of a few individual roads took it upon themselves to place interpretations on Supplements 7 and 8 so as to apply to draftsmen and subordinate engineers, this was not generally done. Consequently many of the technical men have had a valid grievance against the Administration. The matter of salary adjustment for these men was the subject of a hearing before the Board of Wages and Working Conditions early in the year, but no action was taken and the matter was finally transferred to the regional directors. The Northwestern region has been the first to act officially in this matter and its officers deserve a great deal of credit for recognizing the justice of this case and for having the courage to set a precedent for the other regions.

Government Control and Strikes

Premier Lloyd George's speech before the House of Commons on Monday of this week, which was reported at length in most of the leading daily papers, was of special importance in more ways than one. The premier had considerable to say in his three-hour address concerning Britain's serious financial condition, but we should like to refer particularly to the decision he announced that the government had rejected the majority report of Justice Sankey's commission which proposed the gradual nationalization of the coal mines. The government, he said, would launch, instead, a plan for partial state control, by which the government will buy out the owners of coal lands, who receive royalties from the mining companies, give the miners a share in the control of the mines, organize the mines into districts and establish a fund for improving the living conditions of miners. This decision is of special importance because it indicates that the British government has finally taken a definite stand against nationalization. Judging from what the premier said as to nationalization, it is apparent that the British government has at last discovered that government ownership does

not at all mean satisfied labor and efficient work. The premier deprecated severely the intentional slowing down of production, which, although he did not say so, has been emphasized by government control. But even more important is the evidence that the premier is firmly converted to the idea that government ownership or control does not mean the end of labor troubles and strikes. "The premier contended," says the despatch, "that there was no evidence that harmony would prevail with the workers under state ownership. He instanced the recent miners' strike in Yorkshire, which he declared was a strike against the government, and the experience of the railways under government control. Therefore, he thought the whole basis of the Sankey report that state ownership would promote harmony had been falsified." The argument that government ownership and control will mean an end to strikes and similar labor difficulties seems to die hard. But two blows in two successive weeks, one from the British premier on the other side of the ocean, and the railway shopmen's strike on this side, will no doubt go far towards downing it at last.

Economies Effected by Signals

THE increased cost of material and labor makes it necessary for the railroads to effect economies in every way possible. This condition prevails not only in this country but throughout the world. One method being considered for reducing costs on the British railways is by the general installation of automatic signals to replace their present system of manually operated signals. The New South Wales Government Railways were confronted with a heavy increase in traffic and found it necessary to double track a considerable mileage beyond the metropolitan area. Although operating under the British Board of Trade standards with respect to the safe working of the lines, the officers have found it advisable to install automatic signals on certain stretches, which have proved to be a profitable investment. Under the operating conditions on these lines it was found that signals could be used to advantage in the suburban areas and also on the country stretches of the double track lines where the distance between stations is greater than the length of block stations necessary to handle the existing traffic.

On the single track lines in New South Wales it is felt that automatic signals cannot be used to advantage, as the electric tablet or electric staff system is employed. The larger part of the system is interlocked. The installation of signals in the suburban area was found necessary in order to shorten the headway between trains and in this manner increase the capacity of the tracks. On the double track country lines automatic signals were installed to facilitate the movements of through trains and to obviate the necessity for the force of men that would have been required to operate the old type of signals.

While a greater expenditure in first cost was necessary than for a manual system, the smaller number of employees required, with the increased safety of operation through the elimination of the human factor in the operation of the signals, has proved of great advantage. The economy effected shows the value of such installations. On the territory where 108 automatic block sections were provided it would have been necessary to construct 46 additional interlocking towers and use a staff of 138 men whose wages would have amounted to at least $116,640 per annum. The saving in wages by using automatic signals in a short time more than offset the increased investment. Under the operating conditions now existing on many lines in the United States automatic signals can also be used to advantage as they will produce similar savings.

Has Railroad Capital or Railroad Labor Been "Exploiting?"

THE FUNDAMENTAL POSTULATE upon which the advocates of the Plumb Plan based their arguments for it in the hearings before the House Committee on Interstate Commerce was that the railroads should not be privately owned and managed for private profit, but should be government-owned and operated by the employees "at cost." Their operation by private companies for private profit results, it was asserted, in the public on the one hand and the railroad employees on the other being "exploited" to get huge profits for the private owners.

If this contention is based upon experience, and not upon mere theory, it must be possible to show that under private ownership and operation, the railroad owners actually have received large and increasing profits, while, in order to make these profits, they have exploited the public by charging it ever higher and higher rates, and exploited the employees by keeping down or reducing their wages.

In fact, in one of his closing statements to the House Committee on August 12, Glenn E. Plumb made numerous charges to the effect that the railroad companies have issued fictitious securities, have given their stockholders stock bonuses, have padded their property investment accounts, and have done numerous other things of similar character with the purpose and effect of enabling the owners to make enormous profits at the expense of the public and the employees. When he attempted to supply any facts in support of his allegations—a thing Mr. Plumb seldom does—he referred chiefly to transactions which he asserted had occurred since the year 1900.

We do not wish to cause pain and embarrassment to Mr. Plumb and his fellow leaders of the "red" element of organized labor by applying the standard of cold official statistics to their wild ravings against capital. It is necessary, however, for the enlightenment of the public that this be done. Let us therefore take the official statistics of the Interstate Commerce Commission for the years 1900 to 1917, when the railways were under private management, and see just how much support they give to Mr. Plumb's series of allegations. Let us see who, if anybody, connected with the railroads, did any exploiting during this period; and if so, who really were the exploiters and the exploitees. We shall add to the Commission's statistics for the years 1900 to 1917 some estimates based upon the available statistics of the Railroad Administration for the year 1918 and for the first six months of 1919, to show who, if anybody, connected with the railroads, has been doing any exploiting under government operation.

The accompanying table shows, for the seven year period 1900 to 1907, and the ten year period 1907 to 1917, and also, as closely as can now be estimated, for the two year period 1917 to 1919, and the nineteen year period 1900 to 1919, the increases which have occurred in the book cost of road and equipment, and the operating income of the railway companies, in the number of their employees, and in the total compensation of the employees.

If the reader will take the trouble to study these statistics he will see that they throw much light upon the validity of the allegations made by Mr. Plumb. They show that in the seven years from 1900 to 1907 the book cost of road and equipment, as reported by the railway companies and compiled by the Interstate Commerce Commission, increased about 27 per cent. Meantime their operating income increased 59 per cent. ("Operating income" is all that is left to a railway company after it has paid its operating expenses and taxes; and every dollar of interest and dividends it pays, and every dollar of earnings which it invests in its property,

comes out of operating income. Therefore, operating income is the best measure available of the profitableness of the railroads to their owners.) During this same period of seven years the number of railway employees increased 64 per cent, and the amount of compensation paid to them increased 86 per cent. During this time the profits of the owners of the railroads increased faster relatively than did the average wage per employee.

The statistics for the ten year period 1907 to 1917 tell a somewhat different story. During this period the railroads were subject to strict regulation. Their net capitalization increased less during this time than their book cost of road and equipment, but their books were kept under an accounting system prescribed by the Interstate Commerce Commission, and therefore the additions to their book cost of road and equipment must have been correctly made. The Interstate Commerce Commission has not given us its figure for total book cost of road and equipment in 1917, but its figure for 1916 exceeded $17,500,000,000, and therefore we have assumed that for 1917 it will be about $18,000,000,000, although it may be less.

The increase in property investment in ten years, then, was about 38 per cent, while the increase in operating income was less than 40 per cent. (The year 1917 was the best ex-

Years	Book cost of road and equipment	Operating income	Number employees	Total compensation of employees

‖Decrease.

cept 1916 in point of operating income that the railroads have ever had. A very different story regarding the increase of operating income would be told if we compared the year 1915 with the year 1907.) In the same ten years the number of railroad employees increased less than 4 per cent, while the total wages paid to them increased 62 per cent. It can hardly be said that during this period the railroad companies were very successful in increasing their profits by "exploiting" their employees. The increase in what the employees got out of the railroad business was relatively and absolutely much greater than the increase in what the owners got out of the business.

In the period of seventeen years, 1900 to 1917, the increase in the book cost of road and equipment was 75 per cent, and the increase in the number of employees only 70 per cent. Meantime, operating income increased only 124 per cent, while the total compensation of employees increased 221 per cent. Relatively and absolutely the employees increased their income from the business during this time much more than did the capitalists against whom Mr. Plumb directs his melodramatic series of "I charges."

What was happening to the public meantime? Was it being "exploited" to make a Roman holiday for the owners? The statistics of the Interstate Commerce Commission show that the average receipts per ton per mile declined from 7.3 mills in 1900 to 7.15 mills in 1917, and that there was a slight decline in the average receipts per passenger per mile. In spite of all the crimes and misdemeanors alleged to have been committed by the railway companies during these seventeen years, the public was charged lower rates at the end of the period than at its beginning, and the average wage of employees had increased 75 per cent.

We come now to the period of government operation of railroads. The railroad owners have had no opportunity during this time to exploit the public. The return they are being paid on their capital is based upon the average operating income earned by them in the three years ending on June 30, 1917, and is about 13 per cent less than what they received in 1917. Meantime how has labor been getting on? The pay roll of the Railroad Administration for January, 1919, which contains the latest statistics available, indicates that since 1917 the total number of railway employees has increased about 7 per cent, while the total wages paid to them have increased at the rate of 63 per cent per year. Mainly in order to pay this advance in wages the public has had its passenger rates increased 50 per cent and its freight rates at least 25 per cent; and it is defraying a huge railroad deficit from taxes. If anybody connected with the railroads has been "exploiting" the public during this time, it has not been the terrible Morgans, Rockefellers, and so on, but the Stones, the Garretsons, the Lees and other leaders of railroad labor organizations.

Reviewing, now, the record of the last nineteen years, we find it shows that the increase in the book cost of road and equipment, which represents the investment made in the railroads, and which Mr. Plumb says is enormously inflated, has been about 80 per cent, while the increase in the operating income from which the railway companies are deriving their return has been 98 per cent. Meantime, the increase in the number of railroad employees has been less than 82 per cent, while the increase in their annual compensation has been 391 per cent.

Let us state the matter in another way. In 1900 the operating income of the railways was $477,000,000 and the wages paid to labor were $577,000,000. The operating income upon which the railroad companies' guaranteed compensation for 1919 is based is less than $950,000,000 while the total compensation of railroad employees in 1919 is running at the rate of approximately $2,835,000,000. *Nineteen years ago the wages of the employees were about $100,000,000 more than the operating income of the companies, while in 1919 the compensation of the employees is running at the rate of $1,900,000,000 a year more than the return guaranteed to the companies.*

In the face of facts such as these the leaders of the labor organizations are demanding still another increase of $800,000,000 a year in wages, and, at the same time bitterly assailing the companies for alleged "profiteering" and for seeking legislation which will enable them to pay perhaps 6 per cent upon their property investment. The increase in the wages of the employees since 1900 has been over four times as great, both absolutely and relatively as the increase in the operating income of the companies.

Let us consider these statistics regarding capital return and wages in connection with statistics showing the service rendered to the public. In the last nineteen years, as we have seen, the book cost of road and equipment has increased about 80 per cent and the operating income of the companies about 98

per cent. The number of tons carried one mile has increased meantime 160 per cent and the number of passengers carried one mile about 181 per cent. The traffic handled annually for the public having increased almost twice as much in proportion as the book cost of road and equipment and the operating income of the companies, it follows that the *capital cost* of moving a ton one mile, or a passenger one mile, is now a little over *one-half* what it was nineteen years ago. Meantime, the annual compensation of the employees has increased 391 per cent. In consequence the labor cost of moving a ton one mile and a passenger one mile is now *more than twice as great* as it was nineteen years ago. Again we ask, since the labor agitators indulge in so much wild talk about "exploitation," who do these figures indicate has been "exploiting?"

It is difficult for a generous and rational mind to decide whether Mr. Plumb and the other labor agitators are prompted by ignorance, malignity or sheer recklessness in indulging in the sort of wild misrepresentation and melodramatic vituperation regarding railroad management with which they recently have been regaling the House Committee on Interstate Commerce and the American public. One good result they do cause by it, however. They prompt people who know something of the facts regarding the railroad business to present them; they jar the public into taking an interest in the facts; and the more the facts are presented, and the more widely they become known and are understood by the public, the better chance there will be of securing the return of the railroads to private management under a system of regulation under which they can be efficiently operated and can become prosperous again.

Far be it from the *Railway Age* to say the statistics presented above show that railroad labor has been "exploiting" the public. But if it cannot truly be said that railroad labor has been exploiting the public during nineteen years when the labor cost of moving a ton one mile has more than doubled, surely it cannot truly be said that railroad capital has been exploiting the public when it can be shown that during the same period the capital cost of moving a ton one mile has been reduced by almost one-half.

New Books

The Design of Walls, Bins and Grain Elevators (third Edition), by Milo S. Ketchum, dean of the College of Engineering, University of Colorado, 6 in. by 9 in., 556 pages, illustrated, bound in cloth, published by McGraw-Hill Book Company, 239 West Thirty-ninth street, New York.

This constitutes an amplification of the preceding edition of this well known treatise on structures subjected to the lateral pressures of earth and other materials. The additional material consists of data on the economic design of reinforced concrete retaining walls, formulas for wedge-shaped reinforced concrete beams, formulas for calculating the load on bin walls according to several methods, the calculation of pressures in sand boxes and one feature—which will be most welcome to a great many engineers—fully worked out problems in the design of retaining walls and bins. A report on the design of retaining walls adopted by the American Railway Engineering Association in 1917 has been added to this volume. The arrangement of the matter in the present edition follows that of its predecessor, commencing with a general explanation of the theory of lateral pressures on walls and bins as expounded by various authorities, reports of various experiments and types of walls constructed with detailed explanations of retaining wall design as mentioned above. The second part of the book is devoted to the design of coal bins, ore bins, etc., and the third portion to the design of grain bins and elevators. There is also an appendix of about 70 pages on plain and reinforced concrete materials, design and specifications.

Letters to the Editor

How About Eliminating the Flagman?

To the Editor:

I was much interested in the article on "Flagging and Its Relation to Railroad Accidents," by C. C. McChord, in the issue of the *Railway Age* of June 20, page 1528. I consider it a very good treatise on the shortcomings of flagmen and the disastrous results often attributed to the failure of the flagman to give the engineman warning in time to avert collisions.

I wonder if the author has given very careful consideration to one other view that might be taken in regard to the prevention of collisions in block signalled territory; that is, eliminating the flagman, and depending entirely on the engineman's observance of the signal indications. Every instance of collision cited shows that in those instances the presence of the flagman did not avert the accident, and to these can be added a much longer list of such instances. If there were any records to show how many accidents the presence of the flagman in block territory averted, I wonder how it would compare with the other. In very few cases has it been shown that the signals failed to give a proper warning, and I believe that the proportion of accidents due to improper automatic signals is at least as small as that caused by air brake failures. It cannot be disputed that an occasional false clear indication is given by an automatic signal, but the investigation of accidents seems to show that false clear signals are responsible for a very small percentage of them, and the fact that the accidents occurred at those times is positive proof that the practice of having a flagman out did not prevent them.

It was my good fortune recently to be present at a conference on this subject where the operating officers of one of the largest railroads in North America begged for the opportunity of eliminating flagmen in automatic block signalled territory, but they were denied the privilege through the joint action of other roads and a government body. These men had the courage to do this even though there had been rather a bad accident not long before on their road in automatic territory where there was some, but not conclusive, evidence that a signal of an old design had given a false clear indication. Had they carried out such a procedure, that road would, no doubt, have been able to furnish interesting and valuable information on the value of the flagman in automatic territory. There is no doubt but that such a practice would increase the capacity of a railroad by eliminating the time required to recall a flagman. Possibly the increase in alertness of the engineman in observing signal indications and in acting on the instructions given by the signals, which he would know was the last warning he could have of conditions ahead, would reduce rather than increase the number of such accidents. Would it not seem more logical to make full use of and put full dependence on the automatic signal before we augment it with an automatic stop? Perhaps we would find the automatic stop was needed after all, but there certainly is a chance that the automatic signal is sufficient if a way is found to cause its indication to be obeyed. There does seem to be foundation for the argument that the presence of the automatic signal helps to make the flagman careless and the presence of the flagman tends to make the engineman careless of obeying the signal indications. If this can be corrected by elimination, it must be the flagman. If it must be corrected by addition, it seems we must add the automatic stop, in which event will we still require the flagman?

C. H. T.

The Import Situation in England and France

Economic Conditions Have Made It Necessary to Restrict Imports; Present Regulations More Favorable

By Robert E. Thayer,
European Editor of the *Railway Age*

London, July 31, 1919.

THE ECONOMIC POLICIES formulated by England and France immediately upon the signing of the armistice regarding imports have been exceedingly discouraging to American manufacturers of export materials. Both of these countries realizing the almost disastrous condition of their local industries made a very determined effort to protect them against "foreign invasion" by establishing rigid embargoes against the importation of materials. This gave their own local industries an opportunity to supply the particular needs of these countries and at the same time prevented any increase in the already collosal national debt. This policy has been found to react against them as it has not been possible for the home industries fully to supply their needs. The governments of Great Britain and France have, therefore, made considerable concessions in the matter of restricted imports, so that now exporters of railway materials have a much clearer field than heretofore. The need of France for railway material has been well stated by the Paris correspondent of the "London Post," who, under date of July 30, states that it will be a long time before France is again in a position to meet the demand for such manufactured goods as railway rolling stock, whereas these things have been urgently required for many months past for the purpose of enabling the transport service of the country to be readjusted to something like a normal footing.

France, however, has increased the duties on certain classes of goods up to as high as 300 per cent;—that is the existing rates of duty are to be multiplied by factors or coefficients varying up to three, according to the protection desired.

Both France and England have been critized for having taken such strong measures, but neither of these countries can be blamed for wanting to keep as much business for their own manufacturers as possible and thus build up their impoverished industries and provide labor for their demobolized men. The credit situation was so bad and the problem of reconstruction so vast and complicated that, true to the inborn conservatism of these nations, they sought protection behind a rigid embargo to give them time to really find themselves. The magnitude of the war, and the problems arising therefrom were wholly without precedent and were impossible of immediate solution. The American nation as a whole has not experienced the great trials, both physical and financial, of our allies in Europe. It was thus hard for us to appreciate fully the mental attitude of those nations.

After the signing of the armistice, the American manufacturers, realizing the great need for railway equipment in France and England, came over in large numbers expecting to obtain a large amount of business. There were and are quantities of railway business to be done in these countries, but at the time they were not ready to go out into the open market for materials until they determined what it was possible for them to obtain in their own countries. The rigid embargo gave these countries an opportunity to determine their actual conditions, and to find out exactly what they could do for themselves. They have realized that their problem of reconstruction is so vast that outside help must be obtained, and thus the removal of restrictions has been very pronounced during the past few months.

On June 14 a decree was issued by the French government removing the restrictions on all goods imported into France, but at the same time placing an ad-valorem surtax on such goods which varied from 5 to 45 per cent. This was only a temporary measure which has been changed (July 8) to an increase in the duties, as described above, by multiplying existing duties by certain coefficients. This change was made to facilitate the application of the increased duties and to eliminate possibilities of disputes. In view of the necessity of not exceeding the limits of a just equalization of these tariffs, the government will continue to follow the markets closely and will reduce the coefficient figures when necessary. An inter-ministerial commission has been established for the purpose of preparing periodical revision of these coefficients, in order that the schedule may correspond as exactly as possible to the present and pre-war values. While these figures will be quite burdensome to many of our American manufacturers, particularly while the present rate of exchange between the United States and France is so low, it was felt necessary to take steps to assist the French industries to reestablish themselves, particularly on account of the fact that at the present time the exports of France only represent one-sixth of the imports.

The following table gives a list of the items of particular interest to railway supply manufacturers together with the coefficients which are to be used in multiplying the present rate of minimum tariffs to obtain the new tax:

Articles	Coefficient
Fine steel for tools	2.7
Special steel containing—	
At least 0.5 per cent of nickel	1.9
From 0.5 to 6 per cent of chromium	1.9
From 0.5 to 6 per cent of tungsten	1.9
From 0.2 to 2 per cent of molybdenum	1.9
From 0.1 to 0.5 per cent of vanadium	1.9
From 0.1 to 0.5 per cent of titanium	1.9
Special steel containing—	
More than 6 per cent of chromium	1.9
More than 6 per cent of tungsten	1.9
More than 2 per cent of molybdenum	1.9
More than 0.5 per cent of vanadium	1.9
More than 0.5 per cent of titanium or any other rare elements	1.9
Wheels, tires, and wheel centers of iron or steel—	
For railway and tramway cars and carriages	2.6
For locomotives	2.6
Axles—	
Straight axles for railways and tramways, axles not specially mentioned, of iron or steel	3
Crank-axles for locomotives of iron and steel	3
Steam and other engines	
Steam engines, stationary without boilers; stationary steam pumps; various gas and air compressors; gas, petrol, alcohol, hot-air and compressed air motors and those operated by any other gaseous or explosive mixture as well as all other motors not mentioned	2.6
Locomotives	2.6
Tenders for steam locomotives	2.3
Dynamo-electric machines	2.9
Electric and electro-technical apparatus containing coils of insulated metallic wire	2
Electric and electro-technical apparatus not containing coils of insulated metallic wire	2
Machine tools	3
General machinery—	
Pulleys for transmitting power, lifting apparatus balances, scales, fixed railway and tramway stock, presses	2.7
Straight axletrees mounted as material for railways and tramways	3
Component parts of boilers and similar apparatus of pressed or welded sheet iron	3
Balls for ball bearings	1.8
Rough frames and bodies of dynamos and electric motors, armature crosses, covers of electrical collectors ("fourreaux de collecteurs"), solid poles of dynamos and alternators, of iron or steel wrought or swaged of molded iron or steel, of malleable cast iron, of pressed or welded plate	3
Springs of steel for carriages, automobiles, railway carriages and wagons or locomotives	3
Component parts of copper, pure or alloyed with any metal, cast, molded, wrought (brasses, cocks, and accessory apparatus for water, gas, and steam, etc.)	3

Component parts of machines and of shafting, not specified, of two or more metals, such as iron, steel, cast iron, copper pure or alloyed with any metal named in the preceding articles, such as brasses, cocks, and accessory apparatus for water, gas and steam	3
Wires and cables, insulated, for electricity, composed of cores of iron, steel, copper, or an alloy of copper, covered with	
Silk in combination with india-rubber or gutta-percha, without protective covering of metal	3
India-rubber or gutta-percha alone or in combination with material other than silk, without a protective covering of metal	3
Other, if the metallic core has a diameter:	
Equal to or greater than 5/10 mm	3
Less than 5/10 mm	3
Dynamo armatures and component parts, such as coils, solid or hollow, of metal surrounded by insulated copper; worked parts of metal, fitted or not, for electric machines, electric apparatus, electrotechnical apparatus, transformers and other electrical appliances	3
Tools with or without handles* of cast iron or steel (except twist drills [American drills] and other drills, screw taps, dies for screw stocks, stamps and matrices, reamers and milling cutters in one piece)—	
Saws—	
Circular saws, endless hand-saws, fret-saws, hand-saws	2.7
Files and rasps, cut or pointed, finished or not	2.7
Vises of all kinds, diestocks, stocks and dies, ratchet braces, breast drills, spiral drills, monkey wrenches, with wooden handles, adjustable spanners, and others	2.7
Mechanics' tools—	
Shear blades, tools for threading, turning, planing, mortising, "a moleter," reaming blades, sockets for reamers, reamers and milling cutters with blades	2.7
Other tools	2.7
Articles of cast iron (neither turned nor polished)—	
Railway chairs, paving plates, furnace plates cast in the open mold	3
Straight cylindrical pipes, for canalization, 7 mm. or more in thickness. Beams and columns, solid or hollow, not ornamented; frames of columns simply pierced with holes; retorts for the manufacture of gas; solid bars for grates, even put together; bars and plates for furnaces; straight bars of solid section; vats of large size for industrial purposes; inspection doors; plates for sewers and similar rough castings	3
Straight cylindrical pipes, for canalization, less than 7 mm. in thickness; water and like unions, such as elbow pipes, branched pipes, straight joints (including joints furnished with rough flanges drilled)	3
Manufactures of case-hardened cast iron	3
Iron-work for carriages, especially such as enters into the construction of railway rolling stock (including buffers and couplings)	3
Tubes of iron or steel	3
Carriages—	
Carriages to run on rails, upholstered or not, for ordinary gage tracks, including passenger carriages, good wagons, ballast trucks, and tramway carriages†	1.2
For narrow gage tracks—	
Passenger carriages	1.2
Goods wagons	2.4
Ballast trucks	2.6
Tramway carriages†	1.3
Bodies, chassis or bogies, or parts of bodies, chassis or bogies of railway or tramway carriages or wagons	1.3
Paint and other brushes—	
Paint brushes of martens' or other animal hair, except pigs' or boars' bristles, mounted on quill or on wooden, bone, etc., handle, with or without ferrule of non-precious metal	1.8
Paint brushes of pigs' or boars' bristles—	
Common wooden handles, with or without metal ferrule	1.8
Fine wooden, bone, celluloid, etc., handle	1.8

*Handles of fine materials are subject separately to the duties payable on manufactures of the material of which they are composed.
†The motors pay duty according to kind.

In England there has been no increase in the custom rates with the removal of restrictions. A revised list of exports from the United States for which a license is not necessary, corrected up to June 17, 1919, was recently published in the "Anglo-American Trade," the monthly bulletin of the American Chamber of Commerce in London. The following list taken from the published list applies particularly to railroads:

Abrasive wheels.
Carpenters' tools.
Cells, Edison and component parts, for electrically propelled vehicles.
Chucks.
Die heads.
Dies and die stocks.
Drill presses.
Drill sleeves and sockets.
Drills.
Electric batteries, secondary.
Emery stones.
Expansion bits.
Files.
Friction clutches.
Gages.
Grease cups.
Grinding stones.
Hacksaw blades.
Hammer heads, iron.
Hammers: Engineers', hide, household or upholsterers', lead.
Hand screwing machines.
Hatchets.
Injectors and ejectors.
Jacks, motor car and track.
Lathe carriers.
Lathe dogs.
Lubricators.
Machinery: Prime movers, except agricultural and electrical textile, woodworking and parts thereof driven by power, and suitable for use in cutting, working or operating on wood, including: sawing machines of all descriptions, general joiners, mortise, tenon, and boring machines, lathes and rounding machines, box and cask making machines, and all accessories thereto, scraping and sandpapering machines, wheelwright machinery, firewood making and bundling machinery, wood wool fibre and pulp machinery, saw sharpening and setting machines, saw stretchers and brazing apparatus, all machines for grinding, planing or molding irons. Unenumerated (not including typewriters and sewing machines.)
Machine tools and parts thereof.
Machine vises.
Micrometers.
Milling cutters.
Mitre blocks and scrapers for metal.
Mitre boxes.
Motors, electric, up to ¼ h.p.
Motors, electric rolling mill for auxiliary, driving up to 250 h.p.
Motors, single phase repulsion induction.
Oil, Fish, viz., train, blubber, sperm or head matter, animal coco-nut, unrefined, refined, mineral jelly (including vaseline), olive, palm, lubricating oils, turpentine, essential (if not capable of retail sale as perfumery) unenumerated.
Pipe cutters.
Pipe tongs, adjustable.
Pipe vises.
Pipe wrenches.
Pliers.
Pressure regulators.
Pressure and vacuum gages.
Punches.
Reamers.
Rods, copper, steel, and iron wire.
Saws, band circular, crosscut, kitchen and others.
Screwing tackle (i. e., chasers, dies and stocks, taps and thread milling cutters).
Smiths' tools.
Spanners.
Steam traps.
Swage shapers.
Tapping attachments.
Taps.
Tap wrenches.
Time recorders, and parts thereof.
Tool holders.
Union coupling, pressed steel.
Water gage fittings.
Wire: Brass, copper, coppered steel spring, phosphor bronze, steel wire—coppered and flattened, tinned mattress, wire leading in nickel copper.
Wood boring bits.

At the same time, when the licenses were removed from the articles mentioned above, important concessions were granted in gun metal, brass or bronze valves for gas, water and steam, which permitted an importation of 100 per cent of the 1916 imports. The importation of Yale triplex blocks is permitted to an amount equivalent to the 1913 imports, the business to be given to regular pre-war importers.

There are still some items requiring individual licenses. These include the following:

Ball bearings.
Cables and wires, electric (other than flexible wires for telephony and house wiring).
Electrical accessories and parts thereof, including fan motors.
Fan blowers and forges.
Hoists, electric.
Jacks, except motor car and trap jacks.
Motors, electric and parts thereof other than for renewals, except (a) small motors up to ¼ h.p.; (b) rolling mill motors for auxiliary driving up to 250 h.p.; (c) single phase repulsion induction motors.
Pinch bars.
Pipes, cast iron and fittings.
Pulleys, iron and steel, except pressed steel pulleys, of which 200 tons (actual net weight) are to be admitted until September 1.
Pulleys, wooden.
Pulley blocks, steel, except Yale triplex.
Roller bearings.
Shop cranes, portable.
Spring cotters.
Spring washers.
Trolleys and trucks for warehouse and wharf.
Tubes, welded iron and steel up to 2 in. in diameter.
Valves, iron and steel.
Weighing machines (and scales).
Weighing machines, portable platform.

With the increase in the custom duties in France, with the low rate of exchange between both France and England and the United States, and with the high freight rates, there will be some difficulty in making sales to both those countries on account of the net cost of the delivered materials. In fact the industries of France have brought great pressure to bear on the government to protect them properly in the manufacture of railway materials. Regardless of the fact that the American government is willing to accept a very low figure for the railway material it now has in France, it is believed the Fench commercial interests will strongly oppose the purchase of this material.

The removal of the restrictions, however, has given American manufacturers a basis on which to work which will be far more satisfactory than under the licensing system. In the matter of deliveries the United States has the advantage and undoubtedly more sales will be made in the future than since the signing of the armistice.

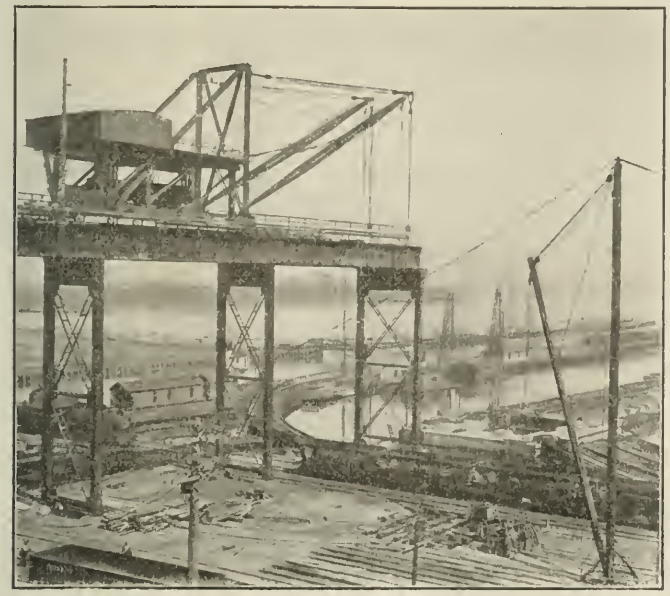
According to the "Popolo Romano" the "gravest danger threatens Italy at this time" as a result of the British coal crisis, says a press despatch from Rome. The only hope in the situation, says the newspaper, lies in American coal, though the problem of sufficient shipping to carry it is a difficult one at the present moment. Little hope is held out that coal can be received from the Saar Valley and the Teschen district. "In a few weeks," the "Popolo Romano" says, "our coal stocks may be completely depleted. As Italy imports 7,000,000 tons of coal out of the 12,000,000 tons consumed each year the prospect for the winter is alarming."

Duluth Ore Dock is the Largest in the World

Description of Record Structure Completed This Spring for the Duluth, Missabe & Northern

By W. H. Hoyt
Assistant Chief Engineer, Duluth, Missabe & Northern

THE LARGEST ORE SHIPPING DOCK in the world is the new dock of the Duluth, Missabe & Northern, on Duluth-Superior harbor, which was placed in operation on May 1 of this year. It has a length of 2,438 ft., sufficient to dock two of the world's largest ships, the Bismarck and the Leviathan, end for end on either side. The



Double Boom Traveler Erecting the Steel Work

deck is 84 ft. above water with electric light masts reaching to 120 ft. above water.

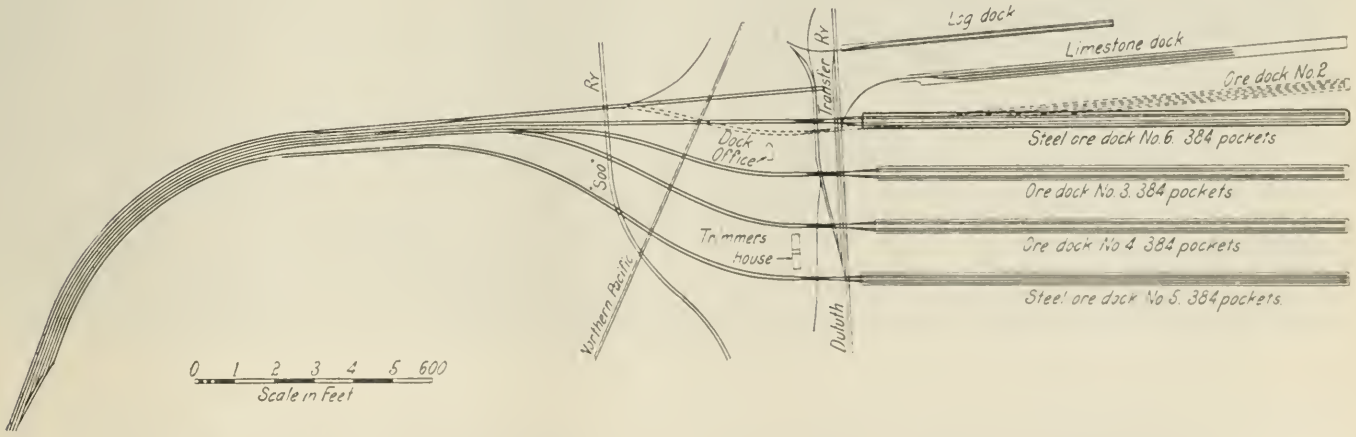
Construction work on this pier was started in August, 1916, by tearing down an old wooden ore dock which occupied a large part of the site of the new dock. The wrecking of this old structure and the pulling of 8,255 piles from 50 to 75 ft. in length was a big job in itself. After removing the timber superstructure and pile foundation, three rock-filled timber cribs were removed with powerful dredges and derrick scows.

The first shipments of new piling were received on December 2, 1916, and pile driving started on December 23. Four drop hammer drivers, with 60-ft. leads, were used on this work, and a total of 971,014 lin. ft., or over 183 miles, of timber piling was driven by July 28, 1917. During this time two other machines drove 174,230 lin. ft. of 12-in. 43-lb. United States Steel sheet piling, in 38-ft. lengths. The timber foundation piles run from 50 to 85 ft. in length and receive loadings not exceeding 20 tons per pile.

The drivers used were swing machines carried on platforms supported by piling driven ahead, followed by the steel sheet pile drivers and then by the outside fender driving machines.

The pile cut off was 9 in. above low water datum, which is amout average water level. About 180,000 ft. b. m. fir timber was used for caps. Tie rods, 1¼ in. in diameter, running across the dock every 12 ft., serve to anchor the tops of the sheet piling in place. The entire dock foundation, being surrounded by steel sheet piling, was pumped full of sand, of which 33,000 cu. yds. were taken from slips alongside and 49,000 cu. yds. was brought in by scows. This sand was carefully leveled off at low water datum and served as a support for the concrete foundation slab, leaving the piles projecting 9 in. in the concrete.

The foundation of the dock is a reinforced concrete slab 2,438 ft. long, 69 ft. wide and 6 ft. deep, with openings along the center line which were filled with sand. The concrete was composed of a 1:3:5 mixture of Universal Portland cement, Lake Superior sand and crushed run trap rock, taking everything through a 3½-in. screen. The reinforcement consisted of a layer of 1-in. plain round steel rods on 6-in. centers, crosswise of the dock and a layer of ¾-in. rods on 12-in. centers lengthwise of the dock, placed



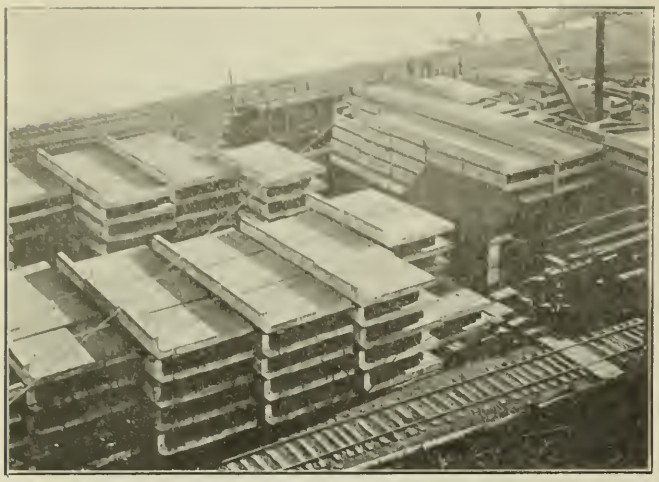
Map Showing Relation of New Dock No. 6 to the Other Docks and to the Approach Development

near the bottom of the slab. A total of 884,410 lbs. of reinforcing steel and 171,320 lbs. of tie rods were used in this part of the work.

Recesses were left in this concrete slab at proper points to allow the placing of column anchor bolts and the pouring

of the column footing pedestals as one block. This avoided the horizontal joint line at the top of the slab and permitted the simple handling of anchor bolts. Expansion joints are provided at cross sections 144 ft. apart in the foundation slab as well as in the superstructure. An oak wale strip 12 in. by 10 in. is embedded in the face wall of the foundation, set into the concrete 8 in. and held in place by anchor bolts every 6 ft. A total of 28,698 cu. yds. of concrete was placed in this work between July 7 and November 8, 1917.

A 1¼-in. water pipe was laid the whole length of the dock foundation to supply drinking water to bubbling fountains on



Concrete Deck Slabs in the Storage Yard

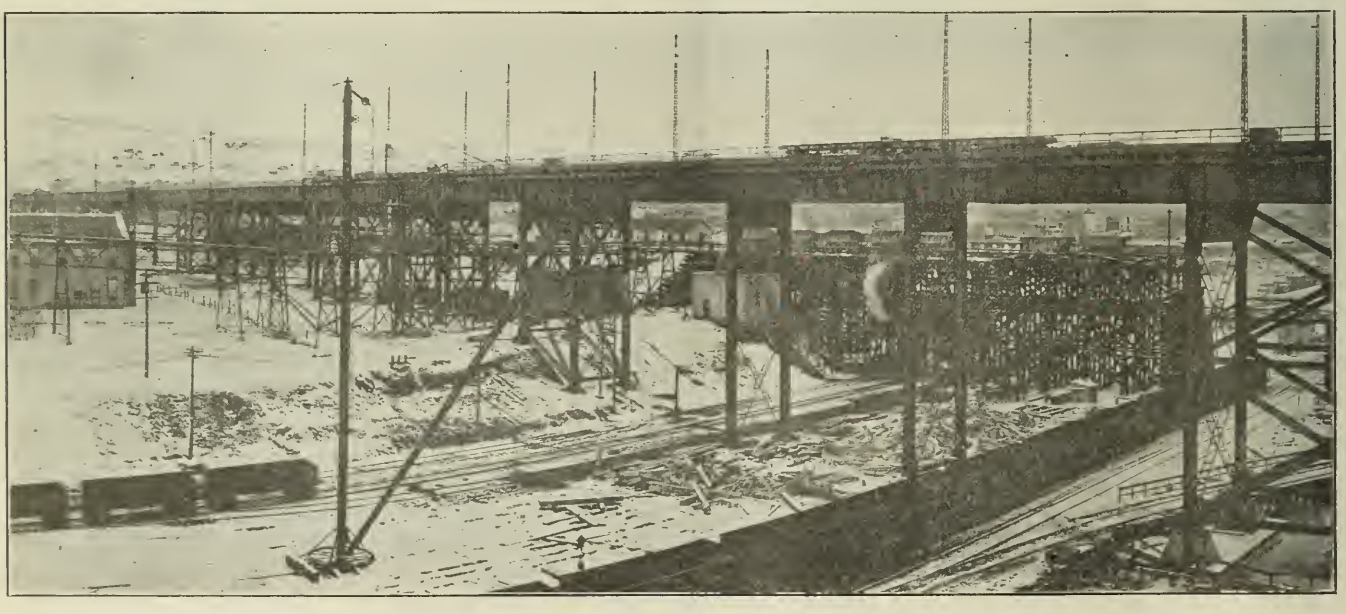
the deck. This pipe was laid 3 ft. 9 in. below the top along the center and covered with sand, thus ensuring a cool supply during the summer months. The pipe was laid with a

5 in. wide, out to out of concrete, and carries four tracks the entire length. Seven lines of walks furnish ample working room and safety for employees. The elevation of rails and walks was set to leave no troublesome flangeway openings to

View of the Deck of the Dock

require constant cleaning. The entire dock and approach are designed to carry the heaviest locomotives of the Duluth, Missabe & Northern, a 304-ton Mallet type and a 266-ton Santa Fe type with 55,000-lb. axle loads.

The superstructure has a structural steel frame with concrete partition walls, pocket walls and sidewalk slabs. The



The Approach Viaduct

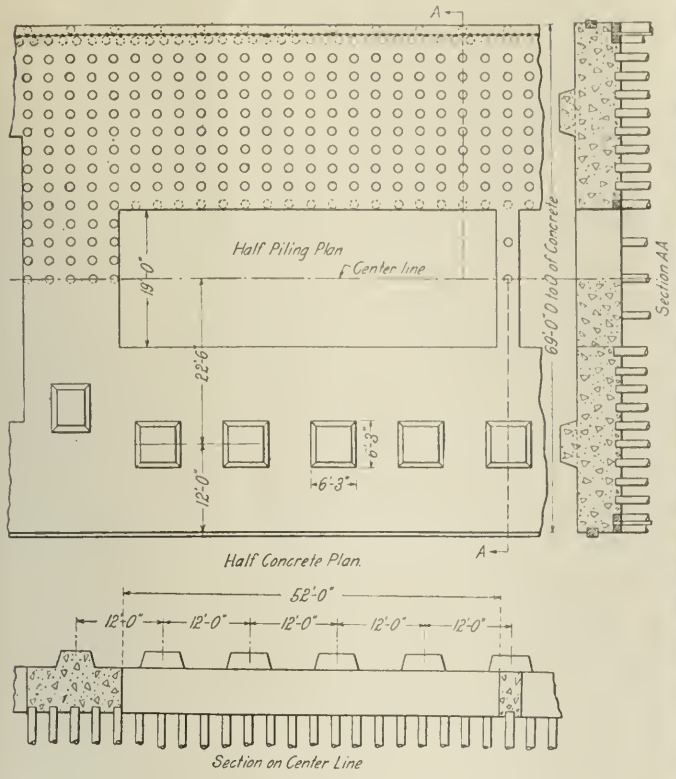
grade and drain outlets in order that it might be drained to prevent freezing in winter when the dock is not in use.

The Superstructure

The superstructure provides for 384 ore pockets, 12 ft. center to center, with 6,540 cu. ft. capacity each. Eight standard 50-ton ore cars can be dumped into each pocket without trimming, thus providing a storage capacity of 3,072 cars, or 153,600 tons. The top of the dock is 76 ft.

fronts are of plate steel, supported between pocket walls by I-beam wales and held against the walls by tie bolts. The entire pocket structure is carried by two lines of steel columns spaced 12 ft. apart, arranged in pairs to form bents under each transverse wall. Each column is designed to carry 1,500,000 lbs. The columns consist of three 115-lb. I-beams, stayed with batten plates. The partition walls and the loads from the pockets are carried to the columns by two plate girders forming an A-frame, and the pocket bottom slab rests

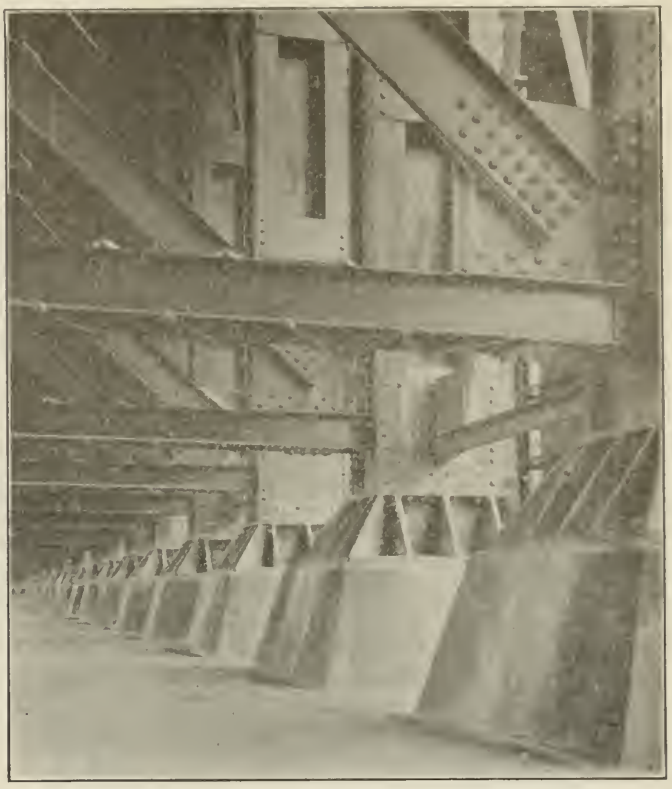
on transverse I-beams that frame into these girders. Reinforcement is put into the floor slab, both for slab action



Part Plan and Sections of the Footing

across the supporting beams and for shear between the slab and the side walls, tending to cause the slab to slide out of the pocket. The column bents are amply wind and sway braced to prevent distortion. Special care was taken to provide effective expansion joints at intervals of 144 ft. in the length of the dock.

The superstructure concrete was made of carefully graded material in proportions by volume of one part cement, three parts sand, five parts of chushed stone, and one quarter part hydrated lime. The hydrated lime was added to secure easy running concrete around and under the reinforcing bars and to assist in water-proofing the mass. The surface of the concrete after removing the forms was very even and required a minimum of hand pointing. Plain round bars, suitably bent, were used to reinforce the bottoms of the ore pockets.

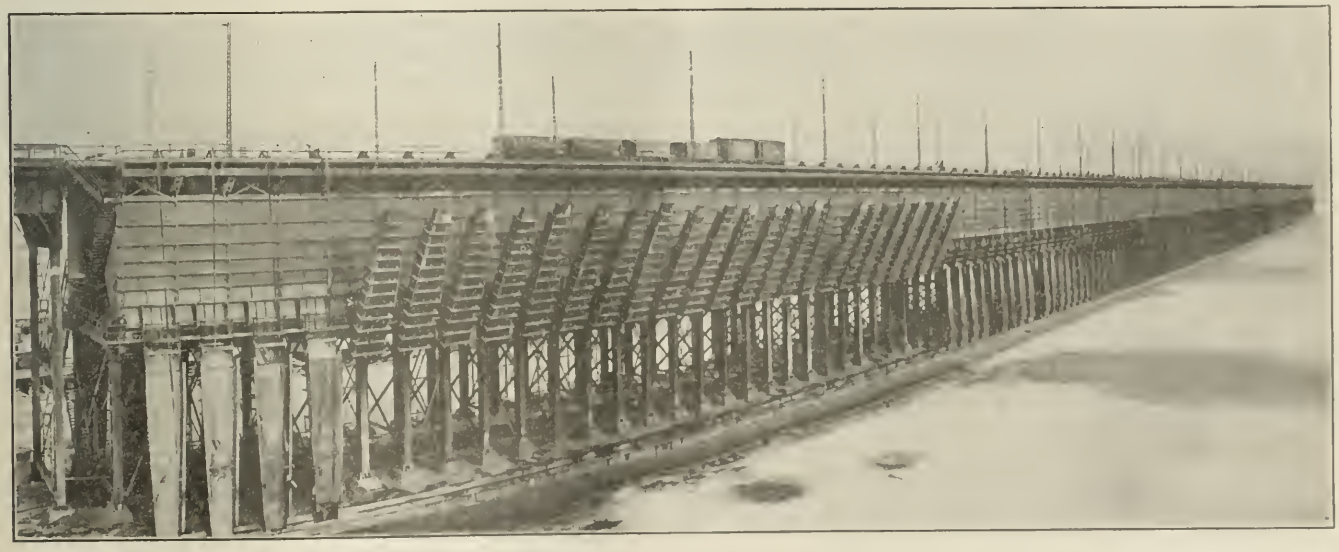


Typical Column Bases and Pedestals

The top deck was reinforced with American Steel & Wire Company triangle mesh.

Concrete bumping blocks properly bonded into the steel and concrete floor finish the outer ends of each track. All stairways are of steel and concrete. Underneath the ore pockets a 4-ft. concrete walk, elevated somewhat above the foundation slab, was placed the full length of the dock. This is to provide a dry walk above the sand and water when this deck is flooded while the ballast water is being pumped out of the ore boats.

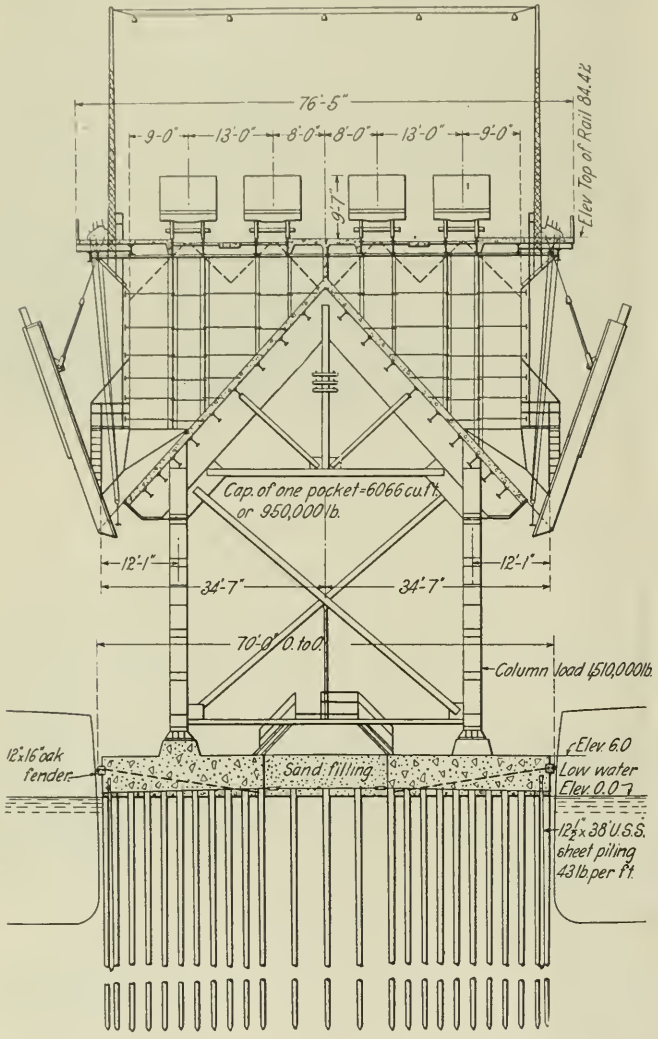
The ore chutes are of the usual type, but heavier, and are raised and lowered by hoists designed and supplied by the



View of the Completed Dock

Whiting Foundry & Equipment Company. These hoists are driven by power from clutches on a line shaft geared to General Electric a. c. motors, one motor operating 12 spouts and doors. The ore pocket doors are the Dickerson type, made of steel plates and frame with two lifting cables wound on drums built into the chute hoists. This makes it possible to raise and lower the doors by power from the deck of the dock. The latching and unlatching of doors is controlled by a lever and connections from the deck. This leaves only the punching and cleaning of ore from the lower parts of the pockets to be done by men on the lower platform.

The deck is lighted by a string of five 100-watt lamps, equipped with Benjamin deep-cone reflectors suspended from a 3/8-in. galvanized strand span wire stretched across the deck from steel poles 35 ft. high. These cross spans are



Typical Cross Section of the Ore Dock

spaced 72 ft. apart along the length of the dock and give a distributed light which has proven very satisfactory. All lighting on the approach is of the same overhead type. Other lamps on the dock light the interior of the pockets, the doors and the boat decks. All wiring, motors and switches are housed in steel conduits and steel boxes. Toilet and drinking facilities are constructed at both ends of the deck and two bubbling fountains are installed at third points between the ends.

The dock has a two-track steel approach trestle 3,087 ft. long, beyond which is also 400 ft. of elevated embankment carried between parallel reinforced concrete retaining walls 24 ft. apart and from 8 to 15 ft. high, held together by reinforced tie walls at intervals of 20 ft. The long steel approach has plumb steel columns resting on concrete pedestals and piles, standard plate girders and a concrete trough deck made of pre-cast reinforced slabs. The longest girder span is 80 ft. 6 in., with 30-ft. spans for the tower bents. Stone ballast and standard track ties are used. On the portion of the approach where the track area is required to be wider to meet the four tracks on the dock the deck slab was built in place.

As a record structure of its kind, some of the quantities of materials used in the construction are of interest and are listed below:

1,667,971 lin. ft. of timber piling, 50 ft. to 85 ft. in length.
174,130 lin. ft. of 12-in., 43-lb. U. S. steel sheet piling.
162,570 sq. ft. of triangle mesh reinforcement.
59,846 cu. yd. concrete in dock and approach.
29,609 tons of steel.

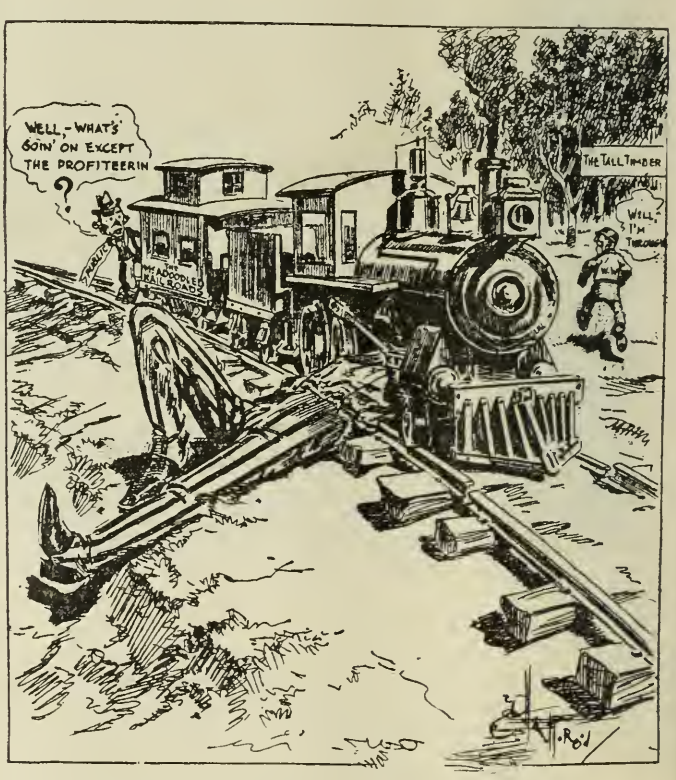
This amount of steel would require approximately 60,000 tons of iron ore, which could be placed in less than one half of the dock and loaded into boats in less than 30 min. time.

The contractors on the work included the Barnett & Record Company, for the foundation; the American Bridge Company, for the steel work; the Stack Construction Company, for the superstructure concrete, and the Whiting Foundry & Equipment Company, for the machinery. All electrical work was installed by the railway.

The following prices were paid on the work:

Foundation piling, let in 1916, furnished for 20 cents per lin. ft.
Foundation piling, let in 1916, driven for 3¾ cents per lin. ft.
Furnishing and placing fir timber in foundations, $42 per M ft. b. m.
Furnishing and placing oak wale timbers, $65 per M ft. b. m.
Driving steel sheet piling, 38-ft. lengths, $1.60 each.
Foundation concrete 1:3:5 mixture (1916 price), $5.51 per cu. yd.
Superstructure concrete 1:3:5 mixture (1917 price), $9.70 per cu. yd.

The personnel concerned with the designing and erection of the dock included the following officers of the Duluth, Missabe & Northern: W. H. Hoyt, assistant chief engineer; W. E. Hawley, office engineer; A. M. Frazee, electrical engineer; F. C. Baluss, engineer of bridges and buildings, and F. N. Graham, engineer of construction.



From the Hartford Daily Courant

Time for Uncle Sam to Get Out and Get Under

Motive Power Under Government Control*

Condition of Equipment and the Means Employed by the Railroad Administration to Improve It

By George N. De Guire

General Supervisor Equipment, United States Railroad Administration

THERE NEVER HAS BEEN a time in the history of your organization when delegates have been called upon to handle matters of as great importance as will be taken up during your present session.

With the country just entering upon a reconstruction period, your organization, if they are to follow the splendid record they have made in the past, will take an active part in the reconstruction problem and as the action of your brotherhood will depend on the attitude this convention assumes towards those matters, it is essential that you weigh carefully every subject that may be brought up so as to fully protect the interests of the men you represent and to assist your country in planning the various industries on a peaceful and successful basis.

Every man in locomotive service has a deep interest in the condition of the equipment he is called upon to operate, and therefore I am going to outline some of the things the Railroad Administration has accomplished from a mechanical viewpoint. In the past 18 months greater concessions have been granted to locomotive engineers and firemen in the way of labor saving devices than have been granted in all the period of time that the railroads were under private control.

When the mechanical department of the Railroad Administration was organized, the director general selected as an officer to be placed in charge of this department, a man who has long held membership in your brotherhood. That person, Frank McManamy, was chosen as assistant director, Division of Operation, mechanical department. In the past 18 months during which Mr. McManamy has held this position, he has continually advocated the application of labor saving and safety devices and because of his extensive railroad training, which started on the deck of a locomotive as a fireman, he has been in a position to show the necessity for any action that has been taken in this respect.

It is not possible to state what the Railroad Administration has accomplished without taking into consideration the conditions which existed at and prior to the time the Government assumed control of the railroads. Therefore, in order to fully comprehend the difficulties encountered by the Railroad Administration and appreciate what has been accomplished, a brief outline of some of the conditions found in motive power and car departments will be given.

The Federal government assumed control of the railroads not because it was desirous of adding to the enormous task it already had on hand, but was forced to do so as a war measure, because the railroad machine had to an alarming extent ceased to function, and in the emergency which confronted the nation it was essential that the railroads should function at their highest degree of efficiency.

The statement has been made and is generally accepted that the principal cause for the railroads failing to function was due to car and locomotive shortage, and while this correctly represents the situation so far as the shipper was concerned, from a standpoint of railroad operation such a condition did not exist.

When a railroad, or a number of railroads are congested with cars and when the shops and roundhouses in any section of the country are blocked with locomotives undergoing or awaiting repairs, in so far as these railroads are concerned there can be no shortage of cars or locomotives. These conditions existed on every railroad which was congested with traffic at the time the Railroad Administration assumed control, therefore, congestion was not primarily due to shortage of cars or locomotives, but to the inability or failure to use to their maximum efficiency, the cars and locomotives at hand.

It was not possible, at the time the railroads were taken over, to say to what extent the condition of locomotives and cars was responsible for the situation which existed. As the Railroad Administration at that time had no mechanical department organized to check up shop practices and the handling of equipment at terminals and advice relative to outlining plans for improvement, the Interstate Commerce Commission was asked to assist in obtaining accurate information relative to the general situation.

The records of the Commission contained much valuable data with respect to general conditions throughout the country and the inspection forces of the Commission were assigned to various congested terminals, particularly throughout the East and Middle West, to investigate and make daily reports of the actual conditions of locomotives and cars and of train movements.

These reports showed that a serious condition existed because of the number of bad order cars at various terminals and also because of the generally defective condition of motive power. This condition, together with overcrowded and inadequate shops and roundhouses, had resulted in trains being held at terminals on account of shortage of efficient motive power, and also had seriously slowed up movement on the road, often to the extent of blocking several divisions.

Condition of Shops and Roundhouses

Prompt handling of locomotives was seriously hampered by the condition of roundhouses and the lack of facilities, at many points, to make running repairs to large locomotives. Roundhouses built 20 years or more ago, for locomotives in service at that time, were not large enough to take care of those in use at the present time, consequently repairs had to be made out of doors or at open roundhouses often with the temperature below zero.

Similar conditions existed in the shops at many points for it was found that there had been no improvements made for many years and consequently there were no crane facilities or proper tools with which to handle and make repairs to modern power promptly. This resulted in locomotives being held out of service for an excessive period of time to receive classified repairs.

The immediate remedy for these conditions was not so much the building of new locomotives and cars as the proper maintenance of locomotives and cars that were in service and more prompt movement of trains.

At a time when the various war industries were clamoring for skilled mechanics at almost any rate of pay, and the supply had been substantially decreased by the selective draft, the problem of improving the condition of locomotives and cars in the midst of exceptionally severe winter weather, was an extremely difficult one.

A survey of the situation indicated that shop facilities were

*From an address at the twenty-eighth annual convention of the Brotherhood of Locomotive Enginemen and Firemen recently held in Denver, Colo.

sufficient if efficiently used, therefore, about one of the first acts of the Railroad Administration was to nationalize the railroad shop facilities so that locomotives could be assigned to shops where repairs could be made regardless of ownership.

Methods for Improving Conditions

Increasing the facilities and forces under war conditions was clearly impossible and the only practical means of improving equipment conditions was the adoption of some plan whereby existing facilities and forces could be made to produce greater results.

The first step in this direction was to call on the representatives of the organized railroad employees to agree to a modification of their agreements and contracts with the various railroad companies relative to hours of labor and the rules governing the promotion of apprentices and helpers to the rank of mechanic.

This was agreed to by the employees' organizations, and on February 14, 1918, a letter directing the manner in which this should be done was sent by the Director General to the representatives of the employees and to the various railroads. Immediate steps were taken to increase the shop hours of men working in locomotive repair shops and roundhouses to 70 per week where the condition of equipment required it.

The average increase in locomotive shop hours for the entire country amounted to about 16 per cent, and the effect immediately became apparent by the increased number of locomotives repaired per week in comparison with the most accurate records available for the corresponding week of the preceding year.

This increase in shop hours applied to roads where locomotives were in good condition and shop facilities ample, as well as to roads which were not so favorably situated. This permitted a comprehensive program of nationalization of railroad shop facilities over the entire country to be carried out and locomotives from roads where shop facilities were not sufficient, and motive power in bad condition, to be sent to shops on other lines for repairs. This distribution of locomotives was so arranged as to reduce, in many instances, the distance travelled to the repair shops, therefore, the cost of transporting locomotives to the shops was no greater and all the shops under this plan were kept working to their maximum capacity with a full force.

The plan of considering the condition of equipment as a whole and taking steps to improve it by uniformly increasing shop hours on all railroads in the country and utilizing to their full capacity the facilities of all shops, which could only be done under federal control, is really what improved the condition of the locomotives and cars. The result of this was that not only was the existing congestion of traffic cleared up, but trains were moved by locomotives in good repair, with promptness, and with reasonable assurance that they would reach their destination without delay.

The result of the policy of nationalizing railroad shop facilities made it possible to thoroughly overhaul and in some cases to practically rebuild at other line shops, 3,493 locomotives for railroads which lacked sufficient shop space and shop organization, thus improving the general situation without detriment to the railroads that furnished this help. In addition to this, during the period January 1, 1918, to April 30, 1919, there were 310 new locomotives constructed in various railroad shops under federal control. At the present time, due to this method of handling repairs to locomotives, we have been able to put in first class condition and place in storage, for service when business improves, over 5,000 locomotives.

Investigation was also made of the facilities of the different locomotive builders with a view to having locomotives repaired by them. It was found, however, that this could not be done to any material extent without disarranging their schedule of new work both of domestic and foreign locomotives, and in view of the need for both, this was not considered advisable. Both the Baldwin Locomotive Works and the American Locomotive Company did endeavor to make use of surplus facilities to repair what locomotives they could without interfering with their output of new locomotives.

Illustrative of the improvement in motive power and the changed conditions in railroad shops, is the fact that it was possible to grant the request of the Baldwin Locomotive Works made on September 13, 1918, for assistance in machining locomotive frames, driving boxes, rods and other parts, thus facilitating the construction of locomotives for the use of our army in France, and this work was continued in various railroad shops until the armistice was signed.

The increased working hours in railroad shops under the instructions issued on February 14, 1918, were continued until after the signing of the armistice, and without this loyal support from the employees the increased number of locomotives repaired during this period and the assistance rendered locomotive builders would not have been possible. On the signing of the armistice, shop hours were reduced to nine per day, effective November 25, and to eight hours per day, effective December 9.

Standardized Locomotives

In addition to the vigorous action which had been taken to improve the condition of existing equipment, the necessity of adding to the available stock was recognized and designs were worked out for standardized locomotives and orders placed for their construction.

The director general realized the necessity for new power, which to some extent had been neglected by the railroad companies, and decided that all new power would be built to standard design. S. M. Vauclain, senior vice-president of the Baldwin Locomotive Works, and who at this time was chairman of the Committee on Production of the Council of National Defense, was requested to assemble a committee composed of practical experienced locomotive builders, to select standard locomotive types, stipulating that Mr. Vauclain was to act as chairman of this committee. The personnel of this committee consisted of S. M. Vauclain, senior vice-president, Baldwin Locomotive Works, chairman (representing Committee on Production, Council of National Defense); Grafton Greenough, vice-president, Baldwin Locomotive Works; Andrew Fletcher, president; Charles M. Muchnic, vice-president; J. D. Sawyer, vice-president, and J. B. Ennis, vice-president and chief mechanical engineer, American Locomotive Company; John E. Dixon, vice-president and W. E. Woodard, vice-president and mechanical engineer, Lima Locomotive Works, Inc.

Instructions were issued to this committee to prepare specifications for not more than 12 types of standard locomotives with particular consideration given to creating standards of parts subject to wear and replacement, so that they may, as far as efficiency and economy would permit, be made standard for as many types as possible, and at the same time permit the entry of better and improved parts in the future. This committee recommended twelve types of standard locomotives, and specifications were prepared and orders were placed for 1844 locomotives of standardized types and 86 locomotives are on order, the type of which has not been decided on.

In addition to this committee it was decided by the director general that a committee made up of mechanical representatives of various railroads be assembled to consider these general dimensions and specifications, and to work out the details, meeting the various equipment and patterns, and the maintenance, fuel, water and other operating factors, as well as give due consideration to various items, usually termed specialties, which have already been developed and practi-

cally made standard practices, or which may be in process of development and in line with conditions and requirements of the future. As locomotives have a probable life of at least twenty-five years, they should be made as modern and as practicable as possible. The Committee was further instructed to take into consideration greater expediency in movement on the road and in terminals, greater comfort for engineers and firemen, and all others concerned, the most effective and economical operating resources, and particularly greater safety, the elimination of arduous manual labor, to provide for superheating, for the best and most perfect combustion of fuel burned in solid or liquid form, the utilization of all possible waste heat and reduced liability for setting-out fires. In other words, the locomotive to be brought to the same standard of efficient operation as the modern stationary power plant.

In the interest of safety, there has been provided on each standardized locomotive which has been built, two water glasses, so that each might be a check on the other, as well as permit the men on the left side of the locomotive to observe the height of the water in the boiler. To insure more accurate registering of water in the gage cocks, gage cock water columns have been provided, and the gage cock screwed into the water column rather than into the boiler to avoid the irregularity and unreliability which is sometimes experienced where gage cocks are screwed directly into the boiler. In carrying out this practice, we had in mind the recommendations of the Bureau of Locomotive Inspection of the Interstate Commerce Commission, which has devoted a great deal of time and thought to this subject.

For the protection of the men against bursting flues, bursting arch tubes, etc., pneumatic firedoors have been applied to all locomotives built by the Administration. These locomotives are provided with a power reverse gear by which the cut-off may be changed without any risk of accident to the man handling the reverse lever. Pneumatic bell ringers are applied to each locomotive, and the grates on each are provided with power grate shakers. Much thought also was given to the location of cab lights. Drawbars have been provided which are a guarantee against the locomotive and tender becoming uncoupled. Radial buffers insure better riding qualities by not only preventing slack between the tank and the engine, but also guard against derailment of the tenders, particularly in backing trains around curves or in the sidings. Double strength pipe and flexible joints have been used instead of hose connections for the train brake and signal line, as well as for the train heating lines on passenger locomotives.

In the further interest of safety all pipes carrying boiler pressure are placed outside the cab, the only exceptions being the short lengths of brass pipe which connect the water column for the gage cocks to the boiler, the steam gage syphon and the steam pipe to the lubricator. Injector, steam pipes, air pump steam pipes, steam pipes to blowers, stokers, train heater and headlight generator are all located outside the cab. While some work has been done along this line by one or two roads, the locomotives constructed on Administration order are the first on which this was generally carried out.

Much consideration was also given to the convenient location of the appliances manipulated by the engineer and the fireman. The reverse lever, injector, throttle, brake valves, sanders and bell ringer, are all within the engineer's reach while sitting on the seat box. The steam and air gages and water glasses are so located that they may be observed by the engineer without losing sight of the track. In all of these things the locations have been made uniform so that the man who yesterday ran the Mikado and who today is called to run the Pacific or the Mountain, will find each of these things in the same relative position on each class of locomotive. I know that you can appreciate very much better than I can tell you, just what this means for comfort and convenience. One other thing in connection with reducing the labor of the fireman is the application of automatic stokers to these locomotives.

In considering the question of the size of locomotives to which stokers should be applied, it was thought that the limit of coal which could be handled by a man with a shovel on the firing deck of a locomotive, was approximately 4,000 lb. per hour, and locomotives which consumed this amount or more are provided with stokers.

Freight locomotives with a tractive power of 54,700 lb. and over, (light Mikados) and in passenger service, those with a tractive power of 43,900 lb., (heavy Pacifics) have been provided with stokers. Those locomotives on which, by reason of coal consumption, it was felt that the application of stokers was not desirable, have been equipped with coal pushers of a type which may be operated while the locomotive is in motion so as to bring the coal to a point where the fireman can reach it with a shovel easily.

No matter how good or how perfect a device may be when new, some measure of maintenance is required, and this maintenance can not be done either economically or intelligently if those charged with this duty lack information. I urge, therefore, that each of you who have to do with the making out of Form 2 of the Interstate Commerce Commission, daily locomotive inspection report, which is filled out at the conclusion of each trip or day's work, give explicit information as to the repairs which are necessary in order to maintain the locomotive and its accessories in a safe condition for service.

There are three other matters upon which the mechanical department of the Railroad Administration has taken action, and in which I am sure you will be interested.

First: The proper lubrication of locomotives.

Second: Seeing that locomotives are kept in proper repair.

Third: Enforcement of the various laws that have been passed by Congress from time to time compelling the railroads to equip cars and locomotives with safety appliances and to see that they are maintained in proper condition.

Shortly after the government assumed control of the railroads, many reports reached us which indicated that locomotives were not properly lubricated, which, in addition to increasing the coal consumption and consequently the work of the firemen, was also causing excessive wear on cylinders, cylinder packing, valves and valve chambers, as well as on piston and valve stem packing.

To correct this condition, Mechanical Department Circular 6 was issued which provides that all lubricators shall be filled to capacity before locomotives leave terminals and in addition thereto sufficient oil should be carried on the locomotive to provide against any emergency that might arise, and I am pleased to state that the issuance of this circular has resulted in a great improvement.

The Railroad Administration, recognizing that in the interest of safe and efficient operation, locomotives should be repaired before being offered for service, issued Mechanical Department Circular 3, which provides, among other things, that road foremen of engines or traveling engineers, or men with any other title who perform similar duties, will be required to carefully supervise the locomotives in service to see that they meet the federal requirements and that they are in a condition to render efficient and economical service. If not, they should order the necessary repairs to be made and such orders will be observed as if issued by Federal inspectors of locomotives, and it further provides that locomotives that are in violation of the Federal laws or are not in condition to make a successful trip, should be repaired before being offered for service.

The President of the United States, realizing that laws on this subject were essential and necessary, promised the rep-

resentative of your brotherhood to protect the Bureau of Safety and the Bureau of Locomotive Inspection of the Interstate Commerce Commission, from interference when the government assumed control of the roads. In carrying out the policy outlined by the President, the director general issued General Orders 8 and 46, which outline a plan for the enforcement of various Federal laws, rules and instructions of the Interstate Commerce Commission on such matters.

Under General Order 46, Frank McManamy was placed in charge, so far as the Railroad Administration was concerned, of seeing that these laws were complied with. Reports received from the bureaus of the Interstate Commerce Commission indicate that these laws are being complied with in a manner that is gratifying to them, and in your national legislative representative's report, which has been presented to the delegates of this convention, you will note Mr. McManamy states,—"On December 26, 1917, the President took over the railroads and proclaimed that our safety laws would be protected and this has been religiously lived up to since that time."

I desire to thank you for having had an opportunity to address you at this time and I trust that your deliberations will result in the passage of laws which will be of great good to your membership. It is my sincere hope that when the history of the World war is written, proper emphasis will be placed on the great work which the railroad employees have performed in connection with the winning of the war.

Classification of Technical Employees in the Northwestern Region

A DEFINITE STEP toward the classification of technical employees of the engineering, mechanical, land and valuation departments was recently made in the Northwestern region through the issuance of a communication by R. H. Aishton, regional director, to the federal managers of railways in the Northwestern region for their information and guidance. This classification was prepared by a committee consisting of H. E. Stevens, chief engineer of the Northern Pacific, C. F. Loweth, chief engineer of the Chicago, Milwaukee & St. Paul, and A. Montzheimer, chief engineer on the Elgin, Joliet & Eastern, and is the result of a detailed study of the technical service of the roads in this region. This schedule is of particular interest because of the detail in which the duties, responsibilities, degree of technical training and extent of experience are treated in defining each classification. The statement covers positions in the engineering, mechanical, land and valuation departments below the grades of assistant engineer and chief draftsman, and the definition of each grade includes a salary rating giving the maximum and minimum limits of salary comparable to the character of services rendered in each grade of position.

The classification, which is given in detail below, is prefixed by an explanation or statement of general principles involved in its application. In this explanation attention is directed to the difficulties of fitting a classification definitely to all existing organizations, for which reason considerable range of salaries is given to allow for such irregularities. Along this line attention is given to the fact that a large organization may need a more expanded classification, while a small road may require an even smaller number of grades than those given in the schedule. The purpose of the classification is to grade each man in accordance with his duties and responsibilities, familiarity with standard practices, and length of service.

Authority is given to apply this classification as effective July 1, 1919.

No overtime is to be allowed men covered in this classification.

SCHEDULE

DRAFTSMEN, CLASS 1, $200-225

On general or special duty, requiring special knowledge, training and experience, and a special degree of initiative and originality, thoroughly competent, engaged regularly in the design and general direction of the design of large and difficult work on yards and terminals, track details, etc., or steel, concrete and timber bridges and structures, or special buildings, etc., or locomotives, cars, special machinery, mechanical and electrical power plants, etc.

DRAFTSMEN, CLASS 2, $175-190

On general or special duty, requiring special knowledge or training and experience and the use of initiative and originality. Engaged in the general designing and the direction of detailing of plans of yards and terminals, track details, etc., or steel, concrete, or timber bridges and structures, or special buildings, power plants, etc., or locomotives, cars, special machinery, or signals and signal apparatus, or land, right-of-way and valuation maps and profiles from field notes and records.

DRAFTSMEN, CLASS 3, $150-165

On general or subordinate duty, requiring special knowledge or training, experience and initiative, generally engaged in the designing and detailing of work in accordance with standard practices, and the direction of work of a minor character on right-of-way maps, mileage records, or steel, concrete and timber bridges and structures, or locomotives, cars, special machinery, mechanical and electrical power plants, or signals and signal apparatus, or land, right-of-way and valuation maps and profiles from field notes and records.

DRAFTSMEN, CLASS 4, $125-140

On subordinate duty requiring a certain amount of knowledge, training or experience, and engaged generally in detailing, compiling and recording general engineering plans, land and right-of-way maps, or valuation maps and profiles, or records of bridges, buildings, locomotives, cars or signals.

TRACERS, $100-120

On subordinate duty requiring a certain amount of experience or knowledge of drafting. Capable of doing neat, accurate and rapid work.

ENGINEERING INSPECTORS, CLASS 1, $175-185

On general or special duty requiring special knowledge, training and experience and the use of initiative. Capable of directing and supervising the inspection of extensive engineering construction and all classes of construction materials.

ENGINEERING INSPECTORS, CLASS 2, $150-165

On general duty requiring special knowledge or training and experience and the use of initiative. Capable of supervising the inspection of average engineering construction and materials.

ENGINEERING INSPECTORS, CLASS 3, $125-140

On subordinate duty requiring a certain amount of knowledge or training and experience. Capable of inspecting minor construction work and materials.

INSTRUMENTMEN, CLASS 1, $180-200

On general or special duty, requiring special knowledge, training and experience and the use of initiative. Capable of directing a field party, and responsible for technical field work of a complicated and difficult nature, and platting the field notes and data.

INSTRUMENTMEN, CLASS 2, $150-170

On general or special duty, requiring special knowledge, training and experience and the use of initiative. Capable or directing a field party, making personal investigation of ordinary field work, and platting the field notes and data.

RODMEN, CLASS 1, $120-130

On subordinate duty with knowledge, training and experience. Capable of doing ordinary field work without supervision or more difficult field work with supervision, and platting the field notes and data.

RODMEN, CLASS 2, $100-115

On subordinate duty with a certain amount of knowledge of field work, but not required to use transit or level.

CHAINMEN OR TRAINMEN, $90-100

On subordinate duty, preferably with a certain amount of knowledge or experience in field work.

There Must Be an End.—It is not a railroad man, but a member of the Interstate Commerce Commission, Mr. Clark, who has told the House Committee that the raising of freight rates is inevitable. Time was when the Commission conceived it to be their duty to oppose every application of the railroads for higher rates. Mr. Clark believes the high wages will have to be maintained. The suggestion that the Commission be given power to fix wages he earnestly repelled. Not for the Commission the job of cutting wages to meet income! There remains only the universal last resort—to make up the deficit out of the pockets of the public. This process is now world-wide. But there must be an end to it some day. English miners, fearing the effect of public feeling regarding their pleas for shorter hours and higher wages, have asked the Government to suspend the order until they have had a chance to show that it may not be necessary. "Strike and the world strikes with you; work and you work alone."—*New York Evening Post.*

Railroad Hearings Before House Committee

Executives Submit Outline of Principles—Ask That Roads Be Made Self-Sustaining—Other Testimony

WASHINGTON, D. C.

THOMAS DE WITT CUYLER, chairman of the association of Railway Executives, appearing before the House Committee on interstate and foreign commerce, on August 20, on behalf of 94 per cent of the railroad mileage of the country, presented the following outline of principles which the carriers believe should be incorporated in legislation for the return of the roads to private operation:

1. Approval by public authorities of rates that will enable the railroads of the country to be self-sustaining, and to command the new capital needed year by year for expansion of railroad facilities; but with no guaranty of income by the government.

The growth of population and industry now requires the annual investment of from $700,000,000 to $1,000,000,000 of new capital.

2. Exclusive regulation of rates by the Interstate Commerce Commission with the aid of regional sub-commissions, and with a definite direction by Congress to the Interstate Commerce Commission that:

"the level of rates shall provide revenue sufficient to pay wages and other expenses of operation, a fair return on the value of the property used in the public service, and establish and maintain a credit sufficient to attract the new capital necessary to meet the public need for transportation facilities."

3. Greater unification of public regulation of the privately owned and operated companies, by broadening national control; with exclusive national control of the issue of securities and the expenditure of new capital, and provision for federal incorporation of interstate carriers.

4. Authorization of consolidations of existing lines into strong, competitive systems, whenever found to be in the public interest; also providing for joint use of equipment and terminals when in the public interest.

5. A Federal Transportation Board, charged with the general oversight, from the point of view of the public interest, of all transportation.

The Federal Transportation Board, proposed by the railroads, would be composed of three commissioners appointed by the President.

This board would be co-ordinate with the Interstate Commerce Commission, and would relieve it of all functions excepting rate regulation, valuation and accounting.

The duties of the Federal Transportation Board in addition, would be:

(a) To certify from time to time to the Interstate Commerce Commission the amount of operating revenues needed by the carriers to enable them to perform their public service.

(b) To require the distribution in times of congestion of traffic from the more congested to the less congested lines, when in the public interest.

(c) To require the joint use of terminals when in the public interest.

(d) To consolidate all lines into a unified system in times of national emergency, as directed by the President.

In order to provide a bridge over which the railroads can return to private operation, without risking financial disaster, the railroad executives make these suggestions:

(1) With the termination of government operation, the level of rates established by the government to remain temporarily in force.

(2) The Interstate Commerce Commission, in consultation with the director general of railroads and the new Federal Transportation Board, to readjust rates so as to restore the equilibrium between revenues and expenses and make the carriers again self-supporting.

(3) Pending this readjustment the government guarantee of the standard return to continue.

(4) The indebtedness of the railroad companies to the government on account of new capital expenditures made during war control to be funded for 10 years.

Mr. Cuyler stated that the principles and measures proposed had been unanimously agreed to by all the roads in the association.

They include several important changes from the original outline of principles presented before the Senate committee early in the year.

Mr. Cuyler also introduced a complete bill containing the provisions to carry out the principles proposed by the railway executives which was explained in more complete detail by Alfred P. Thom, counsel for the Association of Railway Executives.

Mr. Cuyler also read a statement prepared by A. J. County, vice-president of the Pennsylvania, in reply to Mr. Plumb's statement including the Pennsylvania among eight eastern roads which he said had issued stock for less than its market value.

He pointed out that a large issue of stock always depresses the market value and showed that in the period mentioned the Pennsylvania had received more than $40,000,000 in premiums by issuing stock to its stockholders at 120 per cent of par.

Instead of being watered he said the Pennsylvania had property that cost over $400,000,000 in excess of the capitalization.

In conclusion Mr. Cuyler made the following statement regarding the Plumb plan:

"I cannot bring these remarks to a close without reference to the proposal as to a future railroad policy made to this committee by counsel for certain groups of the railroad employees.

"I am unable to accept this proposal as creating an issue between railroad companies and the great body of employees. The workers on the railroads are fair-minded men, thoroughly patriotic and devoted, as their fellow citizens are, to our American institutions. In my judgment, they will never knowingly consent to dangerous experiments destructive of our institutions, under which we have grown to be the foremost nation of the world, and under which there have been established standards of happiness and well-being of which all of us have a right to be proud.

"I have complete confidence that a proposal as radical, as revolutionary of the accepted and cherished principles of our social and economic life, as the proposal made to you, will never, when it is fully understood, receive the sanction of the great body of our citizens, whether engaged in railroad work or in other occupations.

"The people have already made a correct appraisal of the danger of the proposal, and have realized that it involves in essence the taking of the means of all the people, to acquire

the railroad properties from their owners, and turn them over, not to all the people, not even to all labor, but to one class of labor—and that a comparatively small one—to manage and operate for their own advantage and without adequate responsibility to any public authority.

"In order to popularize the proposal, it is accompanied by a suggestion of a reduction of railway rates. Without reference to the pending large demands for further increases, railway wages, since the beginning of Federal control, have already been increased about a thousand millions of dollars a year, which is more than the entire annual return on the capital invested in the railroads.

"The public has been quick to see that the promise in this plan of a reduction of railway rates is entirely illusory, and, in fact, that it promises instead a very large increase either in rates or taxes, for the public burden would depend upon the exercise of the power of the employees to fix their own wages.

"The payment of the wages thus fixed would constitute a charge against all the people either in transportation rates or in taxes.

"It is declared by the proponents of this measure that it introduces democracy into industry. Democracy is the rule of all the people. But this would be the rule of a very small minority.

"Instead of democratizing industry, it would establish in industry class power and privilege. It is a proposal to take a large part of the national wealth and set it aside for the benefit of relatively a very small class of our population, at the expense of all the rest.

"Railroad owners, while the immediate object of attack, are by no means chiefly interested in the issue which has thus been raised, although these owners, directly and indirectly, constitute a very large part of our population.

"As long as we have a Constitution, the owners must be paid adequate compensation for their property if it is taken.

"The issue affects the entire people, for it constitutes an assault upon the very fundamentals of our institution.

"As such it is the business of the entire public and as such it will be opposed by all these who are attached to American ideals and to American conceptions of government and social order."

Mr. Cuyler explained that the proposed bill did not include any provision for the settlement of labor disputes but that one would be submitted later. Asked how the executives proposed to take care of the situation of the weak roads, Mr. Cuyler said they had not intended to, on the ground that it would be contrary to the spirit of American enterprise as well as unconstitutional to require a strong, well managed road to contribute to the support of a weak road. In reply to a question he said that in order to protect a community vitally dependent upon the service of a weak road the public might be willing to have the government aid it financially, but he did not suggest such a plan.

Mr. Sims referred to the arguments made by advocates of the Warfield plan that a road ought to be required to give up two-thirds of its return above 6 per cent. Mr. Cuyler said the Warfield plan apparently represented the interest of the bond holders, who desire protection for their fixed return, rather than the stockholders. When Mr. Sims asked why there should be any difference of opinion between the executives and the bondholders, he said there should not be because the executives feel that they represent "the whole road," but he added that he was a director in a large insurance company and in many large trust companies and had never heard the Warfield plan discussed in any of their meetings, nor had he heard of any dissent from any of the bondholders to the proposals of the executives nor any evidence, except the Warfield plan, of any difference of opinion between the two classes of security owners.

Mr. Cuyler said that if satisfactory legislation can be enacted the sooner the roads are returned the better, because both the corporate and the operating organizations are "rapidly going to pieces."

Mr. Thom began his argument with a brief discussion of the Plumb plan, quoting opinions of the Interstate Commerce Commission to controvert the assertion that railroad property paid for out of surplus belongs to the public and should not be included in the value. He also declared that if the labor organizations should possess sufficient political influence to put through such a bill as that they have proposed there would be no difficulty about their being able to get control of the board of directors.

The plan proposed by the railway executives was also to be discussed by R. S. Lovett, Howard Elliott and S. T. Bledsoe.

Luther M. Walter

Luther M. Walter, general counsel of the association, brought out the fundamentals of the Warfield plan, providing for rates that would give a fixed minimum return on the aggregate property investment and for division of all surplus over the fixed return between labor, the roads earning the surplus and the public in equal shares. Mr. Walter declared that labor should participate in the earnings of the carriers and that such participation was a fundamental of the plan. He showed that under the minimum return plan the net result of railroad operations in the pre-war test period would have been the turning in of a surplus of $84,000,000 by some of the carriers for division with labor and the public.

Mr. Walter said in part:

"The purpose of this association is to secure from public authority such action as will protect the investments made and make it possible for capital to be furnished to the railroads for future needs. The financial structure of all credits depends upon the results of legislation by this Congress upon the railroad question.

"We believe that capital invested in railroad properties is entitled to a fair return, that labor is entitled to a just wage, and that the public which furnishes the money is entitled to efficient service at the lowest cost.

"Our association presents to you a bill which embodies and effectuates the views of the association. Our plan can be put into effect immediately. No other plan yet suggested dealing with the financial needs of the carriers can be effectuated short of a period of years. The keystone of the plan is a congressional direction to the Interstate Commerce Commission that it shall make freight and passenger rates sufficient to pay operating expenses, maintain railroad properties, and give not less than 6 per cent return upon the aggregate fair value of the property devoted to transportation in each of the principal traffic territories. The chief difficulty in the past has been the impossibility of adjusting rates so that the great bulk of the railroads of the country could earn sufficient to operate and maintain their individual properties without at the same time furnishing excessive earnings to a few great carriers.

"We use the property investment account as the basis upon which to apply the 6 per cent, because the Interstate Commerce Commission in the five per cent case found that the only basis available for prompt determination of the sufficiency of the return upon investment. In that case the commission found that the average return had been 5.64 per cent over the period from 1900 to 1914. Under the Warfield plan, Congress is asked to direct the commission to furnish a return from rates of not less than 6 per cent. When two-thirds of the excess earned by individual carriers over 6 per

cent upon their property investment has been placed in the excess earnings fund, there will remain to the carriers average earnings of 5.78 per cent, or only .14 per cent more than the commission found was not adequate in the public needs and for the railroad needs. The Supreme Court at its last term held in the Lincoln Gas Case that the return of 6 per cent on the property devoted to the public use was the minimum which the law would permit.

"The second fundamental is that labor shall participate in the earnings of the carriers. Labor's share should be used for the establishment of the insurance system or for profit-sharing. By reason of the largely increased duties which will fall upon the commission the security holders ask Congress to create six regional interstate commerce commissions, subordinate to the Commission, but with all the powers of the Interstate Commerce Commission in their respective territories. Our plan contemplates that these regional commissions shall act as boards of conciliation in settling wage disputes, being a body close to the employees, the carriers and the shippers. The issuance of securities of all carriers engaged in interstate commerce would be vested exclusively in federal authority.

"Finally, the plan would create a corporation operated without profit to the railroads and managed by the nine interstate Commerce Commissioners and eight railroad men selected by the railroads. This corporation would furnish expert advice to the commission in the operation of carriers, would unify terminals, would operate equipment such as has been built by the Railroad Administration and allocated to the individual railroads. It would furnish a great clearing house for railroad operation and in times of emergency would constitute the directing force for the handling of the railroads as a single system.

"Our association is opposed to the compulsory federal incorporation of railroads, to the provision for a new cabinet officer, or for a federal transportation board, or any board having supervisory power over the interstate commerce commission.

"We are opposed to the creation of new and larger regional companies because it means the elimination of competition in service, and competition in service is the thing which the public demands and which the Railroad Administration has not furnished. Many shippers and manufacturers' organizations have approved our plan. It is simple, easy of application, and can be made immediately effective. Under it investors will feel secure, labor will receive a fair wage and the shipper will obtain the service which he pays for.

"I have quoted liberally from the commission's two important general rate increase decisions to show that the commission itself used the property investment account to test the sufficiency of the revenues of the carriers as a whole in each of the three great traffic territories. That 6 per cent is the proper rate of return will not be questioned by anyone if private operation is to obtain. One of the great difficulties has been the adjustment of the rate structure so that the great bulk of the roads would have sufficient revenue without at the same time giving excessive earnings to the stronger roads. The weak and the strong roads operate in the same territory. The rate which is applicable on one must be applicable upon the other, else the road with the lower rate would enjoy all the tonnage, and the road with the higher rate would find itself without tonnage. Having in mind the fundamental, long-established rule that an investment in a public utility such as a railroad is entitled only to a fair return, there can be no constitutional inhibition upon this Congress fixing a maximum return. There should, however, be accorded to a carrier a portion of the earnings in excess of the maximum reasonable return so that the incentive to economy and efficiency in operation should not be lost. We believe that one third of the excess over 6 per cent is sufficient to encourage incentive and initiative in operation; that the carrier will be anxious to make the additional dollar in order that it may have the 33⅓ cents for its own treasury. The other two-thirds of the excess, I believe, should be divided equally between labor and the public which has paid the money.

L. M. Walter

"The application of this principal will not reduce the usual and customary dividends of the carriers. Had the system been in effect during the test period of three years ending June 30, 1917, there would have been excess earnings of $126,000,000. The 78 corporations earning in excess of 6 per cent would have received one-third, $42,000,000. There would have been left to divide between labor and the public some $84,000,000. During that three-year pediod, had the plan been in effect every customary dividend could have been paid. The only effect would have been to reduce the corporate surplus of carriers to whose earnings the plan applied.

"The plan contemplates a continuation of the present rate committees composed of representatives of both railroads and shippers to primarily consider and pass upon all changes in rates requested by either railroads or shippers and before being filed with the regional commission or the Interstate Commerce Commission."

Mr. Walter began his statement by telling the committee that the operation of the railroads up to June 30 had cost the government a deficit of $550,000,000 and that by the end of the year we can count on an irrecoverable loss of at least a billion. He presented the six months figures to show the present situation of the carriers and to show that the government cannot fairly turn back the roads without making provision for an assurance of revenues sufficient to enable them to provide good service with reasonable wages to the employees and a fair return to the investor. "When you do that," he said, "the quicker you return them the better." In commenting on the reduction in traffic expenses he said that one of the reasons why the Railroad Administration has not been successful was because the men who kept in touch with

the shippers had been removed from duty. He added that he said this after having handled most of the complaints from shippers for nine months while he was assistant director of public service for the Railroad Administration. Many of the traffic men were given other duties, many taken care of by the corporations and many good men were let go, he said in reply to a question.

Asked about the volume of traffic during the six months period, Mr. Walter showed that the ton miles per mile of road per day were 5,081 in the first half of 1917, 4,975 in the first half of 1918 and 4,266 in the first half of 1919. Representative Merritt remarked that these figures have some bearing on the statement that the railroads "had ceased to function." Mr. Walter said that the congestion had come in the latter part of 1917 but that if some of the restrictions had been removed and the railroad officers allowed to create their own organization and their own director general he thought they would have done as well as or better than was done under government operation. He added that west of Chicago and south of the Potomac there was little congestion.

"I feel that way myself," said Representative Montague.

Representative Sims asked if the roads would not be more economically operated if they were returned now.

"They might reduce the deficit," replied Mr. Walter, "but to return them under present conditions would be to shift from all the people to the railroad owners the burden of expenses which the government has itself put on the roads."

The first problem is to get a proper rate level, Mr. Walter declared, and for that reason the association suggests that Congress should give the commission a definite instruction. The commission, he thought, ought to be glad to have a more specific basis to work on than a law that rates must be "just and reasonable" and a specific rule is needed, he said, because the commission is composed of several minds.

Until the commission has completed its valuation, Mr. Walter said, the property investment account should be taken as the only available basis, subject to corrections for any obvious defects. He pointed out that defects in this account as to individual roads would be absorbed in the aggregate on which the rate level would be based and also in the indisputable increase in values not represented in the accounts.

Replying to Mr. Plumb's repeated claims that the property investment accounts are unreliable, Mr. Walter pointed out that Mr. Plumb had read to the committee only some of the earlier statements by the commission criticizing these figures. He also pointed out that of the 19 billions in the property account, 6 billions are represented by cash expended under the strict accounting rules of the commission since 1907 and that the five roads whose valuations were taken by Mr. Plumb as the criterion for charging that the other roads were worth only half their property account represented only 1,800 miles out of 260,000. The points were readily appreciated by members of the committee, who smiled some at Mr. Plumb's expense.

"Do the proponents of the Plumb plan question that 6 billion dollars?" asked Representative Cooper.

"Mr. Plumb just tells you what he thinks the property is worth as a whole," replied Mr. Walter. "But this shows how futile it is to accept his figures. Of course, the lower he makes the valuation the less the fixed charges and the more for wages. Mr. Plumb probably believes what he says."

"I have seen some very honest men believe some curious things," remarked Mr. Montague.

Chairman Esch asked if the courts had ever ignored the property investment account and when Mr. Walter replied that they could not, he asked: "Then what hope have the Plumb plan advocates that the courts will sustain their figures?"

"I can't see a possible chance," said Mr. Walter. "I haven't any doubt that the courts will sustain a value of 18 or 19 billions. However, we are asking you merely to accept it as a yardstick until we get an actual valuation."

Mr. Walter devoted some time to explaining the proposed rule of rate-making. "If you are going to see that rates are high enough," he said, "you have got to do something to see that some roads do not earn too much." He replied to the argument that the government cannot take from one road to give to another by saying that this plan does neither, because the two-thirds of the excess never becomes the property of the company, which has had its fair return and a little more as an incentive, but is held in trust or dedicated to a public use. He compared it with an amount collected by a carrier above what the commission finds to be a reasonable rate, which is returned to the shipper as reparation. He insisted that none of the excess goes to make up any deficiency of the weaker roads. The proposed corporation might take over special equipment such as refrigerator and tank cars and collect car hire from the roads. As counsel for one of the packers, Mr. Walter said he knew the packers would be glad to get rid of their investment in cars if assured an adequate car supply, but no single road can afford to own enough special equipment which has a seasonable use.

Mr. Walter thought the shippers would be entirely willing to pay rates high enough to produce an average of 6 per cent if assured that an undue proportion of profit would not go to the richer roads. He also said that the Federal Reserve Bank act affords a precedent both for the 6 per cent and for the distribution of excess earnings. Applying the proposed rule to the average figures of the test period, in which the railroads earned 5.2 per cent, Mr. Walter showed that to raise the rate level to produce 6 per cent would result in 78 roads contributing $84,000,000 to the excess earnings fund, but would leave them better off by $24,000,000, while 84 roads would not contribute but would be better off by $29,000,000.

Forney Johnston

Forney Johnston, of advisory counsel of the association, urged that the Warfield plan is the one solution upon which all the conflicting elements in the situation could unite. Congress must give constructive relief, he said, or look upon the overwhelming of the present economic situation, the plunging of the railroads into bankruptcy or government ownership.

His statement was in part as follows:

"We suggest no radical, complicated or costly process. We urge Congress to put into effect certain policies which have been found by experience to be essential both to the protection of railroads and to the protection of the public interest in transportation.

"We freely acknowledge the propriety of the main features of the bill introduced by Mr. Esch. The measure we have formulated embodies substantially all of the advances proposed in the Esch bill but accompanies them with the indispensable provisions necessary to protect American transportation from headlong bankruptcy. We earnestly caution the committee against the report of any bill without provisions for constructive relief. The representative of the commission who has testified before you has asserted that transitional and constructive relief is imperative; that the Esch bill does not embody that relief; that normal pre-war conditions can never be expected to return and that it is squarely up to Congress to define the policy which is to govern the railroads. Shall they be returned to their owners on a self-supporting basis that will justify further investment or shall the established system of ownership and operation under complete regulation be condemned by leaving them as permanent mendicants before the United States Treasury or the Interstate Commerce Commission?

"The American people have invested six billion dollars in

permanent railroad property—road and equipment—since 1907. That sum was added under supervision of the commission. Yet that vast sum produced in 1917, the so-called high-water mark of railroad prosperity, only about 200 millions in net income more than was earned in 1907. In short, the American railways produced six billion of new money to earn less than the government paid for loans secured by a mortgage upon the American people.

"In the so-called banner period of 1915-16-17, 120 out of the 162 systems, Class I railroads, operating a total of more than 170,000 miles or over two-thirds of the total mileage in the United States, earned less than 6 per cent upon their property investments. In the year 1916, 91 railroads, operating over 80,000 miles, paid no dividends whatever. Yet before the committees of Congress and in every case brought before the commission to advance rates, a vast mileage of American railways has been choked off with the assertion that average statistics show average prosperity.

"In all of these cases the commission has been actuated to deny general relief because certain roads were prosperous and the commission was unwilling to add to their prosperity even to save the large number of roads which were receiving admittedly inadequate revenue. Under these conditions, opposed in every effort to adjust rates to meet proven necessities by powerful mobilization on part of the shippers, the American railroads have been kept in a bread line before the door of the Interstate Commerce Commission since 1910. Relief has been denied or grudgingly and sparingly dealt out because certain roads in each region were thought to be affluent.

"The fundamental proposal of the Warfield plan is that this continual basis for warfare between the shipper and the railroads, this constant depressing factor against relief before the commission when relief is necessary, must be removed by regulation of excess earnings which will relieve the shipping organizations of their apprehension and the commission of the odium which would be visited upon it if affluent railroads were given higher rates to protect American transportation from bankruptcy.

"For this reason we believe that in asking Congress to instruct the commission that a 6 per cent rate level which would leave only 5½ per cent in the treasury of the Class I railroads we are suggesting the lowest possible ratio on which the railroads, as a whole, can survive, the lowest in the aggregate which any court would sustain. It is the irreducible minimum. The present law and the bill being considered by your committee give no consideration to the necessity for general advances. The power of the commission is the power to suspend and reduce. It can act only when individual rates are proposed or put into effect by the railroads which are in violation of the law, that is, unreasonable or discriminatory.

"Thus a petition for general relief can be inaugurated only by the needy carriers conspiring to advance competitive rates in violation of the Sherman act, filing those rates, and having the proposed schedules suspended. While the commission ordered an investigation in 1913, members of that body dissented on the ground that the commission had no power to investigate the carriers' necessity for revenue. So the railroads filed tariffs in October, 1913, and forced their suspension. This situation is fundamentally wrong. The commission which is to be given the power to force railroads to add billions of dollars to their investment for new tracks and facilities should be required to produce a reasonable return upon that investment. If a railroad is ordered to secure a hundred million of dollars for additions or facilities, it should not be forced to stand in line before the commission in year long efforts to secure the revenue to sustain that investment. It would be immoral to ask the commission to approve the sale of securities as being consistent with the public interest unless Congress proposes that the purchasers shall be permitted a square chance for a reasonable return.' That investment, which will hereafter be forced and in every event approved by the commission, should go on the books of the carrier at what the money cost and the rate level should directly reflect that cost.

"For every dollar invested in the average American railroad in cash since 1907 it has received a return of less than 4 per cent, if the income and investment of 1917 be compared with the income and investment of 1907. Congress cannot expect this result to continue. It must now determine its policy to the railways as a whole, when that policy is declared, the so-called weak roads, indispensable to a vast population, can decently and in order readjust their organizations to a permanent and wholesome basis. Under the 6 per cent level, accompanied by a regulation of earnings over 6 per cent as proposed by the plan, and applying that plan to the three-year pre-war period, 78 railroads would have received less than 6 per cent on the property accounts. Their average would have been 8.34 per cent. It is obvious that this result is just what we have asserted—the irreducible minimum.

"We feel absolutely assured that in presenting the Association plan we stand upon safe ground, consistent with the Constitution and with American traditions. While it is progressive in its acceptance of the idea of complete regulation, we are certain that it preserves the incentive to good service, high efficiency and consideration for passengers and shippers which no governmental organism or class organization would accord."

Samuel H. Beach

Samuel H. Beach told the committee that half of the people of the United States are directly interested in return of the railroads to private ownership on a basis that will afford adequate protection to security holders. He strongly advocated the Warfield plan as the only acceptable vehicle for the accomplishment of the end. Mr. Beach said in part:

"The only idea in the minds of many people regarding railroad securities is that they are mainly owned and held by the very wealthy. They do not stop to consider the fact that the major portion of the liquid wealth of the nation consists of the small accumulations of the many. The Savings Banks Association of the State of New York, comprises in its membership 139 of the 141 mutual savings banks in the State. It is needless to say these banks are popular with the people, for over one-third of the entire population of New York state are depositors in mutual savings banks. To be exact there are 3,500,000 depositors, who have to their aggregate credit the enormous sum of over two billions of dollars. There are similar mutual savings banks in 14 other states, the total number being 615, which own approximately $850,000,000, of railroad securities. These securities belong to over 9,000,000 people.

"Savings banks are required by law to invest the money of their depositors as speedily as possible in certain safe and specifically designated high-class securities and among them of necessity are these issued by railroads. Besides the savings bank depositors there are 33 million citizens holding life insurance policies; and railroad securities form a large block in the investments of the companies by which these policies are issued. In addition to these are millions of small depositors in trust companies, national banks and state banks; also hundreds of universities, thousands of trust estates and individual investors, so that in all 50 million people, a full half of all the people in the nation, comprising mainly the middle class—made up of business men, mechanics, clerks, laborers, the widow and the orphan—are vitally interested in having the railroads returned to private ownership under such terms and conditions as will render present outstanding bonds de-

sirable to retain and future issues attractive as an investment.

"The vital point of this proposed measure is that if to those roads having the average of efficiency can be assured a return of 6 per cent by act of Congress, it will settle and take out of the hands of the Interstate Commerce Commission the much vexed question of 'What is a reasonable return?'

"Ex-Senator Elihu Root said, in a letter addressed to Mr. Warfield touching on this plan, 'I think you have put your hook into the key log of the jam.' No more terse or more effective description of the conditions which prevail could be expressed than is contained in these words of Mr. Root. We all know there is a jam. Every business man in the nation knows that government ownership or government operation of railroads can never be made either economical or efficient and, in a Republic to the continued existence of which political parties are necessary, the making of a political asset of the vast number of railroad employees which our great transportation system requires, would be a constant and grave menace to a good government.

"It is our firm conviction that the railroads cannot avoid destruction and eventual governmental absorption unless they are assured of a return of not less than 6 per cent, 'though exercise by Congress of its duty to stop, by act, the knife of regulation short of the heart of the transportation system of the United States.'

"Nothing in human experience affords a precedent for such operation of railroads, in this or any other country, as the past two years have witnessed. Operating costs have mounted so far out of proportion to receipts that the bonds of at least eight or nine railroads, which were eligible before the war started are in a fair way to become illegal for savings banks to hold. It is easy to ask 'Why cannot these laws be made more liberal to conform to new conditions?' But we do not want these laws changed. We have no need to attempt to camouflage our position. What we do want is to have such legislation enacted as will bring the railroad securities up to the requirements of the law; so that instead of being forced to sell the bonds we now hold and thereby still further deflecting an already depressed market we may feel warranted and justified in adding to our holdings by investing in new issues of railroad bonds as much of the two billions of deposits entrusted to our care as we are permitted to do by the laws which govern our investments."

George A. Post

Submitting the National Chamber's plan, and its objection to the Plumb plan, on August 18, George A. Post said that at the time the referendum vote was taken there was no doubt in the minds of the railroad committee that government ownership and operation was not the issue pressing for attention upon the present Congress.

"Due to the unfavorable impression made upon the public mind by the operation of the railroads under federal control for the period of 16 months," he said, "there was manifest throughout the country a strong, even overwhelming, sentiment against continuance of federal control and operation. Many men in public office and multitudes of private citizens, prior to the adventure into the field of federal control, had been harshly critical of railroad management; had jealously advocated and brought about legislation severely restrictive and punitive respecting railroad operation, and in their bitterness because of what they considered unfair and aggravating practices of the railroad, had declared that government ownership and operation was the only remedy for railroad evils. Later they were so aroused by what they deemed the baleful effects of government operation upon their personal convenience and the conduct of their business, brought about by the indifference of governmental agencies, that they renounced their previous advocacy of government ownership, and became vigorous opponents thereof. So recently as July 15 last, at the opening of these hearings before this committee, Chairman Esch said: 'In view of the widespread sentiment throughout the country against government ownership, I feel that we ought not to spend very much time on that proposition.'

"American business is deeply concerned respecting the future of our railroads. It has high hopes of the wise outcome of your deliberations. It has noted with gratification the earnestness, patience and fairness with which the Congressional committees are seeking to secure all possible information. The chamber has keen appreciation of the perplexities that confront you in framing the legislation which must precede the return of the railroads to their owners. It has aimed to be helpful to you in showing the trend of thought of American business upon some of the outstanding issues involved in your deliberations. It knows that deep study is needed of the complexities inherent in the very existence of a transportation system which serves those who need service that they desire to obtain at the lowest possible rates—a service which is rendered possible through the labors of those who are entitled to liberal wages for dangerous and exacting toil, and require investment of billions through the savings of thrifty folks who will invest only if the return is attractive to them. In such circumstances, not one of the elements may reasonably hope to exact the fullest measure of its desire, either as to lowness of rates, height of wages, or abundance of investment return."

Mr. Post declared that under government ownership the development of the railroad facilities, which means so much to the country's progress, would depend upon Congressional appropriations, and that would prevent the anticipation of transportation needs. He pointed out that appropriations were not to be made in the amount and at the time necessary to insude adequate development and that political considerations not only would control the amount of appropriations, and the objects for which they were made, but would also weigh heavily for the selection of men for official positions.

To acquire the railroads, he said, the government would have to pledge its credit for 18 to 20 billions of dollars, at a time when other large financing must be done. It would be difficult for the government to dispose of the securities required to purchase the railroads, and it would be necessary for the government to secure from five hundred million to one billion dollars of new capital every year. If the government were to assume the burden of financing the railroads at the present time, when the war debt is so large, its interest rate would necessarily be as high as, if not higher than, the rate at which corporations could secure capital.

Business men of the country are convinced, Mr. Post said, that government operation cannot be as efficient as corporate management. Competition, the incentive to efficiency and progress in private enterprises, he declared, is absent from the government administration of affairs. Individual initiative is less characteristic, bureaucratic methods more so, and the services rendered are less progressively efficient.

The concensus of opinion of the National Chamber, Mr. Post said, is that unless the government adopted the policy of fixing low rates and fares with the intention that any resulting deficit from operations should be placed as an increased burden of taxes upon the general public, rates and fares would be higher under government than under private operation, on the theory that under government operation expenses rise in relation to income, and the charges imposed by the government must be higher than those which it would be necessary to permit railroad corporations to make.

Mr. Post urged the return of the railroads to corporate control as soon as remedial legislation can be enacted. The plan he offered for the future provides that permission be granted for railroads to consolidate, in the public interest,

with prior approval of government authority, in a limited number of strong competing systems, so located that each of the principal traffic centers of the country shall, if possible, be served by more than one system, the proposed grouping to be about the present large systems, and not by territorial subdivisions of the country.

The position of the National Chamber on the consolidation feature, Mr. Post said, is in substance: The existence of so many railroad systems as there are now increases the difficulty of coordinating their facilities, and service to the extent necessary to secure the most economical operation. Moreover, some of the present roads are financially weak and their continuance as separate systems complicates the government's problems of rate making; of common or joint use of equipment and facilities; of the regulation of security issues, and of reestablishing the financial credit of the railroads as a whole. If the railroad systems that are financially unstable and the many systems of minor importance can (subject to the approval of the government, and under conditions which it may prescribe) be grouped or consolidated, with a limited number of strong systems, a better service can be rendered and a larger development of lines, terminals and other facilities will be possible. If such a plan shall be found by Congress to be constitutional and feasible, the National Chamber of Commerce recommends that railroad corporations engaged in interstate commerce be made subject to the United States by the enactment of a statute similar to the National Bank Act, the states retaining the power of taxation and police regulation.

Federal regulation of capital expenditures and securities of railroads engaged in interstate commerce is favored, as is federal regulation of intrastate rates affecting interstate commerce.

The National Chamber plan, Mr. Post explained, calls for the enactment of a statutory rule providing that railroad rates and fares authorized by the Interstate Commerce Commission shall be designed to yield the railroads, in each of the traffic sections which shall be designated by the commission, aggregate revenues which shall provide (after allotment has been made for renewals and depreciation) such net returns upon a fair value (determined by public authority) of the property devoted to the public use as will be sufficient to enable the carriers to obtain at reasonable cost the capital required to furnish the public with adequate facilities and efficient and economical service.

The National Chamber, Mr. Post said, authorized him strongly to recommend that the Interstate Commerce Commission retain all its present power, and be given certain additional power, and that there be created a Federal Transportation Board whose general duty it shall be to promote the development of a national system of rail, water and highway transporation, and thus to make possible the economical use of all facilities, including tracks, terminals, transfer facilities, steam and electric roads, waterways and highways.

G. A. Post

The program of railroad legislation presented to the House committee by the National Transportation Conference is up to a certain point identical with the plan which Mr. Post presented as having received the approval of the members of the Chamber of Commerce. The conference program goes further, however, and includes certain recommendations which, although entirely in harmony with the principles embodied in the chamber plan, have not yet been submitted to the members of the chamber for their approval by referendum vote.

The Chamber of Commerce has published in one pamphlet and is distributing widely the program of railroad legislation adopted by the National Transportation Conference and also the statements in support of the program made before the House committee by members of the conference. Both the conference and the railroad committee of the chamber recommend:

(1) Corporate ownership and operation of railroads.

(2) Return of the roads to their owners as soon as the necessary legislation can be enacted.

(3) Consolidation of existing roads in strong, competing systems.

(4) Compulsory federal incorporation.

(5) Federal regulation of capital expenditures and security issues.

(6) Federal regulation of intrastate rates affecting interstate commerce.

(7) Adoption of a statutory rule of rate-making that will assure to the railroads revenue sufficient to enable them to furnish the public with adequate facilities and efficient and economical service.

(8) Creation of a Federal Transportation Board to promote the development of a national system of rail, water and highway transportation.

The further recommendations embodied in the conference program that are in harmony with the principles of the chamber's plan; but as yet have not been submitted to the members of the chamber for approval by referendum vote are as follows:

(1) Creation of a company contingent fund for each railroad and a general contingent fund for all railroads, to be used in strengthening and stabilizing railroad credit.

(2) Creation of a railroad reserve fund for use during the period of transition from government to corporate management.

(3) Creation of boards consisting of equal numbers of representatives of employes and officers of the railroads for the adjustment of wages, hours of labor and other conditions of service of railroad employes.

(4) Organization of the board of directors of each consolidated railroad company with twelve members of whom one shall be a representative of the employes of the system, and three shall be selected by the Federal Transportation Board to represent the principal interests involved in the territory served by the system.

Samuel Spring, associate counsel of the Citizens' National

Railroad League, has filed with the committee a statement supplemental to that of Nathan L. Amster, president of the league, made on July 29:

N. L. Amster's Valuation Plan

"If I may start at the end of our tentative bill first, I would like to point out the next to the last section, that dealing with valuation. It is vital," he said, "no rate base with any degree of permanency can be fixed until we know the value of our carriers on which they are entitled to earn a fair return. Consolidations under government supervision are impossible unless the public can rest assured that such consolidations will not represent financial juggling and the palming off on the public once again of a large mass of water securities.

"Yet, unhappily, the question of physical valuation of our carriers is a legal question to be determined by our courts and not by the Interstate Commerce Commission. This arises, as the committee well knows, from our constitutional provisions which enable the carriers to attack by injunction as confiscatory any valuation which they deem too low. The courts have not laid down any legal rules which are clear enough to enable the commission to fix any final value. Indeed the whole legal question is a sad muddle. The courts, as any lawyer knows, have a fixed judicial rule of avoiding the decision of any unnecessary question. Thus many of the most difficult questions in utility valuation are unsettled. Who can say anything definite about intangible values such as development cost or going concern value? Indeed, the method of reaching a final fair value still remains undetermined with any degree of certainty. Our courts have had too big a task. No one today desires to have the question of physical valuation decided with meticulous, breath-taking accuracy. A fair, honest approximation that will end the controversy is demanded. If we leave the decision of the Interstate Commerce Commission to be passed upon by the courts as valuation questions have been judicially determined in the past I say advisedly that it will take 10 years at least to end the matter. Congress, with due regard to constitutional rights, has got to settle the matter.

"Already the Interstate Commerce Commission has encountered sad difficulties. I might almost call the valuation battle before the commission between the carriers and the public represented by the state commissions acting through their national association a rare and delicate comedy. This committee doubtless remembers how violently opposed the carriers were to physical appraisal in 1913. At that time the theory of reproduction cost was welcomed by the public and condemned by the carriers. Now the carriers—or at least they were before the war—are urging the complete and logical application of the reproduction theory and demanding that the commission fix a final value. The public desires to avoid the reproduction theory because of the unhappy way in which it can be twisted and desires the commission to state the factors of value only, not the final value. Thus we are on the threshold of a heyday of litigation, briefs, arguments and passionate utterance. The Gordian knot must be cut by Congress and at once.

Now Mr. Amster has suggested a sound way of ending this matter. It is based on honest, fair approximation. Let us average the original cost, where an investment was made in good faith, and the reproduction cost. Then let us correct this result by capitalizing the net earnings of the road over a period of 10 years and averaging this result with our former figure. This is obviously fair. A road in reality is not worth what it cost to build it if it can't earn a fair return. By taking a 10-year period we give every road a fair chance to show its latent possibilities. I think that the Supreme Court will not for a moment say that this method of reaching a fair valuation, if adopted by Congress, is so clearly unreasonable as to require it to hold it void. The Supreme Court, it is true, has avoided taking the earnings of a road as an indication of its value in a rate case because it felt that this was arguing in a circle. But it has repeatedly and urgently said that any rate or value, over and above any question of original or reproduction cost, must be fair to the public and to the carrier. It has repeatedly said that any value producing a rate unreasonably high must be rejected. In a word it has left a big space for a corrective, and Mr. Amster's corrective, since it is the only one that I have discovered in a careful examination over a period of years of all court decisions and articles and discussions of the subject, will be in complete accord with the views of the court. Congress cannot leave this problem of determining the value for rates and consolidation of one-tenth of our entire wealth, so far as the principles of valuation are concerned, to the Interstate Commerce Commission. It is too vital a question for any commission to determine. I feel confident that the commission feels this way; at least the commission has shown the greatest prudence in avoiding a final decision of the question.

"Congress must speak. Congress is the logical—indeed the only body—that can speak. Mr. Amster has prepared and devised a solution that is sound, in accord with the views of the courts, is fair and just, and is the only solution seriously suggested.

"This bill adds to Section 19a of the act to regulate commerce various paragraphs which strive to end the valuation controversy. It ends the question of land values; it ends the question of intangible values. These provisions have been drafted only after a painstaking study of court and commission decisions and they are a codification of the best judicial views in a field where the decisions are in confusion.

"I would also like to add a word about the theory of regulation as evolved in this bill. The great weakness of regulation of our utilities in the past has been due to the fact that the public acted only after the act had been done. Then the public approved or disapproved. Too much of our regulation has been of the character of locking the barn after the horse was stolen. Again the utilities were hampered because they had to act and take the risk of the public's disapproval. This bill gives the Interstate Commerce Commission and the state railway commissions representation on the board of governors of the unified railroad corporation. Thus the regulatory bodies will know all that is being done and can exert their influence before the act is done. The time has come when we must have preventive regulation; the public must know all that is done from the very beginning."

Statement of S. H. Cowan

S. H. Cowan, representing the National Livestock Shippers' League, who appeared before the committee on August 18 and 19, argued that very little legislation is necessary before the railroads are returned. He delivered a characteristic tirade against both high rates and high wages, saying the director general has not been able to control either the traffic men who took advantage of the opportunity to "put it over on the shippers" or the brotherhoods. He said that labor was able to get nearly all it demanded and that the railroads want 6 per cent after labor gets what it wants, and as a result it is becoming too expensive to ship freight by rail. He thought it was time for Congress to "talk turkey" to both capital and labor and to fix it so that it won't be necessary, as he said, "to go to Washington to get permission to change a $5 bill." He opposed government ownership vigorously, saying the government is not organized to run a business and that the President has to appoint men he knows nothing about.

If the railroads are returned, he said, all the old statutes and constitutional guarantees will remain in effect, labor will continue to draw its high wages and the rates will remain in effect. When some of the members of the committee ques-

tioned whether the state rates would remain in effect he proposed that the existing rates be continued by law for four months after the return of the roads unless changed by the interstate or state commissions. He also proposed that the director general be authorized to retain control over some roads, that the railroads be paid the amount of working capital taken over, that they be required to pay all liabilities incurred by the director general in the ordinary course of operation, such as loss and damage claims, and charge them to the government, that an accounting board be appointed by the Interstate Commerce Commission to adjust accounts between the railroads and the government, to report to the commission, which should make a recommendation to Congress, and that Congress should make an appropriation for loans to the railroads.

Mr. Cowan said the purpose of the federal control act had been to pave the way for permanent government ownership and that the standard return was too large because it included about $300,000,000 for surplus. He said Mr. McAdoo thought he could shake the railroads up like a kaleidoscope and show a profit from unification, but that he "learned different just before he went to California to go into the moving pictures." He said he was not criticizing Mr. McAdoo, that he was honest in his opinions, and "one of our greatest men since Barnum." Asked whether the railroads would be able to avoid deficits under private operation Mr. Cowan said he did not know, but he thought Congress ought to investigate the operating expenses to see if they do not include a large amount of betterment work.

Mr. Cowan's argument was supplemented by S. C. Rowe, representing the Texas Cattle Raisers' Association, who particularly urged the creation of a board to regulate wages and legislation to prevent strikes.

Plumb Wants Congress to Investigate

INDICATIONS ARE APPEARING that the charges made by Glenn E. Plumb, counsel for the organized railway employees, before the House committee last week, are another part of the campaign to prevent the return of the railroads to private management, and thus to extend the period in which it is possible to pay wages without relation to the earning power of the railroads.

Representative Huddleston of Alabama has introduced a resolution in the House, copies of which were given out in advance by the Plumb Plan Press Bureau, providing for the appointment of a committee of six members to investigate the truth of the charges. Mr. Huddleston also made a speech, which was also given out in advance by the Plumb Plan Press Bureau, declaring that the "entire country was greatly shocked by these sensational charges." He declared that the railroad employees have "inside knowledge of the facts" and he objected to a suggestion that they be referred to the Interstate Commerce Commission.

Representative Denison of Illinois expressed surprise that the gentleman from Alabama, coming from the great industrial center of Birmingham, should state that the people were shocked by these charges. "Charges similar to these have been made in this country for the last five or ten years," he said, "and there is not anything new about them. The Interstate Commerce Commission has been investigating that question for five years."

Mr. Plumb also wrote a letter to Chairman Esch of the House committee, referring to a newspaper report that he intended to confer with officials of the Interstate Commerce Commission in order to learn whether it would be practicable for that body to conduct an investigation of the charges. Mr. Plumb said he feared Mr. Esch had missed the intent which actuated the preferment of those charges at this time; that the investigation should be made and reported upon before Congress acts on railroad legislation, and that the investigation should be made by a committee of the House or Senate or preferably by a joint committee. If Congress wishes to designate the Interstate Commerce Commission, he said, it should be expressly provided that the investigation be prompt in order that the report may be placed before Congress and the public "before the enactment of any measure looking to the restoration of the railroads to hands which we denounce as unclean." The letter then repeated the charges as made before the committee and concluded with another reference to the desire that a report be had before the railroads are returned to their private owners. Apparently Mr. Plumb recognizes that if he can secure a thorough investigation of the history of railroad land grants before the railroads are returned, the present system of government control might be continued for a very considerable part of the period advocated by Mr. McAdoo.

The Plumb Plan League has found another defender in Congress in the person of Representative Carrs of Minnesota, who was recently committee chairman of the Brotherhood of Locomotive Engineers. Mr. Carrs did not say much in favor of the plan, but he objected to statements made by other Congressmen that the railway brotherhoods forced the Adamson law by threats of a strike and that they are now seeking to force the Plumb plan by threats of strike. While the determination of the labor leaders was plainly not to accede to a delay on the question of wages, he said, there never has been a vestige of a threat of strike or the desire of intimidation with regard to the Sims bill.

"I can say of my own personal knowledge that in all the conferences of the railroad union presidents held during the spring and this summer in connection with their advocacy of the Plumb plan the subject of strike as a means to support the plan has never been even broached. The program called for introduction of the bill not before October, and then as the spirit of resistance on the wage questions became apparent the program was changed and the labor bill was thrown into the basket to prove to the men in the shops and on the trains that their interests were being carefully served. So, as it happens, the threats of strike were not made in support of the Sims bill, but the Sims bill was introduced when it was as an effective answer to the strikes."

Six Months Income 39.8 Per Cent of Standard Return

THE CLASS I RAILROADS under federal control during the first six months of this year earned 39.8 per cent of their standard return as compared with 38.4 per cent during the first half of 1918, according to a statement compiled by the Railroad Administration. The net federal income for six months was $156,827,416, as compared with $151,319,830 in the first half of 1918 and as compared with a standard return for this period of $393,975,779. The New England district had a deficit in both years. The Central Western region came nearer to earning its standard return than any of the others, but its percentage was only 63.1. A total of 58 roads had deficits for the six months period and only 20 roads earned their standard return. It will be noted that most of these are comparatively short lines that are handling a much greater traffic than formerly.

The operating revenues in the six months period show an increase from $2,055,966,861 to $2,324,499,304, or 13.1 per cent; the operating expenses increased 14.9 per cent. from $1,790,249,693 to $2,056,720,484.

The operating expenses for the first six months of 1918 do not include those months' proportion of retroactive wage payments made and accrued in subsequent months and are

"Net Federal Income" represents net operating revenue, minus railway tax accruals and uncollectible railway revenue, plus or minus the net balance for equipment rents, joint facility rents, and miscellaneous federal income items (if any). Items of prior revenue or expense, commonly called "lapovers," have been excluded.

Standard return for this period is based on the proportion which the railway operating income of all Class 1 roads in the same period of the three years of the test period bore to the total railway operating income of those roads during the test period. The average for all roads combined is applied to each road as well as to totals. This may not exactly represent this period's proportion for individual roads, but provides a fair distribution by totals, and is closer to the facts for individual roads than the former method of applying one-twelfth of standard return to each month. The proportions to be used for each month are:

January	6.228%	May	8.568%	September	10.113%
February	5.257	June	9.149	October	10.436
March	7.517	July	8.363	November	9.222
April	7.438	August	9.643	December	8.066

b—Per cent not computed as net federal income this year is a deficit.
c—Per cent not computed as standard return is a deficit
d—Decrease.
D—Deficit.

therefore understated to the amount of $98,993,529. The expenses for the first six months of 1919 contain retroactive payments applicable to prior months and are overstated to the amount of $16,166,301.

The operating ratio for the six months' period was 88.5 as compared with 87.1 in the corresponding period of last year and 70.25 for the average of the first six months of the test period.

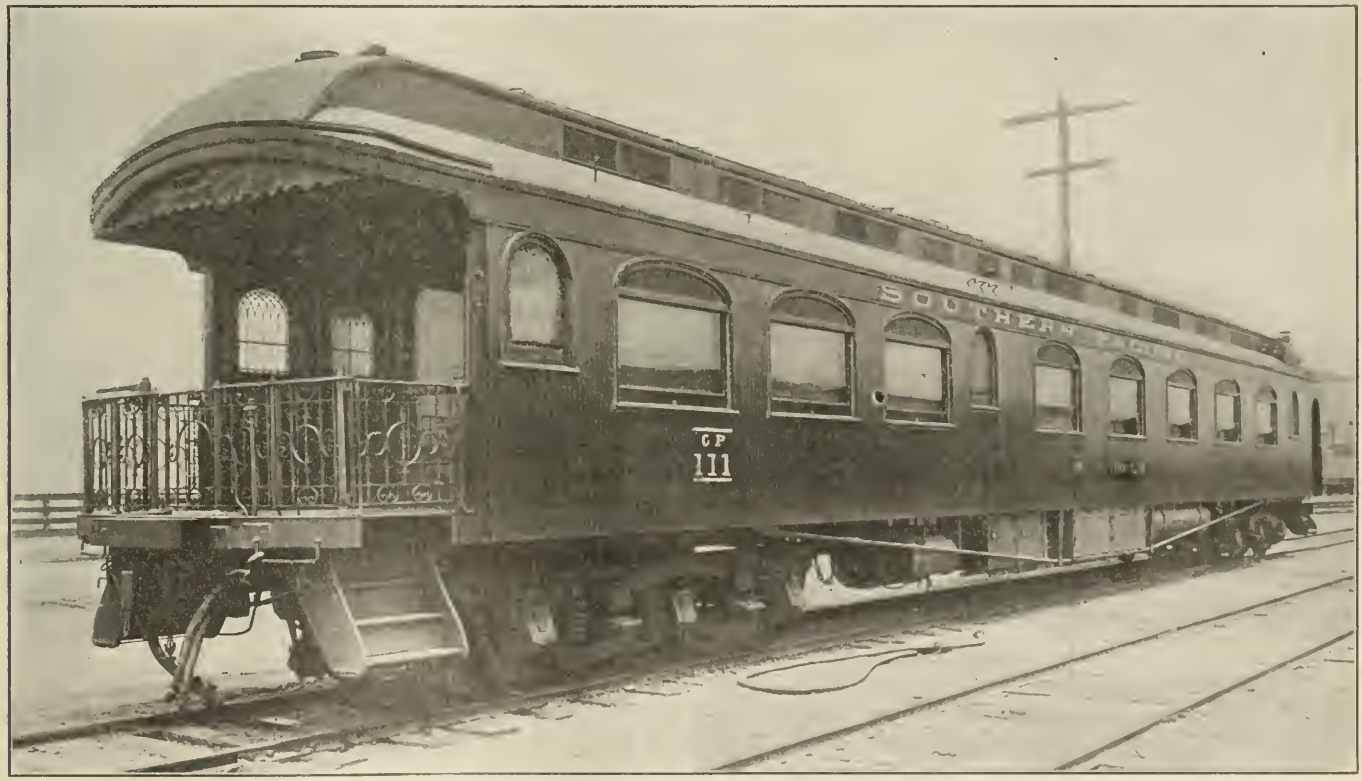
For the month of June the number of roads having deficits was less than for the six months' period, only 45, while 33 earned their standard return. The percentage of the standard return earned by all roads for June was 64. The Ohio-Indiana district was the only district in which the roads as a whole earned the standard return. Its percentage was 100.7. The lowest percentage was in the Pocahontas region, 25.3 per cent.

The figures by regions and by roads are given in the tables on the three preceding pages.

New Instruction Car for the Southern Pacific

Equipment Includes Apparatus for Presenting Operating Problems Graphically to Employees

THE INSTRUCTION of railroad employees, both new and old, is gradually assuming a more important function in the successful operation of railroads of this country. Indicative of this trend is the construction and equipment of a new instruction car recently at the Southern Pacific shops at Sacramento, Cal. The designers and builders of this car believe that this "academy on wheels" represents an advance both in car construction and in facilities for carrying on educational work among railroad men. The car is equipped with modern devices for the instruction and examination of railroad employees and facilities are available for conducting practically every test found in the operating curriculum.



Exterior View of the Instruction Car

The car itself was originally an observation car of the six-wheel truck type, weighing approximately 135,000 lbs., which was in service on the Southern Pacific. The length over end sills is 72 ft. 6 in., with steel under frame and trucks, and the car equipment includes a vapor heating system and both electric and Pintsch gas light, so arranged that connections may be established with city power mains where stops are made for any considerable length of time. Approximately one-half of the car has been converted into a class room with a total seating capacity of 30. The other half of the car contains three staterooms, one for the chief instructor and two smaller compartments each containing a standard Pullman section for his assistants. The observation end of the car has been converted into a commodious office, which is approximately 12 ft. in length and contains, besides desks, facilities for installing another berth to take care of extra assistants. In addition to these conveniences in the living end of the car, a metal-lined shower bath and adequate clothes lockers have been installed for the use of the examiners.

The class room is equipped with a complete automatic block signal working model in which the signals are operated from storage batteries. A display board provided in the

bulkhead near the center of the car enables charts to be effectively exhibited and illuminated, by the side of which there is also an apparatus for displaying various conditions under which trains may be operated when a new time table becomes effective. In addition to this, a projecting machine has been installed immediately behind the display board and apparatus by means of which train orders may be flashed upon a screen placed in front of the display board. In conjunction with this apparatus problems are worked out on the miniature railroad on which practically every situation arising in actual practice can be duplicated.

The car is intended to serve the territory of about 9,000 miles comprising the Pacific system, and to make possible the examination and instruction of approximately 10,000 employees on each round trip. In traversing this territory stops are made at points where train crews lay over, making it possible for the men to attend at either end of their run. Where telegraphers are employed the car is halted the required time for thorough examination and instruction. The local examiner of each division questions employees entering the service or those recently promoted to new positions. However, all employees are required to attend the examinations conducted in the car. In this manner a conductor or engineer obtains the benefit of questions and answers between the despatcher and the examiner and brakemen and firemen learn the problems that confront the conductors and engineers.

As the car passes over each division examiners check all train orders used by the conductors and engineers to see if they are in proper form and legible. Attention is directed to any irregularities and the assembled class receives instructions immediately concerning the necessity for correction. A similar check is made upon the despatchers' train order books, train sheets, checks of train register and clearance cards.

The division officers whose division the instruction car is operating find it to their advantage to be present at these examinations in order to familiarize themselves with constantly changing instructions, and in this manner obtain a uniform understanding of the company's practices. The visualization of problems presented graphically to the men in the class room has made instruction work more interesting to all concerned.

Grand Central Terminal Handled 189,838 Passengers

On Monday, August 18, the elevated and subway service in New York City, Boroughs of Manhattan and the Bronx, was completely discontinued. The surface lines were entirely inadequate to handle the morning and evening traffic from the Bronx and the northern end of Manhattan Island, and the New York Central and, to a lesser extent, the New York, New Haven & Hartford, were called upon to furnish transportation up to the limit of their capacities.

What may be properly called the city traffic as distinguished from suburban passenger traffic begins at about 300th street or just south of the junction of the New York, New Haven & Hartford and the New York Central. To the east of the New York Central tracks are two double-tracked subways, and a little further south a double-track elevated. To the west there are also two double-track subways, and a little further south a double-track elevated. From Woodlawn Junction into Grand Central Terminal the New York Central has four tracks used by both the Central and the New Haven.

On a normal Monday, about 175 through trains and 300 locals are handled into and out of the terminal. The normal number of passengers on Monday into and out of the station is about 100,000.

The strike on the subway and elevated was declared on Sunday on a comparatively few hours' notice. On Monday,

the New York Central handled 26 special multiple unit trains of 10 cars each during the morning rush period and all of the regular trains were built up to the full 10-car limit. The average movement of passengers into the station is about 20,000 during a morning's rush period and on Monday, 62,733 passengers were handled, an increase of over 200 per cent. During the 24 hours of Monday, 50 special trains in all were handled into the station but after 10 o'clock they were not well filled and probably not more than 8,000 to 10,000 people were handled into the station over and above the normal movement.

The evening rush period began much earlier than normally and this was of great help in taking care of the crowds. By 4:15 the lower level of the Grand Central Terminal, from which the suburban trains leave, was crowded with people, and police protection with crowds roped back from the entrances to the ramps was necessary until 8:15. During this period of four hours, 25 additional trains with about 30,000 people were sent out from the Grand Central Terminal in addition to the regular outbound suburban and through traffic movement. Ordinarily, the New York, New Haven & Hartford makes no passenger stops south of Mt. Vernon, so that the extra trains were all New York Central trains. Under normal conditions the Grand Central Terminal, between five o'clock and seven o'clock, handles a very heavy movement of outbound trains. For instance, on the Hudson Division there is a five o'clock, 5:03, 5:30 and a six o'clock express, and there are 5:06, 5:15, 5:19; 5:22, 5:34 and 5:51 locals and local expresses. On the Harlem Division there are 5:09 and 5:23 expresses, two 5:12 trains, 5:26, 5:37, 5:38, 5:46, and 5:56 local and local express trains; and on the New York, New Haven & Hartford there are the five o'clock, 5:03, 5:10, 5:13, 5:19, 5:29 and 5:32 express trains and 5.06, 5:16, 5:25, 5:41, 5:44 and 5:57 locals. All of these trains, of course, leave the Grand Central Terminal.

The Putnam Division of the New York Central terminates at 129th street and, therefore, much of the traffic of this division was also thrown on to the Hudson and Harlem Divisions.

The Grand Central Terminal is called upon to handle very heavy business on the days of the Yale-Harvard and Yale-Princeton foot ball matches at New Haven, on the day preceding a holiday, on the day following Labor Day, etc., but the crowds during these days are distributed over a period of hours and, furthermore, are of a class which can be handled in an orderly manner. On the other hand, on Monday the crowd which was thrown upon the New York Central was particularly difficult to handle; in the first place, because the large proportion were foreigners or people entirely unused to steam railroad travel; and, secondly, there was included in the crowd a considerable element of an unruly nature. The travel in the subway with the jamming of rough element into the doorways after the cars are completely filled engenders in this class of traffic a disregard for the rights of others which made the crowd on Monday night at the Grand Central somewhat dangerous for women or children to venture into. Many of the passengers did not know the names of the stations to which they desired to go, knowing simply the name of the elevated or subway station at which they ordinarily got off. Extra booths were provided, sufficient to handle the crowds as quickly as they could be handled into the trains, but the confusion of mind of the passengers was so great that tickets were lost between the ticket booth and the entrance to the train, groups drifted about, pushed hither and thither by the crowd in a seemingly aimless state of mind. One of the New York Central employees who commutes out of Grand Central picked up, on his way to his train, between 20 and 30 tickets that had been dropped in the confusion. The ticket sellers were generally able to tell passengers what station they wanted tickets to when the subway or elevated station was named, but this took time and made the ticket selling slower than it would have otherwise been.

Fifty extra policemen were on duty at the entrance to the lower level and ropes were stretched across between the pillars midway through the length of the lower level concourse, and passengers were admitted through the ropes as trains were placed ready for loading.

The loop was used exclusively for extra trains and regular trains were run into the stub tracks. Nevertheless, great care was used to have regular commutation and suburban trains run out from platforms as nearly as possible to those from which they ordinarily depart. No train was moved from its regular platform further than would permit a passenger standing at the entrance to the regular platform to see the sign either to the right or left of him of his train.

Notwithstanding the confusion among the extra passengers there was comparatively little difficulty experienced by the regular commuters and the average detention of the regular trains on this Monday was only 2:07 per train.

Miles Bronson, general superintendent and manager of the terminal, and G. H. Wilson, superintendent, were in charge of the situation during the entire period.

The accompanying table shows the train and car movement and number of passengers handled on days of particularly heavy business, on a normal day (August 11, 1919) and on Monday, August 18, the day of the strike:

On a Branch Line in Russia

Doings of the United States Railroad Administration

Director General and Bituminous Coal Operators Engage in Controversy Concerning Possible Coal Shortage

WASHINGTON, D. C.

THE RAILROAD ADMINISTRATION and the bituminous coal operators are again engaged in the polite and preliminary skirmishes of a controversy as to the responsibility for a possible coal shortage this winter. The National Coal Association has been preparing its alibi for some time in an effort to create an impression that the railroads are already failing to supply coal cars, while Director General Hines takes the position that if the public will not place its orders in advance at the present prices for coal and the railroads are called upon to handle an unduly large proportion of the year's supply in the later months of the year, any resulting shortage will not be the fault of the railroads.

In reply to a Senate resolution introduced by Senator Pomerene, inquiring as to the past, present and future supply of coal cars in relation to the demand, Mr. Hines says that if the demand to be supplied is as large as has been predicted by the National Coal Association he foresees difficulties not only in the transportation, but also in the production of that amount of coal during the latter part of the year. However, he says, there is no accurate information available to support the estimate that the requirements for 1919 will amount to 500,000,000 tons and he does not anticipate any shortages in transportation which will be "in any sense exceptional or abnormal," or which will justify "oppressive prices" for coal. He points out that up to date any shortage in coal production must be attributed not to car shortage, but to "no market," which he strongly hints is due to the high prices charged, and he suggests that "in the event any Congressional investigation should be undertaken it would be expedient to ascertain the extent to which the absence of demand for coal has been due to the maintenance of high prices which discouraged the demand."

Opportunity to suggest that Congress might do something to protect the public from excessive coal prices was given to Mr. Hines by the Senate's question as to what, if any, further action by Congress is required in order to meet the demands for the transportation of coal. He does not believe, apparently, that Congress can be of much assistance in the practical matter of producing and transporting the coal, but he indicates an opinion that it might prevent the coal people from convincing the public that high prices are justified by car or transportation shortage.

The National Coal Association has until recently been spending large sums in advertising, urging the placing of early orders for coal and laying stress on the few scattering instances of car shortage that have developed thus far and the prospects for a real shortage later on. Evidences of its propaganda have been seen also in numerous resolutions urging the Railroad Administration to hasten the repair of coal cars and to put into service the unallocated new standard cars. Mr. Hines indicates a belief that this represents an effort to create a psychological condition that will support high prices by hanging the responsibility on the Railroad Administration. The Senate resolution asked five questions. To these Mr. Hines replied in part as follows:

"The number of open-top cars in the United States is approximately 1,067,000, of which over 99 per cent are owned by federal operated railroads and all of which are, generally speaking, subject to interchangeable use on federal operated railroads and non-federal operated railroads. Open-top cars are commonly known as coal cars, though some open-top cars are not suitable for coal loading.

"At the present time something less than 10 per cent of these cars are awaiting repairs, either light or heavy. A large number of the cars so awaiting repairs are so held for very light repairs which can be speedily applied. During federal control the methods of classification to determine what cars need repairs have been made much more strict, with the result that large numbers of cars are now shown as needing repairs which in former years have not been so shown. The Railroad Administration program of car repairs will, it is expected, gradually reduce the proportion of cars awaiting repairs despite the stricter classification.

"The total result is that there are now approximately 900,000 open-top cars in the United States ready for use without any repairs, and about 775,000 of these open-top cars are suitable for coal loading. This type of equipment is, however, regularly used for a very heavy tonnage of other bulk commodities which cannot be handled except in open-top cars. Adequate transportation for many of these commodities, particularly those used in highway construction and repairs, general building, and railroad ballast and improvement work, now requires a large number of these cars. Those actually in current use for the transportation of coal number approximately 600,000. It must also be remembered that box cars have always been used to an important extent in some parts of the country for transporting coal.

"During the first five months of the present year open-top cars were regularly available greatly in excess of shippers' orders for the same. The maximum was reached in February and March when the surplus of open-top cars daily available amounted to the extraordinary totals of 187,339 and 192,933, respectively. There has at no time been any shortage of cars for anthracite coal loading.

As to bituminous coal there occurred in June a slight shortage in Southern West Virginia, Eastern Ohio and Western Pennsylvania, due to an accumulation of cars in lake coal trade, and increased detention of such cars under load at Lake Erie ports awaiting vessels, and also to a strike of railroad shopmen on the Norfolk & Western Railroad. Since about July 15, coincident with a marked upward trend in production, there have been some shortages of cars for loading with bituminous coal in some producing districts, mainly in Eastern Kentucky, Virginia, West Virginia, Maryland and Pennsylvania, and usually in districts producing the higher grades of coal. A strike of marine workers on coastwise ships, floods and other operating difficulties have contributed to these shortages. Contemporaneously, however, there still exist slight surpluses of open-top cars in some sections, principally in the West.

"Exhibit "B" shows comparatively for 1919, as far as available, the weekly reports by the Geological Survey of percentage of full time operation lost by bituminous coal mines in the United States, and the cause of such loss, and indicates that up to July 12 the loss on account of 'car shortages' was a very minor one, and relatively much less than that from 'mine causes' and 'no market.'

"The purchase of 45,000 cars available for coal loading was arranged for by the director general for delivery to railroads under federal control. All these cars have been or will be put in service as rapidly as practicable, whether transferred to the several railroad companies or not. Thirty-seven thousand have already been built, of which 17,000 have been put in service. The remaining 20,000 already built are now being numbered and lettered and are being placed in service as fast as this work is being completed. The 8,000 not yet

built will be put in service as rapidly as they are constructed.

"Of the 45,000 cars available for coal loading thus purchased, 4,750 have not yet been assigned definitely to any one or more railroad companies; 32,800 cars have been assigned to various railroad companies and definitely accepted by them; the remaining 7,450 cars have been allocated to certain of the railroad companies, but up to this time these cars have not been definitely accepted, due to unwillingness of said companies to accept the cars. Mandatory orders to require the cars to be accepted have not been issued pending full opportunity for disussion with the companies, but the fact that in these instances the cars have not been accepted by the companies is not delaying the cars being put in service as rapidly as constructed.

"It is not believed that further action by Congress will aid in meeting the demands for the transportation of the coal which will be needed during the remainder of this calendar year. The matter is largely dependent upon practical conditions which will not be affected by legislation. A statement is appended showing some of the important conditions in this respect and indicating that if the demand to be supplied is as large as has been predicted by the National Coal Association, there promises to be not only substantial difficulties in the transportation of coal, but also in the production by the mines of the coal which can be transported. The transportation difficulties will not be principally or primarily a shortage of cars, but the fact that the entire railroad plant—locomotives, cars, main tracks, terminal tracks, etc.—will be so occupied in handling a very large business of all sorts that an abnormal amount of any particular business such as coal will inevitably lead to congestion and delay. Nevertheless the unified control of the railroads will admit of specializing on the transportation of coal to whatever extent is absolutely necessary to prevent actual hardship.

"The great danger that confronts the public in this matter is that any shortage either in production by the mines or in transportation may be exaggerated so as to serve as a pretext for heavy increases in the coal prices which, in my opinion, are already high, generally speaking. It is worthy of serious consideration whether Congressional action can be taken to protect the public under these circumstances from excessive coal prices. In this connection it is important to remember that shortages in the production of coal by the mines and also in the transportation of coal by the railroads have not been exceptional in the fall and winter months, and any effort to stress unduly these conditions this year will probably be for the purpose of creating a pretext for increasing the prices of coal to the consuming public and the public should be given the benefit of reliable information on the subject.

"I believe it will be of specific advantage to the public if Congress would provide for an official inquiry by the proper branch of the government (presumably the Geological Survey in the Interior Department) to ascertain the probable demand for coal for the rest of the year, so as to determine the extent to which the predictions of an abnormal demand for coal are justified.

"It is important to emphasize that the relatively low production and purchase of coal up to the present date in this year have been due only to a very small extent to shortage of transportation and have been due to a very large extent to 'no market' or absence of demand for the coal, and in some parts of the country the lack of demand for coal still prevails. The weekly statements of the Geological Survey shows that beginning with January, 1919, and extending to June 14, 1919, the weekly loss of bituminous coal production on account of no market ranged from 32.6 to 46.5 per cent of working time, whereas, during the same period, the loss of time on account of car shortage ranged from only 0.6 of 1 per cent to a maximum of 4.8 per cent.

"The ability of the railroads to transport all the bituminous coal will, of course, be largely dependent upon the amount required. On that point no accurate information seems to be available. The National Coal Association, however, has advertised that 500,000,000 tons of bituminous coal must be produced in the calendar year 1919 to meet the requirements of the country. This estimate is just about the production of 1916, a year of great industrial activity, with normal winter weather and normal storage of coal to begin with, whereas in 1919 the year began with storage piles greatly exceeding normal, winter weather was the mildest in history and industrial activity, due to the readjustment of business following the war, has been at a very low ebb for months. Another element to be kept in mind in estimating the prospective tonnage for which transportation must be furnished is the export movement, of which much has been said to indicate that the tonnage will be large, but with respect to which there is little accurate information readily available.

"It may be noted that during the first six months of 1919 the coal consumption by railroads was about 26,000,000 tons less than in the corresponding period of 1918, during which latter year the fuel coal consumption by railroads aggregated 154,000,000 tons for the 12 months.

"If 500,000,000 tons shall be needed in the present year, the prospects are that its transportation will be accompanied by difficulties and, especially in view of the heavy business to be expected this fall, it will be exceedingly difficult to transport the amount required. These difficulties will not be due primarily or principally to the car shortage, but rather to the fact that an abnormal demand for coal will be concentrated into an unusually short period, when the necessary use of the railroads for other purposes will make it difficult to handle the coal.

"There is shown below a comparison of weekly production averages of bituminous coal for selected periods in 1917, 1918 and 1919:

Per week for the year 1917	10,611,230 tons
Per week, July 28-December 31, 1917	10,588,410 tons
Per week for the year 1918	11,216,000 tons
Per week, July 18-December 28, 1918	11,330,000 tons
Per week, July 28-November 16, 1918	11,900,000 tons
Per week, January 1-July 26, 1919	8,349,000 tons

"If it be assumed that 500,000,000 tons of bituminous coal must be produced during the present year, and we deduct the 250,000,000 tons already produced to July 26, it will be necessary during the remainder of the year to produce 11,340,000 tons weekly. When we consider what has been done in former years, and especially the maximum which was produced last year under the war influences which enlarged production as well as increased transportation, it is apparent that serious difficulties will be encountered both in the production and in the transportation of the amount of coal necessary in order to produce 500,000,000 tons for the entire calendar year 1919.

"It is highly important to remember that shortage in coal will largely be due to conditions of production having no reference to transportation. For example, in the case of anthracite coal the predominant cause of failure to produce up to the capacity of the mines is shortage of labor because there has been no shortage of transportation. The same condition is true with respect to bituminous mines in certain fields producing the higher grades of such coal, although at present shortage of transportation has become a factor in those fields. During the year 1918 extraordinary efforts were made by the government to obtain maximum production and to keep sufficient miners at work and to keep them working under sufficiently high pressure as a measure of patriotism to accomplish this result. The changed conditions in these respects this year may easily limit production in ways having no connection with transportation. These are matters, however, outside the field of the Railroad Adminis-

tration and are merely suggested without effort to discuss them exhaustively.

"It will be appropriate, however, for me to point out various conditions which last year favored the maximum transportation. During 1918 every transportation preference possible was accorded to coal traffic in order to obtain the maximum output.

"This was done as a matter of war necessity and under the authority of war legislation.

"Another important point which should be borne in mind is that the recent increase in bituminous coal production has been most pronounced in the eastern states where the higher grades of coal are mined. In a number of the eastern districts production has already reached, or closely approximates, that of the same period a year ago. If the production of the country as a whole is to be further increased, it must come largely from the central West and beyond. I would refer, in this connection, to the weekly reports of the Geological Survey on the production and shipment of coal, dated July 26 and August 2, 1919, particularly the former, which stated 'an average of 10,000,00 tons a week will not be exceeded until buying increases in the middle West.'

"Since the exceptional expedients mentioned had to be resorted to as war measures in order to move the average of 11,330,000 tons per week for the period of July 28 to December 28, 1918 (and the greater average of 11,900,000 tons per week in the most intense part of that period from July 28 to November 16, 1918), it is evident that without interfering with other business pressing for transportation, it is not likely to prove practicable under the modified conditions which have necessarily resulted from the termination of hostilities, to transport an average of 11,340,000 tons per week during the rest of the present calendar year (which would be necessary to bring up the total production and transportation for the entire year to the suggested 500,000,000 tons). As already stated, however, it is believed that the unified control will admit of such specialization on coal as may be necessary to prevent real hardship."

Representative Huddleston of Alabama, speaking in the House on August 13, charged the coal interests with carefully fostering a public impression of a shortage of coal cars as an excuse for increasing coal prices. He said the directors of the National Coal Association in June appropriated $50,000 for newspaper advertising, urging the public to "buy it now" because of present car shortages and prospects of worse shortages later, but that the people refused to buy very much at the prices charged and the propaganda plan was abandoned on July 10 with the idea of putting prices up still further when a shortage develops.

Mr. Huddleston read a letter from W. T. Tyler, director of operation of the Railroad Administration, in which he said:

"The fact is that the railroads are in much better shape than they were for several years preceding the war. We now have more than 4,000 locomotives in good repair stored and ready for service, whereas at no time during the two years preceding the war did any such condition exist. During the week of June 14, 1919, the average number of coal cars in bad order was only 9 per cent, and this 9 per cent included a large number of light coal cars actually withdrawn from service, but not taken off the books. The system adopted by the Railroad Administration classes cars as being in bad order when they are undergoing only light repairs as well as heavy repairs. While figures on the same basis are not available for the years preceding the war, there can be no question but what the situation in this respect is more favorable now than it was then."

The Senate on August 15 adopted a resolution presented by Senator Frelinghuysen directing the committee on interstate commerce to investigate the coal price situation.

During the week ended August 2, according to the report of the Geological Survey, the percentage of full-time output lost by reason of car shortage in the bituminous fields had increased to 14.5 per cent.

Following the receipt of Mr. Hines' letter by the Senate, on August 18, Senator Pomerene put into the record a number of telegrams from coal operators disputing Mr. Hines' statements and referring to serious shortages of cars for coal loading at several places, but these referred in most instances to dates later than those of the official statistics which Mr. Hines used. One of the Senator's correspondents sent photographs of long lines of empty, unstencilled new cars.

New Wage Demands

Enlargement of the Board of Railroad Wages and Working Conditions from six to twelve members for the consideration of the new general demands for increased wages which have been or are about to be presented to the Railroad Administration is now under consideration. Such an enlargement of the board has been proposed by the labor organizations, some of which are not now represented on the board. It now includes a representative of the trainmen, shop men and telegraphers, and three representatives of the management. It is proposed to add a representative of the engineers, clerks and maintenance of way employees and three more officials. Although no announcement has been made, it is understood that the case of the shop employees will probably be handled by the divisions of operation and of labor, as it has already been before the wage board, but the new demands will probably be referred to the enlarged board for investigation.

Several of the organizations that have prepared or have submitted demands are taking referendum strike votes which will give their officers full authority in case their demands are not complied with promptly or to their satisfaction.

Conferences between representatives of the Railroad Employes' Department of the American Federation of Labor and of the Railroad Administration on the demands of the shop crafts on wages and rules and working conditions were resumed on Monday, when the representatives of the shop employees, headed by B. M. Jewell, called on W. T. Tyler, director of the Division of Operation, and W. S. Carter, director of the Division of Labor, and reported that the unauthorized strikes of the shopmen on various railroads had come to an end. The Railroad Administration had received the same information from its operating officials and the labor committee held a further conference with the director general on Wednesday.

In order to meet the high cost of living the Brotherhood of Locomotive Firemen and Enginemen has decided that its members must have not only a large increase in wages, estimated at 35 to 65 per cent, but also the assistance of mechanical stokers on engines weighing over 200,000 lb., mechanical coal passers on locomotives of less weight, and power grate shakers and automatic fire door openers on all locomotives, besides being relieved of various odd jobs that some of them are now required to perform. The new wage scale to be presented to the Railroad Administration was adopted at a meeting of 300 general chairmen of the brotherhood at Cleveland last week. The firemen are the second of the four organizations of train service employees to present new wage demands, that of the Brotherhood of Trainmen having been presented in July. The engineers and conductors have not yet presented specific demands.

The status of the various wage proposals of the different organizations is as follows:

Federated Shop Craft Unions, affiliated with Railroad Employee' Department American Federation of Labor, and including the International Brotherhood of Blacksmiths and Helpers, the International Association of Machinists, International Brotherhood of Boilermakers, Iron

Shipbuilders and Helpers, the International Brotherhood of Electrical Workers, the Brotherhood of Railway Car Men and the Amalgamated Sheet Metal Workers International Alliance.—Demand submitted in January provides for increase from 68 cents to 85 cents per hour in minimum rate for machinists, blacksmiths, sheet metal workers, electrical workers, carmen and boilermakers, minimum of 60 cents an hour for helpers, 10 cents an hour increase for apprentices and differentials above the minimum rates for various classes of employees. Retroactive to January 1, 1919. Also asked uniform agreement on rules and working conditions which the director general has promised to grant. Hearings held before Board of Railroad Wages & Working Conditions, which submitted a divided report to Director General Hines on July 16, the three labor members recommending an increase from 68 cents to 80 cents for machinists, with proportional increases for other classes, and the three management members recommending against any general increase, although recommending certain readjustments. Negotiations with director general suspended on July 31 because of strikes on many roads and resumed this week after strikers had returned. Strike vote now being taken, returnable August 24.

Brotherhood of Railroad Trainmen.—Demand presented on July 1 provides for minimum rate of $150 per month of 26 days for brakemen, flagmen and baggagemen, and of $200 for conductors, with mileage scales ranging in passenger service from 3.85 cents to 4.55 cents per mile for flagmen, brakemen, baggagemen and assistant conductors, and 5.13 cents up for conductors; in freight service from 5.88 cents to 6.91 cents per mile for flagmen and brakemen and from 7.35 to 8.64 cents for conductors; time and one-half for overtime, Sundays and holidays; also rates for yard service and various special rules. Hearings held before Board of Railroad Wages and Working Conditions July 21 to July 31.

Brotherhood of Railway & Steamship Clerks, Freight Handlers, Express and Station Employees.—Demand presented provides for increase of 20 cents an hour, 44-hour week, and time and one-half for overtime, Sundays and holidays; retroactive to January 1, 1919.

Brotherhood of Locomotive Engineers.—Told President that unless cost of living is reduced it will be necessary to ask increased wages and served notice on Railroad Administration of probable request for general increase in near future.

Order of Railway Conductors.—No demand filed, but President L. E. Sheppard told Board of Railroad Wages and Working Conditions that if trainmen's demands are granted conductors should receive consideration based on brakesmen's ratio, being 66 2/3 per cent of conductors' rate, and that conductors should receive $9 a day in passenger service, $8.10 in through freight service and $8.88 in local freight service.

Brotherhood of Locomotive Firemen & Enginemen.—General chairmen in session at Cleveland formulated demand providing: Firemen and helpers in passenger service, $6.50 a day of 5 hours or less, 100 miles or less (Mallet locomotives, $7.20); through freight service on locomotives weighing less than 200,000 lb., $6.50 a day or 8 hours or less, 100 miles or less, on locomotives weighing over 200,000, $6.80; local or way freight service, mixed trains, mine runs, etc., minimum of 50 cents per 100 miles or less in addition to through freight rates; helper, pusher, transfer, work, wreck, construction, snow plow, circus, milk and unclassified service, through freight rates; yard service, $6.50 (Mallet $6.80), on Mallet locomotives in all except yard service, $7.20 a day; inside hostlers, $6.80 a day; outside hostlers, $7.20; hostlers' helpers, $6.50, eight hours or less, all coal burning locomotives to be equipped with power grate shakers and automatic fire door openers. All coal-burning locomotives in road service weighing over 200,000 lb., to be equipped with mechanical stokers and two firemen to be employed on each engine until so equipped. All locomotives weighing less than 200,000 lb. to be equipped with coal passers. Firemen to be relieved of cleaning locomotives, removing tools or supplies, loading coal, filling lubricators, etc.

Switchmen's Union of North America.—Demand presented to Board of Railroad Wages and Working Conditions in July for the following rates east of Rocky Mountains: night foremen, $8 a day; night helpers, $7.50; day foremen, $7.50; day helpers, $7; also differentials for mountain district and time and one-half for overtime Sundays and holidays.

United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers.—New schedule presented August 11 includes rates for bridge and building, track, shop and signal employees, ranging from $200 to $270 a month for foremen, and including 90 cents an hour for pile driver, derrick, hoisting and steam crane engineers; 67 to 85 cents for painters, plasterers, carpenters, masons, bricklayers, etc.; 90 cents for powder men; 67 cents for stationary firemen; 65 cents for trackmen and track-walkers; 67 cents for trace apprentice and assistant section foreman; and 60 cents for crossing flagmen. Retroactive to January 1, 1919.

Demand is also made for time and one-half for overtime. A referendum strike vote is being taken, returnable on August 24.

Railway Signalmen of America.—At convention in Kansas City July 15 proposed further increase in wages, now being submitted to referendum vote of members. No demand yet filed with Railroad Administration.

In addition the 14 railroad labor organizations have filed with Director General Hines a general statement of their desire for further wage increase, which was published in last week's issue. The former demand of the four train service brotherhoods for time and one-half for overtime is also before the director general for consideration, and the trainmen and firemen have repeated it in their new demands.

Rail Bids Submitted

Bids were received by the Railroad Administration on August 16 from several steel companies on its inquiry for prices based on 100,000 tons of rail, Bessemer and open-hearth. In the absence from Washington of H. B. Spencer, director of the Division of Purchases, decision as to the quantity to be ordered was postponed but Director General Hines expected to take up the matter with him in a few days. It was understood that more than 100,000 tons might be ordered if the prices were satisfactory, and it has been reported that the proposals were at the same prices as were quoted on the order placed earlier in the year, $55 and $57.

Supplement to General Order No. 15

Director General Hines has issued Supplement No. 2 to General Order No. 15, by which Paragraph (2) of the order is changed to read as follows:

"2. Where existing industry tracks are not covered by written contracts, they shall be maintained and operated in accordance with the provisions stated in paragraph (1) hereof. In the absence of a written contract as to the maintenance of an industry track constructed prior to March 26th, 1918, the practice of the connecting carrier prior to federal control, as applied to such track of any particular industry from the beginning of its use by such industry, shall be considered as equivalent to a written contract in accordance with such practice.

Department of Public Works in Foreign Countries

M. L. Leighton, chairman of the Engineers, Architects and Constructors' Conference on National Public Works, which is sponsoring the bill for the creation of a Department of Public Works in the United States, now before Congress, has prepared a brief summary of the practices of foreign countries regarding such a department. In Canada a ministry of Public Works presides over the Department of Public Works with control over rivers, harbors, and all hydraulic works, roads, bridges, public buildings, telegraph lines and surveys. Australia has a parliamentary committee of nine, which constitutes a standing committee of public works. New Zealand has the most comprehensive public works' code in existence, presided over by a Minister of Public Works whose powers include lands and eminent domains concerning the same; roads, surveys, bridges, ferries, rivers, railways, drainage, water supply, mining, water power and irrigation.

In France a Ministry of Public Works covers roads and traffic regulations, river and maritime navigation, water power, drainage, irrigation, railroads, mines, public buildings and public monuments. Spain has a Ministry of Public Works covering roads, railways, waters, rivers, canals, ports, mining and forestry. In Italy a Ministry of Public Works has jurisdiction over postoffices, railways, public buildings, bridges, monuments, prisons, fuel, storehouses, telegraphs, internal navigation, water storage, irrigation, drainage, floods, lighthouses, water power and climatology.

Denmark has a Department of Public Works having jurisdiction over buildings, roads, rivers, harbors, water-power, drainage, dykes, ferries, railroads, telegraphs, and telephones, postal affairs and transportation. It is of interest to note that this Department of Public Works was, by royal decree of April 27, 1900, set up by a division of the Departemnt of the Interior in much the same way as is now proposed for the United States by the Engineers, Architects and Constructors' Conference on National Public Works. Norway has a department of Public Works also—made by division from the Department of the Interior—with jurisdiction over highways, rivers, railroads, fire insurance, harbors, postal affairs, technical schools and surveys.

In Prussia a Ministry of Public Works has jurisdiction over coasts, harbors, lighthouses, merchant marine, waterways, public buildings, railroads, highways, monuments, postal service, telegraphs and telephones, rivers, lakes, canals, drainage and hydraulic works. Argentina has a Department of Public Works embracing all enterprises and works concerning means of communication, hydraulic works, all construction—either of architectural or other nature, including public buildings, monuments, churches, prisons, barracks, arsenals, forts, shipyards, lighthouses, roads, bridges and all hydraulic and sanitary matters.

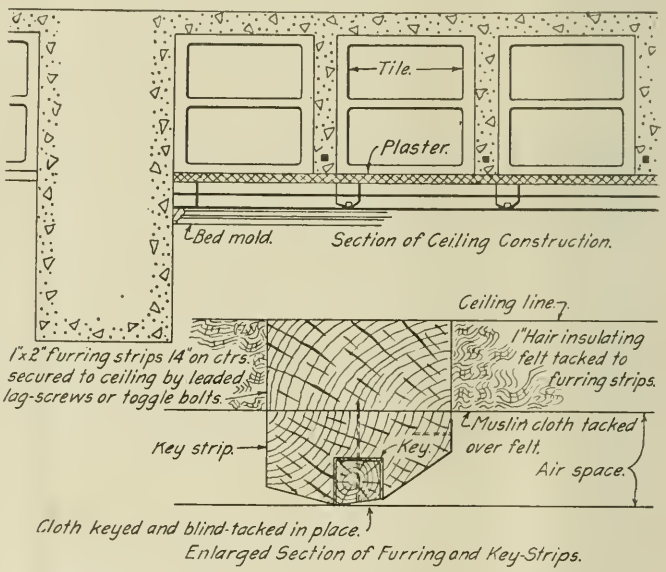
In Brazil a Department of Communication and Public Works has jurisdiction over railroads, highways, interior navigation, ports, rivers and canals, water supply, water-power and surveys. Chili has a Department of Industry and Public Works having jurisdiction over all communications by land, river and sea, the utilization and distribution of waters, public buildings, mines, surveys and mappings. In Peru a Department of Public Works—formerly a part of the Ministry of the Interior—has jurisdiction over irrigation, hygiene, mines, schools, patents and trade marks, water and state railways.

In England the Commissioners of Works and Public Buildings have control over the lands and buildings of all kinds belonging to the Government, while rivers and harbors and their appurtenances are under the jurisdiction of the Board of Trade. This is the only modern government of any size, except the United States, in which all government activities of this kind are not concentrated under one jurisdiction.

Insulating an Office for Noisy Machines

The introduction of a great many calculating and other machines in accounting offices has led to no little difficulty in some instances because the noise made by these machines tends to reduce the efficiency of the persons employed in the department. Following the introduction of dictating machines in the office of the auditor of disbursements of the Santa Fe at Topeka, it was concluded to segregate all operators using mechanical devices of every nature in one room partitioned off from the main office with the intention of cutting off the noise. The partition consisted of plaster wainscot on metal lath to a point about 3 ft. above the floor with double glazed sash from there to the ceiling. The effect of the air space between the glass did not interfere with the lighting arrangement and eliminated the noise and confusion of the typewriters and other mechanical devices so far as the outside clerical force was concerned, but the volume of the noise within the room was so great that it materially reduced the grade of work done.

After trying felt cushions under the machines to obstruct the transmission of the noise to the floor, the idea was conceived of insulating the ceiling as shown in the drawing. The ceilings in the building consist of hollow tile with cement plaster. Accordingly furring strips were secured to this ceiling by expansion bolts with the strips 14 in. center to center. One inch of hair insulating felt was then secured in place between these strips by fine soft wire suspended from the strips, both the furring strips and the insulating felt being then covered by muslin tacked over the felt. One-inch key strips were then placed under the furring strips as a means of stretching a porous cloth over the ceiling, the cloth being separated from the insulating felt by an air space of one inch.



Details of the Insulation Applied to the Ceiling

This improvement was entirely successful. Coupled with the continued use of the felt pads under the machines, the noise was reduced to a minimum. The ceiling insulation effectively eliminated the ringing echo which had been so disconcerting to the workers. This work was done last year and cost $0.86 a sq. ft. complete for 1,584 sq. ft. applied. The material was purchased from H. W. Johns-Manville Company and applied by Lundgren & Carlson of Topeka.

General News Department

The bill to repeal the daylight saving law, effective with the change of the clocks in October, was repassed over the President's veto on Wednesday by the Senate after the House had taken similar action the day before.

Secretary Lane of the Interior Department has submitted a report to Congress recommending the enactment of a bill to forfeit rights-of-way heretofore granted to railroad companies through Indian reservations in all cases where the grantees have failed to utilize the land for five years.

Alfred W. Smithers, chairman of the board of directors of the Grand Trunk Railway of Canada, has been knighted by King George. Sir Alfred has been intimately associated with the activities of the pioneer Canadian line for the past 25 years and chairman of the board since 1909. He is a member of the British House of Commons.

Eleven or more persons, most of them children, were killed in a trolley car accident at a point two miles north of Parkersburg, W. Va., on August 14, an interurban car running into a locomotive of the Baltimore & Ohio, which, according to the reports, appears to have been standing on a side track. Steam from a broken pipe of the locomotive scalded many passengers.

Suspension in street car traffic in Pittsburgh, Pa., last week, because of a strike, threw a large volume of passenger traffic temporarily on the steam railroads entering the city. The United States Railroad Administration sent from Philadelphia and from Washington 127 passenger coaches for use in the Pittsburgh region. These coaches, in seven trains, moved over the Pennsylvania Railroad.

Delos W. Cooke, formerly vice-president of the Erie Railroad and later United States Fuel Administrator for New York, is now a Chevalier of the Legion of Honor, this title having been conferred upon him by the government of France. This honor is in recognition of Mr. Cooke's services in connection with the control of trans-Atlantic traffic for the Allies. He is now associate director of the Cunard Steamship Line.

The National Safety Council reports that the American Rolling Mill Company, Middletown, O., in the first five months of 1919 reduced by 46 per cent the number of casualties to employees and by 51 per cent the total number of days lost as the result of accidents, as compared with the same period in 1918; and the total compensation paid by the company on account of injured employees was 91.9 per cent less than in the previous year. In the month of May, the total outlay for compensation on account of accidents to 3,500 men amounted to $1.71.

The Union Pacific Railroad Company has offered to the Nebraska State Highway Commission to make 50 year leases to county authorities of a sufficient width of the outer margin of its 400-foot right of way for the location of the improved Lincoln Highway, such leases to be at nominal rental and subject to certain reservations protecting the company in case of future need to occupy portions of the leased strip for operating purposes. The conclusion of the arrangement is understood to be awaiting the formal approval of the authorities of the federal government charged with responsibility for the advancement of federal funds in aid of highway improvements.

The Indiana Livestock Sanitary Board has abolished the requirement that all stock cars must be cleaned at the Indianapolis, Ind., stock yards. according to Dr. L. E. Northrop, state veterinarian, and as a result an extra item in the cost of production of beef has been eliminated in Indiana. The regulation was adopted at a recent meeting of the Board and does away with the charge of $2 a car which Indiana shippers were compelled to pay in freight charges. Dr. Northrop said that the cost of cleaning cars varied from $2 to $300 a day for shippers and pointed out that inasmuch as other states did not make this requirement, Indiana shippers have been paying for cleaning cars for the shippers of Kentucky, Illinois and other states. The cars that contain infected or suspicious animals are cleaned now, as heretofore, in compliance with state laws.

The Brotherhoods, in their zeal for developing an idealistic raison d'etre, often ignore the human side of their union. An interesting example of this recently came to light as a result of a decision rendered by the Railway Board of Adjustment No. 1. A number of Chicago Great Western officers early volunteered for war service and went overseas. Conductor J. F. Donnelly was appointed by his superintendent as acting trainmaster to avoid a possibility of section 18, article 9 of the schedule of conductors and trainmen being invoked to demote him. Under this section conductors or trainmen appointed to official positions retain their seniority rights not over six months. Mr. Donnelly served faithfully, preserving the continuity of his service as a conductor by running several trips during each six months period, and his name was retained on the conductor's seniority list without protest, although this seniority list was corrected four times. In fulfilling his duties as acting trainmaster Mr. Donnelly was forced to discharge a brakeman, a member of the Brotherhood of Railway Trainmen, for being asleep in the drawing room of the rear Pullman car on a troop train. This was a serious offense, but the general chairman of the Brotherhood of Railway Trainmen stated that he would get Mr. Donnelly's job and invoked the seniority rule to that end. He obtained the approval of the executive officers of the Brotherhood for that purpose and had the case placed before Railway Board of Adjustment No. 1. Here the case was decided against him.

The Board of Directors of the Associated Industries of Missouri at a recent meeting adopted a resolution opposing the Plumb plan of railway ownership and operation and the nationalization of industry generally. The resolution characterizes the proposal of the railroad workers for conducting the roads as "the most serious menace to the welfare of the nation" which has been presented to Congress since the United States gained its independence.

The resolution as adopted is as follows:

WHEREAS, the proposition is before Congress to nationalize the railroads of the country which is stated to be the first step in the nationalization of industry; now, therefore, be it

RESOLVED that the Associated Industries of Missouri declare itself emphatically and unqualifiedly opposed to the government ownership or government operation of railroads as set forth in the plan of the Railroad Brotherhoods which in our estimation is the most serious menace to the welfare of the nation of any legislation presented to Congress since we became a republic; and

RESOLVED we are unalterably opposed also to the continuation of government operation with all its inefficiency, poor service and high cost of transportation, and that we are in favor of an immedate return of the railroads to their owners; and,

RESOLVED that we are utterly and forever opposed to the nationalization of industry since this will result in ruin to the industries, the workers and the nation.

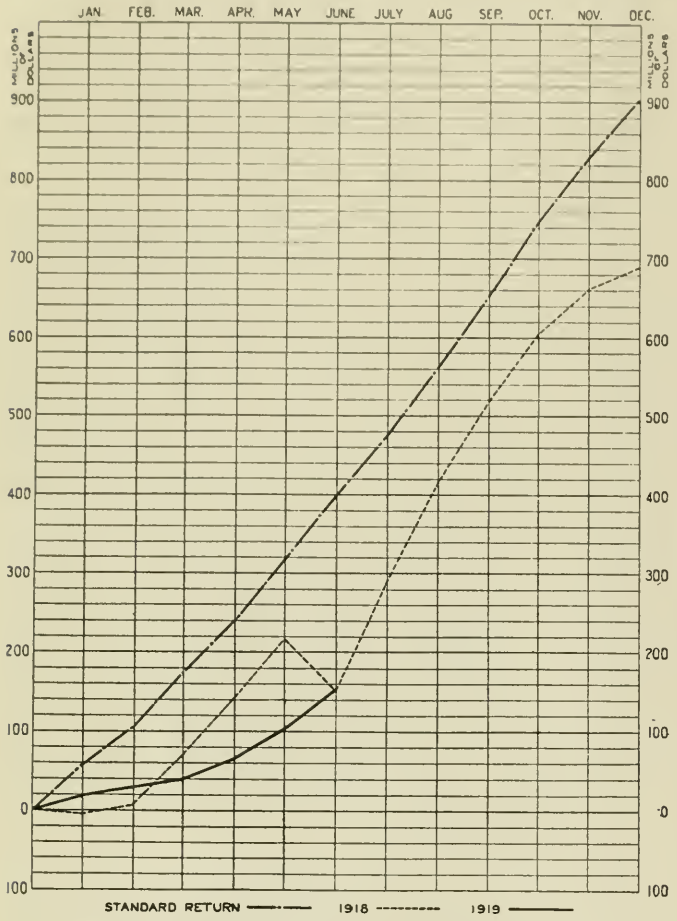
The members of the Associated Industries of Missouri are business men and manufacturers.

Turn Around Service on the Western Maryland

In the issue of August 8 an article on "Turn Around Service on the Western Maryland" was published and, through a typographical error, the author's name was omitted. The author is J. L. Carnochan of Hagerstown, Md.

Net Operating Income

The chart made by the Bureau of Railway Economics shows the net operating income of the Class 1 Roads in 1919, compared with the average in the test period (1915-1916-1917) on which government rental is based. The table gives the figures on which the chart is based.



Net Operating Income, Cumulated by Months, 1918 and 1919, Compared with Standard Return, Class 1, Railways of United States

Month	Average net operating income (Standard return) in 3-year test period: By months	Average net operating income (Standard return) in 3-year test period: Cumulative	Net operating income earned in 1919: By months	Net operating income earned in 1919: Cumulative	Deficit in 1919: By months	Deficit in 1919: Cumulative
January	$56,613,000	$56,613,000	$18,783,702	.....	$37,830,000	.....
February	47,934,000	104,547,000	10,106,268	$28,889,970	37,828,000	$75,658,000
March	68,251,000	172,798,000	10,842,608	39,660,778	57,409,000	133,067,000
April	67,289,000	240,087,000	26,115,214	65,916,807	41,174,000	174,241,000
May	77,385,000	317,472,000	39,462,367	105,215,450	37,923,000	212,257,000
June	82,550,000	400,022,000	52,270,702	157,448,669	30,279,000	242,573,000
July	75,341,000	475,363,000	.....	.....	.....	.....
August	86,860,000	562,223,000	.....	.....	.....	.....
September	91,273,000	653,496,000	.....	.....	.....	.....
October	94,333,000	747,829,600	.....	.....	.....	.....
November	83,536,000	831,365,000	.....	.....	.....	.....
December	73,282,000	904,647,000	.....	.....	.....	.....

Safety by Supervision

R. J. Clancy, in charge of safety work for the Southern Pacific-Western Pacific lines, says that "No-Accident Week," in which casualties were reduced 72½ per cent, confirms the view that four-fifths of all accidents are induced by carelessness, and that most of the carelessness is due to inefficient or lax supervision. This good week's record was accomplished by improved supervision and by all officers taking an active interest in the manner in which employees performed their duties. "Supervision is not confined to officers," says Mr. Clancy; "the most important element of supervision is self-supervision. No one, whether officer or employee, is qualified to supervise others until he has learned to supervise himself—to obey the rules and avoid unsafe practices. Self-supervision is the starting point."

The Safety-Agents' Records for May

The Safety Section of the United States Railroad Administration reports that for the month of May, 2,051 meetings were held by the safety departments of the railroads under government control; attended by 26,188 officers and employees and 1,038 representatives of the safety departments; or one specialist to 26 ordinary members. The total attendance, including visitors, was 31,486, and absences recorded numbered 5,875. Illustrative accidents discussed numbered 4,543; number of safety rallies held 338 and safety bulletins and circulars posted 79,721. In addition to these bulletins and circulars the record of magazines, pamphlets and other literature distributed during the month shows a total of 552,480.

The total numbers of casualties reported from the seven regions for the month of May were: employees killed, 123; injured, 9,206; all cases (including employees), 532 killed and 10,369 injured. The total net decreases, as compared with May, 1918, are: employees killed, 109; injured, 3,393; all cases, killed 129, injured 3,477.

Attention is called to the fact that these comparisons are more satisfactory than those heretofore reported for the reason that on the basis of labor, weather and traffic conditions, May, 1918, was similar to May, 1919.

The Norfolk & Western's report of casualties to employees for six months makes the following remarkable showing, the records being made up according to the Interstate Commerce Commission standards:

Half-year	Killed	Injured	Total	Total man-hours	Man-hours per injury
1918	38	1,270	1,308	36,666,310	28,032
1919	7	735	742	30,826,124	41,545
Increase	..	.....	.....	.....	
Decrease	31	535	566	5,840,186	
Per cent	82	42	43	16	

Net decrease in total killed and injured over man-hours exposed to injury, 27 per cent. The total cost of damage to cars, engines and track in train accidents in 1919 was 38 per cent less than in 1918, though the total number of car miles was only 21 per cent less.

Colorado Governor Aids Heavy-Loading Campaign

Recognizing the necessity for loading cars to capacity and unloading them quickly in order that the heavy crops of the present season may be moved and saved, Governor Oliver H. Shoup of Colorado has issued a proclamation urging the people of Colorado to follow suggestions made by Hale Holden, Central Western regional director, regarding the necessity for loading all cars to their full carrying capacity in order to combat the threatened car shortage.

Governor Shoup's proclamation said:

"In these days when national, state, county and municipal authorities are bending their energies toward the solution of the problems of reconstruction, among which the high cost of living looms most conspicuously, it is

imperative that there be co-operation among all classes of our citizens toward the one end sought. Habits of conservation, inculcated during the period of war activities, should be continued and encouraged along all lines and in every avenue of business activity, and wastefulness, extravagance and inefficiency should be discouraged among the people of the United States.

"The Denver Civic and Commercial Association, representing substantially all of the active forces of the community, acting on the advice of the Transportation Bureau of that organization, calls attention to the imperative need for the conservation of the hauling facilities of the railroads of the country and the imminent danger of a shortage of equipment unless absolute care and great wisdom are used in loading cars.

"A circular from Mr. Hale Holden, regional director of the United States Railroad Administration, dealing with the subject of Car Efficiency—Intensive Loading," states: "We are facing what promises to be the heaviest demand for equipment for some years," and he suggests that "the public can do more to guard against a car shortage than the railroads to the extent that such a condition may be materially relieved by loading all cars to their full carrying capacity, instead of resuming the former easier method."

"Being assured that this serious condition is facing the people of Colorado, I desire to urge the necessity of following the suggestion made by Mr. Holden, who is in direct touch with the situation, and I hereby urge that the shippers of Colorado intelligently and willingly co-operate with the managers of the railroads in the matter of loading, to the end that the people of this state shall conserve their own shipping facilities by seeing to it that freight cars do not go out lightly loaded, but that the maximum carrying capacity be utilized in every instance. This is an imperative matter at this time, and the Civic and Commercial Association is doing a real service in emphatically calling it to the attention of those whose prosperity and happiness will be hampered if the request of the Railroad Administration in the matter of loading care be not heeded promptly and wholeheartedly.

"Real American grasp of a serious situation, such a grasp as was maintained during the war, will ward off a trouble whose consequence might be serious and far reaching."

The necessity for loading cars to the maximum and unloading them with the least delay is especially imperative in Colorado because of the production in that state of an immense fruit crop, perishable and involving millions, which will be in a large part a loss, unless enough cars can be obtained at the right time to move it. The same possibility also arises, although in lesser degree, with regard to the heavy grain and potato crops produced in Colorado. Aside from these imperative reasons, recognition is given to the national necessity for moving the immense wheat and corn yields of the country with a minimum loss. Governor Shoup's proclamation was issued in response to a request from George W. Martin, secretary of the Denver Operating Committee of the Railroad Administration and Arthur J. Dodge, business manager of the Civic and Commercial Association.

Railway Revenues and Expenses for June and Six Months

The Interstate Commerce Commission's compilations, subject to revision, from reports of 105 Class I roads and 17 switching and terminal roads, for the month of June and the six months ended June 30, are as follows:

Item	June, 1919 and 1918				Six months			
	Amount		Per mile of road operated		Amount		Per mile of road operated	
	1919	1918	1919	1918	1919	1918	1919	1918
1. Average number miles operated	233,568.20	234,273.71	.....	.....	233,558.05	234,210.98	.....	.....

26. Ratio of operating expenses to operating revs..%	83.62	110.17	.....	.....	88.71	87.23	.....	.....

*The operating expenses for June, 1918, include wage increases representing back pay for the period, January to May, 1918, inclusive.

†Deficit. ‡Credit item.

Note—The average railway operating income corresponding to item 22 above for the month of June in the three years 1915, 1916 and 1917, included in the "test" period of three years ended June 30, 1917, was $371 per mile of line for the United States.

Freight Claims Section—A. R. A.

J. E. Fairbanks, general secretary of the American Railroad Association, 75 Church street, New York City, announces that the Executive Committee of the association has created an additional section to be known as Section VII—Freight Claims, to include the former activities of the Freight Claim Association. The temporary General Committee, to manage the section until a regular election shall be held consists of H. C. Pribble (A. T. & S. F.), chairman; J. B. Baskerville (N. & W.); E. J. Bloodgood (C. & N. W.); W. O. Bunger (C. R. I. & P.) R. L. Calkins (N. Y. C.); J. J. Hooper (Southern); H. C. Howe (C. & N. W.); W. S. Reed (P. & W. V.); and J. H. Howard, manager of the Claims and Property Protection Section of the United States Railroad Administration.

Passenger Traffic in May

The number of passengers carried one mile on the railroads under federal control during the month of May was 3,656,571,089, a decrease of 0.9 per cent as compared with May, 1918. In the Ohio-Indiana district the decrease was 22.2 per cent, in the Southern region there was a decrease of 13.6, and in the Southwestern region a decrease of 3.8 per cent. The other regions showed increases. For the five months ended May 31 the increase in passengers carried one mile was 4.4 per cent.

Government Ownership Propaganda Mailed Under Senatorial Frank

A protest was made in Congress on August 13 by Representative Denison of Illinois, that the Public Ownership League of America, with headquarters in Washington, has been distributing under the frank of a Senator a pamphlet of 44 pages containing an argument in favor of government ownership of railroads filed with the Senate Committee on Interstate Commerce at its railroad hearings during the spring by Albert M. Todd, president of the League. Mr. Denison declared this to be a very serious abuse of the franking privilege because the pamphlet was sent out, not by the Senator himself, but by the league, which also sent separate letters under paid postage in which Mr. Todd stated that he was sending the pamphlet in a separate envelope. Mr. Todd appeared before the Senate committee on February 21, and was not allowed by the committee to present his statement in full. He was allowed about half an hour for an oral statement, and then filed his written document, of which Congressman Denison says he is informed at least 20,000 copies have been sent out.

Track Supply Association Exhibit

The following names should be added to the list published in last week's issue of the firms who have space in the exhibit of the Track Supply Association, which will be presented at the Auditorium Hotel, Chicago, at the time of the thirty-seventh annual convention of the Roadmasters' and Maintenance of Way Association on September 16-19, inclusive.

Ajax Forge Company, Chicago, Ill.
Blaw Knox Company, Pittsburgh, Pa.
Buda Company, Chicago, Ill.
Carnegie Steel Company, Pittsburgh, Pa.
Cleveland Frog & Crossing Company, Cleveland, Ohio.
Elliott Frog & Switch Company, St. Louis, Mo.
North American Engine Company, Algona, Iowa.

National Safety Council

The National Safety Council headquarters, 168 North Michigan avenue, Chicago, Ill., announces its Eighth Annual Safety Congress, to be held at Cleveland, Ohio, October 1, 2, 3 and 4. About 3,000 men and women are expected to attend, and 160 of these are named in the list of speakers. There are to be four general sessions, four round tables and 35 sectional meetings. All of the general sessions are to be in the afternoon and the sectional meetings in the forenoon.

The first meeting of the Steam Railroad Section will be held at 9:30 a. m., October 2, and R. C. Richards, chairman of the section, will preside. The program of this and the two subsequent meetings of the steam railroad section are as follows:

Thursday Morning, October 2, 9:30 o'clock: Reports of officers and committees. Address, "Aims and Purposes of the Safety Section of the U. S. Railroad Administration," by A. F. Duffy. "Value and Necessity of Safety Agents," by M. A. Dow (N. Y. C.). "Co-operation of Officers and Employees," by R. H. Doolittle (Colorado Southern).

Friday Morning, October 3: "Organized Labor's Interest in Safety Work," by W. G. Lee, president, Brotherhood of Railway Trainmen. "Safety Suggestions—How They Should Be Treated and Disposed Of," by T. H. Carrow (Pennsylvania). "Methods of Selecting Committees and Maintaining Interest in Safety," by Robert Scott (A. C. L.).

Election of officers.

Friday Afternoon, October 3: Round-Table Discussion, J. T. Broderick (B. & O.) presiding. Members are requested to hand the secretary any subject they wish to discuss at this meeting.

Saturday Morning, October 4: Report of nominating committee. Addresses on "Causes of and Remedies for Accidents in Engine and Train Service"; "Inspection of Tools Used in Shops and on Track," by G. L. La Fountaine (Great Northern); "Motor and Hand Car Accidents," by J. L. Walsh (M. K. & T.).

Master Blacksmiths' Convention

The twenty-fifth annual convention of the International Railroad Master Blacksmiths' Association opened at the Hotel Sherman, Chicago, on August 19, with approximately 400 members and guests in attendance. At the first session the association was welcomed by a representative of the mayor and an address was presented by President W. C. Scofield. A more complete report of the proceedings with abstracts of the papers will appear in next week's issue.

Traffic News

C. E. Warner has been appointed traffic manager for the Southwestern Interstate Coal Operators' Association, Kansas City, Mo., with office at Kansas City.

The railroads centering in Montreal have announced increases in their rates for cartage. On carload lots the increase is from 4.5 cents per 100 lb. to 5 cents; and on l. c. l. from 6 cents to 7.

The movement of fruit eastward over the Union Pacific is now somewhat handicapped by the destruction by fire of ice houses at Ogden on August 5, part of the buildings being owned by the railroad and part by the Utah Ice & Cold Storage Company and leased to the Pacific Fruit Express Company; estimated total loss about $90,000.

The Delaware Railroad (Pennsylvania System) extending from Wilmington, Del., southward 95 miles, was compelled to suspend freight traffic almost completely for several days last week because of floods and washouts. Losses of crops and destruction of roads, bridges and buildings caused by the storm, aggregated in Delaware, according to estimates made on August 16, to more than $2,000,0000.

For the month of July, the Troop Movement Section of the Railroad Administration reports the movement of 949,660 soldiers on the railroads within the United States, exceeding the number of men carried in June by 35,000 men. This number included 299,009 men returning from overseas, and 411,642 men discharged from the army. The remainder were included in movements between camps, etc. During July 1,173 special trains were run to carry troops, and the average number of passengers per train was 421 men; average distance per train 603 miles.

The Omaha (Neb.) District Freight Traffic Committee to correct what seems to be a general misunderstanding on the part of shippers, has issued the following instructions:

"Tariffs issued by administration publishing agents such as the Western Freight Traffic Bureau, Transcontinental Freight Traffic Bureau, etc., will only be furnished to shippers by such bureau when the request for them is approved by the District Freight Traffic committee in whose territory the shipper is located, and freight tariff publications issued by individual railroads should be secured direct from the railroads issuing these tariffs.

The Plumb plan for government ownership and tripartite operation of the railroads was vigorously condemned in resolutions recently adopted by unanimous vote by the Texas Industrial Traffic League at a meeting held in Dallas, Tex., August 11. The resolutions adopted, furthermore, condemned any and all plans submitted to Congress which advocated government ownership or plans for guarantees by the government of the earnings of railroad properties, believing that such guarantees will inevitably lead to government ownership. The league at this meeting also adopted resolutions opposing the proposal in the Esch-Pomerene bill conferring upon the Interstate Commerce Commission jurisdiction over water carriers and making port to port rates subject to the provisions of the Act to Regulate Commerce.

The St. Louis, (Mo.) Traffic Club's special committee, appointed to investigate the Esch-Pomerene and Poindexter bills now pending before Congress, in reporting the results of its deliberations stated that the Esch-Pomerene bill is the most comprehensive bill which has been submitted to this session of Congress. The committee endorses especially the proposed plan to pool equipment and terminals. It is felt that competitive conditions should be restored as promptly as possible and in order to secure its restoration the plan which contemplates the pooling of earnings should be eliminated entirely from the bill. The report of the committee furthermore did not concur in resolutions recently adopted by other traffic club committees which advocate the insertion of a provision requiring the commission to take cog-

nizance of the cost of labor in the making of rates. The Poindexter bill was also highly recommended and the suggestion was made that Congressmen be emphatically advised of this support of the bill. In reporting its deliberations on the Poindexter bill the committee said: "Today flagrant fourth section violations exist, based on fictitious water competition. Because unduly favorable rates can be made to such centers, carriers have been unwilling to readjust such rates, because no intermediate territory has been involved. Routes so circuitous as to make inadvisable the application of rates to intermediate points, are not desirable under any conditions. Your committee is not unmindful of the advantage in the past of some of these indirect routes, but their necessity will be obviated in the pooling of equipment and terminals if the Esch-Pomerene bill is approved." Copies of the resolutions as adopted are to be sent to all Congressmen and Senators.

Weekly Traffic Report

The movement of traffic, both passenger and freight, was somewhat retarded during the week ended August 11, owing to the strike of railway shopmen, according to a report to Director General Hines. The Allegheny, Pocahontas and Northwestern regions showed a reduced movement in freight traffic. In the Northwestern region, while the prospects were that the loadings would show a substantial increase over the same week last year, the strike interfered with operations, with the result that the total loading showed a decrease of 2,232 cars under the same week last year.

While the western portion of the Allegheny region was affected by the strike, statistics furnished the director general show that grain loadings into vessels increased 616,000 bushels for the week ended August 11 over the previous week. Revenue freight handled in this district shows an increase of 16,679 cars over the previous week.

In the Pocahontas region, as compared with the same period last year, tidewater coal dumped during the week ended August 11 decreased 9 per cent, domestic coal loaded decreased 14 per cent, and other freight loaded decreased 8 per cent.

In the Southern region, while the movement of peaches from middle Georgia was one of the largest in the history of the industry during the week mentioned, the supply of equipment was ample, although some difficulty was experienced in obtaining sufficient ice for refrigerator cars.

N. I. T. League Opposes Plumb Plan

The National Industrial Traffic League has actively entered the fight against the Plumb plan propaganda for government ownership by sending to members of the league a statement by the president of the league and expressing the views of the league's membership on this subject, as heretofore indicated by formal action taken and reaffirmed on numerous occasions. Co-operative effort is advocated to bring about a defeat of this or any other plan for the government ownership of railroads. This circular says in part:

"The members of the league, while differing in their opinions regarding some details of the federal legislation affecting railroads which should be enacted, have been unanimous in their opposition to government ownership of railroads. This opposition of the league to government ownership applies to such ownerhip in any form and therefore covers the so-called Plumb plan proposed by the railroad brotherhoods and supported by the American Federation of Labor.

"This plan is so radical and fantastic that it is difficult to take it seriously, but its advocates are conducting a vigorous and systematic campaign in its favor and already claim the support of a very large number of voters. It is publicly stated that if the present Congress does not yield to the demand that this plan be adopted, it will be made a political issue and men will be elected to office pledged to support the plan. Under these circumstances it is not wise to ignore the matter, but active measures should be taken to combat this proposal. Will you therefore give the subject prompt and earnest consideration and have the interests which you represent register with their representatives in Congress their opposition to this plan or any other plan of government ownership. . . ."

Foreign Railway News

France is sending locomotives and railway carriages to Switzerland to be repaired at the Federal factories of Yverdon, Olten, Zurich, and Schaffhause.

The Government Railways of Java, says the Far Eastern Division of the Bureau of Foreign and Domestic Commerce, have been desirous of purchasing large quantities of American rails and car materials, but as American manufacturers have been unwilling to comply with the required specification the Netherlands Government has been obliged during the war to buy heavier rails than it needed, and also equipment which was unsatisfactory, especially chilled car wheels. No further purchases are being made in the United States at present.

The safety of passengers on the railroads of Great Britain and Ireland, often the subject of comment in past years, is brought to attention at this time by a note in the Railway Gazette (London) to the effect that no fatal passenger train accident has happened in the United Kingdom since that at Aberdeen, Scotland, on July 6, 1918, or considerably more than a year. Prior to the Aberdeen accident there had been none for a year and 16 days. These records are made in the face of adverse conditions; unusual density of traffic during the last two years, depleted staffs and the unavoidable lowering of standards in some departments of maintenance. Following a collision on October 26, 1907, the railroads of the United Kingdom were free from fatal passenger train accidents for one year and eight months; and a record nearly as good was made as far back as 1901.

Indian Built Rolling Stock

A company has been formed says the Times (London) Trade Supplement for the manufacture of special rolling stock for India which contains no wood.

Transport Director for Ireland

H. G. Burgess, Minister of the Irish Traffic of the London & North Western has been appointed Director of Irish transport of the Ministry of Ways & Communications, and will be responsible for the whole territory of Ireland.

Electrification in Italy

It is announced officially says the Times (London) Trade Supplement that the Italian Government has authorized the electrification of 3,750 miles of line. A large amount of the water power from the Torento is available. There are at the present time only about 300 miles being worked by electricity in Italy.

Locomotives for the Uganda Railway

At a recent meeting of the Chamber of Commerce and Agriculture of the East African Protectorate, a statement was made by the Secretary that the difficulty of transportation was due to a shortage of locomotives. Instructions have been issued that orders must be placed with the mother country or with another British state. Sometime ago 50 engines were ordered in England, but up to last month nothing had been heard of them.

Government Ownership in England

On August 1, a petition was circulated through banking and other financial institutions in the City of London for signatures, which requests the government to consider fully the bearing of nationalization on the national production before any irrevocable steps are taken. It requests that the question be not considered by the government until the people of the country have been given an opportunity of expressing their opinions upon it.

China Will Join in Siberian Loan

A dispatch to the Far Eastern section of the Sun, New York, is authority for the statement that the Chinese government has decided to participate with the United States, Great Britain, France and Japan in the loan for the reconstruction of the Trans-Siberian Railway and has replied in this sense to the recent inquiry made at the Foreign Office by the Japanese Minister. China's share in this loan will be $000,000, and the government is making arrangements to raise this money itself rather than to borrow it from one of the Powers.

Channel Tunnel

The Commission which was appointed by M. Claveille, the Minister of Public Works in France, to study the questions involved in the building of the Channel Tunnel, has reported in favor of the enterprise, and M. Claveille has authorized the French Submarine Railway Association which obtained the contract for building the tunnel to begin at once to make fresh trials of the technical processes necessary. The Minister of Foreign Affairs is to consult also with the British government with a view to appointing a Franco-British Commission to conclude the necessary agreement for the tunnel.

Increase of Railwaymen's Wages

The Minister of Labor of Great Britain announced recently in the Houses of Parliament the following average rates of wages for railway men in July, 1914, and July, 1918, respectively:

Transport railway service	July, 1914, per shift. Per week	July, 1919, per shift. Per week
Engine drivers	35s. to 50s.	68s. to 83s.
Guards	25s. to 35s.	58s. to 68s.
Signalmen	25s. to 30s.	58s. to 63s.
Porters	20s. to 26s.	53s. to 59s.
Carting (12 large towns) one-horse drivers	24s. to 27s.	54s. to 57s.
	Per hour	Per half day
Dock laborers (8 principal ports)	6d. to 8d.	5s. 10d. to 7s.

Electric Regeneration on Swiss Single Phase Railways

The first experiment, on the recovery of the electric energy, which the braking or down-grade movement renders available, were made on the Lötschberg line of the Swiss Federal Railways, on June 27. The system tried was that of the Maschinenfabrik Oerlikon, and the success is described as complete. The tests were conducted with the locomotive which the Oerlikon Company, in conjunction with the Lokomotivfabrik Winterthur had built for the Gotthard Railway, and which has since May been in regular service in the Bern-Thun Railway. In the tests the engine was run at different speeds, up to 70 km. per hour, down hill, first empty, and then with a load of 310 tons, without making use of the mechanical brakes or of any brake resistances. It is said that the remarkably simple devices operated to complete satisfaction from the start, and the detailed account of the tests will hence be a matter of considerable interest.

Railway Development in Burma

The Government of Burma, says the British Board of Trade Journal, has decided to encourage the development of railway communication by the adoption of the general British policy in the case of colonies—that in a country with a generally scanty population and no towns of considerable importance, strategic points on frontiers and general trade routes, etc., should be linked up. It is thus calculated to develop the country by first establishing the lines of communication—a policy for which, according to opinion in British India, there is ample scope also in British India itself, where, it is pointed out, the construction of feeder lines to the main lines on a wholesale scale should be prosecuted. The conditions for railway development in British India and Burma are very different from those in Australia and Canada, where large areas of useful land—arable, forest or mineral—are opened up by railways regardless of the uninhabited condition of the country. The assumption that rich territory, once opened up by means of communication, will find its own development, is an axiom which, in the case of European populations, never fails. Conditions in India are different, in that the population, even when not apathetic, requires both education and capital, and the railways therefore hesitate to launch out in the matter of undeveloped areas, although these areas may urgently require means of communication for purposes of development.

A New Arabian Railway

A railway from Aden, the principal port in Arabia, to Lahej, the capital of the Abdali tribe in southwestern Arabia, has recently been opened, says Consul Addison F. Southard, writing to Commerce Reports on April 30. The road is about 30 miles in length and is the development of a short military line built from Aden to Sheik Othman in 1915 to supply British forces operating from the latter place against the Turks. The railroad was built by the Royal Engineers of the British Army, and the first few miles were built under shell fire from the Turks. After the signing of the armistice and the surrender of the Turkish forces, the railway was continued to Lahej and has been recently opened for freight and passenger traffic.

The railway is of narrow gage, and the equipment is largely from the Bombay, Baroda & Central India Railway, of India. As conditions improve and the amount of traffic increases, it is likely that new equipment will be needed to replace the second-hand rolling stock.

British Munition Factory to Produce Steel Cars

It is understood, writes Trade Commissioner H. G. Brock from London under date of July 5, that negotiations for the acquisition of the state ordnance factory at Nottingham by the steel manufacturers, Cammell, Laird & Co. (Ltd.), of Sheffield, Birkenhead and Penistone are far advanced. According to the Times of June 28 the factory will be adapted to the manufacture of steel railway cars of the most approved type; later passenger coaches may also be manufactured, but the immediate object is the production of steel freight cars, as the springs, tires and other parts can be built at the Sheffield works of the firm.

During the war Cammell, Laird & Co. undertook the designing, erection and management of the ordance factory at Nottingham without remuneration of any kind. The factory was originally laid out for the manufacture of shells, but in its second phase started the construction of 18-pounder guns, of which 11 per week were being produced at the signing of the armistice, with a weekly output of 5,000 9.2-inch shells and 13,500 6-inch shells.

Railway Dividends in England

The accompanying tables gives a list of the dividends paid by various important railways in Great Britain for the first half of 1919, as compared with the same period of 1918, and to the entire year of 1918.

English Railway Dividends

	1st half, 1918 %	1st half, 1919 %	Year 1918 %
Gt. Central (1889) Pref.	2	2	4
Great Eastern	½	½	2½
Gt. Northern Defd. Ord.	nil	nil	2¾
Great Western	2¼	2½	7¼
Lancashire and Yorks.	1⅝	1⅝	4½
London & N. Western	2¾	2¾	7
London & S. Western	2	2	5⅞
London, Brighton & S. C.	1¼	1¼	5¼
London, Chatham, & D. 1st Pref.	2	2¼	4½
Metropolitan	½	½	1¼
Midland Deferred	1⅝	1⅝	4¼
North-Eastern	3	3¼	7
South-Eastern Ord.	¾	1	4
Central London, Ord.	1¾	2	4
Lond. Electric	¾	1	2
Metrop. District	nil	nil	nil

It will be noted that in several instances the dividends for the first half of this year are higher than those of last, although on account of the arrangement with the government one year's results should differ but little with those of another since 1913. There are two sources by which the companies have derived extra income, one arising out of the modification of the government arrangement whereby the companies

receive an allowance in respect of capital invested in property since the railways were taken over and worked by the government, and secondly from interest upon renewal and reserve funds, which, owing to the arrears of maintenance which have accumulated during the war, amounts to quite an appreciable sum. Some of the companies, however, have indicated that the increase for the first half of the year does not necessarily mean an increase for the year.—(*London Post*).

Brazilian Roads Injured by War

War conditions in Brazil for five years have seriously injured the railroads there, especially those owned by British capital, and have not only made it difficult to maintain the existing lines in good repair but have diminished the chances of getting fresh capital from abroad to invest in Brazilian transportation systems, according to a British writer in a London financial journal. This is due to the fact that while expenses and costs have risen and caused the companies to fail to earn dividends, no corresponding increases in rates have been granted which would enable the companies to recoup their losses.

"The problem now to be solved," says this writer, "not only by the companies but also by the Brazilian Government, is how can capital be raised for new construction to make up the leeway for the last five years and to provide for the normal increase of the future.

"There is no doubt that the attraction to investors in investing in Brazilian railways has been greatly diminished by the results of the last five years. There would seem to be only one way of effecting an improvement, and that is by a general raising of the tariffs. Generally speaking, the present situation is not due to diminution in traffic, but to the heavy burden of increasing expenses and to the fall in the exchange. The raising of the tariffs by a moderate amount would restore the earning power of the railways without imposing any undue burden upon their customers. The government should not (and being thoroughly alive to the situation, probably would not) oppose such a proposition. In fact, it has already shown that it recognizes the necessity. In the president's lucid message, recently issued, it is stated that a 20 per cent augmentation of tariffs has been put into force on the Central Railway, belonging to the government, and a similar increase authorized in the case of the Sul de Minas system and of the F. de l'Est Bresilien.

"The last five years have been a lean and unsatisfactory period for the English railways in Brazil, which have not only suffered from the same troubles that similar undertakings in other countries have endured but have also had special causes for loss. The restriction of tonnage and the high rates for freight have been very serious matters for companies which have to import most of their supplies of material, etc., from Europe. In addition, the fall in the Brazilian exchange has reduced their receipts by a large amount when translated into sterling. It might appear that the fall in exchange would not be serious, since the expenses would also be automatically less when valued in sterling. This is not correct. While all the receipts are paid in current Brazilian money, on the other hand expenses (excepting local wages and supplies bought in the country) have to be paid for in Europe in gold, and all the companies before disbursing any profit to the shareholders have to satisfy in gold the interest and amortization payments on their debentures. Finally, unlike the railways in England, they have been mostly unable so far to recoup themselves for higher expenses by raising their rates.

"The result has been unfavorable to their financial position. The reports for 1918 of the three principal companies, the San Paulo Railway, the Leopoldina Railway and the Great Western of Brazil, show the following comparisons between the five past years and the five years ended 1913:

	Average length of line	Average gross receipts	Average working expenses	Average net receipts	P. c. of expenses
1909-1913 (Inc.)					
San Paulo	153	£2,066,989	£1,268,213	£798,776	61
Leopoldina	1,631	1,492,104	925,751	506,353	66
Gt. Western ...	953	644,282	427,868	216,414	66
1914-1918 (Inc.)					
San Paulo	155	1,610,217	1,108,592	501,625	69
Leopoldina	1,820	1,526,543	1,062,045	464,498	70
Gt. Western ...	1,010	658,796	485,056	173,740	73

Equipment and Supplies

Freight Cars

The Solvay Collieries Company, Syracuse, N. Y., is inquiring for three steel tram cars.

The Pittsburgh Construction Company, Pittsburgh, Pa., is inquiring for two 40-ton box car bodies.

The Pennsylvania Coal Company, New York, has ordered 200 mine cars from the American Car & Foundry Company.

The Jamison Coal & Coke Company, Greensburg, Pa., has ordered 125 mine cars from the American Car & Foundry Company.

The Cosden Company, Tulsa, Okla., has ordered 40, 40-ton, 8,000-gal. insulated tank cars from the American Car & Foundry Company.

The Commerce Petroleum Company, Chicago, has ordered 50 40-ton, 8,000-gal. tank cars from the American Car & Foundry Company.

The Imperial Refining Company, Ardmore, Okla., has ordered 100 40-ton, 8,000-gal. tank cars from the American Car & Foundry Company.

The Johnson City & Big Muddy Coal & Mining Company, Chicago, has ordered 250 mine cars from the American Car & Foundry Company.

The James B. Berry Sons Company, Oil City, Pa., has ordered 50 40-ton, 8,000-gal. tank cars from the American Car & Foundry Company.

Hernandez, Robinson & Co., Inc., 29 Broadway, New York, advises that it is in the market for 5 second-hand standard gage flat cars, 30 ft. in length, for export.

The Arkansas City Pipe Line Company, Arkansas City, Kan., has ordered twenty 50-ton, 10,000 gallon tank cars from the American Car & Foundry Company.

The Providence Gas Company, Turks Head building, Providence, R. I., advises that it desires to purchase second-hand, if possible, an all-steel drop-bottom gondola car of 50-tons capacity. Jesse L. Johnson, purchasing clerk, may be addressed.

The Pennsylvania Equipment Company, 1420 Chestnut street, Philadelphia, Pa., desires to lease 150 8,000-gal. tank cars, 90 clean and 60 for crude or fuel oil, for a period of six months to one year, deliveries to start about October 1.

Passenger Cars

The Eastern Massachusetts Street Railway, Boston, Mass., is inquiring for 100 street car bodies.

Locomotives

The Pennsylvania Equipment Company, 1420 Chestnut street, Philadelphia, Pa., is in the market for one Consolidation locomotive weighing about 70 to 75 tons, with 44 to 48 in. driving wheels and with a steam pressure of not less than 180 lb.

Iron and Steel

The Missouri Pacific has ordered 120 tons of structural steel for deck girder spans from the Virginia Bridge & Iron Company, Roanoke, Va.

Supply Trade News

Paul Mitchell has returned to Chicago and has resumed his duties as traveling representative of the Chicago sales office, of the **Independent Pneumatic Tool Company**, Chicago. Mr. Mitchell was a sergeant in the American Expeditionary Forces in France.

The Pettibone-Mulliken Company, Chicago, has awarded a contract to Westinghouse, Church, Kerr & Company, New York, for the erection of a one-story steel foundry at West Division street, Chicago, which will cost about $200,000, including equipment.

Herbert Duckworth has been appointed sales manager of the grinding-wheel division of the **Norton Company**, Worcester, Mass.; **Howard W. Dunbar** has been appointed sales manager of the grinding machine division; **John C. Spence** has been appointed superintendent, and **Charles H. Norton** chief engineer, of the grinding machine division.

W. Terry Field, constructing engineer for the American Car & Foundry Company, New York, with office at Detroit, Mich., has resigned to form a partnership with **John R. Fordyce**, formerly Major and Construction Quartermaster at Camp Pike, Arkansas. The new firm will be known as **Fordyce & Field**, consulting and construction engineers, Little Rock, Ark.

Captain Thomas O'Leary, Jr., of the Fifty-First Engineers, has returned to the service of the **New York Air Brake Company**, New York, as western representative on lines west of the Missouri river. Captain O'Leary was adjutant of the Touraine division of the Fourteenth Grand division, Camp DeGrasse, France, operating the French railroad out of that place.

The **Drew Electric & Manufacturing Company**, Indianapolis, Ind., manufacturers of overhead electric railway materials, started work on July 11 on its new factory in Cleveland, Ohio, which it is expected will be finished about September 1. The first unit, now being built, will be a brick and steel structure 80 ft. by 205 ft., with a two-story section devoted to the general offices and engineering department. This building will have about 20,000 ft. of floor space and will include machine and assembly shop and brass foundry. A contract for the second unit of the factory will be let soon. This will be 40 ft. by 60 ft. and will house the hot galvanizing plant.

At the annual meeting of the **U. S. Light & Heat Corporation**, Niagara Falls, N. Y., on August 13, the following directors were elected: **R. C. Caples, E. H. Gold, J. E. Kepperley, C. L. Lane, C. O. Miniger, J. O. Moore, B. J. O'Reilly, J. A. Roberts, G. G. Shepard, J. Allan Smith** and **J. N. Willys**; and the following officers were elected for the ensuing year: **John N. Willys**, chairman of the board of directors; **E. H. Gold**, vice-chairman of the board of directors; **J. Allan Smith**, president; **C. L. Lane**, vice-president and general manager; **R. C. Caples**, vice-president; **B. J. O'Reilly**, treasurer; **R. H. Van Nest**, secretary, and **T. G. Swannie**, assistant secretary and assistant treasurer.

Fred H. Jones, resident manager of the New York territory of the General Railway Signal Company, Rochester, N. Y., and **Park B. Hyde**, product engineer in charge of primary battery construction of the Thomas A. Edison Company, Inc., Orange, N. J., have resigned and have formed the Hyde Battery Company, with offices in the Railway Exchange building, Chicago. The new company will open a factory in Chicago to manufacture caustic soda batteries for railway signaling. Mr. Jones is also vice-president of the Magnetic Signal Company, Los Angeles, Cal., and will represent that firm in the Chicago district with the same headquarters. The Magnetic Signal Company will also open a factory in Chicago to manufacture highway crossing signals, signal accessories and specialties. Mr. Jones will also act as Chicago representative for the **C. H. Whall Company**, Boston, Mass., manufacturers of fibre insulation for railway signaling.

The housing facilities of the **Westinghouse Air Brake Company**, Wilmerding, Pa., are to be extended at once by the erection of a number of new dwellings, for the families of employees. **The Westinghouse Air Brake Home Building Company** has been organized with a capital of $1,000,000 to transact all business relative to the real estate and dwellings, which have been transferred by deed to this company by the Westinghouse Air Brake Company. It includes over 400 houses and considerable vacant property in the borough of Wilmerding and adjacent territory. The officers of the new organization are **A. L. Humphrey**, chairman of the board of directors; **C. A. Rowan**, president; **W. S. Bartholomew**, vice-president, and **H. C. Tener**, secretary. In addition to the first three mentioned above **J. F. Miller** and **G. W. Wildin** are included in the board of directors. **S. R. Gittens** has been appointed manager. Since the Westinghouse Air Brake Company built its first houses for employees in 1890 there has never been an increase in rents and the new company will carry out the same policy.

Consulting Mathematicians

T. Dantzig, G. A. Pfeiffer and **J. F. Ritt** announce the formation of a firm of consulting mathematicians under the name of **Dantzig, Pfeiffer & Ritt** with office at 500 West One Hundred and Sixteenth street, New York. This firm undertakes to handle all problems arising in industry for the solution of which the knowledge of a mathematical specialist may be necessary.

Each of the members of the firm has been privately engaged for some time in work of this nature, in addition to his other professional activities, and it was at the suggestion of clients that the decision was made to set up a consulting service which would extend to the industrial world the resources of modern pure and applied mathematics.

Dr. Dantzig is a graduate of the University of Paris and of the Ecole Superieure d'Aeronautique et de Construction Mechanique. He has taught at Indiana University and at Columbia. During the war he was in charge of the mathematical work of the instrument section of the U. S. Ordnance.

Dr. Pfeiffer received the degree of mechanical engineer from the Stevens Institute of Technology and the degree of Doctor of Philosophy from Columbia University. He has taught mathematics at Harvard, Princeton, and Columbia. He is an associate editor of the Annals of Mathematics.

Dr. Ritt took the degree of Ph.D. at Columbia University. He was for three years at the Naval Observatory and has since taught mathematics at Columbia. During the war he was one of the chief ballisticians in the U. S. Ordnance.

Trade Publications

Book of Buildings.—The Austin Company, Cleveland, has just issued a new booklet known as Catalog No. 9. It briefly outlines the scope of Austin construction and equipment service. It also contains cross-sections of the 10 Austin standard types of buildings and a description of Austin service to foundry and steel plant operators.

Large Ferro-Concrete Bridge.—The recently completed ferro-concrete bridge over the Ore River in Sweden has an arched span of 90.7m. It belongs to the northern railway system of the country, and crosses the river about 4 km. to the north of the town of Nyaker. There was a parallel-girder bridge at the place, built in 1891 and calculated for axle loads of 12.5 tons and speeds of 20 km. per hour. The new bridge can bear axle loads of 20 tons at speeds of 100 km., and belongs to the longest ferro-concrete bridges in existence, the one over the Tiber at Rome having a length of 100 m., and the Auckland bridge in New Zealand, a length of 97.5 m. The cost was estimated not to exceed 850,000 kroner in 1914, but owing to the war, the expense will probably amount to 2,100,000 kroner.—*Engineering, London.*

Railway Construction

Asherton & Gulf.—Plans are now under consideration for the extension of this road from Asherton, Tex., 50 miles west of Eagle Pass, and from Artesian Wells, Tex., east to Beeville, approximately 100 miles.

Canadian Pacific.—Contracts have been let for building new lines for the Canadian Pacific as follows: To Stewart & Welch, Vancouver, B. C., from Counsul, Sask., east for 30 miles; from Leader, south 25 miles; from Lanigan, northeast 50 miles; from Milden, southwest 34 miles, and from Acme, Alta., to Drumheller, 37 miles. Contracts have also been given to the Northern Construction Company, Winnipeg, Man., to build from Russell, Man., north 12 miles, and to the Canadian Construction Company, Winnipeg, to build from Rosetown, Sask., south 25 miles.

Merrill Coal Mines, Inc., Railroad.—This company is asking for bids on August 20, to build a three-mile line, from a point 75 miles from Huntington, W. Va., on the Guyon Valley branch of the Chesapeake & Ohio. The work involves the handling of 50,000 cu. yd. of material, the construction of 2,500 yd. concrete piers, a 400-ft. steel bridge, 50 houses, one stub tipple and a sub-station. L. B. Conway is president, Danville, Va., C. W. Jones, vice-president and general manager, and W. C. McCall, chief engineer, Logan, W. Va.

Missouri, Kansas & Texas.—This road is now constructing a double track through the town of Burkburnett, Okla., in order to relieve the congested traffic conditions that have existed there since the development of the oil fields in that locality. The length of this work is about three and one-half miles.

Moore Haven Railway.—Organized to build a line from Moore Haven, Fla., on the Atlantic Coast Line, southeast along the shore of Lake Okeechobee to Ritta, 26 miles. The work will include building a steel bridge with a 30 ft. draw. The promoters expect to develop a traffic in perishable truck and general farm products. The work is temporarily held up, pending the settlement of present strikes. John J. O'Brien is president, Moore Haven.

Oklahoma Railway Company.—Plans are now being completed for the rebuilding of the terminal station at Oklahoma City, Okla., at an approximate cost of $250,000.

Red River Lumber Company.—Surveys have been completed for the last seven miles of a line from Westwood, Cal., to Chester. The extension will be of standard construction with a maximum grade of 1.75 per cent, and maximum curvature of 10 deg. The complete line will be about 15 miles long of which eight miles has already been completed and is in operation. The construction work is being done by the company's forces.

The Bagdad Railway.—It is obvious that the railroad as now projected and built (the exact facts not yet being fully known as to the continuity of the line through to Bagdad to meet the military lines built by the British during the War) was due to German money and influence in Turkey. But the fruits of this great project are to be reaped primarily by the regions through which the railroad runs, and the regions which have railway communication connecting with it as a trunk line; and, secondarily, by international trade. This railroad would run when completed through the dominions of several powers, and therefore ought, as much as Constantinople and the Dardanelles, to be internationalized. Whatever the powers given to any mandatory under the League of Nations Covenant, assuming it to come into operation, one of such powers to be expressly stipulated in the decree appointing the mandatory, should be the governmental power of consenting to the internationalization of such an important commercial trade route. *The Future of the Ottoman Empire, by Henry W. Jessup, in the Annals of the American Academy of Political and Social Science.*

Railway Financial News

Boston & Maine.—The Wall Street Journal, under a Boston date line, prints the following:

"Case of the Hampden Railroad, which brought suit against the Boston & Maine for an original claim of $3,798,000, for alleged breach of contract, has evidently not been finally disposed of.

The Massachusetts Supreme Judicial Court has now withdrawn its recent ruling against the Hampden.

"Although this at first appears as having a possibly unfavorable bearing on the Boston & Maine situation, it is pointed out by people in close touch with the situation that this does not necessarily mean that there will be a rehearing of the case, or that the ruling against the Hampden will be essentially changed. The Boston & Maine people have received no notice of a rehearing, and it is legal opinion that there will not be any. It is not unusual for a court to withdraw a ruling, owing to some subsequent objection made to wording or technical point."

Boston & Maine.—Legal matters continue to hold the reorganization of this company in check. Although the Massachusetts Supreme Court convened in special session July 29 to hear arguments on the petition of minority stockholders of the Boston & Maine for a review of the Public Service Commission's decree approving the reorganization of the road, Attorney Crooker, representing the minority stockholders, told the court that he had not had time to prepare his argument and asked for a postponement to October. It was then agreed that the matter would be submitted on briefs. Attorney Crooker had until August 18 to file his. Attorney George L. Mayberry, for the railroad and the public service commission, has already filed his.

The Railroad Administration has filed with the Massachusetts Public Service Commission a statement of the Boston & Maine for the quarter ended June 30, which shows that the net income for the quarter amounts to $936,184 against a deficit of $361,268 for the corresponding period last year.

Chicago & Western Indiana.—Director General Hines under date of August 19 has written the following letter to the financial editor of the New York Sun:

"In today's edition of your paper under the sub-heading of 'Chicago & Western Indiana,' appears a statement as follows:

"'It was learned in banking circles yesterday that the United States Railroad Administration has arbitrarily advanced one year the life of an issue of $15,000,000 6 per cent notes which mature on September 1, and which were put out by a banking group exactly a year ago. This is an entirely new departure in meeting an indebtedness by the Railroad Administration, and Wall Street wondered yesterday just how far it could or would be extended. It was stated that no matter what the circumstances none of the bonds would be paid until one year after they are due, September 1, 1919. It was said by bankers who aided in floating the loan that the distribution of the notes had been extremely wide, and that the average of individual holdings would not exceed $10,000.'

"It is proper that I should say to you that the statement above quoted, so far as it purports to state any past action or proposed action of the Railroad Administration, is not warranted by any facts in connection with the matter, and is entirely erroneous. The Railroad Administration, in response to a request by the Chicago & Western Indiana Railroad Company for its approval, in accordance with Section 7 of the federal control act, of a renewal for one year at 7 per cent interest, without discount, of $15,000,000 of notes of said company maturing September 1, 1919, has stated in a letter of date August 15, 1919, to Messrs. E. H. Lee and W. H. Lyford, finance committee of the Chicago & Western Indiana, that the director general approves 'as consistent with the public interest' the proposal as above set forth.

"In view of these facts, I am sure you will want to correct the erroneous statement contained in your paper."

Railway Officers

Railroad Administration

Central

Judge John Barton Payne has resigned as general counsel of the Railroad Administration on account of assuming the positions of chairman of the Shipping Board and president of the Emergency Fleet Corporation. **E. Marvin Underwood,** heretofore general solicitor, has been appointed general counsel to succeed him. Judge Payne has consented to act as special counsel for the railway, giving such advice and assistance as his new duties will permit. Mr. Underwood was born on December 11, 1877, in Douglas County, Ga. After graduating from Vanderbilt University in 1900 he attended law school, receiving his degree of bachelor of laws in 1902. He then spent the following year in studies at the Faculte de Droit of the University of Paris, and upon his return to this country began the practising of law at Atlanta, Ga. He later became a member of the firm of King, Spalding & Underwood, of that city, and as such engaged in railroad practice, representing, among other companies, the Seaboard Air Line Railway. On February 24, 1914, he was appointed assistant attorney-general of the United States and as such represented the government in a number of important litigations before the Supreme Court of the United States, notably the case in which the constitutionality of the Adamson Law was upheld and the Pacific Terminal Case. In September, 1917, he was appointed general counsel of the Seaboard Air Line and in April, 1919, was appointed general solicitor of the United States Railroad Administration.

E. M. Underwood

Regional

F. E. Desey has been appointed general assistant to Percy R. Todd, director of the New England district of the Eastern Region, with office at Boston, Mass.

Charles G. Weinbrenner has been appointed inspector in the Southwestern region representing the Secret Service and Police Section of the Division of Operation, with headquarters at 1041 Railway Exchange building, St. Louis, Mo.

The Southwestern Regional Association of Chief Special Agents, recently organized, has elected the following officers: **E. R. Hines,** chief special agent, St. Louis-East St. Louis Terminal District, St. Louis, Mo., chairman; **J. S. Webster,** chief special agent on lines under the jurisdiction of Federal Manager W. R. Scott, Houston, Tex., vice-chairman, and **W. H. Boullt,** acting chief special agent on lines under the jurisdiction of Federal Manager A. Robertson, St. Louis, Mo., secretary.

Operating

B. M. Brown has been appointed assistant superintendent on the Galveston, Harrisburg & San Antonio, with office at El Paso, Texas, vice **R. U. Lipscomb,** promoted.

W. M. Stillman, who has been released from military service, is restored to the position of assistant superintendent of the Stockton division, on the Southern Pacific (lines south of Ashland), with headquarters at Stockton, Cal., vice **E. D. Leavitt,** transferred.

G. LeBoutillier, superintendent of the Cleveland & Pittsburgh division of the Pennsylvania Lines West, Northwest system, with office at Cleveland, O., has been appointed superintendent of the Pittsburgh division, Southwest system, and the Pittsburgh, Chartiers & Youghiogheny Railroad, with office at Pittsburgh, Pa., vice **J. C. McCullough,** promoted.

Henry A. Koach, inspector in charge of the Buffalo (N. Y.), district, of the Secret Service and Police Section of the Division of Operation, has been transferred to Chicago as chief of the Chicago district. Mr. Koach was formerly assistant chairman of the Railway Ticket Detective Bureau, Chicago, from 1903 to 1918 with offices in Chicago and from the latter date to January 1, 1919, he was an inspector in the passenger traffic department of the Division of Law with headquarters at Washington, D. C.

Charles Henry Calkins, whose appointment as superintendent on the New York Central, has already been announced in these columns, began railway work in December, 1889, as a telegraph operator at Pierrepont Manor, N. Y., on the Rome, Watertown & Ogdensburg, and has been in the continuous service of that road and its successor, the New York Central, ever since. In July, 1896, he was promoted to train despatcher and later served consecutively as chief despatcher and assistant trainmaster, at Watertown. He was promoted to trainmaster at Richland in December, 1906, and the following October was transferred to Watertown. On October 1, 1913, he was appointed chief trainmaster, at Buffalo, and since November, 1916, served as assistant superintendent at the same place until his recent appointment as superintendent of the Adirondack division, with office at Utica.

Engineering and Rolling Stock

R. W. Lipscomb, assistant superintendent on the Galveston, Harrisburg & San Antonio, at El Paso, Texas, has been appointed chief assistant mechanical superintendent on the Southern Pacific Louisiana Lines and Texas Lines, with headquarters at Houston, Texas, vice **J. P. Nolan,** retired on pension.

B. F. Kuhn, master mechanic on the New York Central lines west of Buffalo, with office at Ashtabula, Ohio, has been appointed assistant superintendent of motive power, with headquarters at Cleveland, and **F. M. Crandall,** assistant master mechanic at Collinwood, has been appointed master mechanic, with headquarters at Ashtabula, and jurisdiction over the Franklin division, including the Oil City branch, the Franklin & Clearfield branch, Ashtabula and Youngstown yards, and the Alliance division.

Traffic

W. E. O'Day has been appointed auditor of disbursements at the Chicago Regional Accounting department of the **American Railway Express Company,** with headquarters at Chicago, succeeding **H. E. Cartwright,** who has been transferred.

Corporate

Executive, Financial, Legal and Accounting

George M. Taylor has been appointed receiver; **H. G. Lunt** has been appointed general attorney and **H. R. Stroupe** has been appointed auditor of the Colorado Springs & Cripple Creek District Railway. All will have offices at Colorado Springs, Colo.

Operating

W. B. Gill, superintendent of transportation of the Bauxite & Northern, has been appointed superintendent, with office at Bauxite, Ark., succeeding **J. R. Gibbons,** deceased.

J. W. Cummings has been appointed superintendent of the Colorado Springs & Cripple Creek District Railway, with headquarters at Colorado Springs, Colo.

Damming the Stream at Its Source

In spite of the well-recognized fact that a return to normal conditions in many lines of endeavor is being hindered seriously by the existing shortage of unskilled labor, a bill to suspend immigration for the next two years has just been introduced in Congress. Probably there never was a time in history when the country was less prepared for such legislation. Trading on the shortage of labor has succeeded in raising its pay requirements until improvement projects which ordinarily would prove paying investments have become out of the question. As a result, a vast amount of work which, if carried out, would help enormously in restoring somewhere near pre-war conditions is being deferred. Even under normal conditions, the percentage of native born in the ranks of unskilled labor is remarkably low, and employers have come to depend largely on foreign sources in recruiting unskilled labor. If the principal source of supply is made unavailable by law, it seems to be beyond question that the situation will grow worse before it becomes improved.

An Engineer on the Commission

While the idea is not new, Engineering Council has taken the initiative in suggesting to the President that he appoint an engineer as a member of the Interstate Commerce Commission. This suggestion has much to commend it, not because of the recognition it might give to the engineering profession but because of the opportunity it would afford to give to the Commission the experience and the analytical point of view of one technically trained and familiar with the construction of railways, the relation of standards of construction such as gradients and curvature and of maintenance on operation, and the development of facilities to meet public demands. At present much of the work of the Interstate Commerce Commission is directly or indirectly of an engineering nature. This is particularly true of valuation work, but it also applies to the coordination of existing facilities and the enlargement of the existing plants to care for growing traffic adequately, etc. If the Commission is to do constructive work in the future in cooperating with the carriers in the development of the transportation system of the country to meet the needs of the traveling and shipping public it will be necessary to give more attention to matters of this character than has been done in the past. At present the personnel of the Commission is drawn principally from the legal profession, while only one of the members has worked for any considerable period on a railway, facts which have frequently been offered as an explanation of its failure to recognize many practical aspects of the railway problem. It has long been contended that an industry as large and as vital to the country's welfare as the railways should be regulated by those who know its problems first hand, just as the administration of the Federal Reserve Banking System is properly in the hands of men trained in the banking business. It should be possible for the President to find engineers in this country of sufficient breadth of vision and knowledge of the public's needs and of first hand acquaintance with the problems of railway management to qualify for such an appointment. Surely they can be found when men such as Goethals and Hoover have been found to meet other needs in public life, and men such as Samuel Rea, Julius Kruttschnitt, Samuel M. Felton and W. B. Storey have been promoted from engineering to executive positions on the railways themselves.

Are Railroad Fatalities Relatively Numerous

Some interesting mortality statistics for 1917 were recently issued by the National Safety Council which show the deaths resulting from railway accidents in a relationship not generally brought to the attention of the public. Deaths and injuries resulting from railway operation have been given a great deal of prominence by the imposing tables appearing in the accident bulletins of the Interstate Commerce Commission where a total of about 10,000 deaths and nearly 200,000 injuries per annum presents a rather appalling aspect. The National Safety Council, however, shows railway accidents in comparison with those caused by other agencies. Thus railway fatalities totalled 11.5 per 100,000 of population, while fatal automobile accidents total 8.9. Those resulting from vehicles other than railroad cars, street cars and automobiles, average 3.1, thus giving a total of 12 deaths per 100,000 population from vehicles not running on rails. The year 1917 was one of heavy railway traffic and therefore more than the normal number of accidents. The enormous growth in the use of power vehicles, on the other hand, would indicate that automobile accidents will increase. It should be noted in this connection that fatalities resulting from the contact of railway and highway traffic at grade crossings number only 2 per 100,000 persons and include those involving pedestrians and street cars as well as automobiles.

Electric Regeneration

Regeneration of power for single-phase locomotives equipped with series motors has been used for the first time under regular operating conditions in Switzerland. Road tests, on the recovery of the electric energy which the braking on down-grade movement renders available, were made on the Lötschberg line of the Swiss Federal Railways on June 27. The system tried was that of the Maschinenfabric Oerlikon, and the success is described as complete. Regeneration for three-phase railways, such as that on the Great Northern, has long been practicable, as it is an inherent characteristic of the three-phase motor to return electric power to the line when mechanical power is applied to the motor shaft. In the same way regeneration applies to the single-phase system used on the Norfolk & Western, as the motors on the locomotives are three-phase motors. It was made practicable for direct current operation in the design of the equipment used on the Chicago, Milwaukee & St. Paul, in which case the motors are separately excited by a motor generator set in order to make them function as generators. In the case of the single-phase series motors, one motor is separately excited from a transformer, and it supplies exciting current for the others which then function as generators and return power to the line. The particular significance of this development is that regeneration can be had without regard to the type of equipment and kind of electric power used.

Unauthorized Strikes Here and in England

THE STRIKE of the engine and train crews in Southern California, following so closely upon the recent walk-out of the shopmen in different parts of the country, strikingly emphasizes a peculiar feature in present world economics in a similarity of labor unrest here and in other countries—especially England. In Great Britain, there have been a number of strikes, among which may be mentioned: One on the part of the train crews of the electric lines out of London, one on the part of the engine crews of the London & North Eastern concerning an eye test, and, most important of the three, a strike of the coal miners in Yorkshire. These strikes all have had closely paralleling characteristics, especially in their absolute disregard of the public welfare, the manner in which they have been carried out against the wishes of the national labor union leaders and in the fact that the men concerned in them have represented, not ill-organized trades characterized by a predominance of the radical element, but the most highly skilled and best educated workmen and what are presumed to be the best organized unions.

These strikes are only a few of the many that have occurred in all lines of industry and form only a small part of the labor difficulties following the war. They stand out from among the other labor disturbances in a number of ways, and, looking at them from another point of view, it is apparent that there must be some reason for such similar disturbances 3,000 to 6,000 miles apart.

In both countries, the strikes in question have taken place under government control, spiking, incidentally, the old argument that such occurrences do not take place under such conditions. They have all occurred at a time when the unions have been negotiating with their governments for higher wages, shorter hours and better or different working conditions. In most of them, although the local bodies went out at a critical time in the negotiations, the strikes have related to questions under consideration by the government. In both England and the United States, the national leaders of the unions which struck have been working in favor of new plans for the control of their industries; in the case of the railwaymen here, for the Plumb Plan; in the case of the railwaymen in England, for the Transport Bill; in the case of the Yorkshire coal miners for the nationalization of the coal mines as recommended by the Sankey Commission.

It also happens that in both countries, the railwaymen, and in England, the miners, have for some time been in an exceedingly strong position before their governments and for a time at least have easily had the upper hand. They have secured nearly all they have asked of the government in the way of better wages and shorter hours, and no one will claim that their demands have been modest.

Besides all this, the strikes have occurred under most disagreeable conditions, and, as has been noted above, with absolute disregard of the public welfare. We are familiar with the difficulties on this side of the ocean. It is worth noting, however, that the strike on the electric lines out of London took place in the worst kind of weather, and hundreds of thousands of London's workers had to walk to work in deep slush, and this during the severe epidemic of influenza. In Yorkshire, on the other hand, in a local strike concerning piece rate scales, not only did the miners go out, but they also withdrew the pump men and stationery engine operators. Some pits were flooded and destroyed just as the mines around Lens were, and more would have been had not the navy sent men in to man the pumps. Coal production in the Yorkshire district was cut off to the extent of 115,000 tons daily. Many factories at Sheffield and Leeds had to close down with resulting unemployment. The train service was threatened and, last but by no means least, the strike took place while strong agitation was going on to emphasize the fear that Britain would fall from its pre-eminent position as an exporter because of a general shortage of coal supply.

From this brief outline it is apparent that the leaders in organized labor on both sides of the ocean are either following a parallel course or are being made to follow a parallel course. Inconsistent as it may seem, we are inclined to believe that they are doing both. They have demanded and received so much from their respective governments—whether the governments have been willing or not, is not the question—that they have gotten to the point where they are not afraid to demand almost anything. On the other hand, their actions and their apparent disregard of the people's welfare have been imparted to the rank and file, thereby encouraging such radicals as will always be found in even the most conservative organizations. By their actions they have thus been trying to kill the goose that lays the golden eggs. They are alienating the good-will of the public, which is the last judge in a democratic country, and they are even hurting themselves as well as their unions by the lack of discipline which has been too evident in the several disturbances.

Whether they yet realize these facts or whether they want to realize them is a question. We have heard too many statements of late on the part of the national leaders that they might be unable to forstall unauthorized strikes on the part of local bodies if such is not made thus and so, to be willing to believe that they want to realize the true state of affairs. Even the strongest advocates of labor unionism must regret this present tendency, and as for the public, it will stand much, but it always succeeds in finally fixing a reasonable limit.

Hard Work by Railway Officers

THE STRIKES of shop employees of the railways which occurred recently in various parts of the country are over. The men returned to work under pressure of the officers of their unions because President Wilson announced no action would be taken on their demands for higher wages until they did so. But the effects of the strikes on several railways will be felt for a long time. The only way in which it was made possible for several important lines to maintain operation was by the officers, from the highest to the lowest ranks, putting in as many hours a day as they could stand, doing not only the work for which their salaries were paid but also work for which the striking shopmen ordinarily were paid. Employees in other branches of the service would give little or no help because this would have been in violation of the rules of the unions. In not a few cases even the shop foremen, who are now largely organized, refused to do any work ordinarily done by the employees. The officers labored so hard, so skillfully and so effectively, however, that while train service on numerous railways had to be curtailed, no road had entirely to suspend operation, and the inconvenience and loss to railway patrons was kept at the lowest possible minimum. The officers of the railways repeatedly have been accused by the leaders of the railway brotherhoods of having "laid down" under government operation. It has been asserted by labor leaders—in spite of the fact that railway employees have received large advances in wages while many of the higher officers have had their salaries cut—that "the same men who built up the surpluses under private management created the deficits under government management." W. G. McAdoo has testified, however, to the loyalty and ability which railway officers showed during the war, and Mr. McAdoo's testimony, and the loyalty and energy railway officers displayed during the recent shop strikes, are the best answer to the charges of the labor leaders. The officers have not been given a 50 per cent increase in salaries, or an eight-hour day, or

time and a half for overtime, but they have had their consciences to keep on good terms with and the traditions of their class to maintain, and they have done so under very trying and discouraging conditions and through both good and evil report. The government and public owe them much—how much, the government and public do not realize.

President Wilson Opposes Increases in Railway Wages

President Wilson has refused to grant the demand of the railway shop employees for a large advance in wages. He has given them a general increase of four cents an hour and to certain classes some larger increases. All these increases are made, however, to remove inequalities deemed to exist in the present wage scales, and they do not give the shop employees more than about one-fourth of what they asked for. In announcing these increases, the President made a statement to the representatives of the shop employees, and also issued an appeal to the public and to railway employees, which apparently have great significance. His utterances clearly indicate that he has decided to make no further substantial advances in railway wages under government operation.

The claims of the shop employees were based partly on wages paid to other classes of railway employees, partly on wages paid to similar classes of workmen in other industries and partly on the increase in the cost of living. Director General Hines in a letter to the President stated that his own investigations showed that the average wage paid to the principal metal trades in private industries on May 15, 1919, was probably not more than three cents in excess of the 68-cent rate being paid to the railroad shop employees. Therefore, the advance of four cents makes the wages of the railway shop employees slightly higher than those of workmen in the principal metal trades.

As to the increase in the cost of living since before the war began in Europe, it probably cannot be shown as to the railway shop employees, and it certainly cannot be shown as to railway employees in general, that the advances in their wages have not kept pace with the increase in the cost of living.

The results of all the investigations which have been made indicate that the increase in the cost of living during the five years since the war in Europe began has been approximately 80 per cent. The Industrial Commission of the State of New York recently published a report of an investigation regarding the advance in retail food prices from June, 1914, to March, 1919. This showed that the average price of foods in March, 1919, was 77 per cent higher than in June, 1914. The Bureau of Labor Statistics has estimated the increase in the cost of living since the war started at 80 per cent. The National Industrial Conference Board has estimated it at 71 per cent.

In the year ended June 30, 1914, the average earnings of a railroad employee were $810. In the year ended on June 30, 1915, they were $827. In January, 1919, the railways had 1,848,774 employees whose average earnings for the month were $125. At this rate the average per employee per year would be $1,500, but additional advances have been granted since then which made the average earnings of a railroad employee at least $1,533 a year. Compared with 1915, therefore, the average increase in the earnings per employee is 85 per cent, while compared with 1914 the average increase is 89 per cent. These increases exceed the increases in the cost of living.

As nearly as can be estimated, railway wages are now running at the rate of $2,834,600,000 per year. Director General Hines has estimated that if all the demands for advances in railway wages recently made should be granted the increase in the railroad pay roll would be $800,000,000 a year. This would make it a total of $3,634,600,000 per year. For 1,848,774 employees this would make an average annual wage of $1,965. The increase in the average earnings per employee over 1915, if this additional advance should be granted, would be 137 per cent, while the increase over 1914 would be 142 per cent. The wages of railroad employees already have increased more in proportion than the cost of living; and they are asking for increases which would make their total advances far exceed the increases in the cost of living.

The responsibility of determining what action shall be taken upon the demands of the employees rests, first, upon Director General Hines and, finally, upon President Wilson. The director general and President are not dealing with a war emergency now as they were in 1918. It is not necessary now, as it was then, to make large advances in wages to enable the railroads to get and keep enough employees for efficient operation. It is not necessary now to maintain uninterrupted operation as a war measure. The only questions to be considered are what the employees are entitled to and how much it is worth while to give them to avoid a strike.

The President has decided that they are not entitled to a general advance in wages at this time. It seems not improbable that President Wilson's virtual announcement that no substantial general advance in wages will be granted will result in a general railroad strike. The older railway labor brotherhoods, which formerly were conservative, have passed into the control of men who are as radical as the Russian Bolsheviks and who are drunken with the idea of their power. Their advocacy of the Plumb plan, which is nothing but the Russian soviet plan, shows how radical these men have become. But the danger of a strike is without the slightest validity as an argument for a general advance in wages. Either the employees are entitled to higher wages or they are not. If they are entitled to them they ought to have them. If they are not entitled to them they ought not to be given them even if it is certain that in that case they will strike. If the employees will strike now for an advance in wages to which they are not entitled, they will strike a year from now or two years from now for advances in wages to which they are not entitled. Therefore, to give them an advance in wages would be merely postponing the evil day of the strike and meantime paying an exorbitant price for the postponement.

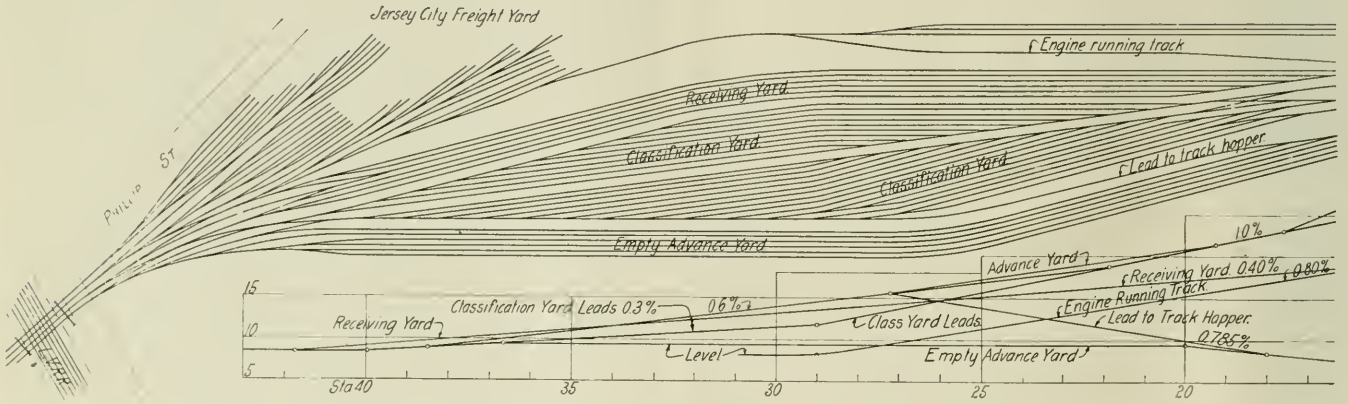
President Wilson's statement to the shop employees and also his statement to the public were conciliatory and even appealing in tone. He asked for a truce to labor disputes both on the railroads and in other lines of industry until business conditions can be restored to normal. The attitude assumed by the president to the shopmen's demands indicates, however, that, while his tone is conciliatory, he has made up his mind as to what he is going to do. Now, everybody knows that when the President has made up his mind he is hard to change. His friends call a certain marked trait of his character "firmness" and his enemies call it "stubbornness," but everybody knows that he has it. If, therefore, there should be a general strike while the railroads are under government control, there is good reason to assume that the President would use all the power and resources of the government to break it. In doing so he would have the support of an overwhelming majority of the public. A general railroad strike while the roads are in the hands of the government would be a strike against the government itself. If the strikers should win, this would demonstrate that they were stronger than the government. Whenever a particular element in the nation shows that it has become stronger than the government it has practically destroyed the government, or, rather, has become the real government itself. The American people are not yet ready to see their government destroyed. Therefore, there would be very little chance of a general railroad strike being successful. Let us hope that the leaders of the railway labor organizations will open their eyes and recognize this fact.

View at the Pier from the River Side

The Jersey Central Is Building a Modern Coal Pier

Includes Facilities for the Trans-Shipment of Coal From Cars to Vessels and for the Coaling of Tugs

THE LARGEST COAL HANDLING TERMINAL in New York harbor is now under construction by the Central Railroad of New Jersey. When completed, the project will include a complete and interesting yard layout in which will be located a duplicate system of thawing sheds and a reinforced concrete pier on which two McMyler car dumpers will be located on the inshore end for the trans-shipment of coal from road cars to barges and schooners, together with a screenings pocket and conveyor and, on the offshore end, facilities for coaling tugs, steam lighters, etc., consisting of 42 reinforced concrete silos for the storage of tug coal with hoppers, conveyors and other apparatus incident thereto. A modern power house on the shore adjacent to the pier furnishes the necessary steam electric power and compressed air required for the operation of the pier and the thawing houses.



Map and Profile of the West End of the Supporting Yard

The project involves the placing of 800,000 cu. yd. of embankment in the yard and 10,700 cu. yd. of concrete on the pier, excluding the offshore end of the pier, which will be devoted to the tug coaling facilities and upon which work has not as yet been started; approximately 23 miles of track and a total expenditure in excess of $3,000,000. The new facilities replace two old gravity-type coal piers having a combined capacity of about 1,750,000 tons of tidewater shipments and tug coal per year. The estimated capacity of the pier under construction is 6,000,000 tons of trans-shipment coal and 1,000,000 tons of tug coal per annum.

The site upon which the new terminal is located was originally open water of shallow depth. The section back of the bulkhead on which the yard is located had been filled in previously to a height of 6 ft. above mean tide and it was on this filled area that the embankments were placed in order to provide the necessary grades for the yard tracks. The area offshore from the bulkhead, consisting of about 2,000,000 sq. ft., has been dredged to a depth of 25 ft. and it is expected that it will at a later date be dredged to 30 ft. The material obtained from dredging operations, which consisted chiefly of pure sand, was used for the yard fill on the inshore section. In this last-mentioned operation a hydraulic dredge was engaged for a period of about 10 months, moving approximately 900,000 cu. yd. of material which was deposited in place by means of pipe lines which were run inshore from the dredge. During part of the operation the length of the pipe line exceeded 3,000 ft., the flow of sand making it possible to deliver the material to a maximum distance of 4,000 ft. from the bulkhead line. Material was discharged direct from the pipe lines to an elevation of 17 ft. above mean low water. The additional height of 8 ft., which was required in certain sections of the yard, was obtained by rehandling the dredged material with a steam shovel and dump car equipment, about 200,000 cu. yd. being handled in this manner. The yard fill has a top dressing of 8 in. of cinders under the ties. The cinders were secured from the locomotive terminal at Communipaw and were distributed by work trains in the usual manner.

The pier, when completed, will be 1,584 ft. long. The inshore section is 970 ft. in length with a maximum width of 184 ft. at the bulkhead line, narrowing to 66 ft. at the sea end of this section. The offshore section, on which the concrete silos will be located, will be 614 ft. in length and 66 ft. in width and will be used for the coaling of tugs.

At the present time the inshore section is practically completed and one dumper is now in operation. It is not expected that work on the offshore or tug-coaling section will be started before next spring.

The completed portion of the pier consists of a reinforced concrete deck and concrete foundations for the car dumpers, the supporting structure consisting of 4,400 creosoted pine piles, averaging 70 ft. in length, which were driven by floating equipment. The track trestles over which the cars are delivered to the dumpers and returned to the empty yard are of reinforced concrete.

As may be seen on the plan, the layout for handling transshipment coal is in duplicate, each dumper being served by a separate thawing house located in a separate gravity service yard. The thawing houses are each 320 ft. long by 51 ft. wide and are divided into three bays having a capacity of eight cars per bay, making a total of 24 cars per house, or 48 in all. These houses, which are now under construction, will consist of precast reinforced concrete units with insulated walls supported on creosoted piles driven through the sand fill by means of a water jet and air-operated hammers, the air being supplied from the compressor unit in the power house. Thawing of coal will be accomplished by forcing air heated to a temperature of about 180 deg. into contact with the bottoms and the sides of the cars. It is estimated that the average time required for the thawing of a car will be 2½ to 3 hr. The air heating apparatus will consist of steam engines, blowers, steam coils, recording thermometers, etc. Steam will be supplied from the power house. Re-circulation of the air in the thawing houses is provided for.

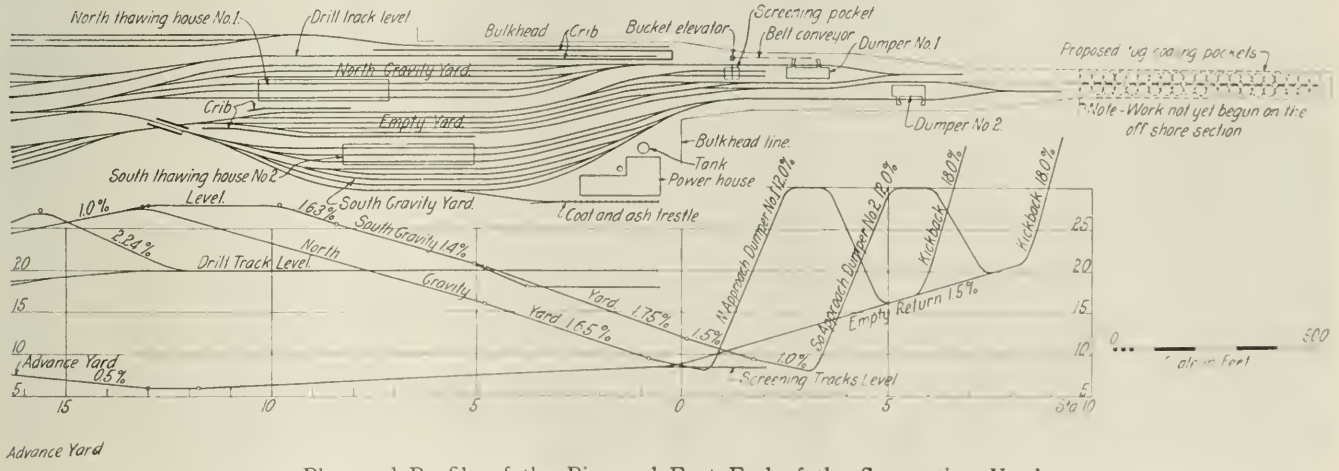
The Car Dumpers

The car dumpers are similar in every respect except that the north dumper is equipped with facilities for screening the coal and with a screenings pocket and belt conveyor for handling the screenings and the south dumper is equipped with a hopper on the side of the pier for handling the coal which will be stored in the silos on the tug-coaling section. While each dumper can handle up to 45 cars an hour, in view of other governing factors, such as the delivery of cars to the dumpers and the handling of the boats, it is estimated that each dumper will handle 25 cars per hr. over a period of hours. They are designed to handle cars of 100 tons capacity with a 10 per cent overload and of a length of 54 ft. over end sills. The cradle of the dumper, on which the car is placed by means of the barney, is 30 ft. above mean tide and operates through a 27 ft. vertical lift.

Both steam and electric power are utilized in the operation of the dumpers, steam being used for the barney and the cradle, while electricity is used for the pan, chute, screenings conveyor and the boat haulage. The coal handled on the north dumper may be screened if desired, as it is dumped from the car. By means of a belt conveyor and a bucket hoist, the screenings are returned to the screenings pocket for storage and shipment in cars to any point desired.

The trestles provided on the pier for carrying the ap-

Looking Over the Yard During Construction

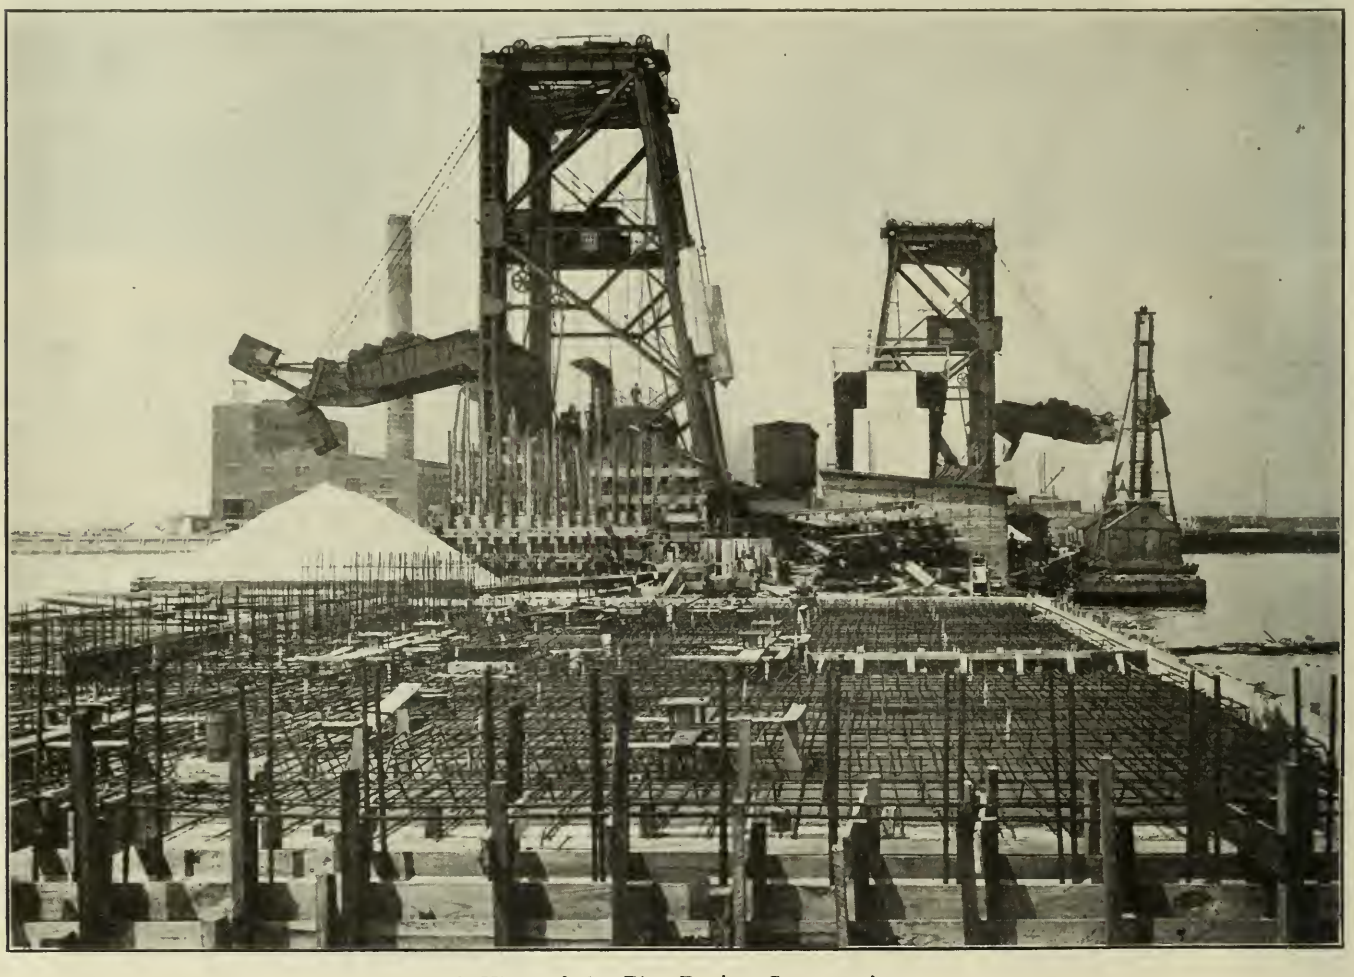


Plan and Profile of the Pier and East End of the Supporting Yard

proach, run-off and kick-back tracks are of concrete throughout with the exception of the long spans immediately adjoining the dumpers, this type of construction being determined upon primarily because of the present high cost of structural steel. The concrete girders for the trestles except on the 12 per cent grade approaches were all pre-cast, the deck of the pier being utilized as space for the casting yard.

In the casting operations, material and labor were saved by casting the girders broadside down; when properly cured they were picked up by a locomotive crane running on a temporary track which closely followed the work as it progressed and were then set in their proper place. On the extreme end of the south kick-back track this method was impractical and floating equipment was utilized.

At the south dumper a hopper has been provided in the deck of the pier for handling coal destined for the offshore facilities. By this arrangement coal passing over this dumper may be loaded into vessels alongside the pier or discharged into the hopper from which it is transported by means of a series of belt feeders to the main belt which will extend to the offshore end of the pier. For emergency use a track hopper in the south return track, discharging onto the cross conveyor, has been provided. By this means continuous operation of the offshore facilities is ensured even in the event that the south dumper is temporarily out of service.



A View of the Pier During Construction

The Power House

In the design of the power units built in connection with this improvement provision has been made for possible further terminal developments. The house is of steel frame construction with 6 in. hollow tile curtain walls resting on concrete foundations which are in turn supported on piles. This type of construction was adopted because of the decreased dead load and the resultant economies which could be obtained in the foundations. For its insulating properties gypsum was used in the roof which is flat and made up of pre-cast slabs covered with Johns-Manville asbestos roofing. The slabs were placed by a "Jim Crow" and are secured to the steel members in the usual way. The power house stack, which is 150 ft. high with an inside diameter of 9 ft. 4 in. at the bottom, was constructed of radial bricks.

The equipment consists of four batteries of Babcock & Wilcox boilers of 500 hp. each or a total of 2,000 hp. Provision has been made for two additional batteries of 500 hp. each. The boilers are equipped with Roney automatic stokers which supply coal to the boilers from overhead coal bunkers constructed of structural steel and concrete, having a capacity of 1,200 tons. The coal is placed in the bunkers by means of a bucket elevator which receives the coal from a track hopper provided in a trestle adjacent to the house. From the elevators the coal is discharged onto a shuttle conveyor which in turn discharges into any of the bunkers.

A basement under the boilers provides space for a narrow gage track on which small ash buckets are operated, the ashes being dumped into the cars which are pushed by hand to the north end of the building where, by means of an electric hoist, they are elevated and dumped into a concrete ash storage hopper located over the coal supply track. At convenient times the hopper is emptied into cars, a storage capacity in the hopper being provided of about 200 cu. yd. of ashes.

The engine room equipment consists of an Ingersoll-Rand

air compressor having a capacity of 2,500 cu. ft. of free air per min., and two 300 kw. General Electric rotary converters which with their complementary transformers are used to convert the 2,200 volt alternating current supplied from the company's power house at Communipaw to 550 volt direct current used on the pier.

The air is used in the empty yard for train line purposes

Looking Over the Coal Dumpers Towards Ellis Island

and in the yard and on the pier for general repair and utility purposes. The maximum demand for electric power will be taken care of by one of the converters, the other being spare for emergency use. Electric operation is provided at the dumpers for the pan, the telescopic chute, the boat haulage and the screenings conveyor. The installation is also designed to care for the offshore operation including the 54-in. belt conveyor for future tug boat coaling facilities.

A concrete tunnel from the power house part way out on the inshore end of the pier is provided for steam, water and air lines. An underground conduit system is also provided for power, lighting and telephones.

As may be seen by reference to the general plan of the layout, the horizontal distance available for the service yard is limited to less than one mile by two grade crossings with the Lehigh Valley on the west and the bulkhead on the east. The difficulties of this constricted location have been overcome to a remarkable extent in the design of the yard and track facilities by the adoption of left-hand operation and other interesting expedients.

The receiving yard to the north of the layout consists of six tracks having capacities ranging from 50 to 65 cars. In operation the coal trains will pull into this yard, the locomotive finding its way to the engine house by means of the engine running track to the extreme north of the layout, connecting with the tracks of the main terminal yard. The receiving tracks are all laid on a 0.4 per cent grade ascending in the direction of traffic. At the east throat of the receiving yard a drill track approximately 1,000 ft. long is provided on a level grade. By means of this track the cars are drilled out of the receiving yard and pushed back over a hump having an approach grade of 2.24 per cent and a descending or accelerating grade of 2 per cent to the classification yard leads which are laid on a 1 per cent descending grade for a distance of 1,140 ft. where the grade flattens to 0.3 per cent, still descending. The classification facilities are arranged in two parts, a north unit consisting of 10 tracks with capacities ranging from 23 to 26 cars, and a south unit containing 10 tracks, the capacities being 21 cars for each of 9 of the tracks, and 23 cars for the remaining track. The grades of the tracks in the classification yard units range from 0.6 per cent for the outside tracks to 0.3 per cent for the inside tracks, all grades descending in the direction of classification.

To the south of the classification tracks is a loaded advance yard containing six tracks with capacities ranging from 15 cars to 21 cars each. All of these tracks are laid on a

Looking Inshore From the Dumpers Towards the Power House and Yard

0.732 per cent ascending grade in the direction of traffic.

The advance yard is separated from the empty advance yard by a lead track to the track hopper for emergency use in connection with the conveyor to the offshore facilities of the pier. The empty advance yard consists of six tracks with capacities ranging from 60 to 65 cars. These six tracks are on a level grade through the yard proper, the approach grade being 0.5 per cent ascending and the departing grade 0.3 per cent descending.

As stated previously the coal handling facilities on the pier are in duplicate and each car dumper is fed by a gravity yard, the two being separated by an empty yard serving the two dumpers. Including the tracks passing through the thawing houses, the north gravity yard consists of six tracks having a total of 115-cars capacity, while the south gravity yard consists of eight tracks with total capacity for 130 cars. The empty yard consists of five tracks with a total capacity for 96 cars.

The grades of the tracks in the north gravity yard are 1.4 per cent at the west end, increasing to 1.645 per cent at the east throat. In the south gravity yard somewhat sharper grades were installed, being 1.63 per cent at the west end and 1.75 per cent at the east. The tracks in the empty yard are

A Concrete Tunnel Is Provided for Steam, Air and Water Lines

all laid on a 0.215 per cent grade descending in the direction of traffic.

In spite of the natural difficulties presented by the site, flexible operation of the facilities is afforded by the installation of a diamond crossover between the leads to the two units of the classification yard, by means of which either car dumper may be served from either classification unit. Again the loaded advance yard with its entrance from the west ensures the operation of either dumper in the possible event that egress from the classification units is temporarily cut off. These movements as may be seen by reference to the map, are made possible by carrying the lead track between the empty yard tracks and the empty advance yard under the approach track to the south gravity yard. In other words, a car may be received in the usual way in the receiving yard, drilled into either of the classification yard units and passed on from either of the units to either of the dumpers and out over the kick-back tracks and the empty yard to the empty advance yard or it may be placed in the loaded advance yard and run over either dumper and out as before.

The approach tracks to the car dumpers are laid on 12 per cent ascending grades for both units. The grade of the run-off track from the north dumper is 11 per cent and from

A View of the North Dumper, Taken from the Kickback

the south dumper is 8 per cent. Eighteen per cent grades have been installed on both kick-back tracks.

The improvement was planned by and constructed under the direction of the engineering department of the railroad; A. E. Owen chief engineer, A. M. Zabriskie principal assistant engineer.

Resolutions declaring that the Indiana State Chamber of Commerce is opposed to the Plumb plan for government ownership and tripartite operation of the railroads were adopted at a special meeting recently of the board of governors and directors of the organization. The stand taken by the Indiana State Chamber of Commerce is outlined in the following paragraph from the letter written to senators and congressmen as a result of the resolution:

"They are strongly opposed to the so-called Plumb bill as proposed by the brotherhoods, and especially so in view of the action taken by the same brotherhoods on the Adamson measure in 1916. They believe that labor should have fair wages and good conditions of work. They are opposed to government ownership because it stifles initiative, destroys efficiency, and substitutes political influence for wise regulation. They urge that the brotherhoods be given a fair hearing, but that the same fairness be accorded to organized farmers (the backbone of America), and that bond holders and stock holders, as well as the officers of the roads, be also given a fair hearing."

The Restoration of Railway Development*

Purposes of Railway Legislation, Conditions in the Railway Supply Industries and Legislative Proposals

By Alba B. Johnson
President Railway Business Association

REPRESENTATIONS of these business men are those of a special element speaking from its own point of view. They believe they desire nothing that is not in the public interest. National prosperity is their prosperity. Nevertheless, those for whom I speak offer testimony only about matters which concern or afflict them in their occupation. Nor have we any detailed plan. We rather emphasize certain objects which we hope Congress will seek to accomplish through whatever plan it may adopt.

The purposes of which we ask your consideration can be stated in one sentence. We favor a prescription by Congress that rates and fares shall be such as will yield revenue sufficient for adequate maintenance and development of transportation, and a lodgment of the authority and the duty to promote such adequate maintenance and development in federal agencies each adapted to its respective task.

Conditions in the Railway Supply Industries

Railway buying for nearly a decade has shown two distinct changes from conditions previously existing.

On the one hand the total amount of material consumed in additions and betterments during a given period has decreased rather than increased. It would be superfluous to repeat here the familiar figures as to provision of track, motive power and car capacity. The slowdown in development of terminal facilities other than track is also well known. In the long run this has had the effect of restraining the growth of railway supply industries, limiting the opportunities of employment in them and retarding the progress of communities where railway goods are made.

A. B. Johnson

On the other hand, at the same time that the aggregate quantity of industrial output for transporation purposes in a given period has exhibited this backward tendency, there has been a marked drift in the direction of instability. Large purchasing has come to be concentrated in periods of general business activity, whereas in times of general depression the railroads have drawn their purse-strings tight and waited for resumption of traffic and earnings.

Now, if there is one thing that the Railway Business Association has endeavored year after year to make clear it is this—that we would not desire and would not favor superfluous or excessive railway purchases for the purpose of keeping these supply industries busy. Waste retards national prosperity; and, I may say again, national prosperity is our prosperity.

What we ask you to consider in regard to the volume of purchases through a given period is that their amount measures our national growth; that during many years down to about 1910 the inventors and developers of railway appliances proceeded on the assumption that the United States would continue to develop its natural resources and to open up territory not yet accessible. They calculated future railroad needs by the yardstick of past consumption.

This was regarded as a warrantable basis of forecast because the undeveloped regions within our continental domain comprised still a vast empire containing untold riches—agricultural, forest and mineral. They hoped and believed that the time when a halt would be called on internal development of this wonderful new country was far beyond their lifetime. What warning had they to the contrary? Was there any decision, either formal or informal, to stop opening up new areas and to slow down the development of older regions?

If there had been a formal decision, where was it made and who made it? Had Congress ever enacted legislation of which the declared purpose was to arrest railway improvement and extension? Had any committee of Congress or any President recommended or even considered such a course?

Had there been any consensus of public opinion that the time had come to withdraw encouragement for capital to go on giving the American people closer communication with one another and new access to the wilderness? On the contrary.

Farmers were clamoring to be brought nearer to market. Consumers of food, clothing and fuel, users of dwellings and furniture were shouting from the housetops their demands that new sources of supply be created and a reduction made in the cost of living.

The voice of labor was beseeching that measures be found for that stabilization of employment in industry which results from the creation of new centers of population where the products of labor might find new markets.

Chambers of commerce were establishing bureaus to at-

*Abstract of statement before House Committee on Interstate and Foreign Commerce in August 25, 1919.

tract new factories and enlarge old ones, and calling upon the railroads for improved terminals and other facilities.

There was nothing to indicate that the people were content with the national development thus far accomplished; but there were innumerable signs that they desired and expected a continuation of pioneering and settlement of the rich regions still awaiting communication.

Railway supply men, therefore, 10 years ago went ahead equipping themselves to perform what they supposed was the highly important and universally desired function of getting the railroads ready for future traffic needs and equipping themselves on a scale proportioned to the continuance of past ratios of railroad growth.

Without formal or informal notice or declaration railroad construction all but ceased, and we had our plants and our organizations on our hands. What is done is done. Our thoughts are of the future. Industrial managers in this field are trustees for their employees and for their stockholders.

Their course from now on must be shaped by their impression of the federal purpose. They await a decision one way or the other. They inquire whether or not the country intends to continue internal development; whether it looks to them for trustworthy provision of railway appliances and for progress in the introduction of economical and efficient devices. They think they ought to ascertain if possible what is their responsibility and their opportunity. They believe they should receive authoritative assurance whether their co-operation is desired and whether they may prudently go forward with projects.

Instability of Railway Purchases

Consider next, if you please, the instability of purchases. A large part of the time those who have plants and organizations established to serve railway needs have had either feast or famine. We have not the slightest doubt that financial panics have been obviated by the Federal Reserve Bank system. There was no panic in 1914, yet in that year commerce and industry in the United States were in dire distress, destined to be relieved only by war contracts, because the railroads were confining their purchases to the barest necessities.

A common remark is that distress in the railway supply field is merely an incident in a general depression, and that at a time when everybody else is suffering it is unreasonable for the makers of railway accessories to complain of unemployment.

Unemployment is only tolerable when it is unavoidable. For unemployment in these particular industries there is, in these days, very little valid excuse.

What grinds us is the needlessness of it. General depression is not a time in which to stop building railroad track and equipment, to leave off repairing railroad plant, but a time to begin. Can anybody suggest a juncture when labor and material will be cheaper than when nobody else wants them except the railroad and the railroad supply maker? Is it difficult to grasp the fact that by keeping those industries going steadily year after year the total output for all the years can be produced with a smaller investment in plant, a smaller overhead for interest and organization, less waste through idleness?

Is it not clear that the very railway plant itself has to be substantially larger to carry the peak-of-load when that load is further burdened with the vast, heavy and bulky tonnage required for the fabrication of track, cars and locomotives and their maintenance?

That is what has been happening. The first inkling of a slump in earnings brought curtailment of buying. When in the next active period general merchandise was crying for cars, power and tracks, the railroads would come into the market frantically bidding against one another for deliveries, demanding that factories work overtime for them and crowding with their own consignments the facilities whose very insufficiency this avalanche of company freight was hysterically intended to relieve.

The greatest railroad genius America has produced, the late E. H. Harriman, pursued the well-settled policy of liberal buying in depressions with the two-fold motive of relieving the depression and of obtaining goods at bargain prices. A similar policy has been characteristic of the Pennsylvania system. The principle was coming to be understood and gradually brought into application in the period before 1906.

Why do not the railroads buy steadily instead of spasmodically? The answer is that the railroads generally speaking since 1908 have lived from hand to mouth, not knowing one year where the next year's bond interest was coming from. Net income was of such proportions that investors declined stock and took bonds, but even these in reduced quantities.

The manager saw the mortgage advancing across the disc of the property like the shadow of the moon across the face of the sun. Dividends can be passed. Interest cannot be passed. With interest staring him out of countenance, he refrained from purchases involving future commitments. Sufficient unto the day was the evil thereof.

Mechanical Progress Devitalized

I wonder if all the members of your committee are aware of the extent to which that hand-to-mouth policy has devitalized the forces formerly serving the country in the mechanical progress of transportation. I hope you share the conviction of engineers that very great improvements in the direction of safety, economy and efficiency are destined to be developed if conditions are propitious. I believe that the further progress in the development of the science of transportation will be as great or greater in the next 25 years than it has been in the last 25.

In an appendix I give some account of the former absorption of inventors and managers in the testing and demonstration of new railway devices and methods and the division of their time and thought now and undoubtedly in the future between the railroad customer and other customers; such impairment of the former concentration having begun with the determination to avoid the disasters which have come from having the eggs all in one basket and spread still further with the war-time experience in turning from one kind of product to another.

The spirit in which we are commenting upon the pending legislation is not that of a lot of people who are sitting with their hands folded and sulking. We ask no alms. Competition is free and the railway supply manufacturers can take and are taking their chances in a more general field. Your attention, however, is invited to the unquestionable fact that if at a given time there is only so much demand, and those for whom I speak are invading fields which they formerly left to others, we may be able to keep our men employed, but that will not save from idleness the employees of those other concerns who would be making goods if we were engrossed in producing railroad accessories. The degree in which those forces can be tempted again into speculative investment of money, time and energy for shop and field experiment in the transportation interest will depend upon the inspiration given by your legislation, by the discussion accompanying it and by the spirit in which the government proceeds to administer it.

Ultimate Consumers of the Public Wrath

Now what was the primary cause behind the financial condition of the roads which led to that hand-to-mouth policy? Our diagnosis was that errors in railway management and in railway financiering had given occasion for public

resentment, and that when this found vent in governmental measures these were conceived more in anger than in wisdom.

We are fond of quoting an epigram made by one of the founders of our association, a veteran maker of car wheels, Thomas A. Griffin, of Chicago, who has for some years now been gathered to his fathers. Standing amid the havoc of smokeless chimneys, bread lines and the general misery of industrial paralysis, with weeping wives beseeching audience that they might implore reinstatement for their breadwinners, Mr. Griffin made a gesture to include himself with those unemployed, and said: "We are the ultimate consumers of the public wrath."

As the years have gone by we have had the satisfaction of hailing a new era. The railway financier proclaims higher standards. The railway manager more fully realizes his obligation to the public and his responsibility as a diplomat. The public official perceives in the popular element a less insistent demand for punitive measures, a more anxious solicitude for encouragement to transportation enterprises. I wish Mr. Griffin were here to enjoy the bright promise of a sound solution which is vouchsafed to us by the attitude of Senators and Representatives in the present Congress.

He would know that if in the future wage-earners are to be turned away from the factory gates because of needless cessation of railroad orders they will be ultimate consumers not of the public wrath but of cold-blooded governmental unwisdom; and I do not see how he could listen to the questions which have been propounded to witnesses during these hearings or converse with leaders in the Senate who are giving concurrent consideration to this great problem, without feeling confident that the seven million persons dependent upon earnings in the railway supply industries and the many more millions in agriculture, trade, professions and other occupations who in turn depend upon them, will be consumers neither of wrath nor of unwisdom but of governmental sagacity.

Proposals for Remedial Legislation

If it were not for fear that silence on certain aspects might be taken to imply opposition, we would state our recommendations in three paragraphs. Lest we be misunderstood, we precede these three with another, enumerating various proposals which have our approval, but which we do not consider especially appropriate for detailed discussion by our industry as such. That enumeration is as follows:

We favor corporate ownership of railways and their permanent return to private management; permitting and facilitating under federal sanction their consolidation into strong competitive systems; bringing railway corporations under federal jurisdiction; federal regulation of railway security issues; adjustment of railway labor conditions by a joint board of employers and employees, disagreements to be adjudicated by the federal authority which determines the amount of revenue to be yielded by rates and fares; accumulation of surplus railway income in good years in order that in poor years railway maintenance, additions and betterments may be carried on vigorously.

All of these recommendations in one form or another are contained in plans submitted or to be submitted to you by others, who are especially qualified to explain them.

Following are the recommendations which we deem essential to be especially emphasized by us:

We favor a federal statutory rule of which the effect will be that rates and fares of the railways within each traffic section shall be sufficient to yield the average railway in the group in the average year its necessary expenses and to provide the credit basis for adequate facilities.

We favor a federal board to promote articulation of transportation by rail, water and highway; to keep informed of the public need for facilities and service in the several traffic sections and of carriers' projects for improvements and extensions; to regulate security issues; to estimate the amount of revenue prescribed under whatever rule for adequacy of revenue Congress may adopt, and the further amounts, if any, which may prove necessary to attract the capital required, and to certify such estimate as the amount of revenue in each traffic section necessary in the public interest to be yielded by rates and fares authorized by the Interstate Commerce Commission.

We favor giving the Interstate Commerce Commission by statute the authority to regulate maximum and minimum rates and fares of all instrumentalities of interstate commerce in the development of just, reasonable and non-discriminatory rate structures, and the duty so to adjust tariffs that they will produce as near as may be in each traffic section the amount of revenue certified as necessary in the public interest.

Most manufacturers are not lawyers. Yet their work may be profoundly affected by legislation. The country looks to those whom I represent or to others who may come into that field to attain reliability in quality and dealings, to acquire resources so that they are ready to meet normal demand, to engage in spirited rivalry so that cost of production may be reduced, to maintain shops for the testing and development of mechanical inventions—the instruments of safety, efficiency and economy in transportation.

Communities of wage-earners and their dependents expect of these manufacturers that when they create works and induce people to locate in a town, with all the mercantile, professional and other population which gathers round such a fountain of wages, there is something more behind the enterprise than guesswork. They assume that men who pretend to such standing and who can command from hard-headed investors the capital for such an undertaking have made due and diligent inquiry regarding all the essential conditions necessary to be ascertained before permitting thousands of people to remove thither and make commitments and investments of a hundred varieties.

So that when we come before you recommending that one of the purposes of the act which you are to frame shall be what I have just read to you, it is with no pretense of legal lore or legislative competence, but it is after years of systematic study of the laws as they are and of the consequence which they seem to contain as affecting us. As well as we could we have analyzed these laws ourselves. We have maintained an association for their concerted consideration. We have caused specialists to study them for us.

Our analysts informed us that the interstate commerce act requires carriers to furnish adequate facilities and every individual rate to be reasonable. I think the time has come to make confession at least for myself that when large-scale rate cases were before the Interstate Commerce Commission the grave anxiety of members of our association led to the assumption of an attitude toward the commission for which there was no warrant in the law.

Our association, I am proud to say, under the wise leadership of my predecessor as its president, George A. Post, refrained from beginning to end from any expression of opinion with regard to any particular rate schedule filed with the commission for its sanction. We merely suggested to our friends in other associations the propriety of letting it be known to the commission that whatever decision it might find in the public interest would meet with their ungrudging acquiescence.

Nevertheless, there was running through our participation in those discussions the assumption that the commission under the law had the authority and the duty of sanctioning rate structures which as a whole would yield revenue bearing a relation to the financial needs of the carriers.

Such jurisdiction was strenuously denied to the day of

his death by the late Commissioner Judson C. Clements. It was unanimously denied by the commission in the first great Eastern rate advance case, though they proceeded to infer authority which they said was not in the law, and denied advances on the ground that the carriers did not need additional revenue.

Shortcoming That of Law

Citizens protesting against advances argued that the law, in prescribing that "any rate" should be reasonable, gave no warrant for consideration of a large number of rates in their aggregate effect upon total revenue. They insisted that in a large-scale case, where millions of tariffs were involved, it was incumbent upon the proponents of a general advance to justify the reasonableness of each one of these millions of rates by the tests which the commission under its traditional practice would apply if only one rate were in question.

If it is true that nowhere in the act as it stands or any act of Congress the commission is authorized and directed to regulate rates with a view to adequacy of maintenance and of development of facilities and service, then I for one desire at this time to say that it seems to me that the shortcoming which there has been in the regulation of rates this past decade is to be laid at the door of Congress and not at the door of the Interstate Commerce Commission.

What of the future? You began these hearings with the detailed consideration of House Bill No. 4378. On page 23 of the committee print the following words appear in italics indicating that they are new matter:

"The commission in reaching its conclusion as to the justness and reasonableness of any rate, fare, charge, classification, regulation, or practice, shall take into consideration the cost of labor and other operating costs in so far as they become material in any case under investigation."

In response to one of those questions which the chairman has been putting to witnesses and which have contained so much encouragement to us, Commissioner Clark stated that the commission would have no objection to adding to and inserting in the above sentence the words "and the cost of capital."

Suppose you enact this provision in that amended form. Obviously you would not have given the commission the responsibility for the financial results of its regulation. You would still be saying "any rate." You still would be inviting citizens to demand that each one of a million rates be justified by a formal proof of reasonableness.

Is it the intention to change the old act in that respect? If so, why not say so in the text? Having so many times been urged to say it, if now you decline to do this, the implication will be that you have deliberately omitted from the act the declaration that the revenue derived from the rates as a whole shall be adequate. If you do omit that declaration it will be taken as a signal by the manufacturers for whom I speak that the government shrinks from acknowledging its responsibility and has no definite purpose of discharging it.

Examine once more the words "shall take into consideration." Is it intended to convey the thought that the statute is defining the purpose of Congress for the guidance of the commission? If not, then why put it in? If yes, then why not explicitly specify what the purpose is? If you shall enact authority for the commission merely to "consider" a rate or even all the rates without setting up a standard by which they are to be considered, you have instructed your administrative arm to make your policy for you, or in other words to determine what in their judgment is in the public interest.

If any deputy of Congress is to decide in any matter what is in the public interest without any indication from Congress of a test or standard, why not all deputies of Congress in any and all matters, and where will delegation stop? Why not proclaim forthwith that our boasted government of laws has been discarded and in its place there has been set up a government of men?

"Shall take into consideration." Where in that phrase are we to find hope? The only sense in which it could be interpreted to promise restoration of railway credit and resumption of railway development would be this—that it commanded rates and fares to be adequate for operations and credit. If it does not mean that, why say it at all? If it is intended to mean that, why not express it so that nobody can have any doubt?

Bill 4378 is not the only current plan in which an attempt is made to define what the regulatory body shall consider in making rates. From among such plans the Railway Business Association refrains from a choice. This much we earnestly urge upon you—whatever rule for rate-making you adopt, whether a prescription of adequacy, or a rate per cent of return, or something else, clinch it by saying somewhere in the statute that the rates and fares of all the roads in any sectional group shall be sufficient to yield necessary expenses and to provide a credit basis for adequate facilities and development.

In our correspondence and conversations with business men these 10 years we have found in the main three avowed reasons for hesitancy about swallowing that pill.

Some merely could not bear the thought of making railroad rates adequate. The word gave them goose-flesh. When invited to declare for such adequacy they inquired, "Does this mean an advance in rates?" To this the natural reply was that if anywhere at any time rates were too low they would certainly have to be raised in order to make them adequate. To this we used commonly to hear it rejoined that no rate anywhere ever could be too low. As you gentlemen are aware, that attitude nowadays is pretty generally stuffed and mounted in the museum along with the dodo and ichthyosaurus. It died contemplating one of the most useless and dismal of institutions—a national railroad system that cannot carry the nation's tonnage and hence chokes industry, and that is powerless to build into new areas of agricultural and mineral production, and hence droops helpless while the cost of living soars.

"Shall"

The second misgiving was that somehow it would be an indignity to the commission if the legislature which created it should announce what it was created to do. There were those who predicted, "Congress will never say 'shall' to the commission." We have lived to see the commission itself write a bill in which the word "shall" is embodied—"shall take into consideration."

Competition in Economies

The third misgiving was not so amenable to easy solution. This was the obstacle of the strong road and its weak competitor both taking the same rates. Toward that phase of the problem the attitude of the Railway Business Association is distinctively occupational. Numerous solutions are offered. One is consolidation.

We favor this, but as developers of mechanical improvement we earnestly hope that the independent corporations will be as numerous as is consistent with their financial stability. Centralization tends to over-standardization and to bureaucracy. It narrows the field of railway managers to whom one after another a new device or method can be offered until somebody is found willing to afford a demonstration. Another solution, either as an alternative or as a supplement to consolidation, is a contingent fund drawn from excess income and employed according to the various plans to tide over lean years or to aid the weak roads or both.

The Railway Business Association volunteers no comments upon these proposals, and its occupational attitude merely takes the form of a hope that whatever is done the condition will be such that the unprogressive road will suffer for its indolence and the progressive road enjoy the reward of its enterprise. Cobwebs would gather in the departments where railway appliances are developed if no railroad had anything to gain by trying new devices or anything to lose by ignoring opportunities for efficiency and economy. So we use the general expression with respect to revenue that it should be sufficient for "the average railway in the group in the average year."

Rule for Rate-Making

Summarizing, then, our observations regarding the rule for rate-making, we urge upon you:

(a) Explicit authority for the regulatory agency or agencies to test the reasonableness of rates as a whole by the sufficiency of the total revenue which they produce.

(b) Prescription by statute that rates and fares shall be such as to yield the average railway in the average year its necessary expenses and to provide the credit basis for adequate facilities, including reasonably rapid settlement of new territory.

In numberless forms Congress might accomplish these two things. As business men we have no pride of authorship. We don't care where the ultimate language originates. We do think that the language when found ought to be so clear and unmistakable that we may know at once whether Congress is giving confidence or dread to those who would like to devote themselves to mechanical progress in transportation, and hope or despair to the wageworkers whom they employ or might employ.

How Much Revenue Will Be Required?

We do not see how anyone can predict what return upon the investment would in the future be necessary in order to attract new capital in the amounts which may be required.

The proposal of the National Transportation Conference, the quality of whose contribution to the clarification of the whole problem it would be difficult to exaggerate, has been explained to you by Paul M. Warburg as follows:

"It has been the consensus of opinion of members of the conference that if private capital is to enter freely upon the venture of further developing the roads, and if railroad credit is to be re-established on a solid basis of genuine confidence, that 6 per cent on the final valuation plus a modest share in earnings in excess of this percentage would constitute the minimum required."

Mr. Warburg does not itemize the elements which led the conference to hit upon the figure 6, although he explicitly speaks of this as the very least that would accomplish the result, and he suggests a decennial revision of the figure. The text of the conference bill itself uses the expression "not less than" 6 per cent.

Is it not evident that in the minds of its framers this plan, having fixed a minimum rate of return below which the regulatory authority must not go, and establishing contingent funds, supported by a grant of Congress, to insure the return up to 6 per cent, leaves undetermined a zone of income in excess of 6 per cent which the Interstate Commerce Commission is neither forbidden nor commanded to permit, and concerning which the statute would give it no guidance whatever?

To our practical minds, and in view of the responsibility which rests upon us, this undetermined zone appears to place upon the Interstate Commerce Commission a discretion by no means accurately described as computation by a mathematical formula. "Not less than 6 per cent." But how much more than 6 per cent, and by what standard determined?

So far as we are aware, nobody has estimated for you the magnitude of the improvements to existing lines which the public interest requires to be made within any specified period in the future. If you were in possession of such estimates, who shall say how far short they would fall of the needs which may actually become manifest? Even if you had the power of divination to make approximate guesses at the requirements expressed in physical units and in units of work performed, what human faculty can be brought to bear in the year of grace 1919 to compute the cost of carrying out such projects?

Vast Capital Demanded

Additions, betterments and extensions are made with new capital. Construction of a new stretch of mileage, whether by an existing system or by a new one, involves investment of capital equal to 100 per cent of the cost of road, structures and rolling stock. The same is true of additions to the property of existing roads. Betterments of existing lines are provided 100 per cent from investment less the value of property scrapped or replaced.

If a locomotive requires repairs which can be made in a few days at a roundhouse, the cost of those repairs is an operating expense. If a locomotive is so in need of overhauling that it is put into the shops, it will be repaired and also brought up to date by the application of new devices; and the cost will be divided between replacement of old value, which is paid for as operating expense, and creation of new value, which is paid for as investment.

Expenditures vast in the aggregate for each region are to be provided from new investment. Nobody knows what labor and materials will cost. How, then, can anybody predict within many millions a year how much capital would have to be raised to carry out projects approved?

If you do not know how much capital you must raise, how can you possibly know what rate of return you must pay in order to obtain it? Supply and demand govern the rates for money as they govern all other prices. The more securities you put out the higher goes the rate.

Some have said that with a fixed rate in the statute investors would regard railway issues as more secure and that this stabilization would enable the roads to command the money at lower rates than heretofore. But this is already discounted in fixing the figure at 6 per cent as the return for the average road. Mr. Warburg points out that 6 per cent is substantially less than investors can obtain in other industries.

Again, there is the complication of reducing the preponderance of bonds over stock. The reason why bonds have been salable and stock not is that railway income available for dividends was insufficient to make a market for stock. Sooner or later that problem must be grappled with. Is there any other way to solve it than by increasing income until a market is made? Six per cent means, say, 4 and a decimal on bonds and 7 or 8 on stock. Will stock of the average road sell for those figures in the quantities that would be necessary if projects were carried out on a large scale and if substantially more than 40 per cent of the new issues are to be stock?

The truth is we do not know what average rate of return will be necessary in order to develop the railroads.

Would 6 Per Cent Pass and Stand?

Nobody knows whether Congress will enact the 6 per cent, and if it did whether subsequent Congresses would let that figure stand.

Suppose this committee and the Senate committee as well were to report 6 per cent—what assurance is there that when the measure reached the respective branches the 6 would not be pared down?

What I am now saying is not to be taken as indicating

any view whatever as to whether the statute should or should not prescribe a minimum of 6 per cent return. What we beg of you to consider is that if you do embody a rate per cent in the bill which you report you shall in addition recognize the undetermined zone of return which may prove necessary above the rate prescribed as the minimum.

Obviously if the statutory rate is made less than 6 the undetermined zone will be by so much the wider. Suppose, moreover, the sixty-sixth Congress says 6. What will the sixty-seventh Congress say? Does anybody expect any Congress to feel itself bound to maintain a rate merely because an earlier Congress fixed it and perhaps provided for decennial revisions? You will invite disappointment if you expect to peg public sentiment at 6 per cent by making the rate 6 per cent in the statute. Laws are created by sentiment, not sentiment by laws.

Your minimum rate of return will not restore development.

Development can only be restored through the undetermined zone; and it will be restored or not accordingly as public sentiment as to interest rates is or is not brought to see and to keep seeing that fact. There is no way of insuring it. No solemn pronouncement and no hocus pocus can put the result beyond jeopardy of public apathy or hostility.

There is only one route to our destination—genuine and continuous public acquiescence in the purpose and definite assignment of responsibility first to the power that appoints, and secondly to the functionaries appointed for exercise of judgment and courage.

Threatened Destruction of Judicial Mechanism

The functions of appraising the carriers' projects and sanctioning security issues involve an assumption of responsibility inseparable from the responsibility of estimating and prescribing the amount of revenue necessary for the projects approved, and impossible of performance by the Interstate Commerce Commission without destroying its character as a tribunal for adjudication of competing citizens' and competing communities' rights.

We assume that Congress will regard the question of the agency of regulation as one of the most important aspects of the whole problem. Touching that aspect, the Railway Business Association will speak only from the practical experience of the industry which comprises its membership. From that point of view we ask you to ponder well at this critical juncture an element in regulation that may be condensed into the word "justice." You may feel duly appreciative of this. I venture to express the fear that you unconsciously take for granted a matter which requires the most continuous and assiduous solicitude.

What was the cause of the public wrath? Was it big grievances—alleged lootings, alleged overcapitalization? Not primarily. It was little things—rebates, discriminations. These sometimes reached large proportions when prominent concerns were the beneficiaries, but the sensitive state of the public mind in which stories of these conspicuous incidents aggravated the inflammation was due to the everyday contact of the general run of the citizens with the railroads. The individual was told and believed that his competitor was getting a lower rate than he was. The community was angry because a rival trade center was favored. A had a pass while B paid or walked. All this was the foundation of the public wrath.

This in reality is the thing of which the railway supply industry has been and is today the ultimate consumer to a degree even greater than the owners or managers of the railroads themselves. Even the first moderate decline in railroad earnings, which might entail little if any effect upon the income of officers or owners, immediately involves drastic curtailment of purchases and unemployment in the supply industries, greatly out of proportion to the reduction of railway earnings. We are here to implore you for protection so far as Congress can give it against such an experience in the future for us and our employees.

Today the citizen has his contact with the railroad, he has his differences, his complaints, but if his emotion reaches the stage of wrath this is directed not against the railroad but against the public authority which regulates the railroad —an authority which the citizens themselves established and which they can change at will.

So far as federal regulation is concerned, they do not desire to change it; for in these disagreements of theirs with the carriers over shipments and rates and practices and regulations they long ago came to believe that they were getting or could get a square deal from an impartial umpire. I wish to say in this presence that I know of no governmental tribunal here or anywhere, now or at any time more highly esteemed for integrity, for conscientious devotion to the litigation which comes before it, for freedom from prejudice in adjudicating controversies between competitors, than the Interstate Commerce Commission.

High Prestige of the Commission

The commission for 32 years has been dealing with this problem. No breath of scandal has ever blown upon its work or its personnel. In its adjudication of differences between users or groups of users of railways no disappointed litigant has ever been heard to insinuate that the decision was affected by fear or favor. When reappointment of one of the present incumbents was before the Senate it was emphasized by those who doubted his fitness that they questioned not his personal character, but the correctness of his economic views.

From time to time in performance of its statutory duties the commission has encountered situations which led to a request for particular authority not previously bestowed. Congress in most instances has promptly complied. Where such a request has been denied or postponed reason has been found in objection to the proposition in view, or the method proposed, never in distrust of the commission as a court for determination of citizens' rights. We believe that Congress in thus giving its confidence to the commission has accurately reflected public opinion throughout the nation.

For five days at the beginning of these hearings you listened to the chairman of the legislative committee of the commission explain the bill which the commission advocates. You asked him many questions. He impressed me as the spokesman for a body dealing with a highly intricate and special problem, meeting its practical phases in a practical way, capable of explaining the reasons for the modifications proposed in the law and deserving of the confidence with which Congress and the country look to it for the highly important judicial functions falling within its purview.

The development of the commission and its performance day by day comprise a chapter in human progress. They demonstrate the capacity of the American people to substitute reason and arbitrament for passion and strife. Our success in this undertaking is a triumph in self-government.

It is our apprehension that the system which I have endeavored to describe is in grave danger.

Powerful groups are urging Congress to superimpose upon the present statutory duties of the commission certain entirely new and wholly incompatible duties. The common purpose of these several plans is to introduce into the governmental policy an element of encouragement to railroad development. The cry has gone up on every hand for better railroads and more railroads. You are asked to create the new duty of promoting adequacy of facilities and the opening up of new areas. Such a declaration of policy to be made effective must be delegated by the law-making body to an administrative arm—an agency.

Is it the object that national growth shall be both promoted and anticipated by provision of transportation facilities? Is it the expectation that representatives of the government will counsel with railway men and waterway men and hard-surface-road men and with users of all these instrumentalities everywhere, planning for the future? Is it in your minds that the reasonable public need for enlarged terminals or multiple tracking or extension into new territory shall be quickly and practically judged and promptly sanctioned and that carriers undertaking such projects shall be provided with the means of carrying them vigorously to completion?

If this is the purpose and the representative of the government in that field is to be the Interstate Commerce Commission, then what is proposed is to transform the commissioners from judges into men of action.

It may be that you could not effect such a transformation. If you tried but it proved that you could not, this would be a gigantic calamity in itself, as I shall endeavor to maintain in a few moments; but if you could and did transform these judges into men of action what would become of the machinery of justice which it has taken us 32 years to construct and develop?

By the word action is meant getting things done—appraising projects, determining methods and bringing results. Gettings things done is a function concerning which as business men we are qualified to speak. We choose our executives according to our lights and place upon them the responsibility of ways and means and results.

We expect them to make mistakes. We look for a certain degree of false motion and waste of money, inseparable from pioneer and creative work. We do not regard the performance as setting up precedent for future guidance but largely as containing warnings. We cannot require that in his relations with other people the executive as he hurries along will necessarily conduct himself with the primary aim of being a paragon of manners, a model of forbearance, or a professor of ethical philosophy. He uses the self-restraint which all responsible citizens use in a civilized community where there is law and order and a decent respect for the rights of others; but his specialty is getting things done.

Action Called for by the Nation

Congress, which is the board of directors of the nation, is about to undertake a project—the restoration of railroad development. Congress is about to assign supervision of that task to an agent. Those who have elected Congress as their board of directors will not be satisfied with a report that postponement of the result desired has been accomplished politely or learnedly or according to tradition.

What the nation requires is that each year's end will record additions to mileage at least larger than were made by a nation of 32,000,000 before the Civil War. They require some progress and some completion of terminal and double-track projects, construction of motive power and cars somewhere near that before 1906, a year in which industry was shackled and foodstuffs rotted because there was not enough rolling stock to carry material to or product from the factory or to convey grain and livestock to market or seaboard. The country wants results.

Suppose Congress appoints as its agent for that task the Interstate Commerce Commission. I suppose nobody will assert that any one of the present commissioners has ever had occasion to demonstrate by performance the possession of the special qualifications universally exacted of an executive who is charged with a work of creation. Each of them would doubtless classify himself in this respect with the man who was asked whether he could read Greek. He answered, "I don't know, I have never tried."

During these hearings, in fact, Commissioner Clark has said that the bill advocated by the commission would require an enlargement of that body. I understand he has special reference to the regulation of security issues. Whether the commission is to be enlarged or not, vacancies in it will from time to time occur. There is one such vacancy at this moment. In the long run, appointments would doubtless be made of both types, the judicial and the executive. The injection of one or two men of action into the commission would certainly and immediately precipitate conflict.

Here you would have on the one side a man or men whose temperament, instinct, training and habit it is to be anxious lest any project may not have money enough and hence to provide an ample margin for contingencies. On the other you would have men whose temperament, instinct, training and habit it is to be anxious lest any project have too much money and hence to hold it down to the minimum.

Public Opinion and Rate Decisions

What would be the outcome? In the past the commission has had the protection that hedges about a judicial body. You will not have forgotten that in one of the early large-scale rate-advance cases the commission complained of what it called the campaign of publicity. Having had laid before it for determination the question how much earnings a group of carriers ought to have, which is the same thing as saying how much or how good work those carriers should be permitted to perform, the commission was in position to rebuke concerted expression of the public desire on the ground that the proceeding was judicial and that public discussion ought not to be employed for the exertion of influence upon the judgment of the commissioners.

Utterly different will be the situation if Congress shall now decree that railroads are to grow and assign the task of stimulating that growth to the commission.

I need not elaborate to a committee of Congress on the distinction between a statutory provision which defines misdemeanors with prescription of penalty and a statute which sets up a standard for the instruction of an administrative department in the carrying out of a public project.

If a shipper solicits a rebate and a railroad officer gives it to him the process by which these lawbreakers are brought to book is one with which public opinion and public discussions should have nothing to do. If the citizens of Philadelphia or of any other city can unite in advocating a unification of terminals nothing ought to stand in the way of their getting all the allies they can to convince the authorities that the thing should be done and carriers' revenues adjusted accordingly.

Does it take the eye of a prophet to see what would happen within a commission made up partly of builders and partly of judges? At the first important difference of judgment over the amount of earnings necessary in the public interest the tribunal would be rent in twain and in a few hours two factions in the country would begin the struggle for control. This, mark you, is a judicial body. It adjudicates citizens' rights. It has made peace in the United States where once there was conflict, and it is relied upon to continue the calm and even-handed administration of justice.

And here we have the proposal that Congress knowingly and wilfully shall toss into the court of interstate transportation a patented and guaranteed occasion for disputation and bitterness, with the people of the United States surrounding the combatants tier above tier and yelling like the local mob at a national party convention.

If any one suspects that the commission under the proposed conditions would somehow be immune from schism, I commend to him an incident which has already happened. At the time, Congress never had decreed that rates and fares should be adequate for any specified purpose whatever or even that the commission must or might consider rates as a whole as affecting total earnings. Just what occurred I

do not pretend to know. The commission guards its confidences well. But the record is eloquent and the deduction is obvious.

It was the western rate-advance case of 1915. The commission had constructed a majority report, stating what advances would be permitted. Two commissioners dissented on the ground that the grant was insufficient. What the majority replied to their arguments is not of record. But one of the dissenters, Mr. Daniels, in his opinion said:

A Punitive Body

"While it is nowhere explicitly stated in the majority report, I am unable to escape the conviction that the reluctance to find that increased rates have been more generally justified is largely rooted in an unwillingness to find that the revenues of the carriers as a whole are smaller than is demanded in the public interests, and also in the belief that the financial exigencies of many of the carriers are traceable to financial maladministration, and that if due economy and integrity had been observed the difficulty over the attested decline in revenues would have been readily surmounted. . . . It would appear that . . . the time had at last come to take a discriminating view of the effect of refusing rate increases otherwise just and reasonable because of a widespread resentment at evils perpetrated in the past by dishonest or designing railroad officers or their allied financiers. Such a policy visits in large measure the same penalty upon the proprietors of a railway conducted with integrity and honesty as upon the luckless shareholders of a looted road. In either case those who suffer from its effects are not those who have profited by the wrongs perpetrated in the past. It is, therefore, suggested that the appropriate remedy is the prosecution and punishment of the individual offenders, not the continual withholding of adequate rates to the carriers as a whole. In bank management this distinction has in large measure been recognized. . . . Similarly in considering propositions involving more or less general increase of rates, the question should be judged in the light of the carriers' revenues as a whole, and in the light of the reasonableness or unreasonableness of particular rates proposed, and neither prejudiced nor complicated by considerations of individual instances of corporate mismanagement."

Out of those earnest, almost passionate fragments can you not reconstruct the scene which Commissioner Daniels refrains from describing? If this is what he felt impelled to impart to the public, what did he say to his colleagues in the shelter of executive session? What did they reply? It is immaterial. Their official acts convey the information which we require.

That commission at that hour was not a court adjudicating citizens' rights, but a legislature determining the policy of a nation; not a tribunal applying law to a particular case, but a Congress enacting the law itself.

Verily, it is not alone against dangers yet to be created that we warn you, but against perpetuation of a present danger. Great as is the necessity for avoiding the imposition of legislative functions upon the commission, an important purpose is the removal of that present cause of discord, the struggle within the commission for and against readjustments designed primarily to promote transportation development.

No More Rate-Making by Men Who Get Things Done

Bring on the combat for control of the commission and you destroy it as a court, for during the conflict you will turn the bench into a shambles, and when it is over, and the advocates of development have prevailed, as they will, you will have turned over the administration of justice to men whose specialty is getting things done; and if you want to know what that means ask some shippers how they like the rates that were made by Mr. McAdoo. Let us profit from at least one lesson taught us by the war. Let us never again have railroad rates made by men whose primary job is getting things done.

You cannot authorize the Interstate Commerce Commission to determine how much revenue is needed and escape a demoralization of the mechanism for justice which we now have. You cannot place upon the commission the responsibility for fixing the amount of revenue and escape a revival of agitation against the roads, which would be accused as the beneficiaries of ruthless rate-making.

Separate Board Imperative for Promoting Development

Even if for the sake of getting adequate facilities, you were willing to sacrifice the judicial system so laboriously built up, about the most circuitous and slow-moving method, as well as the most doubtful in point of ultimate effectiveness, would be an attempt to transform the Interstate Commerce Commission into a body of action.

As an exhibit convincing on that point we can hardly choose better than to examine the testimony of Commissioner Clark at the beginning of these hearings. I have given you my impression of the judicial body which could produce a witness inspiring so much confidence. From practical experience on the bench the commissioners through him offered detailed amendments to the law as it stands.

I now give you another impression. This second impression was one of incredulous amazement that any group of eight men having to do with transportation in the United States could have lived and worked through these last few years and come before you without apparently the faintest realization that the country is confronted with a railroad problem requiring heroic measures.

The chairman opened the proceedings by enumerating the aspects which would have attention. First of all, he said:

"One of the great problems we are to consider is the matter of credits, and credits involve the matter of rates."

Where in the whole course of Judge Clark's analysis of the bill is there a word indicating recognition by him or by the commission of the existence of a great problem of credits, involving rates? The suggestion has appeared in some of the transportation journals that the bill drawn by the commission and Mr. Clark's comments upon it form only one part of a comprehensive scheme in which the credit problem will be dealt with separately. The commissioner, indeed, in his introductory remarks pointed out that as explained by the chairman the purpose of the hearing covered principles as well as details, whereas the bill was confined to amendments, but he gave no intimation of any supplementary recommendations to come from the commission. So far as was decided that body stood upon its annual report for 1918 and its special report to Congress dated December 31, afterwards explained in detail to the Senate committee in the sixty-fifth Congress.

A Delusive Hope

The special report catalogued a series of objects of legislation. Upon first perusing that document I was startled to note what seemed to be an indirect declaration for adequacy of revenues. It began characteristically enough, declaring for "limitation of railroad construction to the necessities and convenience of the government and the public"—a delicious bit of humor, as if superfluous railroad construction were a pressing national peril which must head any list of evils to be abated; but immediately following were these strange and unaccustomed words:

"and assuring construction to the point of these limitations."

My enthusiasm was warm while it survived. I read along through the statement of reasons underlying the pro-

posed limitation of railway construction, and came upon the statement of the thought underlying the assurance of construction to the point of limitation, which was this:

"that a railroad having been permitted, by public franchise, and the powers that go with it, to build into a given territory, it should be required to properly serve and develop that territory. And in developed territory it is important to provide for the extension of short branch or spur lines or spur tracks to communities and industries that should be served and that can furnish sufficient traffic to justify such extension."

Not a word about enabling the carrier to improve or extend; only power to require him to do so.

In the commission's bill the power to require construction is qualified by the following proviso: "That the commission shall find that such provision of facilities or extension is reasonably necessary in the interest of public convenience and will not impair the ability of the carrier to perform its duty to the public." In other words, the carrier must construct if it can spare the funds, but not even in case of public necessity for construction will the commission be directed by law to supply the carrier with the increased earnings necessary for the credit basis.

Except for this one false alarm, I have been unable to find a solitary phrase in any of the statements of the commission acknowledging that railway development needs encouragement and that a change in governmental policy is essential to that end.

Consolidations would be permitted under the commission's bill. Mr. Clark in his testimony mentioned as an advantage of this economies in use of railway plant. He did not mention the rate problem of the strong and the weak road, which for months has commanded the attention of all the leading railway economists, and for which a solution proposed by many of them is consolidation.

The bill confers upon the commission jurisdiction over minimum as well as maximum rates. Some of the advocates of the commission as the agency for restoring railway credit have predicted that if granted this new power they would do everything necessary in that direction. You remember what Judge Clark told you about that provision. The farthest he went was to point out that "the competition between carriers or the insistence of one carrier upon having its own way results in an unnecessary and unwarranted depletion of the revenues of all the carriers in a given situation."

He gave no endorsement to the idea that the revenue derived from the correction of such situation would build in the next year miles of track, freight cars and locomotives in capacity approaching the annual provision which was maintained in former years of vigorous development.

After he had analyzed the provisions of the bill section by section to the end, Judge Clark added the most startling statement that has come from the commission on the subject. In less than five minutes he did away with the need for any other evidence that a new and independent agency is required for the rehabilitation of railway credit. He turned back to a new provision which in its order he had passed without comment. I have previously quoted the provision to you in another connection.

No Problem, No Remedy, No Hope

If nothing which preceded had contained cause for astonishment occasion enough was afforded by his having been able to glance down that page, with that new matter staring at him in italics out of the context, and regard it as so trivial as to require no explanation.

The words are as follows:

"The commission in reaching its conclusion as to the justness and reasonableness of any rate, fare charge, classification, regulation or practice shall take into consideration the cost of labor and other operating costs in so far as they become material in any case under investigation."

Of that provision the commissioner said:

"I originally passed this by, but it seems desirable to comment on it a little. As a part of the statute, it develops the rule which the legislature contemplates shall be followed by the administrative tribunal."

And now mark what he says next:

"In actual practice it will not change the rule followed by the commission, because the commission has recognized that the necessary costs affect the net return."

The chairman then observed that the Traffic Club of Chicago had recommended the addition of the words "and the cost of capital," and asked the witness his views on that.

Judge Clark replied: "I think it would be entirely appropriate to include that, Mr. Chairman, because I cannot conceive of the commission ignoring it if it were pertinent and material to the issue."

The Chairman: "In view of the fact that you say the commission has always heretofore considered the cost of labor and operation—you have also considered the return on capital?"

Judge Clark: "Yes; we have considered the return on capital."

So here was a proceeding which began with a statement by the chairman that "One of the great problems we are to consider is the matter of credits, and credits involve the matter of rates"; a proceeding which followed with examination of a bill brought in by the commission purporting to require adequate rates and making the commission the agency for accomplishing such adequacy; a proceeding which then plunged to its anti-climax with an avowal by the representative of the commission that there is no great problem of rates in relation to credit, because the commission always has considered the return on capital, so that the new rule would not change its course in the least.

I submit, gentlemen, that the least eligible candidate you could find for the task of restoring railway development is a body which in the face of universal opinion here and throughout the country denies the existence of the problem and virtually promises to frustrate any attempt at a change of governmental attitude.

Men of Action for Getting Things Done

It is for these reasons that we advocate the creation of a Federal Transportation Board, which, having jurisdiction over security issues and hence over railway development, shall have the power that goes with the responsibility for results—the power of certifying to the commission the amount of revenue necessary to the public interest.

This would designate men of action for a task of getting things done. It would preserve this excellent and highly esteemed tribunal, the Interstate Commerce Commission, as a court to insure that in getting things done the men of action shall not ride rough shod over the citizens and communities who use the facilities.

Many of those who have made valuable contributions on various phases of the problem as a whole are yet to be converted into advocates of a Federal Transportation Board.

First, it is said that there is no support for such a board in the country.

If Senators and Representatives are as open-minded upon this aspect as they have given token of being on other aspects of the question, what validity is there to the argument that a recommendation should be withheld because they are not already in favor if it? If we knew that Congress favored a Federal Transportation Board it would be a waste of time for us to come and urge them to create it.

With regard to sentiment in the country evidence is accumulating. Our own association is a constituent member of

the Chamber of Commerce of the United States. One of the recommendations contained in the Chamber Referendum No. 28 was that a Federal Transportation Board be created. We conducted an internal poll among our members to determine how our association would vote. On the recommendation in question fewer than 5 per cent of those voting said "No" on that provision. All the constituent bodies in the Chamber throughout the country recorded a vote of 1,196 in favor to 245 opposed. The National Transportation Conference makes such a board the central piece of mechanism in its plan for rehabilitation of railway credit. The proposition is really just beginning to be explained to the public, and there is no reason whatever for dismissing the proposal as a project which has no chance of adoption and therefore is a futile feature of any program.

Another objection is that if such a board were to be created during the present administration the appointments made by the President would be of the same character as the appointments which he has made to the Interstate Commerce Commission. I hold no brief for the present chief executive, and happen to belong to another political party than his own, but the argument reduces itself to absurdity.

It is that citizens are willing to trust the commission, four of whose members were appointed by this same President, and which as a whole is practically organized and committed against any change of governmental policy, but are unwilling to trust a new board appointed by him, although the launching would be in the atmosphere and under the influence of a great constructive and non-partisan plan.

It is said in the third place that there is confusion and deadlock in co-ordinate tribunals. Amen and amen. The Railway Business Association is no advocate of co-ordinate authority. We desire to see the Interstate Commerce Commission supreme over the construction of rate schedules. We desire to see the Federal Transportation Board supreme over issuance of securities and over the amount of revenue necessary in the public interest.

With regret we have noticed that some of those who accept our idea of a certificate of public necessity for revenue would still leave with the commission some discretion as to whether it likes or not the estimate of the Federal Transportation Board. As well provide that the auditor of a commercial company be empowered to refuse to sign checks, if he believes that the purchasing authority has bought goods not needed by the company.

Weak and Strong Roads

The only other obstacle which has been specified to us is that the creation of a Federal Transportation Board would not solve the problem of the strong and weak road. The answer is that it would if it did and the Interstate Commerce Commission wouldn't if it didn't.

If your legislation shall provide a way of dealing with the problem of the strong and the weak road what possible difference can it make who is the agent for executing the plan provided that he is competent for the job and his instructions and power are in accordance with his responsibility?

What is involved is largely the exercise of business judgment. Without any moral obliquity and doubtless with the best intentions in the world, the temperament, training and environment of the Interstate Commerce Commission are all against that liberal provision of present earnings and surplus which a business executive insists upon as a margin of safety for future contingencies.

It is proposed that Congress shall so prescribe the duty and authority of the Federal Transportation Board that the President will have a perfectly clear definition of the qualifications of its members and will select his nominees accordingly.

To say that Congress cannot frame an authorization and the American people cannot through their chief executive establish a competent agency to effectuate the national will is to assert fundamental pessimism concerning our American experiment in self-government. Your present deponent believes we are justified rather in a glowing optimism, and if there were no other warrant for that sentiment we believe it is to be found in the quest and discovery six years ago of the soundest banking and currency system anywhere in the world.

For Congress to enact a scheme sound and strong in every other detail and present it to the public as possessing the same finality as the federal reserve legislation of 1914, but designating the Interstate Commerce Commission as the agent of rehabilitation would be to settle nothing and accomplish nothing. It probably would mean government ownership in ten years if not in five, with all the evils which have attended that system wherever tried. We cannot believe you will take the risk.

Doings of the Railroad Administration

WASHINGTON, D. C.

SOME ADDITIONAL information regarding the number and compensation of railroad employees is likely to be made available as a result of a resolution proposed by Senator Cummins and passed by the Senate on August 21, calling on the director general to furnish to the Senate as soon as practicable the following information:

The number of employees of each class engaged on the class I railroads under federal control in the United States for each month from January to July, 1919, and also for the month of December, 1917; the amount of their compensation; the number of hours or days work; and the compensation per hour or per day for each of said months and for each class of employees, such as engineers, firemen, conductors, brakemen, shopmen, and each of the other classes as shown by the records of the Railroad Administration; also the percentage of change between December, 1917, and the last month of 1919 for which there are available records, both in the unit of compensation and in the average compensation per employee of each class; also to attach to the report on this resolution copies of all orders making advances in wages and of all schedules explanatory thereof.

This will make public some of the up-to-date statistics on wages which the Railroad Administration has been keeping to itself, but as it goes back only to 1917 it will show only the increases in wages made by the Railroad Administration, and not the full effect of the increases made during 1915, 1916 and 1917 by the railroad companies.

Contracts Executed

The Railroad Administration has executed compensation contracts with the Chicago, Indianapolis & Louisville, for $1,620,000, the Texas & Pacific for $4,107,432, and with the Pullman Company for $11,750,000. A short line contract has also been executed with the Missouri Southern.

The Cleveland Railways Company has taken out $10,110,000 insurance policy against "riot and civil commotion," paying a premium of $37,110. The policy covers 90 per cent of the company's line and is written by four western insurance companies.

The total annual freight bill of the lumber industry is estimated at about $215,000,000. Lumber and forest products furnish about 11 per cent of the total tonnage of the American railroads or about 215,000,000 tons yearly, according to Interstate Commerce Commission statistics. This total is greater than the movement of all agricultural products and is exceeded only by the tonnage of general manufactures and mine products.

President Calls a Halt on Wage Increases

Says Insistence on Unwise Demands at This Time Menace Peace and Prosperity of the Country

WASHINGTON, D. C.

PRESIDENT WILSON and Director General Hines have decided that there shall be no new cycle of wage increases for railroad employees. This is on the ground that the increases already granted by the Railroad Administration and by the railroad companies during the two years preceding federal control have kept pace with or exceeded the increase in the cost of living up to date, and that further advances in railroad wages are not warranted by comparison with other wages, and would merely result in a further increase in the cost of living, which the government is now bending every effort to reduce.

"The way to re-establish the pre-war purchasing power of wages," Mr. Hines says, "is to reduce the cost of production, not to increase it."

Whether the decision would be accepted by the labor organizations, however, is still uncertain. The shop craft unions whose demands were directly involved, have formally rejected the offer of a small increase in wages by way of a readjustment and are taking a new strike vote.

The railroad shop employees who have been pressing their demands for higher wages since January, having received two increases in 1918, and who had just taken a vote authorizing their officers to call a strike unless their new demands were granted, were awarded an increase of 4 cents an hour to make up for the fact that they did not receive 10 hours' pay for 8 hours' work at the time other railway employees had their wages adjusted in that way, and some other minor adjustments, retroactive to May 1, for all employees who do not leave the service pending the completion and adoption of a national agreement with the shopmen's organizations.

The President's decision, based on a recommendation from Director General Hines, who had been in frequent conference with him on the subject, was communicated to the committee of 100 representing the shop craft unions affiliated with the American Federation of Labor at the White House on Monday, August 25. In his statement to the committee, and in another addressed to the public, the President also spoke indirectly to the other railroad labor organizations that either have presented or have been preparing demands for further wage increases, as well as to labor generally, when he said that questions of general wage increases ought to be postponed until the return of normal conditions, and, with undoubted reference to various strike votes now being taken, he added: "Demands unwisely made and passionately insisted upon at this time menace the peace and prosperity of the country as nothing else could, and thus contribute to bring about the very results which such demands are intended to remedy."

That his position with reference to the shopmen's demands, which represented the first effort to begin a new wage cycle for railroad employees, also applies to other demands was indicated in the President's statement that "the position which the government must in conscience take against general increases in wage levels while the present exceptional and temporary circumstances exist," will not preclude the Railroad Administration from considering claims by other classes of employees for readjustments intended to establish the proper relationship between various classes of employees. It was made unmistakably clear, however, that the President and the director general do not intend to be influenced by strike threats to grant any further general increases at this time except such as may result from effects to effect equalizations.

The President's statement also indicated that any decision as to increases in freight rates must also be postponed until more normal conditions are restored, on the ground that it is impossible at present to estimate the earning capacity of the railroads and that there is no certain basis for calculating what the increase in freight rates should be. Both he and Mr. Hines are anxious to concentrate every energy on the campaign to reduce the cost of living and are unwilling to take any step that will tend in the other direction by giving any excuse for further increases in prices.

Director General Hines and representatives of the divisions of operation and of labor of the Railroad Administration resumed negotiations with the representatives of the Railway Employees' Department of the American Federation of Labor, representing the shop crafts, on August 20, following the receipt of final information that the unauthorized strikes of shopmen on various roads had been concluded. Later in the day Mr. Hines went to the White House, and on Saturday, August 23, he again called on the President, giving him a complete report of his recommendations on which the President decided to take personal action. On Monday the shopmen's committee was called to the White House to receive the final decision from the President, and a copy of Mr. Hines' report, the President's statement to the shopmen and another statement to the public were given out. The public statement is as follows:

President Wilson's Statement to the Public

My Fellow Citizens:

A situation has arisen in connection with the administration of the railways which is of such general significance that I think it my duty to make a public statement concerning it, in order that the whole country may know what is involved.

The railroad shopmen have demanded a large increase in wages. They are now receiving 58, 63 and 68 cents per hour. They demand 85 cents per hour. This demand has been given careful and serious consideration by the board which was constituted by the Railroad Administration to adjust questions of wages, a board consisting of an equal number of representatives of employees and of the operating managers of the railroad companies. This board has been unable to come to an agreement, and it has therefore devolved upon the Director General of Railroads and myself to act upon the merits of the case.

The shopmen urge that they are entitled to higher wages because of the higher wages for the present received by men doing a similar work in shipyards, navy yards, and arsenals, as well as in a number of private industries, but I concur with the director general in thinking that there is no real basis of comparison between the settled employment afforded mechanics by the railroads under living conditions as various as the location and surroundings of the railway shops themselves and the fluctuating employment afforded in industries exceptionally and temporarily stimulated by the war and located almost without exception in industrial centers where the cost of living is highest.

The substantial argument which the shopmen urge is the very serious increase in the cost of living. This is a very potent argument indeed. But the fact is that the cost of living has certainly reached its peak, and will probably be lowered by the efforts which are now everywhere being concerted and carried out. It will certainly be lowered so soon

as there are settled conditions of production and of commerce; that is, so soon as the Treaty of Peace is ratified and in operation, and merchants, manufacturers, farmers, miners, all have a certain basis of calculation as to what their business will be and what the conditions will be under which it must be conducted. The demands of the shopmen, therefore, and all similar demands are in effect this: That we make increases in wages, which are likely to be permanent, in order to meet a temporary situation which will last nobody can certainly tell how long, but in all probability only for a limited time. Increases in wages will, moreover, certainly result in still further increasing the costs of production and, therefore, the cost of living, and we should only have to go through the same process again. Any substantial increase of wages in leading lines of industry at this time would utterly crush the general campaign which the government is waging, with energy, vigor and substantial hope of success, to reduce the high cost of living. And the increases in the cost of transportation which would necessarily result from increases in the wages of railway employees would more certainly and more immediately have that effect than any other enhanced wage costs. Only by keeping the cost of production on its present level, by increasing production, and by rigid economy and saving on the part of the people can we hope for large decreases in the burdensome cost of living which now weighs us down.

The director general of railroads and I have felt that a peculiar responsibility rests upon us, because in determining this question we are not studying the balance sheets of corporations merely, we are in effect determining the burden of taxation which must fall upon the people of the country in general. We are acting, not for private corporations, but in the name of the government and the public, and must assess our responsibility accordingly. For it is neither wise nor feasible to take care of increases in the wages of railroad employees at this time by increases in freight rates. It is impossible at this time, until peace has come and normal conditions are restored, to estimate what the earning capacity of the railroads will be when ordinary conditions return. There is no certain basis, therefore, for calculating what the increases of freight rates should be, and it is necessary, for the time being at any rate, to take care of all increases in the wages of railway employees through appropriations from the public treasury.

In such circumstances it seems clear to me, and I believe will seem clear to every thoughtful American, including the shopmen themselves when they have taken second thought, and to all wage earners of every kind, that we ought to postpone questions of this sort until normal conditions come again and we have the opportunity for certain calculation as to the relation between wages and the cost of living. It is the duty of every citizen of the country to insist upon a truce in such contests until intelligent settlements can be made, and made by peaceful and effective common counsel. I appeal to my fellow citizens of every employment to co-operate in insisting upon and maintaining such a truce, and to co-operate also in sustaining the government in what I conceive to be the only course which conscientious public servants can pursue. Demands unwisely made and passionately insisted upon at this time menace the peace and prosperity of the country as nothing else could, and thus contribute to bring about the very results which such demands are intended to remedy.

There is, however, one claim made by the railway shopmen which ought to be met. They claim that they are not enjoying the same advantages that other railway employees are enjoying because their wages are calculated upon a different basis. The wages of other railway employees are based upon the rule that they are to receive for eight hours' work the same pay they received for the longer workday that was the usual standard of the pre-war period. This claim is, I am told, well founded; and I concur in the conclusion of the director general that the shopmen ought to be given the additional four cents an hour which the readjustment asked for will justify. There are certain other adjustments, also, pointed out in the report of the director general, which ought in fairness to be made, and which will be made.

Let me add, also, that the position which the government must in conscience take against general increases in wage levels while the present exceptional and temporary circumstances exist will of course not preclude the Railroad Administration from giving prompt and careful consideration to any claims that may be made by other classes of employees for readjustment believed to be proper to secure impartial treatment for all who work in the railway service.

In addressing the committee the President asked them to disregard the strike vote which had been received on August 24, and took occasion to try to calm their frequently expressed fears that the railroads would attempt to reduce wages after the return of the roads to private control. In this statement President Wilson said:

Statement by the President to Railway Employees' Department of Federation of Labor

I request that you lay this critical matter before the men in a new light. The vote they have taken was upon the question whether they should insist upon the wage increase they were asking or consent to the submission of their claims to a new tribunal, to be constituted by new legislation. That question no longer has any life in it. Such legislation is not now in contemplation. I request that you ask the men to reconsider the whole matter in view of the following considerations, to which I ask their thoughtful attention as Americans, and which I hope that you will lay before them as I here state them.

We are face to face with a situation which is more likely to affect the happiness and prosperity, and even the life, of our people than the war itself. We have now got to do nothing less than bring our industries and our labor of every kind back to a normal basis after the greatest upheaval known to history, and the winter just ahead of us may bring suffering infinitely greater than the war brought upon us if we blunder or fail in the process. An admirable spirit of self-sacrifice, of patriotic devotion, and of community action guided and inspired us while the fighting was on. We shall need all these now, and need them in a heightened degree, if we are to accomplish the first tasks of peace. They are more difficult than the tasks of war—more complex, less easily understood—and require more intelligence, patience and sobriety. We mobilized our man power for the fighting, let us now mobilize our brain power and our consciences for the reconstruction. If we fail, it will mean national disaster. The primary first step is to increase production and facilitate transportation, so as to make up for the destruction wrought by the war, the terrible scarcities it created, and so as soon as possible relieve our people of the cruel burden of high prices. The railways are at the center of this whole process.

The government has taken up with all its energy the task of bringing the profiteer to book, making the stocks of necessaries in the country available at lowered prices, stimulating production, and facilitating distribution, and very favorable results are already beginning to appear. There is reason to entertain the confident hope that substantial relief will result, and result in increasing measure. A general increase in the levels of wages would check and might defeat all this at its very beginning. Such increases would inevitably raise, not lower, the cost of living. Manufacturers and producers of every sort would have innumerable additional pretexts for increasing profits and all efforts to discover and defeat profiteering would be hopelessly confused. I believe that

the present efforts to reduce the cost of living will be successful, if no new elements of difficulty are thrown in the way, and I confidently count upon the men engaged in the service of the railways to assist, not obstruct. It is much more in their interest to do this than to insist upon wage increases which will undo everything the government attempts. They are good Americans, along with the rest of us, and may, I am sure, be counted on to see the point.

It goes without saying that if our efforts to bring the cost of living down should fail, after we have had time enough to establish either success or failure, it will of course be necessary to accept the higher cost of living as a permanent basis of adjustment, and railway wages should be readjusted along with the rest. All that I am now urging is, that we should not be guilty of the inexcusable inconsistency of making general increases in wages on the assumption that the present cost of living will be permanent at the very time we are trying with great confidence to reduce the cost of living and are able to say that it is actually beginning to fall.

I am aware that railway employees have a sense of insecurity as to the future of the railroads and have many misgivings as to whether their interests will be properly safeguarded when the present form of federal control has come to an end. No doubt it is in part this sense of uncertainty that prompts them to insist that their wage interests be adjusted now rather than under conditions which they cannot certainly foresee. But I do not think that their uneasiness is well grounded. I anticipate that legislation dealing with the future of the railroads will in explicit terms afford adequate protection for the interests of the employees of the roads; but, quite apart from that, it is clear that no legislation can make the railways other than what they are, a great public interest, and it is not likely that the President of the United States, whether in possession and control of the railroads or not, will lack opportunity or persuasive force to influence the decision of questions arising between the managers of the railroads and the railway employees. The employees may rest assured that, during my term of office, whether I am in actual possession of the railroads or not, I shall not fail to exert the full influence of the Executive to see that justice is done them.

I believe, therefore, that they may be justified in the confidence that hearty co-operation with the government now in its efforts to reduce the cost of living will by no means be prejudicial to their own interests, but will, on the contrary, prepare the way for more favorable and satisfactory relations in the future.

I confidently count on their co-operation in this time of national test and crisis.

Director General Hines' Report

Mr. Hines' report to the President, dated August 23, is as follows:

In view of the importance both to the railroad employees and to the public of the wage demands of the shop employees, and in view of the intimate relationship between that subject and the all-important subject of the cost of living, I feel it my duty to make this report to you for action by you if you wish to take personal action in regard to it.

The responsibility rests upon me to decide upon its merits the claim of the railroad shopmen for the following increases:

	Now receiving Cents	Requested Cents	Increase Cents
Machinists	68	85	17
Toolmakers	68	90	22
Boilermakers	68	85	17
Riveters	68	85	17
Blacksmiths	68	85	17
Sheet metal workers	68	85	17
Electricians	68	85	17
Car inspectors	58	85	27
Car repairers	58	85	27
Car repairers, steel	63	85	22
Helpers	45	60	15

Note.—These figures represent only the principal classes.

This demand was considered by the Board of Railroad Wages & Working Conditions, a board constituted last year by the Railroad Administration to consider wage matters, and consisting of three representatives of labor and three representatives of the railroad managements. On the question of any general increase to the shopmen, the board divided equally, the three labor members favoring an increase to a basis of 80 cents and the three management members opposing any general increase whatever, although expressing the opinion that unless the cost of living could be controlled, there would need to be a further general increase in wages. This is the first time when this board has thus divided on the question of a general wage increase presented to it. In every other case the board has been in agreement upon the proposition that there ought to be a general increase, although in some cases its members have been slightly apart as to the extent of the general increase. In this case three members of the board, who in all other cases have been in favor of a general increase, have thus opposed any increase whatever for the entire class of employees.

I believed it would be more satisfactory both to the employees and to the public to have this grave problem considered and disposed of by a commission created by new legislation. Recommendation to that effect was submitted to the appropriate committees of the Senate and the House, but the unanimous adverse action of the Senate committee made it clear that such a course would not be pursued.

It is also true that the employees themselves vigorously objected to my suggestion and insisted that the matter should be decided by me.

Since the subject must be dealt with, and no other method has been or is to be provided, it follows that it must be dealt with by the director general under the powers conferred upon the President by the Federal control act, and this must be done without the aid of any action by the wage board.

I approach this matter with the clearest conviction that the railroads must be conducted now and for all time in the future in such a way as to give to railroad employees an adequate compensation and a liberal share in the returns from railroad operation. This is not only justly due to the employees who make possible the rendition of the service but it is obviously in the interest of good service. It is true now, and will be true to a continually increasing extent in the future, that a state of contentment on the part of railroad labor will be indispensable to efficient railroad service and this contentment cannot exist unless the evidence of fair treatment is so clear that it will carry conviction to the railroad employees themselves.

I have, after the most careful possible study, and after considering everything presented on behalf of the railroad shop employees, reached the following conclusions:

The main contention of the shop employees is that their demands are just because of the rates paid in the ship yards, navy yards and arsenals. The basic rate in the ship yards was 80 cents at the time the shopmen presented their demands, and an increase effective October 1 next has just been made in an agreement (to which the government was in no way a party) between the employees and the ship builders on the Pacific coast. After the most careful consideration, I can see no escape from the conclusion that the rates paid in the shipyards cannot be adopted as a measure for the rates to be paid in the railroad shops. The conditions are fundamentally different. The work performed by employees classed as railroad shop employees is performed in every city and in every railroad town of considerable size in the United States. The principal railroad shops are not in the largest cities and many of the principal shops are in towns or cities of relatively small size. At the urgent instance of the employees, the rates for all these shopmen throughout the United States, whether in large cities, small cities or towns or virtually rural

communities, have been standardized on uniform bases. It cannot be, therefore, that these standardized rates can be put so high as to reflect the conditions prevailing in the relatively few industrial centers where shipbuilding was developed under high pressure during the war. Not only are the shipyards practically without exception in densely populated centers but employees had to be attracted to those yards in time of war in competition with munition plants and others paying exceptionally high wages, and the employees who were attracted to those yards had to establish themselves in these densely populated centers with particularly costly living conditions. In order to meet the keen competition of other war industries and to build up the forces of men in the shipyards exceptional rates had to be provided.

The work in the railroad shops not only offers year in and year out (despite the fluctuations incident to changes in the volume of business) reasonably steady employment, but also offers a practically permanent career. On the other hand shipbuilding represents to a large extent a temporary employment. This is brought out clearly by the following showing which is actual up to August 15, 1919, and estimated beyond that date, as to the employees who have been and will be employed in the shipyards so far as the present governmental program is concerned:

Date	Number of shipbuilders	Date	Number of shipbuilders
January, 1914	48,700	June, 1919	354,625
January, 1916	78,100	Dec. 31, 1919	250,804
January, 1918	144,600	June 30, 1920	230,000
November, 1918	373,622	Dec. 31, 1920	153,000
January, 1919	361,211	June 30, 1921	0

Note.—These figures do not include, as I understand it, members of office forces, but only include the men engaged in ship construction and men employed in fabricating shops and all other shops actually a part of the shipyard plant.

It is perfectly clear to me that the people of the United States cannot be committed to the policy that the wages of railroad shopmen in every city, town and village in the United States must be brought up to a basis created in an emergency and in a largely temporary war undertaking, concentrated in a comparatively few densely populated industrial centers where living conditions are exceptionally expensive and difficult, so that I conclude that the principal contention of the shop employees cannot be adopted.

Of course if the employees themselves were willing to accede to a plan whereby the wages of railroad shopmen in each community should be made with reference to the average wages in that community, other considerations would have weight. But the employees are insistent that the same wage scale shall be paid in every place in the United States, regardless of its size or of local living conditions, and as this principle has been adopted it necessarily follows that exceptional conditions in exceptional communities cannot be taken as the standard for the wages of railroad shopmen.

The conditions in the navy yards and arsenals cannot, largely for the reasons already stated, be taken as controlling; moreover, it has generally been recognized that the rates therein should reflect local conditions in the particular communities and they have not been standardized at all except for a temporary standardization for the war to correspond with the shipyard rates.

It is further urged by the employees that the rates they receive are below those paid in private industries for similar labor. The employees cite various instances of rates in excess of 80 cents for work of this character, but these citations merely refer to conditions in specific communities. It must also be remembered that to a large extent private industries themselves were influenced to an exceptional degree by the war conditions, enjoying the most exceptional profits and paying unusually high wages to meet emergency requirements. But no convincing evidence has been presented that the average of the wages paid in private industries generally, or in those paying union scales of wages, throughout the United States for similar labor was or is substantially higher than the rates paid by the Railroad Administration.

I myself have collected the available information from the Department of Labor and that indicates that the average rate paid the principal metal trades in private industries, having union scale of wages, was at May 15, 1919, probably not more than 3 cents in excess of the 68 cent rate paid to the railroad shop employees. It is a question whether even as to private industries the advantages of work in railroad shops, including the advantage of substantial amounts of free transportation, do not make it reasonable for the railroad shops to have a differential under the rates paid in other private industries. This question, however, need not be decided because the decision made below will make the rates for the railroad shop employees in excess, if anything of average rates shown in the evidence thus obtainable from the Department of Labor for private industries.

In making comparisons for work of similar character between wages in the railroad industry and wages in private industries, due consideration must always be given to the fact that private industries are frequently able to increase their prices to the public without difficulty to offset, and more than offset, increases in wages, so that to a very considerable extent the wages fixed in private industries are fixed without any representation, either direct or indirect, of the general public which eventually must pay the bill. On the contrary the railroads whether under public or private control cannot increase the prices they charge, i.e., their transportation rates, except with the sanction of public authority. So the question must be viewed from the public standpoint as well as from the standpoint of the employees. This necessitates the most careful scrutiny of rates of pay which have been fixed by industries enjoying tremendous profits which are not subject to public control. Of course the wages paid railroad employees must be not only reasonable in themselves but reasonably satisfactory to the employees, and necessarily the geneal average rates normally paid elsewhere in permanent private industries for similar services, are an important factor for consideration. But the distinguishing conditions must never be ignored.

The further claim is made that the cost of living has increased. In a letter of August 5, 1919, signed by the executives of the six railroad shopmen's organizations, and also by the executives of the eight other organizations of railroad employees, including the various organizations of train and engine men, of telegraphers, maintenance of way men, clerks, the proposition is laid down that railroad employees are entitled to compensation which will, at least, re-establish the pre-war purchasing power of their wage.

The way to re-establish the pre-war purchasing power of wages is to reduce the cost of production and not to increase it.

The government is now taking vigorous steps to reduce the cost of living and is meeting with gratifying progress. This great work would be arrested if not defeated through the present adoption of the policy of moving up wages so as to reflect fully what is probably the very top-notch of the high cost of living. Such a movement would tend to increase still further the cost of living and injure every working man as well as every other person in this country.

In a statement presented to the President on July 30, W. S. Stone, president of the Brotherhood of Locomotive Engineers, said:

"We believe the true remedy for the situation, and one that will result in lifting the burden under which the whole people are struggling is for the government to take some adequate measures to reduce the cost of the necessaries of life to a figure that the present wages and income of the people will meet. Should this not be considered feasible, we will be forced to

urge that those whom we represent be granted an increase in wages to meet the deterioration of the purchasing power of the dollar, be that what it may, which can be easily determined by competent authority."

W. G. Lee, president of the Brotherhood of Railroad Trainmen, in a summary of a statement made by him before the Board of Railroad Wages and Working Conditions and given to the press by him on July 31, stated that an increase in wages was not the proper solution of the present economic stress under which working men are laboring because they will be followed by new increases of cost of everything which would more than absorb the additional pay.

I therefore believe it would be unfair for the general public, subversive of the efforts which the government is making to reduce the cost of living, and injurious to railroad employees themselves, for the railroad Administration at this time to adopt the principle of moving up wages of all railroad employees so as to reflect the highest point yet reached in the high cost of living. Such action would mean inevitably an increase in freight rates which would stimulate an increase in the cost of everything consumed by the public and would give innumerable pretexts for covering up additional unwarranted increases in prices on the claim that such increases will be necessitated by the increased cost of railroad transportation. As a matter of fact the rates of pay and also the earnings of many subdivisions of classes of railroad employees have already been so advanced as to be ahead of the highest point yet reached in the general average increase in the cost of living in the country. Any effort to adopt that high point as the minimum level for all railroad wages will be highly detrimental to the public interest.

I have consistently urged throughout this calendar year that the greatest problem before the country is a reduction in the cost of living and one of the greatest obstacles in the way of such reduction would be substantial increases in transportation rates. I am convinced that it is not reasonable from the standpoint of the public and would not be beneficial from the standpoint of railroad employees to make an increase in wages in the effort to overtake the high cost of living, since the increase would thereby result in putting cost of living that much further out of reach and would seriously obstruct the efforts now being successfully undertaken to bring down the cost of living.

In this connection it is proper to say that if railroad shop employees be viewed as a class it appears from the best data available that, comparing the total earnings of those employees now with their total earnings in the year ending June 30, 1915, the average increase in their earnings is somewhat in excess of the total increase in the cost of living from July 1, 1915, to August 1, 1919. This comes about by the fact that in carrying out the policy of standardization so strongly urged by the railroad employees great numbers of men employed in railroad shops were given the benefit of a higher classification which entitled them to wages much in excess of the increases indicated by the mere difference between the old rates of pay and the new rates of pay. While it is true that those railroad shop employees who enjoyed the highest scale of wages prior to the war may not have received an increase fully commensurate with the increase in the cost of living it is also true that great numbers of those employees have received increases substantially in excess of the increase in the cost of living. This condition however should afford no basis for the claim that the total increase already given to railroad shop employees is excessive, because I do not believe that such is the case. On the contrary, I believe the railroad shop employees were fairly entitled as a whole to the increases in wages provided and are also fairly entitled to the additional increase next below mentioned.

There has been insistent contention that while all other classes of railroad employees have had their wages adjusted in such manner that they receive an increased wage in addition to receiving 10 hours pay (in the pre-war period) for eight hours' work, this same treatment was not accorded to the shopmen. While it has been urged with equal insistence that the shopmen got offsetting advantages, it seems to me it is true that in this specific matter the shopmen did not receive the benefit of equal treatment. On that account it seems to me fair in all the circumstances to recognize this condition by giving the shop employees a rate of 72 cents instead of 68 cents for the classes now receiving 68 cents.

Under Supplement 4 to General Order 27 and an addendum to that supplement, two different rates have been provided for car repairers, one a rate of 63 cents for steel freight car repairmen and another a rate of 58 cents for wooden freight car repairmen. This distinction has been difficult to maintain and has been the source of dissatisfaction and there is general agreement among the members of the wage board that the condition ought to be remedied (although the labor representatives think it ought to be remedied by increasing the rates for all car repairers to the highest rates).

I therefore conclude, that, except as stated below, the rate for all freight car repairmen who by Supplement 4 to General Order 27 and the addendum thereto were intended to receive either 58 cents or 63 cents shall receive 67 cents per hour. There has been great dissatisfaction because car inspectors generally have received only the rate of 58 cents notwithstanding the fact that steel freight car repairmen have received the rate of 63 cents. My conclusion is that, except as below stated, car inspectors should receive the same rate as above indicated for freight car repairmen and therefore should receive 67 cents per hour.

The exceptions above referred to as to freight car repairmen and as to car inspectors are as to such employees at outlying points other than shops and main line terminals at which points the work, generally speaking, is not continuous. The increase for freight car repairmen and car inspectors at such outlying points will be 4 cents per hour. The determination as to the points where the freight car repairmen and car inspectors who according to this principle get only the 4 cents increase will be taken up in conference with the representatives of the shopmen with a view to arriving at a reasonable and definite working rule.

As to all other classes covered by Supplement No. 4 and not above specifically dealt with, the rate of increase shall be 4 cents per hour.

Ever since last September it has been the settled principle of the Railroad Administration to make wage orders retroactive to a date approximating the date upon which the Board of Railroad Wages and Working Conditions made its report and in this instance that report was made on July 16. The conditions here, however, are peculiar in that the action of the wage board has been delayed for an exceptional length of time, the presentation to the wage board having been made last February. In these circumstances it seems to me that, as a part of a negotiation of a national agreement, the changes above indicated could properly be made effective as of May 1, 1919, and the Railroad Administration is willing to make these changes in rates of pay effective as of that date for all employees who do not leave the service pending the completion and adoption of a national agreement with the shopmen's organizations.

In opening the conference with the shop committee on August 20, the director general made it clear that as the representative of the President and of the public, it was necessary for him before acting on the demands for increased wages to have before him adequate information covering the subject in order to determine whether all or any part of the requests of the shopmen for increased wages was justified by the facts. He explained that he had obtained such information as was available from the railroad managements, in-

cluding the facts they had obtained from other industries. In order to develop these facts further, he stated that he understood the claims of the shopmen raised the following questions:

1. Are the wages now paid shopmen in railroad employ on a fair basis compared with the wages paid shopmen doing comparable work in private industries outside of the railroads?

2. Are the wages paid railroad shopmen comparable with the wages paid shopmen doing similar work in ship yards, navy yards and arsenals under government control, and is employment in the shops of the railroads in fact comparable at all with employment in the shops of these other governmental agencies, particularly with regard to the wages established in those other governmental agencies during the war period?

3. Does the increased cost of living at the present time, as compared with the pre-war period and the increases in wages given to shopmen on railroads in the same period, justify further advances in wages to railroad shopmen?

Taking up these three propositions separately, the representatives of the shopmen claimed (1) that wages of railroad shopmen are materially lower than the wages paid shopmen in outside private industries, and that even since the signing of the armistice material advances in wages had been given to shopmen employed in such outside private industries; (2) that the wages paid shopmen in ship yards, navy yards and arsenals under government control have been and are materially higher than the wages paid shopmen on railroads, and that the two industries are comparable because the basis on which the wages in these outside governmental industries have been based had no direct connection with the war, but had direct connection only with a fair basis of wages prior to the war and increases in the cost of living since that time; and (3) that the demands for increased wages paid railroad shopmen did not rest primarily on the increased cost of living, although that it was an important contributing factor, but rested primarily on the proposition that the wages of shopmen ought to be increased so as to be more in line with wages for similar work in other industries.

Shop Employees Take New Strike Vote

After having received the President's decision the executives of the shop unions called on Mr. Hines to ask if the decision was final, and when informed that it was, they went into conference to plan their course of procedure. Ballots were still being counted on the vote as to whether the leaders should be authorized to call a strike or whether they should accept the plan which was abandoned after the strike ballots were sent out, for the submission of the demands to a special tribunal.

On Tuesday the committee representing the shopmen formally advised Mr. Hines that they could not accept the offer, and an order was issued for a new strike vote. With the order were sent copies of the President's statement, at his urgent request, and also of Mr. Hines' proposition with the request that they be given most careful consideration at a summoned or called meeting of each craft. The letter to the officers and members of the unions calling for the vote stated that the director general had declared that the proposition was final and that there would be no wage increase granted to any other class of railroad employees as a class, but that in the event of unjust inequalities, as between individuals, adjustments involving increases to equalize rates of pay would be made where justified, except under the conditions stated in the fourth paragraph of the President's statement.

"Knowing the sentiment of the membership," the letter stated, "your committee, after duly considering the proposition, advised the director general that they could not accept as a basis of settlement the rates established in his proposition, as submitted by the President.

"Practically every class of railroad employees have now submitted requests for substantial increases over existing rates of pay. It is well that our members give very serious consideration to this fact, if there is to be any additional general increase in the wages of railroad employees, the federated shop trades will receive the same consideration. Don't fail to give this statement careful thought and don't forget that if the federated shop trades become involved in a strike now, you are striking alone to force an increase for the two million railroad employees.

"In view of the foregoing facts, the statements contained in the President's letter and the responsibility that must be assumed if a suspension of work is to take place, your executive council has decided that it would fail in its duty were it to authorize a strike until the membership have had an opportunity to decide their course of action on this proposition. It is not our intention to shirk any of our responsibilities as executive officers and the wishes of a constitutional majority of the membership, expressed by their vote as hereinafter directed, will be carried out. Until the wage question has been disposed of there will be no action taken in connection with reaching a conclusion on the national agreement."

Then follow instructions for taking the vote, which is to be returned at once. "Pending the issuance of the official strike order (provided the members vote to strike) it is earnestly requested that every member shall remain at work." It is also stated that owing to the large number of members involved, it must be understood that the respective international organizations will not be obligated to pay regular strike benefits beyond the limits of the funds available for that purpose.

This letter was much less belligerent than a circular issued by B. M. Jewell, acting president of the Railway Employees Department of the American Federation of Labor, and the executives of the shop unions, under date of August 5, giving instructions for the plans and methods to be followed in case of a strike resulting from the vote which was returnable on August 24. In this it was stated that, "If it comes to a strike we want to make the tie-up complete and keep it in that condition until we get the proper recognition from those that can give it to us. Our success depends entirely upon how we can stop the transportation service of the country. If it comes to a strike we must make it the most effective one in the history of this country." In presenting a copy of this in the Senate on August 23, Senator Thomas of Colorado said: "I merely wish to say, in comment upon this remarkable document, that it is a perfectly legitimate development of the action of Congress in 1914 in exempting organizations of men from the operation of the anti-trust law."

Wage Board May Take Up Adjustments

Director General Hines has addressed a letter to A. O. Wharton, chairman of the Board of Railroad Wages and Working Conditions, to define the functions which it is appropriate for it to perform in view of the decision announced by the President.

"The position of the government," he says, "is that in view of its campaign to reduce the cost of living, and of the strong prospects that substantial relief will be achieved, it is not proper now to make general increases in wages on the assumption that the present cost of living will be permanent, and that pending the efforts of the government to bring down the cost of living, the higher costs of living ought not to be accepted as a permanent basis of wage adjustment; although it is recognized that if the efforts of the government to bring down the cost of living should fail, railroad wages should be readjusted in the light of any permanent

higher living costs which would thereby have to be recognized.

"The President has also made it clear, however, that the Railroad Administration is not precluded from giving prompt and careful consideration to any claims that may be made by the various classes of employees for readjustments believed to be proper to secure impartial treatment for all railroad employees.

"I therefore request that you take up promptly the claims which have already been presented and those which are to be presented by any classs of railroad employes to the effect that either for their classes as a whole or for any subdivisions of those classes, readjustments ought to be made in order to make sure that equal treatment is done on the basis of the general principles of wage adjustment which the Railroad Administration has already established.

"It has been our constant endeavor since the first wage adjustments were made by the Railroad Administration to deal fairly and impartially with all classes of railroad employees. The situation is so complex that absolute perfection in this regard is unattainable. Nevertheless, our experience up to the present time may in all probability develop that certain relative injustices may have been unintentionally done, and it should be our purpose promptly to correct these injustices.

The Railroad Administration has been firmly committed to the policy since last September that it cannot make wage adjustments retroactive back of a date approximating the date upon which your board makes its report, because otherwise there would be unending confusion and all effort to get a measure as to the cost of conducting the railroads at any given time in the past would be rendered hopeless. I therefore hope that your board will be able to report promptly upon any inequalities which may be found to exist, to the end that any correction which the director general may find appropriate can be made effective at the earliest justifiable date in accordance with the policy of the Railroad Administration.

"In all such matters the board will be expected to report not only a statement of facts and its conclusions upon the facts, but also its recommendation."

From the Columbus (O.) State Journal

Precedent

Coal Association Says Transportation Is Insufficient

THE RAILROAD ADMINISTRATION is not furnishing enough transportation to insure production and shipment of sufficient bituminous coal to meet the requirements of the nation this year, John Callahan, traffic manager of the National Coal Association, testified before the Senate committee investigating the coal situation.

"Car shortages caused the coal mines to fail to produce 5,900,000 tons of coal during the weeks ending August 2 and August 9," Mr. Callahan said. "This is sufficient coal to supply the requirements of the state of New Jersey for ten months. The difficulty to-day is a transportation deficiency and not a car shortage alone. Coal is one of the few commodities which cannot wait on transportation. It is physically impossible in many instances to bring coal to the surface and store it. "Moreover, the proper place to store coal is at the point of consumption, where it will be available when required for use. Railroad cars must be ready when the coal is brought out of the ground.

"Many mines are idle to-day on account of no cars. Two hundred and eighty-five mines were idle because of car shortage in one West Virginia district during the week ended July 26. This was before the shop men's strike. Ninety-seven mines in this district failed to go to work in one day while many others only worked part time that day.

"The total bituminous coal lost through lack of railroad cars at the mines from the week ending June 7 to the week ending August 9, inclusive, was 12,251,762 tons, distributed by weeks as follows—June 7, 338,996; June 14, 655,190; June 21, 936,662; June 28, 644,149; July 5, 385,485; July 12, 428,359; July 19, 1,146,075; July 26, 1,764,264; August 2, 2,311,402; August 9, 3,591,180. This means 245,000 cars, or 7,000 train loads. This is more than six months' supply for all of the New England states; and this loss occurred in 10 weeks only.

"Since July 12, this shortage has been increasing by leaps and bounds. These figures are based on the United States Geological Survey reports, which indicate that whereas for the week ended July 19, where Director General Hines chose to close his recent report to the Senate, the loss on account of car shortage was 7.4 per cent of full time output, the loss on August 9 was 22.5 per cent; this in the face of statements by the Railroad Administration to the effect that conditions are not now normal. In other words, the loss because of no cars at mines has trebled in three weeks, and is now on a parity with the ordinary shortage during severe winter months when the railroads are handicapped by congestions and engine failures.

"The director general points out that 37,000 new cars have been built, of which 17,000 have been put in service. If all of these 37,000 cars had been in service during the week of August 9 there would still be a shortage of 34,000 cars during that one week alone; but these cars are not yet in service and they are going into service very slowly. The director general states they are being stencilled and lettered and placed into service. He does not say how rapidly. In one instance recently where 2,000 of these cars were being lettered, the work was being done at the rate of 10 cars per day; on this basis, more than seven months would be necessary to place this one batch of 2,000 cars in service."

Mr. Callahan said that the movement of traffic is not adequate to the demands of coal to-day, and presented a table indicating that the average miles per car per day of all cars during 1915 was 24.4 miles. "The mileage per car per day for all cars in 1916," he continued, "was 26.9 miles. It declined in 1917 to 26.4 miles per day, and in 1918 it was 24.9 miles per day, but during the first six months of 1919, the

average miles per car per day for all cars declined to 21.5 miles. This means a much lower mileage on coal than the average figures shown. If all traffic is moving slower, it is natural to suppose that coal moves much more slowly."

Mr. Callahan also introduced charts showing bad order coal cars by weeks from April 5 to July 19, and indicating that whereas there were 66,192 coal cars in bad order on April 5, on July 5 there were 105,295 of such cars requiring repairs, a rise in the percentage from 6.5 to 10.4 percent of the total coal cars in the country. He also stated that "while the Railroad Administration statements recently set forth that there are 208,531 bad order cars at the time Mr. Hines's report was written (August 14) and while the director general stated that 'a large number of cars awaiting repairs are held for only light repairs which can be speedily applied' the facts are there were 135,895 cars requiring heavy repairs, and 72,636 cars requiring light repairs at the middle of July. This figure includes all cars and it is assumed that there are relatively as many coal cars requiring heavy repairs as other cars requiring heavy repairs." At the time to which reference is made 47 per cent of these 208,531 cars, or 98,139 cars were coal cars in bad order; and that on August 2, there were still 96,758 of these coal cars to be repaired.

"The shop men's strike has occurred since August 2, and there are doubtless many thousand additional cars to-day requiring repairs, over and above the number on August 2," Mr. Callahan said. "There are proportionately more coal cars in bad order to-day than closed cars. Of a total of 1,183,490 closed cars, 95,928 or 8.1 per cent were in bad order on July 12, as compared with 98,139 bad order coal cars, out of a total of such cars of 974,547 or 10.1 per cent coal cars in bad order. Repairs to coal cars are being neglected through preference to other cars. Moreover a figure of 10 per cent of coal car ownership in shop is abnormal. There should not be to exceed 5 per cent of the total number of coal cars in shop under ordinary good railroad management.

"The country is full of bad order cars. They impede the movement of freight through railroad yards in certain districts and are backing up the current of traffic. Moreover 8 to 10 per cent of the 62,000 locomotives owned by the railroads under Federal control are now in the shop for classified repairs. These 5,500 or more engines, according to indications, will be needed quite early this winter. They could be used now in avoiding blocking coal mines with loaded cars. If these engines are not repaired at once, they may, when required for use, be in just the same condition so many cars are in to-day."

Mr. Callahan also quoted some correspondence with the Railroad Administration in which Mr. Hines said:

"There appears to be quite a disposition on the part of coal operators to exaggerate the argument about car shortage. I hope this disposition will not be persisted in because necessarily if the situation should be habitually exaggerated we would have to take issue with the claims thus made. It would be unfortunate for the Railroad Administration and the coal operators to get into a controversy on this subject because the controversy would tend to encourage people who are postponing the purchase of coal to feel that the coal operators are not justified in urging the purchase of coal. Naturally we prefer to see the purchase of coal expedited so it can be handled before the Fall and hence we prefer not to say anything which will tend to encourage purchasers to hold off. Yet we could not remain quiescent under repeated assertions exaggerating the car shortage situation and incorrectly stating the policy of the Railroad Administration as to utilizing and repairing its equipment.

"What I would like very much to do is to get the practical co-operation of the coal operators in notifying us of any serious car shortages that exist in specific regions. Of course these matters are reported through our regular channels and are supervised accordingly, but a systematic and accurate check of the matter from the standpoint of the coal operators would be an additional safeguard of which we would gladly avail ourselves. Specific information along these lines conveyed to us will help us to handle satisfactorily a situation of common interest."

Senator Lenroot Introduces Railroad Bill

UNIFICATION OF ALL RAILROADS in the United States into a single national system, privately owned, with minimum earnings guaranteed, and with the management shared by shippers, farmers, security owners, employees and the public, and excess profits divided between the public and employees is provided for in a bill introduced in the Senate on August 27 by Senator Lenroot of Wisconsin.

The bill embodies the views of the Wisconsin Senator and Nathan L. Amster, president of the Citizens' National Railroads League.

Some of the principal features of the bill are:

The ownership and operation of all the railroads by one privately owned and privately operated railroad company with full public control.

The management of this corporation, under the supervision of the Interstate Commerce Commission, by a board of 11 directors selected by the President out of a limited number of names proposed to the President by the various classes of the public—two from the employees, two from commerce, industry and the shippers as represented by the United States Chamber of Commerce, two from the farmers as represented by recognized farm organizations, three from the security holders, one from the Interstate Commerce Commission and one from the state railway commissions.

The selection by the directors of a director-general, who holds office at their pleasure, to operate the roads under such regional divisions as the directors may determine. An efficiency and economy board of five men selected by the President out of engineers proposed to him by the leading engineering and technical societies of the nation, to study service and suggest and supply improvements and inventions.

The valuation of all the railroads by averaging the original cost less depreciation, the reproduction cost less depreciation and the net earnings over the last 10 years capitalized at 5 per cent per annum, varied by urgent equities. Procedure is provided for expediting the valuation and for an early judicial determination of the fairness of such valuations.

Existing bonds would not be disturbed; new stock with maximum dividends of 6 per cent per annum would be exchanged for existing stock as valued by the Interstate Commerce Commission. Earnings in excess of 6 per cent will go 40 per cent to labor, 30 per cent to the public for improvements and retiring outstanding stock, and 30 per cent to the stockholders.

The government would guarantee dividends of 4 per cent on all stock issued by the corporation. No stock to be issued without the consent of the Interstate Commerce Commission.

The directors would establish various labor boards with equal representation for labor to suggest improvements of service, working conditions and safety and to study wages and mediate in all labor disagreements. The right to organize and the right of collective bargaining would be guaranteed.

The Traveling Engineers' Convention.—The Railway Equipment Manufacturers' Association announces that 65 firms have already arranged for space at the exhibit which will be held in connection with the convention of the Traveling Engineers' Association at the Hotel Sherman, Chicago, on September 16, 17, 18 and 19.

American Railway Materials in the Far East

China a Big Market—Japan Likely to Be More of a Competitor Than a Customer in the Future

That American railway supply concerns should find a large market in China in the future, but that Japan will probably come to be regarded as less of a customer than a competitor is the conclusion of Frank Rhea, as expressed in his report on Far Eastern Markets for Railway Materials, Equipment and Supplies issued this week by the Bureau of Foreign and Domestic Commerce. Mr. Rhea, whose earlier report covering Australia and New Zealand was published some time ago, investigated for the present report, China, Japan, Manchuria, Korea and the Philippines. The report, Special Agents Series No. 180 is a paper bound book of 339 pages. It goes into great detail concerning the history and development of the railways in the countries visited and contains a detailed analysis of the physical, financial and operating conditions of all individual railways. It draws particular attention to the lack of unity of the Chinese railway system and the great need of further extensions, additional equipment and the working out of standards on these lines. It also emphasizes the difficulty of bringing about these things without some scheme of consolidation or unification, a change which in the past has been hindered by the various loan agreements and spheres of influence. "Regarding Japan," he says, on the other hand, "it seems only necessary to say that it has passed through all the stages of its railway development until at present, from the standpoint of railway markets, it seems a question rather of competition from Japanese sources than of retaining the general trade in the Empire that the United States has enjoyed in the past. While there will continue to be markets for many materials of American manufacture, the Japanese will, of their own accord, investigate and decide as to their requirements. In short, Japan has reached the point where it is capable of carrying on its own individual railway development. This has been the object of the Japanese railway policy for a considerable number of years."

A Train of American Equipment Throughout on the Kwangtung-Yueh-Han Railway, Which Will Eventually Become Part of the Canton-Hankow Line

Equipment

Mr. Rhea brings out plainly in his report the effect of the existence of the loan agreements and spheres of influence on the equipment and construction of the Chinese railways. These lines have been built to the standards of the countries which supplied the capital for their construction. There are, for example, four distinct types of locomotives, British, Franco-Belgian, German and American. The last are present to a greater or less extent on all lines, but they predominate on the Chinese built lines, such as the Peking-Suiyuan and the Shanghai-Hangchow-Ningpo. Mr. Rhea favors the American engines with their bar-frame construction as being best suited to the class of track construction and maintenance that prevails on most Chinese railways.

The Chinese railways have as a whole, the report says, a more miscellaneous assortment of equipment than any other equal mileage of railways in the world. A considerable part of the rolling stock is light and of small carrying capacity. This, the report says, is unfortunate, for the reason that the railway business of China is not naturally a classified goods business but rather the transportation of commodities, and this tendency as the railways are extended and the traffic grows, will probably become more pronounced. Therefore, the advantage of freight cars of large capacity and heavy motive power along the lines of American practice is readily apparent. The small capacity of the bridges, on most lines, however, will have to be corrected before the type of equipment demanded by this class of traffic can be used. The tendency nevertheless is towards rolling stock of greater capacity until today practically all new freight cars are of 30-ton capacity.

It is surprising, says the report, to find the small amount of freight equipment that is equipped with air brakes. When used, air brakes are of the Westinghouse design of the nation furnishing the equipment. It is not usual for other nations to put as much braking on the locomotive and tenders as is the American practice.

The British have used their typical steel-tired wheel, usually with cast steel centers and of 42-in. diameter on passenger and freight cars of all classes and capacities. The Germans have done the same with a wheel 100 cm (39.37 in) diameter. On the American equipment, particularly freight

cars, most of the wheels have been of the regular chilled cast-iron type and according to the information obtainable, have given satisfactory results.

With the conditions now prevailing and until such time as the Ministry of Communications adopts definite specifications, it is quite proper (and, in fact, advisable) for American manufacturers to put forward propositions conforming in general to American specifications for equipment to be furnished to the Chinese Government railways; advantage should be taken of such points as type of engine frame, but such non-essentials as type of boiler and fire-box materials can be conceded. This suggestion is made for the reason that, in the writer's opinion, the best interests of the Chinese Government Railways will be served by the use of rolling stock along the lines of American practice. Inquiries from Japan will no doubt give very definite and detailed specifications as to what is wanted.

Buying Additional Equipment

In view of the small amount of rolling stock that the Chinese Government Railways now have for the handling of their traffic and the immediate need of additional equipment to take care of their growing business, it appears to the writer that there exists an excellent opportunity for American interests to furnish a considerable quantity of rolling stock, to be financed through the medium of equipment trust certificates, along the same general lines that have been followed in connection with the American railways for many years.

Kind and Amount of Equipment Needed

At the risk of repetition, it is felt that the situation warrants the statement that additional freight equipment in general should be of large hauling and carrying capacity, that it should be provided with power brakes, and that there should be a continuance of the use of automatic couplers constructed with robust draft rigging for the handling of heavy tonnage trains over moderately long distances. It is not probable that the hauls in China will equal those in America, but in all

A Typical Station on the Canton-Kowloon Line

probability the average future haul in China will considerably exceed the average in most other countries and much of the business will be done on a commodity basis.

It is quite impossible to state the amount of equipment that will be needed, but, with the car efficiency now obtained, it seems reasonable to assume that the Chinese railways will not need an amount of equipment equal to that needed in the United States. However, as the haul becomes longer (as it has been steadily doing) and as the business grows it is hardly likely that the present car efficiency will be maintained. Therefore, it is probable that a very considerable amount of additional rolling stock—especially freight cars and locomotives—will be required, but that this will not be equal to that on American railways handling an equal amount of business. One element that has helped the Chinese lines and probably will continue to do so is the supply of labor available in all parts of China, which makes it cheaper to unload cars and store the materials than to pay the present high car-demurrage rates.

Roadway and Bridge Materials

One serious handicap from which the Chinese railways are now suffering and which it will be very expensive to remedy is the fact that all the bridges that have been built carry what

On the Yunnan Railway. A Typical Scene of Almost Any Chinese Line

American railway men consider very light loads. In only a few cases does the load exceed the equivalent of Cooper E-40, and in a number of instances it is as low as E-35. A good example is the Shantung Railway, where the Japanese management is desirous of using heavier motive power, but is unable to do so because the bridges only carry a load equivalent to Cooper E-35; there are about 1000 structures involved, but most of them are short single spans. Each nation has followed its particular practice. It is also apparent that on some of the lines sufficiently large openings have not been provided.

Bridge materials for the Chinese Government Railways thus far have been largely furnished by the loan interests or from the Shanhaikwan bridge works of the Peking-Mukden Railway. In general, the specifications have conformed to the practice of the nation responsible for the loan. For recent construction and replacement, however, a good many bridges have been obtained from American sources. This is particularly the case with the new work on the Canton-Hankow line and the replacement on the Peking-Hankow line of bridges lost in 1917.

On account of the great scarcity and high price of lumber, there is a decided tendency to construct railway buildings of all classes with brick stone or concrete. On most of the lines very substantial buildings of all classes have been provided, and, as already mentioned, in some instances these are elaborate and ornate.

The supply of crossties is a matter of the greatest importance to all the Chinese railways. No part of China, except portions of Manchuria, has any timber suitable for ties. In the past most of the ties used have come from the North Island of Japan, and this will probably remain the main source of supply for some years to come.

One of the great problems of railway construction and maintenance in China will be the supply of suitable crossties.

The life of most timbers is comparatively short and the cost high. In the writer's opinion, a special steel or other similar type of crosstie will provide the solution of this difficulty. One of the conditions that will assist in the success of special track construction in China is the large supply of the cheap and capable labor required for such construction and maintenance, particularly when heavy traffic is handled.

The supply of timber in China is small and the price very high, and the present growing practice of using reinforced concrete for station curbing, information signs, fence posts,

A Scene on the Yunnan Railway Showing Typical French or Belgian Railway Construction

and many similar requirements will no doubt be further extended on all the lines.

Normally the Japanese railways are supposed to obtain their supply of rail and fastenings from the Imperial Japanese Steel Works and the Chinese railways from the Han-Yeh-Ping Steel Works, but, because of the demand for the products of these plants, considerable quantities of rail and fastenings have been obtained from other sources. Japanese railways recently obtained a considerable quantity of rail from the steel mills in Colorado. There is a decided opportunity for the use of rail anchors (anti-creepers) on many of the Chinese railways. All rail anchors used thus far in both countries have been largely from American sources, although in Japan the practice is quite extensive of using second-hand ties set on end to anchor the track.

While the frogs and switches have conformed in the main to the practice of the builders, the tendency for new work and maintenance is to use material along the general line of practice that is becoming common in both China and Japan, representing what might be termed a compromise between British and American practice. Thus far only a few special hardened parts have been used, but the growing traffic on both the Chinese and Japanese railways will warrant the extensive use of such material, for which their track work is well adapted.

Shop Machinery and Tools

The Japanese railways have given this subject careful study, and their shops, as a rule, are equipped with well-selected machines and tools, a large percentage of which are from American sources, although much equipment is also of British and German manufacture and a growing percentage is of Japanese manufacture. The Japanese are very alert and are increasingly appreciative of the benefit of the best equipment along these lines. They will doubtless keep close watch on American developments, and, in all probability, this will continue to be one of our best fields in the Japanese railway markets, particularly on account of the special adaptability of many American products. American machinery and tool manufacturers are, as a rule, well represented in Japan either by American concerns or by the strong Japanese commercial and engineering companies.

Outside of the South Manchuria Railway shops at Shakako and to a certain extent the Tangshan and Harbin workshops, the railways in China are rather inadequately equipped with expediting and labor-saving machinery and tools. Much of the present equipment is of American manufacture, even on the lines built with British, French, and Belgian loans, but in the German-built shops nothing but German machinery has been used.

With the limited equipment and the pressure of growing business the present slow hand methods of doing much of the work have proved unsatisfactory—not from the standpoint of cheapness but because they keep equipment out of service when it is badly needed. A typical case of this is the boiler repairs to the large locomotives in use on the Peking-Suiyuan Railway, which are held out of service almost twice as long by reason of the hand work as they would be if the repairs were effected with a full complement of compressed-air working tools. Therefore, notwithstanding the cheap and capable labor, there should be, and probably will be, a growing demand for shop tools in the Chinese Government Railway workshops.

Representation

The question of representation is admittedly one of much importance. In Japan, at present, there are a number of well-organized American concerns representing American manufacturers; most of these have Japanese employees who are technically familiar with the products handled. The several strong Japanese commercial and engineering companies usually represent a number of American manufacturers for the sale of railway materials, and as a rule these concerns have a well-organized technical staff. In addition there are a num-

French Equipment on the Yunnan Railway

ber of large American manufacturers who have established branch plants in Japan. Much has been said concerning the advantages of these different arrangements, and, on the other hand, there has been considerable criticism of each of the last two methods as not being, in the long run, to the best American interest. The writer inclines to the opinion that it is quite desirable, in any event, for American interests to retain control of the business in some form, and the first of the above arrangements has much to commend it, especially in view of the fact that there are at present a number of well equipped American concerns for handling the business.

In China, aside from the Han-Yeh-Ping Co. and the railways' own workshops, there are very few strictly Chinese

concerns handling railway business. There is, however, a considerable variety of commercial concerns in China representing American manufacturers of railway materials. Some of these are of strictly American interests, but few are fully staffed with Americans, although several are approximately so, especially as regards the technical staff. Some of the other concerns are mixed as to interest, nationality of concerns represented, and nationality of staffs (particularly the technical staffs). It is felt by the writer that American interests and also the customer's interests would be best served

Typical Light Railway Equipment Such as Is Used on the 2 Ft. 6 In. Gage Feeder Lines of Japan, Korea or Formosa

through the repreentation of American manufacturers by American or American-Chinese concerns. Such interests will give the best consideration to the permanent maintenance of the business, while the houses of other nationality will be chiefly interested in the immediate business and the profit therefrom and will desire to secure later business for their own nationalities. This statement is especially pertinent in connection with the recent war conditions.

The question has been asked whether there are sufficient

A Light Railway of 2 Ft. 6 In. Gage. This Scene Taken on the Antung-Mukden Railway (Since Converted to Standard Gage) Is Typical of the Light Railway Lines in Japan, Korea or Formosa

American concerns of this character to handle the present and future business.

The writer believes that there are; in fact, he is strongly of the opinion that some of the present concerns should make a working arrangement under the provisions of the Webb-Pomerene law (making it possible for American interests to combine in handling foreign business), especially to eliminate some of the unwarranted competition between American interests and to represent fully the best American products. Another desirable result that such a consolidation would tend to insure is the utilization of the most experienced men, particularly those who have been in China and have become acquainted with conditions. Probably more than in other countries, experience is an asset in handling business in China. Application engineers should be engaged for long periods—at least 5 years and preferably 10 years. As a matter of fact, this is the rule with the engineers of other nationalities. Also, to handle these markets to the best advantage, it is very necessary that such engineers should return to America for periodical visits to keep fully up to date with developments. Another advantage of such an arrangement would be the utilization of high-grade men to handle extensive lines of railway materials, equipment, and supplies. This will be particularly desirable when competition is encountered.

In the writer's opinion, the railway markets of China are going to develop along such lines—in fact, conditions are such now—that one experienced, energetic representative can handle a very considerable numbr of similar lines; and he can do this at the various commercial centers if aided by the staffs of the several local offices. This is especially true where these local offices have well-qualified engineers (as they frequently have). These remarks apply particularly to the concerns that have their principal or head office in one of the large trading centers—usually Shanghai but sometimes Tientsin—and branches in the other centers, such as Peking, Hankow, and Canton or Hongkong, these centers being the most important from the standpoint of railway markets.

An additional reason for American manufacturers to combine for handling the sale of railway equipment and materials to the Chinese Government Railways is the growing tendency for the Ministry of Communications to supervise large purchases. Manufacturers in the United States do not yet appreciate as they will later the difference between selling railway equipment and material to a centralized buying organization and the competitive buying of a large number of private railways. This is also a strong argument for having seasoned application engineers available to handle this business, particularly in view of the weight that such men's opinion carries with the Chinese officials. It goes without saying that an acquaintance with the personalities of the officials and a knowledge of the formalities of procedure are valuable assets in this connection; and they both take time to acquire.

Commercial interests of Yoakum, Tex., Hallettsville, Eagle Lake and Houston have protested to the Railroad Commission of Texas against the lack of train service on the San Antonio & Aransas Pass, which has not maintained through passenger service between San Antonio, Tex., and Houston for several months. The contention of the railway is that it has no money for better service and that there is no through travel between Houston and San Antonio. Prior to November, 16, 1918, the San Antonio & Aransas Pass operated two night trains without layovers between Houston and San Antonio. At that time a layover of four or five hours at Yoakum was adopted, the idea being to operate these trains in the interest of local travel into and out of San Antonio and Houston rather than of through travel. This layover at Yoakum led to complaints from that and other points and effective June 1, the layover was changed to Eagle Lake which in turn led to the recent complaints. The Railroad Commission, after investigating the matter, concluded that the through service in effect prior to November 18, should be reinstated and so recommended to the Railroad Administration.

Talk is cheap and so are Thrift Stamps, but the similarity ends there.

Railroad Hearings Before House Committee

Executives Explain Need for Changes in System of Regulation and for Temporary Continuation of Guarantee

WASHINGTON, D. C.

THE PLAN PROPOSED by the Association of Railway Executives for the regulation of the railroads after their return to private control with some provision for the transition period during which they ask that the present guarantee be continued pending a readjustment of rates to the new level of expenses, was advocated before the House committee on interstate and foreign commerce by Alfred P. Thom, counsel for the Association of Railway Executives, R. S. Lovett, president of the Union Pacific, Howard Elliott, president of the Northern Pacific, and S. T. Bledsoe, general counsel of the Atchison, Topeka & Santa Fe. An outline of the plan as presented by Thomas De Witt Cuyler was published in last week's issue. Mr. Thom presented a legal argument and Judge Lovett and Mr. Elliott discussed various phases of it and the general railroad situation.

One feature of the testimony was the appearance of an open breach between the executives and the National Association of Owners of Railroad Securities, which puzzled members of the committee as to why there should be such a difference between the executives of the railroads and men claiming to represent their owners until it was explained that the Warfield plan particularly represents the views of representatives of the bondholders while the executives more particularly are the spokesmen of the stockholders, although neither side was very careful to draw the distinction.

Judge Lovett's Statement

Judge Lovett's statement was principally an argument against any plan which would confiscate any of the net income of a railroad above 6 per cent for the benefit of the less fortunate, or, as he put it, the less efficient roads, and he was bitter in his denunciation of the Warfield plan, declaring that "a man would be a fool to put his money into railroads under such a system." He showed that a net income of 6 per cent would mean much less than that for the security owners because it is necessary to use a part of it for that part of the cost of replacements which cannot be charged to operating expenses but which in many cases adds nothing to the real capital of a road or to its earning power. He applied his remarks to a less extent to the plan of the National Transportation Conference, which also proposes a division of the income above 6 per cent, and insisted that both plans propose to take away the fruits of enterprise and efficiency and give them to the less deserving roads, although the Warfield plan advocates deny this and say that none of the excess earnings of any road under their plan go to any other road.

Judge Lovett also discussed the Plumb plan briefly, saying it is "plainly an effort to Russianize the American railroads," but that so long as we have a constitution the railroad owners will be protected and that the public has the most vital concern in the dangers of the plan. Railroad employees, he thought, do not understand the plan, but when they do, he said, they will repudiate it. If labor is allowed to fix its own wages and hours, he said, it is obvious that rates will have to be increased or the people will have to suffer the consequences through increased taxation. "There would be no protection for the shipping and traveling public against extravagant operation and inefficient service. It is rather a bold move on the part of the American Bolshevist to take first for Russianization the one industry that affects all the people."

"The so-called railroad problem as it exists today is solely a question of railroad credit," Judge Lovett said. "The question before Congress is to find how to get the capital necessary to keep up the railroad facilities which the country must have. Any legislation that does not accomplish that object is futile.

"New capital cannot be driven into railroads. It must be induced to enter. The mere request or invitation or desire of the government that investors should come forward and put their money in railroad improvements will not suffice. It is a business proposition. The government does not propose to guarantee the interest or the dividends. The investor must depend upon the net earnings under the regulations which this Congress is going to prescribe and decide whether he will risk his money in railroads or put it in some other business. If you have decided against government ownership, then it inevitably follows that your system of regulation must be such as to attract investors to railroads, or you won't get the necessary railroad facilities.

"It is absolutely necessary to understand some features of the commission's accounting rules in order to deal intelligently with the matter you have in hand. 'Net earnings' or 'net income' or 'profit,' as these terms are ordinarily used, means the amount remaining from the year's operations after paying all expenses of operation, maintenance and taxes, and is supposed to be applicable to investment as interest on bonds and dividends on the stock. The Interstate Commerce Commission has always so regarded it, and proceeds upon the assumption that the sum may be so disposed of. Legally and theoretically this undoubtedly is true, but practically it is far from the fact.

"Any railroad company that exercised this legal and theoretical right by distributing as dividends all this paper profit or 'net income' would soon come to grief and bankruptcy. Unlike manufacturing business or ordinary commercial business or any other business I know, the amount chargeable to maintenance and repairs under the Interstate Commerce Commission's regulations is not sufficient to make the renewals and repairs necessary to maintain the railroad property. The result is that a very substantial part of this reported and apparent net income at the end of the year has already been spent in renewals and replacements, and is not on hand in cash or any other form available for the payment of interest and dividends.

"This leads to the point I particularly desire to make, which is in connection with the much discussed proposition to confiscate the net earnings of all railroad companies in excess of 6 per cent. If the government is to take for itself or for the inefficient roads or others all in excess of 6 per cent, as proposed, I suppose, of course, it is intended that the stockholders will be entitled to distribute the amount, if any is left after the payment of interest, as dividends.

"The Supreme Court said in effect in the Lincoln Gas Case, decided only last June, that a return of 6 per cent was not enough. But I want to point out to you that it will be impossible for the owners to get even that under the scheme proposed. The 6 per cent which the company is to be allowed to retain as 'net earnings' will not be in cash, but a very considerable part of it will have been spent on the railroad.

"Under the accounting rules of the Interstate Commerce Commission, it is absolutely impossible to even maintain a railroad in running order without spending a very substantial part of the so-called 'net earnings' upon the prop-

erty. Practically all renewals and replacements involve charges to capital account. No railroad company, and certainly no progressive railroad company, renews main line rails without increasing their weight. Very few put down new rails of precisely the same weight as the old. Under the commission's rules, the additional weight and any improved fastenings must be charged to capital. Generally speaking, rail renewals involve a charge averaging probably 20 or 25 per cent to capital account.

"As to other renewals, it is even worse. When a railroad company renews a wooden trestle or other bridge, even in kind, it is required to charge the entire cost of the new structure under existing conditions to capital account, and deduct only the original cost of the ancient structure replaced, which, of course, is much less. So it is with every other structure replaced in kind; and where there is an improvement—as a larger or heavier bridge, or a stone or steel bridge, or a larger or better station or other building in place of an old—the charge to capital account is that much greater.

"What, then, will be the predicament of the railroad company, of the financially strong company, if you pass a law requiring it to pay over to inefficient railroad companies or to the government, all its net earnings in excess of 6 per cent upon the value of its property? It is assumed that after making such payment, it would have 6 per cent left—but not in cash—with which to pay its interest and its dividends, but a substantial portion of it in new rails, bridges, trestles, section houses, stations, coal chutes, water tanks, side tracks, yards, etc.

"I give it as my opinion based upon rather long observation that the average railroad company in this country must spend on an average each year an amount equal to 2 or 3 per cent upon the total value of its property for renewals and replacements of roadway and equipment and in wholly unproductive work, which, under the commission's accounting rules, is chargeable to capital account, in addition to ordinary maintenance.

"What is to become of even the strongest and best company and its credit, if at the end of the year it is required to pay over for the benefit of its weak and inefficient rivals, or to the government, all its apparent net earnings in excess of 6 per cent, and be left, not with cash that it may use in payment of interest and dividends, but with these expenditures upon which it cannot get cash? This is the practical difficulty from which there is no escape if you enact such a law.

"The suggestion which I understand was made by one of the lawyers advocating the Warfield plan, that everything earned in excess of 6 per cent must be deemed wrongful and as taken illegally from the shippers, is utterly preposterous. Six per cent is a minimum on questions of confiscation, but there is no statute upon the books of Congress, and no statute of any state in this Union, so far as I know or have reason to believe, that has ever declared that 6 per cent in any year shall be the limit of return upon any railroad investment. If Congress enacts any such law, it will be a radical and new departure in this country, and in my judgment, it will put an end to the flow of new money into railroad enterprises, for who will put his money into a business involving such enormous risks with no hope of reward in the event of success?

"In dealing with railroad capital, haven't we in this country been indulging in much loose thinking and loose talking as to the old expressions about railroad property being 'devoted to a public use' and its being 'affected with a public interest'? The Supreme Court has repeatedly declared that money invested in railroads is as much private property as money in a bank or as an investment in a home. It is subject to regulation, but not to confiscation.

"Too often and in too many minds, these expressions seem to have led to the delusion that there is some taint upon railroad capital, that it is entitled to less consideration than other capital, that the stock of the banker, the manufacturer and merchant and all forms of corporate enterprise are sacred as private property, but the railroad investment has no rights which anybody ought to respect. We ought to correct that fallacy, for just the contrary is true.

"Capital invested in railroad enterprise is of the highest merit, and there is none more deserving. None is more essential to the public welfare. It is even more deserving of praise than money invested in government bonds, because the latter takes no risks. Unlike the older countries that were built up before railroads, this country was built on railroads, and it is absolutely dependent upon them. The need for additional railroad facilities grows with the growth of population and business. If the government itself is not going to furnish the money, then we must look to private individuals for it; and not only regard for their constitutional rights, but good policy and common honesty demand that they should be encouraged and protected, instead of being made the victims of every half-baked theory that unthinking and unmoral ignorance can suggest."

Judge Lovett said he had not much respect for the property investment account as representing the value of the railroads, because in some cases the accounts represent hard cash and in others almost nothing, because the par value of the securities was entered in the books although much less than par may have been received for them in cash. He insisted that a road's value depends upon what it can earn, particularly when its rates have been made or sanctioned by the government for years.

Representative Winslow asked Luther M. Walter, counsel for the Warfield plan, whether its proponents had taken into consideration the point made by Judge Lovett that part of the net income must be used for renewals and replacements.

"No," said Mr. Walter. "We provide for 6 per cent after all operating expenses are paid, according to the commission's rules, but we do not provide that the shipper shall pay any part of the capital investment. Our plan would not reduce the Union Pacific's dividend, but it would cut into its surplus."

Judge Lovett insisted that he was not talking about operating expenses nor new capital, but about the expenses incurred for replacements which merely maintain the property but which under the commission's rules must be charged to capital. Mr. Winslow said Mr. Walter had confirmed Judge Lovett's statement, but Mr. Walter insisted that the security owners are not asking for enough to pay for capital expenses out of earnings.

"I do not want to use intemperate language," said Judge Lovett, "but in my judgment any man would be a fool to put his money into a railroad under any such system as that. It would not attract capital into the railroads."

The present system of accounting, Judge Lovett said, results in constantly diluting the value of railroad securities if new securities are issued to cover replacements which merely maintain the property, particularly because there is a tendency on the part of operating officers to try to keep down expenses and not worry about the capitalization. He was thoroughly opposed to depreciation accounts except for equipment, and not very enthusiastic about that, but said that the practice ought to be uniform. He did not understand why the Interstate Commerce Commission has not established uniform rules. The Railroad Administration has considered doing so, and had prescribed a uniform rate on all new equipment, but it did not change the practice as to old equipment because the amount of depreciation was involved in determining the standard return. Expenditures that do not add anything to the property in his opinion ought to be charged to a reserve and paid out of operating expenses instead of being allowed to "pile up capitalization."

Unless a company had other resources it would have to use a part of its income to purchase equipment, he continued, because it is necessary to make an initial payment of 25 per cent and the equipment cannot be capitalized for more than 75 per cent of its cost.

The Warfield plan, Judge Lovett said, proposes to take the earnings over 6 per cent from a good road, whose stockholders may have paid 150, 175 or 200 for their shares, to make good the stock of a road which had been sold for 10 cents on the dollar and never was worth anything. "I was recently castigated in the newspapers for saying that," he said, "but it proposes to take money my road has saved to buy equipment for other roads and for the benefit of the labor of other lines. The Chamber of Commerce plan goes even farther and plainly says that the excess is to go into a fund for the benefit of other roads. A great many roads never will pay and never ought to pay; they ought to be reorganized and the losses pocketed. The government should not be asked to guarantee them to pay for their mistakes, but if it is to do so it should pay the bill itself, not take it from others. The Warfield plan does not mean recapturing earnings, as has been claimed. It means capturing savings; the net result of efficiency and economy. If it were desired to carry out such a purpose it might be done by an excess profits tax, the proceeds of which the government could appropriate as it saw fit, but it cannot be done as a regulation of rates, after the relation of carrier and shipper has ended, and it has ceased to be a matter of transportation or carriage. The carrier has performed its service at a legal, reasonable rate. The government may make reasonable rates and as low as it likes provided they are not confiscatory, but it cannot regulate the amount of money the railroad gets out of it. There is no reason in morals, and up to this time there has been none in law why the government should regulate earnings instead of rates. It is inconceivable that the government can make a rate and declare it reasonable and then say a railroad has to give up some of the money. If you want to tax it that is another matter."

Chairman Esch asked why there should be such a difference of opinion between the executives and the investors.

"It is very surprising," replied Judge Lovett, "but the term investors is rather broad. I don't know just who Mr. Warfield represents. I understand he has a wonderful following of investment bankers, large insurance companies and savings banks, but in my judgment he represents mostly bondholders. I know he doesn't represent the Union Pacific. I represent the Union Pacific and my directors are fully advised as to what I am doing."

In reply to questions by Representative Winslow as to whether the roads could be turned back without increasing their income Judge Lovett said it would be utterly impossible for the companies to take over their property and operate it at the present rates.

"Then isn't this committee confronted with a delicate question in proposing to return the roads, and shouldn't we hope that if the Railroad Administration raises wages again it will also provide the necessary rates?" asked Mr. Winslow.

"It isn't a matter of delicacy or hope; it is a necessity," replied Judge Lovett. "It is a question of the solvency not only of most of the railroads, but of many other institutions dependent upon them. This is no time for the popular Washington sport of 'passing the buck.'"

Representative Sims said there had been a good deal of objection because of the increase in rates last year and asked if there would not be a storm of opposition if they were increased again on being returned to private management.

"If we are going to have transportation in this country we have got to pay for it," declared Judge Lovett. "It can be paid for either by the traffic, as it ought to be, or it can be paid for out of the treasury, but no amount of popular clamor will change the fact that you can't get it without paying for it in one way or another, and as the government increased the expenses it ought itself to raise the rates before the roads are turned back—unless it can reduce the expenses."

Representative Rayburn asked if the railroads would not be able to effect economies under private control.

"I should say that as long as the present scale of wages and prices continue they will not be able to. I don't see how any great economies can be expected as long as they stay up," replied Judge Lovett. He said that the increase in the number of employees was practically due to the adoption of the eight-hour day and that the Union Pacific is being operated by the same officers as before, but he had asked the federal manager how much he could reduce expenses if relieved from government control and he had replied that he didn't know how it could be done.

Judge Lovett also urged the necessity for the creation of such a body as the proposed Federal Transportation Board, although he said that personally he had favored a secretary of transportation. "If you are going to leave the question of the sufficiency of rates and facilities to a lawsuit between the railroads and the public," he said, "the future is hopeless. I have seen statements by four of the present Interstate Commerce Commissioners which indicate that they are not aware that there is any question of railroad credit. What hope is there for an investor to put his money in railroads under such conditions?"

Representative Watson said he had tried unsuccessfully to get from the Interstate Commerce Commission figures showing the decline in railway construction, and had finally got them from the *Railway Age*. He asked if the cessation of new railroad building was attributable to the regulation of the Interstate Commerce Commission.

"I don't charge it to the commission," said Judge Lovett. "It is the general situation of which they are a part."

Howard Elliott

Mr. Elliott said in part:

"In creating this great piece of industrial machinery under new, varying and oftentimes very difficult conditions, the government, in its regulating policy, the investors, builders and managers, in their financial and managing policy, and the leaders of organized labor have naturally made some mistakes. There has been competition between the nation, the states, individuals (both in and out of legislative halls) and executive commissions representing both the national and state governments in proposing plans for taxation, regulation and supervision. This competition has resulted in action being taken by the nation and the states which has gradually weakened the capacity of the railroads to live and grow as the country grows. There have been some unfortunate and unwise policies of railroad building and managing that have been magnified and distorted and have aroused some popular distrust. Labor leaders have called or authorized, and sometimes encouraged, strikes that were unfortunate for the men and the communities served.

"The system of private ownership and government regulation, however, was successful on the whole, and resulted in the development of the railroads and the country to a marvelous extent. This growth and development were steady and continuous until the system of regulation failed to respond promptly to changed conditions, the more expensive and luxurious methods of the people, the increased wages needed by employees, the higher cost of everything necessary for keeping the railroads equal to their task, including the higher cost of capital and rapidly increasing taxes, and lacked the necessary elements of protection and encouragement to the business.

"What has been accomplished under private ownership and operation in the past is good evidence of what can be accomplished in the future if private energy and initiative

are encouraged, repressive and conflicting regulation removed, and protective measures added to the regulatory system.

"Is it wise to attempt to improve the present difficult situation by radical measures that dislocate the machinery that has in the last 50 years accomplished so much for the country and all the people in it? Is it not wiser to correct the errors and weaknesses of the present system of private ownership and government regulation rather than to 'fly to evils that we know not of?' I believe it is. If so, in order to obtain the results needed for the protection and development of the nation it will be necessary to change and modify some practices and ideas that have long prevailed.

"The owners must assent to a larger measure of governmental control, but they should also have governmental protection and encouragement.

"The great railroad labor organizations must assent to some orderly way of settling disagreements over wages and working conditions, so that the railroads may continue to serve the public pending the adjustment of disputes.

"The government, in its regulatory practices, must be more responsive to changed conditions, and there must be protection of this great industry as well as regulation, and there must be no twilight zone between national and state authority.

"While the situation is very difficult and fraught with danger to the integrity of our institutions, it is possible that the way out has been befogged somewhat by the numerous remedies proposed. It is helpful, however, that all kinds of people have made various suggestions, and Congress has the great opportunity, duty and responsibility of clarifying the situation and of considering all the plans and producing by a process of elimination a bill that will represent the needs and thought of the nation as a whole and not of any one particular class or idea.

Howard Elliott

"If, as I believe, it is for the best interest of the Nation to go on for at least another generation and have the furnishing of transportation a business function subject to governmental regulation rather than to turn over the work to the government itself, then some general amendments to our present regulatory practices will, I believe, produce the results we all desire, especially if all those in authority, either in private or public life, will advocate patience, forbearance, and a spirit of helpfulness and hard work while all are going through the period of readjustment.

"It does not seem as if we can advance the cause of the Nation or of any individuals by reducing the productive effort of the country and creating a chaotic condition while Congress is at work on this important matter.

Confidence Will Return if Definite Policy Is Announced

"I believe that if the country and the people can be made to feel that the United States has adopted a national transportation policy along the following lines, that the situation will be vastly improved. Naturally, so long as discussion continues, people of all classes will be uncertain and unsettled.

"1. That the governmental regulatory machinery that has for the past 32 years devoted so much time and energy to correcting abuses and to a certain extent punishing the companies for past errors, shall now turn its abilities in part to the encouraging of our system of transportation so that it shall receive income enough from the rates charged to pay:

"(a) All costs and expenses, including reasonable wages in accordance with the constantly improving living conditions that we hope always to have in the United States.

"(b) Returns on the system as it exists today substantially equal to the present 'Just Compensation' until such time as the fair value of the property is determined, when the return should be based on that figure as finally determined.

"(c) Returns on new capital needed to expand the facilities (so that the public will at all times be well served) sufficient to obtain that capital in the markets of the world; in other words, to put the policy and power of the government squarely behind the idea that any regulatory system to be adopted must not only correct abuses and prevent them, but foster and encourage the business and sustain the credit of the enterprise.

"2. That the present method of adjusting disputes over wages and working conditions for public utilities be abandoned and a sane method of deciding these questions be adopted and the strike abolished in the interest of the people as a whole and the forward movement of the country.

"3. That the Sherman law be modified so that consolidations and mergers will be permitted, subject to the approval of federal authority.

"4. That the federal authority be supreme as to all rates and regulations about rates, and as to securities and accounts; state commissions not to be abolished, but the Interstate Commerce Commission to be the regulatory authority for these questions.

"If the Congress will assure the people that these principles are to be the law of the land, the support and good will of the people will come back and their mental attitude will be to encourage and build up the railroads just as much as to encourage and build up agriculture, banking, manufacturing and the various enterprises in which the millions in this country are engaged.

"As rates are the one vitally important part of the financial problem of creating conditions that will permit good service, wages and development of the properties, and also bring a fair return to the owners of the securities, the railroads should have the right to initiate their rates, or prices.

"The general level of rates should be such as to bring to a railroad sufficient revenue, under honest and capable management, to maintain the property in a progressive manner, pay operating expenses, including good wages, taxes, permit proper charges for depreciation and obsolescence, and other

reserve funds, a fair return on the fair value of the property, and provide the credit the railroads must have in order to furnish to the public the necessary facilities and service.

"Another most important element in arriving at a satisfactory adjustment of the situation is that of the wages and the working conditions of the large body of employees. Wages are taking directly more than 50 per cent of every dollar of revenues, and indirectly, through materials purchased, a good deal more than that. To arrive, therefore, at any satisfactory net income, wages must be considered in connection with rates.

"The labor question is, of course, one of the most serious and important confronting the whole world, the railroads in particular, and there must be a broad, human view of it and a spirit of 'give and take' by all classes of people. All good citizens desire to see wages and living conditions improve, but there is a limit to what commerce and industry can pay and survive. It is surely better to have reasonable wages and continuous employment than to force wages so high that industry languishes, for then the wage-earners themselves will suffer most of all.

"The man who puts a dollar of his savings into the transportation business does so knowing that his dollar is subject to the power of the government to make the rules and regulations governing the business. The man who decides to earn his dollar by working for the railroads should be willing to submit to reasonable wages, rules and regulations, just as much as does the man who puts in his dollar already earned. It is in the public interest to have the dollar invested regulated reasonably, and it is equally in the public interest that the dollar paid for service and the conditions of service should be regulated reasonably.

"To bring this about there must be some method devised for fair and reasonable governmental supervision and regulation of wages and working conditions, and such regulation should eventually receive the final approval from the same power that is finally responsible for the rates of fare and freight charges by the transportation agencies, so that the question of income with which to pay will be considered at the same time and by the same final deciding power as the outgo to be paid. Just as the government should have the power to veto the wasteful use of the railroad dollar to be invested upon which the public will be asked to pay a return through rates, so should the government have power to supervise wages and conditions of service, which ultimately are paid for by the public through these same rates.

"With the preservation of private ownership and management in individual systems of railroads there will be a better esprit de corps among the great army of railroad employees than if all became employees of the government.

"Capital may be timid, but it was bold enough in the last 50 and more years to create our great American railroad system. I believe it will be willing to go on with the work if it can be assured that the policy of the government will be to sustain the railroads in the legitimate conduct of their business and allow reasonable liberty of action and will encourage and protect this business, as well as prevent any abuses. The credit of the roads will come back when people understand that Congress has laid down the rule that a reasonable rate is also an adequate rate, sufficient to reflect changed costs, increased wages and a fair return upon the property; when Congress insists that some reasonable method of adjudicating controversies over wages and working conditions shall be written into the law of the land; and when the Nation insists that it is the duty of the government to preserve, protect and expand the transportation facilities of the country as well as agriculture, banks, manufacturers, commerce or other forms of individual activity.

"I believe the plan suggested by the railway executives is a reasonable, business-like and elastic one under which our national transportation system will grow, and which can meet the changing conditions of a growing country like the United States. It preserves and encourages the initiative and energy of the American man that has done so much to build up the present system of transportation.

"It points the way to having the transportation system of the country adequate for its needs.

"It suggests the importance of a reasonable adjustment of controversies over wages and working conditions so that service to the public will be continuous.

"It retains reasonable and regulated competition as an incentive to good service and development along progressive lines.

"It permits the continuation, under suitable regulation, of any plans developed under governmental control that tend to eliminate waste and give improved service through unification of facilities, common use of terminals, co-operative methods, etc.

"It strengthens the regulatory powers of the government to make certain that abuses and wrong tendencies may be corrected and checked.

"It suggests a method of placing the influence and power of the government back of the credit of the roads, so that capital may be obtained for needed improvements and additions.

"It provides machinery of regulation, through a transportation board, Interstate Commerce Commission, regional commissions and state commissions that will be responsive, prompt, and that will safeguard the interests of the railroad users, the railroad owners, and the railroad workers.

"I am an optimist of the long future of the United States. I believe we are on the eve of the most important 50 years in the history of this country, or any country, and that we shall accomplish wonderful results if we exercise common sense, work hard, are thrifty and economical, and all pull together.

"It is very important to come to a conclusion this year as to the new railroad legislation. It can be done. When done, and with reasonable financial protection until the readjustment between income and outgo is completed, our wonderful American railroad system wil start forward again on a period of development and service. These great highways, which are the arteries through which the commerce of the country flows, will be nourished and become elastic again. With co-operation between the railroad users, the railroad owners, and the railroad employees, and with reasonable liberty of action so that the American citizen can use his individual initiative and his tireless energy, the country will go forward to meet its great future better equipped than ever before.

In reply to Mr. Plumb's charges, naming the Burlington among others as having given stock bonuses, Mr. Elliott showed that its only issues of stock during the period mentioned had been 25,000 shares exchanged for convertible bonds and 98,000 shares offered to stockholders at par, which was slightly below the market price at the time so that the rights were worth between $3 and $4 a share. As to the New Haven, he said that all of its stock had been paid for in cash at par or at a premium. Mr. Esch asked that a similar statement be filed for other roads mentioned by Mr. Plumb.

In emphasizing the necessity for legislation to protect the roads during the transition period, which the executives' plan proposes to provide by a continuation of the guarantee pending a readjustment of the rates, Mr. Elliott pointed out that the railroads in the first half of 1919 earned only about 30 per cent of their standard return and that the New England lines had a deficit. If they were turned back in this condition, he said they would be earning practically nothing, in spite of the fact that the valuation reports now being worked out by the Interstate Commerce Commission will show both the New Haven and the Boston & Maine to be worth more than the par value of their securities. He added that the 100,000 employees of the New England lines are receiving good

wages, but that their 75,000 owners would be receiving nothing but for the guarantee. He thought a 25 per cent increase in rates would be necessary to meet the situation, and said he would prefer to have the rates increased to the proper level than to have the guarantee continued.

In reply to questions regarding the effect of freight rates on the cost of living, Mr. Elliott submitted some figures estimating the amount of the trade of the United States in 1918 as $82,600,000,000, whereas the total railway revenues in that year were $5,036,000,000 and the revenues from freight and milk were $3,557,000,000, or only 6.1 per cent.

Referring to a question asked of a previous witness as to whether the railroads did not have a surplus of about one billion dollars, Mr. Elliott analyzed the surplus of the Burlington, which amounts to $213,000,000, to show that very little of it is in cash or available. Of the total, he said, $26,000,000 represents excess of current assets over current liabilities, of which $15,000,000 is in materials and supplies, and $187,000,000 has been invested in the property without capitalization, a saving of approximately $3,300,000 a year for 64 years.

Mr. Elliott called attention to the fact that government operating of railroads does not prevent strikes, and he urged the importance of legislation to regulate labor unions as one means of preventing strikes. He suggested that they be incorporated and required to submit reports to public authority, that their strike votes be counted by public authority instead of secretly, and that the wives of the employees be allowed to vote. He also proposed that the right to strike pending an adjudication be taken away. He said the majority of the men he had talked with had told him they did not want to strike, but felt compelled to by the power of the organizations, and that when the employees of the New York, Westchester & Boston struck because they were not satisfied with a 25 per cent increase, the company had bona fide applications from enough men to fill their places who would accept the pay offered, but the company had feared to take them because of the threat of a sympathetic strike on the New Haven.

Mr. Elliott thought the railroads would be able to effect an improvement in economy and efficiency after expiration of federal control. He pointed out that railroads generally have come to the conclusion that the divisional system of organization produces the best results because it enables questions to be settled at division headquarters without referring them to general officers, but that the Railroad Administration has adopted the departmental form of organization, with inspectors that are sent out from Washington to go over the heads of the officers on the ground. He said the railroads may not be able to get an immediate increase in efficiency, but that they might be able to stop some of the decrease in efficiency. However, they would have to take up "a lot of lost motion" and do an enormous amount of work to get the equipment and other property in good shape. "It will take a little time," he said, "but closer supervision in time will give better service for less money than you can get out of the present highly centralized organization, although it is made up of the same men."

Mr. Thom's Argument

Alfred P. Thom appeared before the committee on August 21 and 22, and then allowed his argument to be interrupted while Judge Lovett and Mr. Elliott and other witnesses testified. He resumed his argument on August 26, discussing the legal phases of the plan proposed by the railroads and explaining the provisions of the bill, which he said was not intended for introduction in Congress, but merely to put in the specific language of a bill the details of the plan. Regarding the proposed Federal Transportation Board, he said:

"We don't propose to put this body in a position superior to the Interstate Commerce Commission. We make its certificate subject to be overruled by the commission for cause, but we give the commission the aid of the recommendations of an independent public body as to what policy is in the public interest.

"The problem before Congress is to present a system that will appeal to the private investor in the future. To prevent oppression or extortion by discriminatory or unreasonable rates is easy enough. That is no longer your problem. The system of railroad regulation heretofore has turned always on the question of trying to control rates. That has been the single object up to this time, but that is based on the assumption that a sufficiency of the facilities and service the public needs was assured. That has been the radical oversight in our policy of regulation. Something must now be done to give the public that assurance. Our first object is to lift up to its proper place the importance of facilities and service.

"When the railroads go before the commission to urge the need for adequate rates we cannot divest the proceeding of the character of a controversy between selfish private interests and the public as represented by the shippers who oppose higher rates. We recommend that you appoint a governmental body to determine what the public as a whole needs in the way of facilities and service and what is necessary to get it."

Representative Winslow asked what kind of men should be appointed on such a board.

"Men of the highest character and ability, the best men it is possible to get, and paid sufficiently to get the best men," replied Mr. Thom. "They should be men of large business experience, but not necessarily of railroad experience; in fact, I should rather prefer that they be not railroad men, who might be hampered by previously conceived ideas."

"We take away no powers from the Interstate Commerce Commission," he continued, "but instead of proposing a definite rule of rate-making, that rates shall provide a certain percentage of return, we have preferred to leave the determination of what is required in the hands of an impartial body, to see that we have enough revenues in order to serve the public properly, and that we do not have too much. We have not felt justified in recommending to you a system of rate-making that isn't flexible enough to respond to changing economic conditions. I have never found anything but difculty in trying to put economic conditions in a straightjacket."

Mr. Thom also laid stress on the contention that the proposed board would be more free from the pressure of popular clamor or the fear of a hostile attitude in Congress than the Interstate Commerce Commission, but various members of the committee dissented from this view. Chairman Esch said the commission had been singularly free from any attempt to influence it, and Mr. Sims pointed out that it would be practically impossible to create a body that could not be subjected to whatever influence might result from the ability of Congress to cut off or threaten to cut off its appropriation. He said that a Senate committee had recently proposed to omit the appropriation for the Federal Trade Commission because it disapproved of its attitude. Mr. Sweet also said that the proposed board would be charged with matters of business policy of such a character that its duties could not be rigidly prescribed, and that its policy would be largely a matter of opinion on subjects likely to become political questions.

In discussing the proposal that the federal commission be given exclusive jurisdiction over rates, Mr. Thom read a letter sent him by the late Theodore Roosevelt, expressing the opinion that it was wrong to permit states to neutralize the action of other states or of the federal authorities, and declaring that "everything connected with interstate business should be a purely federal matter."

State interference could be prevented immediately by Con-

gress taking charge of the whole field, Mr. Thom said, and the whole rate structure should be under the jurisdiction of the Interstate Commerce Commission, so that "a state that wants good railroads will not have to contribute for the benefit of the commerce of a state that doesn't want to pay for good railroads."

In order to protect local interests and to prevent too great a centralization the plan proposes regional federal commissions, with the right of appeal to the Interstate Commerce Commission in some cases. Mr. Esch asked if this was not open to the objection that it interposes one more source of delay before a final determination. Mr. Thom insisted that the regional commissions would expedite matters because they could pass on minor cases much more promptly than the commission at Washington, and could also reach a decision on more important matters in less time than is now required to send an examiner and for the preparation and consideration of his report.

Mr. Thom said the proposal of the Warfield and other plans to distribute all or part of the excess earnings over 6 per cent is based on the assumption that there may be excessive earnings; whereas, he argued, the power of Congress to regulate rates is to prevent their being oppressive or extortionate as to individual transactions, not to regulate earnings from the business as a whole. He said the Supreme Court has held that the reasonableness of rates is not to be determined by the aggregate of the profits of a railroad.

"There is much confusion of thinking on this point," he said. The legislature never attempts to place a limitation on a carrier's earnings. It always approaches the subject from the standpoint of its power over rates. The question of the amount of the earnings has been introduced by the courts in holding rates unreasonable when they produce less than a fair return, and some persons have jumped to the conclusion that the legislature itself could fix maximum earnings. No branch of the government has the power to limit earnings, except by taxation. Earnings depend upon rates and not rates upon earnings, and the government cannot declare a rate reasonable and then take away part of the proceeds on the ground that the volume of business and the number of services performed at reasonable rates result in unreasonable earnings."

The necessity for legislation which will protect the railroads during the transition period immediately following their relinquishment from federal control and until the proper relationship between their revenues and expenses can be established was strongly urged by Mr. Thom. He pointed out that this relation has been thrown out of all proportion by the enormous increase in expenses during the period of federal control, which has caused a loss to the government of a million dollars a day in its operation of the railroads, or $546,000,000 in the 547 days of federal control up to June 30 this year, and that it is the duty of the government to tide the railroads over until they shall have had time to restore a condition of economy and efficiency. For this reason the railway executives ask that the present guaranteed standard return be continued for not exceeding a year until the Interstate Commerce Commission, in consultation with the director general of railroads and the proposed Federal Transportation Board, shall have readjusted the rates so as to restore the equilibrium between revenues and expenses and make the railroads again self-supporting.

Mr. Thom said he was not discussing the causes for the great increase in expenses, but that his concern was for the future, although he declared that "the disappearance of morale which is inevitable in a government operation, has been one of the factors. "When the railroads come back," he said, "I believe that after a time they can make a great improvement and get back to a condition which will make for economy and efficiency, but there must be a period of transition during which the morale impaired by government control is being restored. We are now confronted with expenses that we can't put down and with a degree of disorganization of forces which we must for a time inherit.

"Whose obligation is it to restore the relation between revenues and expenses which has been disturbed by the government? Is it the obligation of the owners? If the government seeks to unload that responsibility on us and place on us the onus of responsibility before the people of increasing these rates will it be doing the fair thing?

"The railroads must have the good will of the people. Isn't it better that the government itself undertake the duty of correcting the situation in the way best justified in the public interest? So we ask that you command the Interstate Commerce Commission to study the proper relation between expenses and revenues and do the thing that is necessary, and that the guarantee be temporarily continued, instead of leaving a trail of bankruptcies that would destroy the financial system of the country."

In reply to a suggestion that 75 per cent of the guarantee be continued, Mr. Thom pointed out that this would not help the roads, whose guarantee now represents their bare requirements and that 75 per cent of the standard return would be $88,000,000 less than is required for interests and dividends for the railroads as a whole.

Mr. Thom also urged provision for funding for a period of ten years the large indebtedness of the railroads to the government for capital expenditures for cars and locomotives and other additions and betterments. Speaking generally for the railroads as a whole, Mr. Thom said, it will be impossible for them to pay this amount at once, because it represents the kind of expenditures usually provided for by long term securities.

Laws to Prevent Strikes Urged

Charles Piez, president of the Illinois Manufacturers' Association, and George A. Nutter, representing the Boston Chamber of Commerce, appearing before the committee on August 21, urged the importance of legislation to settle wage disputes and to prevent the danger of strikes. Mr. Piez said in part: "In order to carry out our view that the rights of the public are paramount, and therefore that interruptions of transportation by strikes or lockouts must not be permitted, we recommend an addition to the act which will empower and instruct the Interstate Commerce Commission to appoint and provide the necessary organization and funds for an arbitration board consisting of six persons, two to represent the public, two to represent railroad managements, and two to represent railroad employees. This board shall, when appealed to by either side of a controversy, or upon failure of the carriers and their employees to agree, investigate and make a finding which shall be final and conclusive to both parties, subject only to final appeal to the Interstate Commerce Commission. As a part of the machinery thus created the employees of common carriers upon taking service with common carriers, shall, as a part of the contract of hiring, accept the provisions of the act and subject themselves to the findings of this body and waive the right to strike. The right of any individual employee to resign permanently from his employment shall not be denied."

In reply to the objections stated by Commissioner Clark in his testimony before the committee to the idea of the commission being given any responsibility for wages, Mr. Piez insisted that it is essential that some one having responsibility for the amount of revenues have a voice in the fixing of wages. He said the Emergency Fleet Corporation had made a serious mistake in surrendering al control over the amount of wages that constitute so large a factor in its cost of production and that the Chicago packers and clothing industries had made the same mistake. The railroad employees, he said, are strong enough politically to have no

reason to fear to accept such a plan as he proposed. In conclusion, he said his association wanted to record its objection to the Plumb plan, but he did not take time to discuss it.

Mr. Nutter presented the results of a referendum taken by the Boston Chamber of Commerce in which the members had put themselves on record by large majorities as being in favor of private ownership and operation of the railroads; against a regional reorganization of the roads; in favor of a return to corporate operation at once with a continuation of the guaranteed standard return for the balance of this year and with provision for an increase of rates, the increased revenues to be placed in a fund administered by the government and to be used in making up any deficiency as compared with the standard return during 1920; in favor of a direction to the Interstate Commerce Commission to authorize a rate structure sufficient to pay a reasonable return; in favor of regional commissions, representation of the public on boards of directors, consolidations and joint use of facilities, supervision of security issues, and the creation of a wage tribunal and the prohibition of a strike pending its decision.

Alba B. Johnson, president of the Railway Business Association, appeared before the committee on August 25 and presented the statement which is published elsewhere in this issue, urging the creation of a Federal Transportation Board and a clear instruction by Congress that rates shall be adequate to insure the development of the railroads. During the reading of the statement Representative Sanders asked how the volume of railroad purchases had compared during the period of federal control and under private management. Mr. Johnson replied that there had been a very large reduction in purchases since federal control. Mr. Johnson was not questioned by the committee regarding the points brought out in his statement, although numerous questions were asked about the cost of locomotives and their repairs.

Land Grants

S. T. Bledsoe, general counsel for the Atchison, Topeka & Santa Fe, replied to the "charge" made by Mr. Plumb that the railroads had received land grants, a form of charge which in past years has been very popular with people seeking grounds on which to attack the railroads. Mr. Bledsoe admitted the soft impeachment that millions of acres of lands had geen granted to railroads to induce them to build and added some additional information.

"There was not the slightest element of donation involved in any federal land grant," he said. "It was a clear-cut trade between the United States and the railway company, or between the United States through the instrumentality of the state and the railway company, whereby the government agreed to grant so much land in consideration of the construction of so many miles and in its operation by the grantee. Each and every grant was highly beneficial to the government, and the great majority of the grants proved extremely burdensome to the roads receiving them. That is to say, the government fully reimbursed itself for the value of the lands granted by doubling the selling price of the alternate sections reserved; every land grant railroad of the United States is now transporting over its land-grant mileage the property of the United States and its officers and employees at 50 per cent of the established tariff rates, and must continue to do so in perpetuity; and the land grant roads are now carrying and must carry in perpetuity the mails of the United States over the land grant mileage for 80 per cent of the compensation fixed for non-land-grand roads. In addition, the states in many instances imposed further obligations, as a condition to pass the grant received by it to the railway company. An instance of this is the 5 per cent gross receipts tax imposed by the state of Illinois on the Illinois Central.

"The amount which the government has received from various land grant roads in the form of reduced transportation and in reduced mail costs has not been ascertained, and can only be estimated. It has, however, been substantially in excess of $75,000,000. The Interstate Commerce Commission is now requiring each carrier which owns a piece of railroad property in aid of the construction of which land was granted, to report in the most complete detail the information required by the federal valuation act. However, the process must be somewhat slow, because many railroads were not able to financially survive the efforts and expenditures necessary to construct the mileage required to secure the benefit of the lands granted to them. In almost every instance construction of the lines was into territory where substantially no traffic existed. The operation of a railway in the absence of existing traffic is a most hazardous undertaking. Bankruptcy followed this effort as to many of the land grant roads. Such grants, therefore, passed from the companies to which they were made to other companies, and sometimes there was a second failure, reorganization or sale, and they passed into the hands of a third company. Some of those engaged in the conduct of public agitation against railroad companies discuss the land grants in the light of the value today and fail to mention the value at the time the grant was made, the obligations imposed upon the railroad companies in accepting the grants, and the fact that the acceptance of many of them resulted in financial disaster.

"Perhaps the only facts not submitted to the jury of public opinion are those showing how inadequate the grants were when compared with the obligations assumed by the railroad companies and how the construction of the roads in pursuance of the obligations assumed in the grants resulted in financial ruin."

Mr. Bledsoe also discussed various features of the railway executives' plan, which he said was the most flexible and workable that has been presented and the only one which attempts to prescribe a definition of a reasonable rate. He also advocated strongly the federal transportation board, saying that now in order to secure a needed increase in rates it is necessary for a road to present to the Interstate Commerce Commission a state of facts that discredits the financial standing of the road and makes it difficult to sell securities because in order to get the rate increase "you have got to prove you cannot survive without it." He also urged the importance of continuing the standard return pending a rate readjustment because the President has indicated that he does not, for the time being at least, contemplate an increase in rates. He added that the stockholder has had no increase to meet the high cost of living. Mr. Bledsoe also answered vigorously some of the arguments made by Luther M. Walter in his advocacy of the Warfield plan, which Mr. Bledsoe said is thoroughly destructive of the property rights and security values of those roads that have heretofore been regarded as successful and the securities of which constitute a large part of the assets of life insurance companies, savings banks and other conservative investors.

Judge Anderson Proposes Unified Railroad System

George W. Anderson, United States district judge at Boston, formerly a member of the Interstate Commerce Commission and the principal author of the present federal control law, appeared before the committee on August 27 and proposed a plan for a unified United States Railroad, combining features of both the Plumb plan and the Amster plan. In describing the plan Judge Anderson said in part:

"Charter a federal railroad company, with very broad powers, including, inter alia, eminent domain to take existing transportation facilities, as well as land, etc., for additional facilities, stocks, bonds of existing companies, or any other kind of needed property with power to issue stocks and bonds for cash at par or for exchange with present security

holders; also to guarantee interest and principal of outstanding bonds.

"This corporation might well be managed by a board of, say, 15 directors, elected and appointed for, say, terms of 5 years each, so classified that the term of one of each class shall end each year. Five of the directors should be elected by the classified employees under by-laws, approved by th Interstate Commerce Commission. Five should be elected by the stockholders and represent capitalistic and profit-seeking interests. Five should be public directors, probably appointed by the President, probably from both political parties and confirmed by the Senate and required to have no financial interest in the stock of the company. This board should have broad, general, managerial powers, including the power to provide for regional administration as they may think wise and experience may dictate. The United States R. R. Co. should be capitalized, not less than 25 per cent nor more than 40 per cent in capital stock, the balance in bonds. The capital stock should have a standard dividend rate not less than 5 per cent nor more than 6 per cent, cumulative—such rate as will fairly ensure par market values in all normal times. Probably new issues for extensions and additions should be distributable to outstanding stockholders at par, although the stock would in ordinary times undoubtedly sell at a substantial premium. But it is desirable that there should be an adequate incentive to spend new money for needed and useful railroad development.

"I think, although this is not free from doubt, that the government should guarantee an annual dividend on this stock, possibly of 4 per cent, not less than 3 per cent. Such guarantee would, in my present view, cost the government nothing; it would stabilize the financial market, improve the credit of the company, and reduce the ultimate capital cost of our transportation facilities.

"Any surplus profits above operating expenses, fixed charges, and standard dividends should annually be divided into thirds:

"(a) One-third for the benefit of capital, applicable to an additional dividend up to a reasonable maximum, probably 7 per cent. Any balance of this 1/3 accruing in fat years should be held in a reserve for the purpose of providing for the payment of the standard dividend in bad years.

"(b) One-third as a dividend to labor on a properly classified schedule.

"(c) One-third for strictly public uses; at the outset perhaps to pay for the government's advances hitherto or hereafter to be made during the transition period, thereafter for such public purposes as Congress may authorize by statute or through the U. S. R. R. Co. and the Interstate Commerce Commission.

"Given a single federal railroad company, with broad powers and organized substantially as above, the present roads might well be taken over substantially as follows:

"An offer should be made to the stockholders of the chief roads to buy their stock by exchanging stock of the U. S. R. R. Co. in such amounts as to give to the present stockholders a return reckoned on the standard dividend of the new stock not greater, and perhaps, considering the greatly improved quality of their security, somewhat less, than that which has accrued to stockholders from the regular dividends paid during the period of federal control. To illustrate: If the standard dividend of the U. S. R. R. Co. stock is 6 per cent, Pennsylvania stockholders who have been receiving 6 per cent should be offered a chance to swap on terms not better than share for share. Northern Pacific stockholders who have been receiving 7 per cent would be given a like return by receiving one and one-sixth shares of the new stock for each share of their old stock. New York Central stockholders would have five-sixths as many shares of the new stock as of their present stock. In my present view, the new stock will be so much better than the old stock that the government ought to get some diminution in rate from the regular dividends paid even by the best of the railroad companies during federal control.

"At any rate, an offer should be made to existing stockholders so just and fair that the great majority of them would be glad to accept it. The rights of dissenters should be taken care of by due process of law substantially as are dissenting stockholders in ordinary cases of consolidation.

"No plan for the reorganization of our railroad system has any reasonable prospect of success that does not recognize the fundamental need of a radically changed status for labor.

"Labor must be given just and proper representation in the initial management of the roads, and assume a responsibility for the uninterrupted, efficient, economical and progressive development of the rail facilities—entirely different from that which has obtained hitherto when the railroads have been run by corporations, organized for profit, and by labor unions, organized for economic war. Full recognition must be given to the fact that the men who contribute faithful, efficient and long-continued service in the transportation industry are as much entitled to representation in the management thereof, and must be held as responsible for the wise exercise of managerial powers, as are the contributors of capital used to pay for the railroad facilities.

"The present status of irresponsibility and consequent threatened interruption of railroad service, together with the utter lack of proper incentive for efficiency and economy in the management and operation of rail facilities, is practically admitted by all to be intolerable. The only plan now before Congress which really undertakes to meet this essential difficulty is the Plumb plan, and that plan offers, in my view, a remedy which may not improbably be almost, if not quite, as bad as the disease that it undertakes to cure.

"Labor is entitled to a large and influential position in the management of our transportation industry. It is not entitled to control that industry, either as proposed in the Plumb plan, through management of the corporation administering the rail facilities, or as is potentially involved in the present system through the domination of extra corporate organizations called labor unions. The railroad business is a public business. It must be managed by, and controlled for, public interests. Until that fundamentally important principle is recognized and sought to be made effective, there will be neither peace, security, nor progress in our transportation field.

"I propose to meet this difficulty by providing that in the contemplated unified United States Railroad Company the classified employees shall elect one-third of the directors or governors. In addition the law should provide for a competent and impartial tribunal to deal with all wage and other labor controversies, its decision to be final. Labor should also have a one-third profit-sharing interest in any surplus profits above standard dividends.

"Given, then, a fair share of initial managerial responsibility, a competent tribunal to determine all labor controversies, a profit-sharing interest in the business, combinations of employees in restraint of trade must be made illegal on the railroads, as are like combinations of capital in general industry. Strikes are combinations in restraint of trade. They are now legal. With this radically changed labor status, labor would need no such weapon, and they must, on the railroads, be made illegal, their illegality to be dealt with by the courts of equity and the courts criminal, substantially as are illegal capitalistic combinations in restraint of trade.

"But the right of the individual employee to leave his employment, even if he breaks a contract, should remain inviolate. The railroad employee should be as free (and no freer) to break his contract as is the capitalist."

Representatives of the state commissioners were to follow Mr. Anderson, after which it was expected that Mr. Walter would return to answer some of the attacks on the Warfield plan made by the representatives of the executives.

At a party conference of the Republicans in the House the railroad question was given a prominent place in the legislative program for the session. Chairman Esch, of the Interstate Commerce Committee, said it would probably be three weeks before the hearings on the railroad legislation would be completed.

Orders of the Regional Directors

FEDERAL TAX ON LONG DISTANCE TELEPHONE MESSAGES.—The Southwestern regional director in Order 230 quotes a letter from the Commissioner of Internal Revenue, stating that telephone messages directly connected with the operation of railroads under federal control are not subject to tax. The Northwestern regional director has issued a similar order, Supplement 4 to Circular 59.

Secret Service Department.—Order 231 of the Southwestern regional director states that Charles Weinbrenner, recently appointed inspector in the Southwestern region representing the Secret Service and Police Section of the Division of Operation, will co-operate with special service departments in every way possible. Chief special agents should forward to him copies of their reports relating to important cases of theft.

Shippers' Export Declarations.—Supplement 1 to Order 110 of the Southwestern regional director states that it will hereafter be necessary for shippers to file but two copies of shipper's export declaration covering shipments to foreign countries.

Roadmasters' Convention.—The regional director of the Central Western region issues similar instructions to those issued by the Eastern regional director in Circular 102-42 (*Railway Age*, page 316, August 15).

Grain Embargo, Primary Markets.—Supplement 7 to Circular 83, canceling Supplement 6 thereto, states that grain that is included in permit regulations when reconsigned from destination originally named to a primary market will require an individual permit from the primary market to which reconsigned. This will include:

1. Cars shipped from one country station to another and reconsigned thence to a primary market.
2. Cars shipped from a country station to a primary market on road or blanket permit basis, and before reaching that market reconsigned to a different primary market.
3. Cars shipped to a primary market and afterwards reconsigned to another primary market.

National Railroad Accident Prevention Drive.—The Northwestern regional director, file 97-1-20, promulgates a letter from the director general with reference to the "National Railroad Accident Prevention Drive," October 18-31. (*Railway Age*, August 15, p. 326.)

Export Bills of Lading.—The Southwestern regional director in Circular 240 issues revised instructions governing the issuance of through export bills of lading via North Atlantic ports. The Southwestern regional director in Circular 241 issues revised instructions governing the issuance of through export bills of lading via Pacific ports.

Parcel Post Weight Limit.—Circular 242 of the Southwestern regional director quotes the order of the postmaster general fixing the limit of weight for surplus food products and other supplies under the control of the War Department, placed on sale to the public by that department and distributed to the purchasers through the parcel post service, at 125 lbs.

Special Agents' Organization.—Circular 243 of the Southwestern regional director announces the organization of the Southwestern Regional Association of Chief Special Agents, the object of which is to promote co-operation between the special service departments of the various lines in the Southwestern region. The first meeting of the association will be held at Galveston, Texas, August 27.

Pay and Vacations of Train Despatchers.—Supplement 13 to Circular 28 of the Northwestern regional director states that, because of the rather indefinite status of train despatchers in the past, they appear to have suffered the disadvantages attached both to officers and employees without enjoying the advantages attached to either class; and in view of the exceptional importance of the work of train despatchers, the men should be classed as officers and given fully the consideration due to officers. Instructions are issued to insure train despatchers the same treatment accorded other division officers.

Industry Tracks.—Supplement 12 to Circular 33 of the Northwestern regional director quotes Supplement 2 to General Order 15 issued by the director general and providing that in the absence of a written contract as to the maintenance of an industry track laid prior to March 26, 1918, the practice of the connecting carrier prior to federal control, as applied to such track of any particular industry from the beginning of its use by such industry, shall be considered as equivalent to a written contract in accordance with such practice. While contracts are desirable covering side tracks constructed prior to federal control and not previously covered by written agreement, the execution of such contracts is not now required by General Order 15. The rails and fittings in that portion of the track required to be paid for by the industry may be leased to the industry with rental at 6 per cent on the current market value of the material, provided good and sufficient security is furnished to cover the return of such material and that the rental be paid annually in advance.

Inspection and Testing of Stationary Boilers.—The Southwestern regional director in Circular 245 states that Rules 6 and 7 of Mechanical Department Circular 11, dated November 11, 1918, are modified as follows:

"Where two or more boilers are connected in parallel to one steam main, the maximum period between the testing of steam gages and the testing of safety valves will be six months. These tests should be made at the time the annual inspection certificate (Form MD-27) and semi-annual inspection certificate, (Form MD-26) are prepared."

The Northwestern regional director in file 67-1-8, issues similar information.

Issuance of Through Export Bills of Lading Via North Atlantic Ports.—Supplement 1 to Circular 240 of the Southwestern regional director states that paragraph 6 of Circular 240, which reads: "Ocean charges should be collected by steamship lines and bills of lading should read 'Ocean charges collect,'" has been amended as a result of advice from the office of the Director of the Division of Traffic so that there is no objection to accepting prepayment of ocean charges in instances where shippers desire to prepay.

Application of Floor Racks in Refrigerator Cars.—Circular 244 canceling Circular 225 of the Southwestern regional director (*Railway Age*, page 108, July 18), states that in order to reduce the loss of perishable freight in transit particular attention must be given to insure proper ventilation in refrigerator cars used for that purpose, and calls attention to the necessity for carrying out the provisions of Circular 225. Authority is also extended to provide for the application of floor racks under the conditions outlined in Circular 225 prior to securing the consent of the corporate officer. Any program should include only that work which will be finished in time to put the cars in service prior to January 1, 1920.

Roadmasters' Convention.—File 8-1-8 of the Northwestern regional director similar to Circular 102-42 of the Eastern regional director (*Railway Age*, August 15, page 316).

Master Blacksmiths' Hold Twenty-Fifth Convention

Papers on Heat Treatment of Steel, Autogenous Welding, Spring Making and Shop Equipment

METHODS OF SECURING increased production in the shops and increasing the service secured from forgings were the principal topics discussed at the twenty-fifth convention of the International Railroad Master Blacksmiths' Association, held at the Hotel Sherman, Chicago, on August 19-21. The convention was opened with prayer and an address of welcome, following which the president, W. C. Scofield, delivered an address which reviewed briefly the developments since the last meeting in 1916.

President's Address

Mr. Scofield said in part: "In reviewing the great world conflict, our craft can with reasonable pride look at the many monster guns, munitions and engines of war, and know that their ingenuity and brawn helped in making these mighty implements. In the present upheaval let us forget the fallacies of socialism, the ignorance of bolshevism, and the utter nonsense of the soviet, and return to the principles of our fathers and realize that the safety of our institutions, the success of country and the happiness of our home, depend not so much upon how much we can get, but upon how much we can do.

Cost Accounting in Blacksmith Shops

By G. F. Hinkins
Westinghouse Air Brake Company

A paper touching on the history of the association and the duties and responsibilities of its members was submitted by G. F. Hinkins. In concluding his paper Mr. Hinkins made a plea for more thorough methods of computing the cost of work, which is given in part below:

As a rule, the foremen blacksmiths have every qualification for handling shop work. By that, I mean that they possess executive and mechanical ability, but how many understand the fundamental principles on which their business is conducted? Of course, they can tell the flat labor cost of their product, but do they know the overhead expenses? This is a very complex proposition. The overhead for making a flat chisel is much less than the overhead for making an intricate drop-forging, by reason of the high first cost and upkeep of the dies. The overhead expense of producing different forgings varies in accordance with the nature and shape of the forging, as the shape of the forging will determine the cost of both the drop forging and trimming dies. Drop forgings on account of their shape and refinement will influence the life of the die. The maximum output from a set of dies will vary from 10,000 to 50,000. In order to get the cost of the product, it is necessary to get the first or original cost of the dies and also the number of times the dies are dressed before they are worn out and the number of forgings made from these dies. It will be perceived from the foregoing that everything that is necessary to produce a forging must enter into the cost of that forging, every detail operation must enter into it.

There must be business methods for ascertaining the true cost of doing work, especially if manufacturing is being done for the market. If a furnace needs repairing and the brick mason helps himself to a load of fire brick to repair it and does not charge the brick against that furnace, then some part is not charged for something it did get and some other part is paying for something it did not get. The upkeep of the various types of equipment, such as steam hammers, drop hammers and forging machines will differ and the expense for repairs must be kept separate, which is done by charging such items against the individual machine. Every machine and furnace is designated with a shop or machine number so that all repairs and renewals are charged against the equipment. In this way, the cost of maintenance of every machine and furnace is known. This is a necessary feature of a cost accounting system which gives the cost of any manufactured article. You may manipulate your charges as you please, but you cannot get away from the cost. Your firm pays the bill.

Drop Forging and Its Possibilities

By J. D. Boyle

The following is an abstract of the paper on this subject: "Steel is not a simple substance like pure iron, gold or copper, but a complex artificial substance. It is composed of groupings of elements which enter into its makeup. These elements are only visible with the aid of a microscope. The term micro-structure has been given to what is thus brought to view. Upon polishing and etching a piece of steel the structure is apparent through the action of the etching medium (acid or other corrosive materials) which affect the elements differently, causing each to assume a color or structure peculiar to itself.

When steel is heated to above its critical point for the forging operation and submitted to blows under the hammer, the molecules of the metal are forced apart. To bring the steel to its greatest maximum strength a proper scientific heat-treatment is needed. This is accomplished with proper furnaces, heat measuring instruments and trained workmen. With all the above-mentioned facilities, automatic signal pyrometers, well-designed cooling systems and semi-muffle furnaces designed for this purpose should be used. Heat-treating departments of this type are built to insure quality and progressive production. The materials going into the vital parts of a locomotive should be subjected to a chemical analysis and a heat-treatment applied. After heat-treatment, test specimens should be taken to determine the physical characteristics.

DISCUSSION

H. E. Gamble (Penn.), told of the wide variety of work made under drop hammers. At the Juniata shops hammers ranging from 1,500 to 12,000 lb. are in use, and the capacity of the largest size has been overtaxed. All reciprocating parts for locomotives are heat treated after they are drop forged. G. Fraser (A. T. & S. F.) stated that a steam hammer could be used for drop forge work by making dies similar to those used in the drop hammer. The dies are held in a box tool secured by a band and hung in the frame. Several members stated that this method was being used with satisfactory results. O. Schutze (C. M. & St. P.) told how drop forge dies had been adapted to use in a Bradley hammer for making spring hanger gibs. Ample clearance must be allowed to dispose of surplus material, otherwise the dies will have a short life. Attempts to make drop forgings under a hydraulic press had proved unsuccessful. There was some discussion regarding the best material for piston

keys, and it was agreed that tire steel was the most satisfactory for this purpose.

The Heat-Treatment of Iron and Steel; Purposes and Results

By George Hutton
New York Central

Heat treatment as pertaining to railroad work in railroad shops seems to have gone backward during the past three or four years. When first introduced on locomotive work, it was thought this method was going to create a great improvement in the quality of forgings over the hit or miss method. The method in vogue today is for the forge shop to construct the different forgings and send them to the various departments to be machined to size and then applied to the locomotive without any record or any means of knowing if these forgings are of equal strength or of uniform quality.

These are the conditions today. In forging side rods, piston rods, rod straps or any piece of work that may be important, you endeavor to have these forgings made up by the best workmen you may have, and to exercise great care in heating and hammering them. You may also be cautioned and caution your men to have them carefully annealed and laid on the floor stacked in such a way as to cool off equally, so that machining may be best accomplished. When you have carefully looked after this you have forgings that will only stand up to a strain equal to the strength of annealed material. Remember, annealing weakens forgings.

You will remember when vanadium steel was introduced in railroad work about the time when heat-treatment was also introduced or brought into shop practice. Why was heat-treatment confined to the alloy steel only? The steelmakers furnished a steel which, if no heat-treatment was applied, would not be any better or any different from the annealed open hearth steel generally in use before the time of alloys or the open hearth in use today.

You have, no doubt, noted the breakage of heat-treated alloy steel forgings that may have come to your shop off the road, and I am positive in my opinion that your verdict was, "Too hard; brittle; too hot when quenched; not drawn back enough," and this is exactly what has set back or almost killed the wonderful results of heat-treatment, especially on alloy steel. The average results of this method has been a sacrifice of elasticity for tensile strength. I am of the opinion that when the alloy steel was introduced, it was never meant that forgings should be treated to such an extent that breakage was the natural result, and certainly this has been the case.

During the 1915 convention in the discussion on heat treatment, one member remarked that if we make our forgings, get the proper heat and proper hammering we would have much better forgings than any of the heat treated ones. If we could only attain efficiency of that kind the whole problem would be solved. But who are the craftsmen who could do it and put it in effect in all our smith shops? There is too much left to guesswork when that method is compared to heat-treatment. When heat-treatment was introduced the main object was to get strength, durability and uniformity, and also to reduce the weight of forgings and castings, and to a great extent this has been accomplished with the exception of securing uniformity, and that is what we are trying to attain with this method.

Heat-treatment of locomotive forgings is a very different practice in comparison with heat-treatment on automobiles or trucks or any light forgings in other industries. We must all admit that the automobile builders have been successful. It has been proved that we can get the desired strength and also the endurance test on some forgings, and several shops have been very successful on all forgings they have heat treated, but failure has been the result in the majority of shops. I believe it has come about through the fact that all the experiments were on alloy steel only. The greatest trouble is to attain uniformity in heavy forgings. Aside from all the discouraging features of heat-treatment that are found in the average railroad shop, I believe it is a method we should all endeavor to learn more about.

There are many obstacles which are detrimental to successful heat-treatment of locomotive forgings in railroad shops. There is the cumbersome equipment and space which is essential to success. There are very few shops that could readily be prepared to treat even the lightest of forgings. Then there is the output to be considered and the extra help required. But considering all the obstacles and expensive equipment, I believe it would prove a good investment when the method was thoroughly understood.

Discussion

There was considerable difference of opinion regarding the advantages secured by heat treatment. H. E. Gamble (Penn.) stated that in addition to improving the quality of the steel, heat treatment brought out defects. G. Fraser (A. T. & S. F.) stated that he considered annealing preferable to heat treatment. While heat treated parts showed high tensile strength, they seemed to break down under the vibration to which they are subjected in actual service. W. C. Scofield (I. C.) attributed much of the trouble experienced in using heat-treated parts to the unequal rate of cooling in light and heavy sections. Large forgings are heated above the critical temperature, to treat the material in the interior of the section, and are then quenched again at a lower temperature to take care of the outer layer. Mr. Scofield thought that the high temperature might do more harm than good, and suggested that this explained why small parts have given splendid service after heat treatment, while larger parts have often failed. George Hutton (N. Y. C.) stated that the New York Central has heat treated material for three years and he had still to hear of a single failure. A motion was adopted stating that it was the sense of the convention that wherever heat treatment can be done, it is a success.

An Up-to-Date Railroad Blacksmith Shop

By George Fraser
A. T. & S. F.

The location of the blacksmith shop is an essential feature not only as it influences the design and arrangement of the building and the layout of the tools, hammers, forges, etc., but also as affecting the output of the shop. The nature of the work and the conditions surrounding it require the building to be in an isolated location in order to provide light and air on all sides. In repair work much material travels from the erecting and assembling shop to the blacksmith shop and back again, especially in locomotive work. A large proportion of the material passing between the locomotive and blacksmith shop is heavy and bulky. For this reason the blacksmith shop should be so situated in relation to the locomotive department as to provide for movement over the shortest and most direct route. Such material is usually transported on push cars and trucks, so that distances are important in economizing time and increasing output.

From the standpoint of shop production, the blacksmith shop is looked upon as a feeder for other shops of prime importance. Sometimes this is overlooked in preparing the original plans, and the average blacksmith foreman is never consulted with regard to them, so when the shop is completed he is invited into it, and it is up to him from then on to make the best of it.

The blacksmith shops at the principal shop plants of the

large railway systems turn out the forgings entering into the construction of new cars, and the bulk of the car forgings required in keeping up the repairs of both freight and passenger car equipment on the line, as well as the forgings for locomotive repairs. As there is a difference in the nature of the work for the two departments, each should occupy a section common to itself, and the machines, forges and equipment should be arranged accordingly. Naturally, the equipment for each department is situated in that portion of the blacksmith shop building nearest to the principal shop which it serves. A ground plan in the shape of the letter L is a convenient arrangement for the blacksmith shop, accessible to both the locomotive and car departments. The many conditions affecting the demands upon the blacksmith shop and the differences in the dimensions of the shops on the various railway systems render it impractical to attempt to give a definite proportion based upon any given unit.

The introduction of cast steel in many details for which forgings were formerly used almost entirely has affected the necessary size of the blacksmith shop so far as the locomotive department is concerned. The increased scope of forging machines assisted by the extended use of formers and dies for rapidly duplicating standard parts of cars has increased the possible output of car forgings without enlarging the area required by the shop building.

A general practice has been to span the entire floor without providing intermediate supports for the roof trusses, and in a number of cases this distance equals 100 feet. The trusses are usually supported by the side walls, which carry the weight of the roof structure and roof. At Topeka the steel skeleton is entirely independent, and the roof structure is carried by built-up columns, to which the walls are secured to provide stability. The roof trusses span a distance of 100 ft. The elimination of supporting columns and the long span of roofed trusses without intermediate support allow free scope in the distribution of equipment on the floor. The method of handling heavy work in the blacksmith shop by means of swinging jib cranes requires freedom of action for the crane arms, and the absence of obstructions facilitates the arrangement of these cranes. The long span of roof trusses, together with the requirement of a stiff frame construction to withstand the additional load imposed by supporting the upper ends of the crane column calls for heavy parts and careful design of the roof structure. The horizontal loads imposed by the swinging shop cranes requires stiff lateral bracing. While the distance from the floor to roof trusses at some of the older shops is about 20 ft., the height of the more modern shop has been increased to 30 ft.

Almost without exception, the floor of the blacksmith shop is of earth of some kind. This is frequently covered with a coating of cinders well tamped, and by all means should be six inches higher than the level of the outside surroundings.

The ventilation necessary in a blacksmith shop and the amount of natural light needed require a high free space not only to allow the smoke and gas to rise away from the floors and forges, but to permit the diffusion of light from long windows. It is a very noticeable fact that the cleanest, brightest, most airy blacksmith shops are those with high walls. The roof of the blacksmith shop is usually surmounted by a wide monitor extending nearly the entire length of the roof. This is provided for the sake of ventilation rather than to distribute light. The windows in the walls are depended upon principally for natural light, and it is generally considered that the window area should equal at least 60 per cent of the wall area. In order to offer the least obstruction to the free circulation of air throughout the shop in warm weather and in warm climates the windows should be hung on pivots to provide a greater opening than raising and lowering of sashes.

In addition, the shops should be provided with rolling doors and the lay of the shop should be east and west, with an open space clear from other buildings on the south side so that all alike will share the south breeze in hot weather. An arrangement frequently followed in the construction of the monitor is to alternate the windows along the sides with space having wooden slats built in on an angle, thus permitting the free circulation of air, while excluding rain and snow.

The removal of smoke and gases from the forges is provided for by different methods. Experience in some shops where great care was used in their design to provide for efficient ventilation is said to have proved that smoke hoods in high shops are unnecessary and that the interior of the building is clear and free from smoke and gas at all times.

Hand forges are usually arranged in a row along the wall, conveniently placed according to the class of work which they serve. The distance between centers of forges varies from 16 to 20 ft. and 5 ft. from the wall. Forges are arranged at a uniform height of about 24 in. and should be of uniform shape and size.

Careful provisions for tool racks is a necessary detail not to be overlooked, for the care and maintenance of tools and equipment is the duty of the energetic foreman. Tool racks are generally arranged along the wall of the shop and in the center of the shop. For hammer, tools, etc., a revolving cone shape tool rack may be provided.

Oil is the most common fuel used in blacksmith shop furnaces. In latter years it has rapidly displaced coal and coke, not only proving more satisfactory and economical as fuel, but also improving the appearance of the shop by removing the necessity of the unsightly coal and coke boxes about the shop. It has been demonstrated by practice that with oil as fuel it is possible to obtain a larger output, a better grade of work by the greater intensity of heat as well as more even heat, the elimination of the necessity of attending the fires, the shortening of the time required to bring the furnace to the desired working temperature and improvements in the conditions under which furnace men work. It is a noticeable fact that in a majority of the new shops particular attention has been paid to the furnace equipment, the design of the furnaces for the various machines and their location in relation to the machine and the movement of the material.

The location of large scrap furnaces should be on the outside of the shop with the working side of the furnace flush with the inside of the main wall. To avoid any possible shortage of steam, boilers should be installed over all large scrap and forging furnaces. By this plan no fuel expense is chargeable to producing steam as the flame and gas from the furnace does the work

In arranging the fire and furnaces, they should be so placed that the men are not too near a furnace or fire when working on the metal. Efficiency engineers will figure on the number of steps that can be saved in handling from the fire or furnace to the hammer, or anvil, overlooking entirely the comfort of the men whose vitality is sapped out by having the fires too close to the anvil or hammer. The arrangement of furnaces, anvils, hammers and machines should be left to the judgment of a practical man, one who is acquainted with shop practice and in charge of smith shops.

No part of the general railroad repair plant has undergone a greater change during the past 10 or 15 years than the blacksmith shop. A few years ago the majority of work passing through that shop was done on open fires, and a large quantity of the new material was purchased from manufacturing concerns; today, due to the introduction of forging machines, the majority of work in the modern shop is, or should be, machine work.

Modern machines without proper die equipment are of little value. The main blacksmith shop should be provided

with its own tool room, where the die work could be carried along independent of the locomotive department, thus avoiding delays. Little attention is given by other departments to assisting foremen blacksmiths along these lines. The following equipment is sufficient for the average shop: one each, planer, shaper, lathe, drill press and face plate. This equipment is installed in the blacksmith shop tool room at Topeka and greatly facilitates the work of getting out dies, etc.

In connection with furnace equipment and open fires, particular attention should be paid to the layout of blast piping. Efficient blast is a very important consideration to the blacksmith shop, as it practically governs the heating capacity not only of furnaces but of the open fires. The blast line should be overhead, and the safety valves should be provided in the up and down line leading to the forges to take care of any gas that may possibly enter the line. The main blast line should be reduced in area in proportion to the distance covered so as to maintain a good pressure at the end of the line. When compressed air is used in addition to the blast to atomize fuel oil an eight-ounce blast is sufficient. When fan blast alone is used, nothing short of ten ounces will give satisfactory results. The exhaust pipes on steam hammers should pass downward through an independent pipe suitable to carry the exhaust beyond the shop into a catch basin.

The modern shop may have all the facilities it is possible to provide and still not get results. The foreman in charge must have the good will and hearty co-operation of each and every man under him to reach the maximum of efficiency.

Discussion

The ideas presented in Mr. Fraser's paper were endorsed by the members who agreed that the arrangement outlined was practically ideal. W. J. Mayer (M. C.) questioned the advisability of restricting the exhaust from the steam hammers, and asked whether any plants used the exhaust for heating. Several plans for using the steam were described. In some cases a butterfly valve is used in the exhaust steam line to limit the pressure. At the West Albany shop of the New York Central the exhaust from the hammers is piped to the heating system and no heat is required in any part of the plant other than that furnished by the exhaust steam. A similar arrangement is used on the St. Louis-San Francisco at Springfield, Mo. The advantage of piping the exhaust down to prevent condensation, injuring the packing and dripping on the dies was brought out by several who spoke.

Reclaiming Scrap in the Railroad Shop

By Walter Constance

St. L.—S. F.

Although this subject includes scrap reclaiming by the use of both oxy-acetylene and electric cutting and welding process, electric welding is not in use at our reclamation plant, and I will have to leave the discussion of electric welding to others.

The oxy-acetylene torch is used in stripping frogs, switches, etc. Good filler blocks, reinforcement and similar parts are saved to be used again. The shop furnishes over 50 per cent of all switch material used on the system. Switch frogs, switch stands, switch rods and plates are reclaimed or repaired. Brace or slide plates are made from old Weber joints and scrap boiler steel, also transit clips for switch points from the scrap steel. We have made quite a number of oil tanks from tank cars which have been burned. These are cut up by the torch and the best of the steel is sent to the boiler shops for use. The rest is cut up under shears to make switch material and repair parts for steel frame cars. Old cisterns for locomotive tenders are cut up and used to make loading platform running boards, and coal car corner bands. Good parts of scrap steel cars are used for the same purpose. Some of our brake beam stripping is done by the oxy-acetylene torch.

We formerly welded quite a number of bolsters and baggage wagons and warehouse trucks. Oxy-acetylene welding comes in handy on these things, especially for repairing steel warehouse trucks, the frames of which are broken, as it does not pay to repair them in the blacksmith shop when they have to be stripped, but by oxy-acetylene welding they can be made serviceable again at small cost.

We formerly welded quite a number of bolsters and truck frames as well as broken couplers at this point, but of course we have discontinued doing so now. However, we are changing a large number of good couplers with 5 in. by 5 in. shank, 6½ in. butt, to 5 in. by 7 in. shank, and 9⅛ in. butt. This is done by welding tapered slabs of steel on the shanks and blocks upon the butts. These then conform to M. C. B. dimensions.

We also reclaim a number of derailing frogs, which are for smaller rails than our standard 90-lb., by splitting them and inserting a piece in the side and welding up with oxy-acetylene so as to bring them to the proper height.

There are no rolls at our plant, but all second-hand bolts are used by cutting off and rethreading, and nuts by retapping. Also all flat iron and round bars are saved for use. Bottom rods are made with solid jaws from old 1½ in. A. C. rods, dump rods, and so on. Truss rods 1¼ in. in diameter are made into brake slabs. The short pieces left over are made into brake beam truss rods, bolts and coupler rivets. Other sizes of rounds are used for handholds, bolts, etc. Rusty ¾ in. and ⅞ in. steel is rolled into brake shoe keys on an abandoned spring roll. Rusty and pitted rounds 1⅛ in. 1¼ in. and 1⅜ in. are made into grade stakes for the engineering department. All limed iron is rattled and made into frog bolts, and switch chain links. We make standard 1 3/32 in. brake pins by upsetting 1 in. iron on the forging machine.

All brake beam repairing on the system is done at this plant. We use an air bulldozer for straightening. All beams are stripped by laborers and are reassembled by blacksmiths and helpers.

All round iron and bolts are straightened under air hammers at the scrap docks. The bolts are sheared to length and sent to the threader and the iron is sheared for heading in the blacksmith shop. All serviceable track spikes are also straightened at the yard shop.

Coil springs that are standard are reset. Scrap springs are uncoiled on a special machine and made into lining bars, jack bars, rock drills and drift pins.

All track tools on the system are sent here for repairs. Worn claw bars are made into engine pinch bars and lining bars. Picks are welded, if they have one end long enough to sharpen; where both ends are to be welded it does not pay to repair them. Short picks are heated and cut off to obtain steel for welding out others. We also make new claw bars, lining bars, and tamping bars from scrap tire steel. All blacksmith's tools are made from tire steel, and we also use tire steel for bolt dies and hammer tools.

Crooked angle bars for small sized rails are straightened in tools under the steam hammer; this tool spreads the bars slightly and makes them serviceable for siding and commercial tracks.

All coupler yokes are stripped at this plant under a power shear. Yokes are repaired when possible and scrap yokes are used to obtain iron from the forging furnace.

Brake levers that are not standard are repunched, cold plugged and returned to service. All car material, such as brake rods, brake hangers, brake staffs and fulcrums which are repairable are sorted at the scrap docks and repaired in the blacksmith shop.

A very close check is kept on the costs, and if a good margin of profit is not shown we do not attempt to repair and reclaim. The welding and cutting apparatus is here to stay, because we make a specialty of repairing or reclaiming, whereas that is only a side line in ordinary shops, and naturally not so successful.

DISCUSSION

C. E. Stone (D. L. & W.) told of the good results secured by rerolling scrap bars. G. Fraser (A. T. & S. F.) brought out the advantages of reclaiming as much material as possible at the shop where it originates. He also called attention to the necessity for careful consideration of the work done in order to avoid reclaiming where it is more expensive than the purchase of new material.

Powdered Coal for Furnace Heating in Smith Shop

By H. E. Gamble

In handling producer gas and oil furnaces for forging heavy locomotive parts, drop forging, heat treating and bolt making, the question arises whether a change to powdered coal would be warranted on account of the low cost in operating. In connection with experiments on mixing crude oil with powdered coal, this might help to use up heavy grades of fuel oil coming into the markets for heating purposes. Coal in a finely divided or powdered state, represents the most advanced method for producing perfect combustion, making it possible to more nearly obtain the full heat value of the fuel than by any other known means. The generally recognized waste, unstaple or otherwise low-value coal mine products are suitable for converting into the powdered form. To give the best results as regards complete combustion and the least trouble as regards ash and slag, it is very necessary to have powdered fuel dry and keep approximately 48 hours' supply on hand to prevent the possibility of the coal absorbing too much moisture. The statement has been made that it is not necessary to build new furnaces, as by a slight change present equipment can be made to handle powdered coal. Coal rich in volatile matter is preferred, slack or screenings in preference to run of mine. To successfully burn powdered coal, it should be uniformly fine. The maintenance of a correct ratio of air to coal is absolutely necessary, as on this depends the ability to hold an unwavering and uniform temperature in the furnace, which ranges up to 2,200 deg. F.

We have unquestionably passed through one of the greatest fuel conservation periods known, and the members of this association should do all in their power to secure the best equipment and use their good judgment in conserving all fuel possible in running the blacksmith shops.

Other Business

The report of the secretary-treasurer showed a total membership of 375 and a balance of $741 in the treasury. A committee was appointed to confer with the officers of the American Railroad Association regarding amalgamation with Section III, Mechanical.

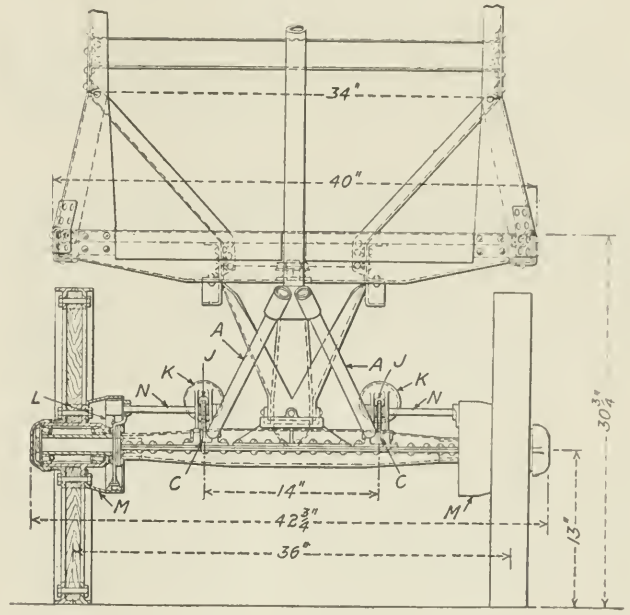
The following officers were elected: President, J. Carruthers (D. M. & N.); first vice-president, W. J. Mayer (M. C.); second vice-president, Joseph Grinc (N. Y. C.); secretary-treasurer, A. L. Woodworth (B. & O.). In the balloting for the location of the next convention, Birmingham, Ala., received the largest number of votes.

The American Institute of Mining and Metallurgical Engineers are planning to make their meeting at the Congress Hotel, Chicago, September 22 to 26, of especial interest to the local industry.

Baggage Trucks With Automatic Brakes

THERE ARE a number of four-wheeled hand-operated baggage trucks in use at various points on the Pennsylvania which stop automatically wherever the user happens to let go of them. The advantages of such a truck are self-evident. It is not necessary to chain the wheels and the truck will not move when heavy pieces of baggage or express are placed or shifted on it. Also the danger of having a truck, left unchained, run into a moving train is eliminated.

The two front wheels of the truck are equipped with inside band-brakes. Heavy coil springs connected by chains to the handle of the truck near the axle, hold the handle normally in a vertical position and keep pressure on the brakes. When the operator wishes to move the truck he pulls the handle down to a convenient position. This compresses the springs and at the same time releases the brakes leaving the truck free to move. When the operator lets go the handle it returns to the vertical position and again applies the brakes.



Front Elevation of Baggage Truck

The value of these trucks is evidenced in stations equipped with a few such trucks and a large number of others not equipped with brakes. There are a few trucks idle most of the time, but those equipped with brakes are never among the idle ones.

The New York State Federation of Labor has adopted a resolution in favor of the Plumb railroad plan.

Bethlehem Iron Ore Dock in Chile Completed.—The Iron ore dock of the Bethlehem-Chile Iron Mines, at Cruze Grande, Chile, construction of which was held up by the war, has just been completed. The dock has capacity for 30,000 tons of ore and is provided with 17 spouts, by which all 17 hatches of the standard 20,000-ton ore boats of the company may be fed simultaneously. The loading time is expected to average three or four hours per vessel, the discharge of water ballast requiring more time than actual loading. The dock is similar to the ore docks in Lake Superior. It is nearly 500 feet long and is loaded by discharging the ore from hopper cars at the top of the dock. The height of the dock from low tide to top of rail is 120 feet.—*Iron Trade Review.*

General News Department

The Canadian Northern freight office at Brandon, Manitoba, was robbed on August 20 of about $2,000.

The return of the railroads to private ownership was advocated by the Commercial Law League of America at its meeting in Cincinnati on August 19.

$100,000 in Liberty Bonds and $3,500 in cash were stolen from a vault in the office of the paymaster of the Boston & Albany at the South Station, Boston, sometime between Saturday night and Monday morning of this week.

In the New York-Toronto air race, arranged by the American Flying Club and Aero Club of Canada, for $10,000 in cash prizes and trophies, 19 of the 47 contestants, 12 American and 7 Canadians, had completed the round trip by last Wednesday night.

The American Association of Engineers, according to a recent statement, now has 35 railroad sections with memberships numbering from 20 to 250. The largest section is that of the Pennsylvania Railroad, while the Southern Railway has a section with 200 members.

A fire at the Jarecki Chemical Company of St. Bernard, near Cincinnati, Ohio, destroyed 20 cars containing corn, lumber and fertilizer. Charles Busch, engineman for the Baltimore & Ohio, and Jack White, conductor, ran a switch engine into the flames and saved 20 loaded freight cars from destruction.

A. W. Smithers, chairman of the Board of Directors of the Grank Trunk and a member of the British Parliament, arrived in Montreal, Que., recently for the purpose of making an inspection of the Grand Trunk System and also to confer with officers of the Canadian government regarding the status of the Grand Trunk in relation to the complex Canadian railway situation.

Louisville & Nashville passenger train No. 7 was held up between Columbia, Tenn., and Pulaski early on the morning of August 21 and robbed of valuable mail pouches. The bandits forced trainmen to cut the engine loose and started it towards Pulaski unmanned. It was found some time after near Wales, Tenn., a few miles north of Pulaski, where it had run out of steam.

The Traveling Engineers' Association has announced that the question of the amalgamation of this association with the Section III, Mechanical, of the American Railroad Association has been considered by a committee. Its findings will be presented at the convention which opens on September 16, at which time it is expected that the association will take definite action on the matter.

The first train over the Valley Railway reached St. John, New Brunswick, from Fredericton, on August 21. The St. John & Quebec Railway, the official name of the Valley road, has completed 159 miles of road. It joins the Canadian Pacific at Westfield and by its completion affords the shortest existing route between St. John and Quebec. The Canadian National is soon to take over and operate the Valley Railway.

The Flathead County (Mont.) Board of Equalization has denied protests by two railroad companies against assessments amounting to more than $2,000,000. The Northern Pacific asked a reduction of $1,595,405 in the assessment against its timberlands in the county, the total acreage of which is 129,675. Its value as returned by the Northern Pacific is $567,445 and that placed by the assessor, $2,162,850. An application made by the Great Northern to exempt from assessment more than $400,000 worth of tools and materials on the ground that it was government property was also denied. Appeals to the state Board of Equalization have been filed in both cases.

A threat to tie up the New York, New Haven & Hartford, helped to bring about a settlement of a strike which lasted five days on the New York, Westchester & Boston. The motormen and conductors on the New York, Westchester & Boston struck for and won the same wages as are paid on the steam railroads. With the increase of 25 per cent granted the men on August 17 this meant an advance of about 34 per cent. The men accepted a nine-hour day instead of the eight-hour day which they demanded. The New Haven owns 98 per cent of the stock of the New York, Westchester & Boston.

The Canadian Pacific social clubs held their first annual convention at Winnipeg, Man., on August 20 and 21. A constitution was drawn up centralizing all the Canadian Pacific social clubs under one governing body with headquarters in Winnipeg. J. Bending, president of the Winnipeg Club, was elected president of this governing body, and R. W. Beatty was elected general secretary. The presidents of all the existing clubs will form the central committee.

A comparative report of the amounts of materials in stock, exclusive of fuel, rail and tires in the Northwestern region shows that the value of this material has decreased from $55,778,875 on January 1, 1919, to $48,160,284 on July 1, of the same year. At the same time the number of months stock on hand, based on the June consumption, has decreased from 6.7 on January 1, to 5.8 on July 1. The value of materials transferred totals $1,115,828 for the period from December 1, 1918, to August 1, 1919.

To present graphically Safety First lessons to railroad employees has been the aim of George Bradshaw, supervisor of safety of roads under the jusisdiction of Federal Manager Frank H. Alfred. The latest bulletin issued by the safety organization under Mr. Bradshaw's direction carries out this idea in presenting to the employees one of their fellow workers who, through neglect, lost the use of one eye. His photograph, a reproduction of the piece of metal which caused the accident and the moral involved are presented graphically to the employees with the consent of the injured employee.

The Frank Thomson scholarships of the Pennsylvania Railroad have been awarded to Archibald M. Thomson, of Haverford, Pa., and Frank J. Travers, of Fort Wayne, Ind. Aside from the two who were awarded the scholarships this year, six other young men will continue their college courses this fall. The successful candidates receive certificates entitling them to payment by a trust company of a sum not in excess of $600 a year for each year during which they attend college. According to the terms of the trust, one scholarship is awarded to the successful candidate from the eastern lines and one from the western lines.

The railroad question is attracting more attention now than at any former period, according to the Chamber of Commerce of the United States, which daily receives hundreds of requests from all parts of the country for detailed information about it. The demand for data has been so heavy that republication of all the chamber's pamphlets and statements is necessary. An edition of 10,000 copies of the statement of George A. Post before the House committee on interstate and foreign commerce, in which the National Chamber plan was set forth, was exhausted within a week. Many inquiries are coming from farmers.

The United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers will hold its annual convention in Arcadia Hall, Detroit, Mich., on September 8

to 20 inclusive. It is expected that 1,800 delegates will be present from the 2,500 lodges of this organization. One hundred and thirty-five general chairmen of this organization, representing the employees on that number of railroads, were in session in Detroit the week of August 19, forming a general chairmen's association and creating committees to arrange for the presentation of the various subjects which will come up for consideration at the annual meeting.

The Black Tom explosion on July 30, 1916, was caused by a German agent known as Lathar Witcke, alias Pablo Wabirski, now a federal prisoner at San Antonio, Tex., according to the statement of Dr. P. B. Altendorf, late of the U. S. Military Intelligence Department. If the cause of the explosion was incendiarism the Lehigh Valley would be cleared of liability for damages. In two suits that railroad has been held responsible for the explosion by juries that gave judgments aggregating nearly $1,500,000 to the Bethlehem Steel Company and Howell & Co. of New York. A suit of Jersey City claimants against the Lehigh Valley is on the Supreme Court calendar for trial in the September term.

George W. Hunter, receiver of the Louisiana & Northwest, nas filed a petition before United States Judge G. W. Jack of Shreveport, La., asking authority to abandon the southern end of the Louisiana & Northwest, i. e., the division running between Natchitoches, La., and Gibsland. The petition stated that funds are not available to keep that portion of the road in safe repair and that it is impossible to sell the railroad in its entirety. A sale was ordered sometime ago by Judge Jack but no bids were received. The petition has been referred to the Louisiana State Railroad Commission whose report and findings will be advisory only. The hearing before the Commission will be held at Shreveport on November 3.

Upon an inquiry from the Railroad Administration the Bureau of Internal Revenue has recently ruled that where transportation taxes have been collected by carriers on the basis of their legally published rates, and such rates have subsequently been declared excessive and unreasonable and ordered reduced by the Interstate Commerce Commission, reparation payments to the shippers being required, the carriers making the reparation payments may refund the amount of the taxes collected on the charges found excessive; or, in the event the taxes have been turned into the treasury, the carrier in making reparation may refund the tax on the amount found to be excessive and take credit for the same against amounts included in any subsequent monthly returns.

In a rear collision on the Pennsylvania at Elwood, N. J., on Sunday morning, August 24, one man was killed and more than 20 persons were injured. Ralph Townsend, engineer of the second section of the Washington excursion train, which telescoped the rear end of the first section, was held responsible for the accident by a committee of five railroad men appointed by R. L. O'Donnel, general manager of the Pennsylvania. The committee reported that the engineer's failure to see a yellow caution signal 4,400 ft. from the scene of the wreck made it impossible for him to bring his train to a stop in time. Director General Hines has announced that a "special inquiry will be made into every phase of the occurrence to ascertain the cause and locate and deal with the responsibility."

West Texas is facing a railroad blockade due to the exceptionally heavy oil traffic, the result of developments in the Wichita Falls district, according to Edward P. Byars, traffic manager of the Fort Worth (Tex.) Freight Bureau and Commerce Counsel of the Texas Petroleum Refiners Association. Appeals have been made by the Texas Petroleum Refiners Association, the West Texas Chamber of Commerce and the Texas Wholesale Fruit and Produce Dealers to the Railroad Commission of Texas and also to Director General Hines urging that action be taken at once to end the congestion. It is claimed that oil companies have no cars in which to transport their oil and that tanks, oil well supplies and equipment are being packed in the Fort Worth yard. In addition to the oil traffic, a large grain crop is being marketed and repeated calls are being made for cars in which to ship this grain. A telegram to the director general advocated the placing under the jurisdiction of Regional Director B. F. Bush of a forceful man to take complete charge of the situation with absolute authority to direct movement of traffic over any line he sees fit. The telegram intimates that there has been a competitive spirit manifested between the Southwestern Region and Central Western Region lines which has added to the congestion. The director of the Division of Public Service has advised the Texas shippers that the situation is being handled vigorously and that reports will be made in the near future.

The Canadian Railway Board of Adjustment No. 1 has issued six awards relating to wages and working conditions. By one of these rulings various clerks, express, roundhouse and station employees and freight handlers on the Canadian National Railways, who have been receiving $60 and $62.50 a month, will now receive the minimum of $87.50. The new scale is made retroactive to September 1, 1918. Another award gives an increase of $10 a month to Canadian Pacific Morse operators at what is termed "outside points" and $12 a month to the three percentage groups in the percentage offices. By the decision of the board in the controversy between the Canadian Pacific and its dining car service employees the allowance for excess mileage, terminal delay, etc., was abolished and monthly rates were substituted.

To Accompany Prince of Wales

H. R. Charlton, general advertising agent of the Grand Trunk, has been designated to accompany the Prince of Wales when he uses the lines of the Grand Trunk System on his visits to the principal Ontario cities. Mr. Charlton has been the representative of the company on the various Canadian tours of important personages during the past twenty years.

Railway Tool Foremen's Convention

The ninth convention of the American Railway Tool Foremen's Association opened at the Hotel Sherman, Chicago, on August 27. Following the invocation an address of welcome was delivered by a representative of the states attorney. W. E. Dunham, assistant to the general superintendent motive power and car department of the Chicago & North Western, spoke on the relation of the tool foremen's work to the general efficiency of the shop and C. A. Shaffer, president of the association, delivered an address. An abstract of the proceedings will appear in next week's issue.

St. Paul Adds 110 Miles to Electrified Line

President R. M. Calkins of the Chicago, Milwaukee & St. Paul says that in a few days electric current will be turned on over another 110 miles of main line from Othello to Cle Elum, Washington. By January 1, the road will be completely electrified from Harlowton, Mont., to Seattle, 885 miles, or within 200 miles of half the entire length of the St. Paul-Seattle line.

The last stretch from Cle Elum to Seattle, 130 miles, will cost about $9,000,000, or 25 per cent to 40 per cent more, relatively, than preceding units, on account of higher prices of labor and material.

Electrification has doubled train tonnage, says Mr. Calkins.

Report on Railroad Annual Pass Holders

Director General Hines has recently sent to the Senate in response to a resolution a statement giving the names of holders of annual all-line railroad passes and Pullman passes. A preliminary reply was sent to the Senate on July 21, as noted in these columns at the time. The later report states that 2,418 all-line Pullman passes have been issued by the Railroad Administration as of July 1, 1919, of which 515 have been cancelled, leaving 1,903 outstanding. As corrected, 4,200 all-line railroad passes have been issued up to July 1, of which 119 have been cancelled, leaving 4,081 outstanding on July 1, 1919. The lists of names include, although out of their alphabetical order, the name of W. G. McAdoo as special counsel for the Railroad Administration for the State of New York, and also of Mrs. McAdoo and a dependent son

and daughter. April 4, 1919, is given as the date of mailing. At about that time Mr. McAdoo returned east after a vacation in California and his appointment as special counsel made unnecessary the observance of the tariff formalities regarding the number of fares required for a private car.

National Industrial Traffic League Meeting

The docket for the summer meeting of the National Industrial Traffic League, which will be held at Pittsburgh, Pa., September 4 and 5 is as follows:

Report of the Executive Committee—Proposed change in Article 6 of the constitution, increasing minimum dues from $15 to $25 per annum; investigation relative to car situation; recognition of established rate relationships in advances or reductions in rates; recommendations to Congress with respect to the railroad situation.

Report of Special Committee—Through Export Bills of Lading.

Report of Special Committee on Railway Leases and Sidetrack Agreements—Liability Clause in Railroad Leases and Sidetrack Agreements.

Report of Committee on Car Demurrage and Storage—Status of Recodification of the Demurrage Code.

Report of the Committee on Transportation Instrumentalities.

Report of Bill of Lading Committee—Uniform Bill of Lading; Two Year and One Day Limitation in paragraph 3 of Uniform Bill of Lading—Intervention in Jos. E. Decker & Sons Case.

Report of Express Committee.

Report of Committee on Rate Construction and Tariffs—Furnishing classifications free of charge to shippers and commercial organizations; consolidation of tariffs of individual lines into agency issues.

Report of Baggage Committee—Uniform Baggage Tariff.

Report of Freight Claims Committee.

Report of Special Claim Committees.

Report of Organization Committee.

Report of Membership Committee.

Report of Weighing Committee.

Report of Classification Committee.

Two business sessions will be held on September 4, one at 10 a. m. and the other at 2 p. m. and a third business session will be held at 10:00 a. m., September 5.

Federal Trade Commission Sees Scandal in Bumping Posts

Asserting that the ownership of refrigerator cars by the packers is a principal factor in their control of the meat industry, the Federal Trade Commission has made public a special report to the President on private car lines, recommending that the government acquire all cars used for the transportation of meat animals and all refrigerator cars and all necessary equipment for their proper operation and that such ownership and operation be declared a government monopoly or that the cars and equipment be owned and operated by the railroads under government license regulation.

"The volume of traffic of the five packers," the report says, "has enabled them to secure from the railroads advantages over competing shippers. Formerly in the shape of direct rebates, these advantages are now usually in expedited service to the big packer cars; in favorable mixing rules which include all their diversified products and even many articles not related to the packing industry; by allowances paid to some of the big packers by carriers for the performance of a part of the transportation service; by favorable arrangements and lease of stockyards by the railroads to some of the big packers; and by the sale to the railroads of bumping posts manufactured by a subsidiary of one of the big five packers."

How much of the high cost of living is due to excessive prices paid for bumping posts is not stated.

A. R. E. A. Co-Operation with A. R. A. Questioned

The advisability of the American Railway Engineering Association continuing its present working arrangement with the American Railroad Association has been questioned by George D. Hill, assistant valuation engineer of the Seaboard Air Line, and a member of the A. R. E. A. Mr. Hill has sent a letter to the members of the engineering association which calls attention to the present working arrangement between the two organizations whereby the committees of the American Railway Engineering Association have been appointed as similar committees of the newly organized American Railroad Association and have formed a part of the engineering section of the American Railroad Association. He calls attention to the vote of the members taken last July in which 577 voted against the consolidation of the engineering association with the American Railroad Association, while 83 voted for it, some of whom qualified their votes by adding "only during the period of the war." Mr. Hill states that the working arrangement "has the ratification of *only* the Board of Directors of the American Railway Engineering Association and *perhaps* a majority of the small representation of members present at the last annual meeting." To ascertain whether he represents the feeling of the majority of the members of the engineering association that this action should be recalled before it is too late and "that a complete divorce of the American Railway Engineering Association from the American Railroad Association be accomplished by a working arrangement or otherwise and return the American Railway Engineering Association to its status quo before the war" a ballot is attached on which the members are urged to express their position.

Workmen Strike at Car Company's Plant

A strike of employees of the Standard Steel Car Company's plant at Hammond, Ind., which has been in progress for almost a month, recently assumed a serious aspect with the outbreak of fighting between the strikers, police and deputies. The belligerent attitude of the strikers during the past week led to the issuance of orders calling for protection of the company's plant by 11 companies of the Indiana state militia, charged by Governor Goodridge of Indiana with the "most rigorous exercise of force" if necessary. Adjutant-General Harry B. Smith, in command of the troops, also carries a proclamation from the governor declaring martial law in Hammond, which will be put into effect if the fighting is resumed. Approximately 1,700 employees are on strike for higher wages and practically all attempts at arbitration have failed. The troops were called by Mayor Dan Brown of Hammond, who feared serious trouble if the company attempted to end the strike by the importation of strikebreakers. With the guards furnished by the state, however, approximately 400 men were brought to the company's plant after the employees had refused a compromise offer which would give them an increase of 7 per cent in pay. The importation of strikebreakers complicated the situation by the necessity for housing them near the plant. Many of the cottages in which the workmen live are owned by the company and they feared that they will be forced from these dwellings to make room for new workers. Officers of the company admit that some provision must be made for quartering the men and that the strikers will be compelled to move if they refuse to return to work.

Latest reports indicate that there has been a break in the ranks of the strikers, approximately 200 having returned to work, and others indicating their intention to do so as soon as they are assured protection.

Safety History

J. C. Silling, conductor on the Joplin Division of the Missouri Pacific, presented some interesting history of the safety movement at a recent Safety Committee meeting. Mr. Silling said in part:

"In many quarters it is believed that the Safety First movement is of comparatively recent origin. Many manufacturers, however, have been engaged in safety work for over 20 years. The Crane Company of Chicago was one of the pioneers in safety work, particularly as regards eye protection. In 1897 this company commenced to furnish goggles to its men, and in 1898 began giving glasses to the men free of charge. As a result of this policy, the number of eye injuries has been greatly reduced.

"It was not until about 1913 that it was taken up generally. Then automobile associations, protective associations and street railway companies financed a program of instruction on Safety First in the schools. In some cities they distributed propaganda and literature stating the causes, results and precautions for preventing further accidents. The plea for preparedness and caution originally came from the United States Public Health Service, Bureau of Mines, Department of Agriculture, Interstate Commerce Commission, Navy Department and War Department.

"There has been considerable discussion as to the origin of the words 'Safety First,' and I have seen an announcement that one of the railroads used the words 'SAFETY SHOULD BE THE FIRST CONSIDERATION' in the seventeenth century, but I think it is generally conceded that the Illinois Steel Company at its South Chicago plant was the first to consciously use the 'Safety First' although, as often happens, it was not supposed then that the words would become popular and express our conservation for life and limb in the industries. Many people deplore the use of the words—they say it is impossible to have Safety First—and some of the companies

are using a substitute slogan, 'BE CAREFUL' But whatever the slogan may be, I believe it should be affirmative and constructive, for very few of us give a thought to the price we pay for our modern transportation.

"In the beginning of the 'Safety First' movement, the cause had the impetus that attaches to a fad, and it was taken up with remarkable rapidity throughout the country. Since then the concern of those who realized the intrinsic value of the agitation has been to denude it of the faddish features in order to prevent a decline of interest on the part of those participating in it, and to insure its permanence as a fundamental principle in the management of men. Proof that such a difficult thing has been accomplished is at hand today in the mere fact that the 'Safety First' movement is as alive now as it ever was. It is universally recognized not only as a humanitarian but as an economic measure and its principles cannot now be ignored by anyone who is engaged in the administration of important business."

Engineering Council Suggests Engineer on I. C. C.

Engineering Council has opened a campaign for the appointment of an engineer familiar with transportation problems to the vacancy now existing on the Interstate Commerce Commission. In order to bring this matter to the attention of President Wilson, who will make the appointment, a letter has been addressed to him, signed by J. Parke Channing, chairman of engineering council, which states in part:

"Engineering Council, being aware of a vacancy on the Interstate Commerce Commission, begs leave to request the Chief Executive that in filling this vacancy, he give earnest thought to the selection of a man who, to his other qualifications, adds the training and experience of an engineer familiar with transportation problems.

"Engineer members widely chosen would bring to the investigations and deliberations of the Interstate Commerce Commission not only technical knowledge of great value, but also experience in executive duties, a judicial attitude gained through the direction of work under contracts, minds of analytical habit, familiarity with costs of construction and operation, experience in dealing with employees of many vocations, and integrity of thought cultivated by that inescapable obedience to the laws of nature involved in the practice of this profession. The engineer's training fits him for that mode of thinking which is indispensable to impartiality of judgment. One important function of the Commission is valuation of public utilities and another is the determination of relationships and responsibilities of the management of such utilities to the public. No other body of men has given so extensive and so scientific consideration to these matters as have members of the engineering profession.

"Council's purpose is not to further the interests of any individual or group, but solely to serve the nation by strengthening one of its most important regulatory bodies. Upon the wisdom, intelligence and courage of this Commission depends in large measure the commercial welfare of the country. It is believed that the engineering profession can and should contribute to the country's well-being through the channel of membership in the Interstate Commerce Commission."

"Our Country First Conference"

The call to "Our Country First Conference," to be held under the auspices of the Illinois Manufacturers' Association at Chicago on September 8 and 9 inclusive, has been sounded as follows:

"Agitation of the causes of our national unrest, coupled with indiscriminate charges, makes the frank discussion by all patriotic citizens of the problems and conditions underlying the situation an absolute necessity.

"Several distinct groups are endeavoring to create public sentiment by the presentation of exparte views. Congress, to arrive at a just conclusion, needs the facts, as well as the views of all classes of citizenship. A clear and fearless expression of opinion should be formulated and proper committees appointed to present the conclusions reached to Congress and others concerned, in order that fair and honest legislation may be enacted, a square deal given to all and the nation freed of the agitators who are trying to overthrow the very foundations of our government."

Invitations to attend the meeting have been sent to every national and state organization, including financial, manufacturing, distributing and wholesale and retail organizations, 415 agricultural societies and consumers organizations wherever organized. Invitations have also been sent to the American Federation of Labor and the Department of Labor to have representatives present to outline their views on reconstruction problems. Approximately 1,000 of these invitations have been accepted and the replies indicate that the attendance at the conference will be exceptionally heavy. The suggestion has been made that a resolutions committee representing all interests be formed and that group meetings of the various industries represented be held prior to the conference. As a result of the latter suggestion arrangements have been made for holding these meetings either on the evening prior to the opening of the conference or on Monday night, the first day of the conference.

More Tentative Valuations

The Division of Valuation of the Interstate Commerce Commission has issued tentative valuation reports on the Tampa & Jacksonville, Louisville & Wadley, Albany Passenger Terminal Company, Macon & Birmingham, Mississippi Eastern, Norfolk Southern and the San Pedro, Los Angeles & Salt Lake. No notable changes have been made in the form or substance of these valuations as compared with those previously served except that "other values or elements of value" are reported as follows: "No other values or elements of value to which specific sums can now be ascribed are found to exist." The value of the property is not reported but the statement is made that the order will be supplemented by such further findings and order with respect to the value of the carrier property as may be deemed appropriate.

In the case of the Norfolk Southern the capital stock outstanding was $16,000,000 and the bonded debt outstanding was $17,426,142. The investment in road and equipment as reported by the carrier was $28,333,531. This, the report says, is too large. It is reported that the original cost cannot be ascertained but the investment in equipment is given as $4,018,619. The cost of reproduction new of common carrier property other than land is given as $24,067,374, and the cost of reproduction less depreciation as $19,800,019. The cost of carrier lands is given as $1,655,427 and of the non-carrier lands as $105,812, while the present value of the carrier lands owned is given as $2,418,698 and of the lands used as $583,272.

The capital stock of the San Pedro, Los Angeles & Salt Lake was $25,000,000 and its long term debt $56,274,000. The investment in road and equipment as stated by the carrier was $76,391,598, but the report says this includes $25,000,000 to balance the stock issue, and with some readjustments the report states it as $42,873,561. It is said to be impossible to state the original cost to date. The cost of reproduction new of the property used, not including land, is given as $43,127,960 and the cost of reproduction less depreciation as $35,701,567. The present value of the lands owned is given as $4,043,749 and of the non-carrier land as $3,624,677.

Pacific Coast Railway Men Strike

Enginemen, trainmen and yardmen employed on the Los Angeles division of the Southern Pacific went on strike August 21, in sympathy with the striking trainmen of the Pacific Electric and the Los Angeles (Cal.) street railways. As a result the entire Los Angeles division of the Southern Pacific as well as the Pacific Electric and the Los Angeles Railways have been completely tied up. Embargoes have been placed on livestock and perishables from, to and through Los Angeles, Fulton and San Bernardino and dead freight is being handled subject to delay. Service to Los Angeles on the Atchison, Topeka & Santa Fe has also been seriously affected by the strike, the westbound movement terminating at Barstow, Cal., although the line from Barstow north to San Francisco is open.

The striking employees of the Pacific Electric and Los Angeles Street Railways demand reinstatement and full pay for all men on strike, for the time they have been out, the discharge of all strike breakers and the discharge of employees who have remained loyal to the company. The strike of the steam railway men is entirely in sympathy with the electric railway workers and no grievances have been presented. The sympathetic strike on the part of the steam railway men has been undertaken without the sanction of the international brotherhood officers and in disregard of in-

structions issued by Warren S. Stone, president of the Brotherhood of Locomotive Engineers. It is estimated that approximately 3,500 men formerly employed on the steam roads in and near Los Angeles are now out and the strike is extending northward and eastward, reports on Tuesday indicating that the switchmen of the Southern Pacific at Indio, Cal., have walked out, cutting off traffic to Texas and Arizona points.

Because of repeated attempts at intimidation and threats of violence, the Los Angeles Street Railway Company obtained an injunction against the amalgamated association of street and electrical railroad employees of America, Division No. 835, restraining them from interfering with the running of cars on that line. The electric railway companies have endeavored to break the strike by the importation of strike breakers and has maintained operation although greatly curtailed. According to officers of the electric line violations of the injunction have been frequent and evidence is being gathered against those who are believed to be directing the strike, among whom are officers of the Brotherhood of Railroad Trainmen and other officers of the steam railway brotherhoods.

Reports filed from San Francisco on August 26, state that yardmen employed by the Southern Pacific at San Francisco and Oakland have gone on strike practically without warning. This strike, which involves men caring for engines in the yards as well as switchmen, went into effect as the day shift went off duty and at a time when it was necessary to handle the evening rush of commuters to suburban points. The men agreed to leave a sufficient number of workers on duty to care for this rush, however, and no serious difficulty was experienced. At Oakland the yardmen left their work without warning shortly before 8 P. M., and it is not known whether or not their strike is connected with the strike in San Francisco.

Indications that the strike is spreading to other branches of railway men were confirmed with the receipt of reports indicating that car repairmen at the Southern Pacific shops at Los Angeles have walked out in sympathy with the striking trainmen and yardmen. Press reports estimate that a total of 1,500 shopmen are out.

Valuation Progress

In a statement issued by Frederick H. Lee, secretary of the President's Conference Committee on the Federal Valuation of the Railroads, under date of August 15, the suggestion is made that no necessity now exists for the carriers to incur the expense of accumulating evidence on the cost of acquisition of lands, parcel by parcel, in view of the attitude of the Interstate Commerce Commission as evidenced in its decision in the Texas Midland case. An effort has been made to secure a definite understanding with the Commission or the Bureau of Valuation, that should the Commission announce in the future that such evidence will be received and such costs reported by it, a reasonable opportunity will be allowed the carrier to assemble such evidence. Difficulty has been encountered in securing a definite agreement in this respect, but the Director of Valuation has suggested that carriers should assume that the Commission would adopt a fair and reasonable course in the matter.

Pending the appeal of the Kansas City Southern Railway Company from the decision of the Commission declining to receive such testimony, it seems reasonable to assume that no change in the present attitude on this question will be made unless or until the Supreme Court of the United States renders a decision on this subject.

In this statement attention is also called to a letter addressed to the regional directors by C. A. Prouty, director of the Division of Valuation on July 25, with reference to valuation order No. 3, a portion of which reads as follows:

"This revised order was served some months ago. The first returns to be made under it are due July 31. As director of valuation, I recently caused a visit to be paid to the officers of the principal railroads with a view to ascertaining what was being done to comply with this order. To my utter surprise, I learned that in most cases the very existence of the order was unknown to the responsible heads of the Administration, often to the auditor himself, and that no steps had been taken to comply with the order. Now it is perfectly evident that the Commission must insist upon a prompt compliance with this order if it is to obey the behest of Congress. The Commission probably has authority today to enforce compliance, but if it has not, it will undoubtedly be given ample authority in the near future.

"After a good deal of consideration and in the light of the facts developed by my recent investigation, it is my own opinion that every railroad must create an organization for the purpose of dealing with Order 3. That organization may be a part either of the accounting or engineering department, and the size of it will depend entirely upon the extent of the railroad system, but there ought to be on every Class I road at least one individual whose sole duty is to look after this order, who will become imbued with the spirit and the requirements of the order, and who will stand responsible for its enforcement.

"Inasmuch as this must go on after these properties are returned to their owners, the matter is one of even greater importance to the corporation than to us, and I would suggest that you get in touch with the corporation and co-operate so far as may seem desirable."

Some Views on the Plumb Plan

Governor John J. Cornwell of West Virginia has sent the following letter to certain railroad employees who appealed to him to support the Plumb plan:

"Of course I regret that any of my fellow citizens should disagree with, or feel aggrieved with me because of my views upon any public question, but that cannot deter me from having and exercising the same freedom of opinion that you have. When you asked for an eight-hour day I was with you, heart and soul. I was then and am now, in favor of your securing not only a fair, but a liberal wage, but when you ask the farmers and the laborers in other lines of work to go in debt 20 billions of dollars through the medium of the federal government to buy the railroads and give them to you to operate for your benefit and to use as you please, you are making a proposition that is neither sane nor fair.

"To me it is little short of amazing that men possessing the intelligence of the trainmen I meet should be gulled into making such unreasonable and outrageous demands.

"If the people bought the railroads and gave them to you to run for your benefit, telephone and telegraph employees would demand the same thing of those properties. They have as much right to it as you have. Then the coal miners would demand that the mines be purchased and given to them, and they have as much right to make the demand as you have.

"Then the farm laborers, with even better right would say, 'We produce the food you live on—buy the farms and give them to us.' Then we have, not Socialism, but Chaos. They are trying to run things that way in Russia and we know the result.

"I intend to try to present to the people of the state what this plan means. First, as to the shifting of the burden of taxation, or some four million dollars of it, in West Virginia from the railroads on to the farmers and home owners if the Plumb plan was to go through. It would make Cabell, Wayne, McDowell, Mercer and Mingo counties unable to pay the debt they are creating to build public roads. It would stop road building, building of school houses, and all public improvements.

"I have been a laboring man myself—carried a dinner bucket—for a dollar a day. My labor now is not regulated by eight, ten or twelve hours but often sixteen and sometimes eighteen. I am not now and never expect to be a capitalist, but I am an American, not a Bolshevik. I stand for law and order and I am not asking somebody to buy property and give it to me, but want to work and give honest service for every dollar I receive."

In a special message to the general assembly Governor Davis of Virginia transmitted a communication received by him from the state corporation commission setting forth what would be the effect in Virginia should the Plumb plan of railroad operation be enacted into law by Congress.

Operation of the Plumb plan would take from the tax revenues of the state approximately $224,000 the first year, $446,000 the second year and $669,000 the third year, according to the commission. At the end of 10 years it was estimated that it would cost the state in taxes $2,500,000 per annum, or approximately 25 per cent of the entire revenue of the treasury. It would cost the city of Richmond alone the greater part of $154,689.73. These figures include, besides revenues from steam railways, revenues from telegraph and telephone companies also, but these latter represent only a small fractional proportion of the total.

Traffic News

Four fast freight trains carrying 10,000 bales of raw silk, valued at $8,500,000 left Vancouver, B. C., for New York on Tuesday of this week. The goods were part of a $10,000,000 cargo of silk brought from Hongkong on the Canadian Pacific liner *Empress of Asia*.

Because of the condemnation of the bridge over the Tennessee river at Chattanooga the Southern Railroad has announced a readjustment of passenger train service between Cincinnati and Chattanooga, and between Cincinnati, Atlanta, Macon and Florida, effective Sunday, August 31.

Two of the forty 2,000-ton barges built for the United States Railroad Administration for use on the Lower Mississippi river have been delivered to the Railroad Administration and are now in commission, and the third will be delivered by the end of next week and the fourth about the middle of September. After that date the deliveries will be very frequent.

The last of the harvest trains have arrived in Winnipeg, Man., from eastern Canada over the lines of the Canadian Pacific, the Canadian Northern and the Grand Trunk Pacific. The number of men who have been transported is below the figure asked for, 18,000, but the authorities declare that it will be ample for requirements now that harvesting is well advanced.

Under the new rules of the American Express Company to go into effect December 1, 1919, shippers are required to adopt a new system of packing their merchandise by introducing outside containers of different weights. The United States Railroad Administration has endorsed the new regulations, the purpose of which is to stop the pilfering of goods in the course of transit.

A land-clearing special train will leave Cordele, Ga., on September 1 on a trip to 17 other south Georgia towns. The special was planned by the extension division of the Georgia State College of Agriculture with the co-operation of six tractor companies, three stump-pulling companies and one powder concern. Two days will be allotted to each town for demonstrations on stump pulling, ditch blasting and general work by the tractors.

There were more monthly sixty-ride commutation tickets sold on the Long Island during the month of July than in any one month in the history of the road, according to a statement by Ralph Peters, federal manager. Exactly 44,595 commutation tickets were purchased in July, 1919, being an increase of 8,883 tickets over the same month of 1918. In July, 1917, 30,943 commutation tickets were sold. There are now 13 stations in Long Island with more than 600 commuters each.

A report on traffic conditions throughout the country for the week ended August 18, made to the director general, shows that the strike of railway employees retarded the movement of both freight and passenger business. The effect was especially noticeable in the New England district and the Pocahontas, Southern, Northwestern and Central Western regions, statistics showing that in each of these regions there was a decided falling off in freight movement. However, it was noted that with the ending of the strike conditions were rapidly returning to normal.

I. T. Sparks, traveling freight and passenger agent for the Southern Pacific at El Centro, Cal., states that the cantaloupe and watermelon crops produced in the Imperial Valley this year have required the use of 7,830 freight cars. The gross return for this crop totaled approximately $9,208,080 and the net return to the growers, $1,710,072. During the month of June over 1,000 carloads of other products were shipped from the Imperial Valley with a net value to the ranchers of $1,122,660. The total value of the products shipped out of the Imperial Valley during the month of June was $11,336,140 gross and $2,898,972 net.

According to a report on overseas traffic made to the director general, for the week ended August 20, 1919, 6,108 cars of commercial export freight were received at North Atlantic ports as compared with 1,031 cars for the same week of 1918. This is an increase of 5,077 cars or 492 per cent for the week ended August 20, 1919, as against the same period cent. There was a total of 12,971,087 bushels of grain stored in elevators at North Atlantic ports on August 20, 1919. There were received during the week 6,050,202 bushels, while 5,019,154 bushels were cleared. At South Atlantic and Gulf ports there were 5,148,142 bushels of grain stored in elevators.

Flat rates on logs, bolts and billets are now charged by all railroads, according to J. H. Townshend, secretary-manager of the Southern Traffic Association. The new rate takes the place of the gross rate which has been in effect and will relieve lumber shippers of the burden of making reports and paying money running into hundreds of thousands of dollars which is held in the hands of the carriers indefinitely before being refunded. At the same time the change will not affect the carriers' revenues. A bond will be given by each shipper to assure the roads that the shipping will be over the same road on which the forest product was brought to the milling point. The lumber shippers were formerly forced to pay the gross rates on the shipment of lumber from milling points and later a refund was made on the first rate.

Strikes Cause Slump in Coal Production

The production of bituminous coal slumped again in the week of August 16, largely as a result of the recent strikes on the railroads and in the coal fields, according to the weekly report of the Geological Survey, which says that "the lack of market has ceased to be the principal factor limiting production in most districts, and car shortage, or more broadly speaking, transportation disability, is of greatest importance. Mine operating time reported lost in the week of August 9, because of car shortage, was 22.5 per cent, the highest recorded in any week since March, 1918, while "no market" was responsible for only 8.8 per cent and labor shortage and strikes for only 4.9 per cent. Production of bituminous coal in the calendar year to date is now nearly 92,000,000 tons, or 25 per cent, behind that of last year, for the corresponding period.

Arrangements for Labor Day Travel

Director General Hines has issued a notice urging that in view of the extraordinary heavy travel anticipated over Labor Day, the public, if desiring to travel on the railroads over Labor Day, make their traveling arrangements, including the purchase of railroad and sleeping car tickets, as far in advance as possible so as to avoid adding to the congestion which usually occurs at this period. As far as is possible, he says, everything that can properly be done has been done, to care for the expected heavy travel over Labor Day. Several weeks ago, the regional directors were asked to give special consideration to this matter and each of them has answered that he has issued the necessary instructions and has taken steps to provide as much equipment as possible to adequately care for the travel as far as its volume can be anticipated.

The arrival, within the next two weeks, of the First and Third Army divisions from France will require a large number of cars, and there is also still a very heavy movement of discharged soldiers from camps to their homes, which takes up a great deal of space in passenger equipment, but all equipment that the Troop Movement Section can possibly spare has been assigned to the Labor Day traffic.

Arrangements have also been made to supply extra baggage men at all large centers and other points where congestion might occur. Also, extra ticket forces have been arranged.

Foreign Railway News

Internationalizing Russian Railway Property

All property in Russia belonging to the International Sleeping Car Company has been nationalized. The clerical and technical employees will be regarded as in the employ of the Soviet.

Italian Import Restrictions

A decree published in the Gazzetta Ufficiale of July 31, to take effect on August 1, abolishes all previous import restrictions, and institutes a new list for which import licenses are necessary. This list includes railway rails of iron and steel, sheet iron and steel, and railway rolling stock. (Times Trade Supplement, August 9.)

Allocation of War Locomotives in England

LONDON.

An article published by the Railway Magazine states that a considerable number of the large 2-8-0 locomotives built for War Office use, to the designs of J. G. Robinson, chief mechanical engineer of the Great Central Railway, are now being taken over by the railways in England. Thirty have already been allocated to the London & North Western, 20 to the Great Western, and a few to the Midland. All locomotives retain the Westinghouse brake.

German Locomotives in France and Belgium

LONDON.

On the signing of the armistice, Germany was required, as has been previously mentioned in the columns of the *Railway Age*, to deliver 150,000 cars and 5,000 locomotives to France and Belgium. Of the cars 80,000 went to Belgium and 70,000 to France, most of which were given to the Nord and Est railways. The locomotives were split up between the Americans, British, Belgians and French; the Americans receiving 500 locomotives, the British 1,300, the Belgians 600, and the French 2,600. The British locomotives have been turned over to the Belgians, and the 500 locomotives assigned to the American Army have been delivered to the French military authorities, which in turn will distribute them between the various railways in France and railways in other countries. Up to July 25, Poland had received 54, Roumania 14, and Czecho-Slovakia 22.

Under the terms of the Peace Treaty these German locomotives will either be bought by the countries now having them, due credit being given in payment of indemnities, or they will be returned to Germany and the indemnity money will be used to purchase new equipment.

England's Import and Export Figures During July, 1919

LONDON.

The English Board of Trade states that the returns for July show that imports into the United Kingdom for the month were valued at £153,140,032, an increase of £44,000,794, as compared with July last year, while the exports were valued at £65,315,422, an increase of £21,671,024. The increase in the amount of re-exports was £9,735,077.

The imports of machinery during July amounted to £1,317,799, as against £850,391 in July last year, making an increase of £467,408, and the imports of railway carriages and trucks (not of iron), motor cars, cycles, carts, etc., amounted to £677,360, as against £2,207,734 of July, 1918, showing a decrease of £1,500,374. These figures include the cost, insurance and freight.

The value of the exports are as follows: Coal, coke and manufactured fuel during July, 1919, £9,110,920, as against £4,658,878 during the same month last year, thus showing an increase of £4,452,042; machinery during July, 1919, £2,802,217, as against £1,436,688 during July, 1918, showing an increase of £1,365,529, and railway carriages and trucks (not of iron), motor cars, cycles, carts, etc., during July, 1919, amounted to £1,035,670, as against £341,360 during July, 1918, showing an increase of £694,310. These figures include the cost and charges of delivering the goods on board the boat.

Steam vs. Electrical Working of Locomotives

LONDON.

An abstract by the Technical Supplement of the Review of the Foreign Press from an article in the Zeitschrift des Oesterreichischen Ingenieure- und Architekten-Vereines, states that the railways of German-Austria only use about one-tenth of the entire coal consumption of the country. Details of the coal consumption are given, pointing out that with the modern superheaters the locomotive has become much more efficient than formerly. Steam locomotives are stated to work more efficiently than electric locomotives, especially where goods trains are concerned; and even in Switzerland the cost per ton-kilometer on the electric railways is often higher than on the railways worked by steam. The whole argument is to the effect that only under certain conditions will electrical working prove cheaper than steam working.

Railway Extension in Mexico

Announcement is made by the Department of Communications and Public Works of the Mexican government that the immediate resumption of construction of the division of the Kansas City, Mexico & Orient Railroad, between Falomir, state of Chihuahua, and the proposed crossing of the Rio Grande, three miles below, Presidio, Texas, has been authorized. This work was suspended in 1912. It is stated when Juan F. Trevino, representative of the Kansas City, Mexico & Orient in Mexico, brought the matter of building the line to the border, to the attention of the Mexican government he was assured that General M. M. Dieguez, military commander of the state of Chihuahua, would give ample military protection to the construction force. The distance from Falomir to the Rio Grande is 75 miles. The Kansas City, Mexico & Orient also plans to begin construction of the extension of its main line from Alpine, Texas, to the proposed crossing point below Presidio at an early date, it is announced. The filling in of these gaps will give a through rail route between Kansas City and Western Mexico, via the city of Chihuahua.

Export Abbreviations

LONDON.

Considerable trouble and unfortunate misunderstanding has arisen between some of the American exporters with importers in Australia, over the meaning of the abbreviation f. o. b. The London Times Trade Supplement, commenting on this expression, says that the accepted interpretation of this abbreviation means that goods will be placed free on board ship, and that the responsibility of the exporter does not end with placing the exported material on the ship's dock. Numerous cases have been found where this was not done by American exporters with the result that their customers in foreign lands, assuming that their goods had been placed aboard ship, were at a great disadvantage in not knowing when to expect the goods, and further that additional charges were made for dock storage. It cannot be too strongly urged that a distinct understanding be had between American exporters and their foreign customers. The exporter is in a far more convenient position to see that the goods are definitely placed on board ship and to advise his client to that effect than the client who often is thousands of miles away. Such service as this will help to make American export business attractive to foreign agents.

Railway Construction in Colombia

LONDON.

In the August 9 issue of the London Times Trade Supplement is given an account of the proposed railway extensions in Colombia together with a map, which is reproduced here, showing the existing lines, those under construction and those which are under consideration. From this map it will be noted that the lines are many and short and that there is no continuity between them. They have been built chiefly to supplement the service of the Magdalena river, which is 1,060 miles long and traverses three-fourths of the country. At the present time the Colombian government is adopting a systematic policy of railroad construction for the purpose of stimulating the national productivity, as Colombia includes some of the richest mineral and agricultural country in South America. The Times Trade Supplement describes the existing and projected lines as follows:

Of railways connecting with the Magdalena the most important are the Barranquilla and Cartagena lines, links between the river and the Atlantic; the Antioquia line from Puerto Berrio to Medellin, which, though having a 14-mile break in the mountainous region between Cisneros and Botero, taps a very prosperous part of the country; and the Girardot line from the river-port of that name to the Plain of Bogotá. The Puerto Wilches and the Ibagué (Tolima) lines are but the beginnings of railways that will, when finished, go far towards completing the systems that the government has projected for joining up the most important cities and districts of the Republic, while that from La Dorada to Beltran is an alternative to the river, filling in the gap between the two steamboat services where they are separated by the Honda Rapids.

Among the new lines planned the most important for Colombian commerce is the extension of the Buenaventura-Cali line in a northerly direction through the Cauca Valley as far as Amaga; another line to run eastward from Cali across the Central Cordillera to join up with the Tolima line at Ibagué, will put Bogotá into direct railway communication with the Pacific; the Ferrocarril del Norte is being extended through Bucaramanga to Puerto Wilches on the Magdalena.

The completion of the latter section would greatly expedite traffic between the Atlantic coast and the capital, providing an all-rail route; but meanwhile an extension of the Ferrocarril de la Sabana, via Pacho, to the Magdalena, now under construction, will greatly relieve the present situation, obviating handlings of freight at the Honda falls, Beltran, Girardot, and Facatativá.

Three out of the four lines indirectly connected with the Magdalena have Bogotá as their center. The Ferrocarril de la Sabana connects with the Girardot line at Facatativá, though unfortunately the two lines are of different gages, and the other two, the Ferrocarril del Norte and the Ferrocarril del Sur, run in northerly and southerly directions along the plain. The fourth line coming under this category is a short length between Medellin and Amaga, which will, when the Cauca Valley line reaches Amaga, help to form a long link between the Pacific Ocean, at Buenaventura, and the Magdalena, at Puerto Berrio.

Work on the Ferrocarril del Norte is being pushed on from Nemocón to Chiquinquira, as a contribution towards the Puerto Wilches line, where construction has also been resumed; the section between Girardot and Ibagué is almost completed; the Antioquia extension is rapidly proceeding to

Map of Colombia Showing Existing Railways and Proposed Extensions

Note.—The following table gives a list of some of the railways in Colombia with certain information regarding them as shown in the Universal Directory of Railway Officials:

RAILWAYS IN COLOMBIA

Name of railway	Length of line: Open	Length of line: Under construction	Equipment: Locomotives	Equipment: Passenger cars	Equipment: Freight cars	Gage	Main offices
Ferrocarril de Antioquia	168 km.	25 km.	27	50	209	3 ft.	Medellin, Colombia. Dr. Juan de la C. Posada, general manager.
Barranquilla Ry. & Pier	17 mi.	.....	15	16	220	3 ft. 6 in.	39 Coleman St., London, E. C. F. Belcher, secretary.
Ferrocarril de Cartagena	106 km.	.....	8	15	112	3 ft.	62 London Wall, London, E. C. F. Thomas, secretary.
Colombian Northern	181 km.	12 km.	..	..	...	3 ft.	9 Bishopsgate, London, E. C. E. A. Green, secretary.
Ferrocarril de Cucuta	73 km.	.....	20	16	116	3 ft.	San Jose de Cucuta, Colombia. Alberto Camilo Suarez, president.
Ferrocarril de la Dorada	114 km.	.....	8	15	115	3 ft.	Finbury Pavement House, London, E. C. T. Lee C. Pilditch, managing director.
Ferrocarril de Girardot	132 km.	.....	17	32	126	3 ft.	Walter House, 418 Strand, London, W. C. 2. John Wharton, secretary.
Great Northern Central	500 km.	154 km.	..	..	...	1 meter	130 Dashwood House, New Broad St., London, E. C. William Chaplin, secretary.
Ferrocarril de la Sabana	40 km.	.....	15	40	82	1 meter	Apartado de Correos No. 127, Bogotá, Colombia. Alejandro M. Olivares, general manager.
Santa Marta	99 mi.	.....	20	17	287	3 ft.	57½ Old Broad St., London, E. C. 2. Thos. Bolter, secretary.

Caldas, the Cucuta line will, in all probability, be extended to Bucaramanga to link with the Puerto Wilches and Norte lines; and the long-discussed extension of the Santa Marta line to the Magdalena, at El Banco, is seriously projected. If, as has been again reported, the United States now intends to make the compensatory payment of £5,000,000 offered to Colombia in 1914 but delayed by Congress, a considerable sum will be available for construction work. British engineers and manufacturers of construction and railway machinery should look to their laurels in this connection.

British engineering, and investment in transport facilities in Colombia are of importance and old standing. The Barranquilla and the Cartagena lines are both British built and owned; the Santa Marta line, the original Cauca railway, the Puerto Wilches, the La Dorada, and the Girardot lines, the Ferrocarril del Norte, the harbor works at Puerto Colombia, and Barranquilla are included in the lists of British construction and capital in Colombia. The Colombian government has of late developed its policy of national or departmental ownership and construction of public services.

Profits of Colonial Railways

An article published by the Zeitung des Vereins Deutscher Eisenbahnverwaltungen and abstracted by the Technical Supplement of the Review of the Foreign Press, gives a comparison of profits earned by a number of colonial railways. The Congo railway from Matadi to Leopoldville is 400 km. long with a gage of 2 ft. 5½ in., and was opened in 1898, the average profits between that date and 1912 being 9.7 per cent. In 1912 the company paid 22½ per cent and in 1913, 19 per cent. The Delagoa Bay railway from Lourenzo Marques to Garcia in the Mozambique is 89 km. long, and was opened in 1890. The interest on the capital in 1901 was 15.2 per cent, and in 1910, 55.47 per cent. The author states that Great Britain endeavored to obtain possession of the line owing to the enormous profits, and compares with these profits the dividend earned by the Uganda railway, which was 3.52 per cent in 1912, and 5.98 per cent in 1917.

The Otavi railway in German Southwest Africa is 671 km. long with a gage of 2 ft., was opened in November, 1906, and paid an average dividend of 11.7 per cent after being bought by the state. The Dutch line in Java paid 6.12 per cent in 1914.

These figures, the author says, prove how profitable such colonial railways are.

Locomotive Building in France

Some interesting figures showing the effect of the war on the locomotives of the French railways were recently given in the Journal des Transports. At the beginning of the war, apart from the railway shops, there were six locomotive building plants in France, of which four were in the invaded zone. Their average annual output was 650 new locomotives, while the railway shops turned out another 50, and as the average annual needs of the French railways were only 575, a balance was constantly available for export, of which the bulk went to Algeria and the French colonies. An average of about 1,570 locomotives underwent repairs every year. One effect of the war was greatly to diminish the possibilities for repair work, with the result that at the beginning of 1918, 2,336 locomotives were "immobilized." New construction also fell off, so that while the Paris, Lyons & Mediterranean should have received 337 locomotives in 1914 and 1915 which were ordered before the war, only 75 were delivered up to the end of 1916. In 1917, 660 locomotives were ordered from the United States and 170 from England, of the Consolidation, Mikado and Pacific types, of which the last should have been delivered by January 1, 1919. The prices were 125 per cent higher than the pre-war quotations; 1,412 locomotives were also lent by the Allies during the war, which helped towards making good the deficiency in new construction between 1914 and 1917 amounting to 1,725 engines. The French railways received a portion of the 5,000 locomotives surrendered by Germany under the armistice terms, and it is hoped that with the reconstruction of the shops in the invaded districts the annual output will eventually amount to from 800 to 1,000 locomotives.

Another Opportunity for Americans Missed in China—Other Chinese Correspondence

PEKING.

The past month marks the missing of two more opportunities for American capital in China due to the absence of a financial agent with power to act—if symptoms are to be trusted. A certain harbor site in North China has been known for some time to be quite essential to the development of a dormant American railway project. A Chinese capitalist who seemed to be able to secure development privileges approached American interests for mutual support. While negotiations were under way, a Sino-Japanese company was formed and apparently has secured the privileges. In a similar way a certain European firm which has started the construction of a considerable line was known to be courting American support. This courtship has ceased, and the issuance of passports to 55 Japanese to travel through the province served by the proposed line seems to offer the explanation.

* * *

Dr. Yen Teh-ching, a graduate engineer from Cornell '06, has been appointed successor to the late Dr. Jeme Tien-yu as managing director of the Hukuang lines now under construction. (The Hukuang lines embrace not only the Canton-Hankow but also the Hankow-Ichang section of the line into Szechuan.)

* * *

The Southern miltary government of China has given permission for the construction of three railways by private enterprise. One line will run from Canton to Macao, another from Swatow to Changlin, and the third will be a branch line of the privately owned Sinning line, and will run from Sinning to Paishaho. All of these lines are short and will require altogether not more than $3,000,000.

* * *

The Ministry of Communications, it is understood, has given sanction to a private company to build an extension to the Mentoukou branch of the Peking Suiyuan line to tap another coal deposit in the Western Hills. The line will not be more than nine or ten miles long but the route to be followed is that frequently mentioned as offering the best grades to the Mongolian plateau. At present the Nankow Pass presents a grade of three and one-half per cent for the Peking Suiyuan to surmount, which will have to be rectified if business ever develops over that route.

* * *

In spite of reported Japanese opposition and an interpellation from Parliament as to why he had not been discharged, the Ministry of Communications has renewed its contract with the American adviser, J. E. Baker, for another year. This is probably not to be construed as favorable to the general unification of Chinese railways, for promoting which Mr. Baker encountered so much opposition, but rather a disposition to temporize. Discussion upon the unification subject has again come to the fore in connection with the reported deliberations of the Consortium. The Japanese press in China and the Chinese militaristic press contain from day to day articles in identical language in opposition to the Consortium as being synonymous with unification.

* * *

Delivery has begun of 500 goods wagons purchased in America by the Peking Mukden line. The Peking Hankow line has purchased ten ten-wheel locomotives from a Belgian firm, delivery promised in ten months.

* * *

Dr. Hirai, Japanese, general adviser on railway affairs to to the Ministry of Communications, has signified his intention to resign shortly on account of ill health. He will be succeeded, so it is reported, by a Dr. Okada.

* * *

The Peking Hankow and the Peking Suiyuan, the only remaining lines upon which the depreciated Peking notes of the Bank of China and the Bank of Communications are accepted, have given notice that after July 25 these notes will no longer be accepted in payment of interline fares or baggage charges. This probably marks the beginning of the end for the depreciated note in railway revenues.

Equipment and Supplies

Equipment Inquiry from Belgium

The Wall Street Journal is authority for the statement that Belgium is inquiring for 400 locomotives and 20,000 freight cars. But equipment manufacturers, it says, are frank to admit that there is little chance of the business being accepted at this time since Belgium wants long-term credits covering the delivery of the order.

Locomotive Deliveries Week Ended August 9

The following new locomotives were shipped during the week ended August 9:

Works	Road	Number	Type
American	N. C. & St. L.	4	USRA Mount.
	Vgn.	1	USRA Mallet.
		5	
Baldwin	P. L. W.	4	Santa Fe.
	At. & S. F.	6	Santa Fe.
	P. L. W.	7	USRA S. F.
	T. & P.	4	USRA Mik.
	C. & O.	1	USRA Mallet.
	P. & R.	1	Mallet.
	N. & W.	1	Mallet.
		24	
	Total	29	

Locomotives

The Pennsylvania Equipment Company, 1420 Chestnut street, Philadelphia, is in the market for one second-hand, 30 to 50-ton four-wheel or six-wheel saddle tank locomotive; must be in first class condition.

Freight Cars

Wilson & Company, Chicago, is inquiring for 200 refrigerator cars.

John R. Walsh has ordered three 8,050-gal. tank cars from the Pennsylvania Tank Car Company.

The Washington, Idaho & Montana Railway, Potlack, Idaho, is inquiring for 20 40-ton flat cars.

The Commercial Car Line has ordered 25 8,050-gal. tank cars from the Pennsylvania Tank Car Company.

The Bolene Refining Company has ordered 25 8,050-gal. tank cars from the Pennsylvania Tank Car Company.

The Wilhoit Refining Company has ordered six 8,050-gal. tank cars from the Pennsylvania Tank Car Company.

The Mexican Petroleum Company, New York, has ordered 600 10,000-gal. tank cars from the American Car & Foundry Co.

The Ohio City Gas Company, Columbus, Ohio, has ordered 200 8,000-gal. tank cars from the American Car & Foundry Co.

The Livingston Refining Company has ordered 20 8,050-gal. and 80 10,050-gal. tank cars from the Pennsylvania Tank Car Company.

The White Eagle Oil & Refining Company, Wichita, Kan., has ordered 20 8,000-gal. and 30 10,000-gal. tank cars from the American Car & Foundry Company.

The United States Railroad Administration is inquiring for 500 to 1,000 55-ton steel hopper car bodies and from 500 to 1,000 50-ton composite gondola car bodies.

The Pennsylvania Equipment Company, 1420 Chestnut street, Philadelphia, is in the market to lease for one year 100 to 200 tank cars of 8,000 to 10,000-gal. capacity for crude oil service.

Supply Trade News

The Chicago Railway Equipment Company, Chicago, is completing plans for the reconstruction of that part of its plant damaged by fire on August 2. About $25,000 will be expended on the work.

The Schroeder Headlight & Generator Company, Evansville, Ind., has appointed **S. Herbert Lanyon** as its representative on the Pacific coast, with office at 507 New Call building, San Francisco, Cal.

T. L. Dodd & Co., Railway Exchange building, Chicago, have been appointed western sales representatives of the Worth Steel Company, Claymont, Del., manufacturer of fire box steel plates, boiler and tank plates.

The Goulds Manufacturing Company, Seneca Falls, N. Y., will open a district sales office in the Dime Bank Building, Detroit, Mich., on September 1, in charge of **E. B. Gould,** who has recently returned from 18 months' service in France.

E. L. Ruby, railway supply agent in the Real Estate Trust building, Philadelphia, Pa., has taken over the manufacture and sale of the Hilliard portable milling machine, a device designed to mill stock rails for housing in switch points, previously manufactured by the Hilliard Portable Milling Machine Company, Oil City, Pa.

The Ryan Car Company, Chicago, is constructing an all-steel, steel car plant 90 ft. by 600 ft., upon a recently acquired 50 acre tract one-half mile east of its old plant at Hegewisch, Ill. In addition to the main plant three smaller buildings are being constructed. It is expected that operation will begin in the fall. The approximate cost of the new buildings with new equipment will be $350,000.

E. H. Bull, for the past seven years in the engineering department of the Green Engineering Company, East Chicago, Ind., and **D. A. Livensparger,** for nine years in the sales department of the same company, have taken over the Chicago sales office of the **Green Engineering Company,** as sales representatives, handling Green chain grate stokers, sealflex arches, steam jet ash conveyors and cast iron ash tanks.

The American Steam Conveyor Corporation, Chicago, announces the appointment of **Morton McI. Dukehart & Co.** as its representative in Baltimore, Md., and surrounding territory, including all of Maryland, the District of Columbia, and a few counties in Pennsylvania, Delaware, West Virginia and Virginia. This firm consists of Mr. Dukehart and E. S. Denise, both power plant engineers and sales engineers.

Charles W. McKay is now in charge of the appraisal division of **L. V. Estes, Inc.,** industrial engineers, Chicago. The appraisal division specializes in the appraisement of industrial properties for federal income tax purposes and in the appraisement of public utility properties in connection with rate cases. Mr. McKay is the author of "Valuing Industrial Properties," published in 1918, and of a book entitled "Telephone Rates and Values," to be published on or about September 1.

Henry R. Moore, general traffic manager of the **Republic Iron & Steel Company,** Youngstown, Ohio, died suddenly on August 8, at the Youngstown Country Club. Mr. Moore was born at Warrensville, Ohio, in February, 1856. Prior to entering the employ of the Republic Iron & Steel Company 20 years ago he was general freight and passenger agent of the Lakeside & Marblehead and general freight agent of the Cleveland, Canton & Southern, with offices at Cleveland. During the war he was chairman of the committee which supervised freight movement in the Youngstown district.

The American Construction Company, St. Louis, Mo., has been organized under the laws of Arkansas with an authorized capital of $250,000 and with the following officers: **F. W. Fordyce**, chairman of the board; **Charles H. Sommer**, president; **George Moldenschart**, secretary; **W. V. Delahunt**, treasurer. The new company will construct an extension of the Fort Smith, Subiaco & Rock Island, formerly the Fort Smith, Subiaco & Eastern, which road had been in receivership for some time and was purchased by other interests who will complete the line between Paris, Ark., and Dardanelle.

On August 1, the promotion and inspection bureaus of the **Universal Portland Cement Company**, Chicago, were combined under the name of service bureau. **J. H. Libberton**, formerly engineer, promotion bureau, an inspecting engineer, in the general offices at Chicago, became manager of the service bureau; **G. E. Warren** was appointed assistant manager; **J. W. Lowell**, eastern manager, Pittsburgh; **J. H. Chubb**, northwestern manager, Minneapolis; and **O. L. Moore**, chief cement inspector, Chicago. The two bureaus which were combined formerly had separate and distinct duties, the promotion bureau handling special service and furnishing of information to cement users and the inspection bureau having charge of the physical testing at the mills.

George Hull Porter, who has been in charge of sales in the middle west, for the **Western Electric Company, Inc.**, New York, has been appointed railway sales manager and will direct the company's railway business for the entire country. Mr. Porter will continue to have his headquarters at Chicago. He was born on July 30, 1883, at Danbury, Conn., and received his education at the Mount Pleasant Military Academy, at Ossining, N. Y. Since 1902 he has spent practically all of his time in the electrical industries, becoming a member of the Western Electric Company's organization in April, 1908, as a steam railway salesman connected with the Chicago office. Sometime after that he became western manager of the railway sales department. Mr. Porter, in addition to becoming president of various railroad and electrical associations and chairman of civic societies and committees, has also been for some time captain in the First Regiment of the Illinois Reserve Militia. In 1918, he entered the government service, serving on the staff of the quartermaster general as a private and received a commission of captain sometime after. He rejoined the ranks of the Western Electric Company in December, 1918.

G. H. Porter

The Detroit Seamless Steel Tubes Company has begun construction of a $3,000,000 plant on a 60-acre tract at Detroit, Mich. The first unit of the plant will cost $1,000,000 and will be completed by January 1, 1920. The building plans call for a structure of steel and glass with brick and concrete facing. The plant proper will occupy a space of 350 ft. by 700 ft. It will consist of three bays for manufacturing units, a separate heating plant and a two-story administration building. The three manufacturing units will be each 90 ft. wide, by 700 ft. and 550 ft. long and 45 ft. high, to permit the use of traveling cranes and other labor saving machinery. The interior layout and special tube mill machinery was designed under the direction of C. A. Ross, consulting mechanical engineer, and C. L. Stafford, mill superintendent. The plant will be equipped with the latest types of modern labor saving devices and machines, and a powdered coal system will be used for all the heating and annealing processes used in manufacturing operations. The total capacity of the first unit of the new plant will be 2,500 tons of seamless steel tubing a month, the range of sizes being from one-half inch to six inches outside diameter, and No. 13 gage and heavier.

American Car & Foundry Company

The directors of the American Car & Foundry Company, New York, having recently abolished the office of general manager, **James M. Buick**, formerly vice-president and general manager, has assumed the direction of the sales division of the company and will be known as vice-president in charge of sales.

The production division will be directed by **William C. Dickerman**, who will be known as vice-president in charge of operations. He will be assisted by **Frederick A. Stevenson**, as assistant vice-president in charge of operations, who will be head of the manufacturing section and have charge of production in the car plants, rolling mills and foundries, also supervision over the engineering, improvement and research, patent and industrial relations sections. The headquarters of both divisions will be at the general offices, 165 Broadway, New York. Mr. Dickerman, as head of the war division, and Mr. Stevenson, as his assistant, directed the company's recent program in the manufacture of munitions for the government of the United States and its allies.

W. C. Dickerman

William Carter Dickerman was born on December 12, 1874, at Bethlehem, Pa. After a preparatory course at William Penn Charter School, Philadelphia, he was graduated from Lehigh University in 1896, with the degree of mechanical engineer. Mr. Dickerman entered the employ of the Milton Car Works, Milton, Pa., in 1897, and when the American Car & Foundry Company was organized he was made assistant district manager for the Milton district. In 1900 he became sales agent of the company and in 1905 was elected to the vice-presidency.

F. A. Stevenson

Frederick Alfred Stevenson was born on April 6, 1880, at Detroit, Mich. After completing the high school course, he entered the employ of the American Car & Foundry Company in 1899, as an apprentice in the machine shop at the Detroit plant. In 1902 he was transferred to the Berwick plant and served as master mechanic in charge of all mechanical work in the steel car department, and in 1907 he returned to Detroit to assume a similar position in the company's plant. In 1909 he entered the assistant general manager's department at Chicago and carried on the development of new ideas and methods until October, 1910, when he became assistant general superintendent of the Detroit plant. In 1912 Mr. Stevenson was made general superintendent at Detroit and held this position until January, 1916, when he was appointed assistant general manager.

Financial and Construction

Railway Financial News

BROOKLYN RAPID TRANSIT.—A group consisting of the Chase Securities Corporation, the Bankers Trust Company, the Central Union Trust Company, J. & W. Seligman & Co., and Hayden, Stone & Co. have purchased $18,000,000 six per cent, two-year certificates from Receiver Lindley M. Garrison. The certificates are dated August 1, 1919, and are being sold privately at 98 and interest.

Judge Julius M. Mayer, in the Federal District Court of New York, has made permanent the appointment of Receiver Lindley M. Garrison.

CHICAGO & WESTERN INDIANA.—In announcing the offer of this company to extend $15,000,000, 6 per cent notes, maturing September 1, 1919, for one year at 7 per cent, President E. H. Lee states that the company has entered into a contract with the United States Railroad Administration fixing annual compensation sufficient to pay all present fixed charges and taxes, including the sinking funds on the bonds deposited as security for the notes, and also including 7 per cent interest on said notes for the ensuing year, if federal control shall continue that long. Interest and sinking fund requirements on the collateral bonds are also provided for by rentals, payable directly to the mortgage trustees by other railroad companies for the use of its lines and terminal facilities.

GEORGIA COAST & PIEDMONT.—This road will be offered for sale for the third time in Brunswick, Ga., on October 7.

ROANOKE RIVER.—This road, extending 12 miles from Manson, N. C., to Townsville, was sold at auction on July 26 for $70,000 to J. R. Paschall of Richmond, Va., the principal owner. The property will be turned over to the railroad trustees for Townsville township upon certain terms agreed upon. The Townsville Railroad has been incorporated and organized to operate the line, and the township has voted $75,000 bonds to subscribe to its stock. Equipment is to be secured and the line again put in operation.

Railway Construction

FORT SMITH, SUBIACO & ROCK ISLAND.—The American Construction Company, St. Louis, Mo., has been awarded a contract for the construction of an extension of this line between Paris, Ark., and Dardanelle, a distance of 30 miles. The line will connect at Dardanelle with the Chicago, Rock Island & Pacific and at Paris with the Arkansas Central and will provide a through line from Fort Smith, Ark., to the Chicago, Rock Island & Pacific main line at Ola, Ark., opening up new territory for traffic moving to the southwest via Little Rock, Ark. A contract for the grading, bridging and track laying has been let to the P. J. Hannan Construction Company of St. Louis and this work was started during the latter part of August. There will be considerable heavy grading, especially where the line crosses the mountains at Hays Creek, Ark., and Shoal Creek, where there is considerable solid rock. The line will be laid with 70 lb. steel rails. It is expected it will be open for traffic about January 1, 1920.

PANHANDLE SHORT LINE RAILWAY.—A charter has been submitted, in the name of the Panhandle Short Line Railway Company, to the attorney general's department of Texas. This road contemplates building a line from Dalhart, Tex., to Lubbock, a distance of 200 miles.

PORTLAND & SOUTHEASTERN.—This company, which was incorporated recently with a capital stock of $2,000,000 with headquarters in the Spaulding building, Portland, Ore., plans to build a railroad from Portland's southeastern boundary through Waldo Hills, Ore., and Santiam to Bend.

Railway Officers

Railroad Administration

Regional

F. E. Dewey has been appointed general assistant to Percy R. Todd, director of the New England district of the Eastern Region, with office at Boston, Mass., not F. E. Desey as was incorrectly reported in our issue of August 22, on page 384.

A regional committee on loss and damage freight claims has been organized in the Southwestern region with the following personnel: **W. G. Vollmer**, assistant regional director, chairman; **H. M. Adams**, traffic assistant; **C. G. Weinbrenner**, inspector in the Secret Service and Police Section; and **R. B. Williamson**, at large.

Operating

W. H. Merritt, in addition to the duties heretofore assigned to him, has been appointed assistant to **W. D. Duke**, federal manager, of the Richmond, Fredericksburg & Potomac, the Washington Southern and the Richmond Terminal Railroad, with headquarters at Richmond, Va.

Captain W. E. Ausman, formerly trainmaster of the Cherokee, Sioux Falls and Onawa districts of the Illinois Central with headquarters at Cherokee, Iowa, has received his discharge from military service and has been re-appointed to his former position, succeeding I. L. Anderson, who has been assigned to other duties.

Engineering and Rolling Stock

The positions of district engineer on the Cleveland, Cincinnati, Chicago & St. Louis, at Galion, O., and at Springfield have been abolished; **W. C. Kegler**, district engineer at Galion, has resumed his duties as engineer maintenance of way on the Cleveland-Indianapolis division, with headquarters at Galion, vice **J. E. Kissell**, who has resumed his duties as engineer maintenance of way on the Cairo division, with headquarters at Mt. Carmel, in place of **E. J. Bayer**; **W. S. Burnett**, district engineer, at Springfield, O., has resumed his duties as engineer maintenance of way on the Cincinnati-Sandusky division, with headquarters at the same place, vice **L. B. Elliott**, who has been transferred as acting engineer maintenance of way to the Peoria & Eastern division, with headquarters at Indianapolis, and **C. F. Hinchman**, who has returned from military service, has resumed his position as engineer maintenance of way on the Indianopolis Terminal division, with headquarters at Indianapolis, vice **N. L. Arbuckle.**

Purchasing

W. A. Miller has been appointed division storekeeper on the Southern Railroad, with office at Spencer, N. C., vice **C. J. Norman**, deceased.

Corporate

Executive, Financial, Legal and Accounting

E. N. Brown, chairman of the board and president of the Pere Marquette Railway, with headquarters at New York, has been elected also chairman of the board and president of the St. Louis-San Francisco Railway, succeeding **Henry Ruhlender**, resigned.

Traffic

W. E. Hellmuth has been appointed traffic manager of the Colorado Springs & Cripple Creek District Railway, with headquarters at Colorado Springs, Colo.

A. T. Weldon, assistant freight traffic manager on the Canadian National Railways, at Moncton, N. B., with jurisdiction in the maritime provinces, has had his jurisdiction extended to include all lines east of but not including Port Arthur and Armstrong, Ont., and his headquarters are now at Montreal, Que.; **M. F. Tompkins,** assistant general freight agent at Moncton, N. B., has been promoted to general freight agent, with jurisdiction over lines Matapedia, Que., Edmundston, N. B., and east thereof, with office at Moncton.

Operating

W. J. Stinson, assistant superintendent of the Trenton division of the Canadian Pacific, with headquarters at Trenton, Ont., has been transferred to Havelock, Ont., succeeding **R. de L. B. Girouard,** who has been transferred.

R. A. Sewell, who has been appointed superintendent of car service, on the eastern lines of the Canadian Pacific, with headquarters at Montreal, Que., as has already been announced in these columns, began railroad work on the Canadian Pacific in December, 1898, as an operator and despatcher, resigning from that position in March, 1912. He returned to the service of the Canadian Pacific in July, 1914, as agent and chief despatcher. In October, 1918, he was appointed assistant superintendent at the Montreal Terminal, which position he held until his recent appointment as superintendent of car service on the eastern lines of the same road, with headquarters at Montreal, as above noted.

R. A. Sewell

Engineering and Rolling Stock

T. C. Fischer, office engineer of the Central Railroad Company of New Jersey, with headquarters at New York, has been appointed corporate engineer, with the same headquarters.

C. S. Ogilvie, assistant engineer on the Grand Trunk, at Ottawa, Ont., has been transferred to the Montreal Division, with headquarters at Montreal, Que., vice **C. Murgatroyd,** resigned.

Purchasing

F. A. Hamilton has been appointed purchasing agent of the Colorado Springs & Cripple Creek District Railway, with headquarters at Colorado Springs, Colo.

Obituary

Henry Hammersley, formerly and for many years previous to 1916, local treasurer of the New York, Chicago & St. Louis at Cleveland, Ohio, died on August 20, at his home in New York, at the age of 77.

W. H. Watkins, master mechanic of the Illinois Central with office at Memphis, Tenn., who was granted a leave of absence in the early part of this year, died at his home in Memphis on August 22, at the age of 50.

George J. Duffey, superintendent of motive power of the Lake Erie & Western, with headquarters at Lima, Ohio, died at his home in that city on August 16. He was born at Clinton, Ont., Canada, on May 24, 1863, and began railway work as an apprentice on the Michigan Central at St. Thomas, Ont., and served later as roundhouse foreman and general foreman on that road. In 1907, he left the service of the Michigan Central to go to the Chicago, Indiana & Southern, as general foreman at Gibson, Ind. On June 1, 1908, he was appointed superintendent of shops of the Lake Erie & Western, at Lima, Ohio; on November 1, 1903, was promoted to assistant master mechanic, and in March, 1911, was again promoted to master mechanic. Since January 1, 1916, he served as superintendent of motive power on the same road.

Theodore Cooper, for many years a consulting engineer in New York City and an authority on iron and steel construction, who retired from active work about 10 years ago, died on August 24, at his home in New York City, after a week's illness of pneumonia. Mr. Cooper was born on January 12, 1839, at Cooper's Plains, N. Y., and was graduated from Rensselaer Polytechnic Institute, Troy, N. Y., in 1858. He served as an engineering officer in the United States Navy from 1861 to 1872 and part of this time, from 1865 to 1868, was assistant professor at the Naval Academy. In 1872, with Captain James B. Eads, he was in charge of the manufacture and construction of the St. Louis bridge, later serving as resident engineer in charge of its erection. After its completion he served as engineer and superintendent. He was subsequently superintendent of the Delaware Bridge Company's shops and then assistant general manager and superintendent of the Keystone Bridge Company. Mr. Cooper was assistant engineer in charge of construction of the first elevated railroads in New York City. Since 1879, until his retirement, he was in practice as a consulting engineer in New York City and designed many important bridges, aqueducts, buildings and railroad shops. He was also consulting engineer for many railroads in the United States, Mexico and Japan and for the New York Public Library and the Quebec Bridge over the St. Lawrence river. He was the author of Cooper's Specifications for the Superstructure of Railroad and Highway Bridges; also many papers on engineering subjects.

T. Cooper

Scenes from Foreign Ports—Train Arriving at Puerto Colombia, Colombia

EDITORIAL
Railway Age

Table of Contents will be found on Page 5 of the Advertising Section

There is no question but that a railroad could be managed more effectively if it was all located at one place instead of being spread over several states. The scattered condition of railroad property is a special handicap in handling maintenance of way work and other activities not directly associated with the conduct of transportation. Many widely separated operations are not readily administered, while any attempt at concentration introduces transportation charges. In scrap reclamation the expense of hauling the worn out appliances to the plant and the renewed parts back again must always be watched carefully. In the case of rail re-sawing this consideration has resulted in the development of portable plants mounted on cars so that the sawing may be done at or near the place where the rail is taken up. The latest development of this kind is a portable creosoting plant now in use on the Pennsylvania Railroad and described on another page of this issue. While many reasons may be given to argue the greater economy of a stationary plant, the transportation charges which arise on some roads in the backhaul of ties that are to be placed in tracks near the point of tie production, but at a distance from the treating plant, constitute an ample justification for this endeavor to overcome them.

Taking the Mountain to Mohammed

In strong contrast to the general condition of unrest and suspicion in the industrial world is the action taken by the representatives of the employees of the Midvale Steel & Ordnance Company, the Cambria Steel Company and subsidiary companies in session at Atlantic City August 22 and 23, in adopting a resolution condemning the persistent demands of workmen generally for shorter hours and higher wages. The resolution states that "the high cost of living needs to be abated by diligent, efficient and conscientious labor, by thrift, and by avoidance of waste and extravagance," and that "the price of commodities is regulated by the day's work of a man and the real unit of value or unit of compensation is not a dollar but the purchasing power of a dollar," which is regulated by the average compensation for one hour's work received by all who labor. The resolution further states that "we believe any workman who demands a greater proportionate return for his labor than his fellow workmen in other lines are getting is as guilty of profiteering as a grocer who charges exorbitant prices for the necessities of life." It is worthy of note and highly encouraging that the representatives duly elected by the great body of employees in the various plants of the Midvale and Cambria companies, numbering some 30,000, have so sound an understanding of the fundamental necessities for the improvement of the present unsatisfactory economic conditions. The pertinent fact in this connection is that the Midvale employees are organized under what has been designated as the shop committee system for collective bargaining and consideration of grievances and working conditions with the local and general managements of the company, an organization which tends to promote open dealings and mutual freedom from suspicion. It is a question whether the great mass of workers in the country at large are not as sound in their estimate of the situation as the Midvale employees, the difference in expression being due largely to the general feeling of suspicion between wage earners and employers, which apparently does not exist in the relations of the Midvale company and its employees.

A Sane Attitude on the Wage Question

For many years prior to federal control railway managers were criticized with some justice for yielding to the pressure of organized labor with respect both to rates of pay and working conditions, while largely ignoring similar claims of equally or more deserving employees in maintenance of way, clerical and station service who had formed no organizations to represent them. In partial defense of the managers it must be admitted that the continually narrowing margin of net income left them in the position of having little to divide after submitting to the demands of the organizations. However, this did not remove the element of unfairness resulting from the increasing disparity in wages. It was then contended by certain advocates of government ownership that such inequalities would not exist if the government was to assume charge of the roads, because it would have no incentive to deal other than fairly with all employees. Yet after nearly two years of federal control and operation, we find some inequalities as bad as or worse than any that existed before. Today a *laborer* in a car repair yard receives 58 cents an hour with time and a half after eight hours, while a section *foreman* receives only about 50 cents an hour with straight time up to ten hours and time and one half only after that period. On the basis of a 10-hour day and 26 days per month the car repair laborer actually receives 25 per cent more wages than the section foreman. He has no responsibility beyond that of his immediate duties as a workman in a gang, while the foreman is responsible for the work of a force of men and for the safety of travel on several miles of main line. It is because of this situation that there is more dissatisfaction and unrest among maintenance of way employees today than ever before. It is also because of this fact that these men are organizing to an extent never before attempted and are taking a strike vote as a means of enforcing their demands. It is fully as difficult to secure equity in the matter of wages under government as under private operation.

Justice to the Unorganized Employee

For the past 19 years the mileage of automatic block signals on the railroads of the United States has increased steadily. During that time approximately 37,000 miles of road have been equipped with such signals. In 1901 only about 2,000 miles of road was protected in that manner. During the next six years the annual average rate of increase was about 800 miles, but, following the depression of 1907, it is interesting to note the extraordinary advance in the application of automatic block signals which was so marked that it almost amounted to a boom. During 1907 alone more than five times the previous annual average increase was recorded, while for the six years beginning with 1907 the average annual rate of increase was approximately 2,500 miles of road, or more than three times that during the preceding

Progress of Automatic Block Signals

six years. In 1913 another very marked increase was noted, for during that year automatic block signals were added on more than 4,000 miles of road, this addition being about the same as in 1907. During the six years beginning with 1913, the annual average rate of increase was about the same as in the previous six-year period, but apparently a break in the cycle has now occurred, because this year there has been no such marked advance. Information received earlier in the year indicates that the best that can be expected in the way of additional protection in 1919 will not exceed 2,000 miles of road, which is less than one-half the mileage added during the years of maximum progress. The principal work which is now being done with respect to automatic block signals is the investigation by some of the more progressive roads of the additions and changes that can be made to facilitate the movement of trains and to increase the capacity of existing tracks, concerning which the Signal division of the American Railroad Association has made extended study. Because of the war and other unfavorable conditions, the country is sadly behind in railroad construction. Additional facilities must be added and enormous railway expansion must be made during the next few years to meet the demands of the country's growth. Some of these needs can and will naturally be met by the more extended use of automatic block signals.

Railroad Labor Situation Improves

DEVELOPMENTS LAST WEEK in the railroad labor field were most of them as unexpected to most people as they were gratifying. With his long and almost unbroken record of supporting the demands of organized labor, there seemed reason to expect that President Wilson would grant another general advance in wages to railroad employees largely regardless of the justification for it. On the contrary, the President, on the advice of Director General Hines, granted the shop employees only a small increase to equalize the advances in their wages with those of other railway employees, and definitely announced that pending the administration's efforts to reduce the cost of living no general advance in railroad wages would be granted.

The employees of the railroads in California had struck in sympathy with the striking employees of the Pacific Electric Railway. It was pointed out to them that the Pacific Electric was not under government control and therefore the government had no authority over its management. The heads of the railroad brotherhoods ordered their followers to return to work. When they failed to do so the director general announced that unless they were back at work on the morning of August 30 their places would be filled and the entire power of the government would be used to restore operation. The strikers promptly returned to work.

Meanwhile Samuel Gompers, president of the American Federation of Labor, returned from Europe. The advocates of the Plumb Plan had been claiming Mr. Gompers was in favor of their scheme. They had been advertising him as "honorary president" of the Plumb Plan League. But Mr. Gompers, since his return, has refused to comment on the Plumb Plan—a strong indication that either he never authorized the use of his name in support of it, or that when he did so he did not understand what it was.

The propaganda for the Plumb Plan, and the numerous recent strikes and threats of strikes, especially upon railroads, seemed to show that organized labor, and especially organized railroad labor, had passed into the control of the most radical and even revolutionary element of its membership. The result of the firm stand taken by the national administration against railroad strikes and another general advance in railroad wages at this time, seems to indicate that all that was needed to cause more conservative councils to prevail in organized labor was energetic resistance on the part of the government and the public to the demands of the radicals. The more conservative element in organized labor apparently was not unwilling to follow the radicals as long as it appeared that by doing so it might benefit. When, however, the conservative element saw that railroad labor was moving directly toward a conflict with the government, in which it was certain that the government would have the support of a large majority of the public, the conservative element began to exert its influence very effectively.

It cannot yet be assumed that the danger of a general railroad strike is past. The two main grounds upon which the leaders of the shop crafts have advised their members to vote against a strike are that, first, they should give the government time thoroughly to test its measures for reducing the cost of living, and, second, if there is to be a railroad strike it should involve all the employees and not merely the 22 per cent employed in the shops, since if the strike was successful all employees would benefit. There is much ground for skepticism as to whether the government's attacks upon the high cost of living will, in the long run, be highly successful. It cannot permanently reduce the cost of living by dumping upon the market surplus commodities bought to carry on the war and by prosecuting so-called "profiteers." In the long run, the cost of living will be determined by the relationship between the supply and demand of commodities. The only way in which the supply of things can be increased is by producing more of them. The artificial reduction of prices by governmental measures will merely increase consumption and in the long run increase the cost of living.

On the basis of the cost of living, railroad labor generally is not entitled to a further advance in wages. The increase in the average railroad wage during the last five years has been greater in proportion than the increase in the cost of living. Since, however, not only the leaders of the shop crafts, but also the leaders of other railroad organizations, have made their abstention from strikes at present conditional upon the success of the government in reducing the cost of living, it may be that the general railroad strike which seemed imminent a few weeks ago really has only been postponed for a few months. The present leaders of organized railroad labor, especially the heads of the train service brotherhoods, are not only very radical but very daring men, and nobody who knows them will doubt that they will "go the limit" if they believe that they will gain anything thereby.

However, as we have remarked, the influence of the more conservative members of the organizations is beginning to make itself felt. Furthermore, a clearing of the atmosphere occurred when the government took a firm stand against wage advances and announced to the strikers in California that unless they returned to work it would fill their places and use the most drastic measures to prevent interference with operation. Government operation has some serious disadvantages, but it has the advantage that it can put back of the railroad management the entire power of the government and of public opinion in resisting unreasonable strikes and threats of strikes. This may not seem an advantage of government operation to the radical labor leaders, but in view of recent experience, it certainly does seem such to the American public. Whether, in view of the stand taken by the government and the obvious fact that it has the backing of public opinion, the labor leaders will feel that they dare in any circumstances order a general strike under government operation begins to seem somewhat doubtful.

The serious mistake made by President Wilson three years ago in failing to stand for arbitration in the eight-hour basic day dispute has caused a large part of the serious labor troubles which have occurred upon the railroads since then. While his course at that time was unwise and harmful, his present stand is wise and promises to be beneficial.

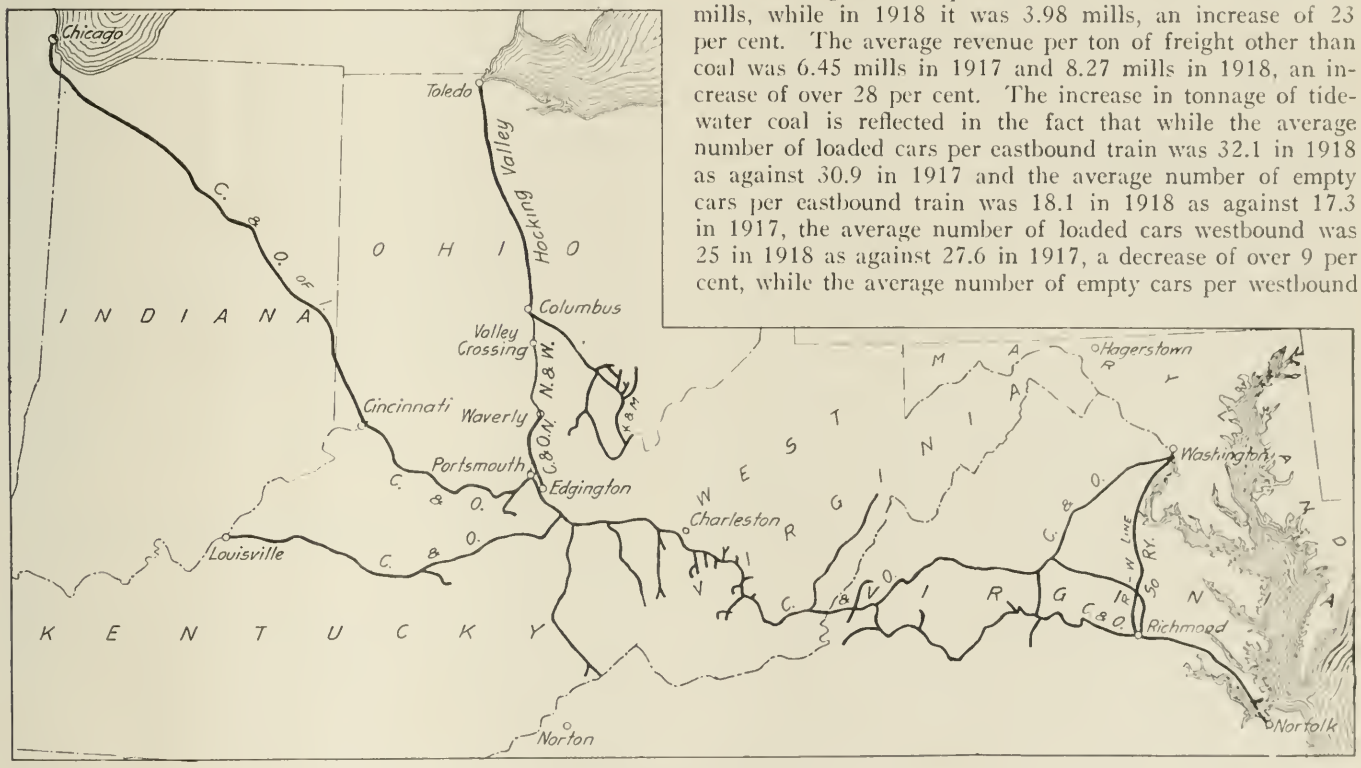
Chesapeake & Ohio

An increase in tidewater coal business and an increase in passenger traffic together with the increase in freight and passenger rates which were put into effect by the Railroad Administration, were more than sufficient to offset increased labor and material costs in 1918 on the Chesapeake & Ohio. The rental which the government pays for the road is tentatively fixed by the Interstate Commerce Commission at $13,227,000. In 1917 the Chesapeake & Ohio earned $14,890,000 operating income after paying expenses and taxes. In 1918, under government operation, the road earned $17,716,000 operating income. There was, therefore, after making certain adjustments, a profit to the government of approximately $4,000,000 over and above the rental paid the company. On the basis of the showing of 1918, it would seem easy for the company to take back its property on the present schedule of wages and of rates and operate it with a reasonable profit to stockholders. An analysis, however, of the 1918 showing gives no sure warranty that present conditions and a return to private operation would assure the company financial success. Coal is not moving to tidewater in any such volume as it did in 1918 and it would appear that the large proportion of coal moving to tidewater in 1918 was an important factor in the ton-mile cost of handling business. Neither is it certain that the passenger business will, under present and future conditions, remain as good as it was in 1918. Maintenance costs on the Chesapeake & Ohio increased about in line with maintenance costs on other roads in its territory, but, like other roads, there is, of necessity, considerable deferred maintenance.

The total tonnage of all freight carried in 1918 was 40,237,000, an increase of 2,357,000 tons, or 6.2 per cent, over 1917. The average haul was shorter in 1918 than in 1917—267 miles and 271 miles respectively,—so that the number of ton miles increased only 4.5 per cent. For some years the development of the Chesapeake & Ohio had been predicated on the assumption that tidewater coal business was of so paramount an importance as to warrant large expenditures for reduction of grades, strengthening of bridges, etc., to more cheaply handle this particular business. Prior to 1914, however, traffic conditions were such that a very considerable proportion of the coal tonnage was handled westbound. On some of this business the Chesapeake & Ohio got a short haul with a considerable loading cost, but a poor division of the rates. With the opening of the Chesapeake & Ohio Northern, which gives the parent company its connection (with trackage rights) with its subsidiary, the Hocking Valley, this rate situation was greatly improved. With the completion of the Chesapeake & Ohio's ore dock at Norfolk, Va., it was in a position to handle coal at tidewater profitably. The war turned the tide of coal and other traffic to the seaboard and the results were reflected in the very profitable showing of 1917. With the elimination of competitive conditions, the establishment of zone systems of coal distribution and the pooling of coal traffic the Chesapeake & Ohio system found itself in a very favorable condition.

The average revenue per ton mile of coal in 1917 was 3.23 mills, while in 1918 it was 3.98 mills, an increase of 23 per cent. The average revenue per ton of freight other than coal was 6.45 mills in 1917 and 8.27 mills in 1918, an increase of over 28 per cent. The increase in tonnage of tidewater coal is reflected in the fact that while the average number of loaded cars per eastbound train was 32.1 in 1918 as against 30.9 in 1917 and the average number of empty cars per eastbound train was 18.1 in 1918 as against 17.3 in 1917, the average number of loaded cars westbound was 25 in 1918 as against 27.6 in 1917, a decrease of over 9 per cent, while the average number of empty cars per westbound freight train was 25.1 in 1918 as against 18 in 1917, an increase of ever 39 per cent. Thus total loaded car mileage increased by 2.4 per cent, while total empty car mileage increased by 22.5 per cent; but good operation combined with the improvement work which had been done to lower the cost of handling tidewater coal more than offset the increase in empty car movement. The average tonnage of revenue freight per train was 1,099 in 1918 as against 1,043 in 1917, an increase of 5.4 per cent. A good improvement was shown in car loading also, the average per loaded car being 38.2 tons in the year 1918 as against 35.6 tons in the preceding year.

Transportation expenses (the out-of-pocket cost of doing the business) on the Chesapeake & Ohio amounted to $26,190,000, an increase of $7,652,000. Of this increase, $1,239,000 is accounted for by the increased cost of fuel for train locomotives alone. Notwithstanding the increase in rates of wages, the increase in the amount spent for train



The Chesapeake & Ohio

enginemen was not in proportion to the increase in coal costs. Train enginemen's wages in 1918 were $2,778,000, an increase of $694,000; while the cost of fuel in 1918 was $4,848,000, an increase of $1,239,000 over 1917.

Maintenance of way cost $9,701,000 in 1918, an increase of 40.5 per cent over 1917, and maintenance of equipment cost $16,179,000, an increase of 53.8 per cent. Apparently, the increase in cost of track labor was particularly great. In 1918 only 589,000 untreated, first-class white oak ties were used in maintenance as against 864,000 used in 1917, and the total of all ties, including creosoted and second-class ties, was 1,148,000 as against 1,468,000 in 1917. On the Chesapeake & Ohio 100-pound rail is standard for main line and in 1918 only 6,130 tons of this rail was used in renewals, compared with 20,056 tons used in 1917.

The average cost of repairs of locomotives was $6,082 per locomotive in 1918 and $3,789 in 1917, and the average cost of repairs per freight car was $150 in 1918 and $92 in 1917. The average cost of repairs per passenger car was $1,634 in 1918 and $1,077 in 1917.

The Chesapeake & Ohio Railway Company on December 31, 1918, had $1,969,000 loans and bills payable and owed the government $16,536,000 for advances, etc. There was $119,000 cash on hand and the government owed the company $10,927,000 out of the $13,227,000 rental certified to by the Interstate Commerce Commission; the government also owed the company $10,714,000 for cash, agents' and conductors' balances, depreciation, etc., which it had taken over on January 1, 1918. In addition, the company claims that the government owes it $1,047,000 annual rental not included in the amount tentatively certified to by the Interstate Commerce Commission.

In concluding his annual letter to stockholders, Frank Trumbull, chairman of the board and president of the company, says:

"The president of the United States has announced that federal control will terminate on December 31, 1919. The practical certainty that operating costs cannot be substantially reduced below their present high level and the probability that determined efforts will be made by shippers to prevent further increase of rates and even to effect reductions, will render it very difficult, after federal control has ended, to maintain between revenues and expenses the margin necessary to insure an adequate return to your company and provide the basis of credit necessary for the improvement and development of its property. This prospect, which faces every railroad in the country, makes it of the highest importance that some plan be devised and enacted into law, which while protecting the proper interests of the public, shall yet also insure the financial stability of our transportation system."

The following table shows the principal figures for operation of the road under government operation in 1918 as compared with operation in 1917 by the company. This is not the corporate income account.

	1918	1917
Mileage operated	2,485	2,478
Freight revenue	$55,720,373	$42,998,223
Passenger revenue	13,629,892	7,899,452
Total operating revenues	73,720,797	54,643,794
Maintenance of way and structures	9,700,660	6,905,579
Maintenance of equipment	16,178,533	10,521,724
Traffic expenses	484,418	694,131
Transportation expenses	26,189,743	18,537,582
General expenses	1,179,251	1,119,732
Total operating expenses	54,081,537	38,105,806
Taxes	1,920,000	1,644,075
Operating income	17,716,459	14,890,416

Corporate Income Account

	1918
Standard return	$13,226,983
General expenses	135,809
Federal income tax accruals	358,184
Income	1,118,414
Gross income	13,851,404
Net income	4,837,507
Dividends	2,511,264
Surplus	8,565,727

Letters to the Editor

Credit for Wage Increase for Engineers

Chicago.

To the Editor:

In your issue of August 22 you devote an editorial to "Justice for the Technical Man" in which you call attention to the recent adjustment of salaries made by the regional director of the Northwestern region and in which you give the credit for this adjustment to the committee of three engineers appointed by the regional director and also to the officers of the Northwestern region for recognizing the justice of the case and having the courage to set a precedent for the other regions. You also mention that the matter of this salary adjustment was the subject of a hearing before the Board of Wages and Working Conditions, but you do not inform your readers that it was the American Association of Engineers which obtained the hearing and presented testimony and evidence collected by the association from all parts of the country. It was the evidence presented at this hearing which caused the wage board to refer the matter to the various regional directors for adjustment. The association then took the question up with the regional directors, furnishing each with a report on his region based on some 1700 questionnaires received from men on 91 railroads, the originals of which were filed with the wage board. I think the adjustment of salaries in the Northwestern region is fair and just and the regional director and his committee of three chief engineers are to be commended for the action taken.

W. W. K. Sparrow,
Chief Engineer, C. M. & St. P. Ry. Co.,
Director, American Association of Engineers.

Condition of Mexican Railways

Guaymas, Sonora, Mexico.

To the Editor:

I have read with much interest the second of P. H. Middleton's articles (*Railway Age*, June 20, page 1530) concerning the condition of railway lines in Mexico. There are some portions of the article, however, which do not reflect the actual conditions. For instance, the statement is made that through billing has been discontinued since 1915 and that American-owned freight cars are only coming into Mexico under bond furnished by the shipper. This condition is not true insofar as the Southern Pacific Railroad Company of Mexico is concerned. We enjoy through billing arrangements with the United States Railroad Administration and there is also a free interchange of equipment.

We have been endeavoring to inaugurate Pullman service on our line, but to date we have not succeeded in procuring the cars from the United States Railroad Administration, possibly due to working arrangements through Texas ports which are not applicable in connection with the Southern Pacific Railroad Company of Mexico.

The statement is also made that the Southern Pacific Railroad Company of Mexico is compelled to operate armored cars on all trains. This is not correct as we only protect our trains with armored cars through the so-called Yaqui Zone, which runs from Torres, Sonora, to Esperanza, a distance of 205 kilometers, which is equivalent to 128 miles. We operate the armored cars through this zone as a precautionary measure and not in anticipation of any trouble.

As a matter of information I wish to state that we delivered the past season, to the United States Railroad Administration lines at Nogales, Ariz., 583 cars of tomatoes which were moved in Pacific Fruit Express cars. We are now moving the garbanzo (Spanish pea) crop, all of which will be transported in foreign equipment. The garbanzo movement will amount to approximately 1,000 cars. We are giving you this information in order that you may see that foreign line equipment is being given to us quite readily

W. H. FRANCIS,
Assistant to General Freight & Passenger Agt.,
Southern Pacific Railroad Company of Mexico.

Eliminating the Flagman

WASHINGTON, D. C.

TO THE EDITOR:

The article by C. H. T. in your issue of August 22 struck a responsive chord in my mind, for the reason that I have long recognized the inefficiency with which flagging generally is performed in automatic block signal territory; even in those cases where flagmen have plenty of time to go back a sufficient distance to afford ample protection, they often fail to perform their duty, and my experience in accident investigation work leads me to believe that in a great majority of cases flagmen depend upon the signals instead of doing the things they are required to do by the rules. We are confronted with the familiar evil of divided responsibility, and it is a natural thought that the logical way to cure this evil is to place the entire responsibility on one man. To put the matter of protection in automatic signal territory entirely up to the engineman would certainly produce excellent results in one direction, at least, where reform in existing practice is sadly needed, namely, it would have a strong tendency to enforce obedience to the caution indication.

While it is true that in automatic block signal territory generally flagging is very poorly performed, and it would appear that better results might be obtained by relying entirely on signal indications, I would hesitate to advocate the complete elimination of the flagman. What I do contend for is a rule for flagging in automatic signal territory different from the rule in force on track not protected by automatic signals. It is unreasonable to expect the same obedience to all the provisions of rule 99 on track that is fully protected by automatic signals that is required on track which is not so protected. In automatic signal territory the flagging rule should fully recognize the function of the signals, and the only thing a flagman should be held responsible for is knowledge that a stop signal is displayed full braking distance behind his train. This principle is recognized in the rules of at least three of our large railway systems with which I am familiar.

Rule 99B of the Baltimore & Ohio, effective January 1, 1913, reads as follows:

> In locations protected by automatic signals and so designated on the time table, the flagman must go back immediately with stop signals a sufficient distance to protect the train, or until he can plainly see that the signal not less than one-half mile to the rear of the train displays stop, and must know that it continues to display stop while the train requires protection.

A similar rule, No. 514, in force on the Northern Pacific reads as follows:

> In block signal districts, where the automatic block signal governing the track in use can be plainly seen from the rear of a standing train to be at stop, such signal being not less than one-half mile from such train, it will not be necessary to protect the train by a flagman. Under all other circumstances, Rule 99 must be fully observed in block signal districts.

Rule 508 of the block signal rules of the Union Pacific reads as follows:

> An engineman of a train entering a block as provided for by these rules will be held responsible in case of accident caused by overtaking the preceding train.

When a flagman has done what is required of him by the Baltimore & Ohio and Northern Pacific rules above quoted, namely, assured himself beyond question that his train is amply protected by a stop signal, nothing further should be expected from him. Complete responsibility should then rest with the engineman of the following train.

When all is said, however, we find ourselves back to the crux of the whole matter, which was pointed out by Commissioner McChord in the article published in your issue of June 20, namely, the necessity for improved discipline and morale, insuring that whatever flagging rules are in force shall be strictly observed. To illustrate what I mean by this statement I will say that in discussing the Baltimore & Ohio rule with an employee of that road some time ago I was told that the rule was no good, for the reason that since its promulgation flagmen never left the rear end of the caboose. This, of course, was an exaggeration, but it forcibly directs attention to that human tendency to minimum effort which was pointed out by Commissioner McChord.

W. P. BORLAND.

More on the Cost of Driving a Spike

NEW YORK

TO THE EDITOR:

On page 190 of the issue of the *Railway Age* for August 1 there appears a letter entitled "Valuation ad Absurdum," signed by "A Liar Who Figures." Prompted by a desire to correct any misapprehension as to the methods and costs of valuation work in general, which may have been instilled in the minds of those unfamiliar with the subject by a perusal of the letter referred to, I desire to present the following:

The writer of "Valuation ad Absurdum" is wrong in saying he is a man "who figures." He states that as it took 10 seconds to drive the track spike, at 40 cents an hour, the cost of driving a track spike is 1-10 of a cent. It will only require the use of simple arithmetic to show that this cost from the data he gives is 1-9 of a cent, instead of 1-10 of a cent.

To prove the misleading character of the original communication it is necessary to answer the question: "Why was $21,849 spent to determine the cost of driving track spikes?"

It has been estimated that there are approximately 350,000 miles of all tracks in the United States. Assuming that there are 2,700 ties per mile, with an average of 5 track spikes per tie, the total number of track spikes in place is 4,725,000,000. A variation of one-half of a mill in the cost of driving spikes when the valuation of the railroads is determined will mean a variation in the total value of $2,362,500. In other words, if the valuation were too high by that amount the public would be compelled to pay 6 per cent interest annually on $2,362,500; and if the figures were too low, the investors in railway securities would lose the interest on that sum. Six per cent interest on $2,362,500 per annum is $141,750, which, less the cost of determining this value given by our friend, "A Liar Who Says He Figures," as $21,849, gives a saving either to the public or to the investors of $119,901 for the first year that the valuation operates, and a saving of $141,750 for each succeeding year.

The amount of this saving at the end of any period of years, computed with compound interest, is left to the imagination of the reader.

We will trust the judgment of the valuation engineers rather than the "Liar Who Says He Figures" as to whether the money expended for valuation is being spent wisely or foolishly.

D. B.

The Senate Committee's Tentative Railroad Bill

Provision Made for Adequate Rates, Limitation of Profits, Federal Incorporation and Gradual Consolidation

WASHINGTON, D. C.

LEGISLATION to establish a new governmental policy of railroad regulation after the return of the railroads to private management was brought a step nearer this week when A. B. Cummins, chairman of the Senate committee on interstate commerce, introduced in the Senate on Tuesday the tentative bill drafted by a subcommittee which is to afford the basis for further consideration by the full committee. The bill contains several important features of various plans which were submitted during the hearings before the committee earlier in the year by the railway executives and other interests, although with many modifications by way of compromise and with some new provisions resulting from the work of the subcommittee, which was composed of Senators Cummins, Kellogg, Poindexter, Pomerene and Robinson. While it contains several features which will probably be objected to both by the railroads and by those who object to any radical changes in the policy of regulation, it also contains many provisions which have long been advocated by the railroad officers and others interested in a policy of encouraging transportation development. It does not provide either for a guarantee or for a definite percentage of net return but it indicates a policy to see that rates are made adequate. On the other hand it limits the profits which may be retained by a railroad to a fair return.

Some of the principal features are:

A railway transportation board, somewhat similar to the federal transportation board proposed by the railway executives and by the National Transportation Conference, to take over many of the administrative functions of the Interstate Commerce Commission and to outline a general transportation policy.

Provision for a gradual consolidation of the railroads into 20 to 35 competing systems, incorporated under federal authority.

An instruction to the Interstate Commerce Commission to lower or advance rates by districts to produce a fair return on the value of the property.

A limitation of earnings of an indivdual road to a fair return and a division of the excess earnings above such fair return, one-half for the benefit of labor and one-half to be expended by the transportation board for equipment or for loans to carriers.

Provision for the settlement of labor disputes by a committee of wages and working conditions and the railway transportation board, and for making a strike or lockout a criminal conspiracy.

Representation of the employees and the government on boards of directors.

Temporary continuance of the guaranteed standard return pending a readjustment of rates.

The following summary or analysis of the bill was made by Senator Cummins in connection with his introduction of the bill in the Senate:

SUMMARY OF THE PRINCIPAL SECTIONS OF THE CUMMINS BILL

SECTION 1.

This section repeals the federal control act of March 21, 1918. The repeal takes effect on the last day of the month in which the bill becomes a law, and the railroads are to be returned to their owners at that time. Rates in force at the time the repeal takes effect are to remain in force until changed by competent authority.

SECTION 2.

Advances made by the government to the railroads and properly chargeable to capital account are to be evidenced by bonds or other securities payable in five years, with interest at 5 per centum per annum; other indebtedness to be evidenced by demand notes, with interest at 6 per centum per annum.

SECTION 4.

Upon the passage of this act the Interstate Commerce Commission is to divide the country into rate districts and the carriers into rate groups, for rate-making purposes; and hearings are provided for with respect to the adequacy of rates for revenue purposes, considering the rate district or rate group as a whole. This issue is to be tried separate and apart from the question of the reasonableness of rates upon particular commodities or for particular communities.

SECTION 5.

New schedules of rates which are filed within 30 days after federal control ceases become effective at the end of four months after they are filed, with such changes as the commission may, in the meantime, order; and, until the expiration of the four-months' period, this act constitutes a guaranty to the railroads which have entered into contracts respecting compensation under the act of March 21, 1918, of a proportionate amount of the contract compensation, and with respect to the railroads with which no contracts have been made, it constitutes a guaranty of a proportionate railway-operating income. At the end of this period the guaranty ceases. If, during this period, any railroad earns more than the guaranty, the excess is to be paid into the Treasury of the United States.

SECTION 6.

In making rates for the groups the commission is to take into consideration the interest of the public, the shippers, the wages of labor, the cost of maintenance and operation—including taxes—and a fair return upon the value of the property used or held for the purpose of transportation, and it is required to lower or advance rates accordingly If any railroad in the group receives more than a fair return upon the value of its property the excess is to be paid to the railway transportation board, mentioned hereafter. One-half of the excess is to be used by the board in the following manner:

First. The promotion of invention and research to ameliorate the conditions of labor and to lessen the hazards of employment;

Second. To extend and improve hospital relief;

Third. To supplement existing systems of insurance and pensions;

Fourth. To afford opportunity for the technical education of employees; and

Fifth. To establish a system of profit sharing by employees.

In the administration of this fund, the board is to organize an employees' advisory council, composed of one representative from each organized craft of railroad employees. The remaining one-half of the excess is to be deposited in a fund and expended by the board in the purchase of equipment to be leased to railroads under proper terms, or to be loaned to carriers unable to provide themselves with proper equipment and facilities upon reasonable security.

No excess earnings above a fair dividend are to be capitalized or used as a basis for increased rates.

SECTION 7.

This section creates a railway transportation board and is one of the most important in the bill. The board consists of five members appointed by the President, with the advice and consent of the Senate. Its members are to receive a salary of $12,000 per year. No member of the board during his term of office can hold any office or employment under any railroad corporation, or be pecuniarily interested in the stock or bonds of any such corporation It has the same powers with respect to summoning witnesses and securing testimony as the law now gives to the Interstate Commerce Commission.

SECTION 9.

This section furnishes the keynote of the solution of the railroad problem presented by the bill. It declares it to be the policy of the United States that the railways of the country shall be divided in ownership and for operation into not less than 20 nor more than 35 separate and distinct systems; each of said systems to be owned and operated by a distinct corporation, organized or reorganized under this act. It provides that, in the division of the railways into systems, competition shall be preserved as fully as possible, and wherever practicable existing routes and channels of trade shall be maintained; that the several systems shall be so arranged that the cost of transportation as between competitive systems and as related to the value of the railroad properties shall be the same so far as practicable, to the end that these systems can employ uniform rates in the movement of competitive traffic and, under efficient management, earn substantially the same rate of return upon the value of their respective properties.

SECTION 10.

As its first duty the railway transportation board is required to adopt a plan for the consolidation of all the railway properties of the country into not less than 20 nor more than 35 systems. When it has agreed upon a tentative plan, it is to give it publicity and provide for full and complete hearings upon the plan. The plan must receive the approval of the Interstate Commerce Commission; but, after it is finally adopted, the voluntary consolidations which are provided for must be in harmony with it, and the compulsory consolidation which are also provided for are to complete it. Street railways and interurban railways used chiefly in the transportation of passengers, and certain other railway facilities which can not be properly consolidated, are excepted from the plan.

The transportation board is clothed with many and most important

powers, in addition to making the plan of consolidation. It is to make continuous inquiry respecting the transportation needs and facilities of the whole country and ascertain when and how they shall be enlarged or improved. It is to inquire into the state of the credit of all common carriers and inform itself respecting the relation between revenues and net income and the like. It is to inquire with respect to the new capital which may be required for adequate and efficient transportation service and the conditions under which it can be secured. It is to certify to the Interstate Commerce Commission its findings in these respects, and the commission is to accept such certificate as prima facie evidence in any hearings which it may conduct. It has authority to lay before the commission any matter of public interest and show such cause as it may deem proper and appropriate. It has authority to make reports to Congress and recommend such measures and policies as will promote and protect the interest of the public concerning the efficiency of the transportation service and the adequacy of transportation facilities.

This section transfers from the Interstate Commerce Commission to the transportation board many of the functions and powers heretofore conferred upon the commission, notably the administration, of the car-service act, the administration of the safety-appliance acts, the administration of the hours-of-service act, the administration of the locomotive-inspection act, and many others which need not be specifically mentioned but which are of the same general character.

It is required also to inquire into water-transportation facilities and the relations between hand carriers and water carriers, the best methods of coordinating the two kinds of transportation, and the most practical plan for preserving in full vigor the two kinds of transportation when they are competitive.

SECTION 11.

The board also has the power, where congestion of traffic exists upon any road to divert it over other lines of railway, in order to relieve the congestion. It has the power to compel a common or joint use of terminals or other facilities when the public interest requires it, and, in a general way, to compel such unification as is necessary to secure the most efficient use of railway facilities for prompt and economical transportation.

SECTION 12.

This section makes lawful the consolidation of railways, but only under the following conditions: First, the consolidation must be in harmony with and in furtherance of the ultimate complete consolidation already referred to, and must be recommended by the board and approved by the commission. Second, the corporation which is to become the owner of the consolidated properties must be either organized under federal authority or reincorporated under this act. Third, the capitalization of the consolidated corporation must not exceed the value of its railway property, as determined by the Interstate Commerce Commission.

Public hearings are to be held in any case of a proposed consolidation, of which the state authorities are to be notified.

SECTION 13.

This section provides that at the end of seven years, in which the voluntary consolidations may take place, the transportation board is to proceed to the completion of the plan of consolidating the railway properties of the country according to its original determination. The compulsory consolidation is to be accomplished through the organization of railway companies under this act, or the enlargement of reincorporated companies which have been organized under state laws. It is not necessary to enter into the details of this section. It is sufficient to say that it is to be so carried out that no obligation on the part of the United States will be created, and that when the work is finished the railways of this country will be divided into the number of competitive systems prescribed by the board, and that the capitalization of each of the companies will represent the actual value of the property used in transportation, as fixed by he Interstate Commerce Commission.

SECTIONS 14, 15, 16, 17, 18 AND 19.

These sections provide for the reincorporation of corporations now owning and operating railways, so as to give them the character of federal corporations, and the only feature of these sections which need to be mentioned is that in any such reincorporated company the classified employees of the corporation are to be represented by two members on the board of directors and the government is to be represented by two members appointed by the transportation board.

SECTION 20.

This section provides that existing railway corporations must have upon their boards of directors two members representing the classified employees and two members representing the government.

SECTIONS 21 AND 22.

These sections relate to the original organization of railway corporations under this act. The two distinctive things in it are, first, that the system of railways which it has organized to own and operate can not be capitalized for a greater sum than the actual value of the property as determined by the Interstate Commerce Commission, and each corporation so organized must have on its board of directors two representatives of the classified employees and two representatives of the government.

SECTION 24.

This is a section which confers upon the Interstate Commerce Commission exclusive authority to regulate and control the issuance of railway stocks and bonds, and needs no comment.

SECTION 25.

This section provides for the use of the excess earnings of any railway company in behalf of its employees. It has already been mentioned.

SECTION 26.

This section provides a new method for settling disputes between railroad companies and their employees. It creates a committee of wages and working conditions, which is to be composed of eight members, four of them representing labor and four of them representing the railway companies. Each railroad craft is to nominate candidates for this committee, and the board is required to appoint four from among such nominees. Each railroad corporation is to nominate a candidate for membership and the board is to appoint four persons from among such nominations. This committee is to consider all complaints submitted by representatives of the employees or of the carriers, and is to decide by a majority vote, and its decisions are to be certified to the transportation board. If the committee of wages and working conditions is evenly divided upon any dispute, the whole matter is to be certified to the board, and the decision of the board is final and constitutes a governmental judgment with respect to the matters in controversy.

SECTION 27.

This section prescribes some of the things which must be taken into account by the committee of wages and working conditions in determining wages. It provides that the committee and transportation board shall take into consideration, among other relevant circumstances, the following: First, the scale of wages paid for similar kinds of work in other industries; second, the relation between wages and the cost of living; third, the hazards of the employment; fourth, the training and skill required; fifth, the degree of responsibility, and sixth, the character and regularity of the employment.

SECTION 29.

This section imposes a penalty of fine or imprisonment, or both, upon any carrier, or any officer of any carrier, who refuses to obey the decisions of the committee after it has been approved by the board, or of the board itself, in the cases referred to. It also provides that if two or more persons enter into any combination or agreement with the intent substantially to hinder, restrain, or prevent the movement of commodities or persons in interstate commerce, or enter into any combination or agreement which substantially hinders, restrains, or prevents the movement of commodities or persons in interstate commerce, such persons so combining and agreeing shall be deemed guilty of a conspiracy, and shall be punished by a fine not exceeding $500 or by imprisonment not exceeding six months, or by both such fine and imprisonment: *Provided*, That nothing herein shall be taken to deny any individual the right to quit his employment for any reason. It will be observed that this section applies equally to the officers or managers of railway companies and their employees. The intent is to prevent any substantial interruption in transportation, and the effect of it is to forbid not only what is ordinarily known as a "lockout," but also what is commonly known as a "strike" of the employees of a railway company. It must be remembered, in this connection, that the bill in forbidding a strike, or combination for a strike, has also provided for the settlement of all disputes by government tribunal.

SECTION 31.

This section increases the compensation of the members of the Interstate Commerce Commission to $12,000 per annum.

SECTION 32.

This section materially enlarges the scope of what is commonly known as the car service act, and transfers its administration to the transportation board. One of its features is that it requires the approval of the government for the extension of an old line of railroad or the construction of a new line.

SECTIONS 33, 34 AND 35.

These sections are amendments to well-known provisions of the act to regulate commerce, and, while important, need not be specifically mentioned.

SECTION 36.

This section authorizes a division of traffic or earnings between carriers, but only when in the interest of better service and economy and not so as to unduly restrain competition. There can be no such division of traffic or earnings until the arrangement is expressly approved by the Interstate Commerce Commission after full notice and hearings.

SECTIONS 37 AND 38.

These sections are amendments to the act to regulate commerce, and need not be described in this summary.

SECTION 39.

This section gives the transportation board full authority to require connections between water and land carriers, so as to utilize water transportation to the fullest extent.

SECTION 40.

This section empowers the Interstate Commerce Commission to make both maximum and minimum, or maximum or minimum joint rates, and this authority is also conferred in another section with respect to all rates.

SECTION 43.

This section deals with the conflict between intrastate rates and interstate rates, and gives the Interstate Commerce Commission full authority to remove any unjust discrimination against interstate or foreign commerce.

CONCLUSION.

There are many amendments to the interstate commerce act in the bill to secure more efficient administration, but it is assumed that they need not be referred to at this time.

The bill was referred back to the committee on interstate commerce, which is expected to hold some hearings on it, and where it will doubtless be further modified after some rather lively controversies as to some of the most important new features. If its general principles are adhered to by the full committee the crucial fight on the question of regulatory policy may be staged in the conference on the Senate and House bills as finally enacted by the two bodies, because it is believed that the House committee will report a more conservative measure, based on the Esch-

Pomerene bill with some additional features suggested in the various plans that have been proposed, and that the bills as reported by the two committees will afford the basis for the bills finally adopted by the two houses.

The House is so far considerably behind the Senate in its work on a bill, because its committee has spent the summer in general hearings which the Senate committee got out of the way in January and February, and the Senate committee was able to take up the work of actually drafting a bill while the House committee was still listening to plans which left little time for the committee to get together by itself. The House committee now expects to spend another week or so in hearings and to report a bill possibly by the end of the month. If it is able to reach an agreement without spending too much time it may therefore be able to catch up with the Senate committee.

The Senate bill is still open to the possible objection that the Interstate Commerce Commission is merely required to "take into consideration" the elements mentioned as affecting the adequacy of the rate level, and the question of what is a fair return is left entirely to it, but there is at least a plain expression of policy that rates are to be viewed "from the standpoint of their effort in producing revenue in any rate-making group as a whole, which it has frequently been argued the commission cannot legally do, under the present law, and it is provided that the commission 'shall' from time to time determine the value of the property in each district and 'so lower or advance the rates of transportation as nearly as may be to provide said fair return as herein provided.' The fair return allowed before the turning over of the excess also "may include a just allowance to provide reasonably for future years in which there may be insufficient earnings."

Conflicts between state and interstate rates are dealt with in section 43 by adding as an amendment to section 13 of the commerce act a provision that whenever there shall be brought in issue any rate, fare, charge, regulation or practice made or imposed by state authority the Interstate Commerce Commission, before hearing and disposing of the issue, shall cause the state or states to be notified and shall confer with the state authorities with respect to the relationship between the state or federal rates, and is authorized to hold joint hearings and to avail itself of the co-operation, services, records or facilities of the state authorities.

"The commission shall, after full, hearing, make such findings and orders as will in its judgment remove any undue or unreasonable advantage, preference or prejudice as between persons or localities in state and interstate or foreign commerce, or any undue, unreasonable or unjust discrimination against interstate or foreign commerce, which is hereby forbidden and declared to be unlawful, and such findings or orders shall be observed while in effect by the carriers parties to such proceeding affected thereby, and shall make the rates, fares, charges, or the minimum and maximum of such rates, fares, and charges, and any classification, regulation or practice which, in its judgment, will remove such advantage, preference or prejudice, "but, nothing in this act shall be construed to amend, repeal, impair, or affect the existing laws or powers of the states in relation to taxation or the lawful police powers of the several states, including the power to make and regulate intrastate rates, except as in this act otherwise provided."

Section 35, which Senator Cummins did not specifically mention in his analysis is an amendment to section 4 of the commerce act to provide a rigid prohibition against charging as much, or more for a short haul as for a long haul and provides that whenever a railroad shall, in competition with a water route, reduce its rates to or from competitive points, it shall not be permitted to increase such rates unless after hearing by the commission it shall be found that such proposed increase rests upon changed conditions other than the elimination of water competition.

Section 44 provides that whenever the commission shall be of opinion that any rate, fare or charge is unjust or unreasonable or unjustly discriminatory, or unduly preferential or prejudicial, or otherwise in violation of the law, it may prescribe what will be the just and reasonable rate, fare or charge, or the maximum, or minimum, or maximum and minimum to be charged for the future.

Some criticism will probably be made of the low salaries proposed in the bill, but it is very difficult to get large salaries approved by Congress. The members of the transportation board are to receive $12,000, whereas in proposing such a board the railway executives suggested $25,000. The members of the committee of wages and working conditions are to receive $4,000, whereas the members of the Railroad Administration's Board of Railroad Wages and Working Conditions receive $10,000. The salaries of the members of the Interstate Commerce Commission are, however, increased by the provisions of the bill from $10,000 to $12,000.

In introducing the bill in the Senate, Senator Cummins ventured the suggestion that "unless some such plan as this can be carried into effect government ownership and government operation are but a question of time." He said the bill represents the painstaking work of the subcommittee for three months, and while it does not represent in every particular the views of every member of the subcommittee, it does represent their composite judgment and the points of difference between them are very few.

"The insuperable difficulty which the Interstate Commerce Commission has always met," Senator Cummins said, "and which it has never been able to overcome, is this: The diversity of the conditions surrounding the carriers have rendered it entirely impossible for the commission to prescribe rates that would be at once fair and just to the public and fair and just to the several carriers. The rates which were in force prior to the possession of the railroads by the government, for instance, would produce for one railroad company an excessive revenue, while they would produce for another railway company which must compete for the traffic, substantially no net operating income. The result was that it either had to prescribe rates that would give to some railway companies an inordinate earning capacity so that they might sustain the weaker railroads, or give to the stronger railroads rates that would be wholly inadequate to sustain the weaker railways. Both kinds of railways are essential to the business and the commerce of the United States; they must both be sustained if the people of this country are to be served as their commerce and their business demand that they shall be served." He then explained that the bill endeavors to meet this condition by providing for consolidations and by enabling the commission to make rates knowing that if they produce excessive earnings for some roads the roads will not be allowed to keep them.

"The earnings of some of the railroads, when the rates are sufficient in the group as a whole to make a fair return upon the value of the property as determined by the Interstate Commerce Commission, will be large," he said. "The earnings of some of the railroads will be small; and the latter must struggle as best they can without complete relief until the process of consolidation takes place."

Senator Lenroot asked what is provided for the case of a particular road where the average rate of fair return upon the group does not afford an adequate return for the particular road.

"Unfortunately we have not been able to provide any assistance of that kind to the weaker roads," replied Senator Cummins, "other than the accumulation of this fund coming from one-half of the excess earnings of the stronger roads in loans to the weaker roads, funds which they may be

unable to secure in the general market of the country."

"That leads me to ask the Senator whether, in his opinion, we have any constitutional right to deprive a particular road, that may be well managed and well conducted, of an adequate return upon the value of its property," said Senator Lenroot.

"Personally I have no doubt about that," replied Senator Cummins. "That has been a question very much disputed, but it will be remembered that we have provided that the excess shall be over and above a fair return upon the value of its property."

"Not its property but of all the property of the group, as I read the bill," said Senator Lenroot, who also asked whether the inevitable result would not be to force the weaker roads into bankruptcy.

"The weaker roads are in bankruptcy," said Senator Cummins.

Regarding the labor provisions of the bill Senator Cummins said that this is "a somewhat delicate subject" and the committee has given it its most careful attention, but the provisions in the bill represent their unanimous conclusions. "It is in accordance with a universal and, as I believe, a just movement in this country and in every other to give the employees of any industry an opportunity to know the policies, the reasons which move the corporations in any given direction. I feel sure that time will but verify my prediction when I say that it will not be long until all industries are organized in that way. If transportation is a governmental function or allied to governmental functions, it is impossible to contemplate continued and disturbing controversies between railway companies and employees. It is the intention of the subcommittee that decisions with regard to all controversies between the employees and the corporations shall be conclusive upon every citizen who desires to be a law-abiding man.

"I have always regarded the strike as a legitimate and inevitable weapons as between the employer and the employee. I have looked upon it as substantially the only weapon that could be employed by the laboring man in order to secure that justice which is his due. But when we advance to the point at which the government undertakes to fix his wages in the event of dispute, when we advance to the point where we authorize a government tribunal to enter a decree with regard to the justice of the particular matter, there is no room longer for the interruption of a strike or a combination among men of any kind, whether employers or employees, to hinder, delay, or restrain the movement of commerce."

Senator Norris asked if, since the corporation could retain only so much money anyway, there would not be a temptation to agree with the employees on the matter of excessive wages.

Senator Cummins answered this by saying that the public would not be unprotected because the Interstate Commerce Commission is not obliged in fixing rates to accept the wages that have been agreed upon.

Regarding the new transportation board Senator Cummins said:

"We have attempted to clothe the board with authority over the physical operation of the railroads, hoping to leave to the Interstate Commerce Commission its judicial or semi or quasi judicial duties, unencumbered by the accompaniment of these administrative affairs which have very greatly hindered the commission in the performance of its wider and more far-reaching duties."

Senators Robinson and Pomerene of the subcommittee also discussed the importance of the labor provisions of the bill. "Current and recent events," said Senator Robinson, "have given emphasis to the fact that it is impossible for the Congress to perform the constitutional function of regulating commerce unless some tribunal is established by the government empowered finally to decide disputes between the railroads and their employees—disputes which might result in a suspension of commerce and in the misery and suffering which we all realize would result from a universal or general lockout or strike. Believing that the time has come when the Congress should act promptly and courageously in considering and disposing of this all-important question, your subcommittee has written into the bill some paragraphs which create a government tribunal authorized to determine disputes between railroads and their employees. There is no purpose to oppress or permit the oppression of the employees. On the contrary the bill is intended to secure to them their just rights.

"Having done this, it cannot be considered unfair to protect the public against the dangers of strikes and lockouts."

Senator Pomerene concluded his speech by saying: "It is the function of government to govern, and when it fails to govern it fails in its purpose. The welfare of the whole people is vastly more to be desired than the advance in wage of a single class, although I believe in good wages and good working conditions for all. When the people as a whole are prosperous, the people of the classes are prosperous, and when we legislate for all we are legislating for the benefit of every individual. I know of no sound reasoning, either in politics or morals, which will permit 2,000,000 men engaged in moving interstate commerce to refuse to adjust their differences with their employers or to submit them to trial and decision before a properly constituted tribunal, and thereby bring distress, if not ruin to the entire people."

Do the Director General's Rules on Courtesy to the Traveling Public Cover This?

Gen. W. W. Atterbury Contrasts French and American Railroads

Brigadier General W. W. Atterbury, vice-president of the Pennsylvania Railroad Company, and late Director General of Transportation of the American Expeditionary Forces in France, has given an original interview to the editor of the Baltimore & Ohio Employees Magazine, which is published in the September number, issued Monday. In his talk, General Atterbury, after paying a warm tribute to the work of the railroad men who enlisted in the Transportation Corps of the United States Army, discusses features of the relative merits of French and American railroading and of the operating methods prevailing in the two countries. Portions of the interview follow:

General Atterbury was requested to express his views as to the relative safety of French and American operating methods. He replied:

"I believe that we in this country have been 'fed up' on the greater safety of French railroads. It is, of course, quite difficult to arrive at a fair measure of comparison, considering the great differences in the way of equipment, methods of operation, etc., but taking everything into consideration, my opinion is that, on the whole, the operation of our railroads is in reality, even safer than theirs, because of our highly developed method of train despatching, our superior signal systems, and the general and increasing use in this country of steel or steel underframe passenger cars."

Racial Characteristics Shown

"Is it not possible that the idea that French railroads are safer than our own has become general because the representative Frenchman is a much safer man that the representative American?" was asked.

"That is true to a considerable degree," was the answer. "The French and the Germans, too, for that matter, are much more highly disciplined than our Americans; they have greater respect for laws and regulations. As you know it is the breaking of the rules of our American railroads that is so often the cause of our accidents.

"The national characteristics of the French show interesting contrasts to those of our own countrymen in many other aspects of their transportation system. For instance, we know that their roadbeds as a whole are better than our own. Why is this? Simply because the French build more slowly and more surely than we do. Their ballast and their drainage are better. And this insistence on permanency and stability is not only shown in the construction of their roadbeds, but also in the building of their bridges and other structures of all kinds.

French Railroads Stood War Test Well

"This was clearly shown when we got to France. They had been suffering the devastation and destruction of war for three years. Yet their tracks and equipment in general had stood up under the excessively hard usage remarkably well; and this with very little time and money having been devoted to maintenance.

"It is not an uncommon thing to see an engine on a French railroad which is 60 years old and still giving good service. While this is a tribute to their careful workmanship and exacting repair methods, it must be remembered that our own engines would last as long if they were not continually being discarded, before being worn out, for newer and more powerful types. In France, generally speaking, they scrap locomotives only for age; here we scrap them for obsolescence. We live faster in America, and changes in railroad operating methods and in the needs of our commerce come too quickly for us to use a piece of motive power 60 years old, even though still mechanically in good order.

French Density of Traffic

"Another thing which should be remembered in contrasting French and American railroads is the difference in the nature of the countries and the consequent difference in the kind of transportation handled. For instance, you will probably be surprised to know that just before the war the Paris, Lyons & Mediterranean, the largest privately-owned line in France, carried more passengers in a single year than did the Pennsylvania System. Yet this is not so strange when we consider the greater destiny of population in France and the closer proximity of their cities, both productive of a large amount of short distance passenger traffic.

"It is to a large extent because of this dense passenger traffic that they are ahead of us in the matter of grade crossing elimination. Their roads were built through populous communities where it was immediately apparent that grade crossings were a source of danger. Our railroads were laid out through sparsely settled sections and brought the growth of the cities with them. What in earlier years here was a safe method of constructing a railroad through a thinly populated section does not continue to be safe when the population expands as rapidly as it does in the United States.

"This same thought can be used to explain in a measure the greater permanency of all French construction work and especially that of the railroads. They have been building for a large and actual population. We built to develop a potential population which has grown much faster than have our transportation facilities."

Will the French Adopt American Methods?

"Do you think, General Atterbury, that the work which our Transportation Corps did in France is going to leave a permanent impression on their transportation systems?"

"Without any doubt. The French now have no system of despatching. Their trains run on what they call 'marches'; that is, at regular intervals of say 8.10 a. m., 8.30 a. m. and 8.50 a. m., etc. Despatching is not necessary. But if an engine breaks down or a derailment or other accident occurs all the schedules are thrown into confusion until the trouble is rectified.

"Again, they have no car record office. A car is sent out in a train in about the same manner as we post a letter in the mail box. Ordinarily it gets there on regular schedule. But sometimes it does not and, if not, it has to be traced practically without guiding records from its point of origin until it is found.

"These are two of the fundamentals of American operation which will probably be instituted on the French systems. On two of our divisions we installed train despatching, with the selector telephone system. French railroad men worked in the towers with our American operators and saw the advantages of our methods. But it will take some time, I believe, for a system similar to our system of train despatching to make headway on the French lines, largely because of the difference in the way their trains are controlled. A chef de gare has his headquarters at each station and his control of track and operation between his station and the station of the next chef de gare is absolute.

"This official is the foundation of the French operating personnel. He controls the movement of the train, the receiving, loading and distribution of the freight. In fact he is all powerful in the territory which he controls and has become not only the most important cog in the railway wheel but also a man of much influence from a civic standpoint in his immediate vicinity. A system of train despatching would take a good deal of power out of his hands, not without objection on his part. And because he is so much of a local power in dispensing service and privileges to the citizens of his community, he naturally will endeavor to retain that power as long as he can."

A Complete Wood Preserving Plant Mounted on Cars

Portable Equipment on Pennsylvania May Be Readily Moved to Sources of Timber Supply

The Pennsylvania Railroad has been using a tie treating plant for the past 18 months that is mounted entirely on cars. This includes not only the retorts but the adzing and boring equipment as well, so that the complete outfit, ready for immediate use, may be transported to the points of principal tie supply and thus save the possible back haul occurring where ties must be transported from the wood lots to the treating plant and then to the point of use in the track. Such a plant is particularly adaptable to districts wherein a large proportion of the ties used are purchased locally and stored along the right of way to season. However, the distribution of ties has been so dislocated in recent months that the plant on the Pennsylvania has operated continuously in the Mt. Union (Pa.) tie yard, where, in 1918, 276,156 ties were treated, adzed and bored at a cost, exclusive of royalties, rentals, etc., of $0.1211 per tie.

The Car Containing the Adzing Machine and Power Plant

Essentially the plant consists of a car housing the power plant and adzing and boring machines, two cars carrying tracks on which the retort cars travel and a car for the treating cylinders. All of these cars are built specially for their particular purposes and are arranged in the train in the order named. The train may be moved from one locality to another as any other train, clearances having been maintained in the design of cars, or it may be moved locally under its own power, the adzing and boring car being equipped with the proper gearing for this purpose.

The adzing car, in addition to containing the adzing and boring machines and conveyors located in one end of the car, furnishes space for a 60-hp. gas engine, a stationary boiler of 50 hp. for generating steam for the operation of the pumps on the treating car, fuel storage for the boiler, tanks for gasolene and kerosene, a bench gainor knife setter, bench grinders turned by a small gas engine, and a work bench for general purposes. The boiler is located in the far end of the adzing car to keep the fire as far as possible from the creosote. The shavings and borings are conveyed away from the machines and are used with coal for fuel under the boiler.

The track cars, two in number, are 50 ft. long with two tracks for the tram cars on their deck, with two additional tracks raised on steel frame work to the elevation of the upper cylinder on the treating car. A ball bearing gravity roller conveyor extends alongside the adzing car leading from the machine to the first track car, which is supplied with turntables at the end adjoining the adzing car. Switches at the end of the second car adjoining the treating car permit flexible operation of the tram cars, it being possible to discharge from either cylinder to either side of the track car as occasion demands.

One of the photographs shows the arrangement of the treating cylinders on the treating car. As may be seen, two are placed on the deck of the car with the third superimposed. The treating car equipment consists of two pumps and the necessary gages and valves, one a low pressure pump working to about 200 lb. and used for pumping creosote into the cylinders, and the other a high pressure pump (600 lb.) used for treating purposes. Steam coils carried on the inside of the cylinders through which all exhaust steam passes serve to heat the creosote.

Each cylinder is supplied with oil sprinkling or spraying apparatus consisting of a main pipe, 2 in. in diameter, running the full length of cylinders with smaller pipes leading into the cylinders to spray the creosote over the ties. The creosote for the plant is furnished in tank cars, which are spotted beyond the cylinder car, and which, with little

trouble, can be connected up with the pumping apparatus on the treating car.

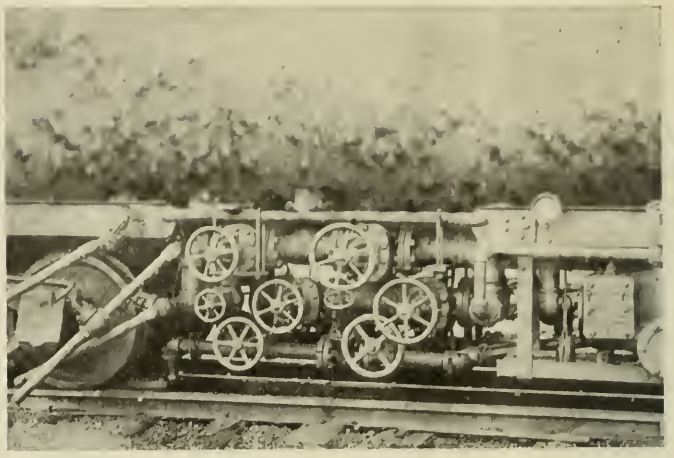
The cylinders are 4 ft. in diameter and 6.5 ft. long, or sufficient to admit seven tram cars with their loads, which average 100 ties. Running to capacity, the outfit is capable of treating 100 ties per hour.

Under normal conditions the force employed consists of two men on the treating car, one to run the pumps and one to open and shut the doors of the cylinders, three men on the adzing and boring car, including an engineman, a

The Cars Carrying the Retort Tracks Have Two Decks

fireman and an operator at the adzing and boring machine, and eight laborers. The engineer is in charge of operations, including general repairs, and supervises the labor forces.

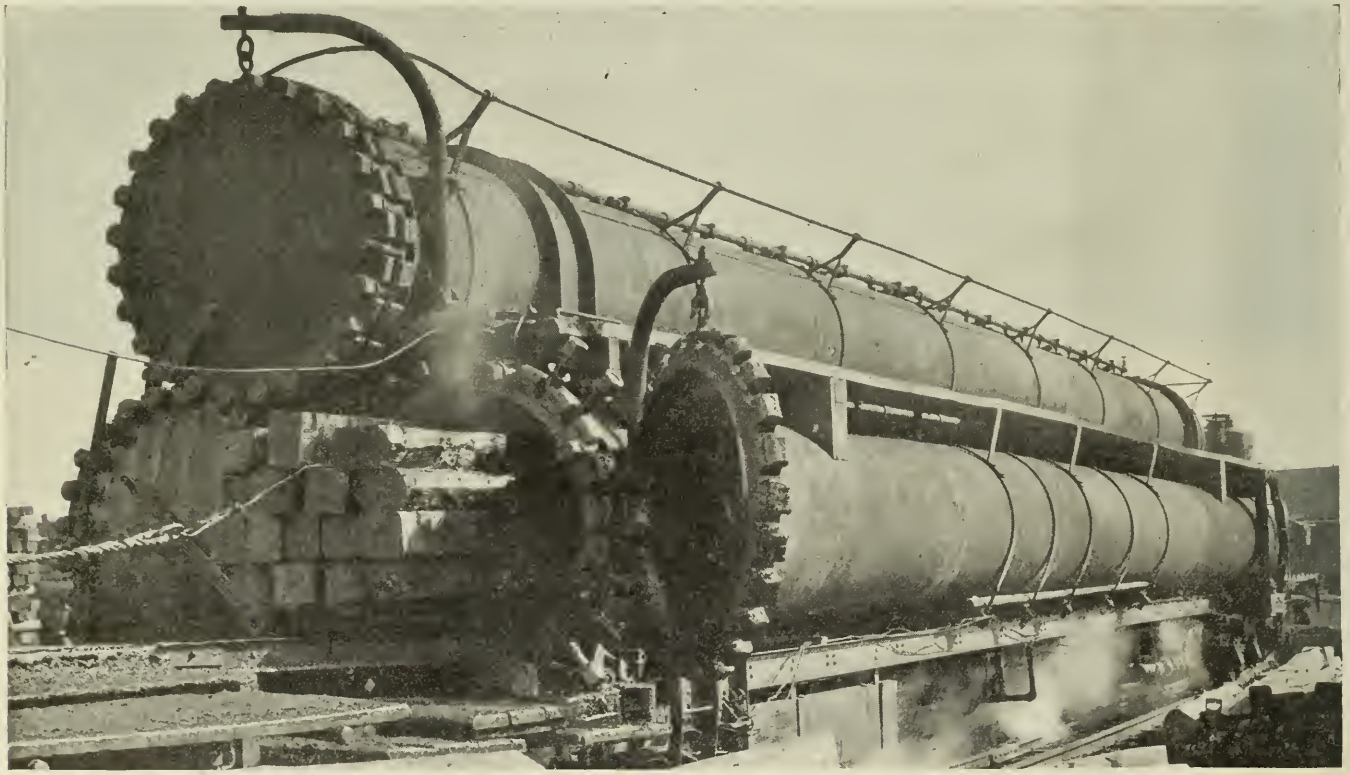
In operation the ties are conveyed from the ground or piles to the adzing machine, where they are shaped for tie plates, after which they pass on to the boring machine and then out to the gravity roll conveyor leading to the tram cars ready for introduction into the cylinders for treatment. When in use along the right of way the operation is so planned that a car containing untreated ties is spotted at the adzing car and the ties are unloaded on



The Air Control Valves Under the Cylinder Car Are Located for Convenient Operation

to the conveyor. The empty car may then be shifted slightly ahead to the proper position for receiving the ties as they are discharged from the cylinder. As noted above, however, the track arrangement on the cars permits the varying of this cycle to meet different conditions.

In operating the plant it is not necessary to utilize all three cylinders. For convenience in describing the operation it will, however, be assumed that all three are to be used and reference will be made to the cylinders by the letters *A*, *B* and *C*. To start, a charge of ties is placed in any cylinder, which will be called *B*. Cylinder *C* is then filled with creosote by means of the pump, letting the air escape into *A*. The air from *A* is then let into *B*,



The Three Cylinders Are Mounted on One Car

while at the same time the charge of ties is being sprinkled with oil from the spraying apparatus, thus subjecting the ties to pressure and oil simultaneously. After the sprinkling, all of the air in *A* is pumped into *B*, treating the charge in *B* by pumping oil from the source of supply, raising the pressure in *B* to 450 lb., holding it approximately 30 min. During this operation cylinder *C* becomes ready to receive a charge of ties which is placed. Then in treating *B* air is forced into the charge in *C*, drawing a vacuum in *A*. That is to say, when running high pressure on a charge that has had air and oil a vacuum is drawn on a treated charge while running oil on the last charge in. The cars are hauled in and out of the cylinders by a line operated by the gas engine.

This plant was built and is owned by the Railway Tie Treating Company of New York. It is operated by the railroad under the direction of the superintendent of the treating plant at Mt. Union, Pa.

The British Transport Bill Becomes a Law*

England Has Entered Upon a Great Experiment in the Solution of Its Transport Problems

By Robert E. Thayer
European Editor of the *Railway Age*

London, August 19, 1919.

Approximately six months after the first presentation of the Ways and Communications Bill to the British parliament, that body has adopted the government's plan of solution of the transport problem in Great Britain. It is an experiment, if not a gamble, which will be watched with the greatest of interest by all democracies. The vast power it reposes in the Minister of Transport is without a parallel in any other democratic nation in times of peace. It has been adopted against the better judgment of many able British subjects, for want of a better plan and for the purpose of postponing for two years—the time this bill will remain in effect—any direct action of the government on the question of the nationalization of railways. The government which has so strongly backed the bill has not had the opposition which such an important measure, and which such an innovation in the policies of a democratically controlled government demands. Particularly is this true of bodies or groups of individuals outside of Parliament. The reason for this is that nobody has put forth a better solution than is contained in the government transport bill, and between it and nationalization, the former was chosen as the lesser of two evils. Parliament has been goaded into prompt action regarding the passage on the bill because of the present disorganized condition of the transport system of Great Britain, and because it realized that adequate transport facilities is the basic requisite of a successful nation.

The Earl of Lytton, who was in charge of the bill for the government in its passage through the House of Lords, stated, in presenting it, that the country which could first put its transport system on a normal basis would be the first to recover from the war, and that owing to the fact that the railway companies were handicapped by the lack of cars and skilled men, the government believed that the only way to solve the problem was to set up some such machinery for coordination and uniform control as was contained in the bill. But at the same time, the Earl stated that the bill did not seek to substitute state management for private management.

As in the House of Commons, the bill was strongly attacked on account of its tendency toward eventual nationalization of England's transport systems, and again an effort was made to obtain from the government a statement as to its policy with regard to the nationalization of the railways by a motion moved by Lord Buckmaster, but which was not passed, to the effect "that this House declines to proceed with the second reading of this bill until the government has stated its policy with regard to the nationalization of the railways and has furnished further information with regard to the extent of the financial obligations imposed by the bill and the measures it is proposed to adopt by which these obligations can be met." He claimed that it was impossible to escape from the conclusion that the passage of this measure was a concession of one of the most important outposts in the great struggle which was bound to take place between private and national ownership of the means of wealth. In criticizing the general policy of nationalization he said that he believed it would prove nothing but a curse to the poorer people of the country, because it would diminish the production of commodities necessary for the support of life. In addition he wanted to know the cost to the country of this tremendous experiment, and how the government intended to raise the money to meet these costs.

Lord Montague, called attention to the fact that conditions might be such at the end of two years that the railways would be in such a state of deterioration that the shareholders would be absolutely at the mercy of the government which was in power at that time, and would have to take any price that was offered to them. Furthermore the bill created a national monopoly from which there was practically no possibility of appeal. The government by the enactment of this bill, he said, was creating a monopoly exceeding in extent any that now existed in other parts of the world.

Viscount Devonport, chairman of the Port of London Authority, in commenting on the fact that the bill revolutionized the whole transport system of the country, stated that the bill was more characteristic of Prussianism than of a sane democratic government, in that it gave the Transport Minister unfettered authority to operate the nation's transport facilities according to his own wishes and ideas.

Lord Balfour characterized the bill as it now stands as "a very clumsy piece of legislation," and said that "although many provisions, such as that enabling the government by an order in council to nationalize the undertakings, had been taken out of the bill, many provisions which were more consistent with the principle of nationalization had been allowed to remain." At the same time he recognized that some organization of the railways was necessary in order to be rid of that system of suicidal conditions which prevailed too much in the past.

Viscount Middleton referred to a statement credited to Bonar Law to the effect that the government did not intend the railroads to revert to the old system, and what the government sought was some control of railroads, stating that "what we want is a simple system of advice." The Viscount denied that this bill was a system of advice, and said that it was a system for absolute control and one from which

*The consideration of this bill before the House of Commons was discussed in the *Railway Age* of July 25, page 161.

there could be no turning back when once it had become law. He strongly urged a division of the bill, having it only apply to the railroads. One of the greatest objections to the bill was, he stated, that it would put the employment of men on a scale which had never before been known into the hands of the government.

Lord Lytton stated that the government was not seeking authority to take over and manage the transport facilities, but what it asked for was power to see that these undertakings were managed by their existing owners in such a way as not to be detrimental to the transport interests of the country as a whole, and further he firmly believed that the bill was the only alternative to complete nationalization of the railways at the moment.

The Marquis of Salisbury contended that on account of the revolutionary character of the bill it should be divided into two parts, that the railways should be considered at once and the rest of the bill allowed to stand until more time could be given to its proper consideration.

Lord Buckmaster very pertinently asked that if Parliament passed this measure in its complete form, would it help the country out of its difficulties or plunge it deeper and deeper in the morass of debt from which at the present moment there seemed no possibility of extraction?

There was a large amount of discussion on splitting the bill as suggested by the Marquis of Salisbury, but the Earl of Lytton for the government, claimed that both parts of the bill were in need of immediate action, that a constitutional crisis would be raised by such action of the House of Lords after the bill had been passed by the House of Commons. He also argued that on account of the Labor conditions existing in England such action would be liable to precipitate danger from "direct action" on the part of labor which would be of dire consequences. The motion to divide the bill was lost by a majority of 51, the number of votes "for" amounting to 59, and those "against" 110.

Regardless of the opposition to the bill as leading towards nationalization, and the opposition to placing so much power in the hands of one man, no definite action was takeng nor could the government be made to express any definite policy on this important subject. In the consideration of the bill in detail very little change was actually made although numerous changes were suggested. An effort was made to require the Transport Minister to confer with the owners or local authorities when improvements in service were required, but this was objected to by the government which held that the Minister should have absolute control.

An unsuccessful attempt was also made to prevent the Minister fixing rates and fares without the approval of a competent committee, as this unrestricted control would place the whole commercial and trading interests of the country at the mercy of the Transport Minister; but the government claimed that if this were done, the responsibility for any increase in rates would not rest with the Minister but with a committee which would not be answerable to Parliament. There was, however, a provision made that notwithstanding anything contained in the act, the right of traders, or port or dock companies to complain to the railway and canal commission should not be deemed to be affected.

One part of the bill calls for an advisory committee of five members for the purpose of advising and assisting the Minister of Transport, one of which is to be nominated by the Lord Chancellor; two to be representatives of trade and agricultural interests, nominated by the Board of Trade; one to be a representative of the transport interests nominated by the Transport Minister, and one to be a representative of the labor interests, nominated by the Minister of Labor. Viscount Midleton moved an amendment to this clause to alter the constitution of the committee to include six persons, one to be an impartial person who should be chairman and nominated by the Railway and Canal Commission, two to be representatives of trading interests nominated by the chairman of the Associated Chambers of Commerce; one to be a representative of agricultural interests nominated by the chairman of the Central Chamber of Agriculture, and two to be representatives of labor interests nominated by the chairman of the committee of the Trades Union Congress. While this amendment was approved by the House of Lords it was rejected by the House of Commons, much against the desire of the labor members. The purpose of the amendment was to provide a committee independent of the government, whereas the House of Commons committee was one which was tied to the government, which would be as Viscount Midleton expressed, "a camouflage committee." It was agreed, however, that the bodies mentioned in the Lords' amendment should be consulted when making appointments.

Likewise the House of Lords voted to restrict the amount of expenditure permissible to be spent by the Transport Minister without the approval of the chairman of the committees of the House of Lords and the chairman of Ways and Means in the House of Commons from £1,000,000 to £500,000, but this too was rejected by the House of Commons.

Thus England has settled for two years, at least, its transportation problem. The roads, which since the war have been marking time, may now expect to take definite action on long deferred improvement programs. There unquestionably will be a development in electrification of the roads, deferred maintenance will be systematically taken up, standardization will be given consideration, larger cars undoubtedly used, and marked changes will be made in the consolidation and joint operation of the properties.

Sir Eric Geddes, who is Minister Designate, in a speech on the transport bill and its provisions, has stated that there will be an elimination of services simply given for the purpose of competition. The private freight cars, of which there are about 700,000, will be eliminated. There will be judicious electrification where the decrease in the cost of production by this method warrants. The rolling stock will be gradually brought up to the best standard and the loading gage will be improved.

In this speech Sir Eric Geddes outlined his proposed organization, stating that with the one exception of roads (highways), which must be treated as a separate department, it is proposed to organize the Ministry in different branches, —civil engineering, mechanical engineering, and so forth. Sir Alexander Gibb, who has been chief engineer of the docks with the British armies in France and who is senior partner of Easton, Gibb & Co., has been chosen as the head of the civil engineering department. The consultant mechanical engineer is to be Sir John Aspinall, formerly general manager of the Lancashire & Yorkshire, who has an absolutely unique knowledge and experience of standardization. The mechanical engineer is to be Lt. Col. L. Simpson, formerly traction superintendent of the Buenos Aires & Pacific Railway, and who has been in charge of the railway equipment and rolling stock of the British armies in France. Sir George Beharrell will be chief of the statistics and accounts. He was formerly statistician to the gun and ammunition department of the Ministry of Munitions, to the transportation department in France, and then to the Admiralty. Sir William Marwood, who is joint permanent secretary of the Board of Trade will have control of licenses, labor questions and regulations. Sir Philip Nash, who was assistant general manager of the East Indian Railway and late director-general of transportation in France, will be placed in charge of the movement and traffic. Rear Admiral Sir C. Bartolome, who was controller of the Admiralty up to the end of the war, will be charged with all question of development. Sir Edwin Maybury, will be in charge of roads, and Sir Hardman Levere will be in charge of finance.

Labor Leaders Adopt More Conservative Policy

Federation of Labor Not Yet Ready to Endorse Plumb Plan— President Calls Conference of Capital and Labor

WASHINGTON, D. C.

OUTSTANDING DEVELOPMENTS in the labor situation affecting the railroads during the past week have been the following:

President Wilson, in his Labor Day message, announced his intention of calling a conference "in which authoritative representatives of labor and of those who direct labor will discuss fundamental means of bettering the whole relationship of capital and labor and putting the whole question of wages upon another footing."

The railroad bill drafted by a sub-committee of the Senate committee on interstate commerce would make a strike or a lockout affecting the transportation of interstate commerce a criminal conspiracy, and provides for the creation of a bi-partisan committee of wages and working conditions to consider labor disputes and certify its findings to a proposed railway transportation board whose decision would be final. The bill also provides for two representatives of the employees on the board of directors of each railroad and for the use of one-half of the excess earnings above a fair return for the benefit of labor.

Executive officers of the shop craft unions, after a conference with Samuel Gompers and the executive council of the American Federation of Labor, advised the shop employees that a strike at this time would be a fatal mistake.

Train employees of the steam railroads on the Pacific coast who had walked out in sympathy with the striking employees of the Pacific Electric Railway, returned to work after Director General Hines had issued an ultimatum announcing that the entire power of the government would be exercised to carry on the railroad service.

President Gompers and the executive council of the American Federation of Labor failed to endorse the Plumb plan and deferred final action determining the position of the Federation on it pending an investigation.

The firm stand taken by the President and Director General Hines against a new cycle of wage increases and the announced intention to use the entire power of the government to keep the trains moving in case of a strike seems to have caused the labor leaders to adopt, temporarily at least, a more conservative attitude. The general manifestation of approval of the position taken by the President that general wage increases at this time would serve to defeat the efforts to reduce the cost of living, which Warren S. Stone, president of the Brotherhood of Locomotive Engineers, has been quoted as endorsing, may have been taken as a warning of the state of public opinion toward strike talk, and the influence of Samuel Gompers, president of the American Federation of Labor, who returned suddenly last week from Europe because of disquieting cablegrams he had received from Washington, is also described as adding a steadying factor to the situation. Whether Mr. Gompers and his lieutenants are merely trying to curb an unruly team with the purpose of preventing something like the result which is to be expected from a collision of an irresistible force with an immovable object, or whether they are strategically postponing action until their forces can be gathered for united action at a more effective time, perhaps remains to be seen.

Predictions of an early strike of the shop employees were freely made at labor headquarters shortly after the President and Mr. Hines announced their position, but these soon gave way to calmer counsel as the unpopularity of such a course became more and more apparent and later reports indicated less of a desire to force the issue.

The various phases of the general labor situation now confronting the country, which include not only those affecting the railroads but the proposed strike of employees of the United States Steel Corporation, were thoroughly considered at a three-day session of the executive council of the federation held at Washington on Mr. Gompers' arrival on August 28. One of the first results was the sending of a letter by the officers of the shop craft unions affiliated with the American Federation of Labor recommending against a strike at this time of the shop employees alone on the ground that such a step would be a fatal mistake and that the question of suspending work be left in their hands. The letter to the shop employees also expressed the opinion that "the next 90 days will bring the entire situation to a head" and said that if a strike is to take place every class of railway employees should be willing to join in the movement. If the government fails to effect a substantial reduction in the cost of living "within a reasonable time" the officers reserve the right to put the strike vote into effect.

If the "reasonable time" is meant to be synonymous with the "90 days" and this means that the President is to be given that amount of time in which to make good on his predictions of a reduction in living costs, and that the railroad labor organizations are prepared to stand together at that time to force an increase in wages just before the date set for the return of the railroads to private management, the chances for trouble in December would appear to be still very good, because there is some well-informed opinion that any reduction in prices that the government will be able to effect from its present campaign will be but a drop in the bucket as compared with the increases in wages which the labor organizations have demanded as necessary.

On the other hand, if the President and Mr. Hines have convinced the labor leaders of their earnestness and that they do not intend to be bluffed on this occasion the danger of a conflict may be avoided unless action is forced by an aggressive minority of the more hot-headed members of the unions.

The steam railroad trainmen who had gone on strike on the Pacific coast in sympathy with the striking employees of the Pacific Electric Railway and had practically tied up the transportation of California for several days, lost little time in returning to their work after Mr. Hines had announced on August 28 that all who did not report for duty on the morning of August 30 would be regarded as having terminated their employment, that their places would be filled and that the entire power of the government would be exercised to keep the railroads in operation.

Mr. Hines' statement also directed attention to the fact that while there is no effective law on the statute books to prevent strikes the federal control act contains a provision, which has attracted little notice, calculated to deal with some of the usual manifestations of a strike by making it a criminal offence to interfere with or impede the possession, use, operation or control of a railroad which the government has taken over.

Mr. Hines Issues Ultimatum

The statement addressed to public officers, railroad officers and employees, and citizens generally in California, Arizona and Nevada, was as follows:

"A strike is in progress on the part of the train and enginemen and yardmen on the steam railroads being operated by

the United States government in parts of California, Arizona and Nevada. This strike began at Los Angeles purely as a sympathetic strike on account of a controversy between the Pacific Electric Railway Company and certain employees of that company. The property of that company is not in the control of the government of the United States. The strike of the employees on the steam railroads was entered upon without any grievance being presented or alleged. The strike was and is a violation and repudiation of the agreements between the striking employees and the steam railroads upon which they worked and also of the national agreement between the United States Railroad Administration and the chief executives of the organizations to which the strikers belong, such national agreement providing for the adjustment of all causes of complaint in an orderly manner without suspension of work. The strike is also an illegal strike under the laws of the organizations to which the strikers belong and has been so characterized by the chief executives of those organizations.

"The chief executives of these organizations stated that they believed they could induce their men to go back to work and urged that they be given time to enable them to do this. The Railroad Administration has given the time for this purpose. The director general has also by publication in the newspapers of San Francisco and Los Angeles urged upon the strikers the absence of justification for their action and the importance of returning to work. Nevertheless many of the strikers have not yet returned to work and to a large extent the public service which the government must render to the public is at a standstill. It follows that the only course which the government can adopt is to exercise its entire power for the purpose of rendering the public service and the President has so instructed.

"All striking employees who do not report for duty on and after seven o'clock on Saturday morning, August 30, when and as called for duty, will be regarded as having terminated their employment and their places will be filled.

"Anyone who interferes with or impedes the possession, use, operation or control of any railroad property, or railroad under federal control, commits an offense against the United States, punishable by fine and imprisonment, and will be arrested and prosecuted accordingly. Anyone who obstructs or attacks persons assisting or endeavoring to assist in the possession, use, operation or control of any railroad under federal control, will be guilty of the offense described and will be dealt with accordingly. Anyone who obstructs or retards the passage of the mail or any vehicle or person carrying the same likewise commits an offense against the United States punishable by fine, and imprisonment and will be arrested and prosecuted accordingly. Instructions have been issued to the United States district attorneys and to the United States marshals, to take the necessary steps to enforce these provisions of the statutes of the United States.

"The governors of the states involved, the mayors of the cities involved, and all other state and local peace officers are relied upon to lend assistance in the performance of the public service as above outlined in every possible manner, including giving aid in the enforcement of the statutory provisions above referred to, and also in enforcing all state statutes, municipal ordinances and other local public regulations which will aid in protecting the railroad property and its operation and in protecting those assisting or endeavoring to assist in the operation of the railroads."

Mr. Hines had previously made it clear that the strike would not be dealt with as proposed by the employees, by the government taking over the Pacific Electric Railway, by stating that it had no authority to do so.

The executives of the four train service brotherhoods ordered their men back to work and on August 29 large numbers of them had returned. By the time set in Mr. Hines' statement the strike had been brought to an end.

Meanwhile the strike vote ordered by the shop crafts after the President and Mr. Hines had offered them only a comparatively small increase in wages by way of equalization, is still in progress. Some of the first local organizations to hold their meetings voted for a strike but it is now regarded as probable that the advice contained in the letter sent out by the shop craft executives on August 28, about the same time that Mr. Hines' statement on the California situation was made public, will be followed.

Text of Letter to Shop Employees

The letter began by quoting Director General Hines' letter instructing the Board of Railroad Wages and Working Conditions to consider only applications for readjustment of wages to correct inequalities of relationship, and continued:

"In our opinion, the importance of this communication warrants the placing of it in the hands of the entire membership.

"It must be understood that practically every class of railroad employees has presented demands for substantial increases in wages or have notified the administration of their intention to do so at an early date. In effect, it is our understanding that this letter is a notice to all railroad employees that there shall be no further general increases in railroad wages unless the efforts of the United States authorities prove unavailing in reducing the present high living cost.

"The federated shop trades represent approximately 22 per cent of the total number of railroad employees.

"It must be obvious that in the event living costs are not reduced, wage increases must and will be made, and if that is done it must also be obvious that the Railroad Administration must give equal consideration to all classes of employees.

"As you are well aware, President Stone of the Brotherhood of Locomotive Engineers and President Lee of the Brotherhood of Railroad Trainmen are on record to the effect that wages must go up or living costs go down. Coupled with this fact practically 78 per cent of the railroad employees have made requests for wage increases that equal or are greater than the requests submitted by the federated shop trades.

"Their requests have been denied except where it can be shown that they have not been given relatively the same consideration. This means that only adjustments of inequalities will be made where it can be demonstrated that such inequalities exist.

"If the federated shop trades strike now, they carry the full burden of securing the same general increase for the 78 per cent of the railroad employees who have not yet decided what action they propose to take. We do not believe that we should allow ourselves to be placed in that position. In our opinion, the next 90 days will bring the entire situation to a head, and if a strike is to take place every class of railroad employee should be willing to join in the movement, share their full measure of responsibility, and not leave the issue to be decided by the 22 per cent of the railroad employees represented by the federated trades.

"The adjustment in wages that has been offered to the federated shop trades, if accepted, will establish increases that are practically equivalent to the increases granted any other class of railroad employees. This must not be lost sight of in considering the situation we now face. It is conceivable that men may decide to do a thing in a manner that will lessen their chances of ultimate success, but common sense dictates that 22 per cent of the railroad employees should not undertake to fight the battle for the 78 per cent who have asked for general wage increases, and who have been denied, as we have, any further general increases, unless the effort to increase the purchasing value of the dollar by reducing living costs proves unsuccessful.

"With a reasonable degree of certainty, we recognize that

this letter, coupled with the recommendation we propose to make, will draw criticisms from the individuals in our organizations who have not as yet indicated a desire to listen to reason or abide by any criticism not of their own making. There is not now, nor has there ever been, objection to honest criticism. Such criticism is not objectionable; on the contrary, is welcome, and this comment is made for the express purpose of directing the attention of the membership to members who have by various means introduced methods of procedure which must appeal to every right-thinking union man as detrimental to the organization that we have perfected as the result of 30 years' untiring effort, and generally against every obstacle that could be invented to defeat us.

"In view of the facts as above stated, your executive officers and national agreement committee recommend that the question of suspending work be left in our hands, with the understanding that no strike order will be issued unless such action becomes absolutely necessary to meet the conditions arising from the present situation, or in joint action with other railroad organizations for a general wage increase.

"The above recommendation is made after mature deliberation and consideration of all the elements entering into this controversy. It is our honest judgment that a fatal mistake would be made by our members to assume the responsibility of tying up the railroads at this time, when the President is evidently doing all possible to reduce the high cost of living. It is but fair to assume that the President will have the loyal support of a majority of the American public in his effort to procure this much-needed relief. We would, no doubt, be charged with obstructing his efforts.

"It should be understood, however, that if the government fails to effect a substantial reduction in the cost of living within a reasonable time we reserve the right to put the strike vote into effect.

"We sincerely trust that the contents of this letter will be given the consideration that this important subject merits."

Mr. Gompers and members of his council also discussed the general labor situation with President Wilson but no announcement was made as to the results. One of the subjects discussed is supposed to have been the threatened strike of the employees of the Steel Corporation whom the federation has been trying to organize and it is reported that the President was asked to intervene. At any rate the time limit set for Chairman Gary of the Steel Corporation to answer the request for a conference, which he had previously refused, expired without an answer being received.

A. F. of L. Executive Council Not Ready to Endorse Plumb Plan

The Plumb plan received one of the hardest jolts of its brief career when it failed to receive the endorsement of Samuel Gompers and the executive council of the American Federation of Labor at its meeting last week, in spite of the fact that Mr. Gompers is named as honorary president of the Plumb Plan League and although the plan was presented to the House committee on interstate commerce and in literature being distributed to the public as having the backing of the federation.

After a three-day session of the council, Mr. Gompers issued a statement on August 30 saying that it had decided to defer final action but had created a subcommittee to make a thorough investigation and report back. The next meeting is to be held about October 6, which is also the date set for the report of a committee appointed by the "leaders of national thought" recently called together by the Plumb Plan League.

Possibly the jolt had its origin in the manner of the presentation of the plan to Congress, accompanied by such threats that it immediately aroused the resentment of Congress and almost universal condemnation throughout the country. Whether the unfavorable reception of the plan caused Mr. Gompers and the executive council to go slow lest the reaction prove dangerous, in the same way that the conference called by the Plumb Plan League declined to endorse it until after an investigation by a subcommittee, or whether Mr. Gompers and his associates are really more conservative than the railroad labor executives who have brought the plan forward and they were premature in seeking to give the impression that it had received the official endorsement of the federation, is a point that still remains to be cleared up. At any rate the statement given out by Mr. Gompers is in such marked contrast to the statements made before the House committee and in the Plumb plan literature as to amount almost to repudiation. The statement follows:

"The executive council had before it the representatives of the labor organizations and their counsel who favored the Plumb plan of railway ownership or railway control and administration. The council considered the plan as well as the provisions of the Sims bill dealing with this important subject. The plan and the bill, so the council declared, are of such transcendent importance to labor, to the people and to the country that the council decided to defer final action determining the position of the American Federation of Labor thereon and in the meantime a subcommittee was created for the purpose of examining into all the facts and evidence obtainable, to secure the advice of all we can who can contribute to a full understanding of the subject, and the subcommittee after its examination and investigation is to report to the executive council of the American Federation of Labor upon the entire subject."

A pamphlet entitled "The A. B. C. of the Plumb Plan," circulated by the league, says that "over 6,000,000 American citizens and voters, through the organized railway employees of America, composed of the 14 railroad internationals, together with the American Federation of Labor, the Nonpartisan League, various farmers' organizations and civic bodies, support the Plumb plan as the only rational solution of the railroad problem."

Before the House committee on August 6, W. S. Stone, president of the league, said he spoke as the voice of two million railroad men, delegated by them to announce "that they are supporting this measure with all the unity of purpose that can move so large a body of citizens" and that "joined with us and represented by Mr. Morrison is the American Federation of Labor, adding three million and a half men to that body of railway employees who instituted this movement." Even Mr. Stone's figures represent a duplication of approximately a million railroad employees who are also members of the American Federation of Labor.

Frank Morrison, secretary of the American Federation of Labor, followed Mr. Stone saying: "I am here representing the American Federation of Labor to testify that it stands behind labor's plan for the reorganization of the railways." He also presented a copy of a resolution considered at the thirty-ninth convention of the federation at Atlantic City on June 17 "that we hereby approve, endorse and adopt the plan for the reorganization of the railway industry" presented to the Senate committee by Mr. Plumb and Mr. Garretson, and that "we hereby pledge ourselves to use every legitimate end to promote the enactment of this plan into law." The resolution apparently was not adopted by the convention but, according to Mr. Morrison's statement, the resolutions committee submitted a report on it which was unanimously adopted as follows:

"With reference to the subject matter contained in the executive council's report and in the above resolution, your committee, in submitting a declaration in favor of ownership or control of railroads by the United States government, recommends that inasmuch as the details connected with the same are at present in a formative stage, the subject matter

be referred to the executive council with instructions to co-operate with the organizations representing the railroad employees."

Mr. Morrison also said that "President Samuel Gompers of the American Federation of Labor accepted the honorary presidency of the Plumb Plan League organized among the rank and file of the 14 railway national and international organizations and generally among the organizations affiliated with the American Federation of Labor, to carry to the public and to Congress the principles of the plan now embodied in the Sims bill which has been endorsed by the chief executives of the 14 railroad organizations."

An interview cabled from Paris recently quoted Mr. Gompers as endorsing the plan but when he arrived at New York last week from his return voyage, although Mr. Plumb was one of the first to confer with him, Mr. Gompers steadfastly declined to discuss the matter for publication until after the meeting of the executive council. Officers of the Plumb Plan League were also among the first to appear before the executive council when it began its session on August 28. These included Glenn E. Plumb, counsel; W. S. Stone, president of the league and grand chief of the Brotherhood of Locomotive Engineers; W. G. Lee, president of the Brotherhood of Railroad Trainmen; B. M. Jewell, acting president of the Railway Employees' Department of the federation, and E. F. Keating, business manager of the league.

President Calls Conference of Capital and Labor

The President's announcement of a conference of representatives of employees and employers was contained in his Labor Day message in which he stated that he was "encouraged and gratified by the progress which is being made in controlling the cost of living" and that he "confidently looked for substantial results." He also appealed to citizens not only to refrain from doing anything which will tend to increase the cost of living but to do all in their power to increase production. He also expressed the earnest hope "that the workers generally will emphatically endorse the position of their leaders and thereby move with the government instead of against it in the solution of this greatest domestic problem."

In two recent messages the President has expressed a view that the relations between capital and labor should be placed on a new footing and he is expected to outline his ideas on the subject at the time of the conference, which will be held after he returns from his speaking tour to the west late in the month. Recently Secretary Lane of the Interior Department as a "happy and timely illustration of the truth of one such a meeting had been introduced in both Houses of Congress.

What, if any, specific plan the President has in mind for placing the question of wages on a new footing has not yet been indicated, although he expressed some general ideas in his previous messages. The fact that the announcement was made on the same day as a statement issued by Secretary Baker of the War Department that good results had been accomplished by a plan adopted at the Rock Island arsenal of giving a measure of responsibility for the conduct of business at the arsenal to employees' committees, who have a voice in the determination of wages and in fixing prices for products of the arsenal which have been sold since the armistice in competition with other industries, was seized upon with avidity by the Plumb plan leaders as indicating a degree of government approval of their plan. In a Labor Day address at Philadelphia Mr. Plumb said of the President's message:

"This represents a movement in the right direction. It indicates a realization on the part of the President that the existing oppressive industrial conditions can be relieved only by an understanding of the fundamental causes of the existing injustice and a readjustment of the forces of society in such manner as to give effect to the promise of the President that 'the object of all reform in this essential matter must be genuine democratization of industry, based upon a full recognition of the right of those who work, in whatever rank, to participate in some organic way in every decision which directly affects their welfare or the part they are to play in industry.'

"But the President was discussing the application of these principles to industry in the abstract. Labor's plan makes a concrete application of these principles to the railroad industry. If permitted, the men supporting labor's plan for democratic control of the railroad industry will gladly join with the President in seeking the solution of these tremendous problems. However, we recognize that there must be a clear distinction drawn between those industries based on a grant or privilege and other industries still conducted as individual enterprises. Another distinction we bear clearly in mind is that the federal government has not been authorized by the states to deal with industries in general, but only with transportation industries; whereas the states still retain their sovereign power over corporations they have created for purposes other than those of operating the national public highways.

"It is extremely gratifying to note the announcement that the administration has already applied, so far as it may without additional legislation, the principles of the Plumb plan to the industries which it is conducting in the United States arsenals. Secretary Baker has called to his aid the skill and ability of the employees, has conferred upon them authority and responsibility for the conduct of the business. They have a voice in the determination of their own wages, in fixing the prices for their own products, and in the organization of the forces to create and preserve the highest possible efficiency. This movement sprang from the workers themselves and at their own suggestion. They have devised and installed the agency which the Secretary of War has adopted and approved.

"The new day breaks. Civilization is built on labor, and labor now supports on broad foundations democracy in government, in industry, in life."

Edward Keating, manager of the Plumb Plan League, also issued a statement referring to the Rock Island experiment as a "happy and timely illustration of the truth of one of the basic principles for which we are contending."

This made it necessary for Secretary Baker to issue another statement saying that "wide misunderstanding of the situation has resulted from the publication of correspondence between representatives of arsenal employees and the Secretary of War. The War Department had encouraged the formation of committees of its employees in the arsenals, which committees consult freely with the men and act in an advisory capacity to the management on questions of shop conditions, production and wages; by this means hearty co-operation has been secured, and complete sympathy between the management and the employees has resulted. The authority of the management, however, is wholly undiminished by the advisory relation of the committees—the management of the plants is undisturbed—the government operates them and the authority of the commanding officer is as complete as it always has been."

During the Pittsburgh street car tie-up from August 14 to 29, the Pittsburgh division of the Pennsylvania daily handled 50,000 passengers who ordinarily travel on the street cars, through the Pennsylvania Station. This, in addition to the 60,000 regular railroad patrons made a total of 110,000 passengers handled daily through the station. Between Pittsburgh and Pitcairn during the busy hours of the morning and evening, trains were run at intervals of three to five minutes.

Railway Supplies for the Dutch East Indies

By J. W. Evans

The Colonial Government of the Dutch East Indies a few weeks ago ordered in this country through its purchasing agent in New York, C. Y. Ankersmit, 12 locomotives at a total cost of $600,000.

This incident in itself partly answers some of the questions which American railroad and railway supply men are just now asking about the Dutch East Indies as a market, both for American-made railroad equipment and American railway engineering talent.

The war produced in the Dutch East Indies a commercial situation which may prove much to our advantage in the United States. The Dutch East Indies used to get their manufactured goods mostly from Europe, and sent their tea, coffee, copra, quinine, etc., to Europe in exchange. When we wanted Dutch East Indian products, we bought them in Europe and paid a substantial commission to the European middleman. Of course, that condition had the effect also of limiting our railway supply market in the Dutch East Indies. They did their shopping in Europe.

Then came the war and closed the path; and the Dutch East came to us for the manufactured products which it had to have and could get no where else. The result was that our trade with them went up by leaps and bounds Their exports to us went from $6,000,000 in 1913 to $80,-000,000 in 1918—that is, multiplied 16 times. Our exports to them, in spite of very unfavorable shipping conditions, embargoes and everything else, jumped from $3,000,000 in 1915 to $20,000,000 in 1918—that is, multiplied 8 times. Fully one-fourth of our exports to the Dutch East have been in iron and steel products, ranging from kitchen utensils to the largest machines.

But what we could send them was far short of their needs, and particularly have their railroads had to peg along on less equipment than they needed. That order for 12 locomotives is a promise of more to come. They want, not locomotives only, but more adequate equipment of all kinds.

The question is, how much of that trade are we going to keep? Will the Dutch East Indies divert their trade toward Europe again?

The answer is that we can retain a substantial part of this new market if we will; and that the Dutch East Indies like American-made goods, like Americans, and want to trade with America direct. And particularly does it want to get as much of their railway equipment from this country as they can.

The first thing for the American railroad supply man to understand about the Dutch East Indies railroads is that the colonial government owns practically the whole system, and is operating and expanding the system in accordaince with a program which will ultimately embrace the whole archipelago. In other words, it is a market that is bound to grow. It is not enormous, but it will be some day. The man who gets into that market now finds something substantial and has the promise of something much bigger later.

The colonial government expands the railroads generally out of the earnings of the old roads. The whole system is out of debt, and every cent over and above operating costs goes for building up the system. What are the possibilities of this expansion may be better understood from the fact that the length of the archipelago is 3,000 miles, and that it has an area of 750,000 square miles, of which 500,000 are still undeveloped. In other words, the railroad project in the Dutch East Indies is partly a project for pushing railroads as rapidly as possible out into the wilderness and so developing the whole region. How much remains to be done may be understood from the fact that there are at present 3,400 miles of railroad in the Dutch East, of which about 2,300 miles are in Java alone.

Industrially, Java is three-fourths of the Dutch East Indies. Of the 50,000,000 population of the archipelago it has 36,000,000. And, of course, it is in that thickly populated island, one-third as large as California and with 700 people to the square mile, that the most rapid railway development takes place.

No figures are available at this time to show with any exactness the size of the market for railway supplies in the Dutch East Indies. An idea may be had of the importance of the field, however, from the figures that appear in the Yearbook of the Netherlands East Indies for 1916. They run to the beginning of the war, and, owing to the difficulty of expansion since, they are sufficiently accurate to form a good basis for calculation now. The figures are in guilders (a guilder being about 40 cents in our money):

	1906	1914
Cost of construction	$178,386,442	$234,495,886
Length of track opened for traffic (miles)	1,316	1,588
Gross revenues	16,506,198	34,714,830
Working expenses (renovation, repair of extraordinary damage and written off capital included)	9,745,895	19,543,195
Net receipts	6,760,303	15,171,635
Staff:		
European	1,480	2,535
Native	*	18,509
Number of engines	424	513
Number of passenger cars	975	1,589
Number of freight cars	5,858	10,094
Length of track in construction in miles	35	436
Capital expenses	2,646,367	20,312,846
Staff at survey and construction:		
European	54	492
Native	22	268

A study of those figures will show the extraordinary way in which those railways have flourished. The work has been done under the management of "the Chief Inspector of Railroads and Tramways," an official of extensive powers.

This official is responsible, not only for the management of the railways, but also for the necessary preliminary work, such as surveying. He has charge of all construction work, purchases equipment, and governs the system by which the roads are run.

Plans for the extension of the railroads in Java are constantly being worked at, and surveying and preliminary work goes on unremittingly. Plans have been completed for putting in several new lines, and surveys have also been made with a view to building a branch line of the South Sumatra Railway which will link the prosperous Lampong districts and the so-called Way Lima region with the harbor on the Bay of Lampong. Investigations are being made also with regard to the available water power in Java, and estimates are being made of the prospective consumption of such power by the railways.

The revenues derived from the State Railways in 1910 and 1914 were as follows, in guilders:

	1910	1914
Length of line in use, miles	1,234	1,380
Number of passengers	26,067,100	39,212,177
Quantity of goods carried (in tons)	3,080,894	4,569,015
Cost of construction	166,507,513	209,361,662
Gross receipts	21,421,617	31,914,555
Working expenses	11,314,977	17,869,600
Net revenues	10,106,640	14,044,955

One promise for the future comes from the recent discovery of a billion-ton deposit of iron ore in Celebes, containing stocks of nickel alloys, common iron ore, chrome iron and manganese.

As Celebes is also extremely fertile, it is intended to run a railroad from the coast to the interior, bring in immigrants from over-crowded Java, and thus develop the country both industrially and agriculturally. The call for machinery, particularly railroad supplies, will be very large.

Another enterprise of moment to railroad men is the development of a $4,000,000 harbor at Belawan, Sumatra, to afford a shipping point for the rubber and tobacco men

of the interior. That harbor will establish a terminal at which much of the railway system of Sumatra will converge.

The purchases of railway equipment by the colonial government in the United States are made through C. Y. Ankersmit, who is its purchasing agent in New York.

Special efforts are now being made by the colonial government to lay before American business men not only the opportunity that awaits them in trade and investment in the Dutch East Indies, but also the need for suitable banking adjustments that will make easy exchanges possible.

An exceptional opportunity will occur next May for American railway men to get in close touch with the whole industrial situation in the Dutch East Indies at the engineering convention which will take place during the industrial fair at Bandoeng, Java. The congress will be held in English, and it will have particular reference to the question of developing and opening up the resources of the archipelago. It will offer an opportunity to American railroad supply men to appraise the prospects, to get personally acquainted with the railroad men of the Dutch East, and to set forth their ideas and explain what they have to contribute to the big problem. That fair will be the entering wedge for many American manufacturers who see the promise of the Dutch East Indies.

The Electrification Problem in England

In a speech by Major Philip Dawson to the members of the Association of British Chambers of Commerce delivered recently and quoted in the Railway Gazette of London, important references were made to the extension of electric traction on railways. The speaker's experience and service to the Brighton Railway in this respect gave additional weight to his remarks, from which we extract the following:

The reasons which have so far brought about electrification are: congested suburban and interurban traffic; tunnel lines with difficulties of ventilation; mountain heavy grade lines; congested lines and difficulties at termini in which electrification will obviate costly widenings; electrification in countries in which coal does not exist but where abundant water power is available. The factor which limits the possibilities of electrification is the capital expenditure involved in the contact, distributing and transmission system and which will be about £5,000 per mile of single track. Interest, sinking fund and maintenance will be chargeable upon this, and this amount will have to be added to the ordinary working expenses and divided over the units of traffic per car, per ton and per passenger or train-mile. How vast this expenditure might be is shown by the fact that there are over 50,000 miles of single track in the country. It is obvious that the denser the traffic the smaller this unit charge becomes. As regards the other operating expenses, including cost of power and maintenance, other things being equal, electrical haulage generally comes out best.

An additional point made in favor of electric haulage is that, provided the generating station supplying power can be economically loaded up, electric haulage will tend towards an economy in coal consumption. The most sanguine American partisans of electrification claim a saving of over 66 per cent in coal on this basis, which would amount to about 10,000,000 tons of coal per annum in Great Britain. Against such a saving must be set off the capital charges already referred to.

The problem of electric power supply will in many cases be tied up with the question of electrification; but this will not always be the rule. There is little doubt that in an industrial area where electric supply stations already abound, and where dense mineral, goods and passenger traffic exists, electrification will be good business, so that we may anticipate the electrification of a very large portion of our railways in such areas as Glasgow and the North East Coast, as well as the counties of Yorkshire, Lancashire, Cheshire, Derbyshire, Staffordshire and parts of Worcestershire, Warwickshire and South Wales. In all these cases, owing to the good industrial loads obtainable, power stations will be in relative proximity and electrification can be classified under the heading of short distance electrification.

As regards long distance electrification, the applications in this country will be far less numerous, as coal abounds and water power is scarce, and electrification will only pay in the case of dense traffic, where the railway load will be such as to provide a good load factor for the power station. There are relatively few lines of this description to be found in this country, and by far the best example, and which should serve as a model and from the results of which conclusions for less favorable conditions could be drawn, is that of the London, Brighton & South Coast Railway. This railway was one of the pioneers as regards electrification in London, and the results of its suburban electrification during the last 10 years have been most satisfactory, the receipts of the electrified lines being more than doubled, and but for the war the whole of the suburban lines, amounting to over 150 miles of track, would have been now electrically operated. In deciding to electrify the directorate and management of the company fully realized that theirs was a case, not only of suburban electrification, but of the electrification of their Southern system as far as Brighton, and hence they, I think, wisely adopted a system which lends itself to indefinite extension. Here is the case of a long distance line operating heavy express passenger and freight trains with such a density of traffic that, without widenings, the train service could not materially be increased and where, owing to the density of service, a good load factor would be guaranteed for the generating stations. This is the one line ready for electrification immediately, and on which work could be proceeded with at once, as practically all the calculations have been made and the plans and specifications are available; the contracts for the suburban section were let before the war, but are not being proceeded with owing to the present uncertainties. The putting in hand of any other electrification would take time, as complete schemes would have to be prepared and contracts let, and there is no other long distance line as eminently suitable for electrification as that from London to Brighton. Unfortunately, present circumstances have and are materially retarding an improvement which would go a long way towards helping to cure the present overcrowding of trains, as well as to simplify and assist the housing problem, and give employment to a large number of workmen.

The completion of the suburban section would naturally be followed by the electrification to Brighton, for which plans are practically completed, and which would simultaneously result in providing plentiful and relatively cheap electric power supply throughout the whole of the purely agricultural and residential districts served by the railway.

The electrification of the suburban system would demand and justify the creation of a super-station, which would comply with the recommendations of the Board of Trade Committee on electricity supply and which could be the first step in the unification of greater London electric power supply on rational and business lines.

Summarizing the position as regards the future of electric power supply, the prospects are very encouraging, provided the government and legislation assist every class of electric enterprise, whilst safeguarding the legitimate interests of the consumers.

Railroad Hearings Before House Committee

Executives and Security Owners' Association in Controversy as to Who Represents the Railroads

WASHINGTON, D. C.

IF MEMBERS OF CONGRESS seem to be experiencing some difficulty in making a diagnosis of and in applying a remedy for the malady of the railroads there may be some excuse for them in view of the wide differences of opinion among those they have called in consultation on the case, including many close relatives of the patient. Also some of the difficulty lies in the fact that the victim of previous quackery that they are trying to cure is not really one patient but a whole hospital full of them in varying degrees of health or ill-health, some of them suffering with various symptoms and some of them sufficiently robust to object strenuously to medicine that others would accept eagerly and hopefully. Some of them are merely experiencing growing pains, others are reaping the consequence of irregularities in their youth, some of them are candidates for the operating table but shrink from the knife, most of them are suffering from insufficient nourishment, a few need only fresh air and sunshine, while still others are ready to be discharged.

The hearings on railroad legislation before the House committee on interstate and foreign commerce have rapidly been degenerating for some time into a free-for-all controversy in polite language between the advocates of the various plans. The confusion into which the minds of some members of the committee seem to have been thrown by the mass of undigested information that has been hurled at them day after day in hundreds of printed pages of prepared statements, thousands of words of oral arguments and hours of questioning, is not materially lessened by the fact that most of those who have plans find it much simpler to direct their arguments against an inaccurate and at times very unfair statement of the other plans which they attack than to meet them squarely.

Many of the witnesses also have sought to save themselves some trouble or perhaps save the committee some time, although most of them are not especially solicitous about the time of the committee, by loosely bunching together a number of plans based on similar principles and proceeding to discuss them generally in terms which apply strictly to none of them. While the apparent lack of scruple on the part of some of those who have testified against the other fellow's plan may perhaps frequently be attributed to the fact that they do not believe it means what its proponent says it does, such an explanation seems hardly applicable in the case of some of the attacks which ignore the fundamental principle of the plan under consideration.

Those who may be characterized as the anti-railroad witnesses, including the labor leaders, some of the shippers and some of the state commissioners, have added force to their rhetoric, if not to their reasoning, by loudly denouncing the railroads, the security owners and the business men for seeking a guarantee, although none of the widely differing plans that have become prominent provide for any guarantee to any one, if the proposed temporary continuance of the present guaranteed standard return be excepted.

On of the most important points of disagreement, leaving aside the general differences between the Plumb plan advocates and almost everyone else, is that between the railway executives and the Warfield plan and the National Transportation Conference plan. The executives have taken a strong position against any division of the so-called excess earnings above 6 per cent, which is provided for in both of the plans mentioned, although under different methods, but the controversy seems to be particularly between the executives and Mr. Warfield and his associates, who are as bitterly opposed to the plan of federal incorporation advocated by the executives and also by the National Transportation Conference as the executives are to what they term the confiscation of excess earnings. The controversy had previously been manifested in two statements made public by Judge Lovett and Mr. Warfield, but it has broken out anew at the hearings.

A few of the characterizations applied by the representatives of the executives to the Warfield plan were mentioned in last week's issue. S. Davies Warfield, president of the National Association of Owners of Railroad Securities, appeared before the committee on Friday, August 29, after his counsel had previously made its presentation of the plan, and replied to remarks made by T. De Witt Cuyler and Judge R. S. Lovett, implying some question as to whom Mr. Warfield represented, by submitting a "memorial to Congress by or on behalf of the fifty million American citizens owning or directly interested in railroad securities" with the signatures of 5,000 institutions and over 8,000 individuals. After this he entered upon a vigorous "correction of misinterpretations," some of which he said were deliberate, and told the committee there was a division of sentiment among the executives themselves, who he said, "have little or no financial interest in the properties that employ them," as well as questioning their representation of their stockholders or even of their directors.

"They certainly do not represent the security owners," he said. "What stockholders they represent I do not know, but I doubt whether they represent their directors."

Memorial Presented to Congress

The memorial urged the adoption by Congress of the fundamental features of a fixed percentage return on the aggregate investment in the railroads and a division of earnings in excess of 6 per cent, which are contained in the Warfield plan. The signers of this memorial declare that these requirements are essential to the investment of trust funds in the railroads, and that if Congress does not provide the protection given by these fundamentals it will fall short in the enactment of legislation to give stability to general railroad credit.

The memorial has signers, Mr. Warfield said, in every state in the union, the District of Columbia and in every urban community in the country, including approximately 5,000 investing institutions, savings banks, life insurance companies, fire, marine and surety companies, national and state banks, and trust companies, and other fiduciary institutions as well as 8,189 individual investors. Sixteen business organizations such as boards of trade, and chambers of commerce, are signers. It was estimated that these organizations with those who have endorsed the plan by resolution represent 30,000 people. Big international banking houses, investment bankers and brokers in the large cities are not included in the signatures, but the smaller institutions in every city in the country are represented.

After citing the necessity of legislation bodying those features of the Warfield plan and stating that many state laws prohibit holding of railroad securities by state institutions in the present situation affecting the railroads the memorial contains this paragraph:

"It becomes a duty to those we represent, and to your

honorable body, believing you would expect us thus to inform you, that without an unmistakable declaration by Congress of its policy toward these properties, embodying adequate assurances against destructive exertion of the regulatory power or the equally fatal results of congressional inaction, we would be wholly unjustified in investing further fiduciary funds inthe securities of the railroads."

In presenting this document Mr. Warfield said:

"The representations made on behalf of millions of American citizens that I present through this committee to the Congress, is the collective voice of each individual and not as members of or concerned in any particular railroad corporation, or in furtherance of the ambitions of any executive of any railroad. They come before you in the exercise of the prerogative of every American with the hope and in the belief that this committee will patiently and patriotically frame the laws for the protection of all without respect to whether such laws do or do not suit the individual wishes of any particular railroad or may curtail the powers heretofore exercised by operating heads of railroad properties.

"We do not ask the continuation of autocratic railroad methods of the past, or of a system which in some instances permitted performances in railroad manipulation, both of which the adoption of legislation based on the principles laid down in the plan of this association heretofore submitted to you could forever end.

"I doubt if the Congress has ever had presented to it a more representative or more important appeal from the investing public of the United States, and from every part and section thereof. Not only are investors and investment institutions signed hereto, but, as already stated, there is a substantial representation from the business and shipping interests of the country.

The total resources of the investing institutions of the United States, exclusive of international banking houses, private banking houses and private banks, investment bankers and brokers, and traders in securities, are	$47,835,330,165
The signatures to this memorial, excluding, in addition to the exclusions above named, individual investors, colleges, universities, etc. (whose resources it would be difficult to estimate, but which, if ascertained, would add a large sum), represent	$27,550,544,032

which equals 57 per cent of the total resources, and a very great percentage of the institutions of the country.

"This includes savings banks, life insurance companies, fire, marine and surety companies, national and State banks and trust companies.

Taking the largest cities of the country, to the number of fifty-six (56), the total resources of the institutions therein amount to	$27,967,310,398
The resources of the institutions of these cities that have signed the memorial amount to	$19,511,627,303

which equals 70 per cent of the total.

"Since in these 56 largest cities are located the great investing institutions representing the majority of the funds available for railroad investment excluding those above mentioned, it seems fair to assume that these institutions represent a percentage of such funds far in excess of 70 per cent, certainly to the extent of between 10 per cent and 20 per cent greater than that figure—or from 80 per cent to 90 per cent of the total.

"The savings banks signing this memorial have depositors numbering over 5,500,000 of the 9,000,000 total depositors in the mutual savings banks of the country. The number of policyholders represented by the life insurance companies, in unduplicated policies, signed to this memorial is 23,000,000 of the 33,000,000 total unduplicated policies. The total number of stockholders of national and state banks, trust companies, fire, marine and surety companies, and fiduciary institutions, is difficult to estimate. But, taking the average number of stockholders of the various institutions, it is estimated the number of stockholders of the signing institutions would be from 1,500,000 to 2,000,000. The institutions or individuals signing the memorial are located in 2,046 cities, towns and communities of the United States, every state of the Union of course being represented. Signatures are continuing to be received in large numbers, so the figures herein given will be largely increased in a short time."

Mr. Warfield Replies to Executives

Mr. Warfield took sharp issue with the position taken by representatives of the Association of Railway Executives in their recent testimony before the committee, quoting Daniel Willard, president of the Baltimore & Ohio, as having "unequivocably endorsed the fundamentals of the Warfield plan." Mr. Warfield also quoted from the earlier testimony of Chairman Cuyler and General Counsel Thom of the executives before the Senate committee, saying they had admitted the necessity for governmental supervision of excess earnings of the more favorably situated railroads. Director General Hines was also quoted as having unequivocably endorsed the position that any legislation to be enacted by Congress must provide a fixed percentage return of not less than 6 per cent upon the property invested in the railroads taken in the aggregate, as essential to credit.

Mr. Warfield contended that it is utterly impossible to make rates to enable the great bulk of the railroads in the country to perform adequate service and to receive sufficient revenue to take care of their financial obligations unless the railroad act provides for regulation of excess earnings of the railroads beyond the 6 per cent return, the excess earnings to be divided in the interest of the railroad, labor and the shippers in such proportion as Congress may determine.

Mr. Warfield said in part:

"Our effort is to endeavor to relieve the apparent barrier between the Interstate Commerce Commission and the representatives of the railroads by asking that the first consideration of the commission in adjusting rates shall be the amount of primary return to the railroads necessary to keep life in them, which should be a known factor, and we ask you to determine this factor as a minimum and state it to the Commission so that this at least may be set up primarily as an essential to the preservation of the transportation system of the country. The result would be that the first consideration would be so to adjust rates as to produce sufficient net railway operating income to let the great majority of the railroads live, and as much more as the public interest may justify; next, to ascertain what is necessary to pay a fair wage to the employees, and what is essential to buy equipment and the other things necessary for adequate railroad service which the public and shippers demand. That makes the rate. We believe practice would result in nearly an automatic arrangement in respect to the adjustment of railroad rates.

"Now, there is nothing revolutionary about this. Very little change is required in the use of the tools you now have to accomplish the result. Under this suggestion we do not consider it necessary to create a new body, such as a board or department of transportation, to go between the railroads and the commission for deciding the question of rates. Furthermore, can you expect one man, or a newly appointed board of two or three men, to do any different or better than what has already been done in the past unless there is some specific instruction to these new appointees? And if you are to give such specific instructions, why not give them directly to the commission with its experience and with such knowledge of its work as would take years of service for any newly appointed men to acquire. As a practical question, what need is there for two regulatory bodies, the new one to advise the present and supposedly well-posted body what to do, except there be lack of confidence in the existing body in its relations to the railroads. The difficulty has arisen out of not providing the commission with methods of procedure and a declaration of policy definite in its character.

"We have sympathy for the four brotherhoods when they say they do not want to see the railroads returned under the system of the past wherein it affects the question of the settlement of wages. In that respect named we agree with them. Let us see what the employees have had to do in the past in regard to any increase in wages. The employees of each railroad go to its president and ask an increase. He is not in position to meet these men. He has no control over the revenue which his railroad is to receive from rates and he is perforce placed in a combative attitude. He cannot give something he has not got, or something which he does not know whether he will get back if he pays it out. His road may be hardly getting along on what he has in sight, so there comes the refusal to the men and then the strike, or their descent in overwhelming force upon Congress or the administration. Under existing laws it cannot be avoided.

"What would be the difference under the plan we propose? The same idea that solves the question of rates and the question of a reasonable primary return that will stabilize not only railroad credit but all credit, will also solve this problem. When the employees go to a railroad president, that officer would have to consult with the rate-making body before he could give any answer so far as any raise is concerned. We suggest six boards of conciliation, in the six rate-making regions, to act in matters of this kind under procedure to be laid down by the Interstate Commerce Commission. These six Regional Commerce Commissions, which we suggest to assist the present Interstate Commerce Commission, act also as such boards of conciliation. They are to act in rate matters, their work, together with that of the Interstate Commerce Commission, to be co-ordinated with the work of the state commissions under procedure to be laid down by the interstate commission.

"We do not suggest that this arbitration be made compulsory, excepting that no strike shall occur until negotiations have failed, but it forms a basis for decentralized wage adjustments in the several districts of the country wherein the railroads affected operate, through bodies clothed with authority to bring about between the railroads and their men those relations that should properly exist, and without which, no matter what laws may be enacted, the transportation system will not be made successful. This is the simple remedy we suggest and it would be effective.

"The basic principle to be met in any legislation for the railroads, if such legislation is to be constructive and successful, must rest on the limitation of excess earnings of the roads. It is very important, that the members of Congress should realize just what this means and the reasons for it. You cannot make rates to suit the needs of each individual railroad of the country. Further, it is well known that if rates are made that will give sufficient revenue to permit the proper performance of service by the great bulk of the railroads of the country, this will give what the commission considers too much money to what are known as the prosperous or more favorably situated roads, and the result has been that adequate facilities and service have not always been given the public. This is the whole question, and upon its decision rests the success of any regulatory measure in respect to railroad rates. It has prevented the commission from adjusting to a level necessary to establish an efficient transportation machine as a whole. How are you to meet it? And if you do not meet it, we feel that your bill will fall short of giving adequate service to the people of the country, whether they be investors, passengers or shippers of freight."

Mr. Warfield then said there were only two ways to solve the present problem which needs fundamental treatment. One of these is through the reduction of excess earnings and the other through formation of 20 big companies. He declared the formation of such companies would be impractical and unconstiutional and cited the opinion of counsel that it would be unconstitutional. Even if it could be done, he said, the holders of present railroad securities could not be compelled to accept new securities in the new companies, making for endless litigation and the destruction of competitive service. He continued:

"Let us return to excess earnings reduction, which Judge Lovett in criticism of the association plan characterized before this committee as confiscatory and which he states will endanger the securities of the privileged railroad for which he speaks and which owes its origin and success to the government that furnished the bonds and land grants that brought it into being. But it would seem to be a selfish position to assume at this time for the representative of one of the roads that secured the benefits of such government assistance and protection to ask that his railroad be let alone, to the destruction of others, and allowed to continue even in these times on the basis of earning 34 per cent more than its full standard return, or a total of 134 per cent, whereas the Atchison is earning but 68 per cent of its standard return, the Pennsylvania Lines, East, 23 per cent, and the Pennsylvania Lines, West, but 6 per cent. And so it goes down the line until you reach the Reading and Baltimore & Ohio systems which are not even making their operating expenses, and where all the railroads taken as a whole are earning for the six months ended June 30, 1919, an average of only 39 per cent of the standard return now being paid them by the government. The dislike of parting with any portion of earnings, excess or otherwise, seems to be hereditary with the executive officers of this railroad. The question now is whether Congress will legislate to sustain those hereditary privileges or to sustain transportation as a whole.

"You have seen a complete endorsement of the vital features of the plan of our association by Mr. Willard of the steering committee of the Association of Railway Executives —concurred in, as I am definitely informed, by at least two other members of that committee; recognition on the part of the chairman of their association that this problem would have to be met, and a distinct statement on the part of their general counsel, Mr. Thom, that the question of excess earnings would have to be dealt with by some means of having governmental supervision over what we term the excess earning power of those roads. If there could be any better endorsement of the necessity for the main fundamentals of the plan of this association I fail to know it."

Mr. Warfield then quoted Director General Hines as to the necessity of dealing with excess earnings. "Unless excess earnings are dealt with in a proper manner, there is great danger of the contingency happening to which Mr. Hines refers—government ownership," he continued. "Is it not, therefore, a serious question for railroad executives with little or no financial interest in the properties that employ them to consider whether their attempt to nullify the efforts of the owners of the properties, as expressed here in the tremendous percentage thereof signed to this memorial, may not bring down upon the country the evils of government ownership and upon the owners great financial loss.

"In his address delivered in Chicago on April 10, 1919, Director General Hines recognized and endorsed the soundness of the rule of rate making and process of excess earnings reduction which is the fundamental basis of the association plan. The two requirements which are fundamental to any legislation which the Congress may pass, if it is to be considered constructive and is to solve the problems of the railroads, are that the act provide a fixed percentage return of not less than 6 per cent on the aggregate property investment in the railroads, as a whole, not on the property investment accounts of each individual railroad, and shall also provide for the division of earnings in excess of 6 per cent; one-third to be retained by the railroad earning such

excess, one-third in the interest of the employees and one-third in the interest of the shippers. This proportion is a suggestion; it is for Congress to determine such division as it may deem wise.

"I have presented to you not only the thought and wishes, in respect to the vital requirements of the railroads, of the thousands who have signed the memorial, which it is fair to consider is representative of millions of other citizens similarly situated in life; and practically every witness connected with the railroads or their owners with the exception of Judge Lovett, who have appeared before the committees of both houses of Congress when questioned has either admitted the absolute necessity of providing for these vital requirements (without the recognition of which Congress will not have been constructive in railroad legislation) or have specifically endorsed the principles involved, from the director general down, and these fundamentals have been adopted by the National Transportation Conference and submitted before this committee. The Transportation Conference applies the excess earnings in a different manner from that we suggest, but all this is 'mere machinery.'

"The continuous statement made by Judge Lovett, utterly unable to read the changed attitude of the times, that under the plan the excess earnings taken by the government from the more prosperous roads are to be handed over to the weak roads is, of course, untrue, and I cannot but feel that Judge Lovett is aware of the fact that this plan provides for nothing of the kind, either directly or indirectly.

"The evidence produced here today so utterly refutes the position taken by Mr. Cuyler that I will not further discuss it. When he stated, however, that his association represents all the railroads in the plan and bill submitted, with all due respect, let me say, that statement is not in accordance with the facts. One provision of that Bill alone, compulsory federal incorporation of the railroads, if submitted to the stockholders of the railroads of the country would, I believe, be overwhelmingly turned down, involving as it does a complete change in the very foundation upon which the railroads were organized. Many lawyers connected with the railroads are utterly opposed to compulsory federal incorporation, as are railroad executives and directors; and I have no hesitation in asserting that the association of executives has been admonished that important member railroads do not concur in any such proposal. The main purpose of compulsory federal incorporation is to kill the state commissions, notwithstanding the fact it has been generally recognized by all lawyers that intrastate rates may be adjusted by the Interstate Commerce Commission so that they will not interfere with the interstate rate structure.

"We believe that a grave responsibility is assumed by those who take issue with the deliberate judgment of those who have used the trust funds of others in support of the railroads particularly when they oppose a fixed percentage return on the investment in the railroads, accompanied by regulation of the excess earnings of these properties. Both of those processes are necessary not only to obtain reasonable return on the investment, but to produce the amount essential to adequate railroad service.

"The situation will be utterly hopeless if the railroads of the country are returned to their owners without constructive legislation embodying methods of regulation differing with those of the past. The questions entering into the regulation of a railroad are purely administrative and can hardly be dealt with by following entirely the procedure of a court of justice. We cannot expect these questions to be satisfactorily settled upon their presentation and discussion under such conditions before the regulatory body to which Congress has delegated unlimited power, unless specific directions from Congress govern the rules and procedure. At a time like this is would seem the Interstate Commerce Commission should be glad to receive these directions. Questions which will now arise are business problems of great moment, having relation to the life of the railroads which the commission has power to give or withhold. Should not the questions involved in the adjustment of railroad rates, upon the proper adjustment of which the business of the country depends, be solved along the general basic lines on which every other great industry solves the problems of its business, one being the price at which its product is to be sold, to determine the margin between the cost and the selling price which is the amount necessary to maintain the business and produce a reasonable profit? Can such questions be properly determined and settled—and I say this with all due respect, having a firm belief in the principle of a regulatory commission—where a railroad operator is required to present a subject of such vast importance to the people of the country in the attitude entirely of a witness supporting an unpopular cause, confronted by a statutory burden of proof, and using great masses of figures dealing with the questions at issue, and subject to intervention at any time by an able lawyer or lawyers who for effect may destroy the presentation of any man, and who upon entering the room finds himself on the defensive? The decision of such questions by the commission must necessarily be subject to such influences and impressions which perforce array the shippers at once against the railroads and, partly at least, has caused the feeling of hostility which before the war had grown up against the roads. No business, whatever its character, could have its problems properly and satisfactorily settled under such circumstances.

"In place of the board of transportation suggested by the executives, we advocate the organization of the National Railways Association with trustees composed of the Interstate Commerce Commissioners and representatives of the railroads selected from various sections of the country, the commissioners being the majority.

"We believe that questions incident to the consolidation of railroad properties and those that relate to the joint use of terminal and other facilities under such unification plans as may be deemed expedient and in the public interest, can be better determined by a board of trustees composed as this board would be, and without expense to the government, than by a newly appointed board. This corporation would give the most effective means to deal with suggested consolidations of railroad properties under the supervision of the Interstate Commerce Commission. Questions of joint use of railroad facilities, division of rates and transfer of equipment from one road to another could best be settled by a trained body of men operating through an organization of this description. This National Railways Association could be used as the means of financing future equipment for the railroads to be leased to the railroads requiring the same and thus save an immense capital charge to the various railroad companies, and saving to the shippers a very substantial amount in the making of rates. Under this plan the railroads would only be required to own equipment to meet their average business, using the equipment of the Association to take care of extraordinary demands.

"The measures used under the association plan for computing the return to the railroads are the property investment accounts of the railroads of the country taken in the aggregate in the three classification territories.

"It will not be necessary to deal with the individual property investment accounts of any carrier, whether each in itself is too high or too low, if you have in mind that sufficient net operating income is required by each of the railroads not earning up to 6 per cent, to make the wheels go round and below which these railroads, comprising a majority of the railroads of the country, cannot be operated in the public interest. The amount of net operating income each railroad would receive from rates adjusted to yield 6 per cent on the aggregate property investment accounts of

a district would be a figure below which those railroads that receive less than 6 per cent could not be operated to give adequate facilities and service. These railroads, which constitute a majority of the mileage of the country, would receive an average of 4.6 per cent on their property investment accounts. Some would earn less than 2 per cent, some 3 per cent, some 4 per cent, some 5 per cent and some just below 6 per cent. Therefore, without respect to their individual property investment accounts, less than 6 per cent would not yield sufficient net operating income for these railroads to be operated in the public interest. The amount of the property investment accounts of these 109 railroads in the aggregate is $8,766,932,000. These 109 railroads fall short $121,459,000 of earning 6 per cent on the aggregate of property investment accounts of their territory, which capitalized at 6 per cent equals $2,024,000,000. Taking the excess earnings reduction, under the plan, $83,000,000, capitalized at 6 per cent equals approximately $1,500,000,000 more upon which no return is received by the railroads, a total of $3,524,000,000. Therefore, when considering this plan it is fair to eliminate this from the aggregate of the property investment accounts of these particular roads. Mr. Walter in his testimony gave figures that were recently published by the Interstate Commerce Commission showing that $6,000,000,000 of actual cash had been spent on the property of the railroads of the country since 1907. Figuring the proportion applicable to the Class 1 railroads, that would be $5,200,000,000 cash put into these properties since 1907. Quite a considerable amount of so-called or possible over-capitalization is thus absorbed under the operation of the plan.

Wages

"There is another point to be considered in respect to the value of these properties. In 1917 the amount paid to the employees of the railroads was $1,700,000,000. This was increased by Mr. McAdoo in 1918, $900,000,000, or a total of $2,600,000,000, 53 per cent of the gross earnings of $4,900,000,000, of that time, and with an estimated increase of $800,000,000 in 1919, or a total of $3,400,000,000 or 62 per cent of the $5,500,000,000 gross earnings of today. If the value of labor has increased over $1,700,000,000 in 1917 to $2,600,000,000 in 1918, it may be asked what should now be added to the total value of all of the railroads. I think the question of over-capitalization may be disposed of, certainly in the consideration of the application of the 6 per cent fixed percentage return on the property investment in the railroads in the aggregate, using this amount as the measure which the custom of the past has made use of; so we have not brought an innovation into the situation.

"In a legislative use of this measure for computation we presume you would state in the act that this is the only purpose of its use and it is in no manner whatsoever taken to reflect any actual value of these properties.

"We have asked that pending the putting into effect the fundamentals of this plan that the standard return now being paid to the railroads be continued. It would be most disastrous owing to existing conditions for these properties to be returned, no matter what may be the legislation enacted, if the time is not given within which to bring about the proper adjustment of the affairs of the railroads and to meet such existing conditions. I think the owners of these properties have shown a fine spirit in this whole situation. I do not know of another instance where the owners of great properties have come forward with a suggestion of limitation of earnings to an amount which would give them a mere legal minimum return on their investment."

Mr. Warfield asserted that the railway executives had apparently experienced a change of heart after Judge Lovett became a member of their "steering committee." He also criticised their attitude toward state commissions, saying that nothing has so interfered with the solution of the railroad problem as the "antiquated policy of damning the state commissions."

In reply to questions as to what would prevent the railroads from making extravagant expenditures if assured an average return of 6 per cent, Forney Johnston, of counsel for the Warfield plan, said the Interstate Commerce Commission should supervise expenditures and establish a standard of maintenance.

Representative Sanders of Louisiana asked whether, if the roads of a given region should earn much over 6 per cent in one year, the commission would not probably reduce rates the next year. Mr. Johnston replied that it could.

"Then there would be no excess earnings to divide," said Mr. Sanders.

State Commissions Want Jurisdiction Restored

C. E. Elmquist, president of the National Association of Railway and Utilities Commissioners, appeared before the committee on August 28, urging the amendment of the Esch-Pomerene bill in such a way as not only to preserve the state jurisdiction over local rates and service, but also, according to some members of the committee, as to restore some of the powers already taken from them by court decisions. Mr. Elmquist said the state commissions were in favor of consolidations, federal regulation of security issues and other provisions of the bill but want to have a chance to pass on local features of the various questions to be passed on by the Interstate Commerce Commission. He suggested that each state commission might be used as a regional commission. He also made a general attack on other plans which he said provide for some kind of a guarantee of return, on the ground that he did not know of any regulating commission, state or federal, that believes the government should guarantee any return and because of a general opinion that as a practical matter rates could not be made on such a basis. He also asserted that a guarantee would result in inefficiency and extravagance because there would be no incentive to a railroad to earn money "to contribute to a jackpot." He ignored the provisions of various plans for allowing a railroad to keep a third or some other proportion of anything it could earn over 6 per cent. Mr. Elmquist opposed the Plumb plan on the ground that it would take away $214,000,000 of taxes a year from the states.

After the return of the roads to private management, Mr. Elmquist said, the rate question will be one of reduction rather than of increase, because "under the highest level of rates ever known" the railroads would have no reason to fear bankruptcy.

H. R. Platt and W. R. Evans, representing the Great Lakes Transit Corporation, and Harvey Goulder, representing tramp vessels on the Great Lakes, opposed giving the Interstate Commerce Commission jurisdiction over water rates.

Bryan Wants Dual Government Ownership

W. J. Bryan appeared before the committee on August 29, attracted, he said, by the widespread interest in the railroad question at this time, to the opportunity to present again his old plan of dual government ownership of the railroads, the main trunk lines to be purchased and operated by the federal government and the intrastate lines by the states. He said this plan would make is possible to acquire the railroads gradually, one state at a time, while the federal government would have to pay out only about $4,000,000,000 or $5,000,000,000, and perhaps could buy the lines cheaper if given the right to construct new lines. He insisted that it would cause no difficulty if some state acquired their lines before the others did. Mr. Bryan refrained very carefully from discussing practical details, particularly after

several members of the committee had asked him some practical questions and showed that most of his information on the railroad situation was 10 to 25 years old, and after Representative Winslow had told him he was not quite confident that Mr. Bryan was not doing some "romancing." He said that a private monopoly is "indefensible because it cannot be defended and intolerable because anything that cannot be defended cannot be tolerated." He did not care either to condemn or endorse the Plumb plan, saying he was for it on the ground that it provided for nationalization but thought that it was bad in some other respects. He preferred government operation as well as ownership and objected to the proposed division of the board of directors. He did not think that the officers and employees together should have two-thirds of the board and the public only one-third, nor that 20,000 officers should have as many as the rest of the employees or the rest of the public.

Bird M. Robinson, president, and Ben B. Cain, assistant to the president, of the American Short Line Railroad Association, proposed a number of amendments to the Esch bill for the protection of the interests of the short lines. Mr. Robinson said that the "ruthless treatment" of the short lines by the Railroad Administration would result in wholesale liquidation of their affairs unless Congress does something for them. He said he was speaking for 35,000 miles of line. Mr. Cain said the transportation industry is faced with a crisis which perhaps threatens our national economic structure and that the question of government or private ownership depends on whether the railroads are allowed sufficient revenues to place them on a sound financial footing. He pointed out that there are only 14 of the railroads of the country whose stock has sold at par or above from 1914 to January 1, 1919.

Maximum Earnings of Engineers and Conductors

REPRESENTATIVE THOMAS L. BLANTON, of Texas, has been putting into the Congressional Record some interesting statements regarding the maximum earnings of engineers and conductors which he has received from the Pennsylvania and the Baltimore & Ohio, with some further comments on how the earnings were built up furnished by Director General Hines. Mr. Hines said the high earnings resulted from overtime, but he did not show the total number of hours worked.

August 19, Mr. Blanton inserted the following letter from R. L. O'Donnel, general manager of the Pennsylvania Railroad, relative to the maximum wages paid engineers and conductors for July, 1919:

"In accordance with your request of the 14th instant, we show below the highest maximum wages paid to any freight engineer, passenger engineer, passenger conductor, and freight conductor during the month of July, 1919, in the service of the Pennsylvania Railroad, eastern lines:

Freight engineer	$392.35
Passenger engineer	376.85
Passenger conductor	313.90
Freight conductor	308.55

Later Mr. Blanton inserted the following letter from Mr. Hines:

"I have noted in the Congressional Record for August 19 your remarks giving the highest maximum wages paid any freight engineer, passenger engineer, passenger conductor, and freight conductor on the eastern lines of the Pennsylvania Railroad in July, 1919.

"I find the figures given by you to be correct, but I think you should know the circumstances under which these wages were paid. I inclose herewith a memorandum giving just how the wages received by each of the men mentioned were built up, how many days they worked, and how many days they have been in the service in order to reach the wages given. You will notice that in order to return the amounts given two of these men worked 31 days, one of them worked 29 days, and the fourth worked 26 days; only one of them gets Sundays off. You will also note that each of these men worked overtime —one of them 7.4 hours overtime, the second 121 hours overtime, the third 144.8 hours overtime, and the fourth 159.9 hours overtime, and with one exception the overtime made up a very large proportion of the total wages received. To show that these earnings are not typical, I quote herewith a table showing the average of rates in effect in 1917 and the average of rates in effect following the increase in pay given to this class of employees in April of 1919:

Service	Occupations	1917	Now ordered
Passenger	Conductors	[1]$135.00 to $165.00	[1]$180.00
Passenger	Engineers	[2]4.47	[2]5.79
Freight	Conductors	[2]4.09	[2]5.40
Freight	Engineers	[2]5.33	[2]6.64

[1]Per month. [2]Per day.

NOTE.—Because of the wide variety of rates it is impossible to do other than show the increases on the average, ignoring both maximum and minimum rates.

"In view of the wide comment caused by the earnings which you quoted, I hope you may have the facts presented in this letter also inserted in the Congressional Record."

STATEMENT FROM DIRECTOR GENERAL ACCOMPANYING THE FOREGOING LETTER.

W. S. Laurie, passenger engineer, West Jersey & Seashore Railroad. Entered service as engine cleaner in July, 1894; made fireman in 1895; promoted to engineman June, 1903. Paid $376.83 in July, 1919.

58 trips at $5.68 a trip	$329.44
27 back overs, at $0.16	4.32
22.6 back overs, at $0.71	16.05
166 miles back overs, at $0.0568	9.43
4.2 miles terminal, at $0.0568	.24
2 days at $6.05	12.10
7.4 hours overtime, at $0.71	5.25
Total	$376.83

Runs passenger train from Hillside Station, Philadelphia, to Cape May and return. Paid a minimum day in each direction, distance of 94 miles each way. Worked every day in the month.

R. C. Christy, passenger conductor, Renova, Pa., Pennsylvania Railroad. Entered service in 1890 as passenger brakeman; promoted to conductor in May, 1896:

Made 5,579.6 miles, at $0.04 a mile	$223.18
121 hours overtime, at $0.75	90.75
Total	$313.93

Runs passenger train in short-turn run. Worked 26 days in July and laid off one day. Does not work on Sundays. Paid on average of 4 hours 55 minutes overtime per day.

M. McGowan, freight engineer, West Jersey & Seashore Railroad. Entered service as truck watchman April 22, 1884; made fireman in June, 1890; promoted to engineer in July, 1900.

3,198 miles, at $0.0716	$228.98
563.1 miles, at $0.0568	31.98
144.8 hours overtime, at $0.895	131.39
Total	$392.35

Runs between Camden and Atlantic City. Laid off two days during month. Averages 123 miles per day.

John FitzGibbon, freight conductor, Allegheny Division. Entered service January, 1887, as freight brakeman; promoted to freight conductor March 26, 1891, and then he went from freight conductor to engineer of steam shovel in April, 1902; freight conductor again in December, 1902:

32 trips, 3,200 miles, at $5.92	$189.44
159.9 hours overtime, at $0.74 an hour	118.33
1.2 hours switching service at end of run	.80
Total	$308.57

Runs local between Oil City and Brockton. Made one additional trip in July, account doubling one day. Normally makes 31 trips per month.

Mr. Blanton also put in the record the following letter from C. W. Galloway, federal manager of the Baltimore & Ohio:

"In answer to yours of August 14, addressed to the general manager of Baltimore & Ohio Railroad, I give below, as requested, the highest maximum wages paid to each freight engineer, passenger engineer, freight conductor, and passenger conductor for month of July in the Baltimore & Ohio service:

Passenger engineer	$349.85
Passenger conductor	345.60
Freight engineer	334.60
Freight conductor	305.05

Doings of the United States Railroad Administration

Railroads Earned $2,000,000 More Than Standard Return in July. Shop Hours Increased to Nine

WASHINGTON, D. C.

AFTER nine months of deficits since last September the railroads in July earned about $2,000,000 more than the guaranteed standard return although if the recent increase awarded the shop employees, retroactive to May 1, which they have not yet accepted, had been included, the month's net would have been reduced by nearly $4,000,000, as the increase in wages is estimated at about $40,000,000 a year.

Detailed statistics will shortly become available of the operating results for July of practically all the Class I railroads and large terminal companies in federal operation. These results will indicate that the net operating income for the month was about $77,000,000. After allowing for one-twelfth of the annual rental due the railroad companies whose railroads are covered by these statistics, the net gain to the government was about $2,000,000. The net loss for the seven months ended July 31 was $290,526,307.

The corresponding net gain or loss for these same properties by months of the present calendar year, as given out by the Railroad Administration, has been as follows:

	Net gain or loss to the Government after allowing for one-twelfth of the annual rental		
Month	Net gain	Net loss	
January	.....	$57,782,557	
February	.....	65,430,850	
March	.....	64,881,856	
April	.....	48,757,056	
May	.....	33,642,128	
June	.....	22,031,860	
July (estimated)	$2,000,000	.....	
Net loss for seven months			$290,526,307

The falling off in freight business as compared with the years 1918 and 1917 continues to be an important factor, but the month of July, 1919, shows a slight improvement over June, 1919, in the actual business handled. The percentage of decrease compared with the same month of 1918 and 1917 is also less than in June. This is indicated by the following comparison of net ton miles per mile of road per day:

	Revenue and non-revenue ton miles per mile of road per day		
	1919	1918	1917
January	4,275	3,878	4,770
February	4,002	4,591	4,511
March	4,059	5,273	5,192
April	4,134	5,471	5,257
May	4,524	5,226	5,617
June	4,615	5,423	5,694
July	4,878	5,487	5,441
Seven months ended July 31	4,351	5,044	5,107

The net operating income for July for the past six years has been as follows: 1919, $75,600,000; 1918, $137,800,000; 1917, $92,600,000; 1916, $90,500,000; 1915, $72,200,000; 1914, $63,200,000. The July earnings when compared with the traffic moved and the extent of the railroad plant, are next to 1914 the lowest in many years. Ten years ago the July net was above $70,000,000, and since then nearly six billion dollars, or nearly one-third of all the railroad capital in the country, has been added to the actual investment.

Comparison of the month's earnings with July, 1918, shows a loss of about $60,000,000 in net. The two months are comparable, because the present level of freight and passenger rates was fully effective after July 1, 1918.

A preliminary comparison of this year's with last year's earnings shows these results:

	July, 1919	July, 1918	Increase or decrease
Revenues	$447,952,000	$463,001,000	3.2% dec.
Expenses	353,889,000	313,500,000	12.8% inc.
Net oper. income	75,331,000	136,026,000	44.6% dec.

The eastern roads earned $33,200,000, a loss of $28,400,000 as compared with last year. The western roads earned $32,900,000, a loss of $20,100,000, and the southern roads earned $9,300,000, a loss of $12,000,000.

Freight traffic in July was 11 per cent less than a year ago, but 25 per cent greater than the July average in the three-year test period. Passenger traffic again showed a considerable gain over last year.

Despite the reduced tonnage hauled, the July expenses are $40,000,000 greater than a year ago, and $120,000,000 greater than two years ago. As compared with the average for July in the pre-war test period, expenses have risen $170,000,000, or 95 per cent.

Report Asked of Uncompleted Or Deferred Improvement Work

D. C. E. Circular No. 22, issued by the Division of Capital Expenditures, directs that in order that the director general may be enabled to furnish the railroad companies with definite information as to the status of all uncompleted work involving a charge to capital account which has been discontinued or indefinitely deferred, together with the expenditures made by him in connection therewith, and for the purpose of dropping from all D. C. E. reports the unexpended authorizations, federal managers (or general managers where federal managers have not been appointed) should cause to be prepared a detailed report on D. C. E. Forms 18 and 18-A, including the following:

1. Projects originally authorized by the railroad companies prior to federal control but which were not brought to a completion, leaving the work in an uncompleted state.
2. Projects commenced during federal control which have been discontinued or indefinitely deferred or so modified that portions of the work will be left in an uncompleted state.
3. Projects authorized during federal control but on which no work was done nor any expenditure made.

Status of U. S. R. A. Open-Top Cars

Director General Hines has a statement in connection with the car supply situation, giving the status as of August 26, 1919, of the open-top cars contracted for by the Railroad Administration. Of the total of 50,000 open-top cars mentioned, 45,000 are coal cars.

OPEN TOP CARS

	55-ton Hopper	Com Gond.	70-ton Hopper	70-ton low side	Total
Number ordered	22,000	20,000	3,000	5,000	50,000
Completed and in service August 26	12,935	8,051	762	2,397	24,145
Completed and in storage August 26 (the numbering and placing of these cars in service is now in progress)	8,186	8,498	.....	794	17,478
To be built	879	3,451	2,228	1,809	8,377

The cars shown as being in storage, the statement says, are being numbered by the car works and placed in service at the rate of 250 to 275 per day. The railroad shops have been called upon to assist in numbering such cars and this will increase the daily number of such cars placed in service hereafter.

The cars shown as yet to be built are being built and placed in service at the rate of 75 per day, so that from 325 to 350 cars of this class are being put into service daily.

The composite gondolas are being delayed because two

of the large plants have been on strike for the last month and consequently are turning out very few.

Two plants are building 70-ton low-side cars. One is now on strike.

Hours of Shop Employees Increased to Nine

The effect of the recent strikes of shop employees is plainly seen in the reports of bad order freight cars as of August 9, when the percentage of bad orders had increased to 9.3, although the strikes were not terminated until about a week later. On August 9 there were 144,000 cars requiring heavy repairs and 83,000 requiring light repairs. Since then the shop employees have been put on a nine hour a day basis. On August 2 the bad order cars were 8.5 per cent, as compared with 7.1 per cent on the corresponding date in 1918. About 135,000 required heavy repairs and 73,000 light repairs. A year ago the classification was not recorded. On July 26, the date of the last report preceding the strike, the percentage was 8.5 as compared with 7.2 the year before, and 139,183 required heavy repairs and 68,922 light repairs, a total of 208,105. On that date 106 roads or 77.9 per cent had more than 4 per cent of their cars in bad order and 30 roads, or 22.1 per cent, had less than 4 per cent. Forty per cent of the bad orders were box cars and 25 per cent were gondolas. The number of bad order cars increased during the spring months while traffic was light and while the Railroad Administration was exerting great pressure to effect economies. In February the hours of the mechanical forces were reduced from the war basis to eight hours a day and in March the forces were reduced. At that time there were 400,000 to 500,000 surplus freight cars. In the latter part of June, when traffic began to pick up and a large number of cars were automatically put in the bad order class by being assigned for grain service, orders were issued to increase the car repair forces, but the strike came before much headway had been made.

New Reports on Coal Car Performance

The Car Service Section has taken steps to secure more detailed information of its own regarding the performance of and requirements for coal cars so that it may have a check against the figures furnished by coal operators and published weekly in the bulletins of the Geological Survey, which have been used by the National Coal Association in its propaganda of criticism of the Railroad Administration for not supplying enough coal cars. The coal association has been making particularly effective use of these reports since the strike of the railroad shop employees, in its testimony before the Senate committee that is investigating the coal situation, as showing a large percentage of full time output lost by the mines by reason of car shortage. For the week ending August 23 this was reported as 25.7 per cent, but railroad men say this is in comparison with perfect conditions and that if the coal mines actually produced their full ideal output the result would be nearly twice the country's normal requirements. The figures are also affected by the fact that those who want coal or cars badly place orders for more than they need. The new reports are called for in Circular C. S. 70 as follows:

"Beginning with the report for week ending September 6, 1919, coal loading railroads in reporting to the car service section their weekly performance of coal cars, required, furnished, loaded and left over, will report not only the figures for the railroad as a whole, as is now done, but will report also the figures for individual coal loading districts according as the same may be assembled now by the reporting officer of the railroad.

"The purpose of this is to furnish us weekly with information as to the performance by individual railroads in various coal-loading districts, thereby enabling us to check more closely the reports of the railroads against the reports made by operators to and published by the Geological Survey of the Interior Department.

"You should also submit to the car service section with the report for September 6 a statement showing as accurately as possible the station or geographical limits of each individual district for which report is made that week and will be made subsequently."

W. C. Kendall, manager of the Car Service Section, also issued a circular recently directing the roads to put into service coal cars of a capacity of 75,000 lb., or less, which were put in storage at the time of a heavy car surplus in the spring, but they are not to be utilized in coal service generally, for which cars of higher capacity will be used preferentially.

Freight Traffic Movement and Car Performance

The net ton miles of revenue and non-revenue freight handled during the month of July show a decrease of 11.3 per cent as compared with July, 1918, according to the monthly report of the Operating Statistics Section. The net ton miles per mile of road per day were 4,878 as compared with 5,487 in July of last year. Train mileage decreased 13 per cent and car miles decreased 8.7 per cent, while the percentage of loaded to total car miles increased 4.8 per cent, from 64.9 to 68. The net ton miles per train mile increased from 710 to 724 but the net ton miles per loaded car mile decreased from 30 to 27.8. The car miles per car day decreased from 26.3 to 24.1 or 8.4 per cent. The net ton miles per car day decreased 11.1 per cent. The percentage of unserviceable cars was 8.7 as compared with 6.9 last July.

For the seven months of the calendar year ended July 30 the net ton miles show a decrease of 14 per cent and the net ton miles per car day of 13.3 per cent. The net ton miles per train mile show an increase from 660 to 677, or 2.6 per cent and the net ton miles per loaded car mile show a decrease from 28.7 to 27.8 or 3.1 per cent. The car miles per car day for this period averaged only 21.9 as compared with 24.2 in the corresponding period of 1918.

From the Columbus (O.) State Journal

Melodrammer

Ninth Convention of Tool Foremen's Association

Standardization of Small Tools and Devices for Facilitating Work Are Principal Topics Discussed

The American Railway Tool Foremen's Association held its ninth convention at the Hotel Sherman, Chicago, Aug. 27-29. Following the opening prayer, the convention was welcomed by G. C. Niemeyer, representing the states attorney. The president then introduced W. E. Dunham, assistant to the general superintendent motive power and car department, Chicago & North Western, who spoke of the relation of the tool foremen's work to the efficiency of the shop.

Address of W. E. Dunham

Mr. Dunham said in part: The tool foremen and the tool foremen's organization are the heart and life of a railroad shop. What the tool room is and what the tool room foreman accomplishes ramify to every department. If the tool room is not furnishing efficient tools, the morale and spirit of the entire shop is gone. The tool foreman ought to give attention to every tool in the plant and those from which the proper output is not being secured should be overhauled so that the utmost production can be obtained. We must see that the equipment the railroads have in their shops is in efficient condition. In this matter, the Tool Foremen's Association has a very vital part to play in the reconstruction period through which the railroads are going.

President's Address

The president, C. A. Shaffer, (I. C.) reviewed the activities of the association since the last convention in 1916. He urged the members to put forth a special effort to enlarge the organization and to continue the work which would bring about higher efficiency in railroad tool service.

Standardization of Tools

By E. J. McKernan

Supervisor of Tools, A. T. & S. F., Topeka, Kan.

In this day and age, the individual idea should be subordinated to such an extent that we should adopt practices that would give better efficiency, reduce the cost of output and on the other hand simplify the tool situation whenever possible. It has been plainly shown that the adoption of standard practices by the Railway Master Mechanics' Association was a good move. When a standard practice was adopted by that body, it was carried out to the letter on all railroads and considered standard.

In the past eight years the members of the American Railway Tool Foremen's Association have attended meetings and returned to their respective homes and made reports to their local officers on these subjects but unfortunately they did not get the co-operation that they should have received. As all the tool foremen who attend these conventions receive instructions from their superiors to attend, they should be invested with such confidence that when they make a report to their superiors that a certain tool has met with the approval of the association and been adopted as standard, the higher officers should put forth an effort to put this into practice. If we could standardize the tool equipment on all American railroads and use the same methods and practices there is no question that it would eliminate a great deal of the making of unnecessary tools. While I appreciate the fact that the tool room foremen and the superintendents of motive power have a certain amount of self-pride in the making of all tools for their respective railroads, nevertheless, the progressive man of today must be able to give and take whenever necessary in order that he may develop a method that will get proper production.

In the automobile industry, where all parts must be interchangeable, the first practice is to get the tools made to the standard before starting production and these tools are maintained to an extremely high standard of accuracy. If this is found to be good practice from a manufacturing standpoint, why is it not a good practice in the railroad shop? There is only one solution and that is co-operation and the insistence on the adoption of practical methods and standards.

On the Atchison, Topeka & Santa Fe, in order that we may get the proper results, it has been found very essential that the tools be standardized and whenever possible, drawings are made of the tools and then submitted to the tool room foreman so that they will be made up in a standard way. It is further found advisable that only tools which cannot be secured from the manufacturer for a reasonable price should be made in our tool room. It is not good practice for a railroad shop tool room to manufacture tools that can be secured from the manufacturers for the same price or less than it would cost to make them locally. In some shops such tools are made but I consider it false economy due to the fact that there is a certain amount of loss incurred by the tool room and when standard tools are secured from the factory all the possibility of loss is overcome due to the fact that all tools are furnished in first class condition and free from flaws and defects.

There is a vast difference of opinion between railroads in regard to a standard locomotive frame reamer. The greatest difference seems to be in the length over all and in the taper. If a standard length and taper of locomotive frame reamers could be universally agreed on, it would be possible to eliminate the excess cost due to ordering reamers of special type from the manufacturer as well as eliminating the carrying of many different lengths of reamers locally in the tool rooms.

For illustration, on the Santa Fe lines a standard reamer has been adopted with a left hand spiral flute and of a standard length that will take care of the maximum and minimum requirements. Heretofore, there were a great number of different lengths which have been eliminated by standardization. By the adoption of the left hand spiral fluted reamer, the breakage has been reduced to about 20 per cent. While using the straight fluted reamer trouble was encountered due to the chipping out of portions of the flute and also chattering, while now this has all been eliminated for the left hand spiral retards the reamer to such an extent that it does not gouge or seize, especially while reaming steel frames on locomotives. All our reamers are tapered 1-16 in. in 12 in. and I feel confident that with the proper co-operation of the mechanical heads on the various railroads throughout the United States, this point could be agreed upon. This standardization not only pertains to reamers but also to all other tools and equipment.

Discussion

Several questions were raised regarding standard forms of reamers. There was some difference of opinion regarding the relative advantages of flutes in the form of spirals having

short and long pitches. The majority favored long spirals on reamers used with air drills, but the statement was made that the shorter spirals reduced the time but required heavier thrust to feed them.

Promoting Safety in the Shop

By J. C. Beville

Tool Foreman, E. P. & S. W., El Paso, Tex.

We must not forget while manufacturing new devices and tools that in each case we should keep in mind "Safety-First." The prevention of injuries should be considered even more than the efficiency of the tool or device. Do you ever inspect the tools that are in daily use in your shop to see that they are in safe condition? The tool foreman should make this his business as he is more capable of determining the safety of tools. Our shop safety committee demands a report from the tool foreman on tools in all departments and this has brought about wonderful results in a decrease of injuries. The blacksmith shop, boiler shop, and even the different tool rooms are good places to find defective tools. There are numerous things in the shops and engine houses that are unsafe at their best and we must see that they are at their best.

Other Papers

J. J. Sheehan (N. & W.) described improved devices used in boiler work. A discussion of the making of carbon steel forgings for tools was submitted by J. P. Fuhrman (Great Northern). A paper on the heat treatment of steel by electric furnaces was presented by H. Otto (A. T. & S. F.). Descriptions of gages, tools and devices were also received from J. B. Hasty (A. T. & S. F.), A. Connell (K. C. S.), J. B. McFarland (N. Y. C. & St. L.) and J. Berling (S. P.).

General Business

The association discussed the advisability of amalgamation with the American Railroad Association and a committee was appointed to consider and report on that question. The secretary reported a substantial increase in the membership. The following officers were elected: president, J. C. Beville, (E. P. & S. W.); first vice-president, J. B. Hasty, (A. T. & S. F.); second vice-president, G. W. Smith, (C. & O.); third vice-president, C. Helm, (C. M. & St. P.); secretary-treasurer, R. D. Fletcher, (Crucible Steel Company); chairman of executive committee, B. Hendrickson, (C. & N. W.).

Watt-hour Meter for Recording Effect of Regeneration

TEN NEW ELECTRIC LOCOMOTIVES for the Chicago, Milwaukee & St. Paul are being equipped with Economy duplex-dial watt-hour meters, which will measure accurately the energy consumed in driving the trains and also that returned to the line through regenerative braking, each reading being shown on one of the two cyclometer type dials. The locomotives are of the Baldwin-Westinghouse passenger type. Each is equipped with six 533-hp. twin-armature motors, and one Sangamo Economy railway meter. These meters are a modification of the single dial type which is used ordinarily on street car and interurban systems. They are manufactured by the Sangamo Electric Company, Springfield, Ill., and sold by the Economy Electric Devices Company, Chicago.

The Chicago, Milwaukee & St. Paul uses watt-hour meters on its electric locomotives for three main reasons: (1.) Because certain accounting charges are distributed on the basis of the watt-hour consumption required by electric locomotives for the respective classes of train service. (2.) To check the economical use of power in connection with the handling of the train. (3.) To provide operating and engineering data to check the economical and satisfactory operation of the electrification system as a whole.

The electric locomotives in use at present are equipped with watt-hour meters, which give the net power used for any run; that is, the regenerated reading is subtracted from the motored reading, but in order to get the approximate values of motored and regenerated energies respectively, it is necessary to read the meters at certain points on the road between which the general use of power is either on the

The Economy Watt-hour Meter Showing the Dials for Recording Power Used in Motoring and Power Developed by Regeneration

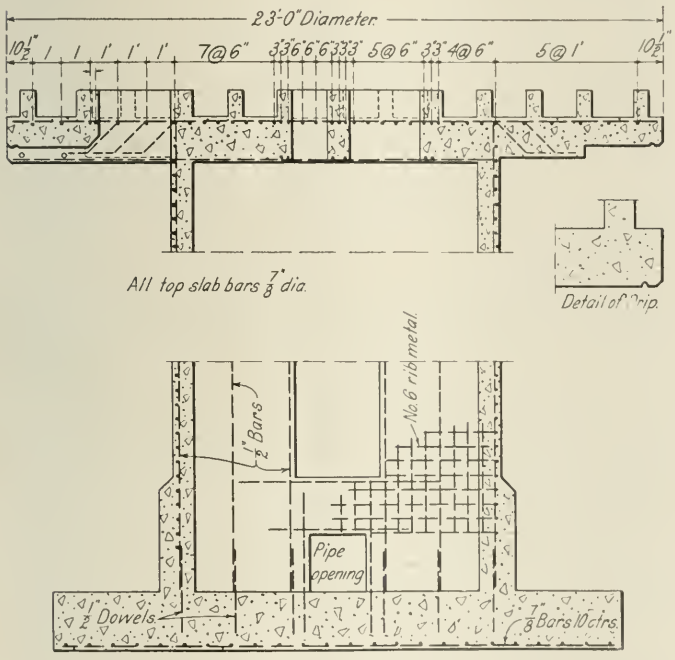
motoring side or the regenerating side. The Economy duplex-dial meters, however, make separate records of the motoring and regenerated energy, so that readings of the meter are required only at the beginning and end of a run, and the results will be exact instead of approximate.

In mechanical design these duplex-dial locomotive meters differ from the regular Economy meters used in electric railway power-saving work only in the dials and gear trains. The dial is of the duplex type with openings for two sets of figures as shown in the illustration. The reading for the motoring is above and for regenerating below, so that a subtraction can easily be made to get the actual net energy used for any period. The single meter element drives the two gear trains through a differential which is arranged in such a way that when the locomotive is motoring the energy drawn from the trolley is registered on the upper train, and when it is regenerating the energy is recorded on the lower train. The reversal is made without loss of motion in the gear train.

In the design of this meter standardized parts are used. The meter element is so mounted on a sub-base that it may be removed from the case with little effort and without disturbing any heavy circuits. The case which protects the element is of heavy construction with tight-fitting joints designed to exclude dust. These meters, without their shunts, may be checked easily as 10-ampere units.

A Concrete Foundation for a Wooden Water Tank

A NEW IDEA IN WATER tank supports has been put into practice by the Chicago & North Western in the form of a reinforced concrete substructure for its 24-ft. by 16-ft. wooden tub tanks. As shown in the drawings the design embodies the use of a concrete tower 10 ft. square inside, with walls heavy enough to carry the tank load. The space inside the tower is occupied by the service pipes so that the design obviates the need for a separate frost box which was an expensive auxiliary of the standard steel and wooden tank towers constructed by the North Western previous to the development of the concrete tower. The roof of the box is expanded to form a circular slab 23 ft. in diameter with the top provided with ribs 6 in. wide and 1 ft. high, spaced 1-ft. 9-in. center to center to carry the planking of the tub in the same manner as joists and thus provide the necessary ventilation to resist decay. With a tub of creosoted planks these ribs could be omitted and the tank set directly



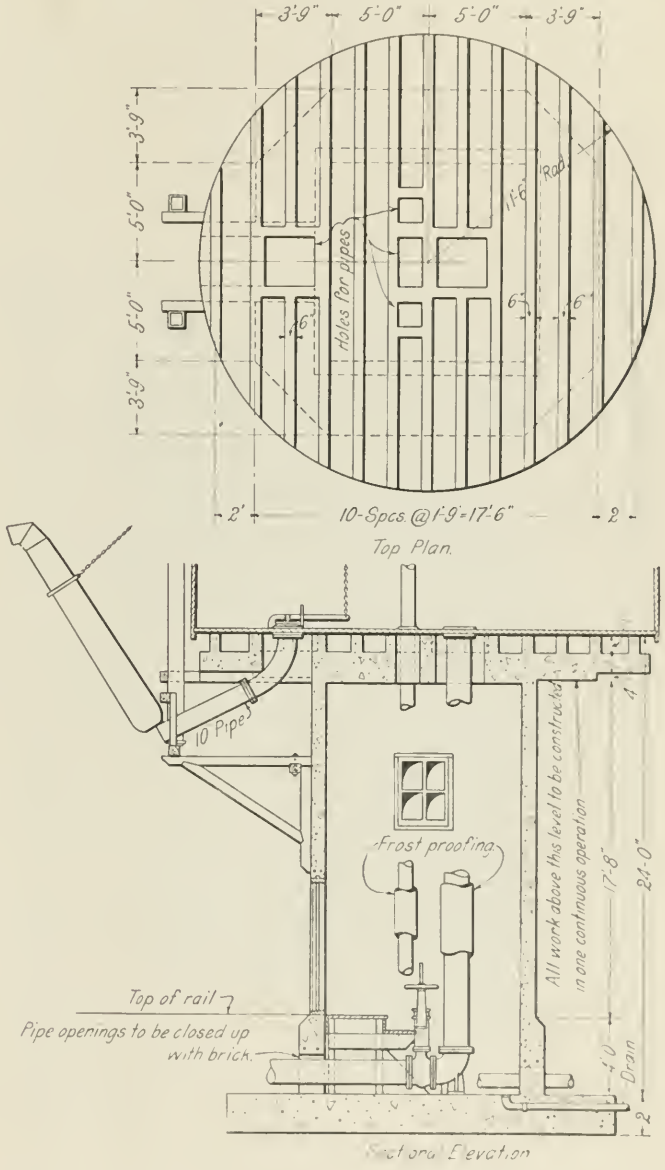
Details of the Reinforcement in the Top and Bottom Slabs and Walls

on the solid top surface of the slab. Square holes through the top slab afford the necessary opportunity for pipe connections, but no openings to the outside are permitted which would serve to let in cold air in the winter time. The thickness of the slab varies from 1 ft. 6 in. directly over the tower to 1 ft. around the edge.

The tower has walls 9 in. thick above the top of rail level but the part below, which normally extends about 4 ft. below the surface, is 1 ft. 3 in. thick. There is a door on the track side 3 ft. by 7 ft., with a window in each of the adjacent sides, 2 ft. 8½ in. by 3 ft. 9½ in. The footing support for the structure consists of a square slab of concrete 20 ft. on a side with a thickness of 2 ft.

The tower was designed for a weight of 429,000 lb. for the tank when filled with water and a weight of 325,000 lb. for the concrete substructure. The footing was designed for an average bearing pressure of 1,900 lb. per sq. ft. and a maximum pressure of 2,300 lb. per sq. ft. The top slab is reinforced with a grid of ⅞-in. sq. bars in both the top and bottom faces, the bars in the bottom extending only to the limits of the portion that is 1 ft. 4 in. thick. The walls are reinforced with No. 6 Rib metal while the footing has a grid of ⅞ in. sq. bars 10 in. spaced center to center in both directions in the bottom. In cases where a track spout is installed it is supported from a wooden bracket carried on the side of the tower.

This structure requires 81 cu. yd. of concrete, 7,735 lb. of reinforcing bars, 730 lb. of Rib metal, and 35 lb. of No. 16 wire. With the minimum depth of excavation as shown in the drawing about 80 cu. yd. of excavation is required. The type of tower shown in the drawings was selected after a study of several different designs including some with



Plan and Section of the Tower

columns and one having a circular wall, but the one chosen was found to be the cheapest and also the simplest to construct. Estimates based on 1918 figures showed the cost of this design to be about the same as for a steel tower. Water tanks with concrete towers of the kind described were built last year at De Kalb, Ill., West Elgin and Caledonia and at Carroll, Iowa, and Deep River, while structures of this kind will be built this year at De Kalb, Ill., Manitowoc, Wis., and South Omaha, Neb. This design was developed by O. F. Dalstrom, bridge engineer, under the general direction of L. J. Putnam, chief engineer of the Chicago & North Western, Chicago.

Train Accidents in June[1]

THE FOLLOWING is a list of the most notable train accidents that occurred on the railways of the United States in the month of June, 1919:

Collisions

Date	Road	Place	Kind of accident	Kind of train	Kil'd	Inj'd
19.	Atlantic C. L.	Santa Fe	rc.	F. & P.	0	24
*21.	C. C. C. & St. L.	Mackinaw	rc.	F. & F.	0	0
25.	Louisville & N.	Faxon	bc	F. & F.	3	1

Derailments

Date	Road	Place	Cause of derailment	Kind of train	Kil'd	Inj'd
1.	Chicago, B. & Q.	Ashland	.....	P.	0	27
4.	Central Vt.	S. Royalton	d. track	P.	0	16
5.	Chi. & N. W.	So. Omaha	acc. obst.	P.	0	2
9.	Pitts. & W. Va.	Hopedale, Pa.	d. track	P.	0	0
11.	Pitts. & W. Va.	Smithfield, O.	d. track	P.	0	2
*12.	Ches. & Ohio	Waugh	slide	F.	3	0
12.	Texas & Pacific	Ranger	.....	P.	..	43
12.	Atlantic C. L.	Scranton, S.C.	unx	P.	0	0

25.	Union Pacific	Schuyler	boiler	P.	0	2

Other Accidents

Date	Road	Place	Cause of accident	Kind of train	Kil'd	Inj'd
13.	Fort Worth & D. C.	Ft. Worth, Tex.	boiler	P.	2	0

The trains in collision at Santa Fe, Fla., on the 19th, were northbound passenger No. 38, and a following train, loaded with logs. The passenger train had been stopped because of a burning trestle bridge. Twenty-two passengers and two trainmen were slightly injured.

The trains in collision at Mackinaw, Ill., on the 21st, were westbound freights, through train No. 95 running into the rear of local No. 61, which was standing at the station. The caboose and four cars were wrecked and thrown against the station building, a new structure, finished last year. The wreck took fire and the station building and 16 cars were destroyed or badly damaged. Estimated total damage $17,000. The collision is reported as due to neglect of flagging on the part of the local train.

The trains in collision on the Louisville & Nashville at Faxon, Tenn., on the 25th, about 1 a. m., were northbound freight train No. 124, and southbound freight train No. 115, third section. Both enginemen, one fireman (of No. 124) and one brakeman were killed, and one brakeman was injured. The cause of the collision was, evidently, the forgetfulness of the engineman of No. 124, who had an order to wait at Faxon. He ran past the north switch before the conductor knew that the southbound train was not clear of the main track. The headlight of the northbound train, shining on a window of the telephone booth near the north end of the passing track, misled the conductor into thinking that he had seen the headlight of the southbound train (dimmed).

The engines of both of these trains had electric headlights of 250 c.p. each. The telephone booth is about 500 ft. south of the north switch and its window has four panes, each 8 inches by 10 inches. Train 124 had 18 cars, and the conductor of this train first saw the reflection of the light when he was about 2,200 feet short of the siding, his train being on a curve. When he drew near and discovered his error, he rushed for the conductor's valve. He found that the flagman had already opened it, but not in season to prevent the collision. The engineman of the southbound train had seen in the sky the rays of the light from the northbound train when a considerable distance short of the siding, and concluded that No. 124 was waiting at the station, mentioning his conclusion to a brakeman. Both engines were knocked off the track, and both boilers were dislodged from their frames.

[1]Abbreviations and marks used in Accident List:
rc, Rear collision——bc, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

The train derailed near Ashland, Neb., on the first of June, was a westbound special carrying troops. Four cars were overturned and fell into the Platte River, and were partly submerged. Twenty-seven soldiers were injured.

The train derailed near South Royalton, Vt., on the 4th of June, was a northbound through passenger, the New England States Limited. One car was partly overturned and fell down a bank, and 16 passengers were injured, none very seriously. The cause of the derailment was distortion of the track by solar heat.

The train derailed near South Omaha, Neb., on the night of the 5th of June, was eastbound passenger No. 8. The locomotive was thrown off the track at a switch by a piece of a brake hanger which had fallen from a westbound train. The engineman and fireman were injured.

The train derailed on the Pittsburgh & West Virginia near Hopedale, Pa., on the ninth, was westbound passenger No. 3. No persons were seriously injured. The derailment was due to a defect in the track.

The train derailed at Smithfield, Ohio, on the 11th, was eastbound passenger No. 2, running at about 35 miles an hour. One passenger and one trainman were slightly injured. The derailment was due to uneven track.

The train derailed near Waugh, Va., on the 12th, was an eastbound freight. The engine was thrown off the track by a landslide, and with ten cars fell into James River. A part of the wreck not submerged took fire and 10 cars were burnt up. The fireman and one brakeman were killed, and the engineman was fatally injured. The landslide followed a cloudburst. The fire was started by coals from the locomotive firebox.

The train derailed on the Texas & Pacific at Ranger, Tex., on the night of the 12th, was an eastbound passenger. Three cars, next behind the sleeping cars, were thrown off the track at a switch and ran against a freight car on a side track. Forty-three passengers were injured.

The train derailed near Scranton, S. C., on the 12th, was southbound passenger No. 83. The train was running at regular speed and two sleeping cars were damaged. No passengers or trainmen were injured. The cause of the derailment is reported as undetermined.

The trains involved in the accident at Carbon, Pa., on the evening of the 16th were an eastbound freight and westbound passenger No. 19. Several cars in the freight train were derailed by the breaking of a wheel and the wreck fouled the westbound track. Into this obstruction the passenger train ran at about 25 miles an hour—and the engine was overturned. The engineman and fireman were killed. No passengers were seriously injured.

The train derailed on the Great Northern near Fergus Falls, Minn., on the 22nd, was the westbound Oriental Limited. The train was struck by a tornado, and 7 of the 11 cars were thrown off the rails. One baggage car was ditched. Only one person, a passenger, was injured.

The train derailed on the Seaboard Air Line, at Alamo, Ga., on the 24th of June, was westbound passenger No. 11. The locomotive was overturned by striking a cow, and the engineman was fatally scalded.

The train derailed on the Union Pacific at Schuyler, Neb., on the 25th, was a westbound passenger, extra No. 279, carrying soldiers. While running at about 35 miles an hour the locomotive was wrecked by the explosion of its boiler and the engine and five cars were thrown off the track. Estimated damage $13,255. No soldiers were injured. The engineman and fireman were to all appearances uninjured, but the physician ordered them to lie off, the engineman two weeks and the fireman one week. The crown sheet had failed because of low water.

The train involved in the accident on the Fort Worth & Denver City, near Fort Worth, Tex., on the 13th, was a

northbound passenger. The locomotive was wrecked by the explosion of its boiler, and the engineman and fireman were scalded to death.

Electric Car Accidents.—The most serious electric railroad accident reported in the newspapers in June, was a rear collision on the Elevated Railroad in Brooklyn, N. Y., on the 23rd. Forty persons were injured.

Canada.—Eastbound passenger train No. 14, of the Grand Trunk, was derailed near Cardinal, Ont., on the third, while running at full speed; cause, defective track. Six passengers slightly injured. A similar derailment on the same road occurred near Lindsay, Ont., on the 17th, two coaches being overturned; twelve passengers injured. An express train of the Canadian Northern was derailed near Port Arthur on the 13th, a dining car being ditched; four persons injured.

Orders of the Regional Directors

AUTOMOBILE CARS—SAFETY CHAINS ON END DOORS.—Order 233 canceling Order 227 of the Southwestern regional director states that the Safety Section recommends that chains or some other suitable device be applied on automobile cars with end doors to prevent these doors opening further outward than the line of the side of the car, and suggests that all cars, regardless of ownership, be so equipped as rapidly as possible.

Repairs to New Freight Car Equipment.—The Southwestern regional director, in Order 232, states that when new freight car equipment built for the Railroad Administration is placed in shop or on track shop for repairs all bolts should be gone over and nuts tightened to insure taking up all shrinkage that has taken place since the cars were built.

Freight Claims for Loss and Damage.—Circular 246 of the Southwestern region director states that a regional committee on loss and damage freight claims has been organized to meet from time on the call of the chairman, and that this committee may call upon federal and terminal managers or their subordinates for representation at these meetings and for information. All concerned are requested to co-operate with this committee in order that aid may be given to the prevention of causes which bring about claims for freight loss and damage.

Through Bills of Lading Via North Atlantic Ports.—The Northwestern regional director, file 93-33-9, issues instructions governing the issuance of through bills of lading on traffic moving via North Atlantic ports, Newport News, Va., and north, including Canadian Atlantic ports, which supersede all previous instructions. The order outlines by whom and under what conditions through export bills of lading will be issued.

Grain Embargo—Primary Markets.—Supplement 8 canceling Supplement 3 to Circular 83 of the Northwestern regional director states that the permit system on grain for New Orleans, La., Galveston, Tex., Texas City and Port Arthur became effective August 18. Individual permits will be required on grain moving to these ports for either domestic or export. Applications for such permits are to be made by shippers in writing to representatives designated in Circular 83.

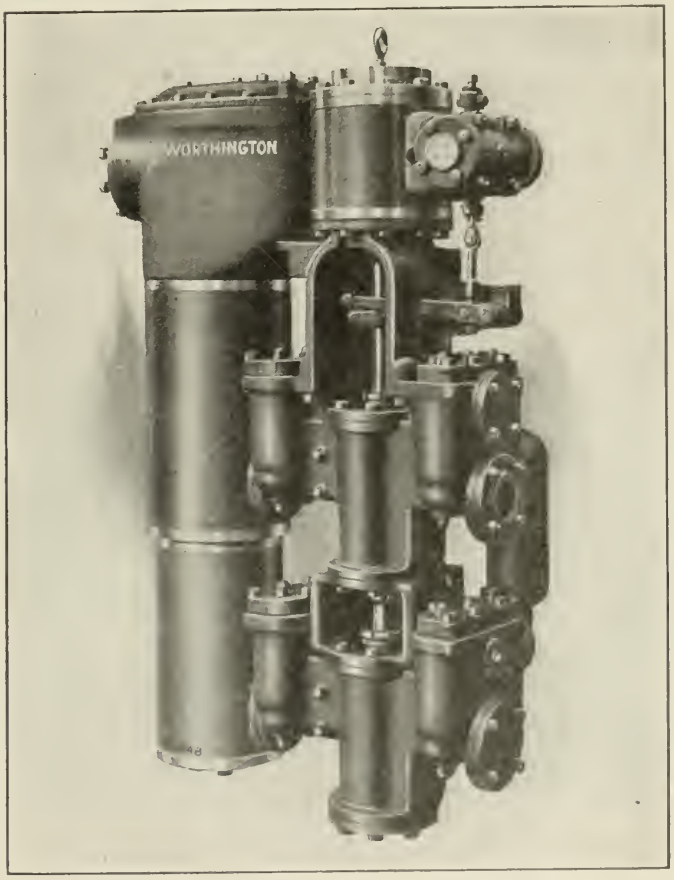
Routing Instructions Allegheny Region.—Supplement 1 to Circular 103A-Chicago, issued by J. E. Weller, resident traffic assistant at Chicago for the Allegheny region, cancels Circular 103A-Chicago (*Railway Age,* issue of June 20, page 1544).

Routing Instructions-Eastern Region.—G. H. Ingalls, senior traffic assistant at Chicago to the Regional Director of the Eastern region in File 1871-1-301 cancels Circular 78-C (*Railway Age,* July 18, page 108).

A New Departure in Locomotive Feedwater Heaters

THE WORTHINGTON PUMP & MACHINERY CORPORATION, New York, has developed and has in service on several Mikado locomotives a combined feed pump and feedwater heater, which follows closely its marine practice. This heater is of the open type, which is now generally used in stationary power plants and is capable of handling 60,000 lb. of feedwater per hour. The full pressure of the exhaust steam is maintained in the heater, so that feedwater temperatures above 212 deg. F. are obtained when there is sufficient exhaust steam pressure available. It is designed for convenient attachment to the side of the locomotive boiler in a similar manner to that used for air compressors.

The pump is of the vertical type with the steam cylinder at the top. It has two water cylinders, the upper or cold water cylinder taking cold water from the tender and delivering it to the heater, and the lower or hot water cylinder taking the heated water from the heater and delivering it to



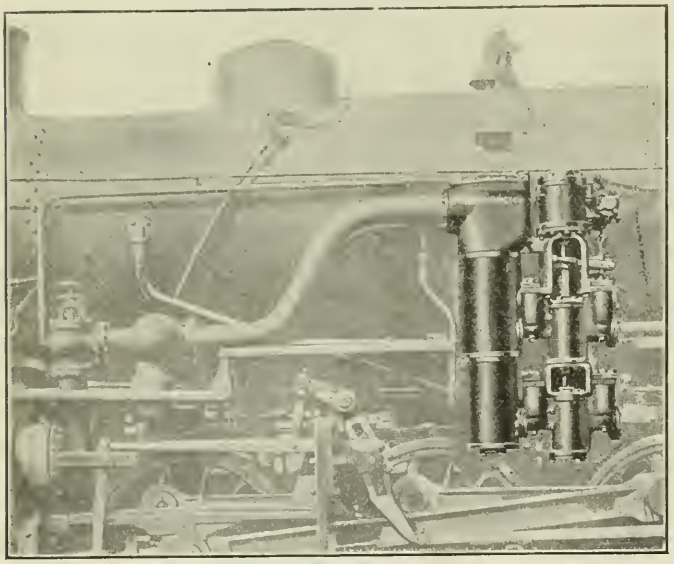
The Feed Pump and Heater Unit

the boiler. The cold pump cylinder has a 6½-in. bore and the hot pump cylinder a 6-11/16-in. bore. Each of the pistons has four packing rings composed of ⅜-in. square (rockhard) piston packing. The drawing shows the pump valve assembly for both pump cylinders. The pump valves consist of three sheets of thin bronze, assembled with the smaller sheet on top and the largest on the valve seat. The pump valve seats, bolts, guards and springs are assembled before being placed in the pump. The suction valve seats are assembled with the long valve bolt projecting through the bottom of the pump chamber when the valves are in position. These valve seats make their joint on the pump chamber casting on the flat and not on the taper. The suction valves are held to their seat by the cap nuts on the lower end of the valve bolt, which is drawn up tight against two thin copper

gaskets. The discharge valve seats are larger than the suction valve seats and also make their joint on the flat.

The heater is a cast iron box attached to the side of the pump by various pipe connections. The cold water that is taken from the tender by the upper water cylinder is delivered through a port in the side of the heater at the top, where it is sprayed into the upper part of the heater. Exhaust steam from the exhaust ports of the locomotive is led into this upper part of the heater through a six-inch opening on one side of the heater close to the top. The cold water sprayed into this space condenses as much of this exhaust steam as is required to heat the water, and, mixed with the condensate, drops to the bottom of the heater, where it is taken by the lower cylinder of the pump and delivered to the boiler. A ½-in. air vent is provided to prevent the accumulation in the heater of the air carried into it by the cold water and by the exhaust steam. A pipe from this air vent is led to a point where the air can conveniently be discharged between the tracks.

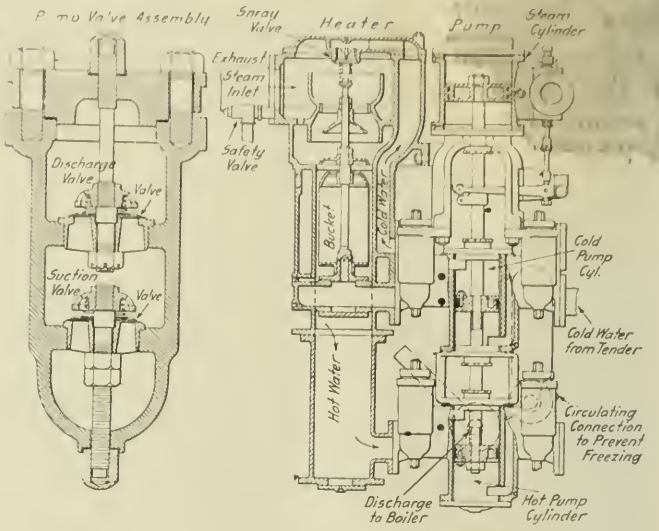
The varying amount of exhaust steam condensed in heating the water necessitates some means of regulating the water level in the heater, and this is accomplished by proportioning the pistons of the two pump cylinders so that there will be a tendency for a slight excess of water to accumulate in the heater. This excess of water will return to the upper pump cylinder where it mixes with the cold water from the tender passing through that cylinder, and is again delivered to the heater. The water level in the heater is regulated by a bucket which is free to move vertically on the central stem, and



Applied to a Mikado Locomotive

having holes in its top through which it is flooded when there is too much water in the heater, causing it to sink. In sinking it uncovers holes in the central stem on which it slides, permitting this excess of water to pass through a port to one of the suction valves of the cold water pump cylinder, from which it is returned to the heater with the water that is being taken from the tender. When the water level in the heater falls the bucket is partly emptied and rises, thus covering these holes and causing the cold pump cylinder to take all its water from the tender. The height of water in the boiler is regulated by the feed pump throttle, which consists of a 1¼-in. globe valve located in the cab. The valve connections between the heater and the locomotive are shown above.

Exhaust steam is taken from the locomotive cylinders through holes cut in the back of the cylinder saddle casting and led through an angle stop check valve, thence through an oil separator having a continuous drip for the oil and water, and from this through the curved pipe to the top of the heater. The pump is driven by steam supplied through a pipe, which has a throttle valve conveniently located in the cab so that the pump can be operated at such speeds as conditions may require. The exhaust steam from the pump is led into the stop check valve, passes through the oil separator and thence to the heater with the exhaust steam from the locomotive. The pipe which conducts the cold water from the tender is shown passing behind the air compressor and entering the side of the upper or cold water pump cylinder. The



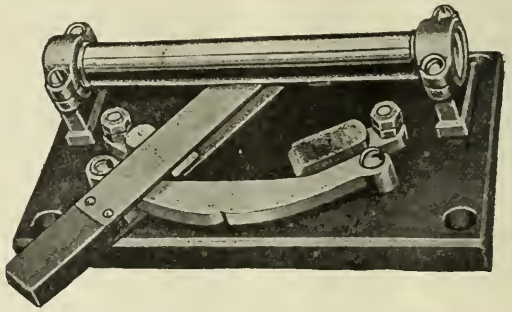
Section of Pump, Heater and Valve

heated feedwater leaves the lower or hot water pump cylinder by an opening in the rear and passes through a feed line to the boiler check valve.

So far as practicable the feed pump should be run continuously while the locomotive is in operation, with the throttle open, but as the heater cannot recover any heat when there is no exhaust steam coming to it from the locomotive cylinders the injectors should be used to fill the boiler when the locomotive throttle is not open.

Locomotive Headlight Switches

THE KEYSTONE locomotive headlight switches now being made by the Electric Service Supplies Company, Philadelphia, Pa., are especially designed for control of electric headlights on locomotives. They are made in different types to meet the varied conditions which exist in



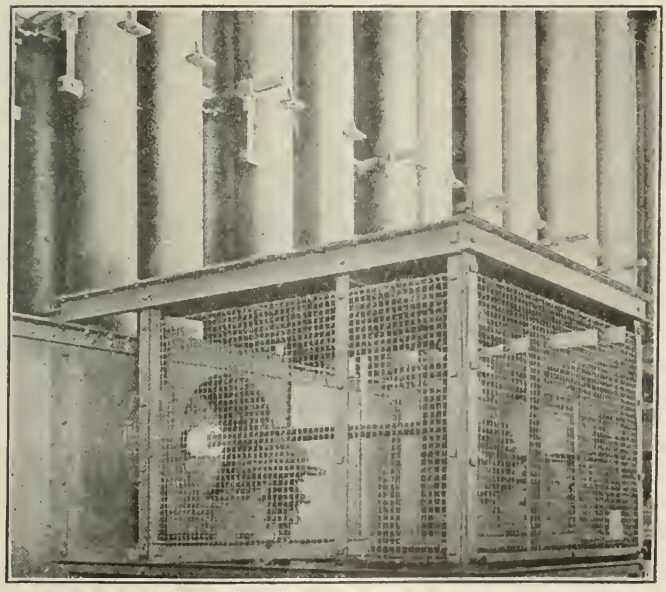
Headlight Switch for Road Engines

this service. The switch, as illustrated, however, is typical of the entire line, and probably is the most commonly used, since it provides "off" and "on" connections, and in addition has a ferrule type resistance mounted upon its base which is used for dimming the headlight lamp. The switch illustrated, therefore, has three positions from left to right, "on," "off" and "dim."

The switch blades operate in a plane parallel to the base and so close to it that the blade handle is not so liable to injury, in any position, as is the case with the ordinary knife switch. The base is of heavy composition insulation. The switch blades are of the duplex type, spaced apart at their upper end by a contact bridge and bolted to it. At the lower end of the blade this spacing is made by the handle. A curved guide, which acts as a support to the blades, prevents bending or distortion. The blades wipe over the upper and lower surfaces of the side contact blocks. The switch blade is held at its "off" point by a spring plunger, which engages momentarily into a notch in the guide. Resistance units used are of the ferrule type. The switches are of rugged design to meet the severe requirements of locomotive service. All parts are made on an interchangeable basis so that repair parts will fit when obtained from the factory. This applies not only to the parts for any particular form of switch, but all similar parts are interchangeable on any type of switch.

Precipitation of Solids from Smoke and Gases

In their circular no. 7375 the Westinghouse Electric & Manufacturing Company has described an electrical method for recovering valuable material from smoke and gases. The system involves the use of a considerable amount of electrical apparatus, but it is quite simple, has proved very successful and may find its application in roundhouses

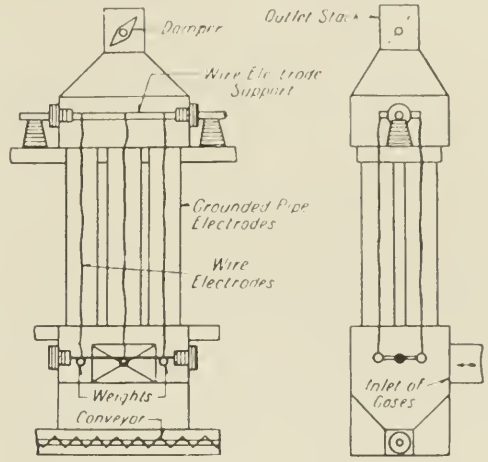


Treater at Plant of International Smelting Company, Miami, Arizona. View Shows Vertical Pipes and Hammers for Loosening Deposits

and railroad powerhouses in large cities. Up to the present time its application has been limited to smelters and cement plants and, in most cases, the by-products collected by the precipitation have paid for the necessary equipment in a very short time.

A treater for electrical precipitation is a comparatively simple structure. In general it consists of two large horizontal flues connected together by a number of small vertical pipes. Gases enter through one flue, pass through the vertical pipes and are discharged through the other flue to the stack, exhaust fan or other draft producer. The gas is then exhausted into the atmosphere. Some treaters are operated with an up draft, some with the down draft, according to the particular local conditions to be met. Some treaters employ rectangular passages instead of pipes to connect the two flues. These are generally referred to as plate or box type treaters. The principle of operation for all these types of treaters is the same.

The actual precipitation of a gas or fume occurs in the vertical pipes referred to above. Centered carefully in each, is suspended a small wire or chain. These constitute the negative electrodes of the treater system. The inside surface of the pipes constitutes a positive electrode. Each wire or chain is carefully insulated from its pipe and from the ground and is charged to a potential of from 25,000 to 65,000 volts direct current. The tubes themselves are grounded. Thus within each pipe is created an intense electrostatic field.



Schematic Diagram of Treater

The gases passing through this field become ionized and the ions travel with high velocity in a direction at right angles to the electrode causing the field. These highly charged ions collide with the suspended solid and liquid particles in the gas and the ions impart a charge of high potential to such particles, which in turn travel toward the electrode of opposite polarity. Since the negative suspended electrode is of much smaller area than the electrode formed by the inside surface of the pipe, there is much greater electrostatic stresses per unit of area in the neighborhood of the wire, and as a result a far greater ionization about the wires. Thus, the gas receives a static charge of the same polarity as the wire, and the solid or liquid particles in the gas receive charges of this same polarity, which causes them to be projected against the inner surface of the pipe, where they tend to stick and accumulate until the electric power is turned off, after which the accumulation of dust is usually collected from the pipe by rapping the sides of the pipe and collecting the dust in hoppers at the bottom.

The treater tubes are usually arranged in a series of units. Each unit or section is independent of the rest and is supplied with dampers and electrical disconnecting switches, so that it can be shut down for cleaning or repairs without interfering with the operation of the other sections.

To produce the high static charge on the suspended electrodes a uni-directional current of high voltage is used. Alternating current at low voltage is stepped up to the desired high voltage by means of a transformer and then changed to a uni-directional current by means of a mechanically driven rectifier. Accordingly, in addition to the necessary flues, tubes and high tension electrodes, the usual equipment for electrical precipitation involves the following: A source of low voltage alternating current, a step-up transformer, a high voltage rectifier, means for driving the rectifier, a switchboard and accessories.

General News Department

The offices of the Mississippi-Warrior river section of the Railroad Administration, St. Louis, Mo., have been moved from the Third National Bank building to the Federal Reserve Bank building.

Shopmen on the Baltimore & Ohio at Cumberland, Md., went on strike on Tuesday morning of this week. There are seven classes of mechanics represented among the strikers and they ask for an increase from 68 to 85 cents an hour. All mechanic helpers ask a raise from 45 to 60 cents an hour.

The Interstate Commerce Commission, Bureau of Valuation, has issued tentative valuations of the Greene County Railroad, the Carolina & Yadkin River, the Rome & Northern, the Central of Arkansas, the Alabama Northern, the Flint River & Northeastern, and the Kinston-Carolina Railroad & Lumber Company.

The Interstate Commerce Commission has extended the effective date of its latest order requiring the railroads to make their freight cars conform to its standards of safety appliance equipment from September 1, 1919, to March 1, 1920. This was done at the request of the Railroad Administration and the American Railroad Association.

The New York-Toronto air race was won by Lieut. B. W. Maynard, who made the round trip between New York and Toronto in 465¼ minutes, an average of more than two miles a minute for 1,042 miles. Lieut. Maynard, because he is in the U. S. Army, cannot accept the prize of $10,000 offered by the Hotel Commodore, New York, to the pilot making the fastest time.

The next annual meeting of the American Wood Preservers' Association has been postponed from January 27-29 inclusive, to February 10-12 inclusive. This change was made necessary because of the fact that the automobile show will be held in Chicago the last week in January and it has been found impossible to make suitable arrangements for hotel facilities during that week.

Four cars of an eastbound freight train buckled on a track adjoining that on which the eastbound Twentieth Century Limited of the New York Central was running, east of Painesville, Ohio, about 29 miles east of Cleveland, Ohio, on August 31. The Century ran into the wreckage and its engineer was killed. The locomotive and passenger cars of the Century remained on the track. A few passengers were injured by broken glass.

The Central Railway Club's annual outing at Grand Island, New York, on August 28, was voted one of the most enjoyable in the history of the organization by the 160 members who attended. A brief business session was held, during which announcement was made that the campaign for a membership of 1,000 has been progressing so well that only about 100 more are required to bring the membership list up to the desired number.

Traffic over the Altamaha river bridge has been completely blocked since Thursday morning, August 28, when a train on the Georgia Coast & Piedmont broke through the trestle about a quarter of a mile east of Darien, Ga. The train consisted of the engine, three box cars, baggage car and one coach. The box car next to the engine and the tender left the rails, falling off the trestle which is about 20 ft. high at this point. The rest of the train remained balanced on the edge of the trestle. No one was injured.

As an indication of the early completion of the field work of the federal valuation forces, all but five of the roadway and track parties in the Pacific District have already been disbanded and it is expected that the remaining parties will complete their work about November 1, when they will also be disbanded. Likewise in the Southern District, the field work has been substantially completed and the field parties either have been or will be disbanded in the near future. A large part of the field forces in the Western District are now also being disbanded.

The American Society for Testing Materials, in accordance with the policy inaugurated in 1917, will publish the tentative standards of that society in part I of the proceedings and will also publish these tentative standards in a separate volume for the convenience of those who may wish to use them in that form. The 1919 edition will contain the 62 specifications, tests, methods and definitions which have been accepted by the society as tentative of which 23 are new this year and 9 have been revised. This volume will comprise about 350 pages and is expected to be available for distribution in November, about a month earlier than the proceedings.

The Southern Pacific, through the offices of the Railroad Administration, has applied to the Railroad Commission of the State of California for authority to abandon passenger service between Long Beach, Cal., and San Pedro. According to the petition filed, competition by the Pacific Electric and auto transportation forced the abandonment of the regular service, the company compromising by attaching a coach to a switching train. This change was made in January, 1913, and as passenger service has proved a failure, the electric line and the auto transportion have been able to handle all the traffic because of their more frequent and rapid trips.

A delegation representing the railroad shopmen recently called upon Governor J. P. Goodrich of Indiana and urged the establishment of a state mediation committee to investigate strikes and threatened strikes before calling out state troops "unnecessarily." It was pointed out that great expense could have been saved the state had troops not been sent to Hammond, Ind., to end the recent disorders resulting from the strike of employees at the plant of the Standard Steel Car Company. This contention, however, was not concurred in by the governor who acted without hesitation when local authorities at Hammond admitted their inability to preserve order. Governor Goodrich has taken the matter under advisement and will hold further conferences with the shopmen's representatives.

The Canadian Railway War Board, in a recent circular, states that reports received by the Board indicate that the shipment of coal from mines in the United States is being reduced as a result of an insufficient car supply, and that any serious shortage in the output of coal will mean a corresponding reduction in the amount of fuel shipped on Canadian orders. The Board advocates eliminating all unnecessary delays in the handling of coal cars in order to assist in avoiding or reducing the anticipated coal shortage. The circular further states that "hopper" or self-clearing cars must, immediately upon release, be returned empty to the United States lines designated by existing orders of the Railroad Administration but that flat bottom cars may be used for return loading to United States points in accordance with current instructions when such loading will not involve undue delay.

The Brotherhood of Locomotive Firemen and Enginemen, the Brotherhood of Railroad Trainmen, the Order of Railroad Conductors and the Brotherhood of Locomotive Engineers recently attempted to act as mediators in the strike of street railway motormen and conductors at Muskogee, Okla., only to be compelled eventually to make a public statement that the strike was illegal and not deserving of the support of the railway brotherhoods. The car men went on strike

for higher wages on August 22. Car service was maintained, however, by the use of non-union men while efforts were made to end the strike by negotiation. After several delays the four railway brotherhoods decided to act as mediators and accordingly called a conference of the street car men, company officers and representative citizens of Muskogee, resulting in the statement on the part of the brotherhoods that the men had taken an unwarranted stand in refusing wage advances which officers of the street railway had offered.

The Missouri, Kansas & Texas of Texas, with the approval of the Railroad Administration, has closed a contract for five years with the Mexican Petroleum Corporation for its requirements of fuel oil for use on its locomotives in Texas. These requirements are estimated at two million to two and one-half million barrels of oil per year. The oil corporation agreed to advance the funds necessary to cover the capital expenditure in making the change from coal to oil, in an amount not exceeding $750,000. As the expenditures are made, the railway furnishes monthly statements to the oil corporation which advances funds to the amount covered by the statements. The receiver in turn issues his receipt for the funds so advanced, such receipts to bear 6 per cent from the date of issue until paid. Repayment is to be made at the rate of 35 cents per barrel of oil purchased. It is estimated that the saving effected by the change from coal to oil will be large while the saving in operating expenses during the period of federal control will amount to more than the sums expended in connection with the change and charged to operating expenses during that period.

General Foremen's Convention

The fifteenth convention of the International Railway General Foremen's Association met at the Hotel Sherman, Chicago, on September 2, with L. A. North, superintendent of shops of the Illinois Central, Burnside, Ill., presiding. At the opening session addresses were delivered by President North and R. H. Aishton, regional director of the Northwestern region. The meeting on Wednesday was devoted to the consideration of safety measures in shops and engine houses and opened with an address by R. C. Richards, claim agent of the Chicago & North Western. An abstract of the addresses and papers will be published in next week's issue.

National Safety Congress

The program for the Eighth Annual Safety Congress of the National Safety Council to be held at Cleveland, Ohio, October 1 to 4 inclusive, has been completed, as have arrangements for the meeting. The congress will open on Wednesday morning at 10 o'clock with the annual meeting of members at which David Van Schaack, president of the National Safety Council, will act as chairman general and sectional meetings will continue until Saturday afternoon, the last meeting being held at 2 o'clock, October 4. The general sessions to be held will deal with employees representation, Americanization, health and safety education. The safety work in various industries will be discussed in sectional meetings devoted to particular or co-related industries. In connection with the congress a safety exhibit will be held at which manufacturers of safety devices will be represented. This exhibit will be present under the joint auspices of the National Safety Council and the Safety Institute of America.

Car Shortage Continues

A close "follow up" system on freight cars to avert a serious car shortage was adopted by the nine roads entering Louisville, at a conference called by R. H. Morris, chairman of the traffic section of the Joint Operating Committee for the Railroad Administration in Louisville. At the same time the traffic department of the Louisville Board of Trade sent out a bulletin to all local shippers to enlist their aid in averting the threatened shortage.

The steel mills in the Mahoning Valley district of Ohio are threatened with a shutdown as the result of the shortage of cars. The gondola shortage is the worst since the present car shortage began.

The Savannah (Ga.) Sugar Refinery which produces more than a million pounds of sugar daily complains that its shipments are being seriously curtailed because of inability to secure empty cars.

Though the car shortage at Cincinnati terminals is still acute, John A. Morris, Cincinnati Terminal Manager of the Railroad Administration, says that it is due rather to an immense increase of railroad transportation than to an actual shortage of cars. Business in the Cincinnati district is reported to be unusually good.

Protest Against Esch-Pomerene Bill

S. H. Cowan, representing the National Live Stock Raisers' Association at Fort Worth, Tex., has protested against that section of the Esch-Pomerene bill relating to car service in a letter to Chairman Esch of the House Committee on Interstate and Foreign Commerce. Mr. Cowan said in part:

"In behalf of those I represent, in addition to what I have presented at the hearings on H. R. 4378, August 18 and 19, I appeal to the committee to strike from the bill Section 2 of this bill amending Section 1 of the Act to Regulate Commerce, under the definition of the term 'Car Service,' but really embracing the entire transportation service and operation of locomotives, cars, trains, terminals, use of the railroads and every right and duty of the railroad as to all service and the performance of it or use of its facilities for doing it.

"A careful reading of it shows that upon the mere whim of an agent of the Interstate Commerce Commission, without notice or hearing, he may stop any train service, transfer cars, locomotives, from one place or road to another, fix the pay for it, direct the use of terminals, give preference and priorities to operate trains or move cars, subject to change any time for any reason or contrary to sound reason, subject to no supervision, taking away all the rights of shippers and the liabilities of railroads."

Pacific Coast Strikers Return to Work

The striking switchmen, trainmen and yardmen employed on the lines of the Southern Pacific, the Los Angeles & Salt Lake, the Atchison, Topeka & Santa Fe and other railroads entering Los Angeles, Cal., and San Francisco returned to work on Saturday, August 30. The men, all members of the "Big Four" railway brotherhoods, have been on strike for more than a week in sympathy with a strike of trainmen of the Pacific Electric System and the Los Angeles street railways. The strike rapidly spread to other points in California, completely demoralizing traffic to southern and central California points and causing the cancellation of transcontinental lines at interior points and the virtual isolation of Los Angeles and nearby towns. The ending of the strike came as a result of the ultimatum issued by Director General Walker D. Hines that unless the strikers returned to work by seven o'clock Saturday morning, August 30, the government would undertake to restore full service on the roads affected in California, Arizona and Nevada. Added to this was the fact that the local striking organizations were not able to obtain the sanction of their international officers who declared the strike illegal and without sanction.

Director General Hines' ultimatum was addressed to public officers, railroad officers, employees and citizens generally in California, Arizona and Nevada and plainly stated that the government would not tolerate a continuance of the strike and that unless it was ended by action on the part of the men themselves, the government would take whatever steps were necessary to restore service.

"Our Country First Conference" Problems

John M. Glenn, secretary of the Illinois Manufacturers Association, under whose auspices a national "Our Country First Conference" will be held at Chicago on September 8 and 9, propounds a series of questions, under the general caption of "Are These Our Problems?", among which are the following:

"The constitution precisely enumerates and delegates limited powers to federal government. It distinctly states that the power of the federal government, as far as interstate commerce is concerned, is limited to regulation. How can congress pass a law such as proposed in the so-called Plumb plan, which compels the government to purchase the railroads and

lease sure to a small minority of people? To regulate transportation does not mean to engage in transportation.

"Would not such a nationalization of railroads, industries and farms result in adding a new pork barrel? Pork barrels are political expediencies and add unnecessary taxes upon the American people.

"Are you in favor of the nationalizing of the railroads? If so, do you favor the nationalizing of banking and insurance? Shall we extend governmental regulation, now under the Food and Drug Act, to include the licensing as proposed by the Kenyon and Kellogg bills? If so, are you willing to have your industry or your farm or organization nationalized?

"Is American industry a financial privilege or a technical achievement? Did not all of the American industries begin with little capital but with technical brains and resolute characters? Did not the present so-called captains of industries graduate from the ranks of labor because they were willing to work, to sacrifice and to face the chances of failure in order that they might give labor more work and serve labor more efficiently than under the German nationalized industrial system? Did we not defeat that arrogant and despotic system? This American system made this country the economical as well as the political hope of the world. Would the nationalization of the railroads, the basic industries, such as coal, iron, lumber and agriculture, and the licensing suggested by the pending Kenyon and Kellogg bills result in a levelling process? How would it affect our commercial future?"

The questions, which number 26 in all, cover all phases of the nation's reconstruction problems and are intended to awaken interest in the contemplation and solution of these problems which in turn is the object of the conference.

The Southern Pacific Oil Lands

The United States district court has handed down a decision finding valid the title of the Southern Pacific to its oil lands in the San Joaquin Valley.

The following statement was issued at the Southern Pacific offices in New York:

"The contention of the government, settled by the decision of Judge Bledsoe, was to cancel, for fraud, patents issued by the government to Southern Pacific Railroad Company, pursuant to act of Congress of July 27, 1866, granting land to aid in the construction of a railroad and telegraph line from the states of Missouri and Arkansas to the Pacific Coast, etc.

"Involved in the suits were 234 defendants, and some 111 other persons claimed interests in the lands in issue, which amounted to approximately 161,000 acres, situated in the oil territory on the west side of the San Joaquin Valley in California.

"The litigation was protracted. Hundreds of witnesses were examined, and nearly 15,000 pages of testimony were taken. According to the terms of the grant, and of the regulation of the Land Office of the Department of the Interior, it was required that the railroad company in making application for the issuance of patent to its granted lands should cause its land agent, duly authorized in such behalf, to make affidavit that he had caused the lands applied for "to be carefully examined by the agents and employees of the company as to their mineral or agricultural character, and that to the best of his knowledge and belief none of the lands in the list are mineral lands.

"The requisite affidavits were signed and sworn to by the company's land agent, and the contention of the government was that, nevertheless, the lands now are, and at all times were, mineral lands; that they were so known to be by the railroad company and by its land agent in particular long prior to making the affidavit required by the act, and that, therefore, in ignorance of the truth and in complete reliance upon the false representations sworn to by the land agent in his affidavit, the Secretary of the Interior was led to and did cause to be issued the patents," etc.

It is also alleged, it may be added, that the fraud thus perpetrated was not only "naturally self-concealing," but was, in fact, through the machinations of the railroad company and its agents, actually concealed from the government and all of its responsible officers until 1910.

In his opinion Judge Bledsoe said:

"Stripped to the core, the claim of the government is that the defendant company, knowing the lands were mineral and that therefore it was not entitled to them, nevertheless deliberately conceived and put into successful operation the fraudulent plan of acquiring such lands to its own use and benefit and in complete disregard of the government's rights. The case as developed by the government on the hearing and through the contentions of its counsel is to the effect that the 'Big Four Owners' of the Central and Southern Pacific Companies, the original initial owners of that great unified enterprise, 'Stanford, Crocker, Huntington and Hopkins,' together with several lesser lights, occupying positions of responsibility and prominence, were all parties to a deliberate, long enduring and wide-embracing scheme to acquire from the government wrongfully vast areas lying on the west side of the San Joaquin Valley, involving some of the richest oil lands that the world has ever known; that this scheme was conceived at some time in the 70s, or possibly early 80s, and continued to flourish uninterruptedly, but all the time concealed, either naturally or through the artifices of the instigators until its accidental discovery by the government through the filing of the Burke suit in 1910."

Exhibitors at Tool Foremen's Convention

The following is a list of the exhibitors at the convention of the American Railway Tool Room Foremen's Association held at the Hotel Sherman, Chicago, September 27-29:

American Steel Treaters' Society, Chicago, Ill. Represented by W. H. Eisaman.

American Twist Drill Company, Detroit, Mich. High speed twist drills. Represented by C. W. Cross.

Armstrong Brothers Tool Company, Chicago. Tools, wrenches, etc. Represented by H. Armstrong.

Athol Machine Company, Athol, Mass. Represented by J. D. Powell.

Besly & Co., Charles H., Chicago. Drills, taps and small tools. Represented by C. Knell.

Borden Company, Warren, Ohio. Beaver die stocks and pipe cutters. Represented by C. A. Green and W. A. Phillis.

Boss Nut Company, Chicago. Lock nuts. Represented by W. G. Willcoxson.

Brown & Sharpe Manufacturing Company, Providence, R. I. Tools, instruments and milling cutters. Represented by P. A. Topee, H. J. Johnson and T. E. Sprigings.

Carborundum Company, Niagara Falls, N. Y. Carborundum devices. Represented by H. P. Frost, J. W. Frazer, W. E. Knott and E. P. Ritzma.

Chicago Pneumatic Tool Company, Chicago. Pneumatic tools and appliances. Represented by L. C. Sprague, H. Barbee, A. C. Andresen and C. W. Cross.

Clark Equipment Company, Buchanan, Mich. Twist drills, reamers, chucks, counter sinks, tool kit holders, tool bits, flue cutters and sockets. Represented by F. H. Woodward.

Cleveland Steel Tool Company, Cleveland, Ohio. Punches, dies, rivet sets and chisels. Represented by V. D. Gilmore, G. H. Kuebusch and H. W. Leighton.

Cleveland Twist Drill Company, Cleveland, Ohio. Twist drills, reamers and screw extractor. Represented by H. O. White and C. J. Kirchofer.

Collis Company, The, Clinton, Iowa. Drill sleeves and sockets. Quick change chucks and special tools. Represented by C. M. Weaks.

Cortland Grinding Wheel Corp., Cortland, N. Y. Grinding wheels. Represented by F. A. Frisch.

Crucible Steel Company of America, Pittsburgh, Pa. Alloy tool steels, high speed steels and springs. Represented by W. M. Stevenson, F. Baskerfield, R. D. Fletcher and F. A. Lawler.

Detroit Twist Drill Company, Detroit, Mich. Drills and reamers. Represented by M. F. Crawmer.

Duff Manufacturing Company, Pittsburgh, Pa. Jacks. Represented by C. N. Thulin.

Faessler Manufacturing Company, J., Moberly, Mo. Boiler maker tools, expanders, flue cutters, etc. Represented by G. T. Manpin.

Grip Nut Company, Chicago, Ill. Grip nuts. Represented by B. G. Forsyth.

Geometric Tool Company, New Haven, Conn. Automatic threading tools.

Hisey-Wolf Machine Company, Cincinnati, Ohio. Electric grinders and drills. Represented by R. W. Wells.

Hoggson & Pettis Manufacturing Company, New Haven, Conn. Lathe chucks.

Hyland Company, R. H., Chicago. Jacks. Represented by G. R. Law.

Illinois Tool Works, Chicago. High speed, cutters, hobs and reamers. Represented by P. E. Tobin.

Independent Pneumatic Tool Company, Chicago. Pneumatic and electric tools, hose couplings, etc. Represented by F. J. Passino, V. W. Robinson, R. S. Cooper, J. D. Hurley, W. A. Nugent, J. G. Cowell and E. F. Bertrand.

Industrial Press. Represented by L. A. Racener.

Ingersoll Rand Company, Chicago. Pneumatic tools. Represented by L. W. Schnitzer, Walter Johnson and R. S. McCreadie.

Keller Pneumatic Tool Company, Chicago. Pneumatic tools. Represented by George McCabe and J. Osgood.

Liberty Tool Company, Chicago. Rivet furnace and heating torch, portable drilling presses. Holding on dolly bar and heading. Represented by E. O. Grinnes, E. T. Astin, A. B. Moore and M. C. Perrill.

Lovejoy Tool Works, Chicago. Jacks.

Ludlum Steel Company, Watervliet, N. Y. Seminole steel. Represented by J. Cran and S. T. Pearsons.

Manning, Maxwell & Moore, New York. Machine tools. Represented by R. R. Cuthbertson and R. S. Dean.

Manufacturers' Equipment Company, Chicago. Grinding wheels.

Marshall & Huschart Machine Company, Cincinnati, Ohio. Machine tools.

Oxweld Railway Service Company, Chicago. Welding torches. Represented by William Leighton, F. C. Hasse and W. A. Hogan.

Racine Tool & Machine Company, Racine, Wis. Power driven saws. Represented by F. J. Kidd and D. B. Maxwell.

Rivet Cutting Gun Company, Cincinnati, Ohio. Rivet cutting gun and Cincinnati rivet head catcher. Represented by J. M. Crowe and H. G. Doran.

Savage Company, W. J., Knoxville, Tenn. Sheet metal cutters.

Scully-Jones & Co., Chicago. Expanding reamers, tap chucks, milling machine appliances toolroom vises and adjustable spacing collars. Represented by W. G. Salkeld and R. Beanlieu.

Starrett Company, L. S., Athol, Mass. Precision instruments, saw blades, tools, vises and combination squares. Represented by J. D Powell.

Street & Co., R. R., Chicago. Tools, chucks, pulleys and hangers, roller bearings and wrenches. Represented by C. J. Butterfuss.

Western Tool Manufacturing Company, Springfield, Ohio. Expanding mandrels, tool holders, shop furniture, vises, emery wheel dressers and safety lathe dogs. Represented by J. Z. Wells.

Westhaven Manufacturing Company, New Haven, Conn. Power hack saw blades, frames, etc. Represented by R. H. Harris.

Whitman & Barnes, Akron, Ohio. Twist drills, reamers, monkey wrenches, drop forgings and wrenches. Represented by J. C. Scanlon, J. A. Dilger and M. J. Keatins.

Williams & Co., J. H., Brooklyn, N. Y. Wrenches. Represented by V. E. Nagle.

Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

Air Brake Association.—F. M. Nellis, 165 Broadway, New York City. Next convention, May 5-7, 1920, Chicago.

American Association of Demurrage Officers.—F. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

American Association of Dining Car Superintendents.—S. W. Derr, C. R. R. of N. J., Philadelphia, Pa.

American Association of Freight Agents.—R. O. Wells, Illinois Central, Chicago. Next annual meeting, June, 1920.

American Association of General Baggage Agents.—E. R. Reynolds, C. G. W. R. R., Chicago. Next meeting, November 11-13, 1919, New Orleans, La.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, October 28-29, Chicago.

American Association of Railroad Superintendents.—J. Rothschild, Union Station, St. Louis, Mo.

American Electric Railway Association.—E. B. Burritt, 8 W. 40th St., New York. Next convention, October 6-10, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—C. F. J. Dell, 50 E. 42nd St., New York.

American Railroad Master Tinners', Coppersmiths' and Pipe Fitters' Association.—Otto E. Schlinck, 185 W. 5th St., Peru, Ind.

American Railroad Association.—J. E. Fairbanks, 75 Church St., New York:

Section I, Operating (including former activities of Association of Railway Telegraph Superintendents).

Section II, Engineering.—E. H. Fritch, 431 South Dearborn St., Chicago.

Signal Division.—H. S. Balliet, 75 Church St., New York. Next annual meeting, September 17-19, Congress Hall and Annex, Chicago.

Section III, Mechanical (including former activities of Master Car Builders' and Master Mechanics' Association).—V. R. Hawthorne, 431 South Dearborn St., Chicago.

Section IV, Traffic (including former activities of Freight Claim Association).

Section V, Transportation (including former activities of Association of Transportation and Car Accounting Officers).

Section VI, Purchases and Stores (including former activities of Railway Storekeepers' Association). J. P. Murphy, N. Y. C. R. R., Collinwood, Ohio.

Section VII, Freight Claims (including former activities of the Freight Claim Association).

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W. Ry., 319 N. Waller Ave., Austin Station, Chicago. Next convention, October 21-23, 1919, Cleveland, O.

American Railway Engineering Association.—(Works in co-operation with the American Railroad Association, Section II.) E. H. Fritch, 431 South Dearborn St., Chicago. Next convention, March 16-18, 1920, Chicago.

American Railway Master Mechanics' Association.—(See American Railroad Association, Section III, Mechanical.)

American Railway Perishable Freight Association.—E. F. McPike, 135 E. 11th Place, Chicago. Regular meetings, 2d Wednesday in March and September.

American Railway Tool Foremen's Association.—R. D. Fletcher, 1145 East Marquette Road, Chicago.

American Society for Testing Materials.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Charles W. Hunt, Engineering Societies Building, 33 W. 39th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 33 W. 39th St., New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Train Despatchers' Association.—D. L. Darling, Northern Pacific Ry., Spokane, Wash.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next annual meeting, February 10-12, 1920, Hotel Sherman, Chicago.

Association of Railway Claim Agents.—Willis H. Failing, C. R. R. of N. J., Jersey City, N. J. Next meeting, May, 1920, Atlantic City, N. J.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Next meeting, October, 1919, Chicago.

Association of Railway Telegraph Superintendents.—(See American Railway Association, Section I, Operating.)

Association of Transportation and Car Accounting Officers.—(See American Railroad Association, Section V, Transportation.)

Bridge and Building Supply Men's Association.—M. J. Trees, Chicago Bridge & Iron Works, Chicago. Next annual convention, October 21-23, 1919, Cleveland, O.

Canadian Railway Club.—W. A. Booth, 131 Charron St., Montreal, Que.

Car Foremen's Association of Chicago.—Aaron Kline, 626 North Fine Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

Car Foremen's Association of St. Louis.—Thomas B. Koeneke, Federal Reserve Bank Bldg., St. Louis, Mo.

Central Railway Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November, and 2d Friday in January, March, May and Sepetmber, Hotel Statler, Buffalo, N. Y.

Chief Interchange Car Inspectors' and Car Foremen's Association.—H. J. Smith, D. L. & W. R. R., Scranton, Pa. Next annual convention, September 23-25, 1919, St. Louis, Mo.

Chief Interchange Car Inspectors' and Car Foremen's Supply Men's Association.—D. B. Wright, Lehon Company, 45th and Oakley Sts., Chicago. Next annual convention, September 23-25, 1919, St. Louis, Mo.

Eastern Railroad Association.—D. G. Stuart, Washington, D. C.

Freight Claim Association (See American Railroad Association, Section IV, Traffic).

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3rd Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, B. & O., Lima, Ohio.

International Railway Fuel Association.—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeing, May, 1920, Hotel Sherman, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 1061 W. Wabash Ave., Winona, Minn.

Maintenance of Way Master Painters' Association.—F. W. Hager, 1323 Hurley Ave., Ft. Worth, Tex. Next annual convention, October 21-23, 1919, American Annex Hotel, St. Louis, Mo.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 9-11, 1919, Hotel La Salle, Chicago.

Master Car Builders' Association.—(See American Railroad Association, Section III, Mechanical.)

National Association of Railway and Utilities Commissioners.—James B. Walker, 49 Lafayette St., New York. Next annual convention, October 14, 1919, Indianapolis, Ind.

National Foreign Trade Council.—O. K. Davis, 1 Hanover Square, New York. Next convention, May 12-15, 1920, San Francisco.

National Railway Appliances Association.—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—George A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Regular meetings, 3d Tuesday in each month, Tenjost Hall, Buffalo, N. Y.

Pacific Railway Club.—W. S. Wollner, 64 Pine St., San Francisco, Cal. Regular meeting 2d Thursday in month, alternately in San Francisco and Oakland.

Railway Accounting Officers' Association.—E. R. Woodson, 1116 Woodward Bldg., Washington, D. C.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Next annual meeting, December, 1919, New York, N. Y.

Railway Club of Pittsburgh.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month except June, July and August, Americus Club House, Pittsburgh, Pa.

Railway Development Association.—D. C. Welty, Missouri Pacific R. R., Little Rock, Ark.

Railway Electric Supply Manufacturers' Association.—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

Railway Equipment Manufacturers' Association.—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Next annual meeting, September, 1919, Hotel Sherman, Chicago.

Railway Fire Protection Association.—G. L. Ball, St. Louis-San Francisco Ry., St. Louis, Mo. Next annual meeting, October 21-23, 1919, La Salle Hotel, Chicago.

Railway Real Estate Association.—R. H. Morrison, C. & O., Richmond, Va.

Railway Signal Association.—(See American Railroad Association, Section II, Signal Division.)

Railway Storekeepers' Association.—(See American Railroad Association, Section VI, Purchases and Stores.)

Railway Supply Manufacturers' Association.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.

Roadmasters' and Maintenance of Way Association.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 16-18, 1919, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

Signal Appliance Association.—F. W. Edmunds, West Nyack, Rockland County, New York.

Society of Railway Financial Officers.—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa. Next annual meeting, October 16-17, New York City.

Southern and Southwestern Railway Club.—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

Southern Association of Car Service Officers.—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.

Supply Association of American Railway Tool Foremen's Association.—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Next annual convention, September 16-18, 1919, Auditorium Hotel, Chicago.

Train Despatchers' Association of America.—J. P. Finan, A. T. & S. F. Ry., Needles, Cal.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. R. R., Cleveland, O. Next annual meeting, September 16-19, 1919, Hotel Sherman, Chicago.

Western Association of Short Line Railroads.—Clarence M. Oddie, Mills Bldg., San Francisco.

Western Railway Club.—A. F. Stuebing, 750 Transportation Bldg., Chicago. Regular meetings, 3d Monday in month, except June

Western Society of Engineers.—Edgar S. Nethercut, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except July and August

Traffic News

A special rate of one cent per mile in each direction is announced by the Railroad Administration for the twenty-ninth annual reunion of the Confederate Veterans, Sons of Confederate Veterans and United Daughters of the Confederacy to be held at Atlanta, Ga., September 7 to 10.

Among the associations which have placed themselves on record as opposing the Plumb plan for the purchase of the railroads by the federal government and their management by a board consisting of representatives of the government, the managing officers and the employees, is the Transportation Committee of the Detroit (Mich.) Board of Commerce.

According to the Association Opposed to National Prohibitions, railroad officers throughout the country have predicted higher freight rates as an indirect result of losses due to the elimination of traffic connected with the manufacture and sale of alcoholic beverages. Statistics compiled by investigators for the association maintain that the railroads will lose approximately $250,000,000 annually in earnings due to prohibition. The results of this investigation support the association's contention that the tonnage offered the railroads in lieu of the alcoholic beverage traffic will never equal or take the place of the latter traffic.

J. H. Glenn, agent for carriers originating cotton traffic in southeastern and Mississippi Valley territory, placed four tariffs on the files of the Interstate Commerce Commission on August 25, which supersede 205 inter-territorial cotton tariffs. The new tariffs are to be effective upon 30 days' notice and are a result of the commission's decision on "Fourth Section Violations in the Southeast," which made a revision of the rates on cotton from the points of origin to all destinations necessary. The large number of tariffs were accordingly simplified to four, one showing the tariffs to the ports, one to eastern destinations, one to Ohio and Mississippi river crossings and one to northern and western points. The abolition of individual line tariffs, it is believed, will reduce the chances of error in the re-issues of tariffs and the probability of error in the assessment of charges.

Director General Hines has issued instructions for the preparation of tariff which will provide for class and commodity rates upon export traffic from points in Ohio, Indiana, Illinois, including cities located on both banks of the Mississippi river from Dubuque, Iowa, to St. Louis, inclusive, also from points in the southern peninsula of Michigan, to South Atlantic and Gulf ports from Wilmington, to New Orleans, inclusive. When the tariffs have been prepared, the matter will receive final consideration in Washington. The export rates to be established will be substantially the same as the rates which apply to New York on domestic freight from the same points of origin. The export rates to Key West will be the usual differential above the South Atlantic ports. Special consideration is to be given to export traffic when destined to Mexico and Central America, because of the generally low ocean rates from Gulf ports to those countries. This action is taken after a very thorough study and careful consideration of the movement of export traffic and has for its object a more reasonable equalization of the rates on export traffic to all Atlantic and Gulf ports.

Coal Production

Production of bituminous coal increased in the week of August 23 to 10,671,000 tons, from 9,089,000 tons the previous week. The recovery to a new high level for the year is attributed to a quickening of demand and the abatement of labor trouble, mainly on the railroads. For the week of August 16 the average for the country of mine operating time lost on account of transportation disability is reported as 25.7 per cent, as compared with 22.5 per cent in the week preceding.

Commission and Court News

Interstate Commerce Commission

The Interstate Commerce Commission has assigned for hearing at Atlantic City on August 25 before Commissioner McChord the application of the Railroad Administration and the American Railroad Association for an extension of time within which to comply with the commission's order of February 1 regarding the application of safety appliances.

Personnel of Commission

T. G. Hughes, assistant auditor of the Railroad Commission of the State of California, has been appointed acting auditor of the commission, succeeding **John W. White,** deceased.

Court News

United States District Judge William C. Van Fleet recently announced a decision in the district court at Sacramento, Cal., in the suit of George H. Nash for damages resulting from injuries, that the United States government is solely responsible in suit at law growing out of injuries or negligence on the railroads of the country in the period the roads have been under federal control. In the suit the Southern Pacific was made defendant, however, application was made by Director General Hines, joined in by the Southern Pacific. Judge Van Fleet, in granting the application for the substitution of the Director General as defendant, said that the taking over of the railroads by the government under the authority of the act of Congress, December 31, 1917, an assumption of ownership by the government for the time being.

The Future of the Inland Waterways

M. J. Sanders, federal manager of the Mississippi-Warrior River Section of the Railroad Administration in speaking recently before a meeting of shippers and members of the Transportation Committee of the St. Louis Chamber of Commerce predicted that Director General Walker D. Hines would approve the request of the River section of the Railroad Administration for $3,000,000 to build river terminals on the lower Mississippi river. Mr. Sander's prediction was made in discussing the future of inland water routes, rates and service, especially on the Mississippi.

In reply to criticism which has been directed against the conduct of the barge line service on the Mississippi river, Mr. Sanders said that delays were the fault of inadequate equipment, but, that even with new equipment which is now being made available, delays could not be entirely overcome because of the lack of proper terminals, the lack of which it is said has necessitated cargoes remaining from 10 to 12 days aboard barges before they could be transshipped. Mr. Sanders is quoted as saying in this respect, "A large section of the country can be most advantageously served by the barge line in connection with the railroads diverging from Memphis, Tenn., other sections through Vicksburg and a limited portion through New Orleans, La. We are doing our utmost to obtain the authority for the construction of these terminals, it now being evident that the localities are not especially interested in river and rail transfer terminals although they should be and we must therefore construct adequate terminals for their local business."

That the project was losing money was no surprise to those familiar with the undertaking, Mr. Sanders said, but in measuring the benefit to shippers inland it must be taken into consideration that they are able to participate in the joint rail and water rates which permit a differential of 20 per cent from the all-rail rates from St. Louis south. The question of granting additional rates depended upon the construction of the terminals at Memphis and Vicksburg and other river points, Mr. Sanders said, but that if these rates were granted now there would not be adequate facilities to take care of the increased shipping at Memphis.

Foreign Railway News

Italian Transport and Shipbuilding

LONDON.

The Italian government's program regarding the transport question, says an item in the Financier, London, includes the electrification of 6,000 kilometers of line. In addition 300,000,000 lire are to be spent on improving railway communication in the Trentino. As regards shipping 1,500,000,000 lire is to be devoted to the development of shipbuilding in Italian yards.

Italian Railway Deficit

LONDON.

The expenditure of the Italian railways for 1918-19, says the Financier, London, has exceeded the earnings by about $10,000,000. The outlook for the current year is still more gloomy, and it is stated that a deficit of 540,000,000 lire, more than tenfold the above amount, is to be expected. Further considerable amounts will have to be raised for the electrification of the main lines.

Railway Communications in Serbia

LONDON.

Reuter despatch dated August 4, from the Serbian Press Bureau, states: "Direct railway communication between Belgrade and the interior, which had been broken off since the departure of the enemy, was resumed yesterday. The first train to Nish left Belgrade at 7 a. m. and the first train from Nish arrived here at night. The direct route between Belgrade, Nish, Salonica and Athens is now open."

Railway Developments in New South Wales

LONDON.

A Reuter despatch, dated August 13, to the Financier, states that the premier of New South Wales, Mr. Holman, delivering a speech on the policy of the government at Lismore, announced the completion of the railways, the building of which was suspended during the war, and the construction of new lines, the construction of a light railway in the forestry regions for irrigation and forestry development, and legislation against monopolization on the lines of the American Sherman anti-trust law. The savings banks will make increased advances for Crown settlers and builders of homes.

High Prices in England

LONDON.

An example of high prices in England is given in a letter published in the London Times, which states that railway fastenings were before the war £9 7s 6d per ton, more or less equal at home and abroad. In England in 1915 the price rose to £13 17s 6d per ton, and in 1919 to £42 10s per ton. English manufacturers were warned that this price was far above the price asked in foreign countries. An order has just been placed in Belgium at under £30 per ton as against £44 to £46 quoted by English manufacturers. It is pointed out that no tariff in England would prevent buying in Belgium and shipping to South America, and no tariff, unless it were a veritable crusher, would enable home manufacturers to put up British home prices sufficiently to repay them for losses on export; or, in other words, to make "dumping" possible.

Extension of the Congo Railway

The authorities of the Belgian Congo, says the Times (London) Trade Supplement, are considering the extension of the Katanga Railway, which now ends at Bukama, to a new terminus at a place called Kibouerno, on the upper waters of the Congo. This would overcome the difficulties of navigation on the upper channels between Kabalo and Bukama, which often necessitates early discharge of cargo owing to the lowness of water. No increase in the price of goods landed at Elizabethville would result, as the cost by rail would be equivalent to the present charge by boat, while more regular and quicker transit would result.

A further line is proposed from Kongolo southward to Kabalo, which would effect a junction with the existing lines from the Upper Congo at the latter place eastward to Lake Tanganyika.

Openings for railway and motor materials exist in the Congo owing to a keen movement in favor of improving means of transit either by motor cars, motor omnibuses, or by railroad.

German Railway Deficit

LONDON.

Representatives of the German railway managements are discussing the question of how the large financial losses of the railways can be made up, says an item in the Times, London, of August 14. To make up the full estimated loss, all railways would have to increase their present tariffs 100 per cent, but this increase will not be contemplated at present in order to avoid putting too great a burden on trade and traffic, but it is certain that both freight and passenger rates must be raised.

The increased price of coal and other articles and the high wages and salaries are the principal reasons for the present losses. Further restrictions in traffic will be introduced from August 20 onwards, within the district of the Berlin railway administration, owing to the situation with regard to coal supplies. These restrictions will go even beyond those already fixed for the whole of Germany from August 15, onwards.

English Railwaymen's Wages

LONDON.

In keeping with their American cousins the English railwaymen are bringing pressure to bear on the government for still greater increases in wages. The men refused the offer of the Railway Executive Committee for a standard wage varying from 7s. 6d. per day during the first year of service to 12s. per day for the twelfth year and after, for engineers; 5s. 6d. per day for the first year and 6s. 6d. per day for the fifth year and after, for firemen; and 28s. per week for cleaners 18 to 19 years of age; 35s. per week for 20 and 21 years of age, and 41s. per week for 22 years of age and over. In addition to this the engineers and firemen already receive 33s. per week as a bonus on account of the high cost of living which will remain in effect during the year and after that is to be changed according to the cost of living. The matter is now being handled by the English Board of Trade and on August 14, the National Union of Railwaymen wrote that body to the effect that if prompt action were not taken by the Board "we fear we shall be unable to restrain the men any longer."

Water Power in Spain and Electrification

Spain's water power in the various parts of the country available for immediate use for electricity has been computed as follows by España Economica y Financiera:

	Kw.
Atlantic slope of Leon and Galicia	70,000
Asturias	40,000
Santander	30,000
Ebro above Saragossa	65,000
Rivers of the Pyrenean slopes	490,000
Ebro from Saragossa to the sea	130,000
Douro within Spain	90,000
Douro on the Portuguese frontier (falls)	150,000
Tributaries of the Douro	50,000
Tagus	110,000
Tributaries of the Tagus	50,000
Guadiana	35,000
Guadalquivir and other Andalusian rivers	40,000
Jucar and Cabril	90,000
Other Mediterranean rivers	60,000
Rivers of minor importance	500,000
	2,000,000

Certain American financiers, in co-operation with important units of the Constructora Naval, are said to be proposing to found a company which will utilize all the electric power in the country for the purpose of electrifying the whole railway system of Spain. The capital of the proposed company will be Pes. 200,000,000.

The Eight-Hour Day in South Africa

[Special Correspondence]

JOHANNESBURG, July 8.

An important statement on the introduction of an eight-hour day on the railways was made in the House of Assembly by the Minister of Railways and Harbors, who said, in introducing further supplementary estimates for working expenditure amounting to £250,000 for the current financial year, that this additional amount arises entirely from the decision to extend the eight-hour day, or the 48-hour week, in the railway and harbors service. Large sections of the railway staff have for many years past worked an eight-hour day, while the hours of the office staff have been less, and it is an important fact that at the present time approximately 50 per cent of railway and harbor servants work the eight-hour day or a shorter day.

Widening the Field of Employment

Some months ago the question of an all-round eight-hour day for the South African railways was again raised by the staff. When the matter was brought to the Minister's notice he expressed himself as being sympathetic to the principle and promised to do his best to get it carried into effect as far and as soon as practicable. At an interview between the National Council of the National Union of Railways and Harbor Services and the Minister at the end of February last, the union representatives made it quite clear that the desire of the union was that every effort should be made to reduce actual working hours as far as practicable to an average of eight hours per week day. That is what the management has been asked to aim at. The Minister felt that where what might be regarded, in normal times and under modern conditions, to be long hours, are being worked by the staff, the case would not be met by a nominal, as distinct from an actual reduction in hours; it would not meet the desire for a shorter day, and it would restrict opportunities for the employment of suitable returned soldiers. Therefore in the extension of the eight-hour day, or the 48-hour week, the sound course has been taken not only to reduce actual working hours but to widen the field for employment as far as is reasonably practicable. The supplementary estimates are prepared on that basis and it is expected that approximately 1,600 men are provided for in addition to those for whom provision has already been made on the main estimate passed by the House for the current year.

The probable ultimate cost cannot yet be estimated but the preliminary estimates show that the additional working expenditure may amount ultimately to £800,000 per annum, while to secure the extension so far as is reasonably practicable of an all-round actual eight-hour day very heavy capital expenditure, probably running into millions, will have to be incurred at a later stage.

In conclusion, the Minister stated that it had been clear to him for some time past that South Africa could not expect and it was not fair to expect her to proceed any longer upon a basis of the employment of railway and harbor servants different from that which prevailed practically throughout the civilized world. Heavy as he knew the responsibility was, and fully as he recognized the position the country would be placed in by having that additional burden placed upon it, he had come to the deliberate conclusion that there was no other way of dealing fairly, honestly and properly with the situation that presented itself to them than by making that endeavor to introduce the eight-hour day.

Return of Sir William Hoy

Sir William Hoy, general manager of these railways, who has been in England for the past eight months, is now on the water on his return to South Africa with the Prime Minister of the Union.

Imperial Government's Gift of £500,000

It may be of interest to mention the gift by the Imperial Government to the Union of railway material to the extent of £500,000. The Minister of Railways in announcing the gift in Parliament said that it was another mark of the cordial relations between Great Britain and the Dominion of South Africa.

Equipment and Supplies

Locomotive Deliveries Week Ended August 16

New locomotives were shipped during the week ended August 16 as follows:

Works	Road	Number	Type
American	Nt&StL	1	USRA Mount.
	Virginian	1	USRA Mallet
	ACL	3	USRA Pacific
		5	
Baldwin	T&P	2	USRA Mik
	PLW	3	Santa Fe
	PLW	7	USRA S. F.
	AT&SF	7	Santa Fe
	C&O	2	USRA Mallet
	P&R	1	Mallet
	SAL	1	USRA S. F.
	SP	1	Santa Fe
		20	

Freight Cars

The Justice Cox, Jr., Company, Philadelphia, Pa., is inquiring for 30 50-ton box cars.

The Midland Packing Company has ordered fifteen 8,050-gal. tank cars from the Pennsylvania Tank Car Company.

The Georgia Rosin Products Company has ordered five 8,050-gal. tank cars from the Pennsylvania Tank Car Company.

The Champlain Refining Company has ordered 100 8,050-gal tank cars from the Pennsylvania Tank Car Company.

The Georgia Rosin Products Company has ordered five 8,050-gal. tank cars from the Pennsylvania Tank Car Company.

The International Vegetable Oil Company has ordered eight 8,050-gal. tank cars from the Pennsylvania Tank Car Company.

The Shell Company of California has ordered three 10,050-gal. class IV insulated tank cars from the Pennsylvania Tank Car Company.

Willits & Patterson, San Francisco, Cal., have ordered 25 standard 8,000-gal. tank cars equipped with steam coils for handling vegetable oils imported from the Orient, from the Standard Tank Car Company, Sharon, Pa.

The Ozarka Company, Eureka Springs, Ark., has ordered from the Pennsylvania Tank Car Company two 10,050-gal. insulated tank cars for the transportation of high grade spring water for drinking purposes.

Passenger Cars

The International Railway of Central America, New York, have ordered 1 first-class passenger car, 2 second-class passenger cars and 1 baggage car from the American Car & Foundry Company.

Signaling

The Lehigh Valley has ordered two 8-lever Saxby & Farmer interlocking machines for use at Conway, Pa., and Fairview. Both machines are being furnished by the Union Switch & Signal Company, Swissvale, Pa., and will be installed by railroad forces.

The Staten Island Rapid Transit is installing a mechanical interlocking plant at the crossing of its line with the Richmond Light & Railway Company's line at Richmond Terrace, N. Y. A 12-lever Saxby & Farmer mechanical interlocking machine and electrical equipment comprising T-2 alternating current signals, electric lockings, etc., is being furnished by the Union Switch & Signal Company, Swissvale, Pa.

Supply Trade News

E. F. Kidd, assistant traffic manager of the **Republic Iron & Steel Company,** Youngstown, Ohio, has been promoted to traffic manag, succeeding H. R. Moore, deceased.

The Schroder Headlight & Generator Company, Evansville, Ind., manufacturers of the "Sunbeam" electric headlight system, has pened an office at 1051 McCormick building, Chicago, in arge of **Harlow A. Varney,** as district sales manager.

A. M. Crai consulting engineer with offices in Detroit, Mich., speciaing in the construction of railway terminals, grain elevato power plants and industrial buildings, has been appoint vice-president of the **Witherspoon-Englar Company,** Chgo.

D. B. Fultc assistant to the chief engineer of the American Brake Sh & Foundry Company, New York, has entered the sales depment of the Railway Steel Spring Company, Chicago, whehe will be associated with **N. C. Naylor,** sales agent, in thicago office.

The Chica Pneumatic Tool Company, Chicago, has removed its Cinnati (Ohio) office from the Mercantile Library building the Walsh building, Pearl and Vine streets, where a servstation with a complete stock of pneumatic tools, electricols, air compressors, oil engines, rock drills and repair pawill be maintained.

The Williaort Wire Rope Company, Williamsport, Pa., announces thstablishment of a branch office and warehouse at Chic under the direction of **C. M. Ballard,** formerly connecvith the Williamsport organization at Cleveland, Ohio. Chicago office is located at 122 South Michigan avenue, ahe warehouse at 755 West Quincy street.

Major H. Cyless, formerly mechanical engineer on the Minneapolis, Paul & Sault Ste. Marie and the Great Northern bute recently chief inspector of ordnance for the War Depent at the Standard Steel Car Company's plant at Haml, Ind., has been appointed combustion engineer and ner of the **Superior Pulverizer Company,** Chicago, in wcapacity he will have entire charge of engineering and and general supervision of **coal installations.**

The Duff Mcturing Company, Pittsburgh, Pa., is building an additioft. by 160 ft., to its works at Pittsburgh. The new buils to be of brick and steel construction and is design accommodate the forge shop and heat treatment depnt. Provision has also been made for installing 16 stemmers with an equal number of trimming presses. The reating department will be equipped with furnaces of tlst type, burning either oil or gas. It is expected that provements will be completed about October 1.

The Electr Oxy-Hydrogen Laboratories, Inc., announce the fo of a sales and manufacturing company under the nathe **Electrolabs Company.** The Electrolytic Oxy-Hy Laboratories, Inc., will continue in charge of the tories and maintain a technical supervision over th of the new company. The general offices and worloth companies have been moved from Dayton, Ohio arger quarters at 2635 Penn Avenue, Pittsburgh, Pa eneral sales offices are being continued at 15 William New York City, and branch sales offices have been opthe Morris Building, Philadelphia, and in the Mercha hange Building, San Francisco. **I. H. Levin** continu harge of technical and research work, and **D. J. Ton** in general charge of sales.

A. W. Thon resident of the **Inland Steel Company,** Chicago, has and P. D. Block, vice-president, has been elected accessor. L. E. Block, vice-president and treasurer, has been elected chairman of the board of directors which is a new office and **G. H. Jones,** vice-president, has been elected first vice-president. **E. M. Adams,** secretary; **E. J. Block,** assistant to the vice-president, general purchasing agent and assistant secretary and assistant treasurer; and **H. C. Jones,** asistant to the vice-president, have been elected vice-presidents. **D. P. Thompson,** assistant to the vice-president, has been made assistant to the president and **J. W. Lees,** superintendent of the Indiana Harbor plant, has been appointed works manager. **W. D. Truesdale,** general auditor, has been elected treasurer and **J. A. Morris** has been made general auditor.

M. A. Long has resigned as assistant to the chief engineer and architect of the Baltimore & Ohio Railroad and will engage in general engineering and construction work at 1523 Munsey building, Baltimore, Md., under the name of the **M. A. Long Company.** The first piece of construction work on which Mr. Long will be engaged will be the design and construction of the McCormick building, Light and Barrie Streets, Baltimore. This is to be an eight-story reinforced concrete structure, having a floor space of 55,000 sq. ft., and will cost $1,500,000. Mr. Long has been connected with the Baltimore & Ohio Railroad for the past 20 years, during which time he has handled a number of important pieces of building construction, among others being the design and construction of the large terminal warehouses of the railroad at Cincinnati, O., Baltimore, Md., Pittsburgh, Pa., and New York; piers at Locust Park, station buildings at Grafton, W. Va., Wheeling, W. Va., and Pittsburgh, Pa., coal handling plants at Deshler, Ohio, Elsmere Junction, Del., Yoder, Pa., and other points; thawing sheds at Baltimore, Md., and New York, N. Y., icing and cold storage plants and rest houses, Y. M. C. A. buildings; shops and engine houses at Grafton, W. Va., Parkersburg, W. Va., Cincinnati, Ohio., and Chicago. He also superintended the construction of the Baltimore & Ohio general office building at Baltimore and Charles streets, Baltimore, Md.

M. A. Long

Trade Publications

VENTILATORS.—A six-page folder has been issued by the Garland Ventilator Company, Chicago, briefly describing and illustrating by means of drawings some of the best known and most widely used types of Garland railway car ventilators.

DATA ON SHAFTS.—Three charts giving the relations for any shaft between power, shaft diameter, torsional stress and speed have been prepared by one of the engineers of the Wellman-Seaver-Morgan Company, Cleveland, Ohio, which has published them in bulletin No. 22 for the use of engineers and draftsmen.

CARE OF ELECTRIC HOISTS.—Facts for Operators of Electric Hoists is the title of a four-page pamphlet published by the Electric Hoist Manufacturers' Association, New York, for the guidance of electric hoist operators. It deals with such matters as connections, lubrication, and the care of the motor, controllers and ropes.

ELECTRIC ARC WELDING.—The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued circular No. 7149, covering the process of electric arc welding and the necessary apparatus required. A comparison is made of the different processes of welding and the advantages of electric arc welding are pointed out.

ANNUAL REPORT

The Chesapeake and Ohio Railway Company—Forty-First Annual Report

RICHMOND, VA., July 21, 1919.

TO THE STOCKHOLDERS:

The Forty-first Annual Report of the Board of Directors, for the fiscal year ended December 31, 1918, is herewith submitted.

The average mileage operated during the year by the United States Railroad Administration operating the Chesapeake and Ohio Lines was 2,479.7 miles, an increase over the previous year of 67.6 miles. The mileage at the end of the year was 2,484.8 miles, an increase of 6.5 miles over mileage on December 31, 1917.

RESULTS FOR THE YEAR.

*Standard return	$13,226,983.23
(Decrease $2,268,815.35, or 14.64%)	
†Expenses of Maintaining Corporate Organization	135,809.58
	$13,091,173.65
Net Operating Income	
(Decrease $2,404,624.93, or 15.52%)	358,184.43
Federal Income Taxes Accrued, were	
(Decrease $437,071.14, or 54.96%)	$12,732,989.22
Net Income, Taxes deducted, was	
(Decrease $1,957,553.79, or 13.38%)	1,118,414.46
Miscellaneous Income was	$13,851,403.68
(Decrease $51,646.01, or 4.41%)	283,390.64
‡Rentals and Other Payments were	
(Increase $68,960.21, or 32.16%)	$13,568,013.04
Income for the year available for interest was	
(Decrease $2,088,160.01, or 13.34%)	8,730,506.49
Interest (64.35% of amount available) amounted to	
(Increase $140,711.89, or 1.64%)	
Net Income for the year, equivalent to 7.70% on capital stock outstanding, amounted to	$4,837,506.55
(Decrease $2,228,871.90, or 31.54%)	
Dividends paid during year: Two dividends of 2% each, aggregating	2,511,264.00
Remainder, devoted to improvement of physical and other assets	$2,326,242.55

*By ruling of the Director General of Railroads, these expenses were required to be paid by the Company, although the corresponding expenses of the three years ended June 30th, 1917, were deducted as operating expenses in computing the Standard Return.

‡Rentals and Other Payments include $96,562.12, representing the difference between the amount of $745,446.08 credited account of Revenues prior to January 1, 1918, and the amount of $842,008.20 charged account of Expenses prior to January 1, 1918.

†The road having been operated in 1918 by the United States Railroad Administration, the Standard Return has been used for that year in lieu of operating and other items corresponding therewith.

RETURN ON PROPERTY.

The following table shows the amount of return to your Company, including subsidiary companies, from transportation operations only, upon its investment in road and equipment at the termination of each year of the five year period ended December 31, 1918:

	Property Investment.	Total Operating Income.	Percentage of Return.
*Year ended December 31, 1918..	$269,914,419.76	$12,871,539.79	4.77%
Year ended December 31, 1917...	263,307,068.67	14,871,459.45	5.64%
Year ended December 31, 1916...	250,247,098.33	15,359,715.04	6.14%
Year ended December 31, 1915...	244,068,206.05	12,465,058.24	5.11%
Year ended December 31, 1914...	243,144,711.90	9,314,430.78	3.83%
Yearly average for five years ended December 31, 1918..	$254,154,300.94	$12,976,440.66	5.11%

*The term "Standard Return" as used in this report means "average annual railway operating income for the three years ended June thirtieth, nineteen hundred and seventeen," as defined by the Federal Control Act, less proportion not accrued to June 30th, 1917, of one-half of war taxes for that year, and the amount of adjustment of wages under the Adamson Law, not accrued prior to June 30, 1917, and paid subsequent to that date, as tentatively certified to by the Interstate Commerce Commission. The Company's claim for additional compensation, if allowed, will increase this amount.

FINANCIAL.

Your Company undertook no new financing during the present year, but it is probable that a considerable amount of money must be provided during the coming year to meet the cost of additions and betterments to your property during Federal Control, including the cost of equipment ordered by your Company early in the year, and the cost of the equipment allocated to it by the Director General of Railroads.

The changes in funded debt in the hands of the public during the year were as follows:

	Assumed	Retired
5 per cent. Kanawha Bridge and Terminal Co. First Mortgage Bonds	$476,000.00	.....
4 per cent. Big Sandy Ry. First Mortgage Bonds	.....	$9,000.00
4 per cent Greenbrier Ry. First Mortgage Bonds	.....	20,000.00
4 per cent. Raleigh & Southwestern Ry. First Mortgage Bonds	.....	5,000.00
Equipment Trust Obligations	.....	1,114,000.00
	$476,000.00	$1,148,000.00
Net Decrease		$672,000.00

Other changes in obligations shown under funded debt on balance sheet of December 31, 1918, were as follows:

	Payments
5 per cent. Equipment Contract—Standard Steel Car Co.	$693,394.64
5 per cent. Equipment Contract—Central Locomotive and Car Works	26,074.04
6 per cent. Equipment Contract—American Locomotive Co.	80,827.09
	$800,295.77
Decrease	

Your Company acquired during the year 5,286 additional shares of the capital stock of The Chesapeake and Ohio Northern Railway Company, payment for which was made with cash derived from sale of stock of The Kanawha and Michigan Railway Company.

There were also acquired, 250 additional shares of the capital stock of the White Sulphur Springs, Inc.

During the past year your Company acquired at par an additional $500,000.00 par amount of coupon notes of the Western Pocahontas Fuel Company, a corporation owning the Dorothy and Sarita coal properties in West Virginia to which corporation, reference was made in the report for 1917.

A statement of charges to property accounts will be found on page 20, showing a net addition of $6,719,305.94; that is, $5,183,676.35 added to cost of road and $1,535,629.59 added to cost of equipment.

There were purchased by your Company Liberty Loan bonds of the Fourth Issue to the amount of $1,000,000.00 for account of which your Company borrowed the sum of $1,000,000.00 included in Bills Payable Account.

During the past ten years your Company's increase capital liabilities in hands of the public, its principal acquisitions of stocks and bonds of other companies, and its expenditures for equipment, new line construction, second track and other additions and betterments, have been as follows:

Capital Obligations Issued or Assumed:	Par Value.	
General Mortgage 4½% Bonds	$4,306,000.00

GENERAL REMARKS.

During the year the following Companies were, pursuant to due authority from the stockholders, merged with The Chesapeake and Ohio Railway Company.

Pond Fork Railway Company extending from Madison, W. Va., to Mouth of West Fork, W. Va., 11.60 miles, but not yet put into operation. Gauley and Meadow River Railroad Company extending from Rich Creek Junction, W. Va., to end of line, a distance of 3.13 miles. Kanawha Bridge and Terminal Company, owning a bridge across the Kanawha River at Charleston, W. Va. Logan and Southern Railway Company extending from Monitor Junction, W. Va., to Barnabas, W. Va., a distance of 9.79 miles. Piney River and Paint Creek Railroad Company extending from Beckley, W. Va., to Prosperity, W. Va., a distance of 6.59 miles. These properties, with the exception of the Kanawha Bridge and Terminal Company, have been heretofore operated as a part of The Chesapeake and Ohio Lines.

Extensions during the year have been as follows: From Man, W. Va., to Mallory No. 2 Coal Mines, 2.7 miles; Construction of Huff Creek Branch 2.7 miles.

The following second track mileage has been completed and put into operation during the year: Second track between Bremo, Va., and Strathmore, Va., 5.0 miles; Salt Rock, W. Va., and West Hamlin, W. Va., 3.1 miles; Locks Mill, W. Va., and Peach Creek, W. Va., 3.4 miles; and additional mileage between Balcony Falls, Va., and Greenlee, Va., .2 miles; Barboursville, W. Va., and Clover Valley, W. Va., 1.4 miles; making an increase in second track out into operation during the year of 11.1 miles.

The equipment inventory as of December 31, 1918, was as follows:

Locomotives owned	665 Inc.	20
Locomotives leased	208 Dec.	20
Locomotives (title to which not yet taken)	18 Inc.	18
Total	891 Inc.	18
Passenger train cars owned	333 Dec.	1
Passenger train cars leased	62	..
Total	395 Dec.	1
Freight Train and miscellaneous cars owned	32,573 Inc.	146
Freight train cars leased	17,000 Dec.	6
Total	49,573 Inc.	140

Included in above statement are fifteen Mallet type and three Mountain type locomotives received during the year. The fifteen Mallet type locomotives were part of an order of twenty-five (fifteen Mallet and ten Switchers) placed by your Company which the Director General of Railroads has agreed to finance. Pending the conclusion of negotiations for financing, your Company has not taken title to same.

The three Mountain type locomotives were part of twenty-five (twenty Mallet and five Mountain type) allocated to the Company by the Director General of Railroads. Pending the conclusion of negotiations with the Director General, for the financing of these locomotives, your Company has not taken title to same.

The changes during the year in the accrued depreciation of equipment account were as follows:

Balance to credit of account December 31, 1917			$7,423,273.09
Amount credited during year ended December 31, 1918, by charges to:			
U. S. Government	$1,468,684.11		
Charged to account, for:			
Accrued depreciation on equipment retired during year—			
1 electric motor car, 1 ferry boat, and 369 freight train and work cars		$51,662.39	1,417,021.72
Balance to credit of account December 31, 1918			$8,840,294.81

OPERATION BY UNITED STATES RAILROAD ADMINISTRATION.

In the Annual Report for the year 1917, you were advised that the President of the United States, by Proclamation dated December 26, 1917, took possession and assumed control of the railroad systems of the country, appointing a Director General of Railroads, through whom the operation of such transportation systems was to be conducted. Under this Proclamation and under the Act of Congress of March 21, 1918 (generally known as the Federal Control Act), the railroad of your Company has, since December 28, 1917, been operated by the United States Government through William G. McAdoo, Director General of Railroads and Walker D. Hines, his successor. The Operating and Traffic Statistics contained in this report relate to the operation of your property by the Director General of Railroads.

	1918	1917		
Operating Revenues were	$73,720,796.68	$54,643,793.52	Inc.	$19,077,003.16
*Net Operating Revenues were	19,503,449.82	16,537,987.63	Inc.	2,965,462.19
Operating Ratio	73.5%	69.7%	Inc.	3.8%
Tons of Revenue Freight carried one mile	10,729,366,446	10,262,440,801	Inc.	466,925,645
Revenue train loads, tons	1,099	1,043	Inc.	56
Revenue tons per loaded car	38.2	35.6	Inc.	2.6

*After deducting expense of maintaining Corporate Organization amounting to $135,809.58.

Notwithstanding the high cost of labor, materials and supplies, and other difficulties incident to war-time conditions, the operations of your property for the year were highly satisfactory, both gross and net earnings being the largest in its history. Reference to the Federal Income Account on page 16 will show that the Government made a profit of nearly $4,000,000 above the standard return for the year. This amount would have been very substantially increased had hire of equipment been computed throughout the year at the rates prevailing prior to Federal Control. In view of the conditions prevailing, the operating ratio of 73.5 per cent., an increase of only 3.8 per cent. over that of the preceding year, was very gratifying.

The revenue coal and coke tonnage was 27,826,207, an increase of 6.1 per cent; other freight tonnage was 12,410,528, an increase of 6.5 per cent. Total revenue tonnage was 40,236,735 tons, an increase of 6.2 per cent. Freight revenue was $55,720,372.55, an increase of 29.6 per cent. Freight train mileage was 9,763,075 miles, a decrease of .8 per cent. Revenue ton miles were 10,729,366,446, an increase of 4.5 per cent. Ton mile revenue was 5.19 mills, an increase of 23.9 per cent. Revenue per freight train mile was $5.707, an increase of 30.6 per cent. Revenue tonnage per train mile was 1,099 tons, an increase of 5.4 per cent; including Company's freight, the tonnage per train mile was 1,156 tons, an increase of 4.0 per cent. Tonnage per locomotive, including Company's freight, was 977 tons, a decrease of .2 per cent. Revenue tonnage per loaded car was 38.2 tons, an increase of 7.3 per cent. Tons of revenue freight carried one mile, per mile of road were 4,326,881, an increase of 1.7 per cent.

There were 8,524,755 passengers carried, an increase of 12.8 per cent. The number carried one mile was 486,093,218, an increase of 34.5 per cent. Passenger Revenue was $13,629,892.18, an increase of 72.5 per cent. Revenue per passenger per mile was 2.804 cents, an increase of 28.3 per cent. Number of passengers carried one mile per mile of road was 196.029, an increase of 30.9 per cent. Passenger train mileage was 4,890,651, a decrease of 9.1 per cent. Passenger revenue per train mile was $2.787, an increase of 89.9 per cent. Including mail and express it was $3.067, an increase of 79.7 per cent. Passenger service train revenue per train mile was $3.110, an increase of 78.1 per cent.

There were 10,645.0 tons of new rail (1,107 tons 130 lbs., 1.8 tons 125 lb., 6,130.1 tons 100 lb., 3,406.1 tons 90 lb.) equal to 68 miles of track used in renewal of existing track.

There were 1,148,061 cross ties used in maintaining existing tracks, a decrease of 519,635.

There were 686,223 yards of ballast (297,725 yards stone) used in maintaining existing tracks, an increase of 31,917 yards.

The average amount expended for repairs per locomotive was $6,082.14; per passenger train car $1,634.03 per freight train car $150.14.

Effective February 1st, 1919, the Chesapeake and Ohio Railroad of Indiana was transferred from the Eastern Region to the Pocahontas Region, so that on and after that date the "Chesapeake and Ohio Lines" were under one regional jurisdiction.

THE FEDERAL CONTROL ACT.

The Federal Control Act authorized the President of the United States to enter into agreements with the Companies owning railroads taken over for their maintenance and upkeep during the period of Federal Control, and for the determination of the rights and obligations of the companies and the Government arising out of Federal Control, including the compensation to be received or guaranteed. The Act authorized the payment, under such agreements, of an annual compensation equivalent, generally speaking, to the average net railway operating income for the three-year period ended June 30, 1917, as ascertained and certified by the Interstate Commerce Commission. The President was also given power, in any case where the average of the three-year period appeared plainly inequitable as a measure of just compensation, to enter into an agreement for such compensation as in his judgment would be just in the particular case.

COMPENSATION CONTRACT.

The Standard Return of your Company and of its railroad subsidiaries, for the three-year period ended June 30, 1917, as tentatively certified to by the Interstate Commerce Commission, was $13,226,983.23. The directors of your Company, being of opinion that the sum named is plainly inequitable as a fair measure of just compensation, have authorized application to be made to the Director General of Railroads for a contract providing for compensation in addition to the Standard Return for the test period as follows.

1. Interest at 6% per annum on the cost of road extensions and equipment, less retirements, constructed or purchased during the six months ended December 31, 1917, the expenditures for which were not reflected in the Standard Return because not in operation during any portion of the test period.

(a) Road Extensions	$19,692.89
(b) Equipment	225,639.68

2. Interest at 6% per annum on the value of materials and supplies on hand, December 31, 1917, in excess of the quantities on hand during the test period. $8,270.28

3. Interest at 6% per annum on the cost of road extension and equipment, less retirements, constructed or purchased during the year ended June 30, 1917, the expenditures for which were not fully reflected in the Standard Return because of not being in operation during a substantial portion of the test period:

(a) Road Extensions 23,200.27
(b) Equipment 383,556.05

4. Interest at 6% per annum upon the cost of construction of, and of additions and betterments to, the line of The Chesapeake and Ohio Northern Railway Company, to January 1, 1918, the expenditures for which were not reflected in the Standard Return because the line was not in operation during any portion of the test period..... 310,049.40

Total Additional Compensation Claimed..... $1,047,408.57

Such contract will be submitted to the stockholders of the Company at a Special Meeting to be called for the purpose, when the amount of compensation which will be allowed your Company by the Director General has been finally determined.

Corporate Organization.

During the early part of the period of Federal Control, the Director General permitted the railways to be operated under his supervision by officials of the corporation for account of the Federal Government. Later separate books of accounts were opened for Federal transactions and separate officials were appointed. The Staff of the Director General for the operation of the railroad of your Company was selected from former officials of your Company and, as the officers so selected were, by order of the Director General, required to sever all connection with the corporation, the creation of a distinct corporate organization to carry on the affairs and protect the interests of your Company during Federal Control became necessary. The expense of maintaining this organization has been, by order of the Director General, excluded as an operating expense chargeable to Federal Railroad operating income, which, in effect, amounted to a deduction of the cost of maintaining the corporate organization from the Standard Return provided by the Federal Control Act.

Allocated Equipment.

During the year the United States Railroad Administration notified your Company that there had been allotted to it—

25 Freight and Passenger Locomotives,
1,000 Box Cars,
2,000 Fifty-five ton Steel Coal Cars,

at an estimated cost of $10,559,500, which your Company was expected to provide. The Directors of your Company were of opinion that the equipment so allocated was not necessary to the efficient operation of the railroad, that much of it was unsuited for your Company's purposes, and that the purchase of such equipment at the current prices, which were abnormally high, was inadvisable. Protests were accordingly made against the Company being required to accept such equipment. Notwithstanding such protests the Administration adhered to its position and notified your Company that unless it agreed to accept the allocated equipment, the entire cost of such equipment would be charged against the compensation due it under the Federal Control Act. Although your Directors believed the position of the Administration to be unreasonable, in order to protect the interests of the Company and to prevent the charging of so large an amount of capital expenditures against its income, they determined to accept the equipment so allocated, with the proviso that the Director General should assist your Company in financing its cost, which it is believed he is prepared to do.

The Future.

The President of the United States has announced that Federal Control will terminate on December 31, 1919. The practical certainty that operating costs cannot be substantially reduced below their present high level and the probability that determined efforts will be made by shippers to prevent further increase of rates and even to effect reductions, will render it very difficult, after Federal Control has ended, to maintain between revenues and expenses the margin necessary to ensure an adequate return to your Company and provide the basis of credit necessary for the improvement and development of its property. This prospect, which faces every railroad in the country, makes it of the highest importance that some plan be devised and enacted into law, which while protecting the proper interests of the public, shall yet also ensure the financial stability of our transportation system.

Your Directors have given and will continue to give their earnest consideration to the various plans that have been proposed for dealing with this problem. Its solution will require the exercise by National and State Legislatures and by public officials generally, of broad statesmanship and wise forethought. Railroad stockholders and creditors can render invaluable assistance in the formulation and discussion of any plan that may be adopted, and will, it is hoped, cooperate actively to the end that a solution may be reached which, while protecting the public, will make railroad securities attractive to investors and thus ensure the continuance of the wise principles of private ownership and individual initiative in the management and control of our transportation system.

Major James H. Dooley, a Director of your Company for many years, resigned on February 21, 1919. His resignation was accepted with regret, and Mr. H. L. Ferguson was elected to succeed him.

Your Directors regret to report the death on December 9th, 1918, of Mr. James Paul Stevens, General Manager of your property, both prior to and during Federal Control.

Effective January 1, 1919, Mr. J. B. Parrish was appointed General Manager to succeed Mr. Stevens.

Announcement is made with regret of the death on June 6th, 1919, of Mr. Carl Remington, Assistant Secretary and formerly Secretary of your Company.

On February 1, 1919, Mr. James Steuart MacKie was, at his own request, relieved of his duties as Treasurer of the Company and Mr. Arthur Trevvett, the Secretary of your Company, succeeded him in that office.

The acknowledgments of the Board are renewed to the officers and employees for all faithful and efficient service.

By order of the Board of Directors.

Frank Trumbull,
Chairman and President.

GENERAL INCOME ACCOUNT—(CORPORATE).¶

Amount of Net Income for year ended December 31, 1918, transferred to Profit and Loss			$4,837,506.55		
Sundry Adjustments			30,270.89	4,867,777.44	
				$11,083,990.52	
Deduct:					
Dividend 36 Paid June 30, 1918			$1,255,632.00		
Dividend 37 Paid December 31, 1918			1,255,632.00	2,511,264.00	
				$8,572,726.52	
Appropriation of Surplus to Sinking and Other Reserve Funds				7,000.00	
Balance to Credit of Profit and Loss December 31, 1918				$8,565,726.52	

¶Does not include interest due to or from the U. S. Government.

*The term "Standard Return" as used in this report means "average annual railway operating income for the three years ended June thirtieth, nineteen hundred and seventeen," as defined by the Federal Control Act, less proportion, not accrued to June 30th, 1917, of one-half of war taxes for the year, and the amount of Adjustment of Wages under the Adamson Law, not accrued prior to June 30, 1917, and paid subsequent to that date, as tentatively certified to by the Interstate Commerce Commission, the Company's claim for additional compensation, if allowed, will increase this amount.

†By ruling of the Director General of Railroads these expenses were required to be paid by the Company, although the corresponding expenses of the three years ended June 30th, 1917, were deducted as operating expenses in computing the Standard Return.

‡Includes $96,562.12 representing the difference between the amount of $745,446.08 credited account of Revenues prior to January 1, 1918, and the amount of $842,008.20 charged account of Expenses prior to January 1, 1918.

Railway Construction

CANADIAN NATIONAL RAILWAYS.—The Joseph Gosselin Company, Levis, Quebec, has been awarded a contract to build a car repair shop for the Canadian National Railways at Edmundston, N. B. The building will be 19 ft. 9 in. high, 48 ft. wide and 200 ft. long. It will have concrete pedestals, a frame wall and a mill roof.

A contract has also been awarded Chappell Brothers Company, Sydney, N. S., to build a stores building at Sydney, N. S. The building will be 17 ft. 5 in. high, 31 ft. wide and 80 ft. 10 in. long.

ROBY NORTHERN.—The right of way is being obtained for the proposed extension of this road from Roby, Texas, south to Sweetwater, 28 miles.

SOUTHERN RAILROAD LINES.—The Cincinnati, New Orleans & Texas Pacific will soon begin the reconstruction of its bridge over the Tennessee river near Chattanooga, Tenn. The work will consist of 10 single track deck plate girder spans approximately 105 ft. in length; two double track deck plate girder spans 105 ft. in length; one double track deck plate girder span 142 ft. in length; one double track span 88 ft. in length; lifting machinery and towers to convert the present 310 ft. double track through truss channel span into a lift span to provide for an opening 50 ft. above high water when the span is lifted; and six additional double track concrete piers containing approximately 5,400 cu. yd. of concrete. The contract for the sub-structure has been let to M. C. Monday, Knoxville, Tenn., and it is expected that the masonry will be completed by January 1, 1920. Bids for the steel superstructure and machinery have been received by the purchasing agent, Washington, D. C.

THE CHARLESTON, HICKMAN & SOUTHERN.—The promoters of this road have obtained right-of-way grants for practically the entire distance from Charleston, Mo., to Hickman, Ky., and have secured pledges of bonus and stock subscriptions from residents of Mississippi County, Mo., to the amount of $50,000, with guarantees of an additional $50,000 from the Business Men's League of Charleston, when a contract for the construction of the road has been signed and a surety bond executed insuring the construction. They have also secured from residents of Hickman pledges to the amount of $15,000 with a promise of $35,000 more to be paid when the road is completed and a river transfer service for freight is installed between that city and the Missouri terminus of the road opposite Hickman. An eastern construction company has agreed to finance the road, build and equip it complete, taking in payments the bonds of the company issued as the work progresses, plus a final payment in cash when the first train is operated over the road. The new line will serve a part of Mississippi county which has been isolated from railroad connections and will be the means of developing 30,000 acres of hardwood virgin timber in the southern part of that county. The new road will connect with the Illinois Central and the Nashville, Chattanooga & St. Louis at Hickman, the Cotton Belt at Anniston, Mo., and with the Missouri Pacific at Charleston. It is proposed on the completion of this portion of the road to proceed at once to extend the line north from Charleston to Illmo, Mo., where it will connect with railroads operating over the Thebes bridge.

THE OREGON, CALIFORNIA & EASTERN.—This road is constructing a single track line between Dairy, Ore., and Sprague River, a distance of 20 miles, including three miles of spurs. This line will cost approximately $450,000 of which $250,000 will be for grading. The bridges will be of timber. All work is being done by company forces.

THE SOUTHERN PACIFIC.—The Shattuck-Edinger Company, San Francisco, Cal., has been awarded a contract for the grading of a new branch of this road, extending through Reclamation District No. 1500 (the Sutter Basin project), Sacramento, Cal., a distance of approximately 20 miles. Work is to be started at once.

Railway Officers

Railroad Administration

Federal and General Managers

Owing to the appointment of **E. W. Mason** as general manager of the Western Pacific, the Tidewater Southern and the Deep Creek (*Railway Age*, September 5), effective September 1, the jurisdiction of all Southern Pacific officers over these lines, as in effect under the administration of Federal Manager W. R. Scott, was terminated on August 31.

E. W. Mason, formerly general superintendent of the Western Pacific and recently a lieutenant-colonel in the American Expeditionary Forces acting as general superintendent of the 14th Grand Division with headquarters at Nantes, France, has been appointed general manager of the Western Pacific, the Deep Creek and the Tide Water & Southern with headquarters at San Francisco, Cal. These roads have been under the jurisdiction of Federal Manager W. R. Scott.

Operating

E. D. Leavitt has been appointed assistant superintendent of the Tucson division of the Southern Pacific, with headquarters at Tucson, Ariz.

W. P. Christie, has been appointed superintendent of safety of the Toledo, St. Louis & Western with headquarters at Frankfort, Ind., succeeding **F. E. Myers,** resigned.

The jurisdiction of **J. S. Spelman,** general superintendent of the Western Pacific at San Francisco, Cal., was withdrawn from the Salt Lake division of the Southern Pacific on August 31, incident to the separation of the Western Pacific-Southern Pacific operating organizations.

J. C. McCullough, division superintendent on the Southwest System of the Pennsylvania Lines, with headquarters at Pittsburgh, Pa., has been promoted to general superintendent of the Central system with headquarters at Toledo, Ohio, succeeding **F. B. Robertson,** who has resigned to become associated with the B. F. Goodrich Rubber Company, Akron, O.

R. E. Sizer has been appointed trainmaster of the Hastings and Dakota division of the Chicago, Milwaukee & St. Paul, with headquarters at Aberdeen, S. Dak., and will have jurisdiction Ortonville and west, including Fargo line. **H. L. Biggs** will have jurisdiction east of Ortonville. **H. A. Hargraves** has been appointed trainmaster of the Prairie du Chien and Mineral Point divisions with headquarters at Madison, Wis., succeeding Mr. Sizer. **R. L. Blakesley** has been appointed trainmaster of the Dubuque division with headquarters at Dubuque, Iowa, succeeding Mr. Hargraves. **James E. Ryan** has been appointed trainmaster of the Chicago Terminals division with headquarters at Chicago, succeeding Mr. Blakesley.

Financial, Legal and Accounting

Philip J. Kelly has been appointed auditor freight traffic of the Philadelphia & Reading, with office at the Reading Terminal, Philadelphia, vice **R. R. Hulme,** retired. **Alfred A. Johnson** has been appointed auditor traffic receipts, succeeding **Mr. Kelly.**

Traffic

R. H. Eberly has been appointed assistant general freight agent of the Seaboard Air Line, with office at Norfolk, Va., vice **H. Govan Waring,** deceased.

Engineering and Rolling Stock

J. E. Fanning, resident engineer of the Illinois Central with headquarters at Golconda, Ill., has resigned to become chief engineer of the Gulf & Ship Island and the Mississippi Central with headquarters at Hattiesburg, Miss.

Get at the Real Facts

One aspect of the disposition of the railroads which is probably overlooked by many is that the physical act of returning the roads to private control is after all but a detail. The larger problem concerns the establishment of a sound policy to foster the extension of railway facilities and service in proportion to the demands made upon them. There is no question but that the railroads would be in exceedingly sore straits today even if the government had not taken over the management as a part of its war activities. This is evidenced by the contemporaneous predicament of the other public utilities, notably the street railways and interurban transportation systems which remained under private control throughout the war. The policy of the Railroad Administration in acceding to the demands of labor unquestionably served to aggravate the present unsound condition of the railroads; a similar policy of the government toward the demands of the employees of public utilities not under government control has operated to produce equivalent conditions in these properties. The 18 months of government operation have demonstrated the utter impracticability of government ownership and operation, but the fact that the roads are temporarily in the hands of the government is but a circumstance of the reconstruction period following the war. The real problem concerns the elimination of those influences in public regulation which had been steadily sapping the life of our national transportation system for a decade or more, the effects of which were brought to a sudden and violent climax by the advent of the war.

A Development in Labor Organizations

Nearly 2,000 delegates are now in attendance at a convention of the United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers which convened at Detroit on September 9, and which will remain in session most of this month. This organization claims a membership of 600,000 men in railway service. Approximately half of this number are foremen and laborers in the track, bridge and building and other maintenance of way branches. Thus for the first time in the history of American railroads, representatives of a large proportion of the maintenance of way employees meet in one labor organization. Numerous attempts have been made in the past to organize these employees, but these efforts have met with little success for a number of reasons. Under federal control, however, efforts in this direction have received such open encouragement from the Railroad Administration that the organization of the employees in this and other departments has proceeded with unparalleled rapidity. Railway officers can well afford to observe the outcome of this youngest but largest of railway organizations. The loyalty of maintenance men has been proverbial since the earliest days of railroading. Not only have these men labored long in times of storms and emergencies to maintain lines safe for operation or to restore them to service after interruptions, but they have remained loyal to their employers in critical times when others have left their work. If past history is a criterion this loyalty will soon disappear under the influence of the organization, but it is possible that the maintenance of way employees will see the wisdom of using organization to promote their own interests without impairing those of the railroads.

Delays in Yard Limits

"Keep trains moving" is the slogan of the operating department, for when trains are kept moving smoothly, the entire transportation machine functions properly. Many delays occur to tonnage trains within yard limits or on main tracks at the entrance to yards. These are often due to congestion existing at such points because of the methods of operation which may be employed. Entrances or exits to many yards are controlled by manual block which system often requires several offices with operators working three tricks at each office to handle the traffic. Even with this expense numerous delays occur. At many such locations conditions may be helped considerably by the installation of short stretches of automatic signals. One assistant superintendent has said, "that on 22 miles of track from the south end of ..... yard to another point, with the present track layout, it would be necessary to install offices with continuous service at three places in order to establish a block and even with these facilities and this additional expense a delay of approximately 25 min. would occur to a train, while with the installation of automatic signals it was possible to eliminate the expense of operators at two points and to dispense with two tricks at the third place. This saving was accomplished in addition to the better movement that the automatic signals gave over the manual block." In view of the large number of yards throughout the country, it would appear evident that a proper study of the existing conditions at such places might show the possibility of securing increased efficiency in operation and a decided saving in operating costs by the substitution of automatic for manual signals for blocking purposes. A further advantage is that these installations may be tied in easily to future automatic signal installations which may be contemplated.

Prohibition and the Railroads

The Association Opposed to National Prohibition, headquarters not given, is apparently trying to secure for its cause a reflection of the sympathy which the American public has come of late to feel for the financial and other difficulties of the railroads. In a statement issued recently it declares that the eighteenth amendment will deprive the transportation lines of the revenue from hauling yearly 8,000,000 or so tons of whiskey, beer and wines, or 20,000,000 tons, including the materials for their manufacture. The statement says that the railroads, among their other troubles, will have to find some means of making up for the loss of the revenue from these shipments, which were three times larger than the tonnage of poultry, fish and game, or more than double the tonnage of dressed meats, and which provided double the transportation revenue derived from shipments of household goods and farm implements. One of every 200 cars,

the statement says, has been used for the shipment of such goods. Even admitting that revenue is all important, the reader will fail to see the diplomacy and tact of tying in the abolition of the liquor traffic with the railroad problem. The railwaymen of this country are law-abiding and know that even if the prohibition amendment will decrease their revenues, it was properly ratified and is now the law of the land. The railways, by the enforcement of Rule G, were among the first to discourage the use of liquor among their employees. Probably the Association Opposed to National Prohibition does not realize that and the incongruity of bringing the railroads in its argument as it has in this case. We do not believe, therefore, that the efforts of the association's publicity man, as evidenced in the statement in question, will go very far towards influencing favor on the part of the railway men of the country or the great number of others now interested in the railway problem, at whom, however, this publicity is apparently directed.

Financial Results Continue to Improve

THE RAILROAD ADMINISTRATION announces that when complete statistics are available they will show that the railways under government control earned in July net operating income amounting to about $77,000,000. The net operating income earned in July in the three test years averaged $75,341,000. It follows that in July the railways for the first time in about ten months earned the government's entire guaranty to the companies. For the first seven months of the year the average net operating income in the three test years was $475,363,000, while the net operating income in the first seven months in 1919 was approximately $234,500,000. Therefore, the net operating income for the first seven months in 1919 was about $241,000,000 less than in the corresponding months of the test period. In other words, in the first seven months of the year the railways earned about 49 per cent of the amount upon which the government guarantees are based.

As pointed out in an editorial in the *Railway Age* of August 22, the proportion of the guarantees being earned by the railways has rapidly increased since March. In May it reached 51 per cent and in June 64 per cent, while in July it reached 100 per cent. Until detailed figures for July are available it will be impossible to determine whether the seemingly excellent showing made in that month was due partly to the marked increase in the efficiency of operation or partly to drastic reductions in maintenance expenditures. One thing is certain, however, and this is that the railways have been operating with increasing efficiency and economy within recent months and as a result the financial showing has become much better than it seemed possible a few months ago it could be made with existing wages and rates. The improvement in results is partly due to better business, although in July the amount of freight handled was 11.3 per cent less than the amount handled in 1918.

The course of developments during the remaining months of the year will be followed with keen interest. Ordinarily the total business and total earnings in the second half of the year are much larger than they are in the first half, and in view of the results shown in June and July it is possible to be optimistic regarding the financial showing of the rest of the year. Unfortunately, however, operating expenses in August undoubtedly will show the effects of the sporadic but extensive strikes which occurred in that month. Indeed, the effects of those disturbances will be shown by operating expenses during the rest of the year, and it is not at all improbable that before the end of the year there will be other labor disturbances. The deficit for the year promises, however, to be smaller than it threatened to be two months ago.

Condition of Freight Cars

THE ACTION of the Railroad Administration in increasing the day of the car repair forces to nine hours is wise; indeed, it is absolutely necessary. Reports showing the bad order cars do not reflect conditions accurately; nevertheless, they show that the situation is far from favorable. On August 2, 8.5 per cent of the cars were reported in bad order, of which 135,000 were for heavy repairs and 73,000 for light repairs. On August 9 the percentage of bad order cars had increased to 9.3 per cent, 144,000 requiring heavy repairs and 83,000 light repairs, and these figures, of course, do not show the full effect of the scattering strikes which took place early in August. A visit to any car repair yard will show that conditions are more serious than these figures indicate. Before the freight congestion became so severe in the early stages of the World War, the railroads generally had programs for retiring old and inadequate freight car equipment. For at least three years it has been necessary to discontinue the retirement of these old cars; the fact that many of them have been off their home lines almost continuously during this period and have received only sufficient temporary repairs to keep them in a safe condition has further complicated the situation.

During the greater part of the last three years the demand for freight cars has been so acute that only such repairs have been made as have been absolutely necessary to keep the cars in operation. Roads that have always taken a real pride in keeping their cars in first-class condition have hardly had an opportunity of seeing them and there is no question but what the cars have considerably deteriorated because of the lack of this same attention on the part of the foreign lines in whose hands they have been the greater part of the time. This is apparent on all classes of cars. Steel hopper and gondola cars will be found with the slope, floor and side sheets rusted through; in some cases, old sheets of car roofing have been bolted over the holes; in others sticks of wood, old overalls and rags have been used to fill up the holes. Under normal conditions, these cars would have received thorough and heavy repairs long ago. The condition of the older wooden cars is in many cases even worse.

Efficient transportation cannot be conducted with equipment of this sort and to a great extent the future prosperity of this country depends upon the furnishing of efficient transportation. The situation is so serious and the problem so big that immediate steps should be taken to concentrate attention upon it and to greatly improve the condition of the equipment.

The Intangible Savings

THE OPERATING OFFICER is expected to keep trains moving with the organization and facilities given him for that purpose and in many cases some one in his department passes upon all budgets submitted for new work. In these budgets there are frequently listed new stretches of automatic signals for the relief of congested districts which in the final analysis may be "blue penciled" because of the feeling that as trains have been operated satisfactorily in the past, it is not necessary to go to the expense of installing automatic signals—at least, for the present. However, under present conditions with the large increases in expenses of all kinds to be met it is imperative that every means possible be used to increase efficiency of operation in order to decrease expenses. It may be the feeling on the part of officers passing upon budgets that automatic signals represent an increased expense, no doubt largely due to the fact that such installations may not make a large showing in direct savings while the intangible savings are ove looked.

The time has now come when means for producing intangible savings should be taken into consideration the same as are those which make direct savings and automatic signals can perhaps produce as large intangible savings as any other one method employed for this purpose.

As an example two trains on a single track line recently received orders to meet at a certain station which was a register point and a water point. The engine on the eastbound freight ran short of water and cut loose from the train about six or eight miles out, running to the station for water. While there, the train was registered in and the engine started back for the train. In the meantime the westbound train pulled into the station and, as the record showed that the other train had registered in, the westbound train proceeded. The automatic signals stopped them a block apart and prevented a collision.

At another time a stretch of automatic signals had been placed in service in the late fall, prior to a severe winter. One night during the coldest weather one of the fast passenger trains was stopped by a signal and on flagging ahead it was found that about a foot of the rail had been broken out.

Numerous other instances could be mentioned but in the two cases above, an intangible saving was made which it would be hard to estimate. The cases mentioned are typical of others throughout the country. In addition to the savings made by the prevention of accidents it may be well to mention the better operating conditions produced, the saving in overtime and the releasing of equipment sooner than would be accomplished otherwise.

The Cummins Bill's Proposed Limitation of Railway Profits

The Senate probably will be a somewhat more important factor than the House of Representatives in determining the railroad legislation which will be passed. The Senate's Committee on Interstate Commerce will frame the Senate bill. A sub-committee of this committee has drafted what is known as the Cummins bill.

The new railway legislation should deal with many important phases of regulation. There is, however, one phase which is much more important than any other. This is the question of adopting means of making rates and earnings such that they will promote efficiency in operation and enable the railroad companies to raise sufficient capital for the development of their facilities. If the new legislation deals wisely with the question of railroad revenues, it probably will be successful, even though in other respects it may not be well designed. If it does not deal wisely with the question of railroad earnings, it will be a failure, no matter how skillfully it may deal with other phases of the problem.

Therefore, the provisions of the Cummins bill relating to the way in which railroad earnings are to be dealt with, are its most interesting and important features. Most of its provisions indicate that those who drafted it have a statesmanlike grasp of the railroad problem. Unfortunately, the bill is weak just where it is most important that it should be strong.

It provides that for the purpose of rate-making the Interstate Commerce Commission shall divide the railways into rate-making groups. It continues:

"In viewing them (the rates) from the standpoint of their effect in producing revenue in any rate-making group as a whole, the commission shall take into consideration the interest of the public, the shippers, the wages of labor, the cost of maintenance and operation (including taxes), a fair return upon the value of the property in the group . . . the requirements for additional capital in order to enable the carriers to adequately perform their duties to the public and the conditions under which the same can be secured; and for the purposes aforesaid, the commission shall from time to time determine the value of the property in each district and so lower or advance the rates of transportation, as nearly as may be, to provide said fair return as herein provided."

Elsewhere the bill provides for the creation of a Transportation Board and makes it the duty of this board to "inquire as to the new capital which the public interests may require the carriers, or any carrier, to secure in order that adequate and efficient transportation service and facilities may at all times be provided, and into the conditions under which said new capital may be secured. From time to time it shall certify to the Commission its findings in these respects, and the Commission shall accept such certificate or certificates as prima facie evidence in any hearing upon the matters to which such certificate or certificates respectively relate."

The apparent purpose of these provisions is to insure that the railway companies will be allowed to earn revenues sufficient to pay a reasonable return upon the value of their present properties and to raise sufficient new capital adequately to develop their facilities. But the bill contains a provision which seems to be inconsistent with those above quoted and adapted largely to nullify the good effects they would tend to produce.

Section 6 provides as follows:

"If any carrier shall receive from operation in any year more than a fair return, to be determined by the commission, upon the value of its property, held or used for service in transportation, which may include a just allowance to provide reasonably for future years in which there may be insufficient earnings, the excess above such fair return shall be paid to the transportation board within the first four months of the succeeding year, to be invested or expended for the following purposes, namely: One-half of all such payments to the Board shall be invested or expended for the purposes set forth in Section 25 hereof, and one-half thereof shall be deposited in a fund which, from time to time, shall be expended by the Board in the purchase of equipment to be released under proper terms to carriers in order to facilitate transportation, or to loan to carriers upon reasonable security in order to purchase equipment or other facilities in the event that such carriers are unable to secure elsewhere the funds with which to provide themselves with adequate transportation facilities."

The "purposes set forth in Section 25" referred to are all purposes relating to the improvement of the condition of employees.

This provision, if we interpret it correctly, means that if any railway company shall earn any more than the Commission shall have held to be a "fair return," all such surplus earnings shall be taken from it and used for the purposes outlined in the quotations from the bill which we have made. The result would be that if the Commission held that 6 per cent, for example, was a "fair return" upon the value of the Union Pacific, and the Union Pacific earned 10 per cent, the entire surplus over 6 per cent would be taken and used for purposes which had no relationship to the progress or prosperity of the Union Pacific. One-half of the excess would be used for the benefit of railway employees generally. The other half would be loaned to railway companies whose credit was not good enough to enable them to raise adequate capital in the market, or used to buy equipment for such carriers. The Union Pacific, under this plan, would not get the use of any of the surplus it earned, because, presumably, the fact that it had surplus earnings would exclude it from the class of carriers which could not finance their own requirements.

Students of railway regulation know what is meant by "a fair return upon value." This is a phrase invented by the courts to indicate the limit *below* which regulating bodies cannot go in fixing rates without unconstitutionally confiscating property. Therefore, what the bill provides is that the earnings of any group of railways shall be made barely large enough to avoid confiscation of the property of the entire group, and that at the same time no individual railway shall be allowed to earn and retain a return any larger than is necessary to avoid confiscation of its property.

For ten years the old system of regulation has been attacked upon the ground that railroad commissions, whatever the

provisions of the laws have been, have constantly tried to make railway rates as low as they could without confiscating property. It has been contended that the purpose of regulation should be, not to make the rates as low as was possible without involving confiscation, but to make them no lower than they must be made to enable the railways to render good service and adequately develop their facilities. The Cummins bill is an attempt to reform the old system of regulation, and yet it would specifically enact into law the restrictive and destructive principle upon which the regulating commissions have acted, namely, that the return of all railroads and each railroad shall be fixed regardless of the public welfare and as low as they can be fixed without confiscation.

The effect of the proposed legislation might be to improve the credit of some railways which under the old system of regulation have been prevented, regardless of constitutional provisions, from earning a fair return. But on any road which is, or might become, able to earn a "fair return," the incentive to increase efficiency of operation would be destroyed. Indeed, under this proposed legislation there would be a direct incentive, when a railway became able to earn more than "a fair return," to begin adopting measures to promote *inefficiency*. If a road earned more than a fair return, one-half of the excess would be turned over to the government to be used in helping other railways which were earning less. These railways might be direct competitors of the railway which was able to earn more than the so-called "fair return," in which case its surplus earnings would be used to enable them to compete against it more effectively.

The managers of a railway company which is, or which became able to earn the maximum return, unless they were angels rather than human beings, would, therefore, have an incentive to begin casting about for means of preventing the net return from increasing. The result might be, and probably would be, the payment of excessive salaries, exorbitant expenditures for maintenance, perhaps the payment of exorbitant prices for materials and supplies. Probably the government would then intervene. But government intervention would never be an effective substitute for the initiative and enterprise of the owners and managers. It would probably do more harm than good.

It will require changes in these provisions to make the Cummins bill a good bill. It might be changed to provide that any railway company earning more than "fair return" would be allowed to retain only three-fourths, or two-thirds, or one-half, or even one-third, of its surplus earnings, depending upon how large the surplus earnings were. As long as every increase in efficiency will result in some increase in the amount of return a company will be allowed to earn and use for its own purposes, the incentive to increased efficiency will not be destroyed, although it should be frankly recognized that even a partial limitation of profits will tend to reduce the incentive to efficiency.

It is now generally conceded in this country that private management is preferable to government management of railroads, upon the ground that it is more efficient. But many of those who concede this do not seem to recognize the further fact that the greater efficiency of private management is almost entirely due to the fact that heretofore the relative profits earned and kept by railroad companies have depended on how efficiently they were managed. Destroy the opportunity to increase profits under private management by increasing efficiency, and the superiority of private over government management will speedily disappear. This seems so obvious that it is hardly conceivable Congress will return the railroads to private operation under legislation which will prohibit each and every individual railroad, no matter how efficiently managed, from enjoying profits exceeding the so-called "fair return."

The Bituminous Coal Situation

NEARLY 100,000,000 tons less bituminous coal has been produced in the United States up to the end of August this year than was produced up to August 30, 1918. The production of bituminous coal in 1918 was extraordinarily large because of the unprecedented demand by war industries both in America and abroad. It was made possible by the economic measures adopted to encourage production and the emergency measures, such as the pooling of coal, the zone system of distribution, etc., which the Railroad Administration adopted.

There is a coal car shortage today, more severe in some parts of the country than in others, but a real shortage. Is the situation a dangerous one; is it not only possible, but probable, that there will be a serious shortage of bituminous coal for manufacturers this year; is the Railroad Administration falling down on its job in regard to taking care of the bituminous coal operators' needs?

First, as regards the danger of a coal shortage; bituminous coal needed by the country is an undetermined quantity. Dr. Garfield, when he was fuel administrator, made, or is supposed to have made, an estimate of the needs of the country, placing them at 500,000,000 tons per year. Up to August 30, 299,705,000 tons of bituminous coal had been produced, while in 1918 up to August 30, 396,074,000 tons had been produced. The production in the last week in August, 1919, was 10,197,000 tons, comparing with 12,691,000 tons produced in the corresponding week of 1918.

Almost immediately after the signing of the armistice there was a widespread cessation of manufacturing industry. Plants which had been working two shifts a day were reduced to one and in many cases the working week was cut down by one or two days. Furthermore, coal continued to be delivered to manufacturers on a basis of full and overtime working schedule and the coal storage facilities of manufacturers generally were taxed to their utmost. On December 31, 1918, there was an important and large carry-over of bituminous coal. On December 31, 1917, there was a minimum carry-over. The production, therefore, in 1918, as determined by the United States Geological Survey, from which the figures used above are taken, does not accurately correspond to the consumption in 1918.

The carry-over of coal was used by manufacturers in the early part of 1918 to supply their greatly diminished needs for as long a time as possible. The entire cessation of munitions' manufacture and the great reduction in many other lines of manufacture in the early part of 1918 slowed down the production and transportation of bituminous coal to such an extent that the Railroad Administration quite properly looked on the situation with considerable concern. Coal miners were urged to continue to produce coal despite the falling off in demand and manufacturers were urged to order coal in anticipation of future needs. This sound advice of the administration was not followed by either the coal operators or manufacturers, neither one desiring to tie up capital in stored coal even where storage facilities were available.

In the present controversy between the coal producers and the Railroad Administration—for the interchange of views on the coal situation has taken on the nature of a controversy—the coal producers brush aside as only natural, human and good business their own refusal to mine coal in anticipation of future needs, but are loud in their condemnation of the Railroad Administration's failure to repair coal cars during the period of depression—the first few months of 1919.

Dun's Review of business conditions on August 30 says "Neither in volume nor in value is new business as distinguished from activity on past orders what it was a month

ago in some important lines." But the general impression one gets from a week to week's study of Dun's and Bradstreet's reviews of trade is that of widespread, general business activity with the rate of production running high, although not as high as it would run if unhampered by strikes, threatened strikes and forced reduction of hours of work.

There is no agency at present which is making a systematic study of the needs of the country for coal. If an entirely candid opinion could be drawn from each of the larger coal producers, a fair guess could be made at the general situation, but with the coal producers we must remember that the wish is father to the thought in their estimate of the country's coal requirements. Congress has failed to make an appropriation permitting the Geological Survey or other agency to make a study of the country's coal requirements. A somewhat limited canvass of coal producers, railroad men closely in touch with the coal situation, and manufacturers in the east suggests that a coal shortage this year is a possibility but not a probability. The possibility, however, of such a calamity under present circumstances justifies forehanded measures to prevent its occurrence.

If railroad equipment were in thoroughly good repair it is safe to say that the coal car shortage would be very much reduced if not entirely eliminated. In the Operating Statistics Section's reports, freight cars are not classified, so that bad order cars include box, automobile, etc., as well as open-top cars. The administration greatly reduced its activities in repairing freight cars during the period of slack business in the first part of 1919. Its excuse was that it did not have the money. This is the same excuse which private owners have given in past years for pursuing a like, seemingly short-sighted policy. On some of the larger bituminous coal carriers, the bad order situation as regards coal cars is estimated to be about double that of normal times. That is, where a road would, under normal conditions, at this time of year, have only about 4½ to 5 per cent of its coal cars awaiting or under repair, there are now from 9 to 10 per cent in bad order. Furthermore, both the coal operators and corporation officers who are keeping closely in touch with the coal car situation claim that theee are a considerable proportion of coal cars in service which would, under ordinary conditions, be classified as bad order cars and would be placed in shops or on the heavy repair tracks.

In his testimony before the Senate committee investigating the coal situation, J. D. A. Morrow, president of the Coal Producers' Association, claimed that not only was there a shortage of cars but also a "transportation difficulty," meaning apparently a slow movement of coal cars.

The best sources that we have wherewith to judge of the coal situation in regard to production are the reports of the United States Geological Survey. The weekly reports include a table showing the percentage of capacity of bituminous production actually achieved during the week for the principal coal regions of the United States. For the week ended August 23, production ranged from about 44 per cent of total capacity in the western coal regions and 50 per cent in the Illinois regions to 87 per cent in the western Pennsylvania districts and to 85 per cent in the Westmoreland district. The rating of districts by the Geological Survey is on a theoretical, perfect production, so that probably 85 per cent production would be a normal, practical, full production. The causes of failure to attain 100 per cent production, which are based on data furnished by the producer, are classified by the Geological Survey as between car shortage, labor shortage, strikes, etc. Car shortage is by far the largest factor in the loss of production of nearly all of the coal districts and varies in the week ended August 23 from a loss, due to this cause, of 49 per cent in the western district and 36 per cent in the high volatile district of southwestern Virginia to 4 per cent in the central district and 9 per cent in the western Pennsylvania district.

The following table shows the percentage of cars placed to the total number of cars ordered on 12 of the largest bituminous coal carriers. The roads are numbered rather than given by name because the figures are for one particular week, August 23, and it might be misleading to show one road low or high in a table such as this because conditions as between different roads vary from week to week, but the comparison of all the roads in 1919 with the corresponding week for 1918 is accurate and significant.

	1919	1918		1919	1918
1	97	79	7	101	105
2	80	107	8	103	72
3	79	84	9	86	84
4	98	99	10	98	63
5	104	99	11	75	92
6	79	99	12	100	107

The total number of coal cars required by the coal operators for the whole country in the week of August 23, 1919, was 164,000. The total number placed was 155,000. In 1918, in the corresponding week, 173,000 cars were required and 149,000 were placed. In other words, this year the Railroad Administration met 94 per cent of the coal operators' requirements while in 1918 at this time the Railroad Administration was meeting only 86 per cent of the operators' requirements.

While the war-time measures such as pooling of certain grades of coal and the limitation of the distribution of coal to zones are no longer in effect, the common use of all companies' cars by the administration is effective and the car pool formed by the railroads voluntarily at Pittsburgh, prior to the taking over of the roads by the government, is at present in full operation. A good measure of conditions both at the mines and of the handling of coal cars by the railroads is shown by the coal car loadings. The following table shows the bituminous coal cars loaded in the week ended August 23, 1919, compared with the corresponding week of 1918:

	Number Cars Coal Loaded		Decrease	
	1919	1918	Cars	Per Cent
Eastern region	28,642	36,227	7,585	20.9
Allegheny region	67,087	67,091	4	...
Pocahontas region	25,855	26,147	292	1.1
Total pool lines	121,584	129,465	7,881	6.8
All other regions	57,696	76,708	19,012	24.6
All regions	179,280	206,173	26,893	13.4

The falling off as compared with 1918 is, therefore, considerable. On the other hand, the loading in the Eastern, Allegheny and Pocahontas regions was 10.8 per cent greater for the week of August 23, 1919, than in the corresponding week of 1917.

One factor that must be kept in mind in comparing 1919 and 1918 is that with war restrictions off and with the almost universal acceptance of a higher standard of "living" in business as well as in personal and social matters, there is a large demand for higher grades of coal. The poorer grades of coal of some of the central western and western districts are passed over in favor of considerably more expensive eastern coal with the result that this added strain of a longer average haul is put on the transportation facilities of the country.

There is another factor, local but important. Coal is moving all-rail into New England in much larger proportion than it would under normal conditions. Coastwise water rates are so high that the all-rail routes compete successfully with the water route. This also increases the strain on railroad facilities.

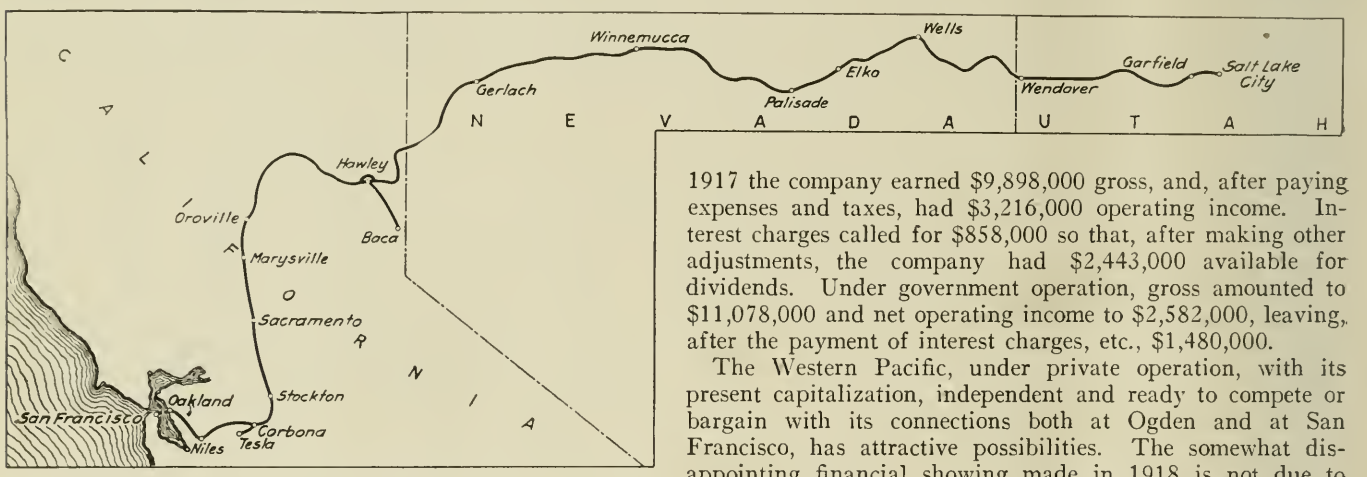
To sum up: there is a coal car shortage of varying intensity with a possibility, but not a probability, of serious bituminous coal shortage this winter. We are without adequate means of determining the coal needs of the country

and either the Railroad Administration, itself, or some specially authorized body ought immediately to undertake a careful study of manufacturers' needs. If the possibility of a coal shortage appears in the light of the results of this study to be slight, present methods of car distribution and coal distribution can fairly safely be continued. If in the light of this study the possibilities of a severe coal shortage are serious, both the Railroad Administration and the coal operators ought to submit to such measures as were put into effect last year—preferential movement of coal, the zone system and pooling of certain grades of coal.

Since the present agitation in regard to coal car shortage was begun, transportation conditions have improved and to this extent the agitation has been beneficial to the country. It should not, however, be allowed to be used as an argument for higher coal prices without, at least, a far more convincing showing of the imminence of a dangerous coal shortage than has been made hitherto.

Western Pacific

THE TOTAL MILEAGE operted by the Western Pacific in 1918 was 1,012, and the average haul of revenue freight was 514 miles. The Western Pacific was built to give the Gould system a share in the Pacific coast business. Operation of the road has demonstrated that to get a share of this business it was necessary to do something more than to have an entrance into San Francisco. Branches were begun to Reno, Loyalton, Tooele and San Jose via Niles. In 1918 both the Reno and the Tooele branches were in operation, but the director general ordered work stopped on the San Jose branch on the ground that the Southern Pacific already



The Western Pacific

had facilities at San Jose and a connection with the Western Pacific, so that since the two roads were to be operated jointly, shipments could be made "via the Western Pacific with the same facility as accorded shipments via the Southern Pacific."

The Western Pacific was a highly competitive enterprise from its inception. Under government operation the operating organization made a particularly good showing, but the financial results of operation were not so favorable. This, of course, did not affect the Western Pacific Railroad Company one way or the other since the government is to pay a fixed rental for the use of the property.

The total tonnage of revenue freight carried in 1918 was 2,689,000, comparing with 2,329,000 tons carried in 1917. The most noticeable difference in the business done in 1918 as compared with 1917 is in the increase in coal and the large increase in empty cars hauled by the Western Pacific. The total tonnage of bituminous coal carried in 1918 was 983,000 tons, an increase over 1917 of 520,000 tons. In other words, the increase in bituminous coal tonnage and of other products of mines more than offset the decreases in each one of all of the other general classes of traffic. Empty car miles totaled 22,379,000 in 1918 as against 18,266,000 in 1917. Loaded car mileage totaled 44,893,000 in 1918 as against 46,564,000 in 1917. The changes in the character of the freight which the Western Pacific was called upon to handle are probably reflected in the ton-mile rate received. Despite the increase in freight rates which the administration put into effect, which gave most other roads an increase of from 15 to 30 per cent in the average ton-mile rate received, the ton-mile rate on the Western Pacific was 6.6 mills in 1918 as against 6.7 mills in 1917.

Notwithstanding the large increase in empty car mileage, the average revenue train load was increased by over 60 tons, totaling in 1918 662 tons. This is a fine showing for a road like the Western Pacific. In 1917 there were 65 Consolidation locomotives of 43,300 pounds tractive power, and five Mallets of 80,000 pounds tractive power each in service. During 1918 five new heavy Mikados equipped with superheaters, of 60,200 pounds tractive power each, were received.

After the Goulds were compelled to give up their plan for a trans-continental railroad system, the Western Pacific went into receivership. The company was reorganized and with a conservative capitalization. In place of the $50,000,000 first mortgage bonds and $25,000,000 second mortgage bonds originally issued, there were $20,000,000 new first mortgage bonds issued. In addition there are outstanding $3,600,000 equipment notes. The company has $75,000,000 stock, divided $47,500,000 common and $27,500,000 preferred. In 1917 the company earned $9,898,000 gross, and, after paying expenses and taxes, had $3,216,000 operating income. Interest charges called for $858,000 so that, after making other adjustments, the company had $2,443,000 available for dividends. Under government operation, gross amounted to $11,078,000 and net operating income to $2,582,000, leaving, after the payment of interest charges, etc., $1,480,000.

The Western Pacific, under private operation, with its present capitalization, independent and ready to compete or bargain with its connections both at Ogden and at San Francisco, has attractive possibilities. The somewhat disappointing financial showing made in 1918 is not due to inherent difficulties under competitive conditions.

The following table shows the principal figures for operation of the property by the government in 1918 and by the company in 1917. This is not the corporation income account.

	1918	1917
Mileage operated	1,011	1,011
Freight revenue	$9,200,062	$7,968,721
Passenger revenue	1,373,496	1,473,538
Total operating revenues	11,078,497	9,898,484
Maintenance of way and structures	2,034,765	1,577,090
Maintenance of equipment	1,635,871	999,072
Traffic expenses	187,314	254,562
Transportation expenses	3,626,433	2,993,342
General expenses	254,493	274,312
Total operating expenses	7,893,879	6,190,055
Taxes	600,976	492,297
Operating income	2,581,796	3,215,936

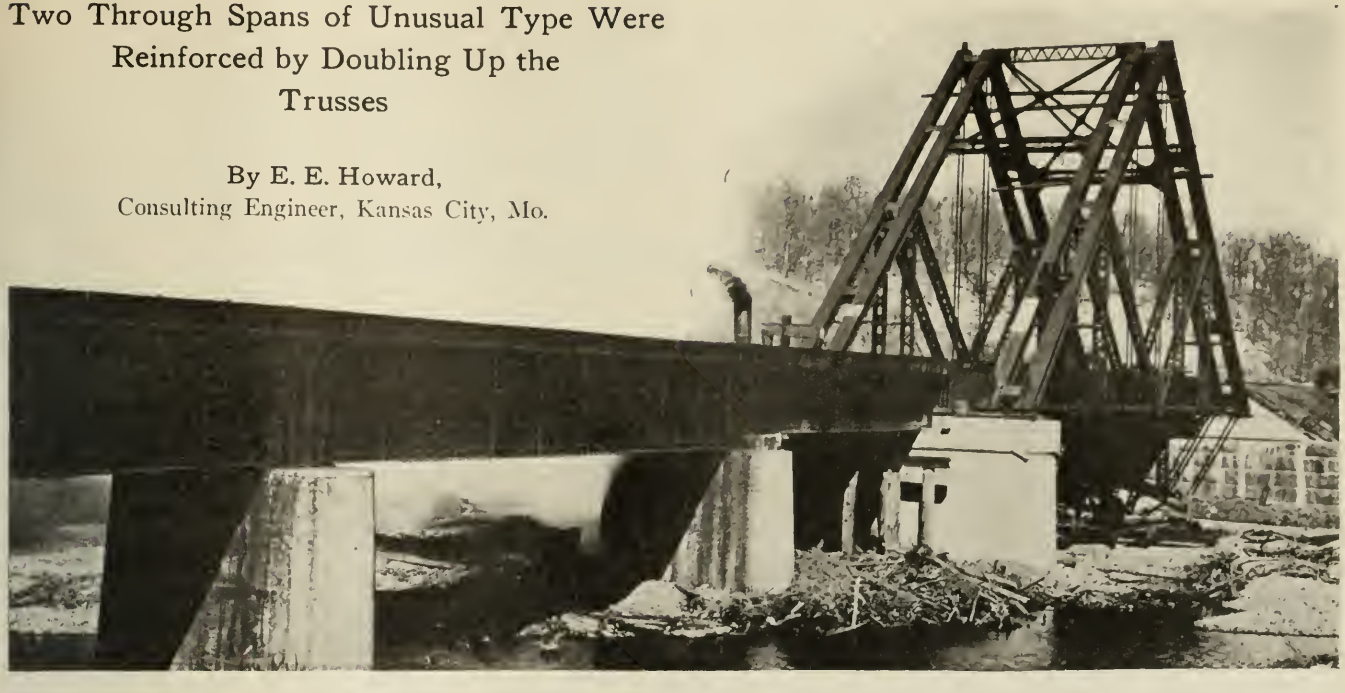
CORPORATE INCOME ACCOUNT

	1918
Compensation	$1,900,350
Gross income	2,397,270
Net income	792,281
Dividends	.....
Surplus	742,281

War-Time Economies in Strengthening Old Bridges

Two Through Spans of Unusual Type Were Reinforced by Doubling Up the Trusses

By E. E. Howard,
Consulting Engineer, Kansas City, Mo.

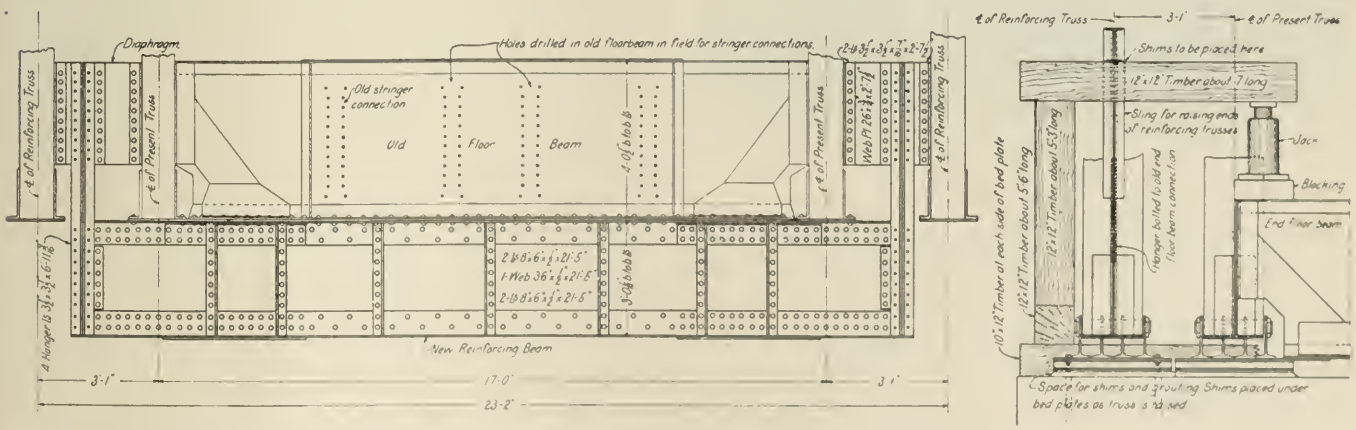


Construction View During Erection of the Reinforcing Trusses and New Floor Members

DURING THE LATTER PART of 1918 two 100-ft. single track railway spans on the Kansas City Southern were reinforced for modern standard loading by adding extra trusses and stringers from like spans which had previously been taken out of service. The spans recently reinforced are in two different bridges and had been continued in service for some years under traffic much in excess of the loads for which they were designed by maintaining slow orders. Formerly there were a number of spans of this type on the road, but all had been removed except these remaining two. They are through pin-connected spans, of the so-called A-truss type, with four 25-ft. panels.

It developed that several of the old spans were still stored in the yards and were available for use and that the metal of the old spans in position and that in storage was in good condition. Estimates were made for replacing one of the spans with two 50-ft. deck girders, building one new pier, and for replacing the span of the other bridge with a truss span designed for present loading. The scheme was also devised of strengthening the old spans by the use of the metal of the similar spans held in storage, and this was adopted.

The reinforced spans are ample for Class E-55 loading and the additional material was added without interruption to traffic. The required modification of the substructure was slight, no changes in the old spans were necessary except for the connection of new metal, and the total additional new metal required was only about 15 tons per span. This method was especially advantageous in view of the difficulty of securing new structural metal work in the summer of 1918, while the money outlay was considerably less than that required for all new material.



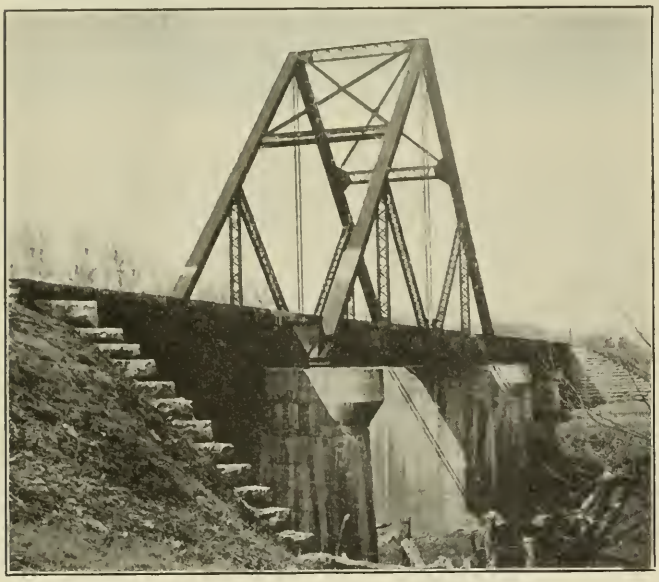
Manner of Reinforcing the Old Floor Beams with Beams Hung from Both New and Old Trusses and Method of Lifting the Ends of the New Trusses

The added trusses are set outside the existing trusses at 3 ft. 1 in. centers. Diaphragms connect the pairs of trusses at the three intermediate panel points and support the floor beams. The trusses are also connected by occasional batten

plates. A new floor beam was placed underneath each existing intermediate floor beam and riveted to its lower flange, forming a composite beam. The new beams extend out and hangers from their ends connect to the diaphragms joining the trusses. The stringers in the existing spans were eight feet center to center. Extra stringers two feet center to center were put in between them to divide the track loads.

The end floor beams were not reinforced, but the piers were built up, and special shoes provided to support the ends of the two middle springers. The lower lateral system was somewhat modified so that connection was made to the new stringers as well as the two original ones.

The erection was very simple and required no falsework. The piers were first cut down a distance of about five feet and built up in reinforced concrete, with the ends extended sufficiently to provide seats for the shoes of the new outside trusses. These reinforcing trusses were erected by suspending them from the existing span and the new floor beams were similarly swung in place and supported. After connections at the intermediate points had been made, the ends of the added trusses were jacked up, and suitable shim plates placed under the end shoes to subject the new trusses to enough deformation so that they would take their share of the load. Careful distortion measurements made after the



One of the Old Spans After the Piers Had Been Prepared to Receive the New Trusses Outside the Old Ones

reinforcing of the spans was completed show satisfactory, although not exact, distribution of live load stresses between the trusses at each side.

The work was carried out expeditiously and the completed structures, while somewhat unusual in appearance, are rigid, substantial and of ample strength. The estimates of the cost for the bridge where two 50-ft. girder spans and one new pier could have been used, was about $11,000 for new construction throughout, and about $8,000 for the reinforcing of the existing span. For the bridge where a 100-ft. opening had to be maintained, the cost of a new bridge throughout was about $19,000 and of the reconstruction with four trusses, about $7,500. These figures represent the cash outlay, without allowance for the amount the railroad charged itself for the old metal stored in the yards, nor for the salvage value of the old spans had they been removed. The total cash outlay, therefore, was cut down from $30,000 to about $15,000—a matter of some importance during the war-time conditions.

The two pictures are not of the same bridge, but one shows the unaltered span at one of the crossings after the piers had been lengthened to provide for the new trusses, and the other shows the reinforcing trusses in place on the other bridge and the superstructure work practically completed.

The scheme for the work was devised and the plans prepared by Harrington, Howard & Ash, consulting engineers, Kansas City. The work was carried out by the Kansas City Bridge Company, all under the direction of J. M. Weir, chief engineer, Kansas City Southern, Kansas City.

Senate Discusses Railroad Labor Question

THE RAILROAD LABOR SITUATION was the subject of a general discussion in the Senate on September 4 initiated by a speech by Senator Underwood of Alabama, who discussed the labor provisions of the Cummins bill and advocated the adjustment of wage disputes by the same tribunal that fixes the rates.

"Industrial wars between labor and capital must ultimately find a solution," he said, "that will stand for industrial peace without resort to force to settle the matters in dispute or we must admit that the advance of civilization has come to a halt. The great difficulty that confronts the country in the settlement of its labor disputes is the fact that up to the present time we have found no sound basis on which to rest the settlement. The avoidance of railway strikes and lockouts in the future is of far greater importance in the nation than the settlement of ordinary industrial disputes. In the latter case the issues involved are largely confined to two contending sides and the public at large, as a rule, has only a remote interest in the controversy, but in disputes between labor and capital engaged in transporting the commerce of the country, the public's interest is vastly greater than that of the owners of the property or of the wage earners in their employ.

"Having the power to act, the question confronts us as to whether the time has come when the Congress should exercise this power and appoint a commission to determine this grave and pressing question. The successful solution of the wage problem on the interstate railroads of the country is most essential to the Nation's economic life and of vital importance to every citizen of the land for it must be borne in mind that an increase of the rate of pay of the men employed in transportation is almost sure in the end to translate itself into increased freight and passenger rates that must be paid by the public and borne by the commerce of the country.

"There is but one way out, in my judgment, and that is to appoint a tribunal with the power to adjust these matters, which has the time to consider and the opportunity to know the facts. Such a tribunal must not only have the power and be prepared to do what is right and just by the labor employed on the railroads but must have authority and power to see that property is not confiscated by its decisions. For, should you confiscate the property of the transportation companies of America, you would break down the channels of transportation as effectively as you would break them down in a strike, with the resultant injury to the people of the United States. A tribunal of this kind must also have the authority and opportunity to consider the rights of the shippers and travelers of America, who in the last analysis will bear any increased burden that falls on the carriage of property or persons over the transportation lines. This tribunal must have authority and power to protect the rights of the whole people of the United States against the recurrence of lockouts and strikes.

"What body, then, is most capable of determining all these

questions and fairly adjusting them to the interests of all parties concerned? A board of arbitration to be appointed by the employers and employees of the railroad companies of the United States will only look to the matters in dispute between the contending parties, and will not have in mind the ultimate rights of the people. The general courts of the land are not equipped either with the knowledge or the power to obtain information in reference to the cardinal facts that must decide the controversy. If you want a final and just solution of such a controversy, you are practically driven to leaving the decision to a governmental commission that has full and ample opportunity to investigate the rates of wage, the earning power of the transportation companies, the cost of living, the burden that rests on the shipping public, and after a fair and full investigation, to determine what is a fair, just, and living wage for the men and to how great an extent a fair, just, and living wage may be increased to enable the toilers to secure the higher ideals of life and living; second, how far this charge can be placed on the capital of the corporation without breaking it down, destroying the value of its securities, bankrupting its property, and taking away from the investing public a fair return for capital invested; third, how far an increased charge for labor, interest, or supplies can be handed down to the public without doing injustice to the shipper and traveler and without becoming a menace to the development of the industry of the country.

"All of these questions must be determined by a court or an independent commission, but their findings, except so far as they may determine the rate for transportation that must be paid by the railroad companies and the rate of wage that must be received by the men if they continue their employment, will be academic, because they will have no power to operate on the side of the problem in which the general public is interested. The power to determine what are just and reasonable rates of transportation of persons and property over the interstate railroads of this country is fixed by law, and any increase or decrease of these rates must be made under the law of the land. Therefore it is essential that the board or commission that is given the power to adjust the wage scale of the men must also have the power to reflect its findings into the rates charged for the transportation of persons and property over the railroads. The board or commission that is created for the determination of these grave questions must determine whether the rates for transportation shall be increased and whether a charge made against the railroads for increased wages shall remain a charge on its capital, or whether in justice and fair dealing, it shall be handed on to the shipper and the traveling public.

"It is therefore clear to me that the same power that has the right to fix the rates of transportation should have the right to fix the rates of wage and the hours of labor on the great transportation companies of the United States, and that this power and this duty should be given irrevocably to a governmental commission or board in order that it may do justice between employer and employee. The granting to a governmental commission or board of the power to determine the hours of labor and the rate of wage will solve the problem for the future. Men will not strike against the just decisions of the government. After a fair determination of the controversy by an impartial tribunal, public opinion will force the contending parties to accept the verdict rendered as final. It must be done in the interest of the men involved, the industry of the people, and the peace of the Nation."

In reply to Senator Borah of Idaho, Senator Underwood said he was not advocating compulsory arbitration. He thought the policy of arbitration has failed, but that the time has come when the government should fix a just and fair wage and make strikes impossible. "A universal strike on the great interstate commerce carriers of America is unthinkable," he said, "and it should be prohibited by law just as you prohibit a man from burning his house for fear he may set fire to his neighbor's house."

Senator Borah wanted to know how he would compel the men to accept the wage fixed in case it was unsatisfactory. Senator Underwood said he would not attempt to do that. He would merely prohibit them from conspiring for the purpose of interfering with commerce, as proposed in the Cummins bill. Senator Robinson pointed out that the bill expressly prohibits the right of the employees to quit at will but it does penalize combinations or agreements among them to interfere with commerce. Senator Borah said he could conceive of large numbers of men quitting work because of dissatisfaction with their wages without the intent to interfere with interstate commerce and he thought it would be difficult to draw the line with sufficient accuracy to determine the intent. "Your law will be ineffective," he said, "because the men will say, 'we are not desirous of interfering with interstate commerce. We simply say that your wages are too low. We are going to seek work somewhere else.'" He said he was in favor of a government tribunal to adjust the question of wages and to call the employer and employee together and to avoid strikes and force just as often as possible, but he did not believe it is wise or that Congress has the power to go as far as to say that if the men are not satisfied with the judgment of that tribunal they shall be punished through the criminal processes of the law.

Senator Underwood said: "But I believe that the hour when the government establishes a fair and just tribunal where these men may have their day in court 90 per cent of them will be willing to accept the findings of the court and that will end all controversy, and if the other 10 per cent want to quit the opportunity will be given to them and other men will take their places."

Senator Williams of Mississippi said: "When a lot of men strike because their living conditions are intolerable or because their wages are not sufficient that is a thing with which we are approvingly acquainted, but we are beginning lately to learn a European habit and it is chiefly against that European habit that the provisions of the bill would operate. Men are no longer striking because they are not getting enough to give them a good standard of living. They are striking out of sympathy with one another, to enforce general propositions that have nothing to do with their individual conditions and to force the Congress of the United States to do things that they are afraid the Congress does not want to do. Quitting work is one thing. Attempting to coerce Congress and the public by closing up the avenues of interstate commerce and cynically suggesting 'starvation or surrender' is another thing and all wrong and intolerable."

Senator Thomas of Colorado suggested that in the passage of the Clayton law Congress exempted agriculturists and laborers from the operation of the law. Senator Williams said he had voted for it at the time under the idea that he was helping the under dog, "but," he said, "things had not then assumed the position they have now assumed of having men threaten us that unless we enacted certain legislation they would enact it by force."

Traffic Work Lectures.—The University of Cincinnati, in its College of Engineering and Commerce, will have a course in traffic management this year. Studies and lectures will be given evenings to accommodate those engaged in commercial affairs.

Lehigh Valley stockholders on June 15, 1919, numbered 15,689, with an average holding of 77 shares. In 1918 there were 12,613 shareholders, with an average holding of 96 shares, according to a statement by President E. E. Loomis. Nearly 37 per cent, or 5,765 shareholders, are women.

Executives Protest Against Limitation of Income

WASHINGTON, D. C.

THE ABILITY of the railroads to finance necessary improvements would be seriously impaired, in the judgment of railway executives, by the provision in the Cummins railroad bill, introduced in the Senate last week, which proposes to limit the amount which a railroad company may retain out of its earnings from rates prescribed or regulated by the government, according to a statement filed with the Senate Committee on Interstate Commerce on September 10 by Thomas De Witt Cuyler, chairman of the Association of Railway Executives, on behalf of the steering committee of the association. This feature of the bill, Mr. Cuyler says, by removing the reward of success, would effectually defeat the apparent desire of Congress and of railroad economists to so establish railroad credit as to make it possible to finance railroad improvements partially by the sale of stock rather than solely by bonds.

Mr. Cuyler's statement follows: "The responsibility for the improvement and development of railroad facilities, and of raising the money from time to time needed to finance the same, rests upon the boards of directors and the stockholders of the railroad companies, of whom the railway executives are the authorized representatives and for whom they are the authorized spokesmen.

"In view of this responsibility, the steering committee of the Association of Railway Executives, appointed especially for the purpose of seeing that the facts and the circumstances affecting the railroad problem are properly presented to your committee and to the corresponding committee of the House of Representatives, without undertaking at the moment to review in detail the provisions of Senate Bill 2906, presented by Senator Cummins, deems it an imperative duty to call special attention to one feature which, in its judgment, seriously endangers the transportation interests of the country and the constitutional protection of all property.

"While adopting the alternative of private ownership and operation, and relying upon private capital, rather than upon government ownership, to provide the transportation facilities which the country requires, this bill, for the first time in the history of our legislation, undertakes to limit the amount which a company, by good management, fortunate location, efficiency, and other lawful means, is able to save out of the rates which the government itself prescribes or regulates. The bill provides that, if any company shall receive from operation, during any year, more than a 'fair return,' to be determined by the Interstate Commerce Commission, on the value of its property, the excess above such 'fair return' shall be paid over to the government within the first four months of the succeeding year.

"It ought to be borne in mind that the earnings of the companies are to be made from rates fixed or authorized by the commission. Inasmuch as the Congress has no right to authorize the collection of unreasonably high rates from the shippers who happen to need the services of a particular road, or to make rates higher than is reasonable for the service, it must be presumed, as against the rate-making power, that the rates which it prescribes or authorizes are reasonable. It follows that any earnings which a company makes will be derived from reasonable rates. Otherwise, the shippers, or those on some roads, would be over-charged and grossly wronged.

There is no such thing as unreasonable earnings from reasonable rates, and, therefore, if the rates are not more than reasonable, as would be presumed if lawfully made, it is impossible to conceive of there being an excess of earnings over a fair return. Returns cannot be more than fair if provided by reasonable rates. The only use made in the law of the terms 'fair return,' is to establish a test below which the legislature may not without confiscation reduce earnings from rates. It is, we think manifest, that a company is entitled, as a property right, to all it can save from reasonable rates, and to deny it this right would be to deny it the right of constitutional protection for its property. The attempt to do this, no matter how high the purpose, would be the beginning of a fatal policy which would tend to the removal from all property of its constitutional protection.

"Moreover, to take from a company a part of its net earnings derived from reasonable rates, not only diminishes, and, in some cases removes, the incentive to competitive effort, efficiency and economy, but forecloses the hope of success as an attraction to capital. This limitation, together with the necessity of constantly expending substantial sums from the apparent net earnings in renewals and replacements incident to maintenance of roadway and equipment, would in our judgment, seriously impair the ability of the railroads, upon which the country is dependent for handling its business, to finance the necessary additions, betterments and equipment.

"Instead of attracting private capital and establishing the credit of the railroad companies, which all seem to agree to be necessary at this time, this provision, in our judgment, by denying constitutional protection to this class of property, by removing from it the reward of success, and by seriously complicating the question of keeping the property up, would repel capital and tend to impair the credit of the railroads generally. Investors will hesitate to go into a business in which, not merely the rates which may be charged are prescribed by law, but the amount saved by good management, thrift, economy and efficiency is to be taken and appropriated for the benefit of others, or for some governmental purpose, to such extent as a government body, in its unlimited discretion, shall deem fair;—a proceeding which, in the common judgment of mankind until now, has been regarded as plain confiscation.

"We have no hesitation in urging the above mentioned view, notwithstanding the apparent support of this provision by some business men and institutions who, we fear, approach the subject too much from the standpoint of bondholders. The problem must be considered from the standpoint of stockholders as well as of bondholders. Bond interest comes before dividends on stock, and a limitation of net earnings ample to provide interest, might still ruin the stockholders; whereas the stockholder cannot protect his holdings without, at the same time, protecting the interests of the bondholder. A limitation on earnings which a bondholder could perhaps regard with equanimity might be destructive of the interests of the stockholders. The limitations provided for in the bill would, in our judgment, effectually defeat the apparent desire of Congress and of railroad economists to finance railroad improvements partially by the sale of stock rather than solely by bonds, since it requires the stockholder to take all the risk of the business, while denying him the right to profits made from reasonable rates, thus making his return uncertain in bad years, and yet little, if any, greater than the return on bonds in good years."

The "Drouth" produced by the federal prohibitory law is given as the reason for an almost complete shrinkage of business at Taylorton, Glenscreek and Labrot, Kentucky, on the Lexington & Eastern branch of the Louisville & Nashville; and the road has asked the State Railroad Commission for authority to discontinue the agencies. The closing of distilleries has reduced business at these points to practically nothing. Objection was filed by E. H. Taylor, Jr., & Sons, who expect that large quantities of whiskey soon will be withdrawn for export.

Director General Hines Testifies on Coal Situation

Sees No Cause for Alarm in Shortage as Compared with Full Potential Capacity of Coal Production

WASHINGTON, D. C.

THE RAILROAD ADMINISTRATION expects to be able to transport all the coal that will be needed this year, but it believes the government should find out more accurately what the requirements will be before the failure of the railroads to furnish all the cars the coal operators would like to have is allowed to be taken as a pretext for increasing the price of coal, Director General Hines testified on September 4 before the Senate subcommittee that is investigating the coal situation. Mr. Hines and other representatives of the Railroad Administration also replied to some of the criticism made by representatives of the National Coal Association.

An abstract of Mr. Hines' statement follows:

"Broadly, as I understand the situation, the conditions in the first half of this year have been radically different from the conditions likely to prevail in the second half of the year. For the first six months of this year I don't understand there is any serious contention that a shortage of transportation interfered substantially with the production of coal. The fact was that during that period the car supply and all transportation facilities were, generally speaking, very much in excess of the coal that was produced. While at a specific mine or in a specific district at some period there may have been a transportation disability (and they are likely to arise, and at any time) which may have interfered temporarily with the production of that mine or in that district, I am satisfied it is a correct statement, broadly, that in the first six months of the year the transportation facilities were very much in excess of the coal production and any shortage in production was due to other causes, except in cases which, viewing the total situation, could be regarded as virtually negligible. I understand the principal reason for the smaller production of coal was that the public was not willing to buy the coal; in other words, it was a condition of no market and not a condition of transportation shortage.

"As to the second six months, the public is getting to the point of buying coal and that is bringing into operation to a much larger extent the matter of production disabilities and also transportation disabilities. They will play an important part in the second half of the year, but certainly the transportation disabilities did not play an important part in the first half of the year.

"As I understand it, the purpose of this committee's investigation is to promote the public interest with respect to coal and as I look at that interest it is that there shall be an adequate amount of coal produced and transported and that the public shall be able to get that coal without having to pay an excessive price for it.

"The one of these objects with respect to which I have responsibility is the object of transportation, and I want to explain that the Railroad Administration is doing everything in its power to meet a transportation situation of unusual difficulty. We are not standing on any preconceived notion of what remedies are necessary, but we are reviewing the matter constantly, from day to day, and adopting new methods as they appear desirable; in other words, we are not handling the matter in a routine way in any sense, but with the liveliest appreciation of the importance of the situation and with a constant purpose of utilizing every expedient that can be developed which will help to enable us to transport during the latter part of this year the coal which the public omitted to buy in the early part of the year and which it will want to buy. We welcome suggestions from every source. We have profited greatly by the comments that have been made in the course of this investigation, and are taking advantage of every practical suggestion. We are proceeding upon the idea which was made clear in my reply to the Senate resolution that it is going to be difficult to transport in the latter half of this year the coal the public will want to buy. We are not awaiting any additional information nor are we concerning ourselves with excuses. We have got a situation and we have got a possibility of a large amount of coal to be transported which will tax the railroad facilities, and we are dealing with it as a practical matter and endeavoring in every possible way to make that transportation come up to the maximum.

Car Movement Not Slowed Down

"There is one point I would like to emphasize. It is a point I find causes a great deal of confusion in other instances as well as this. The suggestion has been made that the Railroad Administration has been inefficient in the handling of coal because the number of miles per car per day made in the first half of this year was less than was made last year, and that that indicates the cars were not moved at sufficient speed. That factor is exceedingly misleading and I think it is rarely if ever a useful factor. It is obtained by taking the total number of cars on the railroad, multiplying it by the total number of days in the period, and dividing that into the total number of miles. The result is that when there is a reduced volume of transportation so that a great many cars are stored, and so that on account of the absence of congestion the traffic moves at an exceptionally good rate of speed, the average miles per car per day show less than normal, because there is figured into the average a great many cars which are not moved at all. In the first six months of this year traffic of all sorts, generally speaking, was below normal, coal traffic particularly was belong normal, and the result was that the number of cars actually being used and actually making miles at all was exceptionally small, and yet when you take into consideration all the cars not moving at all, not in service at all, that pulls down your average. Thus the inference drawn from that factor of average miles per car per day is wrong. As a matter of fact the movement of traffic in the first half of this year was very satisfactory, there was no congestion to interfere with it.

"My motive in this matter is two-fold: in the first place, I have the most lively sense of my obligation to do the very best I can to give the public an adequate service, and in the second place, I am exceedingly anxious to minimize as much as possible any transportation shortage with reference to coal because I am afraid such a shortage is in danger of being made a pretext for increasing the price of coal. From both these standpoints it is the desire of the Railroad Administration to meet this situation in every possible way.

"My reply of August 14 to the Senate resolution calling for certain facts with respect to coal emphasized two points, one of which was the prospect of transportation difficulties for the rest of the year. The reply pointed out that if the estimates of the amount of coal to be consumed in the rest of the year were approximately correct there would be very serious difficulty in transporting the amount of coal transported in the latter part of last year under war conditions

when there were in effect numerous provisions and restrictions which facilitated the transportation of coal and which were not in effect this year. Among these provisions were the zoning of coal which prevailed last year and which accomplished a substantial economy in the use of transportation. With the signing of the armistice that was terminated, being regarded as a war measure, and undoubtedly an important economy in the transportation of coal was necessarily lost, because now coal from practically any part of the country can go to any other part of the country where market conditions admit of its being transported, and the result is that much coal is transported a much longer distance than the corresponding quantity of coal was transported last year. This involves an additional use of all the transportation facilities: cars, locomotives, tracks and terminals, and makes a substantial difference in what can be done. Other important factors were that last year under the war conditions there was less detention of equipment at destination and, through the establishment of certain car pools, the number of cars of coal that had to be held at certain destinations was very much less than was the case in peace times, so that we have a situation where the amount of coal to be transported may come close to what was actually transported last year, and where we will not have the benefit of certain war arrangements which undoubtedly very greatly promoted the transportation of coal last year.

"I also emphasized the danger that these transportation difficulties might be used as a pretext for increasing the prices of coal.

"I want to reiterate both these propositions. My best judgment is, after constantly reviewing this matter, that we are going to be able to transport the necessary coal. We propose to adopt whatever expedients are necessary to accomplish that purpose.

Car Shortage Excuse for Higher Prices

"Now, we must all recognize that these transportation difficulties are going to be played up to their full value and probably beyond it. They always have been and I take it they always will be. Every transportation difficulty, either local or general, which will manifest itself between now and December 31, or between then and the end of the coal year next March, is going to be laid before the public, emphasized, exploited and perhaps expanded. Now, that is a practical condition that we have to meet. I mention that not because I object to it, for that is a part of the job of the director general to be made the target of complaints of shortages or defects in transportation wherever they occur in the country. It is a condition that we have to expect but I mention it because of the danger that these transportation difficulties, which are inevitable, will constantly recur throughout this year and will be so emphasized and stressed as to create a public state of mind of impending disaster which will furnish a favorable medium through which to increase the prices. I am apprehensive about that feature that transportation difficulties, which are inevitable, will be so stressed as to put the public in a state of mind where it will stand for increases in prices which it ought not to stand for. Now, that being the situation, the four specific suggestions I want to urge on this committee are these:

"I think it is highly desirable to get the most complete information possible as to the current production of coal, and as to the limitations on current production, either through transportation disabilities, or labor shortage, or absence of market or any other cause. My judgment is that the best way to obtain that is to give the Geological Survey ample funds to enable it to get this information in a complete form, and also to police and check the information in such a way as to be sure that it is accurate. My understanding is that at present the Geological Survey does not get reports from all the mines, although perhaps it does get reports from the mines producing the great bulk of the traffic. I understand that the Geological Survey has no way to verify the reports which the individual mines may make, or compare them with the reports made by the railroads. The information is available as reported to the railroads, but there is a very considerable amount of clerical work involved in making a comparison of the matter and I understand the Geological Survey is without the clerks and without the funds to make a thorough-going check of that information; so I believe that one thing which would be of very great value to the public, both now and permanently, is the adoption of a definite and permanent policy that some proper agency of the government —and I should think that the Geological Survey would be the best—shall have adequate funds to get complete information on this point from all of the mines and to check that information by comparing it with the information which the railroads have from their standpoint, and on the basis of that to make a report which will be both complete and accurate.

An Example of Human Nature

"We cannot get away from the fact that where a mine operator is in doubt as to the cause to which he can properly attribute any failure of his mine to produce the full amount of coal, it is human nature for him to attribute it to a cause for which he is not responsible. I think the tendency always will be that the operator, when the matter is left entirely to his own judgment, will resolve all doubts by charging that shortages of production are due to car shortages. I want to make it clear that I don't claim that any operator would deliberately misrepresent the facts, but where it is a matter involving elements of doubt, it is human nature, if a man is left to his own judgment, to resolve the doubt so as to shift the responsibility. If the Geological Survey had the necessary equipment to make the comparison between the coal operator and the report of the railroad as to what the car shortage amounts to, there would be an important improvement, in my opinion, in the accuracy of the reports, and that is said without any reflection on the honesty of the operators, but simply in recognition of one of the fundamental principles of human nature. I believe that the funds spent for that purpose will be returned manifold to the public in a saving in the price that it will have to pay for coal.

"While referring to a report of the Geological Survey, I would like to point out the fact that the report is on the basis of potential production by the mines. Comparing one week with another this is useful as it shows the trend from one week to another; but if it is to be assumed that the shortages in production indicated by that report correctly represents the actual loss in production, it is a very mistaken assumption.

"For example: These reports which the Geological Survey is making for, I think, about 2,500 operations, are based on a potential capacity which aggregates close to 16,000,000 tons per week. I understand the highest production that has ever been made in a week was only about 13,000,000 tons, and the highest that has been averaged for any considerable period of weeks is only something over 11,000,000 tons, so that this potential production of 16,000,000 tons per week is entirely misleading if we view it from the standpoint that any failure to realize that production in any week represents a loss to the public. If the mines had the facilities—labor, transportation and markets—to operate up to a capacity of 16,000,000 tons per week, that would supply the entire demand of the country for coal in a fraction of the year, and they couldn't run at all for the rest of the year, so that the showing is very misleading as indicating a corresponding real loss in the production of coal for any period stretching over several weeks.

Information as to Requirements Needed

"Now, the second point that I want to ask the committee to consider is the arranging through some proper governmental agency—and again I think the Geological Survey would be the best one for the purpose—to get an estimate as to what are the actual requirements for coal in the rest of this year, and also between the end of this calendar year and March 31, the end of the coal year. Necessarily the situation is involved in considerable confusion because the conditions have been abnormal in many important respects during this year. As I understand it, we started in with an abnormal amount of coal in storage, so, of course, that took the place of coal which would be produced in this year, to an important extent. We also started in this year with a suspension of activities on the part of a great many industries which were very active last year and which last year were consuming exceptional quantities of coal, so that in the early part of this year especially it seems reasonable to assume that the actual consumption of coal was considerably below normal in many important lines of business. We also had a situation where we had the mildest winter that has ever been known in the history of the country, and the preceding winter was the most severe that the country has ever known, so presumably the domestic consumption of coal in the early part of this year was very much less than the domestic consumption of coal in the early part of the preceding year, and in many part of the country bituminous is the only coal that is used for domestic as well as other purposes.

"Even now conditions are not normal. We are uncertain as to what the prospects are for the rest of the year as to coal consumption in this country, as to coal to be exported, so we have a situation in which it is peculiarly difficult to make a satisfactory estimate of the coal which must actually be produced in order to meet the requirements of the country. Now, so long as that is a very uncertain element, there is danger that the amount of coal which will be needed may be exaggerated, so that my second suggestion is that the committee arrange, through a proper governmental agency, to get an estimate—of course, as accurate as possible—as to what will be the actual total requirements for the rest of this year, taking into consideration, of course, the rather small production in the early part of the year and the amount of storage on hand. In that connection I want to call attention to a point in my reply to the Senate resolution. I stated that in the first six months of this calendar year the railroads had consumed 26,000,000 tons less of coal than they had in the corresponding six months of last year. I discovered a day or two ago that that 26,000,000 tons was an estimate applying for the 12 months, and the actual extent to which the consumption of railroad coal in the first six months of this year fell below the consumption by the railroads of coal in the first six months of last year was 13,764,000 tons instead of 26,000,000 which I gave, which was the estimated amount for the entire year.

"Now another point which I think would be very useful would be for the committee to get information as to the prices both at the mines and to the consumers. It seems to me that we haven't any very satisfactory light on that subject, and I should think it would be a very useful matter for the public to know the prices at the mines, the cost of distribution between the mines and the consumer, and what has been the progress of those prices and how they compare with the government maximum prices which prevailed last year. My understanding was that these government maximum prices were fixed on the theory that they ought to be high enough to encourage production by many of the high cost mines because the total to be produced during the year had to be an abnormally large figure, and it would be of interest to know how the prices actually charged this year have compared with these government maximum prices which, in my judgment, were fixed on a high basis for the avowed purpose of encouraging during the year an abnormal production of coal so as to enable the high cost mines to produce coal freely.

"The fourth point I have in mind is with reference to transportation difficulties. My judgment is that we will overcome them to the extent of transporting the coal which the country needs, but these difficulties will be manifesting themselves all during the year. There will be a most favorable opportunity for stressing those transportation difficulties, creating the impression that there is going to be a serious shortage of coal, and, therefore, that coal had better be bought at a higher price rather than take the chance of waiting. I think, therefore, that we are in danger of having a state of mind created in which prices may be substantially increased.

"A coal operator may have a contract at prices fixed early in the year and if this state of panic develops on the part of the public he might get bids for coal at a much higher price. There will be a very strong temptation on his part to fill the orders which he can get at the higher prices and omit filling the orders to which he is already committed on the lower prices. This will tend to complicate a difficult situation. My thought is there ought to be an extension of the powers which the government had during the war under the Lever act to deal with problems of this sort. I think it would be a perfectly just exercise of the war power passed by Congress. The very fact that the weapon existed would go far to make it unnecessary to use it, and the government ought to be fortified by having an adequate power to deal with it.

"Now, I want to refer to one other matter which has been touched upon here, and that is as to the policy of the Railroad Administration with reference to the purchase of its own coal. Last January, I think it was, the question was raised whether the Railroad Administration would not fix a uniform price for coal in the various districts and buy coal at that price, apportioning its purchases among the various mines which were able to furnish the proper quality of coal. The disposition of the Railroad Administration was to ask for bids for this coal. That was the settled policy of the government, to secure the benefit of competitive bids wherever it was possible. The government had practically always been committed to that policy, but it was suspended during the war period. The representatives of the National Coal Association urged very strongly that we adopt the other policy—the fixing of prices and apportioning the coal. I gave the matter very careful consideration, and I felt it would not be justified for the Railroad Administration to assume that responsibility. The moment the Railroad Administration assumed the responsibility for fixing the price for coal it would have been charged with any failure of that price to meet the expectations of the operators and the employees, it would have had to fix the price high enough to cover a good many high cost operations, and a price so high as to probably be a very excessive price to many operators with low cost of operation. I felt that I ought to resort to the settled government policy of asking for competitive bids for coal, so I took special precautions to avoid the difficulties which it would be pointed out would arise if competitive bids were asked for.

Purchasing Policy

"Therefore we adopted the rule that the purchasing agent of each railroad would buy his own coal, and not through a central agency of the government. Each purchasing agent asked for bids from mines in the part of the country supplying his railroad and dealt with the matter separately. We also adopted the rule that we would not accept any bid unless the operator certified that the price was sufficient to

maintain the present wage schedule or scale and we maintained that policy. In one instance an operator made a bid and stated that it was not sufficient for that purpose and the bid was rejected. We also adopted the policy of making our contracts public. It was urged that unless that was done some operators might make unreasonably low bids to get a status in furnishing railroad coal which would be injurious to the employees and injurious to their operators, so we made the contracts public. We endeavored to adopt the most considerate policy to offset the objections that were urged by the National Coal Association.

"Now, I would be very glad indeed to see an investigation on that point, how much profit the operators made last year and this year, and just how they arrived at it. I don't believe there is a single exception where any operator made the price to the Railroad Administration so low that it would serve as a plausible pretext to increase the price to anybody else. My own judgment is that what reductions were made in price were only such as it would be perfectly natural for a customer who was purchasing throughout the year.

"Prior to the war the railroad companies used as a consideration of their coal contracts the factor that they would guarantee 100 per cent car supply for the railroad coal, and, of course, that was a very important consideration, because the operator furnishing railroad coal could be assured that he could supply them coal even in times of acute car shortage.

"From the railroad standpoint there were valid reasons for that because, after all, the railroad had to run. It had to have this coal if nothing else could be transported; but after that was thoroughly reviewed last year the conclusion reached was that the railroads ought not to use that as a factor in their coal contracts so that guarantee was dropped out. As a result, it was arranged that the Fuel Administration would see that the railroads got all the coal that they needed to run the railroads. I believe reference has been made here to the fact that there was a 10 cent reduction in the price of coal on account of that arrangement, but it is also true on account of that arrangement that the railroads paid a considerably higher price for coal than they had been paying before.

"In many instances the railroads had quite a large stock of coal in storage at the beginning of the year and, of course, there was a natural temptation to use that coal, but it was strongly represented to us that the mine labor situation was very serious because there was such a sudden and serious cessation in the demands for coal that many mines had to remain closed so much of the time that the employees could not earn enough wages to live on, and in consideration of that fact we adopted a definite policy to not consume our storage coal as rapidly as we would normally have done, and we held that coal in storage to a greater extent than usual and therefore bought more coal than we would have bought if we had used up our storage coal, as the general public seemed to be using up their storage coal. I am advised by our Division of Purchases that on July 1 of this year we had about 12,500,000 tons of coal in storage, which is about 3,000,0000 tons more than we had in storage when the government took over the railroads on January 1, 1918.

"It is important to bear in mind the further consideration that the present plan is for the railroads to be returned to private control on December 31 next. If the Railroad Administration buys coal and keeps it in storage and turns back the coal to the railroads on December 31 in excess of the amount which the Railroad Administration got from the railroads at the beginning of federal control, the result will be that the government will be tying its money up in coal for the benefit of the railroad companies. The substance of our contracts is that we will turn back the same amount of materials that we received, but if we turn back an excess amount the result is that the government is tying up its money in this excess amount of material and this will mean that the government will simply carry the obligation of the railroad company to repay it. The financial situation of the Railroad Administration has been such that I am satisfied we cannot afford to tie up any money in railroad materials and supplies in excess of what the contracts call for because Congress has been reluctant to make appropriations necessary to meet the situation which exists and we certainly could not make that situation more difficult by tying up government money unnecessarily.

"In conclusion I want to emphasize again that as to the transportation aspect of this matter we are doing everything that we can to meet the situation which has been brought about. We welcome advice from all sources and we stand prepared to give the committee any facts that it thinks it may need, and aside from that I urge on the committee the adoption of the specific recommendations I have made so as to put the public in possession of the facts which will be a protection to the public, and so as to give the government the control which will enable it to protect the public if the need for that protection arises."

Gutheim Discusses Car Supply

A. G. Gutheim, assistant manager of the Car Service Section, and Frank McManamy, assistant director of the Division of Operation, of the Railroad Administration, also testified last week before the committee and replied to some of the statements made by representatives of the National Coal Association attributing the deficiency in coal production mainly to car shortage and failure to repair cars.

Mr. Gutheim expressed some doubt as to whether a production of 500,000,000 tons of bituminous will be required this year as stated by the coal association on an estimate made by Dr. Garfield. The production last year was 585,000,000, but in 1916, when the industries of the country were running full tilt, which they are not doing now, he said 500,000,000 tons was sufficient. However, Mr. Gutheim said, it is the job of the Railroad Administration to transport all the coal needed by the consumers, whatever that may be, but not necessarily all that the coal operators have orders for because in times of coal or car shortage it is a common practice to place orders with two or three operators for the same tonnage in the hope of getting part of it. On the basis of the reports of the Geological Survey showing percentage of output lost on account of car shortage the potential capacity of the mines is about 850,000,000 tons and it is not necessary for them to work anything like full time to get out the production required. There will always be time lost on account of car shortage, labor shortage, no market, mine disability and other disabilities, Mr. Gutheim said, and it will still be possible to get out all the coal the country needs.

Mr. Gutheim took the position, however, that the thing to do is to find out what the requirement will be and then do what is necessary to get it. He suggested that the Railroad Administration might be able to help in getting a rough estimate, but Congress had not allowed the appropriation asked by the Geological Survey for this purpose. "If we have got a war time job," he said, "we ought to appreciate that we will need war time methods, and if the railroads are to put in war time methods the coal operators should consider seriously if they can assist by putting in theirs." He referred to the emergency measures adopted last year which made it possible to get out a record production of coal, such as the preferential car supply, high demurrage rate, zone system to avoid cross-hauling, pooling of various grades of coal and regulation to see that one consumer did not get what ought to

ıave been distributed among others. If the railroads are to be asked to handle an unusually large tonnage in the last ›art of the year the coal people should consent to some of ıese emergency measures," he urged.

Senator Frelinghuysen, chairman of the investigating com-ıittee, asked if preference could not be given to coal for a me. Mr. Gutheim said it could but the result would be ıat the complaints now made by the coal operators would ıerely be superseded by complaints from others and that ıst year there was a special reason for giving preference to ›al.

John Callahan, traffic manager of the National Coal ssociation, had spoken of the large number of cars tied up ı the transportation of slag, a large part of which, he said, as allowed to stay in the cars all winter and freeze up. Mr. utheim said that it was absolutely necessary in a territory ke the Pittsburgh or Youngstown districts to transport ag, burnt molding sand and ashes in order to get them out the way, but he had no information as to the claim of ıusual delay in handling these cars.

McManamy Describes Bad Order Car Situation

Mr. McManamy discussed the bad order car situation, ying the number of such cars is high at present but that the tion which was taken by the Railroad Administration two onths ago and which is still being diligently followed will, his opinion, be sufficient to meet the demand for coal cars ıless it reaches abnormal proportions, in which event the fficulty will be due not so much to car shortage as to the rminal facilities.

In July, 1918, Mr. McManamy said, 14.9 per cent of the comotives were out of service for repairs and 798 were ›red in serviceable condition. In January, 1919, there ere 16.9 per cent out of service for repairs and 1,582 stored; April, 18.4 per cent were out of service and 4,604 stored; July, 17.9 per cent were out of service and 3,668 stored. ıerefore, he said, the general condition of the locomotives day is better than at any time during federal operation or ıring the three years before and there is no ground for prehension. There will be sufficient motive power to ndle all the business offered to the maximum capacity of e terminals.

With respect to freight cars, Mr. McManamy said, the uation is somewhat different. On July 1, 1918, there were 7,403 bad order cars, or 7.1 per cent. The force of shop-en was then at its maximum and was working 70 hours a ek. In December the number of bad order cars had been re-ced to 130,506, or 5.4 per cent. After the armistice the urs were reduced from 10 a day for 7 days a week to 9 urs and 6 days a week and on December 9 to 8 hours a y. This was fully justified, he said, by the prospective crease in business and was necessary both because of the ere strain under which the employees had been working d because of the importance of reducing maintenance costs reducing the amounts paid for punitive overtime. The crease in business was sufficient to make it possible to intain the low percentage of bad order cars up to March, which time it was 5.2 per cent, which for the country at ge, Mr. McManamy said, is an almost ideal condition. e necessity for further economy on account of expenditures maintenance of equipment as compared with the test ›iod made it seem advisable to make further reductions in department forces and this was done by furloughing men many points and by further reducing the car department ırs. As a result the number of bad order cars began to rease in April and until it reached 8.7 per cent in July, a ıl of 215,953.

With the increase in business the shop forces were in-ased, first by increasing the work on the box cars to meet the early grain movement, and before the grain movement became heavy sufficient cars were provided to handle it as promptly as elevator capacity and terminal facilities would permit. Meanwhile, Mr. McManamy said, the low coal shipments could not be charged to the Railroad Administration because they were due to no market. Anticipating an increase in production the Railroad Administration on June 19 issued instructions to increase car repair forces and this was followed on June 27 by instructions that wherever the demand for coal cars made it necessary cars requiring light repairs should be given preferential attention. This was followed on August 16 by instructions to increase the hours of the car department forces to nine a day on all roads where the number of bad order cars was sufficient to keep the men profitably employed or where work could be furnished from connecting lines without excessive empty mileage, also to give special attention to grain cars, coal cars and refrigerator cars in sections where they would be most needed.

This action was begun, Mr. McManamy said, at a time when the loss of coal capacity was 41.4 per cent, of which 26.2 was on account of no market and but 3 per cent on account of car shortage. The effect had already become apparent in a reduction of 8,414 in the number of bad order cars and of 5,741 in the number of bad order coal cars. The number of employees was increased about 8,000 and their hours to nine a day, making an increase of 12½ to 15 per cent in the number of hours worked.

"The increase in bad order cars," Mr. McManamy continued, "is not at all due to a slowing up of the repair program. It is to a substantial extent due to the fact that since the close of the war the railroads are endeavoring to get their cars in better condition and are therefore sending cars to the repair tracks which at any time in the past four years would have been continued in service without repairs. They are also holding cars for heavy repairs which at any time in the past four years would have been put in service with comparatively light repairs and which, if the demand for cars becomes sufficiently urgent, can again be returned to service with comparatively light repairs.

"The strike also interfered seriously with the car repair program, but I think we can reduce the number of bad order cars very substantially in the next two months unless we have some unforeseen labor troubles—and I do not look for them."

Mr. McManamy also testified that 68,598 of the 100,000 cars ordered by the Railroad Administration have been built, of which 51,428 are in service and 17,170 in storage waiting to be stencilled, which is being done at the rate of 700 a day. The balance of about 31,400 cars is being turned out at the rate of 220 per day and includes 10,658 double sheath box cars, 12,075 single sheath box cars, 3,562 50-ton gondolas, 949 hoppers, 1,826 low side gondolas and 2,332 70-ton hoppers.

C. E. Lesher, in charge of mineral fuel statistics of the Geological Survey, testified that at the present time the reason for the shortage of coal production is transportation disability but that if consumers had bought coal for next winter in the Spring, when the transportation was there, they would not now be facing that condition. "They are asking for it all in a bunch," he said. He also said that if there were always a full supply of cars and the labor worked five and one-half days a week, the country could not absorb the output of coal.

F. S. Peabody, formerly chairman of the committee on coal production of the Council of National Defense, denied that unduly high prices are being charged for coal and said that legislation calculated to affect the law of supply and demand would not remedy the coal problem. He said there is no probability of a coal shortage this winter unless deliveries are held up by a shortage of cars or by labor troubles.

Government Ownership and the Labor Situation on French Railroads

By a French Correspondent

As in all countries, the question of government ownership of railroads is one which is being much discussed in France at the present time. Most of the leaders of the various labor unions are using government ownership of railroads as one of the principal planks of their platform, but as a matter of fact there is great indifference with regard to this matter among the employees themselves. The latter are particularly interested in the application of the eight-hour law for their daily work, in being represented on the boards controlling disciplinary action, and in obtaining higher wages corresponding more nearly with the present high cost of living. If the employees gain these points they care little as to whether the railroads are owned by the government or by private companies. The following are the four main advantages which the advocates of government ownership believe will be obtained by applying this policy to all railroads in France: Uniform scale of wages; uniform scale of rates; abolition of territorial or zone limits between railroads with uniformity of equipment, and a uniform system of signals.

The questions are now being studied by all the railroads, and in a few months' time the first two will probably be settled. When these absolutely essential reforms have been adopted, the main advantages to be obtained by government ownership will already have been attained, and the strongest reasons for adopting that policy will no longer exist.

It must be said, however, that in a way this question will essentially settle itself some years hence. In France the different railroad companies were given "concessions" or grants for 99 years, and these all expire during the years 1958, 1959 and 1960. At that time the railroads will automatically be turned over to the government. It is very probable, however, that the government will take them over under very different conditions from those already established with regard to its administration of the French State Railway System. It is likely that the directors and personnel existing on the various railroads at that time will be kept, and that the directors will be given much greater freedom and power of initiative than is the case at the present time with the State Railways.

Fortunately the expiration of the grants for these railroads will not take place for 40 years. It would have been most unfortunate had this come about at the present time or even in the immediate future, on account of the very unsettled conditions in France resulting from the war. The whole organization of France is now so greatly upset by this tremendous upheaval, and there are so many disturbing labor questions being agitated, that it would have been almost impossible to have calmly and wisely studied the methods to be adopted by the government for operating the railroads under its ownership.

The case of the State Railways, owned and operated by the government, can be taken as an example of the actual effects of government ownership in France. It may be said that this experience has shown, so far, great disadvantages and no advantages. The managers of the railroad have had more difficulties to cope with in running the railroad and they have not obtained equivalent results as regards earnings when compared with the privately owned roads. The employees are not as well taken care of and have not the same opportunity for rapid advancement when they show ability as when the railroad was owned by a private company. A large number of these employees have become dissatisfied and have left the State Railways to take up other government positions. Men very rarely leave the privately owned French railroads.

Take the Paris-Lyons-Mediterranean for instance: Out of the 80,000 employees, not more than 2,000 or 3,000 leave yearly. Of these, the great majority are dropped from the rolls on account of death, sickness, or old age, and very few because they voluntarily wish to change their business. In this connection it is a rather interesting fact that as a rule railroad employees in France are married men. It is a great exception to find an unmarried man in the employ of the railroads at stations. The employees take up their work with the companies in a certain locality, bring their families, settle down and end up usually by spending their lives there. In France one does not find the thousands of employees, as in America, who try railroading for a time and then move on and try something else. Almost all the employees are, therefore, men who remain and who work year in and year out for the same railroad.

There is no idleness among the regular employees on account of changes in the volume of traffic at different periods of the year. This traffic, of course, varies according to the season. For instance in the autumn there is a big coal traffic. In the late winter there is a tremendous movement of fertilizers to different regions of the country. In the spring vast quantities of early vegetables have to be shipped; later come the fruit crops and then the wine. Of course, the passenger traffic of the different regions varies also with the seasons.

These changes in the volume of traffic are handled in the following way. In each region, when the traffic is at its maximum, two methods are employed: The first is to send employees, with their consent, from a part of the railroad where the traffic is light to the regions where it is heavy. The second is to employ temporary workmen, drawn from the region in which they are needed. These men are almost invariably farm laborers, and as France is a great agricultural country, they can always be readily obtained, except during the harvest season. These men are known to the station masters in the different localities, and the same ones are used from year to year. This method works out splendidly as it not only furnishes additional employees for the railroads during the periods of stress, but it also eliminates idleness among the farm hands at times when they otherwise would have no work.

All of the railroad companies in France have done a great deal to try to improve the living conditions of their employees. In order to permit the employees to obtain, at low rates, foodstuffs and the first necessities, such as shoes, co-operative stores and "économats" have been established. In the co-operative stores the employees themselves control the entire organization and direction, but the railroad companies try to facilitate their work in every way possible. In the case of the "économats", or company stores, the railroad companies control the organization and direction. This latter method is that employed on the Paris-Orleans. Canteens have also been established. Thanks to these stores and canteens, the employees are able to purchase foodstuffs and the first necessities at cost price.

The railroad companies have also built colonies of wooden houses for their married employees. The Paris-Lyons & Mediterranean, for example, has bought American army barracks to the value of 2,000,000 francs for this purpose. This also encourages the unmarried men to get married, for they often experience great difficulty in finding lodgings when they are single.

With regard to technical schools for railroad employees, France is far behind the United States. France has some of the finest first-class technical schools in the world, such as the School of Mines, and the School of Bridges and Highways, but she had not had good secondary technical schools. New workmen in the railroads are generally sons of present employees, and they work in small groups in the different

shops, learning their trade under an apprenticeship system. For this they are paid two or three francs a day. This lack of good secondary semi-technical schools for railroad apprentices is very unfortunate, and the more progressive managers of the railroads are planning to study American schools of this kind in order to institute a similar system in France.

The common objection of ignorant workmen to modern and up-to-date machinery exists to a great extent in France, but the managers of the railroads are disregarding this and are gradually installing modern machinery and methods everywhere. In cases where the number of men is reduced for this reason, these employees are not discharged, but are used elsewhere.

The above brief description will show the general methods of handling employees on the French railroads and the prevailing views concerning government ownership. Although conditions, in many ways, are not the same in France as in America with regard to railroad operation, much can be learned by the railroad men of each country by studying what is being done in the other country. The Americans who co-operated with the French during the war in railroad work realized that there was much to learn in France, and the Frenchmen through the contact with these Americans have become tremendously interested in modern American railroad methods, such as train despatching and block signaling.

A great many of the leading French railroad men are planning to visit America shortly—among others Monsieur Claveille, Minister of Public Works—and it is certain that American railroad men will take great pleasure in giving them every chance to study our railroads and their methods.

According to a report on traffic conditions for the week ended August 25, while the recent railroad labor disturbances have subsided in nearly all the regions throughout the country, the movement of commodities, with few exceptions, has not kept pace with the corresponding period of last year. In the Allegheny region, for the week ended August 25, revenue freight handled decreased 8,012 cars, compared to the same period last year. In the Pocahontas region, as compared with the week ended August 25, 1918, tidewater coal dumped decreased 22.7 per cent.; other coal decreased 8 per cent.; commercial freight decreased 12 per cent. and loads received from connections decreased 23 per cent. Figures from the Northwestern region show a decrease of approximately 41,000 car loadings for August 25, 1919, as against the corresponding period for 1918. In the Central Western region, some improvement was noted. For the week ended August 19, 1919, grain loadings increased 15 per cent., over the same week for 1918, live stock increased 22 per cent., and lumber increased 16 per cent.

Patriotism, local pride and just common selfishness all say: "Buy War Savings Stamps and Thrift Stamps."

E. B. Thomas

Eben Briggs Thomas, chairman of the board of directors of the Lehigh Valley, and one of the best known railroad men in America, died at his home in Morristown, N. J., on September 4, at the age of 80. Mr. Thomas had made his mark as an executive officer on four prominent railroads, and was as notable for his knowledge of operating details and his sympathetic interest in the men in the ranks as he was for his efficiency as a financier and his ability in the whole broad field; and yet, strictly speaking, he was not brought up as a railroader; he was a business man of ability and considerable experience before he entered the railroad field.

As a railroad officer he belonged to the old school; devoted with decided singleness of purpose to his immediate tasks and too busy and too modest to advertise himself; but he became prominent through his activities in the American Railroad Association, of which, in its earlier and stronger days, he was one of the leading spirits; and he became popular among railroad officers throughout the country in spite of his modesty; or rather because of his engaging personality, his freedom from all useless frills and the good judgment by which he habitually went to the heart of every question.

E. B. Thomas

He was born in Cleveland, Ohio, in 1839, the son of a clergyman. His early training was in the office of the Otis Steel Company, of which firm he became a member. In 1870 he was appointed receiver of the Lake Shore & Tuscarawas Valley, now a part of the Baltimore & Ohio, and in that position made so good a record that he was chosen general manager of the Cleveland, Columbus, Cincinnati & Indianapolis. Here he remained until 1885 and here he made his reputation as an operating officer. From 1885 to 1888 he was second vice-president and general manager of the Richmond & Danville, which was the nucleus of the present Southern Railway System. After three years in the south, he was called to the New York, Lake Erie & Western as second vice-president and after a few months was called to New York City as chief operating officer of all the lines of the company. On December 1, 1890, he was made first vice-president. He was promoted to the office of president in 1894 and when the receivership was ordered he was appointed one of the receivers. In November, 1895, when the company was reorganized he was made president of the new Erie Railroad Company. Six years later he was made chairman of the board of directors. In 1902 left the Erie to become president of the Lehigh Valley. This office he held for 14 years, and on February 21, 1917, was elected chairman of the board, being succeeded as president by E. E. Loomis.

Mr. Thomas' administration of the Lehigh Valley was marked by the development of the road from a condition near bankruptcy to that of a sound and prosperous concern.

The mileage of the road increased but little, but the gross receipts rose from $24,000,000 to $47,000,000, and the surplus available for dividends to a sum equal to more than twelve per cent on the common stock. A prominent feature of his administration was his intelligent adherence to high standards of engineering practice, both in roadway and equipment. He was not an engineer, but, like Mr. Carnegie, he exercised unerring judgment in availing himself of the work of other men.

Railroad Hearings Before House Committee

The House committee on interstate and foreign commerce expects to complete its hearings on railroad legislation by the first part of next week, after having held almost daily sessions since July 15. It has already heard most of the proposed plans for railroad regulation and this week has been hearing various witnesses who have proposed amendments to the Esch-Pomerene bill.

On September 5 a delegation of colored people representing the Colored American Council appeared before the committee, introduced by Representative Madden of Illinois urging legislation to require the railroads to furnish equal accommodations and service, regardless of race, in interstate traffic. The witnesses did not object so much to the separation of the races as provided by the "Jim Crow laws" of the southern states but based their argument principally on the inadequacy and unsanitary condition of the facilities provided for colored passengers to show that they are discriminated against in many ways. It was said to be almost impossible for a negro to obtain Pullman accommodations in the south and very difficult to get anything to eat while travelling because they are not allowed in the dining cars and many station eating houses have no provision for them. The Jim Crow car, it was testified, is usually only half a baggage car, in a very filthy condition and very much overcrowded. The witnesses presented elaborate and carefully prepared arguments in support of their claim of discrimination together with a large amount of data regarding the conditions of the facilities provided for colored passengers.

A number of representatives of water lines have been before the committee to oppose the provisions of the Esch-Pomerene bill giving the Interstate Commerce Commission jurisdiction over port-to-port rates. Among these have been W. P. Levis, freight traffic manager of the Clyde and Mallory lines, who said the steamship business would not lend itself to the regulation prescribed for rail carriers, as the conditions under which they operate are very much different. Thaddeus H. Swank, of counsel for the Merchants' & Miners' Transportation Company, submitted a statement by A. D. Stebbins, president and general manager of the company. Frank A. Law, of counsel for the Alaska Steamship Company, and John H. Bunch, general freight and passenger agent of the company, protested both against giving the commission jurisdiction over port-to-port rates and against including Alaska in the provisions of the bill.

F. B. McKinnon, president of the United States Independent Telephone Association, F. C. Stevens, counsel for the association, and N. C. Kingsbury, vice-president of the American Telephone & Telegraph Company, asked the elimination from the bill of the provisions which would bring the telephone and telegraph systems within the full regulatory powers of the Interstate Commerce Commission.

B. B. Cain, representing the American Short Line Railroad Association, asked a government guaranty of operating expenses to the short lines which have not been paid the standard return, for the period immediately following the expiration of federal control. He also offered a proposed amendment to protect existing rates during the period of readjustment. L. S. Cass, president of the Waterloo Cedar Falls & Northern, asked that the Interstate Commerce Commission have jurisdiction over the routing of traffic.

Earl H. Morton, president of the Order of Railroad Station Agents, which has a membership of about 6,500, told the committee that the Plumb plan is "the best plan ever devised to drive brains out of the railroad business." "The plan is so preposterous," he said, "that it would not merit serious discussion but for the fact that the so-called Plumb Plan League seems to be securing the support of large numbers of railroad employees who have not really informed themselves as to what the plan is and the way in which it would actually work. Its adoption would destroy efficient operation, cause tremendous rate increases or a deficit to be paid by the public, and wreck the rail systems physically and financially."

J. G. Luhrsen, president of the American Train Despatchers' Association, appeared before the committee on September 10, urging legislation to continue the effect of General Order No. 8, issued by Director General McAdoo last year, which prohibits discrimination against any employee because of membership or non-membership in a labor organization. He said the despatchers were already hearing threats that they would have to choose between their jobs and their organization after the roads are returned to private management. He said, however, that his organization had made little headway against the Railroad Administration as compared with the influence exerted by the larger organizations of employees, and mentioned a case where both the despatcher and the train crew had been discharged for allowing a train to run into a terminal 50 minutes ahead of schedule but the members of the crew had been reinstated through the influence of their organizations.

Senator Lenroot of Wisconsin appeared before the committee in support of the Amster plan, which has been incorporated in a bill which the Senator has introduced providing for unification of the roads into a single system, with minimum earnings guaranteed and privately owned but managed by a board representing shippers, farmers, security owners, employees and the public. He opposed various plans which seek to preserve competition and said the public is only interested in the most efficient operation and reasonable rates, which he argued cannot be obtained under separate managements some of which are likely to repeat the examples of financial manipulation which have furnished scandals in the case of the Rock Island and the New Haven. Senator Lenroot said that physical property should not be taken as the sole criterion of value and that a capitalization of earnings would not be justified because some roads "because of a lack of exercise of regulating power" are earning too much. His plan proposes a valuation based on the three elements of original investment, cost of reproduction and earning power. He suggested that while men cannot be required to work against their will it might be possible to provide that strikers shall not be taken back after a strike at a higher wage than that determined by a tribunal.

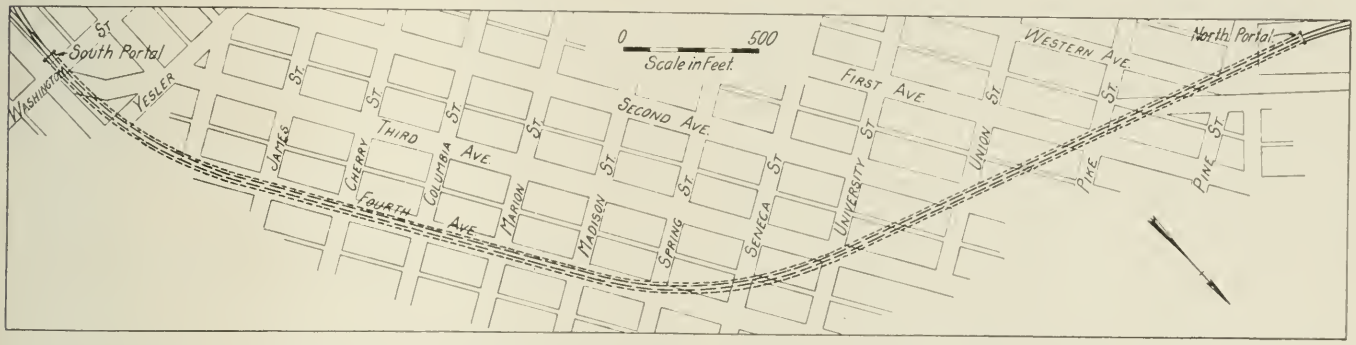
Representative Winslow asked several questions suggesting some kind of regulation of labor organizations to make them responsible. Under present conditions, he said, the committees of Congress do not hear from the great body of working men but only from their leaders and never know whether or not they are properly representing the views of the men. On his last trip home, he said, he had taken occasion to question as many railroad employees as possible regarding the various propositions brought to Washington in their name but had found them rather indifferent. A majority of those he had talked with said they knew very little about the Plumb plan and others said they wished the present agitation was over so they could settle down to work. Most of them seemed to have so much money that their principal grievance as to wages was because someone else was getting more.

Concrete Packing Stops Settlement Over Tunnel

Change in Sub-surface Drainage Conditions Causes Decay of Timber Lagging, Requiring Its Replacement

By E. E. Adams,
Assistant Engineer, Great Northern, Seattle Wash.

THE TRACKS OF THE GREAT NORTHERN and the Northern Pacific enter the Seattle terminals from the north through a double track, concrete-lined tunnel, 30 ft. between the side walls, 26.8 ft. high from the top of rail to the crown of the arch, and 5,141.5 ft. long. The south portal is located near the intersection of Fourth Avenue South and Washington street from which point the tunnel runs northerly until it becomes coincident with the center line of Fourth avenue just south of James street. From this point it follows the center line of Fourth avenue for a distance of 1,360 ft. to the north margin of Madison street, thence curving to the northwest, passing under the cross streets, Third avenue, Second avenue, First avenue and Pike Place, to the northerly portal, which is located about 180 ft. south of the south margin of Virginia street, just east of Railroad avenue, on the Seattle water front. The tunnel lies beneath the heart of the retail district of the city, as is shown in Fig. 1.



Location of the Great Northern Tunnel Under Seattle's Business District

Limited Amount of Moisture Present Originally

The topographical features of Seattle are most unusual, and in order to develop the railway terminals, a site was selected some years ago on the unfilled tide lands at the foot of Beacon Hill. In order to gain access to the terminal which was to be occupied jointly by the Great Northern and the Northern Pacific, it was decided to bore through the hill on which the city was situated and thus escape congestion in the rapidly growing water front district.

The excavation for the tunnel bore was started from the north and the south portals in May, 1905, and the advance drifts met on October 26, 1914. The excavation bore was approximately 40 ft. wide and 30 ft. high, and all excavation throughout the entire length was carried out by the old tunnel method of excavating for advance drifts, headings and side pockets with timber lagging.

The timber section of the tunnel followed the excavation and at points where overbreak occurred the void was packed solidly with slab wood and square timber recovered from the false work used during the excavation. The concrete lining was then constructed within the timber section proper as shown in Fig. 2.

The excavated material along the route of the tunnel consisted of deposits of glacial drift of irregular lenses of hard blue clay, sand, cemented gravel and hard pan. During the removal of the earth more or less water was encountered, but not serious enough to cause any particularly difficult or expensive work. The sandy materials as a rule were water bearing and sometimes the clay had cleavage planes which indicated water. The area influenced by the drainage along the tunnel route was more or less uncertain. It may have extended some distance from the tunnel bore and in unexpected directions. It was a fact that large quantities of water were not encountered, but it was known positively that moisture did exist and it seemed to be the opinion of the engineers that the heavy timbering in the section of the tunnel would be preserved and permanently maintained after being encased outside with the concrete lining.

The construction work on the tunnel progressed rapidly after the advance drifts had met in 1904 and in April, 1905, double tracks were laid through the tunnel and traffic was handled direct to the terminals at the south end of the city.

Re-grading and Street Improvements Change Drainage

From 1906 until 1909 the grades and elevations of the cross streets and thoroughfares along the route of the tunnel were greatly changed and modified for street traffic by an elaborate and expensive system of regrades that the city had undertaken, the principal street changes in the vicinity of the tunnel being along Third, Fourth, Fifth and Sixth avenues, with the cross streets lying between Yesler Way near the south portal of the tunnel, and Pike street near the north portal of the tunnel. The regrade of Fourth avenue was completed in 1909 and this thoroughfare and others crossing the tunnel were paved with material which greatly changed the drainage conditions.

In addition the city also laid extensive sewer systems and, together with the reconstruction of paved street car track areas, the heavy annual rain fall and surface waters were disposed of in an entirely different manner than before the regrades were undertaken. By bettering the drainage conditions to this extent, all of the surface waters and others which formerly penetrated into the soil and kept it in more or less of a moist condition, undoubtedly caused a drying out of the soil and contributed very largely to the decay and dis-

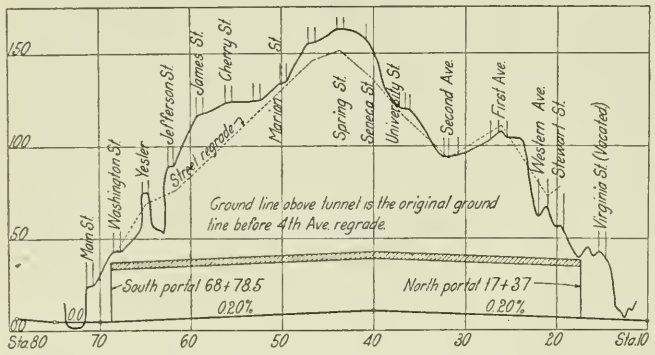
integration of the timber section of the tunnel and the packing over it.

Settlement Appears

In January, 1911, the street pavement and car tracks along Fourth avenue and above the tunnel showed signs of subsidence—not to any great extent—but the fact that slight settlement had occurred along the tunnel route, constituted such presumptive evidence, that after careful investigations and discussions, the railway company's engineers established an elaborate system of bench marks over the streets, buildings and structures from the north to the south portals of the tunnel zone. The greatest indication of subsidence was first noticed at the intersection of Fourth Avenue South and Prefontaine Place. This open street area is immediately above the tunnel and within 100 ft. of the south portal. Traffic conditions at this intersection were most severe and heavy, two street car lines forming a junction, and team and automobile traffic meeting at five corners. The settlement at this point was not heavy. The car tracks made slight, easy depressions and the drainage on the paved streets was not seriously interfered with, nor were there any unusual complaints in regard to the public utilities situated in the street proper.

Insomuch as there was such reasonable evidence of settlement, and regardless of the precise elements producing the subsidence and due to the principal fact that the tunnel angled directly under the zone of settlement, the railroad company took the initiative to ascertain the exact cause of the trouble.

The ground covering over the concrete lining at this location was not over 12 ft. deep, it was therefore not considered advisable to tap the arch of the tunnel and explore above the arch, but to sink a shaft and undermine the street area and thus maintain railway traffic through the tunnel and street traffic above it during the period of examination, which later developed into an extensive repair job. A shaft was sunk on a piece of vacant property and the undermining process was undertakin with a view to removing the timber



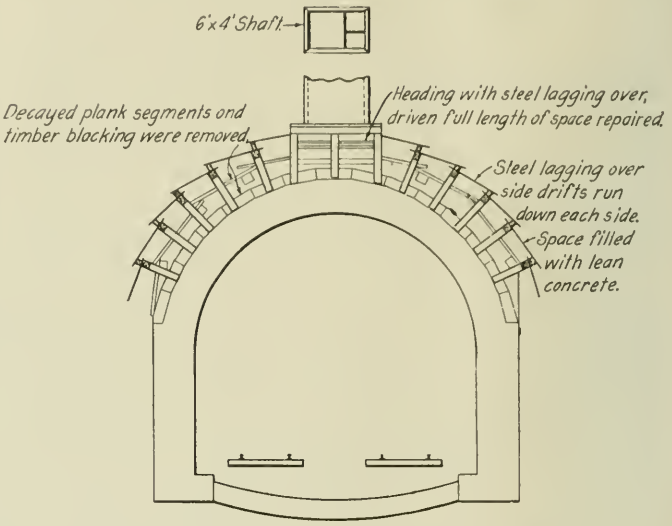
Profile Showing Relation of the Tunnel to the Street Grades

packing above the concrete arch and refilling the space with very lean concrete. This preliminary work was a complete success and the work of placing the concrete packing was carried out with no serious cave-in of the paved streets above or interruption to traffic.

In 1912 subsidence was further observed along Fourth avenue, which as stated above lies directly over the tunnel, and also in a ten-story brick building at the intersection of Third avenue and University street. At other points gas mains, water mains and other public utilities gave evidence of slight openings at some of the joints, at locations immediately over the tunnel. The results of all the uncertain elements of settlement, which was carefully checked by the railway company's engineers and the effects noticed and observed, finally resulted in a definite policy on the part of these engineers to adopt a program of making extensive repairs and improvements along the entire arch of the tunnel.

Method of Backfilling Tunnel

The method as finally adopted (Fig. 3) consisted in sinking shafts at convenient places either directly above the tunnel or located in whatever vacant space could be conveniently secured, or in sections of alleys or streets where traffic was light, and the underground work could be carried on with little or no interruptions. The shafts were usually 4 ft. by 6 ft. in size and were sunk to the level of the highest point on the tunnel arch, where advance drifts



Method of Conducting the Repair Work

were dug in either direction immediately along the center line of the tunnel proper. The advance drifts or headings were built 5 ft. high by 10 ft. wide and the steel lagging was supported by plumb posts and caps made of 8 in. by 8 in. square timber, spaced from 2 ft. to 4 ft. apart, depending on the overburden and the condition of the soil above the excavation. A center row of plumb posts divided the heading in two working vaults, one of which was utilized to remove the excavated material and the other to receive incoming materials, such as sand, gravel, timber, lagging, etc.

In following the excavation work of the headings and as soon as the first bents or forms were installed, the overburden of the soil was carried by supports consisting of steel lagging driven over the caps. This steel lagging was 3/8 in. thick by 6 in. wide and 6 ft. long, sharpened to a chisel end, which made the driving easy and contributed largely to the success of the whole underground operation. There was very little, if any, loss of the soil above the steel lagging and the workmen were cautioned to exercise extreme care in installing the steel lagging at the overhead part of the excavation. After the headings had advanced to a suitable distance in each direction from the shaft, side stopes 5 ft. wide were excavated at right angles from the advanced heading down along the extrodus of the arch to the spring line and to the old wall plate of the timber tunnel section. The old timbers and the broken down soil were then removed by pick and shovel, ax and cross cut saw, no other machinery being used throughout the process of the mining work.

The whole stope was then free to receive the back filling, which consisted of mine run sand and gravel mixed with a very small amount of Portland cement. The consistency of the lean concrete was determined more or less by the conditions above the tunnel; that is, where the excavation was under large buildings or extensive construction, the mixture

was made a little richer, but as an average, one cubic yard of packing when mixed and packed into the void or stope contained one-half barrel of Portland cement. The aggregate was mixed by hand and just enough water added to thoroughly moisten the mixture. This lean concrete was then rammed carefully into place in the side stopes and allowed to set for a few days before the steel lagging was pulled and the next section of the stope packed with a new batch of lean concrete. When the side stope was entirely filled and the lean concrete had set sufficiently to bind itself thoroughly together, the 5 ft. space next to the packed section was opened for another side stope. This allowed the workmen to spread the operation along the advanced headings and did not unnecessarily cramp the working conditions. The distance that mining operations were carried out from each shaft did not depend fully upon the cost of handling the material underground, but depended wholly on the space above the ground where shafts could be located conveniently. Sometimes the advanced headings were carried over 1,000 ft. apart from the shafts and work was thus carried on underground without any great evidence of the extent or character of the repairs that were being made immediately over the tunnel.

Electric power was used wholly in the hoisting apparatus in the shaft and for ventilating purposes in the underground working space. The mined area was well lighted and ventilation was provided through an ordinary 6 in. black iron stove pipe leading to an electric fan. More or less moisture was encountered but the water conditions were undoubtedly different than when the original tunnel was driven, confirming the assumptions the engineers had in their preliminary studies.

The excavated material consisted on an average throughout the entire length of the improvement of about 65 per cent timber and 35 per cent soil. After reviewing the entire work as carried out, it was found that approximately 25 per cent of the timber removed was affected quite badly by dry rot. In most cases no undue pressure from buildings or structures over the tunnel was noticed on the old timber packing, but in a few instances pressure developed on the caps and the plumb posts and the lagging drove and pulled hard in some sections. Under heavy buildings where the railway engineers anticipated settlement, it was deemed advisable not to pull the steel lagging, so as to eliminate as far as possible any voids whatever which might possibly be caused and conditions exaggerated if the steel lagging were pulled from its position after the concrete packing had been placed.

The work was distributed over a period of four years, being started in 1911 and completed in the early part of 1915. Since that time there has been no appreciable settlement to either buildings, streets, public utilities or other construction above ground, and the railway engineers feel confident that the concrete packing over the tunnel was a complete success insofar as subsidence to streets, buildings, etc., was concerned.

A Similar Problem at Everett

This concrete packing was placed for a distance of 4,835 lineal feet along the arch of the tunnel at a cost of approximately $375,000, including some of the miscellaneous repairs to street pavements, street car tracks and public utilities, including water mains along the streets, alleys and public thoroughfares above the tunnel proper. On an average the cost of all of the work, including excavation, backfill, labor charges, material, etc., figured $78 per lineal foot of concrete packing placed, which was approximately 39 per cent of the original cost of the tunnel. The tunnel proper, including the concrete lining and invert completed, ready to receive the track, cost $198 per lineal foot at the time of original construction.

About the time that the work on the Seattle tunnel was completed, more or less complaints were received concerning the subsidence of buildings and streets over the Great Northern single track tunnel constructed under the heart of the city of Everett. This tunnel bore joins tide water with the main line of the Great Northern and its industry and yard tracks in the easterly part of the city of Everett. The Everett tunnel was driven in 1900 by the old tunnel mining method, similar to the method adopted for the Seattle tunnel. As near as can be ascertained, considerable trouble was encountered during the original construction of the Everett tunnel in holding the super-imposed earth which was of a sandy character for the greater distance and flowed very quickly if not properly supported by lagging and posts. The original lining of the Everett tunnel was the Great Northern standard timber tunnel section, made sufficiently wide and high to allow the permanent concrete lining to be placed within the timber section.

When the timber lining was placed in the tunnel bore proper, all voids at the sides of the tunnel and overhead were packed with slab wood, which at places measured several feet in thickness, all timbers were exposed to the air currents of the tunnel until 1909, when the timbers began to decay and the strength of the arch was greatly impaired. In 1911 the concrete lining was placed within the tunnel and in 1914 and 1915 serious settlement was noticed in the buildings, streets and public utilities above the tunnel proper. Insomuch as this trouble was experienced about the time that the concrete packing was placed over the Seattle tunnel, the railway's engineers decided to adopt the same method of placing concrete packing over the Everett tunnel. This was done and the work was completed in 1919. It has also proved to be a complete success, no further subsidence or settlement having been noticed since the underground work was completed.

The work on both the Seattle and Everett tunnels was carried out under the direction of the engineering department of the Great Northern, of which A. H. Hogeland is chief engineer at St. Paul, and O. S. Bowen principal assistant engineer at Seattle. W. J. Coventry was general foreman in the field, and the writer was assistant engineer during all of this work.

Locomotive Exports from a British Point of View

THAT THE PINCH of American competition in locomotive building is not now being felt in Great Britain owing to the great worldwide demands for locomotives; but that British prices are likely to prove a barrier when conditions again become normal, are among the points brought out in an instructive article entitled British Locomotive Building which appeared in the July 19 issue of the Statist, London.

The article follows:

The locomotive industry is peculiarly British, as we were the pioneers in railway building. The construction of the home network first claimed our attention, and when that was nearing completion we undertook the development on a large scale of railway communications in other countries, particularly within the Empire and South America. For this purpose an immense amount of British capital was subscribed, and expended mainly in the United Kingdom on the manufacture of rails and rolling stock, locomotives, carriages and trucks. An important export trade was built up, and the industry continued to expand as the amount of British capital invested in railway development abroad became greater. Long before the War, however, a severe measure of competition was

being experienced from Germany, the United States, and Switzerland, especially in the manufacture of locomotives. The great railway expansion in the two former countries alone made such competition possible, though German capital interests, particularly in the railways of the Near and Far East, furnished, as in our own case, an avenue of entry for the products of their engineering shops.

Locomotives from Germany, and also from the United States, were found in South America and in various African markets, such as Egypt and the Uganda, and even in India. Railway mileage was, of course, rapidly extending everywhere, and our growing output found a sale despite the pressure of competition. The volume of business was sufficient to keep all countries remuneratively employed, and, even if there were irregular spells of depression, conditions in the locomotive engineering industry were, on the whole, good up to the outbreak of hostilities. The war strangled the German export trade, curtailed the British, and promoted the American. In this country the centres affected were Glasgow, Manchester and Leeds, the principal seats of our locomotive industry. They turned to the manufacture of shells and ordnance, and such locomotives as they built were mostly requisitioned for use at home or abroad. The normal foreign trade was almost entirely cut off, especially in the last three years of the war. The revival anticipated at the time of the armistice has not yet set in, because home requirements still remain to be filled, and to these a natural priority must be accorded. As our exports for war purposes have also fallen, recent figures show a decline even when compared with the period of restriction.

The following table indicates the value of rail locomotives exported in each year since 1913 and in the first five months of 1918 and 1919:—

Rail Locomotives Exported from the United Kingdom

	1913	1914	1915	1916	1917	1918
	Tons	Tons	Tons	Tons	Tons	Tons
To foreign countries	18,747	16,603	9,170	13,126	16,604	.....
To British possessions	28,374	44,879	32,219	7,795	6,160	.....
Total	47,121	61,482	41,389	20,921	22,764	15,272

	1918	1919
Five months (value)	£691,813	£365,496

Communications are a necessity of civilized life, and a continuous demand for locomotives is assured as railway mileage and railroad traffic develop. Further, war losses on the continent must be made good, and neutral countries, which were denied their normal supplies in recent years, are eager to place orders if delivery within a reasonable time can be guaranteed. The result of this general shortage of rolling stock is that the locomotive manufacturers in this country are booked well ahead. They are helped by the dislocation of the Germany industry, which before the war had become a formidable factor in the export market, its products being sent even to England. The adjoining table, taken from German sources, shows the extent of the output prior to the war:—

Year	For use at home and in German colonies, tons	For foreign export, tons	Total output, tons	Number of locomotives
1912	153,100	43,000	196,100	4,052
1913	118,800	40,200	159,000	3,782
1914 (7 months)	86,100	26,000	112,100	2,392

In South America the Germans were particularly active. We had not felt the United States competition too severely owing to the unpopularity of their designs, but the Germans cut into the trade with a European model at a lower price than the American, and secured a large share of business. It was our second most important market, and during the war, it has been to some extent overrun from North America. It is doubtful even still if American-built locomotives are regarded with the same favor as European. It is very difficult to compare the two models, as natural exigencies have in each case necessitated a development in design and construction along very different lines. Long hauls predominate on the other side of the Atlantic, and short hauls on this side. Accordingly, America has witnessed a greater development of the tender as opposed to the tank engine. Much of our traffic is suburban, and a tank engine, carrying supplies of fuel and water on the same vehicle, and able to run backwards and forwards with equal facility, is better adapted to this class of work. The long haul has further been responsible for the attention paid to compound locomotives on the American railways, while the British have favored single-expansion engines. The weight, size and power of individual engines have thus increased in the United States to a greater extent than here, and before the war there was an incessant struggle for supremacy between the two types. Strict comparisons, even between those of the same class, are difficult, as the American products have not the finish, either generally or in detail, that ours possess. Fine fits are not a feature in American engineering, and the result is shown in the increased running life and decreased maintenance expenses of the British models. Our locomotives are built to last, and are more suited to well-laid lines, while the American are at times surprisingly efficient where the permanent way shows unmistakable defects.

Locomotive building in the United States has increased considerably during the war, and special attention has been paid to the construction of standardized types. Under the War Industries Board the various plants concentrated on special types, and merely by specialization, without any increase in existing facilities, the rate of production was almost doubled. The American industry has become more strongly differentiated from the British, not only by the larger size of the unit engines, but also by the greater multiplicity of standard models and the more marked originality in design. In respect of finish they are still inferior; but in America the preference continues for mass production on native models, an undertaking which the size of the home market enables them to carry through with complete success. Even before the war they could undersell us in certain export lines, but the superiority of the British-built locomotive in regard to life and running expenses more than made up for its heavier initial cost. It is obvious, however, that the price margin against us cannot be indefinitely increased. A point may be reached at which the cheaper American engine is also more economical, despite its finish. The question may be asked if this point is not already reached. In British shops there has been a general reduction in working hours from 53 to 47, and so far the result has been a decreased production per man per hour. Demands for a 44-hour week have been made, and if conceded, with the rate of wages unchanged, and a further decline in output, on the analogy of the preceding reduction, the price of British-built locomotives must be again raised, and the chances of successfully competing in foreign markets will be lessened. It is not at all easy to explain why individual output should be higher in the United States. Many hold that we still possess a superior craftsman, but as against this the horse-power per operative in the American industry is greater. The leading position of the Americans, if not due to better labor or greater mechanical power, may be brought about by superior machinery or more highly developed factory organization, consequent on specialization and mass production. The pinch of their competition is not very severely felt at the moment. Many urgent requirements in India, the Crown Colonies, and the Dominions, as well as in foreign countries, remain to be filled, and orders have been placed here irrespective of costs. When these orders are completed, and the demand becomes again normal, our prices are likely to prove a barrier to sales, unless present unhealthy tendencies in the British engineering trades are speedily checked.

Doings of the United States Railroad Administration

Shop Employees' Committee to Accept Director General's Offer. Maintenance Men Defer Demands

WASHINGTON, D. C.

THE RAILROAD SHOP EMPLOYEES affiliated with the American Federation of Labor have voted 325,000 to 25,000 to authorize their officers to call a strike to enforce their original demands for a general increase in wages from 68 to 85 cents an hour rather than to accept the offer recently made to them by the President and Director General Hines of increases of from 4 to 7 cents an hour by way of readjustment. The vote places full authority in the hands of the officers, however and they apparently decided to take what they can get while waiting for a reduction in the cost of living or an opportunity to renew their demands. Although they had once rejected the offer the officers entered into conferences with Director General Hines and his assistants in the Railroad Administration on September 5, prepared to accept the offer and to negotiate for the national agreement covering rules and working conditions which Mr. Hines had promised them before the negotiations were broken off on August 1 by the unauthorized strikes. Mr. Hines attended the conferences on Friday and Saturday and they were continued this week by his assistants after Mr. Hines had left for a vacation of about two weeks.

Director General Hines on September 4 addressed an ultimatum, similar to that issued in the case of the striking trainmen in California, regarding the local and unauthorized shop strikes on the New York Central at Depew, N. Y., on the Baltimore & Ohio at Cumberland, Md., and on the Chicago, Burlington & Quincy at Havelock, Neb., saying that unless the men returned to work not later than their regular reporting time on Saturday, September 6, they would be considered as having permanently left the service, their places would be filled and if they returned to the service later it would be only as new employees. This notice was conveyed in telegrams sent to the regional directors, stating that the chief executives of the shopmen's organizations had definitely instructed their men to return to work, directing that the federal managers post the telegrams conspicuously on bulletin boards and consider them as their instructions to proceed accordingly.

Maintenance of Way Employees Defer Demand for General Wage Advance

The United Brotherhood of Maintenance of Way Employees and Railway Shop Laborers was given a hearing last week before the Board of Railroad Wages and Working Conditions and, although its members had taken a strike vote to enforce general demands recently filed with the Railroad Administration, after considering Director General Hines' instructions to the wage board, not to consider requests for general advances, the brotherhood announced its intention of adhering to the advice of the President and holding its general demands in abeyance until the government has had an opportunity to reduce the cost of living. The original demand was left with the board and in its place the representatives of the brotherhood filed a statement asking for the adjustment of what they termed inequalities in the present wage rates. This amounted to so much of an advance, however, that the representatives of the regional directors filed a statement opposing it on the ground that it constituted a general increase and recommending that any adjustment be treated as a local matter to be determined in the light of local conditions.

L. I. Kennedy, representing the brotherhood, said he wanted to go on record as demanding that in the event the cost of living is not reduced within a reasonable time the brotherhood be given an opportunity to present its claims for the general advance, and he called attention to the strike vote. In presenting the request for a readjustment Mr. Kennedy asked that the basic rate of track laborers be placed at 40 cents an hour, to which would be added an increase of 10 cents, making a minimum rate of 50 cents, and that the basic rate of mechanics be placed at 58 cents, to which would be added 10 cents, making the minimum rate 68 cents.

He said that trackmen now receive 28 to 40 cents an hour and track foremen $100 to $122.50 a month and that in many large terminals track foremen and other employees performing the same work receive different rates of pay. Also on many large systems adjoining divisions pay different rates and there are differences between main and branch lines. Shop laborers, he said, receive various rates for the same work, many of them varying between 34 and 43 cents an hour, while mechanics in the bridge and building department receive 53 to 68 cents, whereas in other departments mechanics receive uniform rates for all classes of work. In many instances, he said, mechanics on the same operation receive different rates, part of the difference being that some are paid under Supplement 4, dealing with shop men, and others under Supplement 7, which deals with maintenance of way employees. Signal foremen, Mr. Kennedy said, receive the rates of Supplement 8 while men under them are paid according to Supplement 4. He asked the higher basic rates in order to bring about uniformity.

G. L. Moore, engineer maintenance of way of the Lehigh Valley, chairman of the committee representing the regional directors, said that under the director general's instructions no general increase could be considered at this time and that the present rates do not represent discrimination, except where some roads may not have given the proper rate to section foremen, because the differentials were not disturbed by General Order No. 27 and its supplements except as lower paid men were given the larger percentage of increase. Any adjustments that should be made should be dealt with locally.

Director General on Vacation

Director General Hines is taking his first vacation since he became connected with the Railroad Administration at the time the railroads were taken over by the government. He expects to be away from Washington for about two weeks.

Cost of Freight Train and Locomotive Service

The total cost of freight train service, including locomotive service, continues to show a steady decrease each month as compared with preceding months, although increases as compared with last year, according to the monthly report of the Operating Statistics Section. For the month of June it was 101.8 cents per 1,000 gross ton miles, as compared with 103.9 in May, 112.7 in April, 119.5 in March, and 120.5 in February. No comparison of this figure with last year is given. The cost of freight locomotive service per locomotive mile in June was 107.1 cents, as compared with 97.4 cents in June, 1918, an increase of 10 per cent, and as compared with 110.3 cents in May of this year. The cost of freight train service per train mile was 154.7 cents, as compared with 142.8 cents in June, 1918, an increase of 8.3 per cent, and

as compared with 156.8 cents in May. All items of cost continue to show increases as compared with last year. The combined averages for all regions and the comparative figures for last year and for preceding months of this year are as follows:

	June 1919	June 1918
Cost of locomotive service per locomotive mile	107.1	97.4
Locomotive repairs	36.1	31.1
Enginehouse expenses	8.8	6.8
Train enginemen	19.6	18.5
Locomotive fuel	39.1	38.1
Other locomotive supplies	3.5	2.9
Cost of train service per train mile	154.7	142.8
Gross ton miles	119.5	126.5
Enginehouse expenses / Locomotive repairs	51.1	43.7
Locomotive fuel	44.6	43.9
Other locomotive supplies	4.0	3.4
Train enginemen	22.3	21.3
Trainmen	25.6	25.3
Train supplies and expenses	7.1	5.2

	June, 1919	May, 1919	April, 1919	March, 1919	Feb'y, 1919
Cost of train service per 1,000					
Locomotive repairs / Enginehouse expenses	33.7	35.4	38.6	40.8	43.1
Locomotive fuel	29.3	30.6	34.3	37.5	40.3
Other locomotive supplies	2.6	2.6	2.9	3.1	3.4
Enginemen and trainmen	31.5	31.1	32.4	33.5	34.8
Train supplies and expenses	4.7	4.2	4.4	4.6	4.8

Administration to Order Rails

The Railroad Administration was expected to place orders this week for 200,000 tons of rail, to be divided among the different steel companies in proportion to their ability to make prompt deliveries, but final action was postponed. The price bid by the steel companies is understood to have been the same as that for the original order of 200,000 tons placed by the Railroad Administration in May, $47 a ton.

Report on Collision of Atlantic City Trains

Immediately following the collision on the Pennsylvania Railroad at Elwood, N. J., on Sunday, August 24, involving the ninth and tenth sections of an excursion train from Washington, D. C., to Atlantic City, N. J., an investigation was begun by the Railroad Administration, cooperating with the Interstate Commerce Commission, the local authorities, and the Board of Public Utilities Commission of New Jersey. The management of the Pennsylvania Railroad, acting under the direction of the regional director of the Allegheny region, C. H. Markham, has reached a determination as to responsibility, and disciplinary action has been ordered.

Aside from the responsibility for the wreck itself, claims having been made with regard to the general conduct of the excursion trains in question, C. S. Lake, assistant director of the Division of Operation of the Railroad Administration, was sent immediately to the scene by the Railroad Administration to make a thoroughgoing inquiry into such supplemental circumstances. Mr. Lake has now made a full report, covering the entire situation, particularly with reference to the claim (1) that wooden coaches were used on the excursion trains in question, (2) that the trains were not adequately lighted, (3) that the trains were not adequately watered, and (4) that passengers were not properly treated following the wreck.

Mr. Lake's report as given out by the Railroad Administration is summarized herewith:

Investigation discloses the accident to have been directly attributable to the failure of Engineman Ralph J. Townsend to observe or regard caution indication of automatic signal, and stop indication of automatic signal as required by rule and as was entirely feasible, and to failure of Flagman W. E. Duvall and Brakeman E. F. Quinn, who was also on rear by instructions of conductor, to afford proper protection to train as required by rules, and to failure of Conductor J. E. Price to see personally that protection was afforded as required, which was also entirely feasible.

Engineman Townsend of the tenth section has testified that he did not see signal (stop indication), located 2264 feet from point of accident, until he was within 6 feet of it, and that his vision was obscured by fog, which admittedly prevailed on the morning of the accident, and by escaping steam from the right piston of his engine. Engineman C. W. Disney, who ran this engine from Washington to West Philadelphia, and Road Foreman of Engines Joseph J. Cook, who especially tested the engine in order to determine whether escaping steam was such as to obscure the vision, testify that leaks obtained, but that steam did not escape sufficiently to obscure the vision. If the conditions were as described by Townsend, it was his duty to have exercised such precaution as would have insured safety. Although he is qualified on and thoroughly familiar with the physical characteristics of the division upon which the accident occurred, his testimony clearly indicates that he did not know of his whereabouts at the time the accident occurred; that he failed to discern signal No. 349 altogether, and thought that the accident occurred at Magnolia instead of near Elwood.

Between the hours of 9:00 p. m. Saturday, August 23, and 12:50 a. m., Sunday, August 24, the Pennsylvania Railroad moved 10 excursion trains, 119 coaches, 6,261 passengers, from Washington, and 6 excursion trains, 67 coaches, 3,576 passengers from Baltimore destined for Atlantic City, at which point the first section of these various trains was due to arrive at 4:00 a. m., Sunday, it being deemed inadvisable and contrary to the usual practice to discharge excursionists there earlier than that hour on account of accommodations being inaccessible.

Records indicate that the 16 trains from Washington and Baltimore consisted almost entirely of wooden equipment, part of which was owned by the Pullman Company. The equipment was in condition for safe operation and its use was allowable under legal regulations. Sixty-six per cent of the total equipment operated by railroads under government control is of wooden construction, 7.4 per cent wooden bodies with steel underframes, and only 26.6 per cent of steel construction, which situation necessitates the use of wooden equipment in excursion traffic if accommodations are to be afforded. If wooden equipment were not used it would be impossible to run these excursion trains.

The Pennsylvania Lines East own 2,340 coaches, or 8.5 per cent of the total coach equipment operated by lines under federal control, including 1,411 steel coaches, but the travel requirements of that line this year are approximately 250 coaches per day in excess of equipment owned; and to accommodate daily and especially week-end seashore requirements, it has been necessary for them to make requisition from the Troop Movement Section of the Railroad Administration for equipment, without which excursion service, which has been insistently demanded, could not be furnished.

It did not develop until Friday, August 22, two days prior to the excursion, that it would be necessary to use about 80 tourist sleepers which were obtained from the Troop Movement Section. The Washington Terminal people and Pullman Car Lines co-operated to endeavor to get this equipment in the best possible condition. The cars were thoroughly cleaned, equipped with lights and water, but two P. R. R. steel coaches used in local suburban service were not equipped with water coolers. These cars were placed in the fourth section out of Washington and not in either of the trains concerned in the accident. To insure adequate gas supply the number of burners for service in tourist cars, used in troop movement, had been reduced to two or three, and these were lighted leaving Washington. Tourist cars lighted by electricity had such equipment removed and were lighted by from four to seven ordinary hand oil lanterns, attached to specially designed holders on ceilings and walls of the cars. The reports show that several of the lights were put out by passengers on leaving Washington so they could sleep. Con-

ductor Price stated to the coroner's jury at Atlantic City that he had reported bad lighting to station officers at Washington but a careful check shows he made no such report. Every effort, therefore, was made to condition these coaches to handle the very unusual traffic.

Physicians at Elwood were immediately summoned, and, as soon as means of communication could be effected, physicians from Hammonton (6 miles distant) were ordered, and the accident was reported to the division officials at Camden, who were erroneously informed that both tracks were blocked. The injured persons were transferred to the undamaged coaches and held at point of accident to enable physicians who arrived from Hammonton to render first aid. The train then proceeded accompanied by physicians to Atlantic City.

As to action taken as a result of the wreck: Proper disciplinary action has been ordered against the men found to be directly responsible; the erroneous information concerning the blocking of both tracks, which led to delays and inconvenience to passengers, was due to the fact that first attention naturally was given to the injured. Orders have been issued that cars used in excursion trains must be suitably lighted and provision made for an adequate supply of drinking water on trains.

Committee on Health and Medical Relief to Submit Report

The Committee on Health and Medical Relief, Dr. D. Z. Dunott chairman, which was instructed to make a complete survey of health, surgical and medical problems and to make recommendations to the Railroad Administration, is expected to submit shortly the result of its researches, together with recommendations upon subjects that it has investigated up to the present time.

The committee's chief interest will be found:

First: In the development of a uniform set of sanitary rules and regulations for stations, shops, trains, office buildings, camps, rest-houses, Y. M. C. A.'s, etc.

As a result of its work the man on a small railroad line will receive the benefit of the country's highest skilled surgeons and doctors just as the employee on the larger system has heretofore been so benefited, and the whole body of employees and patrons will benefit through rules and regulations covering all phases of railroad sanitation—the first complete set ever formulated—which is a great step forward.

Second: The study of the latest and most approved methods of treating injured persons, with the view to establishing at strategic geographical locations, in conjunction with city, state or other hospitals, functional clinics and vocational training schools. Thereby an opportunity will be given to injured employees and others injured on railroad property to receive the most advanced and scientific treatment, in order that wherever possible such injured employees and others may be rehabilitated and restored to their former occupations, and, where this is impossible, establishing them as nearly as may be to their former earning capacity.

The committee has given most careful consideration to the question of first aid and is ready to submit a first aid packet containing dressings and a full set of instructions, which will permit the layman to apply intelligently first aid dressings. It is also giving consideration to the establishment of first aid teams on such railroads as do not at the present time have them.

Railroads in some parts of the South, co-operating with state and public health officials, have already conducted a successful campaign in combating malaria and hookworm, and the committee is urging that this campaign be extended to other localities infected with these disabling diseases.

In making its surveys the committee has not only consulted surgical departments of the railroads but has also consulted many prominent professional men outside of railroad service, state boards of health and the United States Public Health Service, with the sole idea of giving to the employees and patrons the best possible protection and care.

Passenger Traffic in June

The number of passengers carried one mile by the railroads under federal control in June amounted to 4,145,379,862, an increase of 5.6 per cent as compared with June, 1918, according to the monthly report of the Operating Statistics Section. The Ohio-Indiana district and the Southern region showed decreases. For the six months ending June 30 the number of passenger miles was 21,320,651,049, an increase of 4.6 per cent. In this case also the Ohio-Indiana district and the Southern region showed decreases, while the other regions and districts showed increases ranging from .2 per cent for the Southwestern region to 18 per cent for the Pocahontas region.

Additional Appropriation for the Alaska Railroad

An authorization of an additional appropriation of $17,000,000 to complete the construction of the government's Alaska railroad between Seward and Fairbanks was voted by the House of Representatives on September 6. The original appropriation for this work was $35,000,000 but because of the increased prices of materials and the increases in wages this was found insufficient. The original appropriation has been practically exhausted and it was stated to the House that unless the additional funds are provided the work would have to be stopped this fall.

If the bill becames a law the appropriation will have to be passed upon by the committee on appropriations. The road is now completed for a distance of approximately 227 miles on one end and 100 miles on the other end with a gap between.

In reporting the bill from the Committee on Territories, Representative Curry of California submitted a report in part as follows:

"Hearings having been held on July 23, 24, 25, and 31, 1919, the report of the Alaskan Engineering Commission having been submitted and the testimony of officers of the Alaskan Engineering Commission having been fully considered, the committee finds:

"That the construction of the Alaska Railroad by the Alaskan Engineering Commission has been prosecuted under most adverse conditions, due in large part to the war, and the work has been done at the lowest cost consistent with the permanent character of the work performed. The railroad will cost on completion approximately 31 per cent more than the amount originally estimated and the entire project, including terminals, rolling stock, and physical property, and maintenance and operation charges in excess of revenue during the entire period of construction less than 50 per cent more than the amount originally authorized to be expended. Since the commencement of the construction of the road, wages of employees increased 59 per cent; the prices of materials and supplies as much as 161 per cent, and transportation costs 147 per cent. The result of accomplishing this construction at an increase of no more than 50 per cent under such circumstances is due in large part to the system of station contracts by which the original estimates of excavation costs were very closely approximated.

"That though engineering mistakes have occurred, due to flood and other unforseen conditions, they have not been a

material factor in the increased cost of the work and probably no greater than would be encountered on any project of such magnitude in a country of unusual climatic conditions.

"That the development of town sites along the line of the railroad and the assistance rendered to home seekers have been of notable value in the settlement and development of the adjacent regions. The providing of ample sanitary housing facilities for employees was wise and was necessary for retaining ample working forces, the maintenance of a proper morale amongst the workers employed on the enterprise and necessary to the preservation of the health, and the maintenance of order in the new communities. The work accomplished has been of a substantial character, at a cost that compares most favorably with the cost of other railroads in Alaska and in the western states, and especially so when consideration is had of the increased costs and abnormal conditions prevailing during the period of construction.

"That the completion of the Alaskan railroad would have been accomplished within the amount originally authorized and at a much earlier date than is now possible but for the heavily increased cost of labor, material, and supplies, and there would have been a considerable saving both in cost and in time of construction, had the entire amount been appropriated so as to be continuously available; whereas by the system of annual appropriations the construction forces have been impeded and delayed in the prosecution of the work, and it has been impossible to take advantage of the full open working season in Alaska, from May to October, inclusive, by reason of such limitations. That in order to complete the railroad from Seward to Fairbanks by December 31, 1922, the sum of $17,000,000 additional to the $35,000,000 originally authorized will be required and this sum should be appropriated at the earliest possible date to be immediately and continuously available until expended. Delay in making such appropriation would have the effect of increasing the ultimate cost of the project and injuriously affect and postpone the development of Alaskan resources. The loss to the Nation by such delay would, through the discouragement of Alaskan industrial enterprises and the prevention of the creation of new wealth from her abundant resources, minimize and neutralize any apparent gain through temporary saving of funds to the Treasury.

"That the importance of utilizing Alaska's coal deposits in providing fuel supplies for the Pacific coast and for the trans-Pacific merchant marine is second only to the fuel demands of the Pacific fleet of the United States Navy. The activities of the Alaskan Engineering Commission have demonstrated the practicable, profitable character of coal mining in Alaska. Much of the Alaska coal is a coking coal and could be used to smelt iron ore and for other manufacturing purposes.

"That failure to complete the Alaskan railroad after having made an investment of $35,000,000 therein would result in the loss of a very considerable portion of the investment, because with the operation of so much of the line as it is possible to complete for that sum, it would be impossible to earn a sufficient revenue to maintain the completed portions; and the consequent depreciation and deterioration would be great. The necessity for appropriating the $17,000,000 additional is evident for the protection of the funds previously invested.

"When the sum of $35,000,000 has been expended, there will be two uncompleted sections of the railroad separated by a gap of 100 miles, on which no work has been done. The south section, consisting of approximately 227 miles of main line and 32 miles of branch line, which is now in operation, but which will require construction of snowsheds, riprapping embankments, etc., to be complete, will serve the coast ports of Anchorage and Seward, the interior settlements at Matannuska, Wasilla, and Talkeetna, and the coal mines of the Matanuska field. The north section, consisting of 106 miles of main line and 37 miles of branch, will be practically complete except for the construction of bridges over the Nenana and Tanana Rivers. This section will serve the terminal city of Fairbanks and the mines of the Fairbanks field, the town of Nenana, and the coal mines of the Nenana fields, effectively only with the construction of the bridges which will not be possible under the appropriation of $35,000,000. The revenue of these two widely separated and independently operated parts, when completed, would be confined to the earnings from such meager traffic as could be locally developed. This would be negligible as compared to the possible earnings resulting from through traffic from the Alaskan seaboard to the navigable waterways of the interior of Alaska. The operation of these fragmentary parts, each independent of the other, can only be accomplished at a considerable loss, whereas traffic requirements of the interior promise to the completed road a much larger volume of business.

"The economic development, however, of the vast Alaska interior is dependent upon the completion of the railroad to the navigable waters of the interior, and the development of agriculture in the region through which the railroad passes is dependent upon the creation of a market for the product, and this market can only be provided by the development of the mining and kindred industries adjacent to the railroad, and the development of the mineral resources is dependent upon proper provision of economical transportation for men, machinery, and supplies, and this is not possible with the railroad left in an uncompleted stage.

"Of the $35,000,000 authorized in the original act there remains but $2,038,029 available, and that amount was appropriated in the last sundry civil act. This amount, however, will only be sufficient to continue the construction work on the railroad with the present inadequate force of about 2,460 men until the middle of October, and provide for operation and maintenance to the end of this fiscal year. The disorganization of the construction force before the commissipletion of the project would entail a material loss in time and money.

"That the length of the main line (standard gage) from Seward to Fairbanks will be 471 miles; with branches, 545 miles; including branches and spurs, 549 miles. The total length of the railroad, including main line, branches, spurs, and sidings, when completed, will be 601 miles. Of this 371 miles have track in place and are in operation, and 34.5 miles of sidings are in place. All of the remaining portions of the line, with the exception of the 100-mile gap between miles 265 and 365 north of Steward, are in various stages of completion. The government purchased the Alaska Northern Railroad of 71 miles running out of Seward, and paid for it the sum of $1,157,839.49. The Alaska Northern Railroad has cost the private owners $5,250,000. The reconstruction of the Alaska Northern has cost to date $1,801,155.08, and it is estimated that it will cost to complete $1,718,182.64 more, or a total of $3,518,337.72.

"The government also purchased the Tanana Valley Railroad for $300,000. This road is narrow gage, 44 miles long, and the purchase price included the shops and terminals at Fairbanks. Its rehabilitation to date cost $46,407, and there will be a further expenditure of $84,300 on this line. It is stated that this railroad cost the original owners about $800,000.

"It is estimated by the engineers and the Alaskan Engineering Commission that on its completion the cost of the Alaska railroad, on the basis only of mileage of main line and Matanuska branch, totaling 508.4 miles, will be about $73,200 per mile, while the cost of the entire project on the same basis will be $99,200 per mile. Including estimated maintenance and operation expenditures in excess of revenue to and including the year 1922, not included in the foregoing, the cost will be about $102,300 per mile. The latter estimate includes all equipment, rolling stock, terminal facilities, including harbor improvements at Anchorage, dock and wharf facilities

at Seward, Anchorage, and Nenana, physical property, purchase and rehabilitation of the Alaska Northern and Tanana Railroads and all expenses of every kind and character connected with the construction of the road, and its activities, including operation expenses in excess of revenue during the construction of the road from 1915 to 1922 inclusive, which is estimated at about $5,987,000.

"The only other government built railroad, that across Panama, cost $221,052 per mile.

"The cost of construction of the Copper River & Northwestern Railway, 194.98 miles in length, extending from Cordova to Kennicott, Alaska, is given in the hearings on the Alaska case before the Interstate Commerce Commission at about $83,000 per mile. The book value of this railway in its return to the Interstate Commerce Commission for the year 1917 is given as $146,090.39 per mile. The grades for the last 65 miles on this road are 4 per cent. This road is not equipped as completely, even proportionately to its length, as the government railroad in terminals, rolling stock construction, operating and marine equipment, machinery, and physical property.

"The Pacific & Arctic Railway & Navigation Co., owning the White Pass & Yukon Railway from Skagway to the international boundary at the summit of White Pass, a distance of 20.4 miles, shows in its return to the Interstate Commerce Commission for the year 1917 a book value of $115,343.68 per mile. This road is narrow gage with 4 per cent grades.

"That all possible inducements, with proper safeguards against monopoly, should be extended to pioneer endeavor in the utilization of Alaska's resources, to encourage and to bring about the intensive private development essential to a stable citizenry. Such a policy will create traffic for the railroad and in time make the enterprise profitable.

"The region tributary to this railroad has produced in mineral wealth over $111,000,000, of which the Fairbanks section at the interior terminus of the road has produced in excess of $71,000,000, practically all of which has been from placer gold. Throughout the Alaskan interior only the very richest and most profitable mining is possible under the uneconomic conditions now prevailing. The completion of this railroad will make profitable the mining of large bodies of low grade ore, the development and working of which is not now practicable.

"The known mineral resources of that part of Alaska that will be served by the railroad are gold, silver, copper, coal, lead, tin, iron, antimony, tungsten, and platinum."

Railroad Problem Discussed at National Conference

"Our Country First" Meeting at Chicago Considers Possible Solutions of the Present Industrial Unrest

FRANK DISCUSSION of the causes of the present national unrest and industrial conflict characterized the national "Our Country First Conference" held under the auspices of the Illinois Manufacturers' Association at the Congress Hotel, Chicago, on September 8 and 9. The conference was largely attended and included representatives of agricultural, manufacturing, mercantile, banking and transportation interests from 36 states. The work accomplished by the conference as a whole, the subject matter of practically all of the addresses delivered, and the prevailing topic at the round-table discussion followed practically without deviation the thought outlined in the call to the conference, a portion of which said: "Several distinct groups are endeavoring to create public sentiment by the presentation of ex-parte views. Congress, to arrive at a just conclusion, needs the facts as well as the views of all classes of citizenship. A clear and fearless expression of opinion should be formulated and proper committees appointed to present the conclusions reached to Congress and others concerned in order that fair and honest legislation may be enacted, a square deal given to all and a nation freed of the agitators who are trying to overthrow the very foundations of our government." There was a "clear and fearless expression of opinion" and the work of the resolutions committee shaped the consensus of the delegates' opinion into effective form so as to best reach members of Congress and others directly interested in the solution of reconstruction problems.

The conference opened on Monday, September 8, at 10:30 a. m. with an address of welcome by Dorr E. Felt, president of the Illinois Manufacturers' Association. S. M. Hastings, former president of the Illinois Manufacturers' Association, delivered the opening address in which he sounded the keynote of the conference and briefly outlined the results which it is hoped will follow. Harry H. Merrick, president of the Mississippi Valley Association, the Chicago Association of Commerce and the Great Lakes Trust Company, closed the first session of the conference with an appeal for vigorous action to combat the unwarranted positions taken by certain branches of organized labor and the efforts of bolshevistic agitators in the labor organizations.

The Monday afternoon session was addressed by S. T. Bledsoe, general counsel of the Atchison, Topeka & Santa Fe, Roland B. Mahany, assistant to the Secretary of Labor, J. F. Zoller, general counsel of the National Conference of State Manufacturers' Associations and Samuel R. McKelvie, governor of Nebraska. The afternoon session touched upon the absurdity and socialistic principles of the Plumb plan for government ownership of the railways and their operation by employees. However, it remained for Mr. Bledsoe adequately to present the present railroad situation, its causes and possible solution and the utter impracticability of the Plumb plan.

Mr. Bledsoe stated that the railroad problem is one of adequate revenue, adequate facilities, efficient and continuous transportation and reasonable and nondiscriminatory rates, (the reasonableness of rates having due regard for the cost of the service). He advocated the placing of supreme rate making authority in one national tribunal with regional commissions well distributed so as to be available for the protection of local interests, the exclusive regulation of the issuance and disposition of all securities of all common carriers engaged in interstate commerce by the national government, a policy of mergers and consolidations with governmental sanction arranged so as to preserve as fully as possible helpful competition and to relieve the maintenance of unnecessary and wasteful competition, the creation by Congress of a board for the settlement of all controversies relating to wages and working conditions, and the prohibition of concerted action in leaving railway service. After presenting a resume of the comparative increases in wages, the number of railway employees, operating revenues and income during the period from 1900 to 1919 and the moral involved, Mr. Bledsoe exposed the fallacies of the plan of the railway brotherhoods for government ownership of

railroads and their operation by employees, presented before the House of Representatives in the Sims bill. The dangers lying behind the adoption of such a bill by Congress were fully explained by Mr. Bledsoe, as were the bolshevistic characteristics of this move on the part of organized labor, backed by what Mr. Bledsoe termed as "the most insidious in character of any propaganda ever conducted in this country."

On Tuesday evening an open forum was held which was presided over by W. H. Manss, former director of the War Service Committees of the War Industries Board. Numerous short addresses were made by representatives of various branches of industry, all deprecating any tendency toward radicalism now being manifested by certain classes of organized labor. The most important address on Tuesday was by Charles Piez, president of the Link Belt Company, who made a vigorous attack upon the Plumb plan.

The resolutions committee was headed by Mr. Piez, who until recently was vice-president of the Emergency Fleet Corporation, and its membership included representatives of the agricultural, the manufacturing, and various other business interests of the country. Alba B. Johnson, president of the Railway Business Association, was vice chairman.

The resolutions throughout express the opposition of the conference to all socialistic and bolshevistic tendencies. They demand maintenance and protection of the right of private property, and that the government's activities affecting business shall be reduced to the smallest scope at the earliest moment. They oppose any further appropriation by Congress to maintain the United States Employment Service.

The resolution regarding railroad regulation is as follows: "We commend the zeal with which committees of Congress are seeking a solution of the transportation problem. The increasing demand for food supplies necessitates the opening up of new areas of agricultural production by the extension of transportation systems. Discontinuance of terminal and other railway development has had an important effect upon the general cost of living. Resumption of railway development will tend to stabilize employment of labor, especially if the country should be afflicted with depression, for experience demonstrates that railway buying always stimulates and sustains employment and general prosperity. We hail with satisfaction the evident purpose of Congress to reject government ownership of railroads or their management under domination by employees, and to enact instead a law for the prompt reestablishment of private operation. We favor transportation development as a government policy and urge a law prescribing that rates shall be such as to yield income sufficient to encourage such development."

The resolutions declare that every attempt by governments to fix prices has been a failure and that experience shows this is a dangerous field for the government to enter.

They advocate freedom on the part of farmers to organize to buy, sell and bargain collectively concerning their own products.

They declare that adequate and efficient production is the basis of social well being and progress for the individual and the community, and that it is the duty of the wage payer, the wage earner, and the community to exert every reasonable effort for improving and increasing the quantity and quality of production.

They set forth that while the individual worker and his employer should be free to cease the individual employment relation, provided no contractual obligation is violated, "nevertheless employee and employer in government and public utility services where the public service is paramount, should be restrained by law from instituting by concerted action a strike or lockout, and instead effective machinery should be established in such services for prompt and fair hearing of any requests, differences or disputes touching upon the employment relation, and for adequate redress of any grievances proven to be justified."

After mentioning the cause of the high cost of living the resolutions set forth that employees and employers individually and by their duly instituted organizations should pledge themselves to exert every reasonable effort for the elimination of disturbances tending to interrupt production, and for a speedy return of all industry to a normal basis.

They urge a reduction of federal taxation as rapidly as possible and the adoption of the budget system by the national government as a means of controlling and reducing its expenditures. The resolutions will be presented to Congress, and steps will be taken to form some kind of organization to give effect to them.

Orders of the Regional Directors

DISPOSITION OF OLD TIES.—The Northwestern regional director, file 113-1-1, quotes Western Region Circular 138 issued June 28, 1918, containing suggestions for the disposition of old ties and suggests that the instructions contained in this circular be carried out wherever practicable. The circular quoted states that old ties may be used for lighting fires in engines, may be given to section men, section foremen or other employees, or to farmers in exchange for plowing fire guards or performing other work for the maintenance for the right of way or they may be disposed of to the public at a reasonable price.

Eastern Car Pool Gondolas.—Supplement 5 to Freight Car Distribution Notice 8 of the Northwestern regional director states that although attention has been repeatedly called to the necessity of the prompt return of Eastern car pool gondolas, including hopper cars, the results obtained have been far from satisfactory and suggests:

1. The conditions now required are that the release, movement and handling of this equipment be followed personally, making such systematic check as will indicate that these cars are being handled strictly according to instructions.
2. Cars in inter-mountain and Puget Sound territory will be given eastbound loading to the fullest extent into eastern territory, and such loading provided with the least possible delay.
3. All pool cars located elsewhere must be moved home empty unless immediate loading is available to or in the direction of the junction point with a pool road.
4. Cars must not be loaded contrary to homeward direction unless specifically authorized, and such authority will only be given in connection with drop-end, low-side gondolas (mill type) when concurred in by the Car Service section.
5. These instructions are not intended to interfere with the backhaul movement of these cars from Missouri river points into Puget Sound territory which has already been authorized.

Yard Operations.—Circular 16 of the Northwestern regional director states that complaints from shippers respecting delays to cars indicate a necessity for careful consideration of the yard operation methods in force and the rearrangement of this work in order that they may be operated more efficiently. The circular outlines the principal causes of complaints concerning yard operation and means whereby the cause of these complaints may be eliminated and suggests that all officers responsible for terminal and yard operation be directed to give these matters their closest attention and that experienced men be especially detailed to check up the operation of yards and terminals.

Fuel Situation.—The Northwestern regional director, file 28-1-33, states that the commercial fuel situation is becoming acute and that the demands on the transportation facilities for the movement of fuel during the next three or four months will be extremely heavy. The circular quotes existing instructions for the handling of this class of equipment and outlines means by which these existing instructions may be made effective on the lines in this region.

A Pulverized Fuel Equipment for Locomotives

A Compact Unit, Easily Installed on the Tender; Variable Speed, Four-Screw Feed and Dual Control

A PULVERIZED FUEL equipment for locomotives has been developed by the Fuller Engineering Company, Allentown, Pa., and has been applied to a Lehigh Valley locomotive. This equipment consists of a fuel tank on the tender, the fuel feeding apparatus, a special arrangement of combustion chamber, slag or ash pans and smokebox. The device is mounted on the tender deck and is operated by a reciprocating steam engine and a steam turbine driven fan.

The standard brick arch supported on four 3½-in. arch tubes is applied in this locomotive as in hand fired practice, except that the arch is run within two feet of the back sheet and within about 12 in. of the crown sheet in the center, while the side bricks are not carried up so far.

The exhaust nozzles in this locomotive, of which there were two, were removed thus giving a free exhaust and eliminating all back pressure in the cylinders due to this cause. A sleeve has been secured to the end of the open exhaust stand and extended several inches up into the petticoat pipe. The petticoat pipe itself has been lowered 18 in. so that its lower end is now practically on a line with the center line of the boiler proper. This was done to reduce the draft in the front end, and thereby in the firebox, in order that the air and coal may enter the firebox at a velocity low enough to permit the coal to be completely consumed before being drawn over the arch, thus preventing the accumulation of slag on the flue sheet.

The pulverized coal tank is divided so that pulverized anthracite sludge may be carried in one side and bituminous coal in the other side. Very poor grades of coal can be burned in combination with soft coal by so manipulating the feed screws as to supply the proper proportions of soft coal and anthracite sludge necessary to maintain a proper temperature.

The apparatus for conveying coal from the tender to the locomotive consists of four 4-in. feed screws working in pairs and driven by a variable speed inclosed marine type two-cylinder double-acting reciprocating engine. The fan for blowing the coal into the locomotive firebox is driven by a steam turbine. The turbine fan supplies approximately 15 to 20 per cent of the air required for combustion, the rest being drawn in by the action of the exhaust through the openings in the firebox and in the burner proper.

The four feeders operating in pairs prevent the fuel from arching over and feeding unevenly due to the tendency of the coal to become tightly packed in the tender by the constant vibration while the engine is running.

The reciprocating engine, which drives the feeders by means of a steel pinion and gears, is controlled by a wide range variable speed governor connected to the crank shaft by a Morse chain drive. A flexible shaft, controlling this governor, enables the fireman to obtain a variation of 346 per cent in the speed of the reciprocating engine, and thereby of the coal which is fed to the locomotive, without leaving his seat in the cab.

As it is carried forward from the tank the coal is pushed over two small shelves in the enlarged end of the feeding casing, where it is spilled off in two cascades, which are in turn caught between three currents of air from the turbine fan mounted directly above. This arrangement causes the coal to thoroughly mix with the air before it is blown to the burner, where it is further diffused and more air added to it.

Lehigh Valley Locomotive Equipped with Pulverized Fuel Burning Apparatus

The turbine fan is driven at constant speed while in operation, the determining factor being that the pressure through the hose and in the burner shall distribute the flame evenly beneath the arch without causing it to impinge on the flash wall and thereby cause undue deterioration of the fire brick.

With the governor control and the two clutches a variation in coal feed of about 800 per cent between the minimum and maximum is obtainable with this apparatus, and the minimum can be reduced still further by throttling the steam in addition to the action of the governor control.

Should either pair of the feeders become inoperative through some foreign matter being caught in them, the governor can be thrown out of operation and a single pair of screws can be driven at double the speed and thus supply sufficient fuel to operate the locomotive without failure. This wide range of speed is permissible as the ordinary maximum

speed at which the reciprocating engine is run is less than half the speed of which it is capable, and this variation is also obtainable with the turbine fan without exceeding its rated capacity.

The maximum direct draft air pressure carried on the Fuller equipment is approximately three inches to four inches in the manifold beneath the fan or about 1¾ oz. to 2 oz., and this pressure is immediately reduced in the burner. A feature of the burner is that the flame spreads out and evenly fills the firebox beneath the arch no matter whether one pair or two pairs of feeders are in operation.

A notable feature is that practically all of the air which enters the firebox, either through the burner or otherwise, is under the control of the fireman at all times, thus eliminating an excess of air and enabling the locomotive to be worked at maximum capacity without drawing in any more air than is necessary for complete combustion. At the same time this permits the velocity of the air entering the firebox through the different openings to be kept at a minimum. This is a desirable feature as it is chiefly the high velocity, accompanied by the abrasive action of the pulverized coal flame, and the high temperatures attendant thereto, which causes a rapid deterioration of the brick arch and the refractories in the firebox, while if these are properly controlled the life of the fire brick will be greatly prolonged.

To aid in preventing and controlling excessive and destructive temperatures a pyrometer is supplied with all pulverized fuel equipment furnished by the Fuller Engineering Company. The thermo-couple of this unit projects into the firebox beneath the brick arch about midway between the front and back sheets, and an indicating unit registering directly in deg. F., in plain view of the fireman, so that by manipulating the dampers and coal feeding mechanism the temperature can be kept at the desired point.

As this is a double cab engine with a Wootten type firebox dual control is provided so that the fireman can control the apparatus either from the tender deck or from his seat in the cab. A pyrometer indicating unit, a revolution counter showing the rate of coal feed and steam gages, indicating the pressure on the turbine fan and the boiler pressure, are located in the cab.

This apparatus as installed on the Lehigh Valley locomotive is designed to feed a maximum of approximately 4,600 lb. to 4,800 lb. of coal per hour, but this amount can be varied within considerable limits by simply changing the sprocket ratio between the governor and the feeder engine, or can still further be varied by changing the ratio between the pinion and gears driving the screws. This is a highly desirable feature as in this manner the same standard equipment can be used to feed a quantity of coal as low as 1,000 lb. or as high as 10,000 lb. an hour if desired, the only change necessary on the locomotive end being that different size burners and hose be employed for conducting the coal and air from the feeder to the burner.

The entire apparatus is assembled in one unit and can be secured to the pulverized coal tank with 18 bolts. It can be removed at any time without in any way disturbing the alinement of the gears, pinions, feed screws or any other part of the apparatus. As will be seen in the illustrations the whole apparatus is above the deck of the tender, where it is in plain view and easily accessible should any repairs or adjustments be necessary, and this feature also enables it to be applied to existing locomotives without cutting into the front water legs of the tender or without cutting below the tender deck to install it.

General Foremen Convene to Discuss Shop Problems

Papers on Accident Prevention in Shops and Enginehouses, Draft Gears and Welding of Cylinders

THE FIFTEENTH CONVENTION of the International Railway General Foremen's Association was held at the Hotel Sherman, Chicago, on Sept. 2-5 with a large attendance representing all sections of the country. During the four day's sessions papers dealing with some of the important technical problems in connection with the repairing of locomotives and cars were presented and in addition labor conditions were discussed informally. The convention was opened with an invocation by Bishop Nicholson. The report of the secretary-treasurer was then read which showed the total membership to be 221, and the balance in the treasury $752.

Regional Director Aishton Speaks

R. H. Aishton, regional director of the Northwestern region, spoke on the present railroad situation. He emphasized the importance of securing increased production in all industries and quoted a letter from Walker D. Hines in which the director-general stated that in his opinion less progress had been made in securing increased efficiency in maintenance of equipment than in any other department. The higher railroad officers, Mr. Aishton said, come in contact with the actual operation of the roads only through statistics and because of that fact it is important that the foreman should be competent and progressive in determining the policies in his own department. He endorsed the proposal to put an end to wage controversies and restore more nearly normal conditions, characterizing this policy as necessary from a patriotic standpoint to keep America from falling behind in the contest for world trade.

Address of President North

Following Mr. Aishton's talk L. A. North, superintendent of the Burnside shops of the Illinois Central, and president of the association, delivered an address. He spoke in part as follows: The greater the demand upon the transportation system of the United States, the greater is the responsibility of those charged with its maintenance. This association must be made one of the potent forces in the progress of transportation. During the war period many appeals were made to us to further the common cause of our country. In my opinion, the present crisis of the nation is just as acute. Let us, therefore, rise to the issue and meet it in a loyal and determined spirit and go home from this convention with a high resolve to do our utmost toward strengthening our nation's facilities.

At the conclusion of President North's address W. W. Scott made a short response in which he dwelt on the difficulties which supervising officers experience under present conditions. He stated that in his opinion the efficiency of shops and roundhouses had decreased 50 per cent in the past five years.

The Wednesday session of the convention was devoted to a discussion of methods of preventing injuries. R. C. Richards, claim agent of the Chicago & North Western, made an address in which he reviewed the results of the safety work conducted during the past nine years on the Chicago & North Western. Several papers outlining methods adopted in safety work were read, some of which are abstracted in the following:

Safety First in Shop and Enginehouse Service

By W. T. Gale

General Foreman, Chicago & Northwestern, Chicago

The results of the safety movement on the Chicago & Northwestern have been highly gratifying. The shop committees hold semi-monthly meetings, after making inspection of the various departments. At these meetings reports are made of the unsafe condition of tools, machinery, etc., with recommendations. These local committees have acomplished most excellent results in shops and roundhouse service; all machines with gears or other working parts exposed and considered a menace to the safety of the operator have received attention and the danger, if any, averted. Line shaft couplings have sheet iron covers, the dangerous setscrew has been abolished, men have been protected from falling belts. Glass windows have been placed in all communicating doors between the various shops, in order that employes who are carrying dangerous implements in their hand, or on their shoulders can see and thus avoid injuries. Emery grinders have sheet iron guards around the wheels, and an adjustable frame with glass in it is attached to wheel guard which allows operators to grind tools without getting the flying particles of emery in their eyes; a round smooth iron cup is placed over the end of the emery wheel mandrel nut, preventing employees' working jackets from being caught upon the end of the revolving shaft. Danger sign posts are placed in proper positions in shops when repairs are being made overhead; employees' working tools, such as hammers, chisels, driving mandrels, etc., are examined by the foreman and the safety committee for cracks or breaks, and sharp splintered edges, and when found are replaced by new or repaired ones. Broken and rotted floors are repaired, automatic bells and gongs are placed on all transfer tables and moving cranes, air warning whistles for overhead cranes are a feature, the man who oils overhead machinery is supplied with a strong metal warning whistle in order that the operators of machines below will not start up machinery while he is oiling.

Floor motors in shops have 1 in. pipe guard rails placed around them, open fuses have been replaced by N. E. C. cartridge fuses, all open switches have been enclosed in steel cabinets with spring hinged doors, the replacing of all fuses is done by an electrician only, motors and generator frames have been permanently grounded to avoid accidents by shorts, open wiring has been replaced by conduit and lead cables, all line shaft motors have been equipped with safety stop control buttons, all drop light cords over machines are being removed, and replaced by individual cords, vapor proof lamps have been installed in oil houses and acetylene store houses. Electricians remove main line fuses when going above to do repair work on cranes, especially automatic floor operated cranes. Crane men are not allowed to keep anything on the crane floor with the exception of grease and waste, safety ropes are attached to cranes for descending in emergency. All employees are required to use and are furnished glass goggles for dangerous work. A large wooden platform fitting over the top of the boiler for grinding in stand pipes is a safe contrivance for men doing this work.

Hoisting chains and wire cable are regularly examined for flaws, lights have been put in dark places and roofs ventilated when necessary. Strong iron cans are used to hold scrap

paper and waste during the day, the same being taken out of the shop at night. There are local fire alarm boxes in every shop, water hose pipes and hydrants in and out of the shops, an efficient fire fighting company, a doctor upon the shop grounds with able assistants to care for emergency cases.

In engine house service, firing-up wood is not put into the cab until it is time to fire up the engine on account of men working in the cab and danger from nails in wood. Men have been instructed in the use of the blow-down pipe to see that it is laid flat upon the floor, and that connections are properly made so that there will be no danger of the pipe blowing off under pressure, etc., all of which shows that safety first is not a question of dollars and cents, but a question of saving human life, the most valuable thing in the world.

Safety First

By B. F. Harris

General Foreman, Southern Pacific, Oakland, Cal.

To generate and maintain a living interest in the movement to protect life and preserve the body from injury, we must face a difficulty that may be relieved by one or more of the following measures: (1) Imposing penalties for gross negligence; (2) awarding premiums for creditable records; (3) publishing the names of persons injured; (4) publishing an honor roll of those who have been uninjured during the month.

Negligence may be generally divided into two classes: Neglect of the injured and neglect contributed by one or more who created the condition causing the accident, or who had guilty knowledge that such conditions existed. As any penalty, however mild, may cause resentment and produce an interest that might detract from, rather than contribute to, the effectiveness of safety first, the most convincing evidence should be required before inflicting a penalty on any party. It should then be tempered with due moderation, should it be imposed on the injured person. Mathematically stated: The punishment suffered from the accident should be subtracted from the penalty that would be due to an uninjured, or second party, who had caused it. This is a period of broken precedents; it follows that a proposal to award premiums to encourage creditable caution, productive of records free from accounts of accidents, will not be met with surprise, but may be thought possible.

Many simple rewards may be given, among them the following: (1) Cancellation of discredit for former accidents; (2) creation of new credits; (3) issuance of an annual pass for the best record in each department on every division (a full year's record included); (4) a vacation on pay. The suggestions of four classes of awards should be sufficient to start this phase of safety first growing.

When a person's name is published as the principal in an accident, there is a condition of mind produced among large bodies of men to discourage all forms of negligence and foolhardiness. Every person of good health and average understanding has enough self pride to avoid public exposure of their identity with accidents. The interest excited by exposure is not pleasant but results are usually forthcoming.

Appreciation is one of the natural cravings of every human mind. The most effective application of the principle is to publicly acknowledge the caution of employees, at each division point, shop, or yard, by posting an honor roll, each month, of all persons who have passed through the preceding month without being a party to an injury. Although it should not be expected that there will be a marked rivalry to keep one's own name on an honor roll we may well know that the acknowledgment of continued caution on the part of workmen will prevent resentment from those who are sensitive when their efforts are not recognized.

Eliminating Eye Injuries

By L. A. North

Superintendent of Shops, Illinois Central, Burnside, Ill.

One of our greatest obstacles in the safety first movement has been in getting the employees to wear the goggles which the company has furnished to properly protect their eyes. Comment was received at the start as to the fear of eye infection. This was overcome by constructing a sterilizer so that when the goggles were returned to the tool-room, being given out to the employee on a check, they were thrown in a bath of wood alcohol, and allowed to remain for a stated length of time, after which they are removed and thoroughly dried. This in a great measure overcame any objections from this source. Then again, complaint was made that the goggles were too heavy and clouded up during the extreme warm weather. This has been overcome by securing a lighter goggle, and a better ventilated one, so that now we do not experience a great deal of trouble in getting the employee to wear the goggle and carry out the instructions that have been issued in regard to eye protection. As the eye injuries were numerous throughout the entire plant, this was one matter that required a strenuous campaign to decrease personal injury.

Papers dealing with the safety movement were also presented by C. Coleman (C. & N. W.); J. B. Wright (H. V.); J. W. Womble, W. L. Shaffer and J. Powell.

Welding of Locomotive Cylinders

By L. A. North

The welding of locomotive cylinders and other parts has been made possible and very successful by the introduction of oxy-acetylene and electric welding. It has been possible to weld locomotive cylinders which formerly would have been scrapped or repaired with either a brass patch or a dove-tailed insert of some other metal, the weld in the majority of cases making a substantial and satisfactory job provided the expansion and contraction had been properly taken care of.

We do not feel that we have reached the highest point of efficiency in the welding of cast metals, nor are we discouraged by the few failures that we have met with in the course of the experimental stage through which we are passing. Experience has taught us that in order properly to weld a locomotive cylinder, or a casting of any make or design, it is necessary thoroughly to pre-heat to insure a uniform temperature in order properly to take care of the contraction and expansion and avoid cracking after the weld has been made and the metal has been allowed to cool off. The success of any weld of this kind depends largely on the care used in the pre-heating and the judgment of the operator making the weld. In the selection of the operator for this class of work, we cannot be too particular in securing the highest class mechanic possible, in order to avoid a failure which may cause a valuable piece of material to be thrown into scrap.

Some difficult welds have come to my observation, one in particular, where the entire upper portion of the cylinder at the port area had been totally destroyed. This was repaired by having a grey iron patch cast in the foundry, fastened to the cylinder by means of clamps and welded in place. The cylinder was preheated to a uniform temperature to take care of the expansion and contraction. After the weld had been made and the cylinder had cooled down a reinforcement was added to this weld by drilling through between the stud holes and securing the additional support by tap bolts which were tapped and screwed into the main barrel of the cylinder.

It is possible to weld broken bridges in slide valve cylinders sucessfully. Recently, this was done and effected a saving of two cylinders in place of the one, which was cracked, as the cylinder which was repaired was an obsolete pattern

and had we not been able to make this weld, the application of an entire pair of cylinders to the engine would have been necessary. As the engine was one that in a few years will be retired, I am satisfied that the weld will outwear the present cylinders.

Not having experience with the electric welding on cast iron, I am not prepared to enter into a discussion of this method to any great extent, but I have examined a number of castings which have been repaired with the electric welding process and careful examination failed to disclose any flaw or fault in the weld.

However, I would suggest that careful examination be made and good judgment used in selecting the welds to be made with either the oxy-acetylene process or the electrical process. Too often the practice becomes too general with the result that either a piece of defective work is allowed to be turned out of the shop, or a bad weld is made, resulting later on in an accident which gives the entire process a bad name, causing the loss of the benefit that might have been derived from the new device if good judgment and proper care were exercised in selecting the operations to be performed.

Autogenous Welding of Cylinders and Other Parts

By J. T. Leach

General Foreman, Pennsylvania Lines, Wellsville, O.

The welding of cylinders and other castings by the carbo-hydrogen, oxy-acetylene or electric process has made great progress in the last few years. Hardly any discovery or invention has meant so much to the railroads and casting manufacturers as the various methods of welding broken or defective castings.

There was a time when it was necessary to inspect all cylinders on locomotives before they were taken into the shop for classified repairs, in order to know that no new cylinders were required, as the stock of cylinders carried by the stores department was limited, and if a broken cylinder could not be patched and the storekeeper had no casting, the locomotive had to be held awaiting repairs until such time as the material could be procured. This was an expensive arrangement at the best, especially in the last few years when power was so badly needed. With the different methods of welding cast iron, a cylinder may be cracked or broken quite badly yet it can be repaired successfully. The question arises as to the cost compared with a new cylinder, except in case of a new design where patterns have not been provided by the railroad or a foreign type of locomotive for which it would require several months to get a cylinder.

In making electric welds, in case the cylinder is only cracked, it is first necessary to pull the cylinder back in place, as nearly as possible, by the use of a rod and clamp. If this will not do the rod should be heated and the cylinder pulled up in that manner. The entire surface should be cut out V-shaped at an angle of from 45 to 55 deg. and then drilled and tapped on both sides of the crack for ⅝ in. to ¾ in. studs. These studs should be staggered; that is, one row drilled down on the bend and the other staggered in the flat portion of the cylinder. The studs should be screwed in the cylinder ⅝ in. or ¾ in. and then cut off about ¼ in. from the casting. All dirt should be cleaned from the portion to be welded before starting the welding. This welding should be done at a slow rate of speed in order to keep the cast iron cylinder from becoming heated.

In welding the cylinder the ordinary grade of Swiss welding rods of ⅜ in. or 5/32 in. diameter should be used. It is not necessary to remove the bushing or do any pre-heating to get a satisfactory weld, although if this is done a much better weld would be the result.

The cost of an acetylene weld is from $50 to $175 for an ordinary weld. This is an average figure, for the jobs vary so much in size and time that it is hard to arrive at a true average; however, the saving in any case amounts to several hundred dollars.

The method of welding by the oxy-acetylene process is as follows: The cracked portion should be cut out V-shaped at an angle of about 60 deg. If the broken or cracked portion is bulged out, a rod and clamp should be used to pull it up as nearly to the original position as possible. The dirt should be cleaned from the area to be welded. Then a furnace of brick should be built around the cylinder and by means of a charcoal fire or blow torch the cylinder should be heated to a cherry red. In some places an acetylene torch is used for pre-heating the cylinder, but that is an expensive method. After the cylinder has been pre-heated to the required heat welding should be begun, always maintaining the charcoal fire so the cylinder will have a uniform heat. In welding special silicon cast iron sticks are used and if this is not available a good grade of air pump rings will answer. The welding of the cylinder should be continuous and if it is a large break, one operator should relieve the other. This keeps the casting at a uniform heat. If the casting is allowed to cool, the weld will crack. The charcoal or blow torch fire should be kept up for several hours after the weld has been completed and then allowed to die out. This will insure a good weld.

Acetylene welds cost considerably more than welds made by the electric process, but this is often due in part to the lack of experience of the operator and also to the method followed. The experience I have had with the carbo-hydrogen has been limited mostly to cutting, but it is possible to get the same result from it in welding cast iron.

Other papers on the subject of autogenous welding were also prepared by W. Gale (C. & N. W.), B. F. Harris (Sou. Pac.), J. H. Frizell (A. T. & S. F.), J. W. Womble and J. Powell.

Discussion

C. D. Walker (Great Northern) advocated banding and bushing cracked cylinders on the ground that the cost of doing the work by that method was lower than when autogenous welding processes were used. Several other members concurred in this opinion, although the majority preferred to weld longitudinal cracks even though the defect could be corrected by the use of clamps or bands. J. M. Horne (M. & St. L.) stated that good results had been secured by using brass wire for cylinder welding, but this method was not generally favored due to the high cost of the wire. M. H. Westbrook (Gd. Trunk) described methods used for burning out bushings by the use of a carbon electrode. He also stated that by using sulphur on the weld the added metal was made soft so that it could be machined readily. Mr. Westbrook gave average figures for the cost of welding as fellows: oxy-acetylene process, $3.00 per hour; electric welding process, 90 cents per hour.

Draft Gears

By J. W. Womble

There is a great diversity of opinion as to what constitutes a satisfactory friction draft gear, but in general we might say that an ideal draft gear should have not only a suitable friction capacity and travel, but it should also be positive in its nature, simple in design, of few parts, readily applied and removed from the car, and applicable to the standard pocket space. It should be so constructed that a buffing shock greater than sufficient to close the gear will not be apt to injure it in any way.

The design of the gear should be such that the frictional load is not dependent upon the speed at which the gear is closed nor should it be dependent on the internal parts of the

gear being carefully machined or requiring considerable care in fitting them together. It should be so made that it could be applied and removed from the car and the repair parts substituted, if necessary, by ordinary labor. It ought also to have sufficient area of friction faces to bring the pressure per square inch to a figure that will insure it having a satisfactory life in service.

The term friction draft gear is somewhat of a misnomer as it is both draft and buffing gear, the latter being undoubtedly its most important function. If the draft and buffing features could be divided and considered separately, no doubt better results could be obtained. Unfortunately this is not feasible and the well designed draft gear must necessarily take both of these requirements into consideration.

On this account it is advisable that a draft gear have a low capacity at the start of its movement in order to get the best results in pulling service. This only utilizes a small part of the capacity of the gear and the capacity at that part of the travel should make it possible easily to start the train. The capacity should then rise quite rapidly, but uniformly, to its ultimate load in order to absorb a large part of the buffing blow without causing too much shock to the draft sills.

Committee Report on Draft Gears

The committee recommended that a large proportion of gears installed be stencilled with date applied and notice to employees to report conditions and all facts whenever they are removed, this information to be used in connection with actual service tests. That draft gears be inspected and maintained at intervals depending on the kind of service. That poor gears be gradually eliminated and good gears be confined to as few as possible. That the General Foremen's Association expresses its willingness to aid the supply men in developing the best possible protection to the car against shock. That so far as possible the length, width and height of gears be brought to a standard so as to eliminate the different sizes of coupler yokes now required without sacrificing the gear efficiency.

The report is signed by W. W. Scott, (B. R. & P.) and C. F. Bauman (C. & N. W.)

Maintaining Draft Gears

By L. A. North

In discussing the subject of draft gears it is with the object of bringing to the attention of the general foreman, particularly the general foreman of the locomotive department, the necessity of spending more time in the car department to obtain such knowledge of car department matters as will be of benefit to them when they are advanced to the next stop in the ranks, that of master mechanic.

They should thoroughly familiarize themselves with all matters pertaining to the repairs to cars, particularly the draft rigging. From observation the logical place to examine the draft gear and the results derived from the application of the different designs of draft gears, is the repair track and the scrap pile. The damage caused from shock and rebound, due to defective draft gear, runs into millions of dollars every year. No matter what make of gear is applied to a car, unless the gear is maintained in working order, it will not properly function nor perform the duties that the designer or builder claim for it. There are a number of different friction draft gears on the market today which under test will demonstrate to the observer that the gear will perform just what the manufacturer claims for it, viz: absorb the shock and decrease the rebound, but as stated before, unless sufficient attention is paid to the maintenance and upkeep of this gear, the money expended is money thrown away.

A visit to the repair track will show end sills and draft arms broken and bent, center sills buckled up and car underrigging in a general dilapidated condition. In looking for the cause as the usual thing we find the draft gear worn out, inoperative and parts missing, so that the casual observer's first opinion would be that the draft gear did not perform the duties that it was intended for or designed for.

Some railroads have made it a practice to drop the draft gear when the car is placed on the repair track and make a thorough examination of the different parts of the gears to determine what parts need renewing or repairing with the result that the gear has a chance to function properly and perform the work that it was originally intended and designed for.

With the introduction of the heavy capacity cars, it has become more necessary than ever to pay particular attention to the draft rigging. Hump service is much harder on draft gear than ordinary switching service and has made it necessary to fit cars engaged in this service with substantial draft rigging and draft gear that will properly take care of and absorb the shock and rebound which comes from this service. A visit to any of the hump yards will verify this statement.

Discussion

The advantage of draft gears of high capacity was generally recognized by the members. M. H. Westbrook (Grand Trunk) described the decrease in the ultimate strength of the draft members which is brought about by locating the center line of the buffing and pulling stresses off the center line of the sills. With the usual construction if the center line of the gear is offset 2 in. from the center line of the draft members, the strength is decreased 40 per cent.

Other Business

During the convention the question of admitting supervising officers of the car department to the association was considered and the by-laws were amended to make general foremen of the car department eligible for membership.

On Thursday V. R. Hawthorne, secretary of the Mechanical Section of the American Railroad Association, outlined the organization under which it was proposed to have the General Foremen's Association affiliate with the American Railroad Association as a division of the Mechanical Section. A committee was appointed to consider and report upon this matter.

The following officers were elected: President, W. T. Gale, machine foreman, Chicago & North Western; first vice-president, J. B. Wright, general foreman, Hocking Valley; second vice-president, G. H. Logan, general foreman, Chicago & North Western; third vice-president, H. E. Warner, superintendent shop, New York Central; fourth vice-president, T. J. Mullin, general foreman shop, Lake Erie & Western; secretary-treasurer, W. Hall, erecting foreman, Chicago & North Western; chairman, executive committee, C. A. Barnes, general foreman, Belt Railway of Chicago.

J. B. Evans, tax agent of the Oregon Short Line stated at a recent hearing before the Idaho State Board of Equalization, that, whereas the Interstate Commerce Commission had for a number of years employed the best scientific and engineering talent available which is still working in an endeavor to ascertain the value of the Oregon Short Line and, by reason of differences of opinion in regard to fundamental principles, had so far arrived at no conclusions, three agents of the State Board of Equalization had, after a brief investigation, been able to determine the precise value of the entire property and the relative value of every individual branch line of this system. The Board's agents recommended a radical advance in the value of the road's property. The Board of Equalization later acceded to Mr. Evans' protest, making no material increase as compared with the recommended increase of about $16,000,000.

General News Department

The Association of Railway Electrical Engineers will hold its eleventh annual meeting at the Morrison hotel, Chicago, on October 28 to 31 inclusive.

The coal pier of the Western Maryland, at South Baltimore, Md., was destroyed by fire on September 5; estimated loss, including coal, and number of cars, $900,000. The pier was about 1,000 ft. long and 90 ft. high.

A delegation representing the Marine Workers' Affiliation of the Port of New York called on the Railroad Administration on Tuesday to ask that their wage adjustment be made retroactive to September, 1918, instead of March 1, 1919.

Frederic C. Howe, long an advocate of government ownership, has resigned as commissioner of the port of New York to become executive director of the conference on "democratic railroad control," organized by the Plumb Plan League, which is to hold a meeting in Washington on October 6.

A fire of unknown origin destroyed four frame buildings of the General American Tank Car Corp., at the East Chicago, Ind., plant on September 9. The buildings destroyed included the brass foundry and special construction plants. The fire will not interfere with the tank car building. The loss is estimated at approximately $200,000.

Delegates from the southeastern and southwestern federations of railway clerks convened in a joint session at New Orleans, La., on August 23. One hundred and fifty delegates representing about 90,000 railway clerks and affiliated employees throughout the southern states were present. The convention lasted three days.

Dr. J. A. Waddell, consulting engineer, Kansas City, Mo., will present two papers before the Western Society of Engineers, Chicago, on Monday evening, September 15, entitled "The Comparative Economics of Cantilever and Suspension Bridges" and "Economic Span Lengths for Simple Truss Bridges on Various Types of Foundations."

The automatic train stop of D. H. Schweyer, of Easton, Pa., was inspected on September 5 by members of the Automatic Train Control Committee of the United States Railroad Administration. This apparatus is installed on one train, and at a number of stations, on the Colebrookdale branch of the Philadelphia & Reading, between Pottstown, Pa., and Barto.

Freight traffic on the lines entering Los Angeles, San Francisco and other central and southern California points recently disturbed by an unauthorized strike of trainmen, yardmen and shopmen is rapidly being restored to normal. The terminal yards at these points are seriously congested. It is stated that traffic will be entirely normal by the end of this week.

The American Association of Engineers will hold a meeting at the City Club, Chicago, on September 12, to discuss its work among railroad engineers. A report of the railroad engineers' salary-increase movement will be made, the activities of the railroad sections of the organization discussed and the reasons for the organization of the railroad sections will be outlined.

The Mechanical Section of the American Railroad Association has changed the effective date of sections G and K of Rule 3 of the 1918 Code of the Rules of Interchange from September 1, 1919, to March 1, 1920. This action has been taken in view of the fact that the Interstate Commerce Commission on August 29, granted an extension of six months within which to make freight cars conform to certain of the equipment standards prescribed by the Commission. A correction has also been made in Supplement No. 1 to the loading rules. In figures 42 and 46, accompanying this supplement, half-inch bolts are shown passing vertically through the ends of the clamping pieces to prevent splitting. These bolts should be applied horizontally instead of vertically.

The American Association of Engineers is taking a ballot within its membership on the soundness of the Plumb Plan as a solution for the present railroad problem. A copy of the bill is being mailed to each member without comment and he is requested to make his own decision after reading the bill and vote "yes" or "no" on the propriety of favorable action on the bill by Congress.

Conspiracy to defraud the United States Government (through the operations of the New York, New Haven & Hartford Railroad) was charged in indictments on which a foreman employed by that road at its reclamation yard in South Braintree, Mass., and a junk dealer from New York City, were arrested at Boston, Mass., on September 5. The foreman, John D. Birmingham, was held in $10,000 bail and the other man, William Natt, in $3,000. It is charged that steel rails were wrongfully sold as low-grade scrap.

The Veteran Employees' Association of the Chicago, Milwaukee & St. Paul held its annual convention at Minneapolis on August 27 and 28. The association, which has a membership of approximately 3,000 members, is open to any employee of the Chicago, Milwaukee & St. Paul who has been in the service of that road for 25 years or longer. The officers elected at the meeting are as follows: C. W. Mitchell, president; W. B. Harter, locomotive engineer, vice-president; Grant Williams, assistant general freight agent, Chicago, secretary and treasurer. The executive board elected includes, in addition to the officers, E. W. Grant, locomotive engineer; Charles Wood, foreman, and Joseph E. Roberts, locomotive engineer, all with headquarters at Milwaukee, and L. C. Boyle, agent at Viroqua, Wis.

New York Railroad Club Meeting

H. B. Spencer, director of the Division of Purchases, United States Railroad Administration, will address the New York Railroad Club on Friday evening, September 19, Engineering Society's Building, New York City, on "Purchasing and Stores Organizations."

Loss and Damage Claims in Northwestern Region

The loss and damage freight claim situation in the Northwestern region is being improved rapidly because of the intensive efforts of the railroads in that region to settle and eliminate old and unsettled claims. This is evidenced by the following statement showing claims received and on hand over four months old from April 1 to July inclusive:

	Unsettled		
April 1, 1919	May 1, 1919	June 1, 1919	July 1, 1919
141,204	129,617	118,247	104,518
	Over Four Months Old		
April 1, 1919	May 1, 1919	June 1, 1919	July 1, 1919
65,676	53,874	52,368	47,600

Coal Production

The production of bituminous coal during the week ended August 30 showed a slight decrease, the output being estimated at 10,197,000 net tons as compared with 10,662,000 tons during the preceding week, according to the Geological Survey report. The week's performance, however, has been exceeded but two other times during the year, in January and in early July. The total output during the first eight months of 1919 is about 96,000,000 tons less than during the same

period of 1918, a decrease of about 25 per cent. For the week ending August 23 the percentage of full time output lost on account of car shortage was 16.2 as compared with 26.6 the week before.

Senate Committee to Hold Hearings

At an executive session of the Senate committee on interstate commerce on Tuesday it was decided to hold some brief hearings, to begin probably next week, on various provisions of the Cummins bill. The committee has been holding executive sessions this week but considerable pressure has been brought to bear on it by representatives of some of the principal interests affected and it was decided to give an opportunity to those who wish to offer suggestions as to particular points in the bill but the hearings will be limited in order to expedite final consideration of the bill. The railroad labor organizations are particularly anxious to protest against the labor provisions of the bill, the railway executives had already filed an argument against the proposed limitation of earnings and several others interested have asked to be heard.

Decrease in Accidents on Western Lines

Substantial progress is being made in the prevention of accidents on the Southern Pacific, the Western Pacific, the Tidewater Southern and the Deep Creek, according to reports made by R. J. Clancy, assistant to the general manager, in general charge of this phase of operation on these roads.

During the first six months of 1919 the total of all accidents regardless of time disability was 3,487, compared with 4,481 for the first six months of 1918, a decrease of 994 or 22.2 per cent. Total accidents reportable to the Interstate Commerce Commission for the first six months of 1919 were 1,249, compared with 1,570 for the first six months of 1918, a decrease of 321, or 20.4 per cent. Accidents per million locomotive miles on the Southern Pacific were 59.81 for the first six months of 1919, compared with 68.99 for the corresponding period in 1918, a decrease of 9.18 or 13.3 per cent, and industrial accidents per million man-hours were 20.91, compared with 24.60 for corresponding period in 1918, a decrease of 3.69 or 15 per cent.

Similar comparison of accidents with the corresponding period in 1917 shows a reduction of accidents in 1919 of 11.7 per million locomotive miles and of 31.3 per cent per million man-hours.

Sixty Per Cent Efficient

The Wall Street Journal, commenting on the strength in the market of shares of stock of car building companies, and looking for reasons for this strength, remarks on the low condition of both cars and locomotives at the present time, and quotes Brigadier-General W. W. Atterbury, vice-president of the Pennsylvania Railroad, in a recent address to the employees in one of the shops of that company, as follows:

"Prior to our entrance into the war you were on a piecework basis; as well as working on a 10-hour day. When the Government took over our railroad piecework was stopped. The output per man per hour fell 25 per cent. The shops were put on an 8-hour basis. This cut the output an additional 15 per cent, so that the output per man per day in our shops is but 60 per cent of what it was before we entered the war. In other words, it takes ten men today to do what six men did before the war. The condition of the power is getting worse and worse, bad order cars are increasing and the roadbed all over the system is suffering from lack of the ordinary maintenance and the introduction of sufficient new rails and ties."

President's Labor Conference to Be Held October 6

The conference called by President Wilson to consider the relations between employees and the employers is to be held at the White House, Washington, on October 6, and will be attended by five persons selected by the United States Chamber of Commerce, five by the National Industrial Conference Board, fifteen by the American Federation of Labor, three by farming organizations, three by investment bankers, and fifteen representatives of the public selected by President Wilson. During the President's absence the arrangements for the conference will be in charge of Secretary Wilson of the Department of Labor. The conference, according to the letter of invitation, is "for the purpose of reaching, if possible, some common ground of agreement and action with regard to the future conduct of industry" and for the purpose "of consulting together on the great and vital questions affecting our industrial life and their consequent effect upon all our people, to discuss such methods as have already been tried out of bringing capital and labor into close co-operation, and to canvass every relevant feature of the present industrial situation, for the purpose of enabling us to work out, if possible, in a genuine spirit of co-operation, a practicable method of association, based upon a real community of interest which will redound to the welfare of all our people."

Heavier Loading of Cars

In a recent circular to Northwestern roads, R. H. Aishton, regional director of the Northwestern region said:

"At the present time there is a very serious box car shortage in every part of the territory in the Northwestern region. The lines in this region as a total, have 97 per cent of their ownership in box cars, which is slightly less than the number of cars they had on hand at this time last year, but the box car loading within the last ten days has increased at the rate of 3,000 to 5,000 cars per day.

"Record of a typical line in this region shows that there has been a very decided decrease in the tons loaded per car for the first seven months of 1919, as compared with the year 1918, as indicated below:

Commodity	Average loading per car		
	1918. Tons	1919. Tons	Dec. Tons
Wheat	40	37	3
Grain products (including flour)	35	30	5
Coal (hard and soft)	43	39	4
Lumber	29	26	3
Steel products	33	30	3

The average decrease in loading has been 4 tons or 12 per cent.

"If the loading at the present time was as heavy per car as last year, the car shortage would be almost entirely eliminated. Particular attention is directed to the very decided decrease in tons per car of grain products, including flour.

"It is very important that traffic officers be instructed to conduct a very intensive campaign with all shippers on the heavier loading per car. There is no way in which they can be of greater service to the shippers and the Railroad Administration today than by securing heavier loading of equipment. In addition to this, it should be the duty of all operating officers to also take action in this direction. It is only in this way, together with the prompt loading and unloading of equipment, that we can expect to meet the demands for equipment.

"Rule 9 of the Food Administration regulations, prescribes the minimum weights for various classes of commodities. This was cancelled shortly after the signing of the armistice, and loading these same quantities at the present time can only be brought about by appeals to shippers. We believe if this information is given to shippers in detail, and that specific cases of underloading, with car numbers, is called to the attention of shippers, they will see the necessity for immediately increasing the loading per car. If the same tonnage per car had been loaded this year as last year, it is estimated that 460,000 less cars would have been required during the past seven months than were actually used."

Signal Division—A. R. A.

The annual meeting of the Signal Division of the American Railroad Association, will be held at Congress Hotel and Annex, Chicago, on September 17, 18 and 19, as heretofore announced. The business to be considered on the first day will be the reports of committees numbers 16, 2, 3 and 11. Committee 16 will report on standard clauses and sections of specifications. Committee No. 2 will present a specification for mechanical interlocking machine with improved Saxby & Farmer locking, and a new chart for use in regulating the compensation of pipe lines for temperature; also a specification for the arrangement of locking in machines to establish uniformity and sequence. Committee No. 3 will present

specifications for universal first and second range voltage electric locks for hand operated switches; for electric locks for interlocking machine, and for a switch operating and locking mechanism. Committee No. 11 will present a specification for primary battery jars.

On the second day reports will be received from committees numbers 10, 4, 8, 9 and 15. Committee No. 10 presents, as information, the requisites for design and construction of automatic train control devices adopted on February 4, last, by the committee of the United States Railroad Administration. Committee No. 4 presents a specification for direct-current motor-operated signal mechanism, and a brief report on the use of zinc-treated ties in track circuits. Committee No. 8 reports on details of numerous specifications which have been approved at previous meetings but which were referred back to the committee for a few changes, or were revised by the committee on standard clauses and sections.

Committee No. 9 presents a specification for wire joints, with five drawings illustrating proposed standards, and a specification for friction tape. Committee No. 15 will report briefly on the studies which it has made in connection with valuation; dealing with the work which has been done in connection with the government Bureau of Valuation.

The reports to be considered on the third day are those of committees numbers 17, 13, 6 and 5. Committee No. 17 presents a specification for lubricating oil for signal mechanisms; and a historical sketch. Committee No. 13 presents a specification for portable direct-current volt-meters.

Committee No. 6 presents proposed standard drawings for pipe compensator (No. 1.014) revised; for a staff tip adapter, for a switch lamp and for a switch lamp base socket; also drawings, which are submitted as information and for discussion, for a switch lamp, a train marker lamp, and for engine signal lamps.

Committee No. 5 presents a code of instructions for installation and handling of caustic soda batteries.

Railway Earnings and Expenses for July

The Interstate Commerce Commission's monthly compilation of railway revenues and expenses, covering 185 Class I roads and 17 switching and terminal roads for July and the seven months ending July 31, is shown in the table.

National Association of Railroad Commissioners

The National Association of Railway and Utilities Commissioners will hold its thirty-first annual convention at the Claypool Hotel, Indianapolis, Ind., on Tuesday, October 14, and continuing probably through the week. It is expected that the opening address will be delivered by Clyde B. Aitchison, chairman of the Interstate Commerce Commission.

This association now has 52 members; the railroad or public service commission of each state—except Delaware, which has no commission—and the five following: Interstate Commerce Commission; Public Utilities Commission of the District of Columbia; Public Utilities Commission of Hawaii; the Board of Gas and Electric Light Commissioners of Massachusetts, and a second commission for New York, this state being divided into two districts.

The president of the association is Charles E. Elmquist, of Minnesota, and the secretary is James B. Walker, 49 Lafayette street, New York City.

Exhibition at General Foremen's Convention

The following is a list of the railway supply companies which exhibited at the fifteenth annual convention of the International Railway General Foremen's Association, which was held at Chicago, September 2-5:

Ahlberg Bearing Company, Chicago.—Bearings. Represented by E. C. Lewis.

American Arch Company, New York City.—Security brick arch. Represented by A. W. Clokey.

American Flexible Bolt Company, Pittsburgh, Pa.—American flexible bolt, American reduced body staybolt, American marine hollow bolt, American hollow staybolt iron and American rivet. Represented by R. W. Benson, W. F. Heacock, L. W. Widmeier, W. W. McAllister and C. A. Seley.

American Steel Foundries, Chicago.—Passenger truck model descriptive of the Simplex clasp brake, models describing Simplex couplers, Simplex shelf coupler pocket, Eclipse coupler yoke, Economy draft arm. Represented by W. G. Wallace, H. J. Melchert and W. C. Walsh.

American Steel Treaters' Society, Chicago.—Represented by W. H. Eisenman.

Anchor Packing Company, Philadelphia, Pa.—Packings. Represented by J. P. Landreth.

Armstrong Brothers Tool Company, Chicago.—Tools, wrenches, etc. Represented by H. Armstrong.

Ashton Valve Company, The, Boston, Mass.—Gages, etc. Represented by J. W. Motherwell and J. F. Gettrust.

Atlantic Hand Brake Corporation, The, Buffalo, N. Y.—Hand brake. Represented by Charles E. B. Smith and J. H. Weidemiller.

Baldwin Locomotive Works, The, Philadelphia, Pa.—Represented by Charles H. Gaskill.

*Credit item.

Note—The average railway operating income corresponding to item 22 above for the month of July in the three years 1914, 1915 and 1916, included in the test period of three years ended June 30, 1917, was $344 per mile of line for the United States.

Barco Manufacturing Company, Chicago.—Engine tender connections, car steam heat connections, roundhouse blower connections, coach yard steam heat connections, air reservoir joints, Barco crosshead and shoe. Represented by F. N. Bard, C. L. Mellor and Charles Thomas.

Bowden Company, The, Warren, Ohio.—Beaver die stocks and pipe cutters. Represented by C. A. Green and W. A. Phillis.

Boss Nut Company, Chicago.—Lock nuts. Represented by W. G. Wilkonson.

Broschart Threadless Pipe Coupling Company, Trenton, Mo.—Couplings and accessories. Represented by J. L. Broschart.

Brown & Sharpe, Providence, R. I.—Tools, instruments and milling cutters. Represented by P. A. Topel and H. J. Johnson.

Buckeye Steel Castings Company, The, Chicago.—M. C. B. Standard "D" coupler. Represented by F. J. Cooledge.

Camel Company, Chicago.—Represented by H. E. Creer.

Carborundum Company, Niagara Falls, N. Y.—Carborundum devices. Represented by H. P. Frost, J. W. Frazer, W. E. Knott and E. P. Ritzma.

Chicago Pneumatic Tool Company, Chicago.—Pneumatic tools and appliances. Represented by L. C. Sprague, A. C. Anderson, C. W. Cross and H. J. Smith.

Clark Equipment Company, Buchanan, Mich.—Twist drills, reamers, chucks, counter sinks, tool bit holders, tool bits, flue cutters and sockets. Represented by F. H. Woodward.

Cleveland Twist Drill Company of Cleveland, Cleveland, Ohio.—Twist drills, reamers, screw extractors. Represented by H. O. White and C. J. Kirchofer.

Coilis Company, The, Clinton, Ohio.—Drill sleeves and sockets, quick change chucks and special tools. Represented by C. M. Weaks

Crucible Steel Company of America, Pittsburgh, Pa.—Alloy tool steels, high speed steels and railroad springs. Represented by W. M. Stevenson, F. Baskerfield, R. D. Fletcher and F. A. Lawler.

D & M Cleaning Process, Chicago.—Process for cleaning locomotives. Represented by D. J. Lewis and F. M. Hilgerink.

Dearborn Chemical Company, Chicago.—Literature on scientific water treatment for locomotive boilers. Represented by G. R. Carr, J. D. Purcell, W. S. Reid, I. L. Beebe and H. Rehmeier.

Detroit Twist Drill Company, Detroit, Mich.—Drills and reamers. Represented by M. F. Crawmer.

Dixon Crucible Company, Joseph, Jersey City, N. J.—Dixon's pipe joint compound. Dixon's locomotive front end finish, locomotive hub liner lubricant, Dixon's solid belt dressing, Dixon's center plate grease and Dixon's brake cylinder grease. Represented by H. L. Hewson and F. W. Brandon.

Duff Manufacturing Company, Pittsburgh, Pa.—Jacks. Represented by C. N. Thulin.

Duntley-Dayton Company, Chicago.—Pneumatic tools. Represented by H. Arnold, P. D. Bates and A. C. Duntley.

Edna Brass Manufacturing Company, The, Cincinnati, Ohio.—Lubricators and injectors, coal sprinklers, water gages and boiler appliances. Represented by E. O. Corey and H. A. Glenn.

Flannery Bolt Company, Pittsburgh, Pa.

Ford & Co., J. B., Wyandotte, Mich.—Wyandotte metal cleaner, Wyandotte alkali special, Wyandotte cleaner and cleanser and Wyandotte detergent. Represented by G. J. Lawrence, A. J. Ratz and H. J. Willwerth.

Forrester Paint & Manufacturing Company, Winona, Minn.—Paints. Represented by Helen J. Caswell.

Franclare Company, Chicago.—Hand-fired stokers. Represented by C. H. Buck.

Franklin Railway Supply Company, New York City.—Represented by J. L. Randolph.

Galena Signal Oil Company, Franklin, Pa.—Represented by W. H. Foster, J. A. Graham, Bloss P. Corey and W. L. Trout.

Garlock Packing Company, Palmyra, N. Y.—Packings. Represented by C. W. Sullivan and W. H. Cook.

Gold Car Heating & Lighting Company, New York City.—Represented by Allen Sheldon.

Grip Nut Company, Chicago.—Grip nuts. Represented by B. G. Forsyth.

Hardy & Co., F. A., Chicago.—Safety goggles and devices. Represented by C. A. Kingsbury.

Hunt Spiller Manufacturing Company, Boston, Mass.—Piston valve bushings, piston valve packing, piston valve bull rings, cylinder packing, crosshead shoe, driving box shoes and wedges, knuckle pin bushings and side rod bushings. Represented by V. W. Ellet and E. J. Fuller.

Hutchins Car Roofing Company, Detroit, Mich.—Models of dry lading, all steel roofs, Hutchins flexible all steel roofs and Hutchins improved plastic roof. Represented by A. R. Wilson and W. D. Thompson.

Independent Pneumatic Tool Company, Chicago.—Pneumatic and electric tools, hose couplings, etc. Represented by F. J. Passino, V. W. Robinson, R. S. Cooper, J. D. Hurley, W. A. Nugent, J. G. Cowell and E. F. Bertrand.

Ingersoll Rand Company, Chicago.—Pneumatic tools. Represented by L. W. Schnitzer, Walter Johnson and R. S. McCreadie.

Iron City Products Company, Pittsburgh, Pa.—Jacks. Represented by C. A. Conklin, V. T. Salter, E. C. Arnold and H. K. Johnson.

Jenkins Brothers, New York City.—Valves and injectors. Represented by B. J. Neely.

Johns-Manville, H. W., New York City.—Packings, including air pump, industrial and brake cylinder packing sets and insulations for pipes, boilers and locomotive lagging. Represented by J. C. Younglove, F. C. Jacobs, P. R. Austin, E. H. Willard, D. H. Jennings, L. S. Wilbur and H. M. Butters.

Kelley Pneumatic Tool Company, Chicago.—Pneumatic tools. Represented by George McCabe and J. Osgood.

Leslie Company, The, Lyndhurst, N. J.—Pressure regulators and removable coupling nuts. Represented by S. I. Leslie and J. J. Cizek.

Liberty Steel Products Company, Chicago.—Brake beams. Represented by A. W. Preikschat, J. J. Borrowdale and S. W. Midgley.

Liberty Tool Company.—Rivet furnace and heating torch, portable drilling presses, holding on dolly bar and heading. Represented by E. O. Grimnes, E. T. Astin, A. B. Moore and M. C. Perrill.

Locomotive Fire Box Company, Chicago.—Nicholson Thermic Syphons as applied to locomotive fireboxes. Represented by John L. Nicholson and Stuart Hawley

Locomotive Lubricator Company, Chicago.—Represented by W. J. Schlacks.

Locomotive Superheater Company, New York City.—Literature on locomotive superheaters. Represented by R. R. Porterfield, R. M. Osterman and G. Fogg.

Lovejoy Tool Works, Chicago.—Jacks. Represented by W. H. Dangel.

Mahr Manufacturing Company, Minneapolis, Minn.—No. 2 oil burning torch and large wheel rivet forges (oil burning). Represented by H. H. Warner and A. E. Stenzel.

Manning, Maxwell & Moore, New York City.—Railroad shop tools. Represented by R. R. Cuthbertson, R. S. Dean and C. L. Brown.

McCord & Co., Chicago.—Journal boxes. Represented by J. A. Lamon.

Miner, W. H., Chicago.—Models of friction draft gear, hand brakes, side bearings and other appliances for cars and locomotives. Represented by A. L. Canavan and J. R. Mitchell.

Nathan Manufacturing Company, New York City.—Injectors, lubricators, boiler checks, gage cocks and coal sprinklers. Represented by F. C. Daven, J. Arn, Richard Welsh, W. R. Walsh, Ed. S. Toothe and J. F. Farrell.

National Boiler Washing Company, Chicago.—National hot water locomotive boiler washing system. Represented by D. Anderson.

National Malleable Castings Company, Cleveland, Ohio.—Adjustable brake beam and wrecking hooks. Represented by L. S. Wright.

National Railway Devices Company, Chicago.—Shoemaker vertical firedoors. Represented by Jay G. Robinson and E. J. Gunnison.

Ohio Injector Company, The, Chicago.—Chicago lubricator, Chicago flange oiler, Chicago non-lifting injector, Chicago U. S standard special B injector, Ohio water glass protector, Ohio lifting injector and Chicago automatic dritting valve. Represented by A. C. Beckwith.

Okadee Company, The, Chicago.—Okadee front end hinge, locomotive blow-off valves, tender hose couplers, Okadee water gage glass and roundhouse wash-out valves. Represented by A. G. Hollingshed, G. S. Turner and W. H. Heckman.

O'Malley-Beare Valve Company, The, Chicago.—Multiple valves, perfection gage cocks, water glass drains and locomotive special valves. Represented by Thomas O'Malley, Ed. O'Malley, J. E. Brown, J. N. Gallagher, James Pigott, Frank Hitesman and Walter Morris.

Oxweld Railway Service Company, Chicago.—Welding torches. Represented by W. Leighton, F. C. Hasse and W. A. Hogan.

Paxton-Mitchell Company, The, Omaha, Neb.—Model of Paxton-Mitchell piston rod packing and Leighton balance and lubricator cylinder packing rings. Represented by J. L. Paxton and R. C. Fielding.

Pocket List of Railroad Officials, The, New York City.—The Pocket List. Represented by C. L. Dinsmore.

Racine Tool & Machine Company, Racine, Wis.—Machine saws. Represented by F. J. Kidd and D. B. Maxwell.

Railway Review, Chicago.

Rich Tool Company, Chicago.—Twist drills, reamers, milling cutters, counter bores, chucks and small tools. Represented by J. L. Crowley.

Rivet Cutting Gun Company, Cincinnati, Ohio.—Rivet cutting gun and Cincinnati rivet hand catcher. Represented by J. M. Crowe, H. G. Dorn and F. L. McCune.

Roberts Automatic Steam & Air Connector, Sarnia, Ont.—Represented by R. E. Allen and J. W. Roberts.

Sargent & Co., Chicago.—"Renu" gage cock, Martin grease plugs, E. S. E. water glass cocks, Loedige blower valve and water glass protectors. Represented by George S. Garren and K. C. Robbins.

Schroeder Headlight & Generator Company, Evansville, Ind.—Headlight with switcher lens, special lens for diffusing light on yard and switch engines, same as furnished on Government standard locomotives. Represented by J. H. Schroeder, A. H. Varney, Chicago district sales manager, E. B. Norris and C. E. Kinnaw.

Scully-Jones & Co., Chicago.—Chucks, spacing collars and vises. Represented by R. Beaulieu.

Street & Co., R. R., Inc., Chicago.—Tools, chucks, pulleys, hangers, roller bearings and wrenches. Represented by C. J. Butterfuss.

Torchweld Equipment Company, Chicago.—Oxy-acetylene welding and cutting torches. Represented by W. A. Slack and A. F. Dillon.

U. S. Metallic Packing Company, The, Philadelphia, Pa.—Single and tandem piston packing (King type) and King type air pump packing. Represented by Harry E. Hyslop and L. B. Miller.

Vissering Company, Henry, Chicago.—Crescent metallic piston rod and valve stem packing for saturated and superheat locomotives, sanders, duplex sander valves, bell ringers and Viloco steam compressed governors. Represented by G. S. Turner, J. M. Monroe and W. H. Heckman.

Wells, R. W., Chicago.—Power saws, grinders and sheet metal cutters. Represented by R. W. Wells.

Western Tool Manufacturing Company, Springfield, Ohio.—Expanding mandrels, tool holders, shop furniture, vises, emery wheel dressers and safety lathe dogs Represented by J. Z. Wells.

Exhibitors at Tool Foremen's Convention

In last week's issue the following name was omitted from the list of exhibitors of the American Railway Tool Foremen's Association, held at the Hotel Sherman, Chicago, August 27-29:

Duntley-Dayton Company, Chicago. Specialized display of new Duntley air drills and Duntley saphil grinder. Represented by W. O. Duntley, C. A. Duntley, P. D. Bates, Charles Booth and Henry Arnold.

REVENUES AND EXPENSES OF RAILWAYS

SIX MONTHS OF CALENDAR YEAR, 1919

Name of road.	Average mileage operated during period.	Operating revenues			Operating expenses						Operating ratio.	Net from railway operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.
					Maintenance of

Traffic News

What is believed to be the first motor-express route tariff sheet to be compiled and put into effect has been promulgated by the Highway Transport Committee of Douglas county, Neb., and adopted by the Nebraska State Public Utilities Commission.

The St. Louis (Mo.) Eastern District Freight Traffic Committee, on a petition filed by the Baltimore & Ohio, will hold a hearing on September 16, on the cancellation of over 100 rates which have become obsolete due to the cessation of traffic in various commodities.

At a meeting of good roads advocates and representatives of highway commissioners from five southern states held at Memphis, resolutions were adopted on September 6 urging that all the southern states join in an appeal to the Railroad Administration for relief from a shortage of transportation facilities for the movement of roadbuilding material, which, it was said, is seriously hampering highway construction in the south.

Travel for the month of July in Yellowstone National Park broke all previous records. July 16 was the biggest day in the history of the park, almost a thousand people having entered that day. A total of 24,090 tourists visited the park during the month, of which 16,784 persons came in 4,457 private automobiles. While the season ends September 15, the roads leading to the park are now excellent and prevailing weather conditions are ideal.

An improved less-than-carload rail-and-Mississippi river merchandise service was inaugurated from Chicago to New Orleans, La., on August 1. On that date the Chicago & Alton commenced the operation of a through daily merchandise service from Chicago to the East St. Louis wharf of the Mississippi barge line, operated under the direction of the Division of Inland Waterways of the Railroad Administration. A comparison between the all-rail class rates and the rail-and-river rates show that the latter will produce substantial savings in the shipment of all classes of commodities.

During the month of August the roads comprising the Central Western region loaded 67,398 cars of grain as compared with 63,715 cars during the corresponding month last year, or an increase of 5.8 per cent. During the same period 48,713 cars of livestock were loaded as compared with 47,312 cars during the corresponding month last year, making an increase of 3 per cent. The loading of coal cars in this region during this period shows a decided decrease from the records for the same period last year. A total of 82,490 cars of coal were loaded during August as compared with 116,125 cars during August of last year, a decrease of 29 per cent.

Conflicting reports of the size of the Western Canadian grain crop have been somewhat cleared by the receipt of a detailed telegraphic crop report at the main offices of Canadian National Railways from the road's agents along more than 6,000 miles of line in Manitoba, Saskatchewan and Alberta. The lines of the Canadian National system in the west lie between Winnipeg and Edmonton. In these vast areas the threshing returns show yields in wheat from 6 to 30 bu. per acre in Manitoba, oats 20 to 60 bu. and barley 10 to 35 bu. In Saskatchewan wheat ranges from 3 to 25 bu. per acre, oats from 12 to 50 bu. and barley 25 to 30 bu. In Alberta the yield in wheat is from 2 to 50 bu. per acre and oats from 20 to 75 bu.

The Railroad Commission of California has granted the petition of the Oakland, Antioch & Eastern for an increase in passenger fares over the lines of that road. The new rates will put the fares of the Oakland, Antioch & Eastern on a parity with those of the federal controlled lines operating in the same district insofar as they apply to the one way rate. This road, however, provides a week end round trip tariff much lower than that maintained by its competitor, the Southern Pacific. It is expected that the new fares will yield about $22,100 additional revenue. It was shown at the hearing on the case that the company's payroll since 1916 had increased 72.97 per cent and that the cost of materials had increased 57.7 per cent during the same period.

A total of 6,443 cars of commercial export freight was received at North Atlantic ports during the week ended on August 27, compared with 1,248 cars for the same week of 1918. This shows an increase of 5,195 cars, or 416 per cent. Deliveries to ships during the period mentioned increased 4,490 cars, or 382 per cent, compared with the corresponding period in 1918. On August 27, 1919, there were 12,827,842 bushels of grain in elevators at North Atlantic ports. There were received during the week 6,493,916 bushels, while 6,212,053 bushels were cleared. At South Atlantic and Gulf ports there were 9,293 cars of export freight on hand as of August 26, 1919, compared with 9,894 cars on August 19 of the same month, a decrease of 691 cars. There were 8,973,336 bushels of grain stored in elevators at these ports as of August 26, representing 74.5 per cent of the total elevator capacity.

Loading reports for roads comprising the Northwestern region for the month of August show substantial decreases in the number of cars loaded on the lines of that region. The total number of revenue freight cars loaded during August, 1918, was 719,566, whereas the total number of cars loaded during August, 1919, totaled but 594,465. The commodities classified under this head show that there have been slight increases in the number of grain and grain product, livestock and lumber and forest products cars loaded, and that these increases have been more than counterbalanced by the substantial decreases in the number of cars of coal, coke and ore loaded. The total number of revenue freight cars received from connections during August, 1918, was 318,878 as compared with 321,762 cars during August, 1919.

After some controversy the traffic department of the Cincinnati (Ohio) Chamber of Commerce has secured a favorable ruling from the Railroad Administration on the proposition to continue in force the sale commutation tickets between Cincinnati, Lawrenceburg, Ohio, and Aurora. Some time ago the Baltimore & Ohio made application for authority to discontinue the sale of ten-ride commuter tickets between Cincinnati and Lawrenceburg and Cincinnati and Aurora. This move was taken because of the charge that Cincinnati salesmen were using the reduced rate ten-ride tickets to effect a cheaper through rate to such points as Connersville and Indianapolis. The Cincinnati Chamber of Commerce accordingly made a canvass of the traffic and, finding no evidence that salesmen were making such a practice, took the matter up with Railroad Administration officers at Washington with the result that no change will be made in the sale of commuter tickets at the present time.

At the direction of the Western Freight Traffic Committee the Kansas City (Mo.) District Freight Traffic Committee will hold a hearing on September 19 to establish uniform rules, regulations and charges for the fabrication in transit of iron and steel articles to, from and between points in western territory. Under the present arrangement these rules are provided for in individual lines and various committee issues. The Chicago Eastern District Freight Traffic Committee will also consider the same subject with a view to providing uniform rules, regulations and charges on all lines which will definitely describe the inbound articles of iron and steel from the rolling mills on which the privilege will be accorded, as well as the processes that will be permitted under the privilege; to determining the circumstances and conditions under which the tariff rate in effect from point of origin of the unfabricated material to destination of the fabricated material will be applied, together with a charge for the privilege which will be sufficient to reflect the value and cost of the service adequately; to providing proper and reasonable rules and regulations to enable the carriers to police the privilege which will require all fabricating plants to keep suitable records of inbound and outbound material received and forwarded from the plant as well as the tonnage received and disposed of locally.

Commission and Court News

Interstate Commerce Commission

The Commission began a hearing on Monday in connection with its general investigation, undertaken at the request of the director general of railroads, of the relationships between rates on grain and grain products from northwestern producing points to eastern destinations. The National Association of Railway and Utilities Commissioners, representing the state commissions, has asked that the commission postpone its investigation in view of the prospective early return of the railroads to private management, but the commission declined the petition.

State Commissions

The Kentucky Railroad Commission has directed the Chesapeake & Ohio and the Louisville & Nashville railroads to erect a new passenger station at Covington, Ky., not later than June 1, 1920.

The Public Service Commission of New York, Second district, acting under a recent law regulating highway crossings, has ordered the erection of cautionary signals (disks, marked "RR," on posts about 5 ft. high) at all grade crossings of highways and railroads throughout the commission's jurisdiction. The posts are to be furnished by the railroads, but they are to be put up by the town or state, and must stand, as near as may be, 300 ft. from the crossing.

Personnel of Commissions

Hon. F. B. Carvell, hitherto Minister of Public Works has been appointed chairman of the Canadian Board of Railway Commissioners, with office at Ottawa, Ont., succeeding Sir Henry Drayton, who has been appointed Minister of Finance.

Court News

The Western Retail Lumbermen's Association, a co-operative association composed of Washington lumber corporations, has brought suit in the federal court at Spokane, Wash., against Walker D. Hines, director general of railroads, and against 23 railroads for the recovery of losses sustained in the shipment of merchandise. A list of more than 300 claims by 53 individuals and companies accompanies the complaint, which was filed by A. L. Porter, secretary of the Association. The Association has contended for some time that the proper measure of loss and damage is the market value of the goods at the time of delivery or when they should have arrived at destination and that technically the carriers have forced the members of the Association to violate the Act to Regulate commerce by accepting payment of claims for less than what they actually should have been paid. The Association also states that the carriers have repeatedly refused to pay loss and damage claims upon the basis of the market value at destination and the suit filed in the Federal court is the result of this action. The court has been asked for an injunction to prevent the carriers from paying claims on any other basis than market value at destination and also for an accounting on claim said to be paid on an improper basis.

Men Needed for Railway Construction.—Press despatches from Swift Current, Saskatchewan, Canada state that contractors on the several lines of railway that are building in that territory, also contractors on government highway work are experiencing no little difficulty in securing sufficient labor for grading operations.

Foreign Railway News

A railroad collision between two trains near Toulouse, France, on the morning of September 5 is reported in press despatches to have caused the deaths of 13 persons and injury to 40.

Increased Tariffs on the Antofagasta (Chili) and Bolivia Railway.—Cable advices from the company's manager quoted in the Railway Gazette (London) announce that the Chilian Government has authorized an increase of 15 per cent on the company's tariffs to come into force 60 days after the customary publication, but the increase on nitrate will not rule until January 1 next, and the fares on second-class passenger traffic will be increased by only 5 per cent also to date from January 1 next.

New Railway in South Australia

The London Times states that Messrs. Timms & Kedman, railway contractors, of Adelaide, Australia, have offered to build, within three years, a railway from Adelaide to Port Darwin, to cost £8,000,000, payable in Government bonds, and provide work for 5,000 men.

Swiss Rolling Stock for Czecho-Slovakia

London.

A news item published in the Economic Review of the Foreign Press states that the Czecho-Slovak government has ordered 20 locomotives from a Swiss firm since France cannot for the present export any locomotives.

Railway Concessions in Brazil

London.

An extract from the South American Express states the Government will renew its concessions to the railways only on condition that large quantities of supplies and materials, including rails and rolling stock, are immediately imported. —*London Post.*

German Locomotives in France

London.

Supplementing a news item giving the disposition of German locomotives delivered to France, under the terms of the Armistice, it has been reported that the 500 locomotives operated by the American military forces have been disposed of as follows: Poland, 100 locomotives, Roumania, 50 locomotives, Czecho-Slovakia, 92 locomotives, French railways, including Alsace-Lorraine, 250 locomotives, Oriental countries, 8 locomotives.

Railway Traffic Reorganization

London.

An extract published in the Economic Review of the Foreign Press from Weltwirtschaftszeitung states that the Traffic Ministry of Jugo-Slavia intends to entirely reorganize the railway traffic. Locomotives and wagons will be provided, normal gage lines will be built. French and American engineers and traffic experts will be employed in addition to home experts. Marine and river shipping to provide means of transport will also be resumed.

Machine Tools in France

London.

Before the war the majority of machines imported into France came from Germany. In 1913, France imported 28,000 machine tools at a value of 52,000,000 francs, 50 per cent of which came from Germany. During the same year 11,000 machine tools, valued at 16,000,000 francs, were exported from France. Machine tools to the value of 65,000,000 francs were produced in France in 1913. It is planned that the French aeroplane factories will be converted into plants for the manufacture of machine tools.—*Le Génie Civil.*

Railway Rolling Stock in France

LONDON.

During 1913 France produced 700 locomotives, 2,000 passenger cars and 18,000 freight cars. Before the war it was necessary to import rolling stock, but today it is expected that, after the equipment plants in the North are reconstructed, France will be able to export both cars and locomotives after the present requirements of 1,000 locomotives, 2,600 passenger cars and 24,000 freight cars are provided. In 1913, France imported railway rolling stock to the value of 23,000,000 francs and exported to the value of 7,000,000 francs.—*Le Génie Civil.*

Railway Extensions in the Federated Malay States

LONDON.

The Times Trade Supplement says that Government of the Federated Malay States is planning the expenditure of large sums to cover railway extensions, the purchase of new rolling stock, the erection of railway stations and the construction of new bridges. Fourteen locomotives have been ordered from the United States, owing to the impossibility of obtaining them from the United Kingdom, and some of these are now on the way. There is a great demand for steel for constructional purposes, especially in connection with the erection of new railway bridges.

Brazilian Coal

According to the British Chamber of Commerce in Brazil, it is reported that experiments have recently been made by the Central Railway with briquettes composed of national coal from the Caçapava mines and American fuel. The experiments, which were carried out under strict technical requirements, gave excellent results and fully satisfied the experts who were present. It is believed, says the Chamber of Commerce, that the tests made with the Caçapava coal, from mines in the State of Sao Paulo situated close to the Central Railway, with which it will shortly be linked up by a branch line of 12 km., may eventually lead to a decrease of over 50 per cent in the imports of American coal, this leading to a very appreciable economy.

Italy's Electric Power

LONDON.

The Financier reports that the Italian Minister of Public Works is proposing a law for the application and development of hydro-electric power for the construction of electric railways and power stations for agricultural purposes. For a period of 15 years a subvention of 40 lire per h. p. generated will be granted and freedom of taxes on house property is to be granted for the same period to all buildings, housing, generating and transformation plants. The bill provides for an annual expenditure of 80,000,000 lire, which should make it possible to obtain an increase in the power production amounting to 8,000,000,000 kilowatts, or a yearly saving of 8,000,000 tons of coal.

Railway Developments in Norway

LONDON.

An extra from the Stavanger Aftenblad by the Economic Review of the Foreign Press states that the difficulties connected with the railway budget of Norway have been overcome. The Railway Committee insists upon an increase of Kr. 13,800,000, which is to be distributed in the following manner: Kr. 3,550,000 for the Dovre line, Kr. 3,550,000 for the Sorland line, Kr. 2,150,000 for the Rauma line, Kr. 1,600,000 for the Sunnan Grong line, Kr. 1,000,000 for the Storen line, Kr. 780,000 for alterations at Trondhjem station, and Kr. 1,170,000 for the East line railway station at Christiania. The work is planned so as to hasten the completion of those lines and a considerable amount of the money will be expended on rolling stock, rails, sleepers, bridges, etc.

Transport Difficulties in Roumania

LONDON.

The Times Trade Supplement states that the transport system of Roumania has suffered more than any other country during the war, for that country has only 200 locomotives remaining out of the 1,200 before the war. The government has made contracts for the supply of 100 locomotives from America, delivery to be at the rate of 10 per month, with France for 100 locomotives, two-thirds of which will be German locomotives taken over by France under the terms of the Armistice, and Canadian firms are negotiating for the supply of 800 locomotives at the rate of 10 a month. Railway trucks are very scarce, but the government is having a considerable number repaired, but many more are urgently needed.

New South American Trans-Continental

Press despatches to the Sun (New York) from Buenos Ayres, report the arrival at Tupiza, Bolivia, of the first train over the new extension running from La Quiaca, Argentina, to Tupiza. It is now possible to go by rail from Buenos Aires to La Paz, the capital of Bolivia, but the journey still necessitates a week and a half's travel.

The La Quiaca-Tupiza section of this transcontinental line was started before the outbreak of the European war, but on account of difficulties the work was held up.

Its completion is to be noted with interest, says the despatch, for by means of it railroad transportation from the east to the west coast is assured throughout the year and will no longer be closed during the winter months when snow blocks the transandine route from Buenos Ayres to Santiago.

Coal Resources of the World

LONDON.

A report in the Financier of August 23 states that according to a report submitted to the International Geological Congress at Toronto in August, 1913, the world's reserves of solid mineral fuel are 7,397,553 million tons of more or less easy extraction and all at a workable depth. This figure comprised bituminous or dry coal, lignite, anthracite, and anthracite coal, and was divided as follows: 3,902,944 mill. tons dry coal, 2,997,763 million tons lignite, 496,846 million tons anthracite. The distribution is shown below in million tons:

	Lignite	Coal	Anthracite	Total
America	2,811,906	2,271,080	22,542	5,105,528
Asia	111,851	760,098	407 637	1,279,586
Europe	36,682	693,162	54,346	784,190
Oceania	36,270	113,481	659	170,410
Africa	1,054	45,123	11,662	57,839
Totals	2,997,763	3,902,944	496,846	7,397,553

Railroad Service and Fares in the Netherlands

During the war the Dutch railway train service was greatly reduced in comparison with peace times, chiefly on account of scarcity of coal for the locomotives, writes Consul Frank W. Mahin from Amsterdam. A new train schedule that went into effect July 9 increased the number of passenger trains 30 per cent, restored fast trains, and brought back the service to nearly pre-war conditions.

Fares, however, will continue high. During the war they were advanced 50 per cent in the summer, when travel was the greatest, this being ostensibly to reduce travel, as the railroads could not operate extra trains. But during all of last year the increased fares were retained, and are now to be continued under the new schedule. First class fare is 5 Dutch cents per kilometer, second class 3¾, and the third class 2½. In American equivalents, these fares are about 3 cents a mile first class, 2¼ second class, and 1½ third class. Only hand baggage is free in the Netherlands. The charge for trunks averages about $0.40 per 100 pounds per 100 miles.

International Train Services in Europe

International train representatives of the British, French, Belgian and Central European railways have been in conference in Paris for three weeks with the object of establishing a new service of international trains. Subject to confirmation at a final meeting of all the delegates, it has been decided to run the Orient Express via the Simplon Tunnel, with through carriages between Paris and Bucharest and between Paris and Belgrade. A portion will go on to Athens.

In connection with this express there will be a train from Ostend to Milan and vice versa via Brussels. Another inter-

national express is to run between Paris, Prague and Warsaw by way of Strassburg and Nuremberg, in place of the former Nord Express.

The timetable for this train through the German countries concerned remains to be settled, and this is to be done at Strassburg in time for the final meeting in Paris. It is expected that this train will begin on September 15.

The delegates have also debated a Paris convention to take the place of the former Berne convention, dealing with waybill, tariff and other international traffic questions.

Chinese Railways

London.

Mr. Wih Kung-Cho, adviser to the President of the Republic of China, Dr. Chin-Chun Wang, Administrative of the Director of the Chinese State Railways, have been visiting Great Britain and other European countries investigating their technical and commercial resources. An interview published in the London Times Trade Supplement of August 16, 1919, states that the gross receipts of the Chinese railways for 1918 showed an increase of 25 to 30 per cent over the profits of the previous year. The increase in the cost of operation due to the war conditions has been relatively small, and the prosperity of Chinese railways is a marked contrast to conditions of railways in many European countries. Reports of brigandism have been greatly exaggerated, and there has been only one attempt at a "hold-up" for the last two years—"a record of which the United States might well be proud." A policy of uniform standardization is to be introduced on Chinese railways, which will affect locomotives, cars, trucks, etc.

American Trade in Malaya

London.

The Singapore correspondent of the London Times Trade Supplement says that a question often asked in Singapore is "Will United States business houses keep the hold on local markets they secured during the war?" and states further that the answer is that it is doubtful. There are several reasons why the Malaya importers will be quite ready to replace the materials brought into their country during the war with British goods as soon as the opportunity occurs. The chief reason is perhaps that the United States firms demand credit before shipment. A common complaint is that the goods often arrive badly packed, as a result of which losses are unduly high. Another grievance is that orders are often duplicated, merchants in America taking it upon themselves to double the order, drawing credit up to the value of the original order asked for and forwarding the rest at sight draft. Another was the practice of selling goods ordered by one man to another at a higher rate during transit.

The correspondent goes on to say that the importer in Malaya knows that as a general rule he can rely on British quality and British merchants' methods of doing business, so that the British merchants may be assured that their goods will be welcomed. He closes with the general opinion that Malaya is likely to enjoy a period of unexampled prosperity.

Hydro-Electric Power in Norway

London.

The London Times Engineering Supplement for August states that Norway's wealth of water power is at present attracting much attention, as according to official statistics the country boasts an aggregate of 15,000,000 hp. of water power throughout the year, a figure which, in comparison with other countries where the figures generally apply to only nine months of the year, is more imposing. Nor does this figure exhaust the total power, because several waterfalls of some importance are excluded, as are also a series with but limited fall, although some of them are quite suitable for exploitation. The extent and power of Norway's water power has greatly increased, and the country has earned such vast sums during the war it is now able to finance undertakings which would formerly have been beyond its powers.

An adequate supply of electric energy for the ordinary requirements of the population naturally claims the first place. If, taking into account the prospective increase in the population, 5,000,000 hp. are allowed for this, 10,000,000 hp. would remain for industrial purposes. The Norwegian Hydro-Electric Company has in ten years exploited 300,000 hp. Electric iron smelting and steel production are among the industries which should need electric energy, and in the production of which Norway has rather lagged behind. Export of electric current to Denmark and Sweden is also likely to require a considerable amount of current, the estimated figure being from 200,000 to 500,000 hp.

The Alsace-Lorraine Railways

A new organization has been set up for the railways of Alsace-Lorraine. According to the terms of a decree by the commissary-general of the Republic at Strasburg the system is to be operated on behalf of the State by an administrative body with headquarters at Strasburg, under the authority of the commissary-general. The administrative body will consist of a *directeur*, or manager, and a council of 21 members, including representatives of Chambers of Commerce and industrial and agricultural associations in the territories traversed by the railways. M. Lebert, assistant operating manager of the state railways, has been appointed *directeur*, and the other principal officers have been selected from among high officers on the Est, P.L.M., Orleans and State railways. The railways of Alsace-Lorraine were from 1871 until the end of the war in the unique position of being the only "Imperial" railways in the German Empire, the other State railways being vested in individual states forming component parts of the Empire The existing system consists in part of lines originally built and owned by the Est and ceded to the German Empire under the terms of the Treaty of Versailles and now restored to France, and in part of extensions built by Germany since 1871. Ever since the Franco-Prussian War Germany has regarded the Alsace-Lorraine railways chiefly from the standpoint of strategical lines, although their commercial value has never been overlooked and tracks, stations and sidings have been laid out and loading and unloading accommodation provided in accordance with military requirements in the event of a European war.

Railway Construction in Poland

According to the Przegloud Wieczorny (Warsaw), the Ministry of Railways has decided to commence the construction of 350 km. of railway lines annually for the next two years and a half, making a total, for that period, of about 875 km. (543 miles) It has been agreed that the most important and most urgent of the proposed constructions are the following:

(1) The creation of direct communication between Warsaw and Poznan (Posen) by the construction of a new line from Kutno to Strzalkowo. This is to be a first-class double track line, and the sum of 800,000 marks per km. has been allotted to it in the estimates. In view of the easy "terrain," it is considered that this sum should be ample for the purpose.

(2) The connection Lodz-Kutno-Plock-Sierpce.

(3) The reconstruction of the narrow gage railway Sierpce-Nasiesk as a line of normal gage.

(4) The creation of better communication between Lwow (Lemberg) and Warsaw by the construction of a line from Zawada to Lublin to take the place of the present connection Rawa Ruska-Rejowiec-Lublin. The Ministry is also in possession of a complete scheme for a line from Rzeszow to Nisko, in Galicia. Some of the Galician members of the Sejur (Parliament) are making energetic efforts to secure the speedy construction of this line.

The solution of the problem of Warsaw's railway connections has also been considered. It is proposed to build a station for passenger traffic on either side of the Vistula, and to connect them by a line running underground along the Jerusalem avenue and crossing the river obliquely by a new bridge. In addition separate stations for goods traffic are proposed on both sides of the Vistula. It is estimated that the completion of the Warsaw scheme will require 10 years, and that the cost (which has not yet been ascertained) will be not less than 100,000,000 marks. The reconstruction and

restoration of stations, stores and similar buildings destroyed or fallen into disrepair in consequence of the war is expected to absorb 120,000,000 marks.

Enginemen Receive Increases in Great Britain

LONDON.

The locomotive drivers, firemen and cleaners after several months of negotiations (since December, 1918) have agreed with the English Board of Trade on a standard daily wage, which is a real standard when compared to the variated scale of wages followed by the railways in the United States. This new rate is based entirely on the time of service of the men and represents an increase of approximately 100 per cent of the prewar wage. Last year these men, who number in the neighborhood of 65,000, were granted a war bonus of 33 shillings per week to cover the increased cost of living, the expectation being that as the cost of living diminished it would be removed. Since the signing of the armistice, there having been no indication of a reduction in the cost of living the men have been seeking to have the 33 shilling bonus included in their regular wage, and although they agreed last April that the existing wages plus the war bonus was to remain in effect during the present year, they made further demands which were used as the basis for settlement. The demands were first placed before the Railway Executive Committee of Great Britain, which made counter proposals as indicated in the table attached which were refused by the men. The matter was then taken up by the English Board of Trade which after some negotiations finally agreed with the men on the schedule which is also shown in the table. The wages shown in the table refer to a daily wage for an eight-hour day, except where otherwise noted, and it includes 33 shillings per week war bonus.

	Railway Executive Committee's award	Railway men's demands	Board of Trade's first award	Board of Trade's second award, which was accepted
Locomotive engineers and motormen—				
First and second years	7s. 6d. to	12s.	11s.	12s.
Third and fourth years	12s. in the	14s.	13s.	13s.
Fifth, sixth and seventh years	eleventh	16s.	14s.	14s.
Eighth year and onwards	year	16s.	14s.	15s.
Locomotive firemen and assistant motormen—				
First and second years	5s. 6d. to	9s. 6d.	8s.	9s. 6d.
Third and fourth years	6s.	10s. 6d.	9s.	10s. 6d.
Fifth year and onwards		11s. 6d.	10s.	11s.
Cleaners—				
Sixteen years old and under	28s. to 41s.	8s.	4s.	4s.

Twenty years old and over		8s. 6d.	7s.	7s.

Shillings (approx. 24 cents). Fence (approx. 2 cents).

Britain's Ministry of Transport Act

The Ministry of Transport Act has at length received the Royal Assent and, apart from the merits, it is interesting to note, says the Railway Gazette, London, how long and severe has been the examination and criticism which it has received from both Houses of Parliament. Not since the days before the war of highly contentious measures of a party political kind has there been such a long contested bill. Party politics did not much enter into the matter, but their place was taken by suspicion of bureaucracy, important vested interests and economic industrial and financial considerations.

Introduced in the House of Commons as long ago as February 26 last, the second reading debate lasted for two days —March 17 and 18. The committee stage began on April 1, and a standing committee labored at it, generally for about four hours a day, for 18 days spread over the time till May 28. The report stage in the House did not begin till July 1, and it continued for four days ending on July 8. The third reading was disposed of in one day—July 10.

The first reading in the House of Lords was formal, but the second reading debate occupied two days—July 21 and 23. On the movement that the bill be considered in committee, Lord Salisbury moved that there be an instruction that they could consider the bill in two parts, taking the part relating to railways and light railways and what he termed certain urgent matters at once, and leaving all the other proposed powers for future consideration. If adopted, this proposal would have involved the House of Lords in one of the most momentous decisions it has taken in the last few years, and would have precipitated a conflict with the House of Commons, but wiser counsels prevailed and the bill was referred to committee. The committee stage began on July 29 and ended on August 6, after occupying parts of five days. The report stage was disposed of on August 11, and the third reading on the following day.

The adjustment of amendments between the two Houses was carried out on August 12 and 13, and on the latter day the Royal Assent was given.

The measure was thus before the two Houses on no fewer than 38 days, spread over a period of about five and a half months.

Railroad Developments Needed in Venezuela

LONDON.

In commenting on the mission of a special commissioner sent to Great Britain by the government of Venezuela for the purpose of obtaining co-operation in developing that country, the London Times Trade Supplement published some interesting facts regarding the need of improved transportation facilities. It indicates on a map, which is reproduced herewith, the railways that are already in operation, those under construction, and those contemplated. Venezuela is primarily an agricultural country, but there are great opportunities for development in petroleum and coal. Having an area of 364,000 square miles, the country has less than 700 miles of railways, and these are all located on the northern coast. They start from the Caribbean seaboard and run inland at different regions. About half of the railways were constructed by the British, the most flourishing line connecting the seaport of La Guaira with the capital, Caracas. The Venezuelan Central, a British railway, operates between the capital and Sta. Teresa, and extends to Ocumare.

Railways of Venezuela Showing the Lines Open, Those Under Construction and New Lines Under Consideration

In the Maracaibo Lake region there is at Tucacas the sea terminus of another British line, the Bolivar Railway Company, with about 170 miles of track; the first strip was built to serve the British-owned copper mines of Aroa, extensions afterwards running to Barquisimeto and from Palmasola to San Felipe. The Puerto Cabello and Valencia line is also British, connecting with the German-built Gran Ferrocarril de Venezuela running from Caracas to Valencia.

Local railway lines have also been built by British interests within the last few years in the Maracaibo region to serve the special needs of sugar, coal and oil companies. Of other lines, that from Guanta to Barcelona and Naricual serves a series of coal fields; the Encontrados line, some day to be extended to the Colombian frontier, is a coffee carrier; the Sta. Barbara-El Vejia line serves sugar regions, but needs rebuilding; that from La Ceiba to Trujillo and Valera also

serves agricultural regions, while the little La Vea-Coro line connects the two sides of Paraguana peninsula. The Carenero line is another example of a short strip giving access to a port, while a section is under construction from the Perija coal fields to Castilletes, above the Maracaibo bar.

Venezuela's most pressing need is for roads and railroads to permit the movement of trade with the interior plains, where large herds of cattle and extensive agricultural areas exist. One of the most important railway projects is that connecting San Fernando de Apuré, the greatest cattle center, with the Valencia line, by way of Calabozo, Ciudad de Cura, Victoria and Maracay. At present herds are sent on the hoof by poor roads to Puerto Cabello, the journey taking several weeks. Another extension projected runs from Valencia in a southerly direction, again for the purpose of penetrating rich pastoral country, passing through Guanare to Barinas. A third plan is to put the Orinoco river in rail communication with the Caribbean coast by an extension of the Barcelona line, by way of Maturin, to Ciudad Bolivar. The Barcelona line serving coal fields would then extend to great gold mining, petroleum and asphalt belts. Altogether, 800 miles of new line are badly needed.

Rolling Stock and Working Conditions in France

London, Eng.

The 50,000 freight cars lost by the French railways in August, 1914, during the first period of invasion, represented, says Le Génie Civil, more than one-tenth of the stock used on the French railways; the density of the traffic soon crippled those which remained, and the lack of repair-shops and construction works (many of which were in invaded regions), together with the scarcity of labor, prevented the upkeep and renewal from being carried out normally. This bad condition of the rolling stock gave rise to many derailments and collisions due to the breaking of couplings, with the result that the shortage of rolling stock was further increased. However, in April, 1918, at the time of the German advance on Amiens, the Northern Railway was able to arrange for 170 trains per day for the transport of troops alone, making a total of 20,000 loaded wagons; in August, 1918, the figure rose to 25,000 wagons.

After the armistice, owing to the sudden advance of the armies as far as Alsace and Lorraine, the distances to be covered for the transport of supplies and the service in the liberated regions, were all at once considerably lengthened, so that the same rolling stock had to cover much more ground, which is equivalent to a proportional decrease in the material available. Other causes further accentuated the crisis. The German stock, delivered in accordance with the stipulations of the armistice, but with much delay, only slightly relieved this state of affairs at the outset. The scarcity of lubricating materials and the formidable distances covered between the Franco-Italian front and the Russian or Balkan fronts, had reduced engines and freight cars to such a condition that many had to be rejected, while the others left still much to be desired. The use of this rolling stock (4,300 engines and 130,000 freight cars) made it necessary to employ, in addition, German drivers and stokers, who showed little zeal and were even suspected of wilful negligence which was eliminated as quickly as possible; then, again, spare parts could only be found in German depots or works.

The following table, taken from an official document, shows the differences occurring between 1914 and the beginning of 1919 in French rolling stock:

	Existing stock		Stock laying idle owing to damage	
	1914	1919	1914	1919
Locomotive engines ..	13,000	14,574	1,729 (13.2%)	2,834 (19.5%)
Freight cars	376,000	368,000	14,840 (4.0%)	38,520 (10.5%)
Passenger cars	49,380	43,956	4,474 (9.1%)	7,817 (18.0%)

As regards the French employees, their number has decreased by nearly 20 per cent between August 1, 1914, and January 1, 1919 (332,700 men against 280,660) The smaller efficiency of women workers (used even in the laborious work of handling luggage), the ravages of the influenza epidemic made in the ranks of a much overworked staff, especially in the army, and lastly the demobilization of a large number of employees mobilized for the working of railways, will explain the difficult position in which the great companies have found themselves during the last few months in this connection as in others. (*Le Génie Civil.*)

English Railway Stockholders Association

London, August 6, 1919.

The English Railway Stockholders' Protection Association, Ltd., which, as noted recently in these columns, has been formed by an influential group of stockholders, results from the anxiety as to the future of the English and Welch railways. An executive committee, representing very large holdings in English railway stocks, has been appointed, and the association has been registered under the Companies Act, with limited liability.

The sole object of the association is to safeguard the interests of all stockholders of the English and Welsh railway companies in the final settlement of the questions arising out of the government control of the railways. The main problems that have to be dealt with are (1) the depreciation of permanent way and rolling stock; (2) the greatly increased cost of operation due to the payment of higher wages to employees and higher prices for materials; and (3) the difficulties attending the issue of new capital or of loans for the development of the railways.

The association is neither for nor against nationalization. It is not political. It stands for no policy other than the policy of fair play for all, whatever the decision of Parliament as to the future of English and Welsh railways.

The appeal of the association is to a large portion of the general public, both directly as individual stockholders, and indirectly through their interest in banks, insurance companies, charitable, educational and religious institutions, friendly societies, trade unions and limited companies, the majority of which have a portion of their funds invested in English railway securities.

The total holdings in stocks of the railways of the United Kingdom represent a face value of no less than £1,350,-000,000. The number of stockholders is probably not less than one and a half millions.

In Scotland there is a similar association, with a membership of over 30,000, which has already performed valuable service on behalf of the Scottish railway shareholders.

The association has a definite plan of campaign. It will give the legislature, royal commissions or committees dealing with the affairs of the railways, facilities for ascertaining the views of the stockholders, and will demonstrate the real merits of their claims. It will watch over all legislation affecting the stockholders, it will place their case adequately before the press, it will hold meetings and establish branches in England and Wales, it will collect and publish all necessary information, and generally give all possible assistance to its members. It is assured beforehand of the sympathy of the boards of management of many of the railways and the support of influential institutions.

A single subscription only is required from a stockholder or bondholder to become a member of the association, the sum to be not more than 42s. and not less than 2s. 6d. Any subscription between these two limits may be sent; it is left to the subscriber to decide the amount, having regard to his interests in English railways. Beyond this, there will be no liability except a contingent contribution not exceeding one shilling (if required) towards the cost of winding up the association.

The secretary is A. W. Burchell, 5 The Sanctuary, Westminster, London.

The Nationalized Railways of Italy

London.

The London Times Trade Supplement of August 16 publishes a review of a book which has just been written by Signor Pietro Lanino,* whose reputation as a railway authority is undisputed. The purpose of the book is to outline a series of suggestions as to the best means by which the Italian State railways can be developed and their deficiencies remedied, and the criticisms of nationalization which it contains are merely incidental to the main subject. In spite of this, or rather because of it, Signor Lanino's remarks on the beginnings, progress, and effects of public ownership are extremely valuable, for they have all the weight of testimony

* "Per le Sviluppo e l'Organizazione dei nostri Transporti Ferroviari." By Pietro Lanino. Published by Nicola Zanichelli, Bologna.

given by an independent witness who is nowhere concerned to make out a case for or against nationalization.

The state-owned Italian lines have a length of 8,700 miles, and are the most extensive railway system in Europe under one management. They were built by a number of private companies, and in the year 1905 were taken over by the government in consequence of a general strike of railway workers which broke out that year and was of an alarming political character.

The private companies paid a tax of 27.5 per cent of their revenue to the government, averaging an amount of £2,560,000 annually. The first year after nationalization the sum had dropped to £1,920,000, and in 1913-14 to £1,120,000, while the year 1915 showed a deficit. The total investment aggregates about £280,000,000.

Lack of Enterprise

Double-tracking was initiated under private management, but progress has been slow since the state entered the field, and today only 23 per cent of the system has double tracks.

Italy's mountain railways are only one-seventh of her lines, but they absorb 40 per cent of the total consumption of coal. Electrification is therefore a pressing necessity from the point of view of economy, and we find that the private companies had electrified 84 miles of most difficult road between the years 1899 and 1902. During the first 12 years of government administration less than 154 miles were electrified, and at the present rate of progress it would take 100 years to electrify the 2,175 miles which it would be profitable to change.

From 1885 to 1905 the private companies actively developed local traffic resources, especially along the Adriatic, organized the export of Italian agricultural and industrial products to England and Central Europe, and started the express service of the country by inaugurating a fast train from Milan to Rome.

Since 1905 no measures have been taken by the state to encourage production and exports. The railway no longer seeks the customers. It is the customer who bows down to the bureaucrat in the railway office.

Unceasing Friction

According to Signor Lanino, the private companies built their extensions in a careful, solid way, making money for their shareholders, and satisfying the state's legitimate requirements. Under public ownership construction has proceeded slowly, the original plans of 1905 have not yet been carried out, and the expense is so much greater than was anticipated that an original estimate of £17,280,000 has had to be altered to £25,560,000. The timidity which caused the government to conceal the sum necessary for the reorganization of the railways in 1905 still persists. Conflicting local interests hinder the completion of new projects. There is unceasing friction between the officials of the departments of Railway Administration and Public Works, and in the end nothing is accomplished.

But the great and all-absorbing question of the Italian state railways is, and always has been, labor. As Signor Lanino truthfully remarks, the employees are not considered as such, but as electors. The state has been unable to attract a high class of workers, or to increase the efficiency of those whom it has succeeded in obtaining. Discipline cannot be maintained, for any official who attempts to enforce it finds himself subjected to political pressure. The payroll amounts to £20,000,000, an increase of £8,000,000 since the beginning of the war. Operating expenses have risen from 68.8 per cent under private management to 82 per cent, of which increase labor represents six per cent. The total number of workers had increased 47 per cent and the wage-bill 53 per cent by 1914, and even in 1907, or two years after nationalization took place, the office force numbered 13,000 persons, as against 8,000 in 1905. On certain of the secondary lines the average number of passengers carried daily is barely equal to the number of employees. From 1911 to 1914 it was necessary to add £840,000 to passenger fares and £480,000 to freights, in order to meet labor's demands for increased pay. In the higher positions the bureaucrat, backed by his powerful political friends, is slowly but surely replacing the trained official, to the further deterioration of the service.

Equipment and Supplies

Locomotive Deliveries Week Ended August 23

New locomotives were shipped during the week ended August 23, as follows:

Works	Road	Number	Type
American	A. C. L.	6	USRA Pacific
		6	
Baldwin	S. A. L.	6	USRA Santa Fe
	P. L. W.	2	Santa Fe
	A. T. & S. F.	2	Santa Fe
	C. & O.	1	USRA Mallet
	P. L. W.	4	USRA Santa Fe
	T. & P.	1	USRA Mikado
	N. & W.	1	Mallet
		17	
Total		23	

Freight Cars

The Baltimore & Ohio is inquiring for 8 50-ton steel hopper cars.

M. C. Fairchild & Co., New York, are inquiring for 50 20-ton gondola cars for export.

The Eastman Kodak Company, Rochester, N. Y., is inquiring for one special 40-ft. 30-ton flat car.

The United States Coal & Coke Company, Pittsburgh, Pa., is inquiring for one motor-driven car.

Cosden & Co., Tulsa, Okla., has ordered one 50-ton 10,000-gal. insulated tank car from the American Car & Foundry Company.

The Madeira Hill, Clark Coal Company, Philadelphia, Pa., has ordered 75 wooden mine cars from the American Car & Foundry Company.

The Warner Sugar Refining Company, New York, has ordered four 40-ton 8,000-gal. tank cars from the American Car & Foundry Company for export.

The Petroleum Refining Company, Cincinnati, Ohio, has ordered 16 8,050-gal. and 2 6,500-gal. tank cars from the Pennsylvania Tank Car Company.

Signaling

The Pennsylvania, Western Lines, has ordered a 28-lever Saxby & Farmer interlocking machine from the Union Switch & Signal Company, Swissvale, Pa., for use at Newburg, Ohio. Another machine of the same type with a 36-lever frame, furnished by the same company is being installed by railroad forces at Brady Lake, Ohio.

Miscellaneous

The Home Oil Refining Company of Texas has been awarded a contract for the furnishing of oil to the St. Louis-San Francisco for five years. Neither the quantity of oil to be supplied nor the price to be paid has been announced. The oil will be delivered to the road at Oklahoma City, Okla., Fort Worth, Tex., and Monette, Mo.

"No Accident Day" was successfully observed on the Tyrone division of the Pennsylvania Railroad on Tuesday, August 26, the day passing without a single accident of any description. J. K. Johnston, superintendent of the Tyrone division, said that "No Accident Day" would be observed at intervals on his division.

Pennsylvania Railroad stockholders on August 1 numbered 112,216, an increase of 618, compared with July 1, and 8,033 compared with August 1, 1918. The average holding on August 1 was 88.95 shares. In two years the average has been reduced from 105.95. About 30 per cent of the $500,000,000 capital stock is held by women.

Supply Trade News

Richard Pintsch, inventor of the Pintsch gas lighting system, is reported dead at Berlin, Germany, at the age of 80.

The Hutchins Car Roofing Company, Chicago, has opened an office in the Railway Exchange building, St. Louis, Mo., in charge of **Charles F. Pace** as district sales manager.

George W. Bender, district manager in charge of the New York office of **Mudge & Co.,** Chicago, has been promoted to manager of sales and service with headquarters in Chicago. Mr. Bender was born at Pittsburgh, Pa., on August 20, 1884. At the age of 17, he entered the engineering department of the Pressed Steel Car Company of that city. In 1906, he accepted a position with the American Locomotive Company where he had charge of the extra work order department. In 1910, he became associated with Mudge & Co. as chief draftsman and subsequently was given charge of the mechanical department. Later he was made assistant to the vice-president, a position he held until his appointment in April, 1918, as eastern manager in the New England and Atlantic Coast states in which capacity he served until his recent promotion.

G. W. Bender

The Chicago Pneumatic Tool Company, Chicago, announces the appointment of **Fred Gehbauer,** as special Navy Yard representative, with headquarters at the Philadelphia office, 1740 Market street.

H. W. Johns-Manville Company, New York, has commenced excavating for a large plant at Waukegan, Ill. No contracts have been let for the building itself as the type of construction and the specifications have not been fully decided upon.

William H. Bruce, sales manager of the **Mark Manufacturing Company,** Chicago, with office at Minneapolis, Minn., has been appointed southern sales manager for this firm and also for the Steel & Tube Company of America with headquarters at New Orleans, La.

Paul Sutcliffe, advertising manager of the Edison Storage Battery Company, Orange, N. J., has been appointed manager of the industrial truck and tractor department of the same company. Mr. Sutcliffe has been with the Edison Storage Battery Company for the past five years.

The Bucyrus Company, South Milwaukee, Wis., announces that it has opened a Cleveland office at 808 American Trust building in charge of **E. G. Lewis,** formerly with the New York office of the Bucyrus Company and more recently president of the New Jersey Slag Products Company, Dover, N. J.

The Locomotive Crane Company of America, Chicago, has been chartered by Charles and Robert Vergan with a capitalization of $300,000. The new company is manufacturing a small locomotive-type road crane with a capacity of four tons which will handle a ¾ yd. clam shell bucket and which can be used with block attachment. The company is at present negotiating a contract for a large manufacturing plant to be constructed at Clearing, Ill., upon which operations will commence within the next 90 days.

W. C. Epstein, formerly in the operating department of the American Brake Shoe & Foundry Company, Chicago, and more recently in charge of the production engineering division of the Bureau of Aircraft Production at New York, has been appointed general superintendent of the **Duff Manufacturing Company,** Pittsburgh, Pa., with office in that city.

Doheny, Quinlan & Robertson, Ltd., Montreal, Que., has been incorporated under the Dominion Companies Act with an authorized capital of $2,000,000 to conduct a general and railway contracting business, and act as engineer and builder of allied work. The directors are: **H. Doheny, H. Quinlan, A. W. Robertson, G. A. Campbell** and **J. Karry.** Mr. Doheny has been engaged in the railway contracting business for some years and H. Quinlan and A. W. Robertson have been associated in government construction work.

The Fastfeed Drill & Tool Corporation, recently incorporated under the laws of the state of New York with an authorized capital of $500,000, has purchased the factory, together with the business and good will, of the **McCarthy Drill & Tool Corp.,** Toledo, Ohio. **John D. McGrath,** formerly treasurer of the McCarthy Drill & Tool Corp., is managing director of the new organization which will continue to operate the plant in Toledo. Additions to the present equipment are planned for the near future.

John Kelly, who for a number of years was New York district manager of the **Edison Storage Battery Company,** has been appointed general sales manager of the company, with headquarters at Orange, N. J. This promotion for Mr. Kelly follows closely upon his promotion, on July 1 of this year, to the position of assistant general sales manager. Mr. Kelly brings to his new position the experience of a long and varied career in the storage battery, electric vehicle and accessory business. For nine and one-half years he was district manager of the New York office of the Edison Storage Battery Company. Before that he had been a salesman for the Westinghouse Storage Battery Company for two years, for the Swinehart Tire & Rubber Company for three years, for the Firestone Tire & Rubber Company for two years, and for the New York Edison Company for nearly four years.

John Kelly

Harry W. Benkart, manufacturers' agent at Buffalo, N. Y., has been appointed representative of the Lakewood Engineering Company at Buffalo, with offices in the Ellicott Square building. Mr. Benkart has had about ten years' experience in the construction business, the greater portion of which was spent with the Dravo Construction Company in the position of superintendent of construction. For the past five years he has been an agent for contractors' equipment including the Lakewood line. In joining the Lakewood organization, he now discontinues all other lines.

A. A. Schneider, formerly with the raw materials department of the Midvale Steel & Ordnance Company and the Cambria Steel Company, has been appointed manager of the newly created raw materials division of the **American Steel Export Company.** Prior to entering military service in 1917 as a lieutenant of field artillery, Mr. Schneider had, for several years, been assistant to H. F. Black of the Midvale and

Cambria companies of Pittsburgh. In his new field, Mr. Schneider will handle imports, exports and domestic sales of pig iron, manganese, chrome and low phosphorus, iron ores, ferro-alloys, coal and coke.

American Locomotive Company Has Record Year

The annual report of the American Locomotive Company for the fiscal year ended June 30, 1919, shows that that year was the most successful in the history of the company. During the year the company, working entirely on locomotive business, had the gross earnings of $108,923,524 as compared with $80,588,071 in the year ended June 30, 1918, or with $82,213,845 in 1917. The profits for the year, after the deduction of interest, etc., and $4,922,789 for income and war profits taxes, amounted to $12,012,567 as compared with $5,911,137 in the previous year. The same dividends were paid as in the preceding year, namely, 7 per cent on the preferred and 5 per cent on the common stock, leaving a surplus of $9,012,567 as compared with $2,911,137 in 1918. From this amount $5,000,000 was set aside as a reserve for additions and betterments, leaving a net credit to profit and loss of $4,012,567. In the fiscal year ended June 30, 1918, only $1,000,000 was set aside for reserves for additions and betterments and the credit to profit and loss was only $1,911,137.

President Andrew Fletcher in his report to the stockholders, says that in arriving at the net profits for the year, there has been included under the heading of manufacturing expenses and deducted from earnings the sum of $1,155,556 for depreciation and $548,491 for new drawings and patterns. He also says that there was expended for permanent additions and betterments to the plants $1,704,854, all of which has been charged against the reserve for such expenditures.

Mr. Fletcher also says in his report: "To offset the effect of the shorter working day and the increased cost of labor of all kinds, the management of the company, continuing the past policy of improving the physical conditions and facilities of the plants and increasing their efficiency, has set aside out of the profits of the year a reserve of $5,000,000 for further additions and betterments. The advisability of making these improvements was demonstrated during the war, and while the plants were working to their full capacity, but they were deferred until they could be made without serious interference with the output. The improvements are now in progress and are principally to the Schenectady, Brooks and Montreal plants and for the extension of the company's steel casting plant at Chester, Pa.

"The tonnage produced in the year ended June 30, 1919, was about 23 per cent greater than the production of the preceding year. This was due to the new high records of production obtained at the larger plants of the company in the forepart of the year, and to the increased tonnage of the Montreal and Richmond plants, which during part of the preceding year were being converted from munitions to locomotive manufacturing.

"The amount of unfilled orders on the books on June 30, 1919, was $16,034,678, compared with $74,736,543 on June 30, 1918, and $54,517,373 on December 31, 1918. Since the armistice was signed in November, 1918, the volume of sales has been very low. There was, however, a considerable amount of unfilled orders on hand when the war ended, and with new business booked subsequently, all plants except Pittsburgh were enabled to operate for the remaining months of the fiscal year at a slightly reduced rate of production. The Pittsburgh plant was closed at the completion of its schedule in March, 1919, and the reduced volume of business concentrated at the larger and more efficient plants of the company. There has been $2,135,352 of new locomotive orders taken since July 1, 1919.

"The excess of current assets over current liabilities on June 30, 1919, was $35,508,422.53.

"The amount of inventories of materials and supplies on hand and work in progress on June 30, 1919, was $11,018,309, as compared with $25,411,834 on June 30, 1918.

"During the year the company completed the order of 800 standardized locomotives for the United States Railroad Administration, which were contracted for on April 30, 1918. The company also completed 381 standardized locomotives for the Railroad Administration, applying on a contract of 500, dated November 1, 1918. Because of the omission of Congress to provide funds prior to its adjournment in March last, the Railroad Administration was unable to meet its obligations in cash for locomotives delivered. To meet this situation the Director General of the Railroad Administration issued Certificates of Indebtedness bearing interest at five per cent for all unpaid bills due this company, and on June 30, 1919, the company had received from the Administration $25,324,424.05, of such Certificates of Indebtedness.

"On July 15, 1919, the Railroad Administration, having obtained an appropriation from Congress, paid the Certificates of Indebtedness then held by our company, amounting to $26,102,218.50. As this amount of cash added to other accumulations since July 1, 1919, is far in excess of immediate needs of the company because of the small amount of business on hand, the company has liquidated all of its loans payable, amounting to $7,535,000, and purchased $23,500,000 of U. S. Treasury 4½ per cent Certificates.

"The contract with the U. S. War Department for 190 trench locomotives, amounting to $1,873,400, which was cancelled shortly after the signing of the armistice, has been adjusted without loss to the company.

"The immediate prospect of orders for domestic locomotives is not bright and undoubtedly this condition will continue until the ultimate disposition and financing of the railroads of the country, now under control of the United States Railroad Administration as a war measure, has been determined.

"While the company has been receiving orders for foreign service, a greater volume of foreign business could be obtained but for the problems of finance and credit, many of the inquiries requiring long terms of payment extending from five to ten years. Unquestionably a broad gage policy of credits to the foreign countries will have to be granted them in rebuilding their railroad facilities, so vitally necessary to their industrial growth and prosperity. One solution of this problem, in our opinion, would be obtained by forming a combination of railroad equipment companies and allied industries of this country together with banking interests, under the form of a Foreign Railway Equipment Finance Corporation, rather than by individual action by any railroad equipment company. Such combination would be permissible under the Clayton and Webb-Pomerene laws, and thereby afford an imperative relief to the foreign countries requiring our help in rehabilitating their transportation systems. The long delay in the settlement of peace is in a measure preventing the formulation of definite plans and action tending toward the re-establishment of normal business relations with European and other foreign countries.

The consolidated income account and general balance sheet follow:

CONSOLIDATED GENERAL BALANCE SHEET

American Locomotive Company and the Montreal Locomotive Works, Ltd., June 30, 1919

ASSETS

Cost of property (less depreciation reserves)		$43,154,192
Sundry securities owned		641,704
Current assets—		
Cash on hand and in banks	$3,339,485

Trade Publications

MAST HOIST BUCKET.—A plant for handling concrete on small jobs by means of a hoist, bucket and chute is described and illustrated in a folder issued by the Insley Manufacturing Company, Indianapolis, Ind This equipment is less elaborate than that covered by the tower and spouting system in that the tower is replaced by a mast.

ELECTRIC TRAVELING CRANES.—A new catalogue of Chesapeake cranes has been compiled by the Chesapeake Iron Works, Baltimore, Md. The book contains 28 pages, 9 in. by 11½ in. The first half is devoted to descriptions and illustrations of the various parts of the cranes, while the last half contains full page illustrations of installations.

COLOR CHART FOR HEATING STEEL.—The Onondaga Steel Company, Syracuse, N. Y., has prepared a graphic color chart containing directions for cutting on high speed steel for tool lengths, for forging and hardening forged tools, milling cutters and finished tools, and for tempering and annealing, with the temperatures for the different operations shown in color.

CURTAIN ROLLER.—The Curtain Supply Company, New York, is revising its catalogue, which will hereafter be issued in the form of bulletins describing and illustrating their various products. The first of these, R-2, covers the Rex all-metal curtain roller and consists of eight pages, describing the construction of the roller and illustrating the detail parts.

HYDRAULIC MACHINERY.—A catalogue of 63 pages, embracing all kinds of hydraulic machinery, has been prepared by William H. Wood, hydraulic engineer, Media, Pa. These machines include flanging, riveting, punching and shearing machines, cranes, hammers, valves, pumps, accumulators, etc. Several drawings are also shown of the Wood's flexible corrugated locomotive firebox, flanged on a sectional flanging press, and a summary of the results of comparative tests, made some years ago on the New York Central, of a Wood's firebox with arch tubes and a standard firebox without arch tubes.

Financial and Construction

Railway Financial News

CHICAGO, ROCK ISLAND & PACIFIC.—This company has applied to the Public Utilities Commission of Illinois for authority to issue its general mortgage gold bonds in the aggregate amount of $1,000,000 and of its first and refunding mortgage gold bonds in the amount of $7,999,000.

OAKLAND, ANTIOCH & EASTERN.—Authority to issue notes in renewal of notes issued to the Union Switch & Signal Company, Pope & Talbot Company, Charles Nelson & Company, J. A. Roebling's Sons Company, and the California National Bank of Sacramento, Cal., has been given to the Oakland, Antioch & Eastern by the Railroad Commission of the State of California. The notes, ranging in amount from $2,374 to $40,000, were issued originally to cover the cost of material and supplies used in road construction.

WESTERN PACIFIC.—See editorial elsewhere in this issue.

Railway Construction

SIKESTON & SOUTHEASTERN.—The directors of this road, at a meeting held in Charleston, Mo., decided to proceed with their plans for constructing a railroad to the Mississippi river, opposite Hickman, Ky., crossing Mississippi county near East Prairie. Residents of Sikeston are backing this project as a means of securing better freight rates through the use of the Mississippi river.

SOUTHERN RAILROAD LINES.—The contract for the steel work on the new bridge of the Cincinnati, New Orleans & Texas Pacific over the Tennessee River near Chattanooga, Tenn., has been awarded to the American Bridge Company.

THE NORTHERN PACIFIC.—Contracts have been let to J. L. Shiely & Co., St. Paul, Minn., for the excavating work, and to the J. & W. A. Elliott Company, Minneapolis, Minn., for the construction of a hospital for the Northern Pacific Beneficial Association at St. Paul, Minn. The building will be of reinforced concrete, stone and brick construction, 42 ft. by 280 ft. with a wing 42 ft. by 60 ft. and will cost approximately $500,000, including a garage and power plant. All excavation and concrete footings have been completed and it is expected that the hospital will be ready for occupancy by the first of the year. Following the completion of the hospital proper, a nurses' home and two residences for the head physicians will be constructed. The new hospital will accommodate 150 patients.

UNION PACIFIC.—The new terminal at Council Bluffs, Iowa, is nearing completion and will be ready for service about September 15. The new terminal is composed of a modern 40-stall roundhouse, a new machine shop, 72 ft. by 209 ft., a modern power plant and a 650-ton coaling station. The new roundhouse of steel, brick and concrete is nearly completed with the exception of painting, the installation of a washout system and the building of a turntable foundation. In adjoining buildings of the same construction are located the tool rooms, the office of the roundhouse foreman and washrooms for the engineers and roundhouse workmen. A new sand house and sand bin have also been erected, the former being of brick and the latter having a capacity of 50 cars of sand.

The membership in the American Society for Testing Materials has passed the 2,500 mark, the present membership being 2,538. While the growth of the society has been steady it has never been as rapid as during the present year, during the first eight months of which 313 new members were enrolled.

Railway Officers

Railroad Administration

Operating

R. K. Rochester, formerly superintendent of the Cleveland and Pittsburgh division of the Pennsylvania, Lines West, Northwest system, with office at Cleveland, Ohio, and more recently a major in the army has received his discharge from military service and has resumed his duties as superintendent, succeeding **G. LeBoutillier**, who has been transferred.

F. W. Boardman has been appointed fuel supervisor of the Texas & Pacific, the Trans-Mississippi Terminal Railroad, the Weatherford, Mineral Wells & Northwestern, the Gulf, Texas & Western, the Denison & Pacific Suburban Railroad, and the Fort Worth Belt Railroad, with headquarters at Dallas, Texas, succeeding **W. L. McMurray**, assigned to other duties.

Engineering and Rolling Stock

C. A. Plumly has been appointed valuation engineer of the Maine Central with office at Portland, Maine.

A. W. Macpherson, chief engineer of the San Francisco-Oakland Terminal for the past five years, has resigned to engage in other business. He will also organize a general contracting firm with headquarters at Woodland, Cal.

J. J. Maginn, formerly master mechanic of the Cincinnati Northern at Van Wert, Ohio, has been appointed superintendent of motive power of the Lake Erie & Western, with headquarters at Lima, Ohio, vice **George J. Duffey**, deceased.

L. L. Sparrow has been appointed principal assistant engineer of the Atlantic Coast Line with office at Wilmington, N. C., succeeding **T. L. Morton**, deceased. **George G. Thomas, Jr.**, has been appointed office engineer, succeeding Mr. Sparrow.

L. R. Wink has been appointed assistant superintendent of the car department of the Chicago & Northwestern with offices at Chicago. **C. J. Nelson** has been appointed general foreman of the car department in charge of the Galena and Wisconsin divisions and Chicago Terminals, succeeding Mr. Wink.

Captains John Maher, George B. Farlow, Joseph M. Lewis, Paul W. Elmore and **Lieutenants W. B. Maurer, J. W. Purdy** and **J. D. Stemm** have been discharged from military service and have resumed their duties as assistant engineers on the Baltimore & Ohio, Western Lines, with headquarters at Cincinnati, Ohio.

Otis Weeks, who has been discharged from military service, has been reappointed division engineer of the Salt Lake division of the Southern Pacific, with headquarters at Ogden, Utah, in place of **W. F. Turner**, assigned to other duties. **F. W. Bordwell** has been appointed division engineer of the San Joaquin division, with headquarters at Bakersfield, Cal., in place of **P. T. Robinson**, assigned to other duties.

Lieut. Leigh Budwell has resumed his duties as mechanical engineer of the Richmond, Fredericksburg & Potomac and the Washington Southern, with headquarters at Richmond, Va., having just returned from 12 months' service in the Transportation Corps in France, where he served as master mechanic in the 16th Grand Division. **B. J. Coffman**, who has been acting mechanical engineer during the absence of Lieutenant Budwell, has been assigned to other duties in the mechanical department.

Corporate

Executive, Financial, Legal and Accounting

S. S. Senne, assistant to the receiver of the Louisiana & North West has resigned to become vice-president and general manager of the Westfield Motor Railway Company with headquarters at Westfield, Ill.

Engineering and Rolling Stock

G. P. MacLaren has been appointed district engineer of the Ontario district of the Canadian National with headquarters at Toronto, Ont.

A. H. Kendall has been appointed master mechanic of the Quebec district of the Canadian Pacific with office at Montreal, Canada, succeeding **C. A. Wheeler**, transferred.

Theodore C. Fischer, whose appointment as corporate engineer of the Central Railroad of New Jersey with headquarters at New York, was recently announced in these columns, was born on August 14, 1879, at Philadelphia, Pa. He was educated at Rutgers College, graduating with the class of 1899. In June, 1899, he entered the service of the Central Railroad of New Jersey as rodman in the engineering department. He was made transitman in December, 1902, and assistant engineer in January, 1906. On January 1, 1917, he was promoted to office engineer, which position he held at the time of his recent appointment as noted above.

Traffic

M. Frank Tompkins, who has been appointed general freight agent on the Canadian National Railways, with headquarters at Moncton, N. B., as has already been announced in these columns, was born on December 6, 1878, at Margaree, N. S., and was educated in the public schools at Truro. He began railway work on November 23, 1896, with the Intercolonial Railway, now a part of the Canadian National Railways, as a telegraph operator, and served at various places until February, 1900. He was then, until May of the same year, freight clerk at Truro and subsequently to September, 1902, served in a similar position at Sydney. On September 1, 1902, he was appointed accountant in the superintendent's office at New Glasgow, and from July, 1903, for one year was telegraph operator at the same place. He then served as relieving agent at different places until January, 1911, when he became chief clerk in the division freight agent's office at Halifax. On November 30, 1914, he was appointed division freight agent at the same place and, since June, 1917, was assistant general freight agent at Moncton, N. B., until his promotion to general freight agent as above noted.

M. F. Tompkins

Obituary

Thomas L. Morton, principal assistant engineer of the Atlantic Coast Line, died at the hospital of the University of Virginia on August 27, 1919, after an illness of about three months. Mr. Morton was born at Petersburg, Va., on May 31, 1854, and was educated at McCates School, Richmond, Va., and Oxford University, England. He entered the service of the Plant System in 1883 as engineer in charge of location and construction of the line from Tampa, Fla., to Kissimmee, Fla., and continued after the completion of that work with the Plant System in charge of the location and construction of many of the Florida lines of that company. When the Plant System was purchased by the Atlantic Coast Line in 1902, Mr. Morton remained with the railroad, holding various positions in the engineering department until he was promoted to that of principal assistant engineer.

The Shantung Situation

China is looked upon as a large potential market for railway material and supplies and American capital hopes to be able to build no small share of the great additions that must be made to China's present inadequate railway mileage. Thus far, we have not had much success. It has been the practice in the main for railway supplies to be bought in the countries owning the concessions for the railways, and the United States has not been one of them. Readers of the *Railway Age* are also familiar through our special correspondence from Peking with the difficulties American railway builders have encountered in being told that lines surveyed by American parties are already covered by some prior concession or that such lines enter a sphere of influence already spoken for. The difficulty has been that America, unlike its competitors—for such they are in a matter of this kind—has not presented a firm front or a settled policy diplomatically in the Far East. This is now being emphasized as the discussion at the Peace Conference is brought to light. It appears that England and France, although they were closer to the United States than to Japan during the war, and despite their great interests in China, tended in the conference towards Japan rather than towards the United States in matters affecting China. The explanation given is that they did so principally because Japan has a definite policy whereas we have not. American railway supply men who are expecting so much from the proposed American railway building in China, as well as those directly interested in this railway building, cannot feel satisfied with this condition. America has the friendship of China as no other country has, but the American doing business in China would prefer to be in a position to use that friendship in a business way. He does not like merely to see America friendly; he also wants to be able to deal with China on the same basis as his business competitors. At present, as is shown by the experiences undergone by the railroad builders above mentioned, such is not the case. It will not be the case until the United States adopts a firmer policy towards the Far East and maintains a policy which protects and stands back of American citizens to the same extent as the policies of other countries stand back of their citizens in China.

How to Use Charts

The article printed elsewhere, discussing the advantages of the logarithmic chart over the chart plotted on an arithmetical scale, suggests but does not clearly bring out the limitations of graphic charts. Whether a column of figures is plotted out on a graphic chart and studied in this form or whether the figures, themselves, are studied, a real analysis is possible only when the student has in his own mind the related facts which give either the chart or the figures significance. Plot cumulative monthly earnings and expenses of a particular railroad on but a horizontal scale of two inches to the month and a vertical scale of $1,000 to the inch; then plot the same figures with the same vertical scale with a horizontal scale of a half inch to a month, and see how very much steeper are the curves. The two charts, however, represent the same set of facts, yet the apparent trend is quite different. But one of the advantages which is claimed for charts as compared with columns of figures is that the charts will show at a glance the trend. A chart does not show anything significant at a glance; it has to be studied just as a column of figures has to be studied. The column of figures, however, has its limitations just as has the chart. Even if a student of a column of figures, mentally or otherwise, translates changes into percentages, he still fails to make a significant analysis unless he knows many facts not shown by the figures alone. For instance, what for a particular month would be a large gross increase in expenses on one road and also a large percentage of increase might be an insignificant increase on another road. A decrease of 40 tons or 10 per cent in train loading in December as compared with November on the Florida East Coast would be a large decrease. A decrease of 60 tons or 10 per cent in train loading on the Northern Pacific in December might not be at all abnormal. Charts, whether logarithmic or arithmetical, may be useful. Certainly, plotting a chart serves to fix the figures firmly in the mind of the man who does the plotting; but charts will be a hindrance, not a help, if they fool the student into believing that he can make an analysis of a situation "at a glance."

The Fatal Defect of the Cummins Bill

One of the most extraordinary features of the present railroad situation is that many people who are in favor of returning the railroads to private operation because they believe private management is more efficient than government management, are at the same time opposed to doing what is necessary to enable the railways to be efficiently and successfully operated under private management. The members of the Senate subcommittee on Interstate Commerce which drafted the Cummins bill are all in favor of a private ownership and management. They are opposed to government management because they believe private management is more efficient. Therefore, they provide for the return of the railroads to private management. But apparently they have overlooked the main thing that always has made private more efficient than government management. This has been the opportunity which has been afforded to increase profits by increasing efficiency. The Cummins bill proposes to destroy this opportunity. While it provides for the return of the railroads to private management, it also provides that if any railroad shall earn more in any year than the Interstate Commerce Commission shall deem to be a "fair return upon a fair value" the entire surplus earned shall be taken from the railway company earning it. This means that once a railroad began to earn a "fair return" it would never be able to increase its profits by increasing the efficiency of its management. Not only would the Cummins bill destroy all incentive to increase efficiency on many railroads, but it would do it in a most unfair way. It provides that the Interstate Commerce Commission shall so fix rates that each group of railroads shall earn a fair return upon the fair value of their combined property, and, also as we have seen, that if any road in any year earns more than a fair return all its surplus earnings shall be taken from it. Suppose, however,

that the Interstate Commerce Commission should so fix rates that in a given year a railroad or a group of railroads failed to earn a fair return. Under the provisions of the Cummins bill the railroad or group of railroads, in this case, would have no recourse. In other words, in any year when a railroad or group of railroads failed to earn a fair return it or they would lose the difference between what was actually earned and what would have been a fair return, but in any year when a railroad or group of railroads earned more than a "fair return" it or they would have the entire surplus taken away. There is still another important point to be considered. The Interstate Commerce Commission under this bill is to determine what is "fair value" and also what is "a fair return." In view of the past regulation of the railways by the Commission no railway manager or financier would feel any confidence that under these provisions the rates would be made high enough to enable the railroads to pay a reasonable return upon the existing investment or upon new capital. The *Railway Age* has been strongly opposed to government ownership and management. It has been in favor of a return of the railroads to private operation at the earliest practicable date. But this paper would rather see a return to private operation indefinitely postponed than to see the railroads returned to private operation under provisions such as those in the Cummins bill which we have mentioned. Government operation is not popular. It is not likely to become popular, and therefore its continuance for some time longer might not result in government ownership. But if the railroads should be returned to private management under legislation such as the Cummins bill, it is certain that their operation would not be efficient, and that they would not be able to raise sufficient capital adequately to develop their facilities. If under private control their operation was inefficient and they did not adequately develop their facilities, the result probably would be the growth of an irresistible agitation for government ownership. Therefore, in our opinion, the surest way to bring about permanent government ownership in the United States would be to enact just such provisions as those of the Cummins bill. It is astounding that men can oppose government ownership, can believe in the superior efficiency and desirability of private management, and yet can draft and support legislation which is unjust in itself, and the certain effect of which would be to prevent private operation from being efficient and to make government ownership inevitable.

The Freight Car Situation

PRACTICAL CAR MEN are decidedly of the opinion that the physical condition of freight cars generally is bad—extremely bad—and far worse than it was when the government took over control of the railroads about 21 months ago. Frank McManamy, assistant director of the Mechanical Department, Division of Operation, outlined the bad order car situation in his testimony before the Senate subcommittee which is investigating the coal situation; this was reported in the *Railway Age* of September 12, page 505. Mr. McManamy indicated that the administration is doing everything it can at this time to get the cars into good condition. He stated, however, that after the armistice a reduction was made in the working hours each week because of the falling off of traffic and in order to reduce the amounts paid for punitive overtime. Further reductions were made in March because of the necessity for further economy on account of expenditures for maintenance of equipment as compared with the test period.

The expenditures for the maintenance of equipment during the three-year test period were subnormal for two reasons; during the earlier part of the period traffic was light and the financial condition of the railroads was such that it was necessary to keep the maintenance charges at a minimum; during the latter part traffic was extremely heavy and the congestion was so great that the cars were only given sufficient repairs to keep them in a running condition. The latter situation continued to exist during the time the railroads were under government control up to the armistice.

It was apparently the intention of Congress to have the government hand the railroads back to their owners in practically as good condition as when they were taken over. The Railroad Administration in trying to accomplish this introduced a clause into the contract with the railroads to the effect that the government would expend for maintenance of equipment each year a sum based upon the expenditures made by the roads themselves during the three-year test period, equated, however, to allow for the difference in the cost for material and wages. There seems to be no question but what this method will be unfair to the owners of the railroads so far as freight cars are concerned and that if it is followed through to a conclusion and the government expends no more money on the equipment than is allowable on this basis, the condition of freight cars will be deplorable when the roads are turned back to their owners at the end of the year.

There are three reasons why it will be unfair to the railroads to measure the condition of freight car equipment on a basis of the expenditures made for maintenance, even assuming that the three-year test period is a fair one for comparison.

In the first place, while the wages have been greatly increased there has been a considerable falling off in the efficiency of labor. There are several causes for this. Large numbers of experienced men were taken from the car department into war service; then too, many of the better classes of mechanics were attracted into the manufacture of munitions and war supplies because of the exorbitant wages that were paid by these industries. The abolishing of piece work was a great blow to efficiency and production. Added to all of this is the spirit of industrial unrest which has been more or less general and which has resulted in a very considerable restriction of production.

Secondly, under former conditions the M. C. B. rules were such that cars were returned more or less promptly to their owners, most of whom took a real pride in the upkeep of their equipment and were able to carry out carefully developed plans for the betterment and modernization of the freight car equipment. Now that the cars are pooled only an extremely small proportion of any one road's equipment is on its lines at any one time and a large part of it may never get near the owning line. The roads do not take the same interest in foreign equipment that they do in their own. The cost of making repairs to foreign equipment is much heavier than it should be because of the difference in standards and types of construction. These things, added to the heavy traffic conditions which existed during the greater part of 1918, have resulted in the general practice of making temporary repairs where in many cases the cars should have been given heavy repairs or have been rebuilt. This is an expensive practice and the effect of the "patch and run" policy is quite evident by an inspection of freight cars in any large yard or repair shop.

In the third place, the steady introduction of more powerful locomotives and the general tendency to introduce economies in operation by increasing the train loads made it necessary a number of years ago for nearly all of the important roads to give special attention to the physical condition of their freight cars and to adopt extensive programs for the steady retirement of the older and more or less obsolete

cars, and the rebuilding or modernization of cars which with a reasonable expenditure would give good service under the new conditions. In most cases it has been found necessary almost entirely to disregard these programs during the last three years and this has added greatly to the average cost of upkeep of the individual cars.

Because of these reasons it would seem that the Railroad Administration should recognize the necessity for adopting a more liberal policy in its freight car repair program, realizing that in order to return the equipment to the roads in as good condition as when it was taken over, a far greater expenditure for maintenance will be justified than is indicated by a literal interpretation of the clause in the contract which relates to the maintenance of equipment.

Reasons for Improved Financial Results

As was pointed out in last week's *Railway Age*, the railways, under government control, in July—for the first time since September, 1918—earned the entire return guaranteed by the government to the companies. The financial rsults gained show a great improvement over those of the early months of the year. It is worth while to study the statistics of earnings and expenses to find out, if possible, how this improvement has been secured.

The low water mark of this year, in the matter of financial return, was touched in March. In that month the ratio of operating expenses to earnings was over 92 per cent and the net operating income was only 16 per cent of the government's guarantees to the companies. In July the ratio of expenses to earnings had been reduced to less than 79 per cent, and net operating income was $343 per mile, as compared with $344 per mile in July of the three test years. Investigation of the tendencies shown between March and July by total earnings, and by the larger items of expense—cost of transportation, of maintenance of equipment and of maintenance of way—will throw light on how the improvement in financial results was obtained. Additional light will be afforded by comparison of the tendencies of earnings and the larger items of operating expenses between March and July, 1916, and 1917, the last years of private operation, with their tendencies between March and July this year.

The following table shows in percentages the changes in operating revenues, total operating expenses, and the cost of maintenance of equipment, of maintenance of way and of conducting transportation which occurred between March and July, 1916, 1917, and 1919:

Percentage of increase (or decrease) March to July, 1916, 1917 and 1919:

	1917	1919	1916
Operating revenues	9.9	23.	4.4
Operating expenses	3.9	3.3	*
Maintenance of equipment	1.4	*	*
Maintenance of way	12.	12.5	14.
Conducting transportation	1.5	1.6	5. d

* Less than 1 per cent change.
d Decrease.

This table shows that there was a very large increase in total earnings between March and July, 1919. The increase amounted to 23 per cent, while between March and July, 1917, the increase in total earnings was less than 10 per cent. This indicates that railway traffic was at a very low ebb last March and was getting back to normal in July. With an increase of 23 per cent in total earnings, which reflected a corresponding increase in the amount of traffic handled, there was an increase between March and July, 1919, of only 1.6 per cent in transportation expenses. These figures indicate a great increase in operating efficiency. Between March and July, 1917, while the increase in earnings was less than 10 per cent, the increase in transportation expenses was 1.5 per cent. While transportation expenses are held down while total earnings are increasing, there is a real increase of economy and of profits, because anything which is once saved in the cost of conducting transportation is permanently saved. The Railroad Administration and the operating officers and train service employees of the railways deserve the greatest credit for the manifest increase in efficiency in conducting transportation which occurred between March and July.

While a reduction of transportation expenses is always a real saving, the same thing cannot be said regarding a reduction of maintenance of expenses. A reduction of maintenance expenses may reflect either an increase in efficiency of management or deterioration of the physical properties of the railroads. The table shows that while between March and July, 1919, there was an increase of 23 per cent in the amount of business handled, there was no increase at all in the expenditures for maintenance of equipment, and an increase of only 12.5 per cent in expenditures for maintenance of way. On the other hand, between March and July, 1917, while the increase in business and earnings was less than 10 per cent, there was an increase of 1.4 per cent in expenditures for maintenance of equipment, and of 12 per cent in expenditures for maintenance of way. An increase in the amount of business handled should ordinarily be accompanied by an increase in expenditures for maintenance and equipment. Furthermore, under normal conditions, there should always be a relatively large increase in expenditures for maintenance of way between March and July. During the winter months it is impossible in most of the United States to carry on much maintenance of way work, and after the frost goes out of the ground in the spring, maintenance of way work should be rapidly pushed and should reach its maximum about July.

The statistics indicate that the management of the railways was stringently holding down expenditures for maintenance in July, 1919. If we compare 1919 with 1916, the impression that this was the case will be deepened. In 1916, between March and July, the increase in total operating revenues was only 4 per cent, and while there was no increase in expenditures for maintenance of equipment, there was an increase of 14 per cent in expenditures for maintenance of way.

The conclusion which these statistics would suggest is that within recent months the efficiency with which transportation has been handled has been greatly increased, but that there has not been a normal increase in expenditures for either maintenance of equipment or maintenance of way and that the physical properties are being allowed to deteriorate. This conclusion as to the deterioration of the physical properties can be supported by other evidence. Freight cars undoubtedly have been allowed to run down, although recently efforts have been made to put them in better shape. Furthermore, much evidence could be cited to show that recently, and especially in July, the expenditures for maintenance of way have not been as large as they normally have been and should be.

To sum up, the greater part of the improvement in financial results shown, has been gained by an increase in the efficiency with which transportation has been conducted. On the other hand, a substantial part has been obtained by a too stringent exercise of control over expenditures for maintenance. The showing made is creditable, on the whole, but the net income is larger than it should be if the railroads are to be returned to their owners in as good condition as they were when the owners turned them over to the government. Of course, an analysis of the changes occurring between two months of a year is not conclusive, but most of those who know what have been the policies of the Railroad Administration, will agree that the results shown in these two months are what would naturally be expected to be produced by the policies being followed.

A Plan for Employees' Ownership and Management

THE RAILWAY AGE is opposed to the Plumb plan. We are opposed to it because it would involve government ownership and employees' management of railroads. We have not heard any good reason why the people of the United States should buy the railroads, turn them over to the employees to manage, pay the interest on the railroad debt and also pay from taxes all losses which the employees' management incurred. We should not, however, be opposed to employees' management if it were based upon employees' ownership.

It may be thought that employees' ownership would be difficult to bring about, but it would be very easy to bring about. The employees are now being paid approximately $3,000,000,000 a year in wages. The cost of living in the United States, according to the most reliable estimates, has increased only about 75 per cent within the last five years, while the average railway wage has increased about 90 per cent. The employees, therefore, on the average could now save approximately one-fifth of their annual wages, and at the same time live about as well as they were able to five years ago. If they should save one-fifth of their wages the total annual saving would be $600,000,000.

The amount of railroad stock outstanding in the hands of the public on June 30, 1916, was $6,315,000,000, and it is not much more now. The average dividend paid was 5½ per cent. Presumably, if the railways are returned to private operation they will be so regulated as to enable them to continue to pay an average dividend of 5½ per cent. If the employees should save $600,000,000 a year from their wages, should invest it each year in railroad stocks and should also invest in railroad stocks the dividends they received from their stocks, they would in five years own $3,350,000,000 in stock, or a majority of all the stock outstanding. This would give them control of the ownership and management of the railroads of the United States. If they should continue to save in the same way, at the end of nine years they would have saved in wages and dividends $6,671,000,000,

With this they could purchase all the stock now outstanding, and also a few hundreds of millions dollars' worth of bonds.

These calculations are based upon the assumption that, on the average, they would have to pay par for their stock. But there are many more railroad stocks selling below par now than above it. Therefore, the employees, if they bought stock at anything like the present market prices, could acquire ownership of the railroads for much less than we have estimated. We have not extended the calculations to bonds, but it would be an easy matter for the present generation of railroad employees, by the practice of merely reasonable thrift, to acquire all the railroad stocks and bonds in existence and leave them as a heritage to their children.

Of course, if the employees owned even a majority of the stock they could elect all the directors, and through them manage all the railroads. This plan would have great advantages over the Plumb plan from the standpoint of both the public and the employees. Its adoption would necessitate the practice by railway employees of the same thrift which the farmer or the small storekeeper practices in order to acquire his property. Since the employees could so easily acquire the railroads by the practice of reasonable thrift, why should the public tax itself to buy the roads for the employees, and at the same time, leave the farmer, for example, burdened with the necessity of saving the money which he must raise to buy any farm he may want to manage?

Under the Plumb plan, if any surplus earnings were made by the railroads, the public would get half of them and the railroad employees half, while under our plan of employees' ownership the railroad employees would get in dividends all of any increase in profits. On the other hand, if under the Plumb plan any losses were incurred the public would have to pay them, while under the plan we have outlined any losses incurred would all have to be borne by the employees. From one standpoint, therefore, this plan would be better and from one standpoint worse for the employees than the Plumb plan. If, however, the employees knew that every increase in the efficiency of the management was going to redound greatly to their benefit while every reduction of efficiency was going to result in loss to them, the incentive they would have to exert themselves for efficient operation of the railroads would be much more powerful than it would be under the Plumb plan.

The effects of this incentive to promote efficiency would be seen in every direction. Under the Plumb plan the employees would have very little incentive to entrust the management of the railroads to railroad officers of the greatest ability, but if the employees were the actual owners of the railroads they would have the same incentive as the present stockholders to put in charge of the management the ablest men that could be obtained and to give them a free hand in order that they might get the best results. Furthermore, under employees' ownership the employees would be much more competent to select the best men for managers than they would be under the Plumb plan. The practice of enough thrift to enable them to buy the railroads, and their ownership of large amounts of property would give them the experience and the vision of business men and would enable them to judge much better than they can now of the qualities which a good railroad manager should possess, of the things he ought to do and of how he ought to do them.

We have not the slightest notion that the plan for employees' ownership and management of the railroads we have outlined will be adopted; but when this plan is placed beside the Plumb plan it brings out strikingly the absurdities and iniquities of the latter. When it can be shown that the railroad employees could so easily and in so short a time become the managers of the railroads by the simple process of becoming their owners, the question naturally arises as to why they should be carrying on an enormous propaganda to get the other people of the country to buy the railroads for them? It may be replied that investment in railroad stocks would not be a safe one for the savings of railroad employees. Would it, then, be safe for the savings of the American people? If it would not be a good investment for railroad employees, what are we to think of all the stories which the spokesmen of the employees tell of the vast profits which other people make by investing in railroad stocks? The advocates of the Plumb plan say that if the roads were turned over to the management of the employees they would effect vast savings which would greatly increase net earnings. If the employees are sure that they could effect vast economies, why don't they back their confidence with their own money, and thereby reap all the vast profits to be made, instead of asking the public to take all the risks of ownership for the possibility of getting half the profits?

While we do not believe that the plan for employees' ownership we have outlined will be adopted, we do believe that if the solution of the railroad problem is to be furthered by giving employees larger voice in the management, the increase of their influence in the management must also be accompanied by an increase of their investment in the enterprise.

The main trouble with part of the plans for future ownership and management of the railroads which have been put forward is that they contemplate giving employees more power in the management without giving them any responsibility for the results of the exercise of their power. Good results are never obtained by giving increased power unaccompanied by increased responsibility.

Railroads Propose Amendments to Cummins Bill

An Abstract of the Memorandum Filed by Alfred P. Thom, General Counsel for the Railway Executives

WASHINGTON, D. C.

ALFRED P. THOM, general counsel for the Association of Railway Executives, has filed with the Senate Committee on Interstate Commerce a memorandum of suggestions for the amendment of the Cummins bill, drafted by a sub-committee, which is now under consideration by the full committee. Some of his comments on various sections of the bill are in part as follows:

Section 2.—It is suggested that the word "five" in line 12 be changed to "ten," so that there will be a funding for ten years instead of five. The objections to having indebtedness other than that incurred for additions and betterments evidenced by demand notes, are forcibly set out in a letter by E. G. Buckland, president of the New Haven road, from which I make the following extract:

My first suggestion is that the provisions for funding the indebtedness of the railroads to the government will not leave them in a condition where they can thereafter finance themselves. I feel that all of the indebtedness should be funded by taking bonds for not less than ten years at a rate of interest not exceeding 5 per cent. The distinction between advances for additions and betterments and advances made to meet maturing loans does not warrant the difference. The inability of the railroads to refund their own loans maturing during the war was not so much their fault as the fact that the government was in the market for all and more than all of the money available for investment. If the provisions of section 2 are enacted the indebtedness of this company to the government at the end of federal control will be financed as follows: $17,000,000 having been incurred for additions and betterments would be evidenced by first mortgage bonds and $43,964,000, having been loaned to meet maturing obligations would be evidenced by notes payable upon demand at the rate of 6 per cent per annum. This last mentioned loan of $43,964,000 is more than twice what the company requested of the Railroad Administration. In April, 1918, when this company's outstanding notes aggregating $43,964,000 matured the company had authority to issue its preferred stock for $45,000,000, bearing 7 per cent cumulative dividends. One-half of this stock at that time was underwritten by the bankers who held or by their customers who were interested in the maturing notes and there was good promise of a considerable portion of the remainder of the stock being subscribed for at par. All that this company asked the Railroad Administration to do was to loan the company so much as it could not raise by the preferred stock issue. The company stated at the time that with this new money its credit would be rehabilitated and it would not ask the administration for any further assistance. Instead of adopting this suggestion the Railroad Administration insisted upon taking all of the company's securities as collateral and loaning it the entire amount of $43,964,000, the effect of which was to deprive the company of the credit which this collateral would have given it and force it to rely upon the government for all future financing.

"Now, it is obviously unfair to put the company in the position at the end of federal control of having a demand note indebtedness of $44,000,000 hanging over it and giving it only five years in which to refund the $17,000,000 advanced for additions and betterments. Obviously any proper financing should give the company at least ten years at a reasonable rate of interest and evidence its indebtedness by bonds secured by a first mortgage or a first lien upon its property.

As to this whole section, we desire to renew our suggestion that the indebtedness incurred during federal control for additions and betterments should be funded without security. The railroads, upon return to their owners, will be confronted by a task (which presents extraordinary difficulties) of obtaining, under market conditions that will then exist and under the conditions surrounding this special industry, the necessary money to perform their public duties; and it is not wise to deprive them of, or to seriously impair, their existing capacity to borrow by an effort to obtain security for the government. The risk that the government will take under these conditions will not be large, as all of the obligations of the companies usually classed as strong may reasonably be relied on as good.

Section 5.—This section relates to the transition period, and provides a method for readjusting the rates of the carriers with the view of establishing a proper relationship between their revenues and expenses. It contains, during such period of readjustment, a guaranty of the standard return for a period of time limited not to exceed five months.

It will be noted that this provision provides no method to insure an adjustment of state rates to the alarming conditions of increased costs. The period of five months is altogether too short to make the adjustment of interstate rates. It is manifestly much too short to secure an adjustment of state rates, with no power contained in the act to bring that about, yet the state traffic should bear a part of the increased burden growing out of the increased cost of labor and materials, unless it be the policy of Congress to impose that entire burden on interstate commerce. There has been an increase of approximately a billion dollars a year in wages during federal control and increases in prices of all railroad materials and supplies in keeping with the high cost of living generally. It would hardly seem fair or wise to impose this entire increase of burden on interstate commerce.

Instead of providing an affirmative method of securing this change, the bill apparently imposes no limitation upon the power of the various state commissions to reduce existing rates on both passengers and freight in their respective states to the full extent allowed by the various state laws, and certainly leaves such state commissions free to prevent any increases which may be found necessary in order to make the requisite readjustment between revenues and expenses.

In our opinion, the power of Congress is, under the commerce clause, adequate to fix all rates of interstate carriers, state as well as interstate, and the policy to do so should be continued as a permanent policy. But if the policy of the bill to allow state commissions to make state rates in the first instance is adhered to, that power ought not come into existence until at least the effects of the war upon the transportation system have been reasonably removed and until the Interstate Commerce Commission is of the opinion that the safety of the railroads during the transitional period following the war has been provided for in a rate structure which shall include both state and interstate rates.

This might be accomplished by a provision requiring the Interstate Commerce Commission, as soon as practicable after the passage of the act, to readjust both state and interstate rates, and that no change shall thereafter be made in the state rates without the approval, after conference with the state commission, of the Interstate Commerce Commission; but when any state rate has thus been changed with the approval of the Interstate Commerce Commission, that then

the provisions of the bill as contained in section 43 shall thereafter control.

We have heretofore urged, and now respectfully urge again, that the entire duty of readjusting rates so as to produce a proper relation between the revenues and expenses of the carriers should be assumed by the government itself. The government's action has disturbed the relation between revenues and expenses, and in fairness it should take the burden of restoring that relationship so as to redeem the assurance of the President that investors in railroad securities might rest assured that their rights and interests would be as scrupulously looked after by the government as they could be by the directors of the several railway systems. If, instead of properly maintaining the relation between the revenues and expenses, it turns out that the railroads, loaded up, during federal control and by governmental authority, with a scale of expenditure hitherto unknown, and the government does not make a corresponding readjustment of their rates, the roads would be ruined, instead of being "scrupulously looked after" by the government. We, therefore, insist that it is the government's duty to restore, on its own initiative, the proper relationship between the revenues and expenses.

Section 6.—We suggest that after the word "provided" a semi-colon be inserted, followed by the following: "and, if no other valuation is at the time available, the commission shall proceed in a summary and expeditious way to determine such value for the purposes hereof." It is manifest, we think, that the fixing of rates under this provision should not require the commission to wait for the result of the valuations under the federal valuation act, but should be required to take action on the basis of the best values the commission can arrive at, subject, of course, to be readjusted when the complete valuation is available.

Section 6.—We respectfully request that these provisions, which relate to the taking of a part of a company's earnings from lawful rates, be omitted.

Congress is now engaged in the effort to establish an adequate system of transportation for the commerce of the country. The problem of Congress may be said to be one of credit almost entirely. To insist on taking a part of what a carrier can save from its earnings on lawful rates through industry, economy, good management, and fortunate location would undoubtedly seriously discourage investment in this class of property, and would in that way defeat the very object which Congress is trying to accomplish of creating a condition of adequate credit for the carriers. Who will care to invest in railroad enterprises which, at best, are subject to great uncertainty as to the extent of governmental control that may at any moment be asserted if a power is claimed to deprive the investor of a part of his earnings at lawful rates, and thus of all hope of legitimate reward for good management, economy, and valuable location? If this Congress can set one measure of such taking, another Congress may go still further until the line of clear confiscation is reached, and investors will inevitably be deterred from entering a field of investment as to which such a power is asserted—and yet the very purpose of legislation is to attract and insure such investment. It would certainly amount to a leveling down of railroad efficiency, rather than to a leveling up. We respectfully submit that it can not be justified from any standpoint of wise public policy.

Section 7.—We suggest that the words "approved by the commission" be stricken out, and in place of them be inserted the words "fixed by the board," or "fixed by the board with the approval of the President." The object of this is to prevent the placing on the board of this unnecessary mark of subordination to the commission as would be the result if the employees of the board must have their compensation approved by the commission.

Section 10.—We suggest that at the end of line 11 these words be inserted: "and other carrier property, parts of existing systems." In this paragraph it is manifestly the purpose to have a consolidation of all the carrier's property, not simply of the railway property. Boat lines which are part of a system should be included in the consolidation, and we assume that it is the purpose to do this.

Section 11.—The provision here referred to gives the board power as to traffic not routed by the shipper, to direct its movement after its arrival at a transfer point, "whenever a fair distribution of traffic and the public interests may require." This would presumably be regarded by the board as a direction to control the routing of traffic. Where traffic is now left unrouted by the shipper it is presumably upon the theory that the carrier may, by its own routing, provide the most expeditious and efficient transportation of the property with proper regard for practical operating conditions. The provision is objectionable for the following reasons,

(a) The initial carrier under the Carmack amendment is responsible for damage occurring on any line through to ultimate destination and should therefore, to protect itself, be permitted to choose the lines over which it shall pass.

(b) The initial carrier in connection with unrouted traffic is bound, under the decisions of the commission, to select the route over which the lowest rate applies, and a determination of the relation between the amount of such traffic to be so routed and the remaining traffic to be apportioned under any order of the board, would present complications in the waybilling of all traffic at all initial points.

(c) Traffic susceptible of division among several lines at any given junction point is the accumulation of a multitude of shipments received at a multitude of stations on the route of the carrier bringing such traffic into the junction point, and also on the route of a large number of connecting lines. In order to expedite the movement of traffic and to permit tracing en route for the shipper it should be, and customarily is, waybilled through from point of origin by the agent at such point. In actual practice distribution of traffic at junction points is therefore not made after its arrival at such points, but at initial points on such line and its connections. It would be difficult, if not impossible, to conform waybilling at such multitude of initial points to such distribution of traffic as might be required by the board at the junction point.

(d) Less than carload traffic is handled in many instances in through merchandise cars passing over several lines. Any requirement for the distribution of such traffic at junction points would require either breaking of bulk or the running of an unnecessary number of through merchandise cars, and would prevent consolidation of loads so as to utilize cars to full capacity, and thereby involve additional expense and delay.

(e) Any rule which would prevent carriers from making arrangements for the forwarding of traffic in the most expeditious and economical way would increase the aggregate expenses in any given rate-making group on the basis of which rates from such groups as a whole are predicated.

Section 12.—The provisions of sub-paragraph (c) of section 12 will constitute a very great impediment in the way of voluntary consolidations, which it is the policy of the bill to encourage. If a railroad proposing to consolidate with other lines must submit to a readjustment of its capitalization, there will be manifest reluctance on part of many lines to undertake consolidation. It is, we think, true that any road that would be approved by the commission, or by the board, or both, as proper to make such consolidation, would be a road not over-capitalized. Most of the important roads are not subject to that charge, even in popular understanding. A provision much more likely to bring about consolidation would be one which would confine the capitalization of the property after the acquisition of one road by the other, to the outstanding stocks and bonds, at par, of

the corporation making the acquisition, plus the value of the property acquired by it, as determined by the commission. Under paragraph (d), page 21, the approval of the commission and board to any proposed consolidation is required, and the question of whether or not a road in undertaking such consolidation is itself over-capitalized is safeguarded.

Section 12.—It being uncertain as to when the result of the valuation of the railroads will be available, it is suggested that the following be added after the word "consolidation," in line 14, in order to prevent delay in making the consolidations which are approved: "provided, however, that in cases where the commission finds that, to await such valuation, would unduly delay any such consolidation, and, from evidence of a general nature, shall be of the opinion that the capitalization proposed to carry out such acquisition or consolidation will not exceed the value as ultimately found of the said aggregate properties, the commission may enter an order to that effect, and may permit such acquisition or consolidation without awaiting the completion of the formal valuation."

Section 13.—It is respectfully suggested that a power should be here inserted to enable a corporation which had begun a consolidation during the permissive period, in accordance with the plan prescribed by the board of transportation, to complete the consolidation by the compulsory method of condemnation after the period of voluntary consolidation shall have terminated. This power should be conferred in terms direct and specific enough to enable the carrier having begun this consolidation, to condemn the property of the carriers in the group already devoted to the service of transportation. Doubt is entertained as to whether a general power of condemnation would be construed as authority for the condemnation of properties already devoted to a public use.

Section 18.—Without discussing at this time the desirability of representatives of the classified employees and of the public being on the board, we desire to call attention to the fact that there are a great many cases in which, if as many as two of the directors from each of these classes be required, the four thus chosen would constitute a majority of the board. There are a great many companies which have only five directors, some which have six, and many have only nine. The laws of Texas limit the number of railroad directors to nine. Four out of nine would seem to be a too large proportion to give to interests having no financial investment in the property. Certainly four out of five or six would be too large a proportion.

Section 21.—There seems to be no power here to create a new federal corporation to build new lines of railroads. While the construction of new lines or systems, independent of existing systems, may be a remote prospect, manifestly there should be a power to build such lines, and it is respectfully suggested that this be provided for in the bill.

Section 21.—We would suggest that after the word "railways" in line 15 the following be inserted: "and other carrier property." This is not only proper in itself, but is in harmony with the provision on page 34, lines 14 to 20. It is necessary in order to permit the continuance of existing water service in connection with the rail service.

Section 21.—It is suggested that fuller powers be conferred upon corporations organized under the act, than are contained in the six specifications of power contained in the bill.

Section 24.—By this provision, as it stands, the Interstate Commerce Commission is made the judge of whether any purpose for which a carrier may desire to issue securities is "compatible with the public interest." The commission is thus empowered to judge whether it is incompatible with the public interest for a company to provide for maturing obligations by a new issue of securities, or to make any capital expenditure whatever to be provided for by new issue. In other words, the provision, as it stands, makes the commission the financial manager of the railroads, substituting its discretion for the discretion of the board of directors, and giving it power to prevent any capital expenditures which it may see fit. This makes the commission the real manager of the carriers and seems to us too great a power to lodge in it.

There are some things which ought, by the law itself, to be recognized as compatible with the public interest. This enumeration in the law prevents abuses by the carriers. There should be, in our judgment, a general power to do other things "compatible" with the public interests, and, as to these, the propriety of securing the approval of the commission is admitted.

Again, the draft, as it stands, prevents any securities being issued except for a purpose "within the company's corporate powers." This raises the question as to whether it is within the company's corporate powers to issue securities contrary to a statute of the state of its own creation, such as a statute requiring it to obtain the authority of a state authority before issuing the securities. If this be a proper interpretation, it will destroy the whole purpose of the enactment proposed in the contemplated bill. To prevent this, the first two lines might be made to read, "unless it be for a lawful object within its corporate purposes, etc."

Section 24.—The provisions here referred to relate to the service of notice on the state authorities. It may be that such notice will become jurisdictional and a bad service might vitiate the issue of securities. It is impossible to define in the statute what "the appropriate state authority" may be, as these differ so much with different states. To get rid of this difficulty, it is suggested that the notice in all cases should be served on the governor of the state.

Section 23, Page 40, Lines 9-11.—These lines confine the notes that may be made without antecedent permission, to five per cent of the par value of the securities of the carrier then outstanding. This limitation, by many of our most important people, is considered too small and would seriously embarrass financing by short-term notes.

Section 23, Page 40, Lines 24-25.—These lines make the issue of securities contrary to the provisions of the section void. Inasmuch as the failure to comply with the section may be technical, and the taker of the securities would have no power to ascertain whether all the provisions of the statute had been complied with, it is suggested that it would greatly interfere with the taking of railroad securities if the investor may find that he, perfectly innocently, is in possession of a void security. We suggest that this provision be eliminated, and that the enforcement of compliance with the act be provided for by penalties against the officers who knowingly violate the requirements of law.

Section 23, Page 41, Line 20.—The provisions here referred to make it unlawful for any person to hold the position of officer or director with more than one company without the authority of the commission. We do not think that this should apply where one of the carriers is a substantial stockholder in another carrier, and we believe that after the word "unlawful," in line 20, the following should be inserted: "except in cases where one company owns a stock interest in the other company of not less than 25 per cent." A stock interest of 25 per cent or more ought certainly to entitle a company to be represented on the board of directors of another company by one of its officers or directors.

Section 25.—The duty of the Committee of Wages and Working Conditions to consider complaints should be confined here, as it is in the first few lines of the section, to unadjusted controversies; and the complaints should be made to relate only to issues between the carrier and the employees interested in the special controversy. Matters of general management of the company should be left to the board of directors, and should not be made a matter, on complaint of

employees, to be settled by the Committee of Wages and Working Conditions. We, therefore, suggest that after the word "complaints" in line 23 there be inserted, "as to controversies not adjusted between the parties as to wages, hours or service, working conditions, or other matters in which the complainant has a direct interest"; and before the word "employees," there be inserted the words "the interested."

Section 31.—Would it not be wise to extend the terms of the members of the Interstate Commerce Commission, as well as to increase their compensation?

Section 32.—We assume that it is incompetent for Congress to require a company to extend its line beyond what it is required to do by its charter. To do so would be to commit the stockholders to an undertaking which they did not contemplate in their contract of subscription, and would be taking their property without due process of law. We think, therefore, the words "to extend its line or lines" in lines 13 and 14, on page 56, should be eliminated, or should be so modified as to require such extension only in cases where extension is necessary to comply with the charter obligations of the company.

Section 35.—Without undertaking at this time to re-argue the question of a rigid long-and-short-haul clause, attention is called to the elaborate hearings before this committee in which it was shown that great injury would be done to commerce if the clause were made rigid, and we suggest the reconsideration of this provision.

Section 35.—By this provision it is made impossible to increase rates which have been reduced in competition with a water route unless the commission shall find that such proposed increase rests upon changed conditions other than the elimination of water competition. It is manifest that the public interest might require the increase of these rates for other reasons, such, for example, as to bear their proportionate part of the transportation burden; and, therefore, we suggest that after the word "competition," in line 2, the following words shall be added after a comma, "or shall be required by the public interest."

Section 33.—We submit that in this same connection agreements as to rates and practices between carriers should, if approved by the commission, be made lawful.

Section 43.—It is impossible under the present law for a carrier to complain to the Interstate Commerce Commission of a state rate. This has proved a great obstacle in securing relief under the doctrine of the Shreveport case. We would therefore, suggest that in line 19, on page 66, after the word "act," the following words be inserted, "either upon the complaint of any carrier or other person interested, or upon the initiative of the commission itself."

Section 43.—We suggest that in line 16, on page 67, after the word "unreasonable" there should be inserted the word "inequality"; in line 17, after the word "localities" there should be inserted "commodities or other traffic"; and in line 2, page 68, before the word "advantage" there should be inserted the word "inequality." The purpose is to bring under the jurisdiction of the commission, not only the question of discrimination, but also the question of inequality of the burden, between state and interstate traffic, as to maintaining the instrument of interstate commerce which both are using.

Section 44.—We are convinced that 60 days is long enough to deprive a carrier of rates which are subsequently declared to be reasonable, for a carrier cannot be compensated for the loss of reasonable rates during this period, whereas it is possible to compensate a shipper for an overcharge. Consequently we urge upon Congress to make the period of suspension not longer than 60 days, with a provision to take care of shippers in the event of overcharge. Accordingly, in lines 12 and 13, on page 72, we think that "60" should be inserted instead of "120," and, in any event, we urge that there should not be a right of suspension, as contemplated by lines 21 and 22, for an additional period of 30 days.

The National Association of Owners of Railroad Securities has also filed a number of suggestions for changes in the bill.

Lenroot Criticises Cummins and Sims Bills

THE SIMS BILL, which incorporates the Plumb Plan, should be denominated "a bill to further increase the cost of living," according to Senator Lenroot of Wisconsin in a statement made public by the Citizens' National Railroads League. Senator Lenroot also criticises the Cummins bill as impractical and harmful in its provisions to security owners. He asserts that the bill might be denominated a bill to shelve temporarily, but to further increase the troubles of the railroads.

"One of the absolutely essential provisions in any legislation calculated to solve the railroad problem permanently must be encouragement of efficiency in operation," the statement continues. "In my opinion, the Cummins bill fails to do this. The Cummins plan is to have the government take away everything in excess of what the ratemaking authority determines is a fair return, and thus there is no incentive to efficiency after a fair return is made.

"Moreover, the Cummins bill provides that 50 per cent of the excess is to be used for the benefit of employees. Only a small part, if any, of this will be paid to employees and they would not, under such an arrangement, have the same incentive as if their share was paid directly to them.

The statement asserts that necessary and essential credit cannot be secured by the roads unless there is a government guarantee, with reasonable rates. Congress never will consent to a guarantee while the management remains in the control of the old form of management. Therefore a government guarantee of income cannot and should not be added to the Cummins bill, but, without it, I do not believe that the bill can solve the problem or save the railroad business from disaster. The bill I have introduced does not purport to take care of the immediate situation, but offers a permanent solution which would take some time to put in full operation. Our bill is supplemental in a way to the Esch-Pomerene measure. I believe that the roads should be turned back to their owners under government aid, for two or three years until a plan like the one embodied in my bill can be made operative. Something must be done to keep the roads from bankruptcy until we can finally dispose of the problem."

Food Supplies for Roumania

Master Car and Locomotive Painters' Convention

Chemical Tests of Paint and Varnish Not Satisfactory; Substitutes for Linseed Oil Discussed

THE FORTY-EIGHTH CONVENTION of the Master Car & Locomotive Painters' Association was held at the Hotel La Salle, Chicago, September 9-11. The first session was opened with prayer following which an address of welcome was delivered by a representative of the Chicago Association of Commerce. J. F. Gearhart, president of the association, then delivered an address in which he reviewed the organization's activities during the past three years and outlined the proposed amalgamation with the American Railroad Association. The convention then proceeded to a consideration of the topics selected for discussion. Abstracts of the principal papers are given below.

The Selection and Purchase of Paint

By S. E. Breese
Foreman Painter, New York Central, Collinwood, O.

Previous to the advent of the United States Railroad Administration the master painter of the railroad was the sole authority as regards paint and varnish both as to materials used and methods of application, and was responsible to his immediate superior for the results obtained. By virtue of this authority and through his experience and ability he secured certain desired results acceptable to the road which employed him. He accepted full responsibility as to results obtained and viewed with pride the results of his work. This pride was justified by the condition and appearance of the equipment coming under his jurisdiction. By an interchange of ideas, the foreman painter was constantly striving for progressive methods, economy, labor saving systems and durability in his work. He chose his tools, his men and his materials and through the proper co-ordination of all three secured results. The questions which I believe are of paramount importance are, whether the above conditions still exist and whether we are still responsible for results and have authority as to what tools to use, methods to employ, or materials to apply.

At the present time the purchasing department chooses and gives us our tools and material and asks for results. Are we allowing our responsibility to be shifted, our authority to be questioned and our methods attacked and submitting to it all without a protest? We were employed for a specific purpose, namely, to maintain equipment in good shape, secure economy as to methods, costs and time factors and yet are unable to choose our methods or materials. If this has come about what is the cause and what is the remedy?

Master Painters Should Choose Materials

A successful organization is one in which the authority vested in each department is absolute and co-ordinated and results are obtained only by a complete assumption of responsibility by the head of each department. In this way a chain of organization is forged, which is strong, well co-ordinated and successful only when each department has this full authority. Are we allowing our department to become the weak link of the railroad shop organization by a question of divided authority or a shifting of responsibility? It is essential that we become cognizant of the real danger of shifting our responsibility, accepting divided authority and lowering our standard methods and materials.

I believe the greatest trouble has been with material rather than with methods of application. This is primarily in the hands of the purchasing department and there has been some little friction over the materials bought for use. Due to the very nature of each department's position, there must necessarily be some friction, as the office of the purchasing department is the securing of materials designed to accomplish certain specified purposes at as cheap a price as possible with due regard for the quality and durability of the articles purchased. The purchasing department must, because of its lack of knowledge concerning the materials used, be absolutely dependent as to the question of durability and quality on information secured from the mechanical department, which in turn secures this information by co-operation with the master painter. This information is obtained by a consideration of a number of essential points including practical equipment tests and weather tests, chemical tests, information secured through the sales representatives of paint and varnish concerns, regarding the tests made by them of the material in question, and the knowledge and experience of the master painter due to his specialization on varnish and paint problems.

Chemical Testing of Paint

The chemical testing of varnish or paint materials has up to date been of little value as a reliable source of information, especially as regards durability. In fact, up to date, except in the case of raw materials, a chemical test is of no use to the painting department. The experienced painter by a few practical tests, such as elasticity, working and drying, can usually determine and foretell through his experience the possible durability of the article in question. General Atterbury has stated "In my experience the only materials which we were unable to purchase by specification were paint, varnish and rubber. In the purchase of the above materials, I was absolutely dependent for information on the man in closest touch with the materials, who by his specialization and experience usually could be called upon to adopt the material best suited for the purpose." This statement still holds true.

The purchasing department backed in many cases by the arguments advanced by sales representatives have succeeded in selling the mechanical department materials against the judgment of the master painter, who accepts these materials rather than get into a controversy. This has brought about changes in materials and standards all tending towards less efficiency and lessened durability, which means higher cost of maintenance in the end. This false economy is now being felt by the equipment upon which it was used. Goods of every description and standards are pouring into the shop; changes are being made from month to month on nearly all materials. Our only duty seems to be to apply them.

Inferior Material Now Being Used

As the price of raw materials advances, the price of paint and varnish declines, a queer economic anomaly which is only explained by a reduction in quality. The purchasing department notwithstanding the above, continues to buy at still lower prices, without consideration of durability or the standards of the road. This is a direct infringement on the authority of the man who, by his experience and specialization, has been placed in the position of the final judge of paint efficiency and durability. It is part of our job to make decisions regarding durability and efficiency. We have all

seen certain materials installed as a standard for painting, whose false economy, is now becoming apparent, and which was apparent to us in the beginning. What is the remedy of this situation? A sales representative told me that any justifiable complaint made to the person in direct charge was always seriously considered by the purchasing department in placing orders, but as the complaints are not made, the purchasing department establishes a precedent for the purchase of still cheaper material. Have we been afraid to complain, have we refused to use materials for the purpose intended? The refusal of these materials would also establish a precedent for the discontinuance of the purchase of such materials. Let us not close our eyes to apparent faults without attempting by honest argument and frank discussion to remedy the situation. Let us carry this to a successful conclusion and put our association back of the fight for efficiency, economy, and durability of all forms of painting equipment, and retain full and undivided authority as to methods employed and standards adopted.

Discussion

The members as a whole agreed that much poor material was submitted and accepted where paint was bought on specifications only. Several stated that material received under present specifications was not satisfactory. Although experience indicated that the paint would not give good service, it met the tests prescribed and for that reason there was no alternative but to accept it. J. W. Gibbons (A. T. & S. F.) emphasized the fact that the efficiency of painting should be judged not by the number of cars painted for a given expenditure, nor the speed with which the work was completed, but rather by the length of the intervals between painting.

Substitute for Linseed Oil

By A. H. F. Phillips
Master Painter, New York, Ontario & Western, Middletown, N. Y.

There have been great demands for linseed oil, and some specialists predict that the call for seed to fill the large contracts will become so urgent that higher prices will eventually be realized. If such is the case, it will mean almost a prohibitive price for use in a railway paint shop. We can safely say that the demand is great and persistent. There has been a general shortage in flax seed, which still continues. The Canadian and American supply continues light, and Argentine conditions are not changed particularly. Prices and freight are high, and cargo space at a premium. American buyers have been credited with considerable stocks in warehouses but receipts and available supplies are somewhat limited.

Under the present conditions of the market, the demand for linseed oil is in excess of the supply, and there is no question that there is a genuine shortage of oil. Perhaps, at some future time when the market becomes more normal the supply may possibly equal the demand and prices may not be so high as to almost prohibit its use as a paint making oil.

Properties of Vegetable Paint Oils

For some time past the railway paint shops have been receiving many paint oils as substitutes for linseed oil. I believe there is none, as yet, equal to linseed oil as paint making oil. A paint oil as a substitute for linseed oil for use in the railway paint shop can be made, and is being made and sold by many companies, on a linseed oil base, and of the same gravity. This dries with a good gloss, as it contains enough of volatile oils as conveyers to assist materially in the application of the paint and when evaporated in drying, leaves a thoroughly elastic and highly protective oil film in combination with the pigment. This paint oil can be used in thinning out paints of any character, oxide, carbon, lead or zinc, where oil is desired as a thinner without danger of any chemical action. Such oil would probably be called a combination oil. I am not prepared to assert what oils make up such a paint oil.

Vegetable oils are used by many in making up their paint oils, namely, cotton seed oil, soya bean oil, hempseed oil, corn oil, peanut oil, cocoanut oil, etc. These vegetable oils being largely food oils and used extensively in paint making oils as substitutes for linseed have found an increasing market. Mineral oils are also used in the paint oils to some extent, but I do not think it advisable to be too free in the use of paraffin oils. Owing to the great demands for linseed oil and the scarcity of the supply, also prices soaring up almost to a prohibitive figure for general use in the paint shop, substitute oils have found a place in making paint oils for use in the railway paint shop.

Oils Other Than Linseed Used in Paint

There are quite a number of these, drying, semi-drying and non-drying and not a few have their special uses in paint. The most important of the drying variety is China wood oil or tung oil. Poppyseed oil is prominent for grinding the finer grades of zinc white and artists' colors, and must be classed among the drying paint oils for the reason that when pressed from ripe seed it dries very nearly as rapidly as raw linseed oil. The reason for the use of poppyseed in colors or paints is due to the non-darkening of this oil and its free spreading. Bombay nut oil was at one time largely offered at a price somewhat lower than poppyseed oil. It was very clear, almost water white, and its drying property fully equal to that of bleached linseed oil. However, this oil has not been heard from in the market for some time.

Sunflower seed oil is also classed among the drying oils, but it has not found its way into general commerce and therefore nothing more is known about it than has been ascertained in an experimental way. Hempseed oil also belongs to the class of vegetable drying oils, but this seed being raised principally in Russia and a few other localities in Europe, is used mostly there as a paint oil; and if any is brought to this country it comes as an admixture with linseed oil.

Another vegetable drying oil that has been largely imported for some time into this country and Europe, under the name of candle nut oil by soapmakers and known to science as Kukui oil, is now being tested by progressive varnish and paint manufacturers. It bids fair to be a strong competitor of linseed oil when its characteristics become better known to the trade and it is prepared in a more scientific manner than it is now. Other drying vegetable oils, as nigerseed oil, tobacco seed oil, Scotch firseed oil, etc., that are not readily obtainable in commerce, are not at all interesting to the paint maker and color grinder.

Fish Oil Has Limited Use

Another oil, which is of animal origin, is the fish oil known as Menhaden oil. This is barred out, however, from use in many paint materials, especially in interior paints, because of its offensive odor, and is made use of only in special outside paints as in roof paints and stack paints, and by some manufacturers in other specialities.

Among the substitutes for linseed oil that interest paint manufacturers most should be classed soya bean oil, corn oil, and cottonseed oil. Soya bean oil requires fully ten days to dry to a film and then the film will not be as firm as raw linseed oil which requires six days to dry to a film. Since linseed oil is extraordinarily high priced there is quite a demand for bean oil and it is quite a task for paint makers to

discover methods to make their products dry in the ordinary way. The usual practice was to use equal portions of soya bean oil and boiled linseed oil, or when this would not work out well in some paints the bean oil portion was increased and also the driers.

Corn or maize oil has been in use in paints for many years, but is made use of only when the linseed oil is high in price. This oil has very little, if any, drying properties, and will harden to a brittle, rather mealy film in from twenty to thirty days. Cottonseed oil has no drying properties, but is a good lubricant, and previous to its rise in price when it came to be used as a cooking and table oil, it was used to adulterate linseed oil. Rosin oils are not only used in printing-ink making, but were largely employed in making paint for rough surfaces, though since their price has advanced to twice, even three times their former cost, they have been replaced by mineral paint oils to a great extent in paint. Rosin oils are practically non-drying, and while they harden in time will soften again under the influence of sun heat and make the paint film part, or alligator. Pine oil and tar oil are products from the distillation of wood spirit and of rosin, and are used in the manufacture of marine paints, especially paints for ships bottoms. These oils are semi-drying and water resisting to a degree.

Mineral Oil Will Not Resist Moisture

Mineral paint or paint and putty oil, so called among the trade, is refined petroleum or neutral oil, so named because debloomed. These oils cannot be used without being mixed in certain percentages with boiled linseed oil, as they lack binder and are apt to wash off the surface in case of driving rains. Even when used in large portions in a liquid paint for rough surfaces such paints have been known to wash off when they were supposed to have dried hard a month or two before.

Petroleum products of this class will sweat, causing softening of the film and consequent damage by water.

Cheap paints for use on rough lumber or other rough surfaces can be made by grinding the base in linseed oil (usually boiled) thinning with a mixture of about 35 gallons of gloss oil (rosin and benzine mixture), 10 gallons of raw linseed oil and 5 gallons of liquid drier. Or if it must be still cheaper, a thinner can be made of 30 gallons of gloss oil, 15 gallons of debloomed neutral paraffin oil and 5 gallons of lead and manganese drier. In any case, however, the pigment to be used as the base for the paint should be ground in linseed oil.

So far linseed oil has not found an equal in paint making, although the subject has been one of deep study, and while other fixed oils have been discovered that for certain purposes have been expected to take its place, it has yet to be demonstrated that such is really the case in long practice. China wood or tung oil, while superior to linseed oil in certain directions, especially in its resisting power to water, has not shown itself adapted to replace linseed oil in making oil paints as we know and desire them.

When linseed oil is placed on a strip of glass that has been painted jet black and shows a bloom, or iridescence, it is adulterated with mineral oil or rosin oil. Admixtures of linseed oil and corn oil or linseed oil and cottonseed oil can be detected by placing some of the oil between the palms of the hands, rubbing briskly and noting the odor thus emitted. The presence of soya bean oil, however, cannot well be ascertained by simple tests, and a chemical analysis is necessary though even that is sometimes misleading.

Discussion

Papers on this subject were also presented by P. J. Hoffman, (H. V.) and F. B. Davenport, (Penn. Lines). Mr. Hoffman brought out the fact that substitutes for linseed oil are suitable for certain purposes only. While it is desirable to make use of these oils, the stocks would be increased due to the limited field of application of the substitute and this would result in increased expense.

J. W. Gibbons (A. T. & S. F.) stated that mineral oil should not be used with putty as it evaporates and leaves a powder that soon flakes off affording no protection for the glass. Good putty effects a saving of glass and labor many times greater than the increased cost of the material. Mr. Gibbons stated that linseed oil is not necessary in paint that is not exposed to the weather.

What Standardization of Painting Railway Equipment Is Necessary

By W. O. Quest

Master Car and Locomotive Painter, Pittsburgh & Lake Erie, McKee's Rocks, Pa.

At the present hour, the most necessary and essential paint shop standardization would be some practical method of satisfying labor on the matter of wages in the painting of equipment. Will it be possible to standardize the labor operations of the railway car paint shops now under government control? As something of an optimist, strong in the faith that the American workman will soon realize that to bring order out of a threatened social upheaval, he must turn back to the old-time ideas of soberness and thrift, I do believe that it can be, will be, and must be done. But how such desired standardization is to be brought about, is open for the suggestive powers of just such an assembly as this. I believe that it can be happily brought about, if an amicable live and let live arrangement is made in the spirit of fair dealing between the railway employers and employees.

Piece Work System Advocated

The labor of painting cars and locomotives, etc., could be standardized by the adoption of a universal piece price system, the wage paying system that we firmly believe in as the most equitable to employ any kind of labor, the most equitable for all interests, notwithstanding the facts that modern labor federations in recent years have been instrumental in entirely abolishing this method of employing labor in the American railway shop systems. In my opinion, a fair scheduled piece price system is the only method whereby labor can give a fair equivalent for wages paid. Such proposed piece price schedule, to be standardized, should be job named and not numbered. The unit or fixed prices should be open to shop inspection at all times and never officially juggled in the event of the more skilled labor earning more pay when called upon to help out in a shop rushed for output. If a piece price labor standardization can be put into action, the prices should be so scheduled that the earnings of a first class skilled worker in a railway car paint shop would equal the earning rate of the outside general trade skilled worker. The original schedule of prices should be carefully figured out and classified, each job continuously named regardless of name repetition in the several classifications. The original job prices as scheduled should never be price changed, as we have found it to be no easy matter for the men to follow up such changes and it was sure to create dissatisfaction. When found necessary to advance or lower the wage scale, an up and down percentage method should be used.

Standardization of Materials

Next to the labor problem, the most important issue would be that of specifying the standardization of paint supplies, as there cannot be any fixed material standardization without manufacturing, purchasing, chemical and application specifications. The paint and varnish maker will be called upon

to furnish certain standards of car shop specialty material on fixed paint making formulas, that must be lived up to. Something represented as just as good or better at a lower price, unless first tested by some prescribed authority, cannot be consistently introduced without upsetting the primary law that demands standardized materials. Possibly in many instances this material is theoretically or authoritatively formulated from raw paint stock listed on the open market, which is often unsuitable or perhaps ruinously mixed by people who are trying to meet competition in the paint business, but do not materially know the special requirements of the railway paint shop.

There are no suggestions that will safely promote a material standardization in the railway paint shop, if the purchasing departments continue to buy paint stock on price regardless of known quality or the paint-making reputation of the selling concerns. Companies have in the past and still will in the future break into the railway paint field, without knowing that such paint is a specialty and is especially applied.

If any such suggested railway paint standardization ever becomes a law, the activities of the railway chemical laboratories will be quite strenuous and especially active when they come to the matter of settling the many disputes sure to arise.

Method of Application Important

It is in the application of the paint stock that the master car painter must receive his full recognition. He will have to be put on the standardizing committees with full power to act, as he and he only knows what is necessary to make a good job. If what is termed necessary standardization of certain or all classes of job paint work is adopted, he will as usual be held responsible for the labor and material costs.

I will here offer a list of work items that in my opinion could be readily standardized, if it is found necessary to try the standardization scheme out. If adaptable, locomotive painting should be standardized. The quality of the protective paint and varnish should be the best weather, smoke, acid, or grease resisting paint stock that can be found on the market at any price. Every inch of the painted metal surface should be sandblast cleaned. All castings to be painted should be chipped off smooth and freed of live rust, etc., with the sandblast, as it is a sure waste of time and money to paint over crusted unremoved grease, mill flash, or live rust of any kind. If the work is standardized, the paint specifications demand should call for hard, tough, elastic paint stock, as it is a great mistake to apply soft oil paint where it is to come in direct contact with solvent cutting greases and acids, which when deposited on the locomotive's painted surface, can only be removed by heavy erosive cleaning.

The painting of passenger, mail, baggage and similar cars could be classified as to labor and material. Owing to the sameness of the work the jobs could be readily standardized. When material classifications are being standardized, the many examples of the best paint and varnishing finishing systems which have been successfully used for many years in the railway paint shop should not be forgotten in the standardization arrangements, and the interests of worthy manufacturers should be protected owing to the fact that their specialty products have helped to make car painting history.

Uniform Stenciling for Freight Cars

Based on the past work of this association's efforts to establish standards in freight car painting, especially to standardize the stencil markings, which undoubtedly has been and still is one of the most pronounced wasters of time, labor and material that the railway officials are confronted with, we heartily endorse the idea of standardizing every detail that covers the painting and stencil marking of the railway freight car. In the standardization scheme, the stencil lettering and numbering should be made in the same style and sizes and sent out from a designated manufacturing base in pounce pattern form. If made by skilled stencil makers from established drawings, the stenciled railway freight car would present a neat lettered appearance. The paint repair costs of the future would be light, owing to the undisputed fact that such a railway freight car stenciling standardization scheme would save thousands of dollars in stencil-making costs for every railway company that will endorse and adopt such standardization.

Discussion

W. A. Buchanan (D. L. & W.) also presented a paper on this subject in which he outlined the methods of painting which he considered best for locomotives and freight cars. He advocated standardization of stenciling on freight cars as a means of reducing the cost of painting.

H. M. Butts (N. Y. C.) proposed that the association issue a pamphlet of approved practices for painting railway equipment. There was some difference of opinion regarding the relative merit of carbon and lead paint. J. W. Gibbons (A. T. & S. F.) stated that for steel underframes he considered red lead and carbon black better than two coats of carbon black. W. A. Buchanan told of steel freight cars painted with carbon paint which were in good condition after 17 years' service.

The Advantage of Using Pure Paints and More Time in Painting Steel Equipment

By W. Bailey
Boston & Maine, Concord, N. H.

Paint should be applied to freight cars with a brush and with as much care as on any other surface. Any well known pigment mixed with linseed oil is the only commercial article worthy of the name of pure paint. Unsatisfactory painting can easily be traced to the use of poor paint and unskilled painting, such as the spraying process.

Most of the commercial paint used today is a poor article compared with good linseed oil paint. Paint mixed with japan and a thinner when applied dries by evaporation and is consequently non-elastic and almost worthless for durability. On the other hand a paint the vehicle of which is linseed oil, dries by the absorption of oxygen and is much thicker when dry due to the amount of oxygen taken up in drying. It is elastic a long time and will resist atmospheric exposures longer than any other vehicle and consequently wear longer than any paint mixed with driers and thinners. Japan, or thinners, should not be used in any paint for outside surfaces and exposure. Nothing but boiled linseed oil should be used for a drier. I am a firm believer in the necessity of the sand-blast process for removing rust and scale, as the smoother the surface the longer the paint will wear.

One thing I am in doubt about and that is, what is the best primer for steel: is lampblack, graphite, white or red lead? I do not believe a paint containing a large percentage of oxide of iron should be used as a primer.

Painting Should Not Be Rushed

A new car should have at least three coats of paint and ten days' time for painting, if one wants an economical job of painting. When cars are turned out with two coats of commercial paint in a few months 10 to 50 per cent of the surface is a mass of rust and scale. The car is seldom returned to the shops except for repairs and then the same process is repeated. This is expensive. On the other hand if a good, economical job is desired, the car should be given a coat of lead primer and finished with two coats of paint.

If freight equipment could be shopped as regularly as passenger cars, and I think it just as essential, it would be a great saving to the railroads. As it is they are seldom sent to the shop until something needs repairs, and then the rush comes when in the hands of the painter. Passenger cars are shopped every year, principally for appearance sake, and if freight equipment could be shopped as regularly for protection it would be a great saving.

I think it is a right a painter owes to his own reputation as well as a duty he owes to his company, to say all the good things he can of good paint and condemn poor paints. To get good paint you must mix it yourself. Twenty years ago mineral was used without grinding and gave better results than the present commercial prepared paints. Mineral, lampblack and graphite can all be used without grinding. Too much cannot be said in favor of linseed oil as a vehicle for paint. It is one of the few vegetable, fatty oils that dries by absorption of oxygen.

To conclude, it should be said that whenever railroads will take time enough to paint steel equipment with the right materials, and in a way that it should be done, then the work will stand, and in the long run economy will be the sure result. The steel coal cars one sees on every hand today are horrible examples of the poor judgment and haste that has been practiced in the painting of this equipment where it has been turned out of the car manufactories. There is no cure for it now but to sand-blast it off and paint it as it should be with right materials and practices. A stitch in time would have saved nine when the cars were built but the nine stitches should be taken now to save the equipment before it rusts out completely, for there is nothing that deteriorates faster than steel unprotected with a suitable coating.

Other Papers

F. B. Davenport (Penn. Lines) told of the results secured with a special heat resisting paint developed for use on car roofs. The best quality and size of sand for sand blasting was discussed in papers by J. W. Gibbons (A. T. & S. F.) and G. M. Oates (Pressed Steel Car Company). Methods of preserving the roofs on passenger cars were described by J. J. McNamara (B. & O.) and H. H. Morgan (C. of Ga.). C. E. Copp (B. & M.) presented a paper on the record of the Master Painters' Association.

General Business

The proposal to amalgamate with the American Railroad Association as a division of the Mechanical Section had been considered by the officers and was brought up at the convention. After considerable discussion, it was unanimously voted to become a part of the new organization and rules of order were adopted. The secretary-treasurer reported a total membership of 328 and a satisfactory balance in the treasury.

The following officers were elected, chairman, J. W. Gibbons, (A. T. & S. F.); first vice-chairman, E. L. Younger, (Mo. Pac.); second vice-chairman, J. G. Keil, (N. Y. C.); secretary-treasurer, A. P. Dane, (B. & M.).

Boston was chosen as the place of the next meeting, which will mark the fiftieth anniversary of the founding of the association.

Prosecutions for violation of the federal safety laws, begun in the United States District Court at Pittsburgh, Pa., on September 5, name officers of the railroad (instead of the company itself or the Railroad Administration) as defendants. The offense was the working of train men more than 16 hours on the Pittsburgh, Cincinnati, Chicago & St. Louis. Six men were named: R. E. McCarty, general manager; I. W. Geer, general superintendent; J. C. McCullough, superintendent, and three others.

Labor Leaders Object to Anti-Strike Legislation

A STATEMENT issued by the Plumb Plan League, signed by the executives of fourteen railroad labor organizations, but not by Samuel Gompers as honorary president, criticises the provisions of the Cummins bill designed to prevent strikes, on the ground that "the right to strike as the last resort is ingrained in the nature of the American workingman." "To attempt to put such a prohibitive law into operation," the statement declares, "would be madness. No leadership in the world could restrain the rank and file of American labor under such an imposition; the human factors called forth would be beyond control."

"This provision," the statement says, "not only would make it illegal to strike with *intent* to hinder interstate commerce, but also would make it illegal to enter into any combination or agreement which *does* hinder interstate commerce. Intent would not have to be proved in the courts. Thus the provision is iron-clad; for any strike on the railroads, of however small proportions, would unquestionably hinder interstate commerce. The provision is carefully written to remove from railway labor the right to strike under any possible circumstances. If this provision were enacted into law, it would impose upon railway labor two insupportable conditions, namely, compulsory arbitration and economic servitude. Such a serious and fundamental proposal opens up the whole question of the relations of labor to the state and to the employer, and precipitates every issue in the industrial situation. To advance it in Congress at this time, in the face of an economic crisis, and when Congress is refusing the legitimate requests of railway labor for a full consideration of its own proposals, is a step calculated only further to increase the difficulties that confront the nation.

"What would be left a workingman, under the provisions of the Cummins bill, above quoted? The final clause of the provision is an empty promise. If two or more men quit work under any excuse, it could be held that they were interfering with interstate commerce. The provision simply means that under it men in the railroad employ would no longer be free to quit their jobs; they would work in economic serfdom, subject to the conditions imposed by the adjustment boards; or, if two or more of them did quit, they would be criminals, and the police and the troops, the courts and the jails, can be used against them.

"A law such as this would spell the end of labor organizations in America. Is this the intent of the provision? Does Congress, at the behest of the alarmed business system, propose to try to break up the organizations of labor throughout the country? Is it decided that the time has come to make this final fight? These are questions which demand an answer. Every workingman in the land is asking them as he reads the newspapers. In his heart he knows that to enact this law would spell more than the death of trade unionism. It would spell the birth of revolution.

"This is not a threat, but merely a statement of obvious fact. The real threat comes from the other side—against labor, to remove from its hands the only weapon by means of which it has built up and maintained its organizations, and against the public, to throw the country into a state of confusion and violence. Labor alone, in this railroad crisis, has been thinking of the public; it is only labor's plan which holds the public interest to be primary. All other plans and proposals have been dictated by selfish motives. This final proposal is cynically disregardful of the public welfare.

"As representatives of the fourteen organizations comprising the organized railway employees of America, we beg Congress most earnestly to consider this situation on the basis of its true values."

Railway Business Association on the Cummins Bill

Suggestions for Making the Object Which the Bill Admirably States Effective in Actual Practice in the Future

Alba B. Johnson, president of the Railway Business Association, has written Senator Cummins a letter in part as follows:

Vital as are the subjoined recommendations for amendments to Senate Bill 2906, I felt constrained to telegraph you on Friday and now reiterate congratulations on the progress toward a solution of the railroad problem which this measure embodies. It has a merit which distinguishes it sharply from most of the other "plans" which are being urged—it is not a stockholders' bill or an employees' bill or a railway supply men's bill, but a bill for the users of transportation.

To you personally it cannot be otherwise than an occasion for gratification and pride that after three years of inquiry and interchange of ideas upon the major stumbling block involved in your question "What shall we do with the weak roads?" this is on its way to an answer through your proposal of consolidation; and your confidence rests not alone upon the apparent willingness of Congress to give your plan the sanction of law but also upon the apparent readiness of railway owners and managers to carry through without compulsion a large part if not all of the program. Once measurably rid of the strong-and-weak-road dilemma you will have just reason to hope for a clear way to a disposition of the revenue and credit aspects.

Objects rather than means concern the industries for which I speak. With all the most important of these objects the sub-committee bill deals.

Good Tendency of Mere Proclamation

In our judgment the mere proclamation of these objects as indicating the purpose and policy of the government would strongly tend to bring into line with such declaration the practice of the administrative branches and substantially increase the confidence of those whose capital is needed for better railroads and more railroads.

Neither Congress nor the country, however, we feel sure, will be content merely to adopt declarations the results of which are expected to come through the sentimental influence of the declarations themselves upon the regulatory agencies. Congress and the country are ready for legislation which will put restoration of railway development beyond a peradventure if a statute can do it. The present juncture affords a rare opportunity, which may never be presented again, for a legislative achievement that will take transportation out of politics and out of controversy.

We offer you our friendly co-operation in your difficult task of appraising this tentative bill and strengthening it where needed.

We are convinced that in the bill as it stands the provisions for making policy effective are in need of modification.

Why Not "Shall"?

The bill does not prescribe that revenue shall be adequate for the objects which it names. It says that those objects shall be "taken into consideration."

In the Interstate Commerce Act as it stands Congress, desiring to enunciate the purpose that rates should be reasonable, did not say that in regulating rates the commission shall take into consideration their reasonableness; it said that rates "shall" be reasonable.

A new element of policy is now to be introduced. It is the purpose of Congress that rates and the revenue to be yielded by rates shall be adequate (for objects specified). What reason is there for evading the straight phrase of the earlier enactment?

We believe the accomplishment of your purpose requires that you say, not that the objects specified shall be taken into consideration, but that revenue shall be adequate for those objects.

Delusion About a "Fair Return"

We have urged that income should be made adequate to afford the basis for credit.

This is included in the bill as one of the objects which are to be taken into consideration in determining the revenue needs; but there is in the bill as bearing on this point phraseology which we fear will return to plague you. The enumeration of things to be considered embraces this language: "a fair return upon the value of the property," "requirements for additional capital," and "the conditions under which the same may be secured."

Is it intended by these words to indicate that a fair return and conditions upon which additional capital may be secured are two distinct things? It would be dangerous to give even an impression that Congress had sanctioned that fallacy, because it has taken a firm hold on a large part of the public mind. People's eyes are focused upon the holder of existing securities as such and the return which he is to have. They use the tell-tale word "entitled"—to what return the security holder is "entitled"—and they imagine that it is somehow the business of the legislative branch or of the Commission through which it applies its policy to determine what the security holder is "entitled" to and to see that he gets this and nothing more.

Your success or failure in dislodging this delusion from the public thought may determine whether we in America can or cannot preserve individual initiative in transportation and hence probably the institution of individual possession in every field. The legislation upon which you are engaged can be made a potent vehicle for the enunciation of the actual facts.

Basic Propositions

Some elemental propositions which could advantageously be made clear by what your statute says and by what it omits would be these:

(a) Protection to the stock or bond owner is not the business of Congress at all but of an entirely different and independent branch of the government—the judiciary.

(b) A "fair return" to which the owner is "entitled" is and can be nothing else but the return below which a Commission cannot constitutionally depress rates.

(c) The concern of Congress is not primarily with the holder of existing securities but with the possessor of savings whose future investment is desired, who will buy or refuse to buy solely in accord with his expectation of a return and whose mind is made up as to future returns by past and current returns upon existing securities.

(d) Congress, being charged with the duty of assuring adequate facilities to the public, is therefore concerned solely with the question what return upon existing securities will make a market for new securities. Congress operates in the

zone of income above what the courts would enforce as a "fair" return.

I have above referred to Senate Bill 2906 as a measure distinctively for the users of transportation. This impression will be strengthened if having said that revenue shall be adequate the bill states the credit problem by eliminating altogether the word "fair" and simply authorizing a return designed to attract what the bill already defines—"additional capital in order to enable the carriers to adequately perform their duties to the public."

We have urged that the certificate of the Transportation Board as to necessary revenue be met by the rates. The bill does not so prescribe. It merely provides that in any hearing before it the Interstate Commerce Commission shall accept the certificate as prima facie evidence. This in our judgment would be a mistake pregnant with the most serious consequences.

The certificate or certificates (to quote the language of the measure) are to be "prima facie evidence in any hearing upon the matter or matters to which such certificate or certificates respectively relate."

The commission can for reasons satisfactory to itself reject even a certificate having the statutory sanctity of being prima facie evidence.

The commission, then, is to pass upon the judgment of the board after a proceeding. The board presumably is to come before the commission as a petitioner. The members of the board through such procedure are to ascertain whether the Interstate Commerce Commission regards their judgment as sound on matters of business; and in all the praise which citizens, including your present memorialist, have justly bestowed on the commission we have never heard or seen it suggested that that body is specially qualified for the business function of estimating future needs and their cost and of exercising courage in making provision in advance.

Will Competent Men Accept?

Obviously if the Board is to have the duty of ascertaining the transportation needs of the country and the amount of revenue required, men of business capacity and experience will be desired and if possible will be obtained for service upon it.

Have you any confidence that men of that caliber will accept or long retain office in the board if in matters of business their judgment is to be reviewed by such a body as the Interstate Commerce Commission?

In testimony presented before the House committee August 25 and 26, of which a condensed print is herewith attached, I endeavored to maintain that to give the commission a voice in deciding the amount of revenue will destroy its incalculable value as an agency for abatement of discriminations and that even if Congress were willing to sacrifice the commission as an instrumentality for the prevention of injustices, the transformation of it into a body of men of action would take years and probably the protracted process would be interrupted by government ownership.

Some members of your committee are business men. They appoint subordinates with defined jurisdiction. Within such jurisdiction the subordinate is supreme. His position resembles what used to be said of the Russian throne—it was despotism tempered by assassination. If the president of the company loses confidence in the subordinate, off with his head; but so long as he is retained in the position his judgment within the designated scope is final. When the question of organizing the production and procurement bureaus of our government was under discussion during the war it was reported that a high official inquired of a business friend: "Do you mean to say that every business is organized like that?" "No," was the reply; "about 95 per cent isn't, and this is the principal reason why 95 per cent of businesses fail." A business need not couple power with responsibility if it so prefers, but it must do it to succeed.

We submit that so must Congress in this matter of railroad regulation. In business to give a man a job and then have another man of similar rank to pass upon his judgment is intolerable. Yet this bill sets up a body equal in salaries to the Interstate Commerce Commission and of longer tenure and subjects its judgment to review by the other tribunal. There is here no element of the judiciary holding an agency of the legislative within constitutional limitations. It is never questions of judgment that are reviewed by a court.

The Interstate Commerce Commission itself affords a perfect illustration. The law having prescribed that rates shall be reasonable and non-discriminatory and Congress having established the commission as an agency to administer that rule, the Supreme Court has again and again declined to pass upon the judgment of that agency. If the commission says a rate is lawful that makes it lawful and no power can reverse that dictum except on the ground that it takes away the owner's right to the use of his property—that is to say, of a fair return upon it.

If a question of jurisdiction is involved—if it is contended that the commission has exceeded the power delegated to it by Congress or that Congress has undertaken to delegate power which it does not itself possess there is a review by the court; but in refusing to annul rates sanctioned by the commission where the question is whether they are reasonable and non-discriminatory the court always says not that it approves the judgment but that it has no jurisdiction to approve or disapprove and washes its hands of the whole matter.

Security Issues and Consolidations

Pursuing the same line of action, the bill empowers the Transportation Board to require that carriers construct new facilities, but it leaves the board, as previously stated, without power to require the revenue necessary for a credit basis upon which to finance the improvement. Again, consolidations are to be dealt with by the board through recommendations which to become effective would require the approval of the commission. Both capital improvements and consolidations are inseparably bound up in the issuance of securities. Yet by this bill the duty of regulating security issues is imposed not upon the board but upon the commission.

Similarly in the field of relations with employees, the bill empowers the Transportation Board to sanction increases in the labor costs without imposing upon the Commission any responsibility in the matter—a responsibility from which the Commission has for several years prayed Congress to deliver it—and yet leaves the Board with nothing but a recommendatory function as to revenue with which to defray such increased labor cost, the final decision as to revenue resting with the commission.

Financial vs. Physical

Although it is not so stated in the bill or in your published abstract, analysis of the measure seems to indicate the theory upon which, whether consciously or unconsciously, the subcommittee classified the several functions for assignment to the board and to the commission respectively. That theory seems to be that the commission will have for its province financial matters and the board physical and other aspects not obviously financial. There are exceptions but the rule runs generally through the bill and is illustrated in a minor clause which places the board in the position of organizing and maintaining a staff and having to get from the commission approval of the salaries.

We believe you can make a sounder classification of functions as between the board and the commission than that of matters which involve finance and matters which do not.

We urge upon your serious consideration whether the problems are not fundamentally those of promotion on the one hand and restriction on the other. We are confident that you will come to regard the assignment of responsibilities chiefly if not altogether with a view to the type of men that each requires for its most effective performance.

We are to have two bodies. Each should be homogeneous in its makeup. The bill admirably points to the two types when it makes the commission the regulator of rates and gives the board the ascertainment of the public need for facilities and the railroads' need for income. If the board is to require a railroad to participate with a carrier by water in the construction of a joint terminal, every step necessary to the consummation of that mandatory requirement should be within the scope of the board—it should decide what is to be done, it should regulate the security issues, it should determine irrevocably the amount of revenue which the railroad will need. If the board is regarded by Congress as a fitter body than the commission to ascertain what consolidations there should be and on what terms, then the board and not the commission is the fitter body to make the final decision.

Full Power with Responsibility

One reason for opposition to a Transportation Board is the misgiving by some that decisions would hang fire between the two bodies. We believe this is a well-founded apprehension. The one way to avoid it and hence to restore railway development is to give full power with each responsibility and review over none except by the courts.

We have been unable to see how the Interstate Commerce Commission could be better employed than in continuing as in the past to prevent injustices. The enlargement of federal jurisdiction over rates which the bill proposes will require an extensive increase in the rate-regulating organization of the commission. Populations hitherto resorting to State bodies for relief must be dealt with reasonably near their homes and by federal officers whose familiarity with local conditions will at all times be supplemented by intimacy with the nation-wide standards which the commission exists both to crystallize and to develop. Nine men may well stagger under such a task of supervision. They may well be spared other burdens.

This would assign the new policy of encouragement for improvement and construction as well as the physical aspects of existing regulations to the Transportation Board, which will be conceived and manned in that light and clothed with independent powers corresponding to its responsibility.

Summary of Proposed Changes

Your sub-committee has adopted as its purpose the objects which the public interest requires. If by amendment it is made more nearly certain that those objects will be accomplished the task will have been achieved and well achieved. Let me summarize for convenience the changes which the Railway Business Association proposes:

(1.) Drop the phrase "take into consideration" and prescribe that rates "shall" be adequate to yield revenue sufficient for the objects which you enumerate.

(2.) Drop the phrase "fair return" and prescribe as an object for which revenue is to be adequate a return designed to attract "additional capital in order to enable the carriers to perform their duties to the public."

(3.) Drop the review of the board's certificate as to needed facilities and income, making it mandatory upon the commission to accept it and sanction rate structures calculated to yield the income certified.

(4.) Drop the requirement that consolidations shall have the approval of the commission, making final the sanction of the board. (5.) Give the board and not the commission regulation of security issues, without review.

War Risk Insurance Held By Railroad Men

THE BUREAU OF WAR RISK INSURANCE of the Treasury Department, in conducting its campaign for the retaining of government war risk insurance by discharged soldiers, sailors and marines, has issued an interesting report concerning the insurance carried by railroad workers in the Transportation Service of the Engineer Corps. This report says in part:

"Locomotive engineers, firemen and trainmen taken from active service on railroads in America and transferred to France as soldiers of the United States, performed notable work in the greatest war of all times. Figures compiled by the Actuarial Department of the Bureau of War Risk Insurance in Washington, show that more than $107,758,200 of government insurance was carried by railroad men engaged in the Transportation Service of the Engineer Corps, American Expeditionary Forces, and upon railroads in the United States. There were thousands of enginemen and trainmen in all branches of the service, but in the compilation of these figures, only these men actively engaged in the Transportation Service of the Engineer Corps are included.

"The conservation of this insurance of the railroad men has been undertaken by the Bureau of War Risk Insurance which is organizing a volunteer field force with the purpose of reaching every discharged service man to encourage him to maintain his insurance.

"A total of $40,000,000,000, approximately, of insurance was carried by the nearly 5,000,000 soldiers, sailors, marines, army and navy nurses. Of this amount, $22,881,000 was carried by locomotive engineers in the Transportation Service of the Engineers Corps.

"There were 500 gasoline locomotive engineers in the Corps. These men carried $4,350,000 insurance. There were 2,520 locomotive firemen in the Engineer Corps of the American Expeditionary Forces, and 110 in railroad work in the United States. Of this number, 450 were engaged in light railroad work in France and 50 in America. In all they carried a total of $22,881,000 of War Risk Insurance.

"Brakemen, trainmen, flagmen in the American Expeditionary Forces numbered 5,460, while 95 were engaged in this work in America, making a total of 5,555. Of this number, 860 were employed on light railroads in France, and 95 on light railroads in the United States. These men carried $48,328,500 insurance. In addition to these trainmen there were 319 engine watchmen carrying $2,775,300 insurance, and of these men, 282 were overseas. There were in addition 46 enginehouse firemen, carrying $400,200 of war risk insurance.

"There were 706 locomotive inspectors, 630 of whom were in France, carrying $6,142,200 of war risk insurance.

"The Engineer Corps suffered in battle, deaths numbering 59 officers and 1,207 enlisted men. The wounded totaled 216 officers and 6,739 enlisted men. An officer and 153 enlisted men were taken prisoners."

"Clean air week" which began in Chicago on Monday, September 15, as a campaign against smoke and as a preventative against a return of the influenza epidemic, is to be marked by daily conferences between the City Health Commissioner and various organizations to devise means of ridding the city of the smoke nuisance. On Friday, September 19, a conference of this nature will be held between the Health Commissioner and the general managers and federal managers of railroads in Chicago, the superintendents of motive power and master mechanics and representatives of the enginemen's and firemen's brotherhoods.

Opportunities for American Signaling in Far East*

American Firms Must Recognize Differences in Operating Methods to Compete Successfully

By Frank Rhea

THE GOVERNMENT of train movements on the Chinese government railways is usually by block control. Some kind of staff is generally in use on single-track lines and a very large percentage of all the mileage is single track. All stations where trains may meet or pass are provided with "station loops" which are really very short stretches of double track. Separate station platforms are provided for the passenger traffic in each direction. At the more important stations, particularly at junction stations, the main-track switches are interlocked; at other stations interlocking of various degrees of completeness is provided; while at some stations—in fact, in a large number of instances—only hand-thrown switches, locks, and signals are provided.

In all cases the direction of the handling of this apparatus is under the jurisdiction of the station master. The method of signaling is usually in accordance with the practice of the country that has provided the loan funds for building the line, but in the main, the general practice can be said to conform approximately to the British Board of Trade practice. In view of the experience in Australia, it would seem, if the Chinese government railways should be able to make their practice uniform in the next few years, that it would be wise for them to adopt the American three-position, three-speed system of signaling. It is also probable that the arrangement of selective telephones with central control, as installed on the New South Wales railways, could be adopted with much advantage on some of the lines, such as portions of the Peking-Mukden line, where the traffic is growing to such an extent as to require increased capacity of the present single track.

The signaling practice, as already stated, conforms to the practice of the country furnishing the loan funds, but the signaling as a rule is very simple, and approaches closely the British Board of Trade practice. Two signal arms are placed horizontally on separate dolls instead of vertically on one mast, as is the American practice. The signal arms point to the left because all the roads in China run left handed. The block working apparatus is largely of British manufacture. It would be of most decided advantage if all the Chinese railways were to adopt at once the American practice instead of doing so later (as they probably will) at a considerable cost.

Operating Methods

The system of train-movement control is the "station-master method" of operation, as the writer termed the arrangement employed on Australian railways. The practice of putting in the hands of the station master the responsibility for the movement of all traffic is even more pronounced in China than in Australia. It may be said to represent the adaptation of the British and Continental methods to the situation in China, where there are many factors in labor and class conditions that justify such an arrangement. In fact, it would probably be impossible to use successfully the American despatching methods with the train crews carrying out such orders without other direction.

All employees of the Chinese government railways are Chinese, except for a few salaried official positions that are filled by foreigners, usually serving under definite contracts. Educated Chinese are employed to fill many of the salaried official positions, but the less important employees in station, train staff, and similar service, have been recruited from the less-educated classes, and they require education and training to make them capable railway servants. Therefore the "station-master method" of operation seems without question to be the most desirable practice for railways in the Far East, and it is the method in general use. There is no doubt that this method requires more men and is less expeditious than the methods in vogue in the United States, particularly in the running of passenger trains, but this is not a serious handicap.

Imperial Government Railways of Japan

The parliamentary head of the Japanese government railways is the prime minister. The administrative and operating head is the president, who has under his direction a complete organization, consisting of a general staff and a director with a complete division staff in charge of each of the five grand divisions into which the entire system is divided.

The system of operation is the departmental or branch method, but there is superimposed the added feature of what might be termed a semi-military organization. By this it is meant that each official is given a rank and grade, with the result that in every contingency there is a ranking official who will have authority to take action. The general administration, in charge of the president, has a vice-president and a general staff divided into six departments, or bureaus, as follows: Secretariat, general administration, traffic, finance, engineering, and machinery and rolling stock.

The duties of the several bureaus are indicated by the titles, except the general administration bureau, which may be regarded as a commission for the control and regulation of the light railways, private railways, and tramways. This bureau consists of three members, one of whom is the director, one the secretary and one an engineer. They supervise in every sense the actions and operations of all the above classes of railways, even to the extent of the specifications for materials and equipment to be bought.

The method of train operation is the typical "station-master method" in all details, and with the conditions present and the help available this is admittedly the eminently safe and proper arrangement. Outside of the Tokyo electrified district the signaling is all in accordance with British Board of Trade practice, but the lines as a rule are inadequately signaled. In the Tokyo electrified zone some automatic signals are installed, but these are somewhat out of date and include several kinds of signals. With the amount of traffic on the Japanese government railways and the small amount of signaling at present, there is every reason why the most modern method of signaling should be adopted for future work. It is important that these lines be adequately signaled as the traffic grows, and they will ultimately require very intensive signaling.

Another feature would be the extensive use of selective telephone apparatus for establishing central control—by this

*From a report prepared by Frank Rhea on the Market for Railway Supplies in the Far East and issued by the Department of Commerce. Mr. Rhea spent the larger part of two years in China and other countries of the Orient as a special agent for the Department of Commerce, investigating the opportunities for the introduction of American railway materials there.

means retaining all the safeguarding features of the station-master method of train operation and still getting the permissible expedition of despatching methods.

Korean Government Railways

The organization is of the typical branch or bureau type, being very similar to that of the Shantung railway which has five bureaus established in the railway department of the Department of Civil Administration in the Tsingtau army headquarters with a chief appointed for each bureau. The bureaus are as follows: General affairs, traffic control, operations, engineering and finance. The bureau of operation has charge of the operation of trains, correspondence relating to operation, signaling and the conduct of the railway. The bureau of engineering has charge of new construction and repairs, railway, and buildings; operation of electric power houses for railway purposes, and control of lands and buildings in railway use. The method of train operation is the typical station-master workings with very little signaling and interlocking, all of which conforms, in general, to the practice on the Japanese railways.

South Manchuria Railways

The method of train running conforms strictly to the station-master system already referred to in connection with the Japanese railways. All signaling is along the lines of the British Board of Trade practice and is all very limited, both for signals and interlocking. The same remarks concerning modern methods of signaling and selective telephone apparatus for central control apply here as in connection with the Imperial Government Railways of Japan.

Manchuria and Eastern Siberia

The organization is of the typically bureaucratic type in all features. Methods of operation and train running conform to the station-master method in all its purity. There are buffet stations, averaging about 25 miles apart, where ample time is allowed for refreshment. One memorable feature of Russian train operation, particularly in yard switching, is the constant use of a large resonant whistle to sound a code of signals to switchmen who are located on the ground to throw switches for the handling of cars. In the yard at Harbin a surprisingly large number of men are used as ground switchmen. While the writer made inquiry as to the performance figures of these lines, it was impossible to obtain data that would satisfactorily show the facts and represent the normal conditions.

The Manila Railroad

Train-running methods conform strictly to the British "station-master" system, referred to at length in the Chinese and Japanese sections above. The small amount of signaling is along the lines of the British Board of Trade practice and as simple as it is possible to make this system of signaling. With the class of employees available, consisting almost entirely of natives in the train and station service, there is little doubt that this is the best method of operation, and government operation will be an added reason for continuing this arrangement.

Conclusions and Suggestions

While the distinctly departmental organization and the strictly station-master method of operation may impress representatives of American concerns doing business with the Chinese and Japanese railways as not being the best arrangement, it is the writer's opinion that the conditions are such that both these situations must be accepted. Business should be done with these railways along these lines particularly when it is a question of specifications or equipment (though this will seldom be the case outside of such matters as those involving signaling and train despatching). It may be true that by these methods the Far Eastern lines do not move traffic with the same speed as the American roads, but to do so they will be obliged to take a greater amount of risk on account of the class of men with which they have to operate these railways.

With the small amount of really modern signals and central train-control apparatus now installed, there is every reason why the simpler three-speed American method of signaling and selective telephones to direct present train working should be adopted in both Japan and China. This could be done with benefit, particularly to take care of the growing traffic which will necessitate increasing the traffic capacity of these railways from time to time.

Orders of the Regional Directors

Industrial Detention of Coal Cars.—The Northwestern regional director, file 44-1-205, calls on federal managers for reports to indicate responsibility for the detention of coal cars. Each agent is to report all coal daily, showing consignee, number of cars placed and number unloaded, number on private or team tracks placed for unloading and not released, and the number held for placement on account of the disability of the consignee.

Commercial Coal Supply and Requirements. — The Northwestern regional director, in Inquiry 239, requests the compilation of information concerning the storage and prospective needs of commercial bituminous coal in the Northwestern region. Reports are to show net tons on hand September 1, 1919, net tons required from September 1 to December 31, 1919, and the net tons required from January 1, to March 1, 1920. These three items are to be subdivided into industrial, public utilities and other consumers, including retail dealers, and these in turn are to be reported separately by states.

Accident Prevention Drives.—The Northwestern regional director, file 97-1-20, announces the National Railroad Accident Prevention Drive, from October 18, to 31, inclusive, and suggests that federal managers call a meeting of general officers to discuss plans for making this drive a success, the meeting preferably to be held in conjunction with the meeting of the General Safety Committee if the meeting of that committee is scheduled to be held in advance of October 1.

Chicago Joint Agreement Between Brotherhoods.—Circular 88, of the Northwestern regional director, quotes rules of the Chicago Joint Agreement between the Brotherhood of Locomotive Engineers and the Brotherhood of Locomotive Firemen and Enginemen, which are to be incorporated into existing schedules on railroads where such schedules exist and where they are not already included.

Export Bills of Lading.—The Southwestern regional director in Supplement 4 to Circular 240, defines the term "North Atlantic Ports," as constituting all ports in the United States from Norfolk, Va., north. In Supplement 5, to the same circular, the Southwestern regional director amends paragraph 6 of the original circular containing a notation to appear on all bills of lading. In Supplement 6, to the same circular, the Southwestern regional director amends Supplement 1 to the same circular, relative to the payment of undercharges.

Fire Prevention—Smoking.—Supplement 11 to Circular 32 of the Northwestern regional director states that during 1918 there were reporteed to the Fire Loss and Property Protection section, 252 fires directly attributable to carelessness in smoking or the use of matches, with a total loss of $159,629, and calls attention to the necessity for strict enforcement of the no smoking rule in wood working shops, paint shops, etc.

Railroad Hearings Before House Committee

Protest Against Plumb Plan by E. J. Rich. Railway Surplus and Business Prosperity

WASHINGTON, D. C.

THE FOLLOWING PROTEST against the Plumb plan was presented before the House committee on interstate and foreign commerce on September 12 by E. J. Rich of Boston:

"I think I may fairly say that I am bearing to you the message of the manufacturers of the United States. I have been requested to bear this message and to enter this protest against the plan of the railroad brotherhoods by the following organizations:

	Members.
Associated Industries of Massachusetts	1,300
Employers' Association of Montana	1,600
Indiana Manufacturers' Association	800
Iowa State Manufacturers' Association	1,500
Connecticut Manufacturers' Association, Inc.	600
Ohio Manufacturers' Association	550
Nebraska Manufacturers' Association	500
Wisconsin Manufacturers' Association	500
West Virginia Manufacturers' Association	350
Kansas Employers' Association	400
Manufacturers and Employers' Association of South Dakota	225
Utah Manufacturers' Association	200
Georgia Manufacturers' Association	250
California Manufacturers' Association	302
Associated Industries of Missouri	130
Kentucky Manufacturers & Shippers Association	173
New Hampshire Manufacturers' Association	400
Colorado Manufacturers' Association	560
Alabama Manufacturers' and Operators' Association	100
Associated Merchants & Manufacturers of New York	2,000
Employers Association of the Inland Empire	540
Pennsylvania Manufacturers' Association	4,200
Michigan Manufacturers' Association	1,050
Total membership	18,230

"The total invested capital represented by these organizations is not less than twenty billion dollars.

"I am also requested to enter the protest of that body of vigorous 100 per cent Americans, the United Commercial Travelers' Association, with a membership of 82,000. The Massachusetts Chamber of Commerce has also requested me to enter its protest against the brotherhood plan. This organization is composed of 69 constituent bodies, local boards of trade, having a membership of more than 40,000. The membership of these bodies is thoroughly representative of the great middle class. One has only to attend their conferences and meetings to be deeply impressed with the fact that their efforts are directed primarily towards the protection of the human rights of labor, rather than towards the preservation of the property rights of capital. I do not claim that this attitude is due to unselfishness, but rather to an enlightened comprehension of the real way to protect their private interests. It is in this spirit towards labor that this protest is made against the plan of the railroad brotherhoods. The manufacturers desire that their private interests may not be jeopardized. They take pride in what has been achieved by private enterprise and do not wish to exchange their property for a government bond and become coupon-cutters, but rather they desire to continue as active agents in the great industrial work of the nation.

"We do not anticipate that the railroad properties, or later our property, will be confiscated. We do not take seriously the implied threat of revolution which seems to have found lodgment in the heated brain of one of the sponsors of the Plumb plan. We have not the slightest apprehension that this committee will recommend the adoption of the plan, or that Congress would for a moment seriously consider it. When members of this Congress have spoken on this subject, there has been no uncertain ring to their utterances.

"It has been stated that this new and strange doctrine is spreading like wild-fire throughout the working classes. This may be an exaggeration, but there are many evidences that it is beginning to receive much enthusiastic attention in the ranks of organized labor. The plan is an adroit one. It has a peculiarly alluring appeal to prejudice and self-interest, and it is because of the danger arising from such an appeal that we desire to enter this vigorous protest.

"The principles of the plan are not the principles of socialism, for socialism in its theory is based upon what its advocates deem to be the public good. Socialism is the nationalization of industry in the interest of the public. The Plumb plan places all the burdens on the public, and gives to a privileged class all the alleged benefits. We see in bolshevism a perverted socialism. Under a bolshevistic regime, the workers are to manage all industry and to take all the profits. When the plan of the brotherhoods is analyzed, it is seen that the fundamental principle is that the public shall own the instrumentalities of transportation, which shall be managed for the benefit of the workers, by the workers, and if there is a loss, that loss shall fall upon the public.

"The fallacies of the plan have been punctured by the members of this committee, and its menaces have been clearly shown. But the issue is so momentous, and the danger of the spread of this pernicious doctrine so great, that I am sure you will pardon me if I undertake a brief analysis.

"It is first proposed that the government shall buy the railroads. It is claimed (and with truth) that the government can raise money at lower rates of interest than private corporations. This is one of the strongest arguments of all government ownership advocates. It is to be placed upon the credit side of the balance sheet, to be considered for what it is worth. The claim, however, that the government can raise money at four per cent is ridiculous. It would probably have to pay over five per cent. If so, the saving would not be much more than one per cent on the value of the railroads.

"It is claimed further that the public would not have to pay interest in the shape of railroad rates upon an inflated capitalization, and that by reducing the capitalization by, say, five billion dollars, a still further saving would be effected. It is true that there has been gross manipulation of securities and that many railroads are weighed down under a capitalization upon which the public ought not to be compelled to pay charges. Furthermore Congress ought now to provide a means whereby the strangle-hold which the banking interests necessarily have on the weaker railroads should be relaxed. But the amount of over-capitalization has been greatly exaggerated. There are some railroads whose capitalization is less than the money actually put into them, and there are many railroads organized in the early days whose bonds represent the cash and whose stock represents the hope of investors. Doubtless many railroads are over-capitalized in the sense that their capitalization is greater than the amount of money actually put in, but they are not over-capitalized in the sense that, under a wise method of financing, more capital was issued than was necessary in order to start the enterprise, and that is the test.

"In the last analysis the government will pay what the courts determine to be their lawful value, but that value, in the judgment of those qualified to judge, will not be materially less than the aggregate capitalization. The brotherhoods, in advocating government ownership on the basis of actual value, are proceeding along paths which have been trodden by many earnest and honest men, but suddenly the

path diverges into the wilderness of Russian bolshevism. A gigantic corporation is to be formed to take over the railroads with the money of the people. The whole body of employees constitute this corporation, and *'the stock of this corporation shall be held in trust for the benefit of the employees.'* This is the bald statement made by the proponent of the bill before the Senate committee last winter.

"Not only is the corporation to be run for the benefit of the employees, but it is to be managed by the employees. No one is misled by the adroit wording of the plan in this particular. Under this plan the employees are the corporation. How long would an officer hold his position who was not zealous in advancing the interests of his real employers? This attempt to convey the idea that the officers would represent something other than the interests of the employees is transparently dishonest. It is not intended that they should represent any other interests than those of the so-called classified employees, and any officer who attempted to ignore the interests of these employees and to favor the public interests would be summarily removed.

"This committee by its incisive questions has torn off the mask and has shown to the country the real power behind this corporation. But the advocates of the plan say that the profits are to be equally divided between employees and the public, and that in this way and because of this, the corporation will be managed in the public interest. The proponents of the plan grow eloquent in expatiating on the tremendous incentive which will be given to every employee to work efficiently and economically. Why this sudden change of attitude on the part of organized labor towards profit sharing and bonuses? In the past they have opposed anything which would speed up production and put a premium on efficiency.

"Let us analyze the proposition a moment. Wages are by far the greatest item of expense in the operation of a railroad. How are wages to be fixed? By an arbitration board, composed of members equally representing the employees and the officers. *That is, all the arbitrators are elected by those who will profit by the award, and who themselves, as employees and officers, will likewise profit by their own award* —all recipients of wages whose fairness they are determining. Today the officers appointed by the corporation represent the corporation, but under this plan they are appointed by a board all of whom are in the employee class. Because today the officers are the opposing party in a wage arbitration, there is an attempt to make it appear that they would be the opposing party in a wage arbitration under this plan. It is a device too transparent for serious consideration.

"Will initiative and incentive to efficiency be increased under this plan? The railroad employees are making wage demands which will probably average not less than an increase of 50 per cent over their present wages. Take the case of an employee earning $2,000. An increase of 50 per cent would amount to $1,000. That is what he would get if his demands were complied with. What would be his share of the surplus? If the profits were $100,000,000, the combined body of the employees would get $50,000,000, which, if divided equally among the 2,000,000 employees would amount to $25 apiece; somewhat less in the case of the classified employees. Which affords the greater incentive to effort, to work efficiently and conscientiously for the accumulation of a surplus of which they would get $25, or to demand from their own officers whom they elect and control an increase in wages? Certainly $25 has not the same lure as $1,000. Would the employees work conscientiously and efficiently for the accumulation of a surplus, or would they work the directors—*their* directors—for an increase in wages?

"But there would be no surplus, and no hope of surplus. After the payment of wages—a first lien on revenues—and other operating expenses, sinking fund requirements, extension of railroads into new territory, improvements and betterments, there would be nothing but deficits to be met by taxation. The employees would never give a thought to the will o' the wisp of a surplus.

"It is interesting how tenaciously the brotherhoods hold on to the right to strike. It would seem that as the employees fixed their own wages and conditions of employment there would be no occasion for a strike. But bear in mind that this plan originated with the 'Big Four,' who though more thoroughly organized than any other grades of employees are in a decided minority. Is there any doubt that the strike provision is retained as a club to be used against other organizations?

"The greatest evil which would come from this plan would be the utter demoralization which would exist throughout the ranks of railroad labor. What a scramble among labor leaders for the directorships and the important offices! *Directors once elected to office are subject to recall by those who elected them.* If the shopmen thought that the 'Big Four' were getting more than their proper amount of the spoils and should combine with the section men and other grades of employees, the existing officers would be recalled and their own leaders designated. One set of ambitious labor leaders would succeed another, even within each organization, and one organization would combine with others for the purpose of ousting those for the moment in power.

"It is fortunate that the issue is raised in a way that it can be met; for the defeat of this revolutionary plan will quiet agitation for its extension to other lines of industry. It is fortunate that this issue is raised before a Congress in which the members of both parties are standing firmly, courageously, fearlessly, in defence of American institutions."

P. J. Coyle, president of the Order of Railway Station Employees, urged the necessity for legislation establishing some tribunal to protect the interests of railway employees after the return of the roads to private management and to prevent the railroads from attempting to keep their employees from organizing. He also had some criticisms to make of the effect of the Railroad Administration's wage orders, saying that its attempts to standardize wages, while of great benefit to some of the employees receiving the lowest pay, did not work out equitably.

Hoyt Chambers, secretary of the National Civic Betterment League, told the committee that any legislation that would tend to "validate" anything like the present par value of railway securities would be a "great public larceny." To prove it, he said, he had taken a list of 12 railroads and computed the market value of their securities on the basis of newspaper market quotations as of September 9 at 56 per cent of par and on this basis he calculated the market value of all the railroads at $11,000,000,000. He also explained to the committee the reason for the high price of coal by saying that the railroads are holding up hundreds of cars of company fuel but that they occasionally let go of some of this coal to favored dealers at a profit. He said he was a former railroad man and knew what he was talking about and that he had evidence from 14 railroad division points but when pressed by the committee declined to name them without asking the permission of his informants. He also charged that the railroads are accumulating supplies at government expense sufficient to last them for years to come but he also declined to be specific on this point.

K. D. Loos, of Chicago, for the National Coal Association urged amendments to the car service provisions of the Esch bill, which he said, had already been adopted by the Senate sub-committee in the similar provisions of the Cummins bill, to impose more specific requirements upon the railroads to insure the equitable distribution of cars in times of shortage, in order, he said, to prevent the railroads from reviving the practice of assigning cars for railroad fuel and not count-

ing them against the mine rating of the coal operators having railroad fuel contracts. Before federal control, he said, the railroads used variations of this practice to obtain lower prices for their coal in return for the assurance of a full car supply, with the result that the mines not having railroad contracts were discriminated against. The practice was stopped last year by order of the President and by agreement between the railroad and fuel administrations at the time the roads were required to pay the regular price for coal but the operators were afraid it might be revived after the return of private management. The Interstate Commerce Commission now has power to issue orders prescribing the method of car distribution, he said, but they have proved ineffective because they run only against the roads named as defendants, because the orders expire in two years and because by the time the order is issued the period of car shortage is over and there is no redress for the past discrimination. He urged an amendment for the purpose of making the declaration of law specific with an effective penalty.

Representative Cooper remarked that if the plan of the United Mine Workers for a five-day week and a six-hour day is put into effect the operators will not need so many cars. Representative Sanders added that if the complete plan is adopted there would be no coal operators because it also provides for nationalization of the coal mines.

Railway Surplus and Business Prosperity

Edward B. Leigh, president of the Chicago Railway Equipment Company, testified before the committee on September 15, urging the importance of allowing the railroads to earn a surplus. Mr. Leigh said in part:

"What I ask you to consider relates specifically to our recommendation concerning surplus earnings. In the statement of objects made to you by President Johnson, as favored by our association, was this:

> ' * * * accumulation of surplus railway income in good years in order that in poor years railway maintenance, additions and betterments may be carried on vigorously.'

"Senate Bill 2906, the Cummins bill, looks in that direction. One of its provisions would make certain specified dispositions of a carrier's return in any year in excess of a fair return. In laying down the rule which the regulatory body is to follow in determining what is a fair return, the bill employs this language:

> 'A fair return * * * which may include a just allowance to provide reasonably for future years in which there may be insufficient earnings.'

"That is to say, wholly apart from the question of taking income from one road and giving it or lending it to another, or for the benefit of those who use another, the Cummins bill deals directly with each individual line and recognizes the legitimacy of its accumulating in prosperous years a surplus against lean years. Our association does not say that income should be diffused in any of the ways suggested. There are undoubtedly serious legal and constitutional difficulties. We do not pretend to have discovered a provision which will attain the end in view. What I am here to urge is that you adopt as your own the basic thought underlying the definition of a fair return which I have just cited from the Cummins bill, namely, that a surplus should be permitted, to any railroad that can earn it, as a fund for years of adversity.

"Some of the plans so ably conceived and presented to you, seem to be animated primarily by solicitude for the present holder of outstanding securities. Some of the so-called rules for rate-making have set forth that rates should be such as to yield a return; as if the be-all and end-all of rates was the return. To the security-holder, of course, the return is the object of the investment. As a security-holder he has no stake beyond the fact of the return and repayment of the principal. But to the user of transportation and to the user of what is transported, the return is merely a means to an end—namely, attraction of new capital for additions and betterments, including those which promise economies and, hence, ultimately a check on rate advances.

"It is gratifying to observe that there are certain leading plans in which the public rather than the security-holder is specifically made the primary object of solicitude. One of these is the Cummins bill. That measure sets forth the aspects which must be considered by the rate-regulating body and gives prominence to the needs of the people for transportation, hence for new capital, and hence for adequate rates.

"The statement of the same object by the Railway Business Association is this: ' * * * a federal statutory rule of which the effect will be that rates and fares of the railways within each traffic section shall be sufficient to yield the average railway in the group in the average year its necessary expenses and to provide the credit basis for average facilities.'

"In discussing the public interest in adequacy of rates and adequacy of return, you have ample testimony touching upon adequacy of facilities as a necessary underlying aim. I do not now volunteer any more. There is another aspect from which the national interest should be considered, and to that aspect I invite your attention.

"I refer to the effect of railway purchases in and of themselves as a stabilizer of industrial and commercial activity in every line whatever throughout the country.

"Ever since Henry Clay raised his voice for policies designed to stimulate prosperity, the attitude of our government has been one of solicitude for the welfare of each and every element in the population; first, for the sake of each element, and, second, for the sake of the country as a whole, all of the units being regarded as prospering by the prosperity of each. Until a few years ago this was the attitude toward railroads, and the frame of mind in which members of Congress are listening to the testimony of citizens seems to give promise that the attitude toward railroads may soon become such again.

"It is true that a large proportion of Americans, though probably at no time a majority, have always held the view that the government should avoid positive aid to citizens in their occupations. Such aid was asserted to be artificial stimulation, the cost of which fell on all the people, whereas the benefits might not be equitably diffused.

"Railroads may be said to constitute an exception, since the creation and maintenance of highways is a duty of government, whether performed directly or through franchises.

"But however you take it—accepting the theory of those who would let the citizen work out his salvation without government aid, and granting, for the sake of argument, that rail highways are not exceptional in that respect—what have we had? In place of aid, positive and aggressive suppression. The government has regulated rates under a statute which provided for restriction but did not provide for adequacy; and the consequence has been a practical cessation of railroad building and improvement, if not also an impairment of maintenance standards. This is only another way of saying that, by keeping rates too low and by making investors fear excessive restriction, which may be equally harmful, we have put a governmental brake on the purchase of railway supplies and hence on the industries which have plant and organization for their production.

"The government has in that field restrained trade. By what almost everybody now sees was plain neglect the government has interfered not only with the prosperity of an element in the nation, but with the prosperity of the whole nation.

"In a great country such as ours and in matters which

are under federal jurisdiction it is inevitable that here and there, for a time at least, mistakes of this sort will remain in force. We can only do our best to find and correct them. But a highly practical rule which we follow by instinct is to place on the docket, for first and most vigorous attention, those situations where a change in government policy would probably affect the largest number of people. The more wage-earners are involved, the wider-spread are the secondary effects.

"In general I make the statement that no occupation except agriculture employs so many people as do railroading and providing the needs of railroads. From raw material to finished product those employed in railway supply industries are believed to be pretty close to 2,000,000. Apparently another 2,000,000 are now employed by the railroads themselves, a large number of these engaged in the maintenance, improvement and extension of the properties.

"If new railroads were in the course of construction the number of employees would be increased by many thousands more whose existence makes no entry upon the statistics of employment compiled by the Interstate Commerce Commission until the new road is completed and actually doing business as a common carrier.

"Without attempting an exact mathematical statement of the number employed, we are in position to make a conclusive mathematical demonstration of the effect which the prosperity or adversity of these many millions has upon the prosperity or adversity of the nation as a whole.

"And the important phase of the railway problem which I desire to lay before you—one entirely different from any you have heretofore had presented to you—is found in a measurement of the extent to which restriction upon railway buying actually does depress general business prosperity, and, conversely, the exact extent to which normal railway purchases can and do hasten return of general activity following a depression, and prolong prosperity once restored.

"Comparatively few realize what a great factor the railways are in the buying field. Having this in mind, a short time ago it occurred to me to try to present this in some graphic form, which would more quickly portray this fact; to give a sort of "back-ground," as it were, for the more ready appreciation of this situation."

Mr. Leigh then presented and explained to the committee his charts showing the relation of railroad purchases to general business conditions, which are already familiar to our readers.

Rewarding Individual Efficiency

A. H. Smith, president of the New York Central, in a letter to Chairman Esch of the House committee, urges that participation of employees in the results of their labor ought to be placed on an individual basis, as a reward for individual efficiency that can be measured, instead of on the general basis of profit-sharing so frequently advocated. Mr. Smith said in part:

"Nearly all of the men on these railroads are, in my opinion, of our best citizenship. They are virile, stable men. Many of them do work of great importance and consequence. Their compensation must be relative, all conditions of their employment must be understood, and their relations to other employment must be considered.

"All men in all walks of life are given the same amount of time—lawyer, farmer and artisan. In addition, there is skill and effort which is variable and must be allowed for as they are furnished. I believe our solution of the railway wage problem is to give the individual employee a participation in the results of his individual labor. This is apparent at the time and ascertainable, and can be paid promptly. To participate in the profits as has been proposed is uncertain and is not the true measure. Such a plan will cause suspicion and distrust, unhappiness and unrest. It is not constructive even if it is feasible, which I doubt. It will not produce uniform results on different properties or on the same properties, and such inequalities will in time disrupt any such arrangement, and besides, it looks like confiscation.

"The man who by skill and effort, care and efficiency, moves a given tonnage in less time than others should have reward. Let us consider as a unit of production a block of railroad say five miles long, worth a million dollars, containing a train consisting of a locomotive worth $75,000, cars worth $240,000, loaded with freight worth $1,000,000. It is like a machine in a shop. The skill and effort which gets the work to the machine, through the machine and away from it contributes to diminish the time the machine is used for a given production, increasing the output and decreasing the cost. So the block should be used efficiently and the train moved expeditiously under safe rules. Any skill and effort that clears the line and enlarges its capacity should have reward.

"To illustrate: Assuming that the normal time of operation over a division for a freight train might be ten hours. Then the skill and effort which move it in nine hours have increased the productivity of the machine and should receive a premium. Conversely, if eleven hours are required a penalty is sustained.

"Man cannot survive without incentive. Without incentive there is no progress. Given incentive a man will try to progress. He will combine the factor of time, which is common to all alike, with skill and effort as he develops. What he gains for himself and contributes to the benefit of mankind will depend on the result of his use of his faculties and skill with time and effort.

"Present labor organizations tend to remove incentive by a horizontal leveling process. This submerges the individual into the average. It causes discontent because it violates human nature. Labor organizations will, eventually if not now, feel the effect of this principle and must ultimately recognize it. It must become the doctrine of the future labor leader if he is to point the way with truth and real leadership. It makes no difference whether facilities and plant are provided by privately owned capital or by publicly owned capital. The principle is the same. The waste of time with these facilities is delayed or inefficient production is a burden on all who must live by their production and those whose means have been borrowed or taxed to provide the plant."

Consolidation of Express Companies

George C. Taylor, president, and T. B. Harrison, general counsel, of the American Railway Express Company, appeared to ask that the legislation providing for the return of the railroads may contain a provision which will permit the continued consolidation of the express companies, which were merged last year under the direction of the Railroad Administration. The merged company was taken over by the government in November. Mr. Harrison said that the express companies were "scrambled" by a director general at the time when he thought that federal control was going to last a long time and that it had resulted in such great economies in overhead and traffic expenses that the express companies desire the combination continued. He said traffic expenses had been cut 50 per cent. The company's contract with the government does not provide for any compensation, but merely guarantees it against loss during federal control. Because of the unexpectedly large increases in wages the company has been operating at a deficit of about a million dollars a month, but with an increase in business and a slight increase in rates it was thought that the company could operate successfully. Mr. Esch asked about the effect of competition of the parcel post. Mr. Harrison indicated that the parcel post was not worrying the express companies much, saying that they carry a great many times as much business as the parcel post. The Esch bill, he said, provides for con-

solidations with the approval of the commission, and the Cummins bill provides a more definite plan of consolidation of railroads. Mr. Harrison said the express companies would like to have the provision of the Esch bill if it applies to them, but there is some doubt about whether it applies to consolidations already effected. He also opposed any rigid long and short haul bill, saying that it would absolutely destroy the present structure of express rates made by the Interstate Commerce Commission.

Newman Erb, president of the Ann Arbor, presented a statement before the committee urging the importance of allowing railroads to earn a sufficient surplus to provide for unproductive improvements and as a provision against lean years. He said that as between the conditions which formerly prevailed and government ownership, he would prefer government ownership, or as between former conditions and a plan of regional consolidation he would prefer the regional consolidation, but the important thing was to give assurance that the railroads should have sufficient revenues to furnish the required service and that the stronger lines should not receive more than they need and the weaker roads should not receive less. He also urged some government supervision over receivrships and consolidations to prevent the control of railroads by men who have no financial interest in them. He also advocated common ownership of freight equipment used for interline business.

W. M. Hopkins of Chicago discussed various provisions of the Esch bill and W. W. Manker, assistant traffic manager of Armour & Company, replied to statements made by a former witness that the packers are given a great preference by being permitted to own their refrigerator cars.

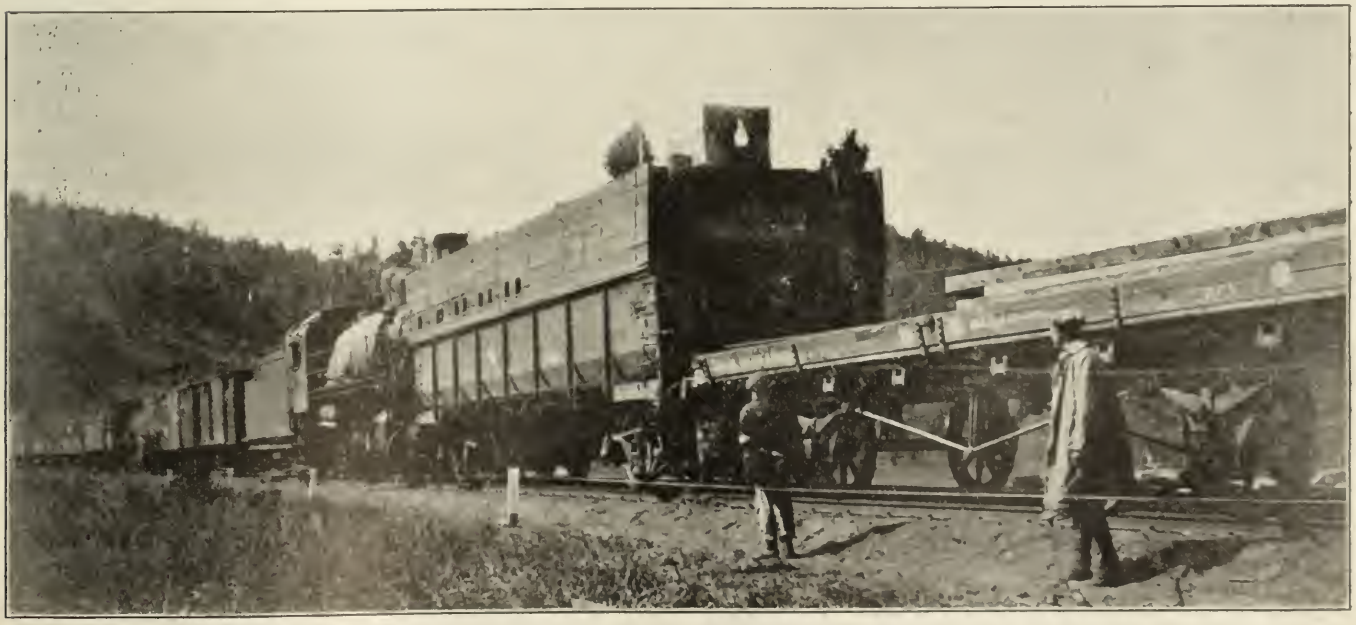
The views of the National Industrial Traffic League on reconstruction railroad legislation were expressed by Guy M. Freer, president of the league, who told the committee that practically all the league's recommendations were included in the Esch bill. He also discussed the Senate bill and the Cummins bill to restore the rate-making jurisdiction of the Interstate Commerce Commission. Regarding the provision inserted by the House committee in reporting this bill he said it was the idea of the league that during federal control jurisdiction over rates should be left with the federal commission but that there was no particular objection to the amendment if an additional provision could be added that in the event the President finds it necessary to make a general change in rates the same advance shall be made in the state rates without securing specific authority from the state commissions. Instead of 120 days, as provided by the Esch bill, Mr. Freer said the league would prefer a suspension period of six months. He opposed regional commissions but suggested that the Interstate Commerce Commission might establish branch offices. He also opposed giving the commission jurisdiction over port-to-port rates. Referring to section 14 of the bill, which requires the commission to take into consideration the cost of labor and other operating costs, Mr. Freer said that the cost of labor was given undue prominence unless all operating costs, which the commission is required to take into consideration, are also enumerated.

In many respects, Mr. Freer said, the Senate bill corresponds with the Esch bill, but it contains many other provisions, some of which are not favored by the league. It is generally in favor of a plan for preventing strikes, but believes that the public, as well as the employees and the employers, should have representation on the wage board.

B. F. Wooding, of Montclair, N. J., appeared before the committee on September 16 to urge legislation to require the railroads to install automatic train control devices, or more particularly the Wooding device, and he presented a long statement outlining its merits. Chairman Esch said the committee was not interested in any special device but that it was interested in any practicable method of protecting life and property that can be available within a reasonable cost.

Chairman Esch has announced that Director General Hines will not appear before the committee to give his views on railroad legislation. It has been understood that the director general would appear before the hearings were concluded and an effort was made to have him as the first witness, but the director general has informed the chairman that his views are outlined in an address he made at Swampscott, Mass., in June, which will be incorporated in the record of the hearings.

It was hoped that the hearings might be concluded this week, but indications at present are that they will run into next week.



Supplies for the Front in Russia

Doings of the United States Railroad Administration

Efforts to Improve Car Supply Situation. Traffic Committees Directed to Clear Dockets

WASHINGTON, D. C.

SHIPPERS who are complaining of car shortage and railroad officers who are called upon to explain why there is a car shortage will doubtless be delighted to learn that the fact is not due to government management, and that while there were car shortages on August 1 there was a net surplus at that time as compared with a net shortage on August 1, 1917, when the railroads were under private management. They will also doubtless appreciate the information that although there were about 216,000 freight cars officially classed as in bad order on July 1, there were still over 2,000,000 cars in service and not withdrawn for repairs on that date, which number was greater than the number of cars not withdrawn for repairs on July 1, 1917. These facts are contained in a statement relative to the freight car situation issued from the director general's office this week during his absence.

It is stated that they "ought to be borne in mind by the public" in appraising car service conditions. But those who are interested in the situation as of a more recent date may get their information from some other source, or in such a way that it is not so likely to be used by the public in appraising conditions.

The statement shows that on August 1 there was a net surplus of 88,000 freight cars as compared with a net shortage of 33,000 on August 1, 1917. From other sources figures are available showing that during the last week of August this year there was a net shortage of about 17,000 freight cars as compared with a net surplus on September 1, 1918, when the country was still at war. The Railroad Administration has not heretofore used its figures of car surpluses and shortages for publicity purposes, on the ground that they were inaccurate or liable to be used in such a way as to be misleading. Such figures were compiled and published by the American Railway Association up to April 1 last year, when they were discontinued by the Railroad Administration at a time of shortage. Later they were made up, although not given out publicly by the Railroad Administration and showed a comfortable surplus of cars during the latter half of 1918, which was increased to around 500,000 in March of this year. For a couple of months the Railroad Administration censorship allowed them to be published and for June 1 the net surplus was about 300,000. The net surplus had entirely disappeared by the last week of August when surpluses amounting to about 45,000 were reported throughout the country, whereas the total number of unfilled car requisitions was about 62,000.

The Railroad Administration statement is as follows:

"Walter D. Hines, director general of railroads, today authorized the following statement relative to the freight car situation:

"Current discussion of car shortages and related questions makes it important to bring to the attention of the public the fact that, contrary to what seems to be the public assumption, conditions in this respect are substantially more favorable than they were in recent years prior to the war.

"On August 1, 1917, the total car surpluses reported throughout the country were 43,481 cars, whereas on August 1, 1919, the total car surpluses were 107,900. The total number of unfilled car requisitions on August 1, 1917, was 77,257, whereas the total number of unfilled car requisitions on August 1, 1919, was only 19,271.

"The number of freight cars in service and not withdrawn for repairs on July 1, 1917, was 1,983,000. The number of freight cars in service and not withdrawn for repairs on July 1, 1919, was 2,065,000.

"The very fact of unified control of all the railroads has tended to concentrate the comments upon any inability to perform 100 per cent of the transportation required, but the foregoing figures show that the situation during and at the end of July, 1919, was very much better than in the corresponding period in 1917. It is believed this fact ought to be borne in mind by the public in appraising the existing car service conditions.

"The extent to which freight cars have been repaired in recent months has been the subject of some comment. The number of freight cars repaired and returned to service by months during the present calendar year has been as follows:

January	2,027,992
February	1,747,146
March	1,953,225
April	1,897,698
May	2,039,661
June	2,013,697
July	1,790,097

"On account of the fact that the Fourth of July came on Friday this year, and of the proportionately small amount of work done on the following day, the falling off in the number of cars repaired in July as compared with June is clearly explainable. The number of cars repaired per month in May and June kept fully up to the number repaired in January, although in May and June many shops were still working on shorter hours than in January.

"Much stress has been laid on the increase in the percentage of cars withdrawn for repairs in the recent months up to and including July. The fact is that this increase in the number of cars withdrawn for repairs has not been due to a falling off in the number of cars repaired but has been due to a number of complex factors which have arisen from the conditions resulting from the war, from the exceptional pooling of cars during unified control, and from questions arising between the Railroad Administration and the railroad corporations. The emphasis which has been laid upon the percentage of cars withdrawn from service for repairs is, therefore, misleading and does not give a correct idea as to the number of cars actually in service. The number of cars actually in service, not including bad order cars, increased from 1,983,000 on July 1, 1917, to 2,065,000 on July 1, 1919.

"The Railroad Administration, however, is not content with its ability to point to the fact that transportation service is more favorable than it was two years ago. On the contrary, extraordinary efforts are being put forth to secure the greatest possible improvement. Although the number of cars repaired in May and June, 1919, was fully up to the normal number of cars repaired, the Railroad Administration gave instructions on June 20, 1919, that all car forces be increased to the full standard measure of 48 hours per week and that additional shifts be worked where the additional employees could be obtained and where they could be economically used. The showing naturally to be expected from the putting into effect of these instructions was hampered in July by the intervention of practically a double holiday, and, of course, was temporarily prevented in August by the strikes of a large number of shop employees. Conditions having now been restored to normal, it is expected that these instructions will promptly show a most favorable result. Further than this, the Railroad Administration instructed on August 16, 1919, that all car forces be put on a basis of

54 hours per week. It is believed that this instruction will result in a marked improvement, also in the monthly repair of a much greater number of cars than the normal number and will steadily increase the number of cars actually available for service as compared with preceding years.

"In addition to this, the Railroad Administration is rapidly getting the benefit of the service of a large number of new cars constructed during federal control, but whose introduction into service was postponed on account of inability to agree with the railroad corporations as to the acceptance of the cars. This inability has been overcome. Between August 1 and September 6, 23,564 of these cars have been put into service, and they are now coming into service under the spur of recent instructions at the rate of over 900 per day."

Efforts to Improve Car Supply Situation

Director General Hines has authorized the following statement relative to the car situation in the United States:

"The Railroad Administration is fully alive to the importance of the car supply situation in the United States and is handling the matter energetically. Instructions have been issued to all the regional directors urging them to bend every effort:

"1. To speed up road and yard movements;

"2. To secure heavier loading of equipment;

"3. To establish and maintain complete and accurate yard checks;

"4. To reduce the number of bad order cars;

"5. To make prompt delivery to connections;

"6. To effect early deliveries at freight houses and team-tracks; and

"7. To expedite the movement of grain cars in terminals.

"Instructions have also been issued for the establishment in each important terminal of a committee of officers of the Railroad Administration whose duty it will be to study and expedite the movement of cars, empty and loaded, in their respective terminals.

"Every effort is being made to speed up the construction of the 100,000 freight cars ordered by the Railroad Administration last year and to place in service such of these cars as are still in storage. The Railroad Administration has decided to place all these cars in service irrespective of whether or not the allocations are accepted by the railroad corporations.

"On September 6, 1919, 54,068 of these cars were completed and in service and 17,469 were in storage awaiting lettering and numbering. The total number of cars in storage was reduced from 34,245 on August 1, 1919, to 17,465 on September 6, 1919. During the week ending September 6, cars in storage were stencilled and placed in service at the rate of 616 per day. New cars at the rate of 218 per day were completed and placed in service, thus making a total of 834 cars per day placed in service. All available railroad shops are being used for the purpose of supplementing the work of the car shops in stencilling cars in storage. The total number of these cars placed in service daily will increase during the next few weeks."

W. T. Tyler, director of the Division of Operation; Edward Chambers, director of the Division of Traffic, and Max Thelen, director of the Division of Public Service, have been appointed a committee to investigate all phases of the car supply situation in an effort to improve it, and it is understood they will confer with a large number of shippers who have been making complaints, including a committee appointed by the National Industrial Traffic League at its recent meeting at Pittsburgh, which sent a telegram to the director general urging an improvement in service and asking an opportunity to consult with him at Washington. Mr. Thelen attended the league meeting and made a report of it to Mr. Hines.

Loss and Damage Freight Claims Reduced

The efforts of the central administration at Washington, and of the regional directors, federal managers and freight claim agents to establish uniform practice and prompt settlements of loss and damage freight claims are showing very gratifying results, according to a statement issued by the Railroad Administration.

The Railroad Administration has caused to be compiled figures with respect to the unsettled loss and damage freight claims on roads under federal control, from which it is noted that on April 1, 1919, there were 806,707 such claims unsettled, whereas on August 1 this figure had been reduced to 519,316—a decrease of 287,391, or 35.6 per cent., in the number of unsettled claims.

Of the total number of outstanding claims on April 1, 1919, 363,476 had been outstanding four months or over. On August 1, this figure had been reduced to 218,424, a decrease of 145,052, or 60.1 per cent.

Statement by regions of loss and damage freight claims unsettled and on hand over four months:

Unsettled Claims

Region—	April 1 1919	May 1, 1919	Decrease	June 1, 1919	Decrease	July 1, 1919	Decrease	August 1, 1919	Decrease

Traffic Committees Directed to Clear Their Dockets

As another step in preparation for the wind-up of the affairs of the Railroad Administration, Directors Chambers and Thelen, of the Divisions of Traffic and of Public Service, have sent letters to the chairmen of the Railroad Administration's territorial freight traffic committees, stating that it is desired so far as possible to clear the dockets of the various committees of pending subjects prior to the end of federal control. With this end in view, instructions are to be issued to all committees to discontinue immediately all investigations with a view to uniformity of rates, minimum weights, rules and practices because considerable time is being spent on such work which should be employed in disposing of the subjects on the dockets. This is not intended

to apply to general investigations already specifically authorized and upon the docket. All committees are directed to review the subjects now on hand to determine whether with the assistance available it will be possible to dispose of them prior to the end of federal control. If the force available is not sufficient, request for the necessary help should be made immediately. In order to save time it is also suggested that the committees may be subdivided into sections for conducting hearings.

Earnings and Expenses for July

The Operating Statistics Section of the Railroad Administration has published figures covering the financial results of operation for the month of July for all Class I roads in federal operation. These comprise 232,004 miles of road, or 97 per cent of the total of 240,177 miles of road federally operated.

The condensed income statement shows:

	Month of July		Increase or decrease		Seven Months Ended July 31		Increase or decrease	
	1919	1918	Amount	Per cent	1919	1918	Amount	Per cent
Operating Revenues	$449,694,136	463,958,521	d 14,264,385	d 3.1	2,774,193,441	2,519,925,384	254,268,057	10.1
Operating Expenses	352,957,237	312,701,610	40,265,627	12.9	2,409,687,708	2,102,951,292	306,736,416	14.6

d Indicates decrease.

One-twelfth of the annual rental due the companies covered by the report amounts to $74,352,976, so that the net profit to the government for the month was $2,316,501 for these properties.

In making comparison with last year it should be noted that while the freight and passenger rates are on substantially the same basis in both years, the wage scale of July, 1919, is substantially higher than that of July, 1918.

The comparison between the seven months periods is substantially affected by the fact that the rate increases, approximately 25 per cent, which were in effect this year, became effective for passenger and freight traffic respectively the middle and latter part of June, 1918.

Mechanical Committee

At a meeting of the Committee on Mechanical Standards last week a special committee consisting of A. W. Gibbs, H. L. Ingersoll and John Purcell was appointed to consider the elimination of angle cocks from the air brake train line. A report and recommendation will be made to the committee at its next meeting in November. The committee also made some minor changes in the proposed standard designs for caboose cars, which, as amended, will be submitted to W. T. Tyler, director of the Division of Operation, for final approval.

Car Shortage May Result in Higher Demurrage Rates

The numerous complaints being received by the Railroad Administration of car shortages in various parts of the country have aroused interest in the question of whether or not it would be advisable to return to the plan of high demurrage rates which was in effect during the war. One of the first things that Director General McAdoo did last year was to raise demurrage rates, almost over night, to a scale ranging up to $10 per car per day. After the armistice shippers besieged the Railroad Administration with demands for a reduction and some time ago Director General Hines reluctantly consented to such a step but he intimated at the time that in the event of a car shortage it might be necessary to put the high rates back in order to reduce the amount of car detentions by shippers and consignees and it is understood that such a move is now being considered. By September 1 the huge freight car surplus that existed earlier in the year had been converted into a net shortage, whereas on September 1, 1918, while the country was still at war, there was a net surplus of 36,000 cars. This is taken as an indication that many of the measures of war time efficiency, in which the shippers co-operated last year, have lost part of their effectiveness. It is now more difficult to induce shippers to load cars to capacity, particularly since the Food Administration's power to compel heavy loading has been given up, and it is no longer regarded as pro-German to hold a car under demurrage for several days awaiting loading or unloading. The California Vegetable Union has been burning up the wires in asking Congressmen to get its members a better supply of refrigerator cars, claiming that they are being discriminated against when the cars are being used for other purposes, which they consider less essential. The Railroad Administration has arranged to furnish 300 to 400 cars a day to California for fruits and vegetables but in reply to the protests point out that under a maximum demurrage rate of $5 a day cars are frequently held at eastern terminals during the time that would be required to get them back to California for another load.

"One At a Time, Please, Gentlemen"

New Developments In Car Lighting Save Money*

Extensive Investigations Have Brought About Improved Methods of Regulating Electrical Equipment

By E. Wanamaker
Electrical Engineer, Chicago, Rock Island & Pacific

A RESUMÉ OF THE HISTORY of railway train lighting compiled from the records available shows that great strides have been made in the art since the days of the first experiments. To one Thomas Dixon, driver of the coach "Experiment" on the Stockton and Darlington Railway, in England, in 1825, is given credit for having first used artificial light in a railway car. He was a man of generous motives, and having in mind the comfort and convenience of his passengers on dark winter nights he placed a penny candle on a table, also provided by him, in the center of the car. From this humble beginning railway train lighting has grown and kept pace with the development of illumination in other fields and with the growth of other transportation facilities. Today, electric systems for lighting cars cost hundreds of dollars per car and a large number of employees are necessary to provide and maintain this service.

A review of the progress made in developing car lighting shows it is divided into periods of approximately 25 years for each illuminant used. The period of candle light lasted from 1825 to 1850, when oil lights were introduced. Oil lighting in turn gave away to gas in 1875, and gas continued to be the most generally used illuminant until about 1900, when the application of electricity to car lighting began to receive wide attention by railroads, and in this country at least is now the system generally preferred for new equipment.

Straight Storage

The earliest electric system of which we have a record was a straight storage system used on the London, Brighton and South Coast railway in 1881. Primary batteries were also tried in France in 1885 on cars operating between Paris and Brussels. At about this same time straight storage lighting was tried by the Pennsylvania Railroad and the Boston & Albany in the United States, and on the first-mentioned road this was for many years the electric system most used. Such a system requires an expensive charging plant at each terminal. Its main disadvantage is the limited time which a car can be kept in service without being held for charging and the liability of light failure due to batteries becoming discharged when trains are delayed or held from regular charging terminals. Another disadvantage arises from the fact that cars equipped with this system cannot be operated on branch lines or at isolated points where charging facilities are not available.

The "Head-End" System

"Head-end" equipment was first tried in 1887, when it was installed by the Pullman Palace Car Company in one of its composite cars operating between Jersey City, N. J., and St. Augustine, Fla., in the Atlantic Coast Line Special. In the same year, the Pennsylvania Limited was similarly equipped, and in 1888 the Chicago, Milwaukee & St. Paul also had a train equipped in this manner.

The head-end system was first tried out with a generator in the baggage car and no batteries, but due to frequent light failures caused by the trains being parted and the locomotives being cut off at division points, it was found necessary to place batteries on the first and last cars of each train so that if a train was parted to cut out or cut in cars, each section would have light. In some cases batteries were applied to each car. This greatly increased the time that lights could be depended upon in case of the generator unit being out of service and also made it possible for each car to have light when cut out.

Various means are used to control the lamp voltage and battery charging rates. Each road seems to have developed a system to meet conditions as they exist on its particular lines, which has resulted in several different schemes of wiring, battery charging and operation, all of which give results more or less satisfactory.

An axle-driven head-end system has been designed to furnish power for lighting the train and charging the batteries from a single unit, the batteries being distributed throughout the train, as for instance, one set in the baggage car, one in the observation or dining car, and sometimes one in the middle of the train. The number of batteries used and their location are governed by local conditions.

While this system is not liable to light failures, due to lack of steam, it has the same disadvantages as the steam driven, head-end systems, namely, that cars not equipped with batteries are dark when cut out of a train, that they are not interchangeable when operating on foreign lines, and are liable to light failure due to small battery capacity when trains are delayed or tied up. It would, therefore, seem that this system is unsatisfactory for universal operation.

For suburban and branch line service, the straight head-end system without any auxiliary battery has been found very economical and successful. The present practice for this class of service is to mount the turbo-generator on the locomotive in a manner similar to that used for mounting headlight turbines, the generator being of sufficient capacity to furnish current for the headlight and cab lamps and the maximum number of cars usually assigned to this class of service.

A three-wire system of wiring and standard train line connectors are used for making connections between cars and locomotive. No doubt, in the near future this system will be used more extensively on branch lines due to the low first cost, low maintenance cost, and the ease with which the installation can be made to existing power and rolling stock. All cars are similarly wired, and the number of cars in a train is only limited to the capacity of the turbo-generator and train line wires. Low first cost results from the simplicity of the car wiring system, which includes only a train line circuit and one lamp circuit connected to it with a fused knife switch in a steel switch box.

Credit for the earliest attempt at lighting a train with axle-driven equipment is given to the London Brighton and South Coast Railway, on which a crude system was tried out in 1883. Since that date development has gone on unceasingly, and individual axle-driven systems are now most generally used for train illumination in this country.

After years of test only one form of transmission for driving the generator is in general use. Various forms of belts and direct drive have been used, but due to the variable relation between the axle pulley and the armature pulley, and the climatic conditions, the rubber belt up to the present has been found to meet the requirements most economically.

* Abstract of a paper presented at the opening meeting of the Western Railway Club, Chicago, on September 15.

Some of the first generators were suspended from the car body, others were mounted on the truck. Much time has been spent in improving generator suspensions, which has resulted in the elimination of many wearing parts, thus simplifying and reducing the maintenance costs.

The body hung suspension is favorable to the maintenance of the generator and possibly to the car truck. With it the belt is considerably longer than with the truck type suspension. Therefore, the belt life must be increased in the same proportion as the length is increased in order to keep the belt cost per car mile the same. Much is claimed for both types of suspensions, each having its possibilities, the conditions under which they operate and the condition in which they are maintained being important factors.

An important point in connection with axle lighting is the proper application of axle pulleys. If they are not properly applied the belt life will be short and the maintenance cost high. In a great many cases axle pulleys are applied to eccentric axles which should have been turned to insure a perfect pulley seat. In some cases pulleys are applied with improper pulley bushings. Eccentric pulleys and small belt clearances over the brake beam comprise two of the main causes of short belt life. Farsighted mechanical men on some roads have made provisions for successful and economical operation of the belt drive by using turned axles or by turning a pulley seat on hammered axles to insure concentric pulleys. Also in some cases special brake rigging is being used to give ample belt clearance.

Maintenance

To secure good service from the entire equipment at a low operating cost a standardized systematic method of maintenance must be used. With the present design of equipments the belt cost constitutes the second largest single item of expense. Records should be kept from which individual belt mileage can be computed. From these records any car using an excessive number of belts will be noted and steps taken to correct any defects found.

At the periodical shopping of cars the electrical equipment should be thoroughly overhauled and placed in a first-class condition, all worn parts being removed and defects corrected. If this is done thoroughly heavy repairs will seldom be found necessary between the shopping periods.

A systematic inspection of the generator and suspension should be made each trip to see that all parts are in good condition. Once each year the generator should be dismantled and all parts thoroughly cleaned, fields and armature painted with insulating varnish and new grease applied to ball bearings.

Train-Line Facilities and Fixtures

On the majority of railroads, facilities are provided for making connections from car to car so as to provide light in a defective one. It is the almost unanimous opinion of car-lighting engineers that with the present equipment, facilities for train-line connections are essential if light failures are to be avoided, connectors being especially desirable for the protection of mail cars.

The tendency in fixtures is toward simplicity of design to harmonize with the interior construction of the car. Center-deck lighting seems to be generally preferred with a sufficient number of units, properly shaded, to give uniform distribution. Enamel finishes the same color as the car walls or ceiling at the point where the fixtures are located are most used, but there is reason for believing that in time the roads will again prefer metal finishes, as these, when properly applied to fixtures of pleasing design, help to improve the interior appearance of the car. In recent years statuary bronze has been the metal finish most used.

A matter of great importance is that of careful selection and design upon which depends effectiveness of the installation, both as regards light distribution and appearance. These various questions involve a study of intrinsic brilliancy, intensity, distribution and color.

Batteries

There are two distinct types of storage battery in use in car lighting service at the present time, the lead acid battery and the nickel-iron alkaline battery. Of the lead batteries there are two general types of plates, the Plante and the Faure. For a given output, the Plante is more costly, more bulky, and heavier than the equivalent pasted plate type. Thus far this type is more durable and better able to withstand the operating conditions incidental to car-lighting service. It is the type most used in car-lighting service, but some car-lighting engineers claim that the advantage it has had over the Faure type is decreasing with the increased cost of labor and improved methods for battery protection. The nickel-iron alkaline battery is of comparatively recent development and is radically different from the lead acid battery. It is light weight and mechanically rugged.

The cost of maintaining batteries constitutes the largest single item of expense in the maintenance of car-lighting equipment, and the entire development of regulators or apparatus for battery protection while the car is enroute has been made with a view of prolonging the life and reducing the cost of maintenance. However, good standard practice for handling batteries is also essential if this cost is to be kept within reasonable limits.

With the present design and construction, the cleaning period is comparatively short. By a change in design the same capacity could be maintained and yet the space for sediment could possibly be doubled, thus greatly prolonging the cleaning period, insofar as it is based on this particular feature. Some manufacturers are now endeavoring to produce a battery which will not have to be removed from the car for cleaning during the life of the positive element, or at least to prolong the period of time between the cleaning far in excess of present practice.

Battery Protection

The control of the generator output while the car is enroute has offered one of the most difficult problems to be overcome, since the life of battery and lamps depends to a large extent upon regulation.

Without the proper protection, the battery life may be only a third of what it should be. In a similar manner also the cost of maintaining the generator depends upon the regulation.

The duties of the regulator for car-lighting service are: (1) To connect the battery to the generator at the minimum speed and voltage for which the machine is designed to operate and to disconnect the battery when the speed and voltage fall slightly below the first mentioned value; (2) to provide a variable voltage to charge the battery at the proper rate, which is determined by the state of charge, and at the same time carry the lamp load, in the event it is turned on, up to the capacity of the generator; (3) when the battery has attained a full state of charge, the regulating means must prevent further charge thereafter, leaving the generator capable of supplying current to lamps or other translating devices; (4) to provide constant voltage on lamps while the car is in motion or at rest.

There are two types of regulators in general use, designed with the view to meet these requirements: First, ampere hour meter control; second, potential control. The first mentioned method charges the battery by starting at a high rate, which is gradually modified to a predetermined lower rate, and when a predetermined number of ampere hours have been put into the battery as indicated by the meter, the potential is reduced by the regulator sufficiently to prevent further charge. With this method it is necessary, for proper battery protec-

tion, to maintain the ampere hour meter in step with the state of charge of the battery.

It is apparent that the proper battery protection depends not only on the proper functioning of the meter itself, but also upon the battery remaining in normal condition in order that the battery and meter may remain in step with each other. Owing to battery characteristics and operating conditions, the meter does not always indicate the true state of charge.

In the second method of charging heretofore referred to as "potential control," inherent characteristics of the battery are taken advantage of to govern the charging rate, and when the battery has attained a full state of charge, to prevent further charge thereafter. With most potential control equipments, a current limit feature is embodied with the potential regulator to hold the maximum current to a value consistent with the generator capacity.

Many forms of potential control equipment have been placed on the market, most of which operate at potentials such that in the course of charging, the battery is caused to gas. In 1913 and 1914, efforts were made by the Rock Island to operate equipment at a maximum voltage of 2.3 volts per cell. At the beginning the experiment was found to be a failure, as in many instances cars on most runs arrived at terminals with the batteries in a decidedly discharged state. There were, however, cars in fast main-line service on which the batteries remained in a full state of charge and at the same time were not being overcharged, the batteries requiring flushing on an average of about every six months. This was encouraging and led to investigations which developed that the failures were not due to the fact that the low voltage would not keep the batteries charged, but resulted from the fact that this voltage of 2.3 volts per cell was not attained except at very high train speeds. In one test covering a period of five hours, the equipment maintained full voltage and load for less than 10 per cent of the running time. On the face of the evidence it looked as though a larger generator designed to give full voltage and load at a lower train speed would be required, but fortunately after further investigation it was found that with certain refinements in the regulating device, a lower cut-in speed could be secured.

A test made with an improved regulator with the same generator that was used on the previous test and over the same run, showed the following comparison:

Full load—Old regulator—35 miles an hour.
Full load—Improved regulator—24 miles an hour.
Full load time in 5 hours—Old regulator—10 per cent.
Full load time in 5 hours—Improved regulator—41 per cent.
In this case the capacity of the unit was increased 300 per cent.

The net results realized from the use of the improved regulator are increased capacity of the unit due to obtaining generator output at low train speed, and increased battery life, which is brought about by the following:

(A) The work imposed upon the battery of furnishing energy for the lights is greatly reduced by the increased working time of generator, and also by the fact that the current for the lights is supplied by the generator, and not by the battery, at all times after the generator cuts in.

(B) The battery is charged at the proper rate to prevent gassing and overheating with the attendant ill effects.

(C) The battery is protected from overcharge and the forming away of the reserve lead in the battery elements.

Even though only a part of the Rock Island equipments have been improved, the cost of operation and maintenance per car per month has not increased, in spite of the increased cost of labor and material, and a very large part of the savings is attributed to the better protection provided for the battery.

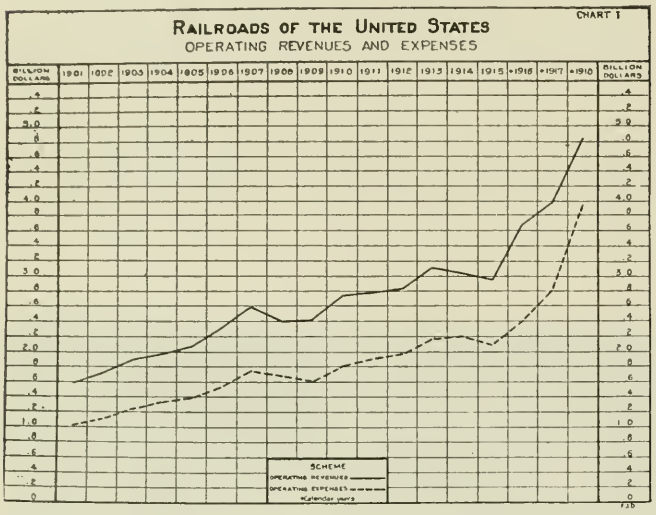
The Logarithmic Chart in the Analysis of Railroad Operations

By F. J. Deesen

The benefits derived from the use of graphic charts in analyzing statistics relative to railroad operation have resulted in their general adoption, not only in the United States, but throughout the civilized world. There are various forms of charts employed, depending upon the subject matter discussed, the most common of these being that in which equal distances are scaled off horizontally to represent time (years, months, etc.) and equal distances scaled off vertically to represent amounts (dollars, tons, miles, etc.). Chart I is an illustration of this form. The chart is divided lengthwise into 18 equal segments to represent each of the years from 1901 to 1918, and vertically into equal segments each equivalent to $200,000,000. The operating revenues are plotted and connected with a solid line, and the operating expenses plotted and connected with a broken line. The distances between the solid line and the broken line show the net earnings.

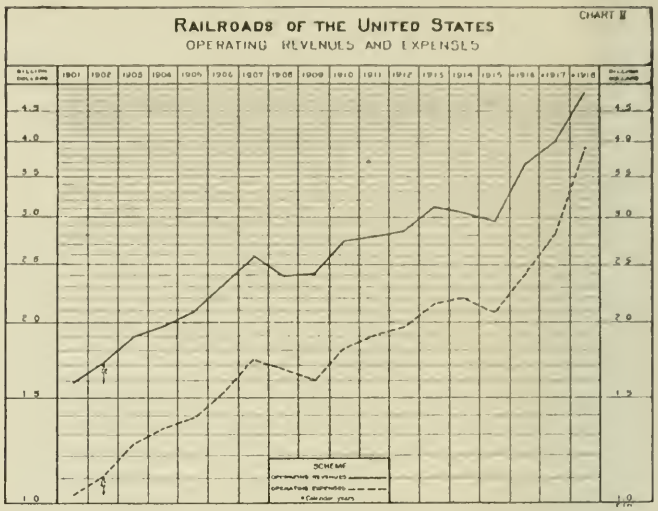
That the general trend of affairs may be more readily as-



certained from a chart like this than from a column of figures is self-evident. A glance at the chart will show the tremendous increase in operating revenues from about $1,600,000,000 in 1901 to over $4,800,000,000 in 1918, accompanied by a tremendous increase in operating expenses from $1,000,000,000 to nearly $4,000,000,000.

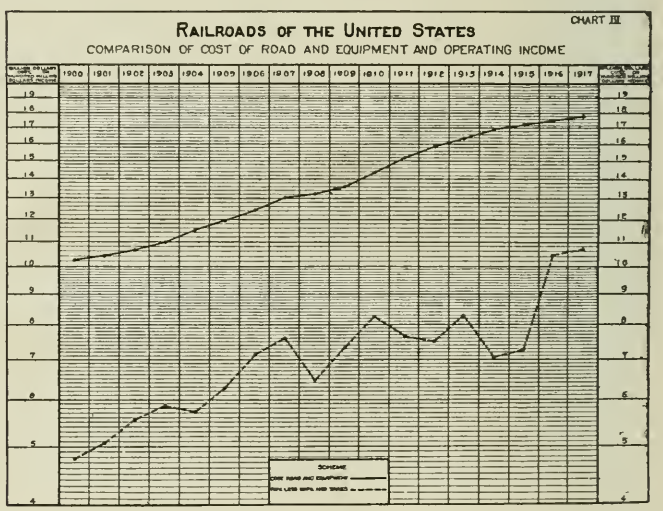
There is, however, one deplorable defect, in a chart of this nature, in comparing two sets of figures, as is done in this instance. From all appearances it seems that since the two lines do not come materially closer together, the roads are being operated just as efficiently in 1918 as they were in 1901, but consideration must be taken not as to whether expenses have increased the same or less in actual dollars as operating revenues, but whether expenses increased in the same or less *proportion* as revenues; in other words, the main question is, are the roads receiving the same proportion of their gross earnings in net as they were previously. From Chart I we cannot readily ascertain this. Of course net earnings could be plotted on this chart, but it would still fail to show whether they increased at the same rate as gross.

To overcome this defect, the logarithmic chart may be employed. Chart II illustrates the same figures plotted on the logarithmic scale as Chart I. It will be noted that the charts are divided in the same way in representing the years. The vertical scale on Chart II, however, employs the distances as used on the slide rule, so that an increase of any per cent on one part of the chart will show the same curve as an increase of the same per cent on another part. For instance, it will be noted that the distance from 1.0 to 2.0 is the same as that from 1.1 to 2.2, from 1.2 to 2.4, from 2.0 to 4.0, etc., each of which represents an increase of 100 per cent; that the distance from 1.0 to 1.5 is the same as that from 1.6 to 2.4, from 2.0 to 3.0, etc., each of which represents an increase of 50 per



cent; and so on for any percentage of increase. The same may be said of decreases.

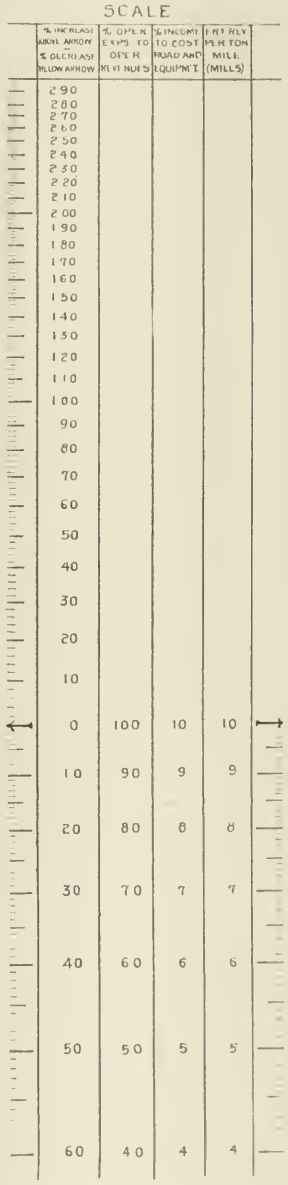
By plotting the logarithmic distances on a separate sheet of paper, scaling off the percentages of increase and decrease, as is done in the first column of the accompanying diagram, and applying this scale against the figures plotted on the chart, the percentages of increase or decrease can be easily read without any further figuring. For instance, placing the ar-



row of the scale on the 1901 operating revenues, 1.59, and reading straight up to 1902 operating revenues, 1.73, as designated by the arrow on the chart, we find that they have increased nearly 9 per cent; placing the arrow of the scale on 1901 operating expenses and reading straight up to 1902 operating expenses, we find that they have increased a little over 8 per cent. If we do the same thing with the figures plotted for 1917 and 1918, it will be found that an increase of a little over 21 per cent in operating revenues has been accompanied by an increase of over 40 per cent in operating expenses. Percentages of decreases may be read in like man-

ner by placing the arrow on the figure plotted for one year and reading straight down to that plotted for any subsequent year. In this way any year's operations may be compared with any previous year's operations. Comparing 1918 figures with those for 1901, operating revenues increased slightly less than 205 per cent, and operating expenses increased over 280 per cent.

Further use of the scale may be made in determining the ratio between the operating revenues and operating expenses of any year by applying the simple rules of division of the

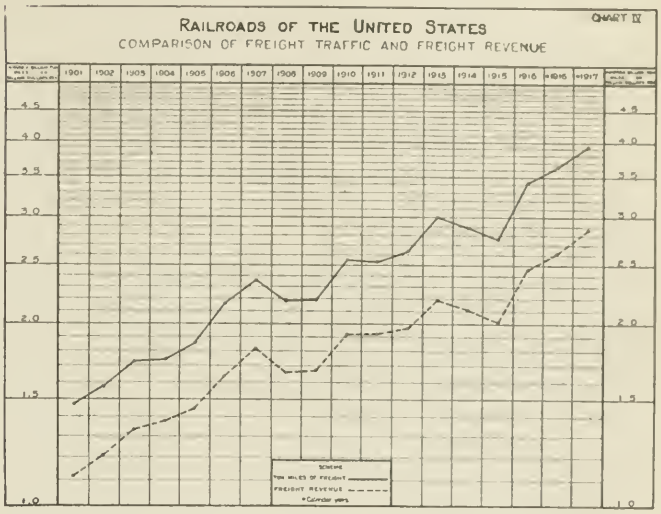


slide rule. If we place the arrow upon 1901 operating revenues and read down to the operating expenses of that year, it will be found the scale reads in the second column nearly 65 per cent, while doing the same with 1918 figures the scale shows a ratio of over 81 per cent; in other words a greater proportion of the gross earnings are going towards meeting expenses in 1918 than in 1901.

The logarithmic chart, therefore, shows both the rate of increase of two quantities and the ratios between them. A further comparison of Chart I and Chart II will disclose further advantages of comparing two sets of figures by means of the logarithmic chart.

Chart III is a comparison of the cost of road and equipment and operating income. The same scale may be used to read percentages of increase and decrease. Since the cost of road and equipment is shown in billion dollars and income in hundred million dollars, in order to determine the ratio between the two, the figures in the second column of the scale should be divided by 10, as is shown in column 3. Using the scale, then, the ratio of operating income to cost of road and equipment in 1900 is slightly over 4.6 per cent as against 6.0 per cent in 1917.

Chart IV gives a comparison of freight traffic and freight



revenue. The percentages of increases and decreases may be ascertained in the same manner as in Charts II and III. The figures in the fourth column of the scale will give the freight revenue per ton mile in the same way as the ratios were ascertained in Charts II and III.

It is impossible to enumerate all of the possible different comparisons that can be advantageously made on the logarithmic chart, such as that between locomotive miles and train accidents, etc.

So Acute Is the Housing Problem in England That the Owner of This Ex-Railway Car Has Been Overwhelmed With Applicants Who Desire to Rent It

Roadmasters Hold Successful Meeting At Chicago

Large Attendance and Good Reports and Papers Characterize Thirty-seventh Annual Convention

The Victory or 37th annual convention of the Roadmasters' and Maintenance of Way Association was held at the Auditorium hotel, Chicago, on Tuesday, Wednesday and Thursday of this week. The attendance was the largest in the history of the association, over 600 roadmasters and higher maintenance of way officers being present. This attendance was the result in large measure of the active support of the United States Railroad Administration, instructions having been sent to all federal managers to arrange for as many roadmasters and higher maintenance officers to attend this meeting as could be spared from their work. As a result men were present from all part of the United States and also from Canada.

The officers for the past year were as follows: President, J. B. Oatman, division engineer, B. R. & P., Du Bois, Pa.; first vice-president, J. W. Powers, supervisor, N. Y. C., Rochester, N. Y.; second vice-president, W. P. Wiltsee, principal assistant engineer, N. & W., Roanoke, Va.; secretary, P. J. McAndrews, roadmaster, C. & N. W., Sterling, Ill.; and treasurer, C. King, supervisor, L. I., Jamaica, N. Y.

The convention was called to order at 10 o'clock Tuesday morning by Mr. Oatman. In his opening remarks he referred to the difficulties which have confronted the association during the past year, particularly because of the feeling that has prevailed among some members that the association should participate in discussions of wage matters and seek to secure more consideration for roadmasters. Mr. Oatman stated that the officers had decided that the association should adhere to the purpose for which it was originally established, namely, the improvement of maintenance practices.

Maintenance of Passenger and Freight Terminals

In large terminals, sections should be established so that yard gangs will be of a uniform size of 15 to 18 men, with a foreman and one assistant foreman. Main line gangs should not be as large as those employed in yards, as the work must be done to a higher standard and needs closer supervision. Section limits should be worked out by the supervisor or roadmaster on the equivalent mileage basis, giving due consideration to traffic and other local conditions. In terminals a regular force of laborers should be employed throughout the year to take care of regular maintenance work, with extra gangs for such work as rebuilding ladder tracks, laying rail and other special work.

In large terminals, a regularly assigned work train, with a work train gang, is necessary for the economical handling of material and supplies. The work train should have a designated headquarters, and a track or tracks assigned to work train equipment and maintenance of way material. Cars so placed can be obtained and handled by the work train without delay. With our present workday of eight hours and limited forces, it is necessary that work trains be given more opportunity to do their work than in former times.

The policing of yards is a problem of ever-increasing seriousness and varies with the different yards and kinds of freight handled. Cleaning yards with a work train with flat cars and a gang of 30 men will cost approximately $15 per thousand feet of track. Such tracks as station, coach yards and repair tracks should be cleaned daily by regularly appointed attendants, and the cleaning put in a rubbish car, if one can be placed conveniently. In yards where the daily accumulation is heavy, an incinerator plant is advisable. Much can be accomplished in policing through cooperation. The cleaning of yard tracks, where the condition can be prevented, constitutes one of the greatest wastes of money in the maintenance of way department, and should be called to the attention of the management in order that necessary action be taken to prevent the continued leakage.

In heavy classification yards it is generally difficult to obtain a track to make repairs, and for this reason repairs are generally made out of face. Arrangements are made for a designated track to be taken out of service for the working period of the day; a car with necessary supplies, such as ties, angle bars and other material is set on the track. The day's work is carried through and the track is restored to service during the night. Where a sufficient force is available, the track can be worked from both ends in the same manner.

In such yards the rebuilding of ladder tracks is the most difficult work in the maintenance of terminals. In doing this work it is necessary that everything possible be done in advance of breaking the track. All material must be checked, all rail cut and drilled for lead rails, all switch ties properly marked, so lengths can be identified at a glance. Where conditions permit, all material should be placed on the ground opposite the ladder. Where this is not consistent, all material should be assembled on cars, so loaded that it can be unloaded as used. Arrangements should be made to suspend operation over the ladder for a period of four hours, during which time a gang of 40 men experienced in laying switches can renew three switches. All old material should be removed to a place of safety on the same day the work is done. On ladder tracks, where the use of the track cannot be given up for any definite period of time, it is necessary to renew the rail on the old ties, a switch at a time, and the ties singly. This is very expensive and it is difficult to accomplish good work.

L. M. Denny, supervisor C. C. C. & St. L., chairman.

Discussion

Several speakers objected to any reference to the Railroad Administration's policy toward reduced maintenance expenditures. However, a motion to exclude reference to "the past six months of retrenchment" in the first paragraph was lost, although one relative to "limited forces" in the paragraph on work train service was sustained. The second paragraph elicited some criticism with reference to the use of smaller size gangs on main line work, but after it was explained that this referred to main lines *within terminals* and had no application to lines outside, a motion to approve this paragraph without change was passed.

In discussing the paragraph on work train service several speakers advocated the use of a motor truck for the delivery of materials about an intensively operated terminal, since the truck could be used on city streets without any of the delays incident to the delivery of material by work train on congested tracks. The committee was instructed to revise the paragraph so as to make proper reference to the advantage of motor truck service under certain conditions.

In the matter of eliminating the sharp angle frogs in the reconstruction of yards a number of members called attention to the fact that this was rarely possible. One speaker called attention to the opportunity for reducing the curvature of a

turnout having a given frog angle by continuing the turnout curve to the switchpoint and the point of frogs through the use of specially constructed frogs and switch rails. Some objections were also raised to the use of manganese tips on switches and considerable contradictory testimony was brought forth without leading to any definite conclusion. Several eastern men gave detailed information on the use of switchrail housings in the stockrails made by a special planer.

The use of a locomotive crane with a clamshell bucket was advocated for cleaning yards. As carried out in practice, all waste material is shoveled into the space between tracks and then picked up by the crane.

Highway Crossing Construction

Only a few roads have yet adopted such excellent substitutes for lumber as asphalt, road oil, macadam, etc., for farm, street and highway crossing construction, while concrete is not a novelty on railroads, as for years past its value and usefulness have been developing. A report from one supervisor's division shows that it required 53,678 ft. of lumber, 3,226 lb. of crossing spikes and a labor charge of $5,642.96 to maintain the public and private crossings on his territory for one year, the cost of the plank alone being $1,717.70. If this amount of lumber can be conserved on one division, assuming that it requires 512 ft. for one single track crossing, or twice the amount for double track, and assuming also that there are 50 or more highway crossings on each of 3,000 supervisors' divisions on the railways of the country, the use of some other material than lumber would mean the conservation of 76,800,000 ft. b. m., amounting to $2,457,600. And this does not include farm crossings or streets sometimes planked solidly from one side to the other of six or more tracks.

Since a crossing must be kept up continually, the method of maintaining it should be simple as to be grasped readily by the average workman. To be practical, the work should be performed with the least possible equipment and this should be of such character as will always be at hand. To be economical, the expense must be within reason and not exceed that of other methods and materials that are used for work of like nature producing like results.

The committee recommends that as far as possible all rail joints be eliminated in road crossings; that good drainage be installed, and that all road crossings in high speed tracks be made of crushed stone of standard size, mixed either with good road oil, bituminous macadam, asphalt or other good substitutes for lumber. In parts of the country where there is considerable frost and where tracks heave, the sealing of the crossings with these substitutes will keep out the moisture and frost and eliminate the heaving of tracks to a considerable extent, also the heaving of crossing planks, which is a source of danger, is eliminated. On slow speed tracks and where heavy trucking is done in yards, etc., tracks should be paved.

Excellent results have been obtained with crossings constructed of good clean crushed stone (ballast size), from a depth of 2 in. below the bottom of the ties up to the level of the under side of the head of the rail, and extending 2 ft. outside the rails, rolling or tamping it thoroughly, the rails having first been painted with hot asphalt below the under side of the head, and a mixture of fine crushed stone (up to ½ in.) and hot asphalt being packed about them for a distance of 8 in. on each side. The entire crossing is then covered with fine stone up to the level of the top of the rails, sprinkling it freely with a good quality of road oil, while fine stone is scattered. The cost of such a crossing is $11.95 for a single track, and $25.45 for a double track crossing (1918 prices) as compared with $28 and $56, respectively, for plant.

A similar type of crossing can be built by packing a mixture of crushed stone (½ in.) and hot asphalt about the rails for a distance of 4 in. on each side and then filling in with a mixture of bituminous macadam with a ½-in. top dressing of ½ in. stone mixed with bituminous material and rolled thoroughly. The cost of such a crossing is $6.55 and $16.25 for single and double tracks, respectively (1918 prices).

A third form of construction is secured by filling the spaces between the ties and between the tracks for the full width of the road between the outside ends of the outside tracks and for the full width of the highway with clean stone ballast thoroughly settled together, this stone of ballast size to come up to the under side of the head of the rail. A good grade of stone screenings containing particles of stone up to ½ in., but with the fine dust and loam screened out (or a clean, fine gravel containing a very small percentage of loam makes a good aggregate) is then mixed with two gallons of good No. 1 road oil to which one gallon of cold water has been added. Two gallons of this mixture are added to one cubic foot of aggregate and mixed well until all particles are well coated with this emulsified asphalt, the same as in mixing concrete. The concrete thus made is then spread over the surface of the road and rolled or tamped thoroughly to the level of the tops of the rails. Where the existing crossing is good except for the top surface, all that is necessary is to scrape off this top surface for about two inches below the top of the rail and proceed as above.

The cost of such a crossing is $13.95 for single track, and $29.45 for double track.

P. M. Dinan, Supervisor, L. V. (Chairman).

Discussion

The discussion of this report hinged largely on the recommendation of the committee that all rail joints be eliminated in road crossings. A number of members described their practice of using 39-ft., 45-ft., 60-ft. and 66-ft. rails through crossings in order to avoid joints in those limits. In some instances rails are cut in half and laid with square joints through the crossing to secure this result. The fact was brought out that it has become the recent practice of a number of rail mills to charge a premium of $5 or $6 per ton for rails longer than 33 ft.

This has tended to discourage their use in some instances, but even at this increased price a number of members expressed the opinion that it was a good investment and urged their extensive use.

A number of the speakers called attention to the large amount of timber being used for crossings and the saving of wood to be accomplished by using a substitute crossing. At the same time attention was drawn to several objections to the macadam crossings, including the difficulties encountered on sharp skews and the fact that some communities objected to their use. It was also conceded that they are not entirely satisfactory for paved city streets. However, it has been found that, with proper construction, most towns may be educated to the macadam construction and even induced to co-operate in carrying out the work. In recommending the use of a substitute for plank crossings, attention was called by several to the hazards of the plank crossing due to loose planks being picked up by the pilots of engines. To be a success a macadam crossing must have a good binder and even with this some material gets on the rail and causes a certain degree of pitting, but this was not considered at all serious.

The report was accepted by the association with the exception of formula No. 3, which the chairman stated was still experimental. This involves the use of an emulsified asphalt, concerning which considerable expert information was presented, following which this portion of the report was accepted as information.

The Labor Supply

Hugh Reid, of the United States Department of Labor, Washington, D. C., spoke Tuesday afternoon on the labor supply, the factors which are influencing it, and the outlook for the future. He stated that there are approximately 37,000,000 persons in gainful occupations in the United States, nearly 11,000,000 of whom are engaged in farming. Of the remainder approximately 3,594,000 are unskilled. The United States is a consumer of unskilled labor, converting it into skilled artisans. Its supply of unskilled labor comes almost wholly from abroad.

Previous to the war over 1,000,000 immigrants entered the United States annually, of which approximately 600,000 were unskilled. Following the outbreak of the European war, this immigration was reduced to 25 per cent of normal at once and in 1918 and 1919 it was only 9 per cent of the pre-war figure, while in the latter years the percentage of unskilled labor to the total fell from approximately 50 per cent to less than 25 per cent. During the war large numbers of unskilled men also returned to their homes. With immigration shut off, a swirling movement of labor was set up in the United States, as a result of which about 600,000 negroes came North, creating crop shortages in the South.

Speaking of the future, Mr. Reid stated that in his opinion no one can forecast accurately what may develop. The index to immigration to America is the industrial situation in Europe. He did not anticipate any great immigration immediately because of the expense and difficulty in reaching our shores. In his estimation the great problem is not that of the shortage of labor, but of its distribution. Because of the surplus which has ordinarily prevailed, the United States has never had to develop an elaborate system of labor distribution such as has been built up in Europe in the form of public employment exchanges.

In conclusion Mr. Reid stated that it was his belief that the labor situation will remain practically as it is now insofar as it may be affected by conditions outside of the United States.

Talk by Mr. Felton

At a meeting held on Tuesday evening, S. M. Felton president of the Chicago Great Western and formerly director general of military railways at Washington, gave a talk on the part played by railway men in America's participation in the war. He explained the entire lack of facilities of the French for the transportation of American troops and supplies and outlined the manner in which our railway troops and equipment were assembled and organized.

Following Mr. Felton's address a group of moving picture films were shown, illustrating the manufacture of steel rails from the unloading of the ore to the loading of the rails for shipment.

Increasing the Efficiency of Labor

By C. A. Morse
Chief Engineer, C. R. I. & P.

There has never been a time in the past generation when it was necessary that there should be such radical changes in maintenance of way methods. We have always been able to get cheap labor and have, in fact, used the cheapest class. The result has been little incentive for the use of mechanical appliances or for being particularly careful that every hour of every man was put in to the best advantage. With the cost of labor doubled and the wages of section foremen increased 50 per cent, there opens up a big field for the careful study of the use of both man power and machinery on our maintenance of way work.

There are in my opinion many advantages in this change in the wages of both section foremen and track labor. In the first place, there was no class of men on the railroad that, considering the responsibility that rested upon them, were so poorly paid as the section foremen. They were and are responsible for the track on their sections 24 hours in the day, and a more faithful and loyal set of men as a class does not exist, I for one was much pleased to see them get the increase in salary that they did.

The low wages paid track labor gave us the poorest class of labor in the land, in fact—except in the country districts—we only got what was left after every one had taken the pick of the men, and we were breaking in much of the foreign labor that could not speak English. They worked in maintenance of way gangs until they could understand and speak a little English and then the best of them left for work that paid higher wages. One result of this was that we have been very short of materials from which to make foremen and many roads have put on special apprentices at increased wages in order to train men for foremen. With the increase in wages now being paid we will be able to pick our men, and also to have plenty of timber out of which to make foremen since the salary paid a section foreman will make it attractive for them.

The fact that we are going to be able to have a better class of men brings us another problem, which is providing proper housing facilities. Old car bodies, tie houses, anything that resembled a protection from the weather has been considered all that was necessary. It is a good thing that something has come to cause a change in such methods. We should all insist on good clean, commodious, comfortable and sanitary quarters for track laborers. There is no reason why a man working on the tracks of a railroad should not have a place to eat, sleep and rest that is comfortable and inviting and where a man can maintain his self-respect.

With choice men well quartered there comes the problem for the section foremen, roadmasters and maintenance officers of using the services of these men to the best advantage so that every hour's work of every man is done where and in such a way as to return the best results to the property.

Maintenance of way work has too often been done in a haphazard manner, this being caused to a greater or less extent by the many interruptions that break into a day's work. In order to get the best results from a certain expenditure on a section or roadmaster's division, the work should be systematized; it should always be kept in mind that maintenance of way begins at the outside of the right of way fence on one side of the right of way and extends to the outside of the fence on the other side.

It is customary to replace or put splices on a broken rail *at once* when discovered. Next in importance should be the replacing of a broken tie, as soon as possible after it is discovered. This on the principle that "A stitch in time saves nine." Ditching of cuts should be done systematically and not left for "odd time" work. There is no work that pays for itself so promptly as ditching cuts—it saves surfacing the track through the cut at least once and often twice a year. A day should be set aside and section gangs required to ditch cuts either all of that day or a half of that day, and the foreman should be required in his weekly report to show the number of lineal feet of cuts ditched on one side during the week and its location. Repairs to right of way fences should be handled in the same manner.

There has been an idea on some railroads, especially those where ballasting has only been done for a few years, that track ballasted with broken stone, gravel, slag, etc., should not be taken out of face, but that the low spots should be raised and the line and surface maintained in that way. *This is a mistake.* All ballasted track should be

taken out of surface once in every three or four years, and a section foreman should be required to take at least one fourth of his track out of face each year, doing what he does continuously to a face.

Another matter that has attracted my attention this season, particularly in the western country where we have had so much wet weather and where we have such great crops, including a rank crop of weeds, is that our section foremen do not seem to realize the advantage of keeping this vegetation out of the track and ballast material. They are inclined to chase weak spots rather than to get after the vegetation.

Digging out the grass and weeds permits the sun and wind to dry out the ballast and embankment, and when dried out any work done on the track stays there, while if wet it goes down again after a few trains have passed over it.

Track bolts should be tightened at least twice a year, and both the bolts and the joints should be given a coating of crude oil at the same time. Some roads are oiling the rail below the head, including spikes, tie plates, joints and bolts, and believe it economical to do so, especially where they have much brine drip from refrigerator cars.

In order to do maintenance of way work systematically a maintenance of way budget should be made up for each roadmaster's territory, sub-divided into section foremen's territory.

This budget should be divided:

(1.) Into the minimum organization that can keep up the track, not including tie renewals; (2) The additional help required to do work that is required at certain seasons, such as mowing right of way and the tie renewal program; (3.) The additional help required to do work that would be of benefit and that would tend to cheapen future maintenance cost, such as widening embankments and cutting surface ditches; (4) An amount to cover extraordinary expense due to weather conditions, wrecks, removal of snow, ice and sand, and other extraordinary expenses. This item should be based on average expenses for this class of work, say during the past five years, revised to fit present labor and material prices.

Under each of these headings the labor cost and material cost should be stated separately. This budget should be made up in detail as to lineal feet of rail of different weights to be relaid; ties to be renewed, divided as to main tracks and sidings; cubic yards of ballast of each kind required, giving location where rail and ballast are to be inserted; lineal feet and location of cuts to ditch; lineal feet and location of surface ditches; lineal feet and location of banks to be widened; number and kind of road way signs to be renewed, etc., etc. With a budget of this kind carefully prepared, each section foreman has his year's work laid out for him and has something to work to.
