The "Principles" of the Esch-Pomerene Bill

The Traffic Club of Chicago, which is composed of both railway men and shippers, has adopted resolutions endorsing the "principles" of the Esch-Pomerene bill. At the same time the Club suggests that the Interstate Commerce Commission be directed, in regulating rates, to give weight to the cost of capital, as well as to the cost of labor and other operating costs. To endorse the "principles" of a bill is manifestly something different from endorsing the bill itself. As we understand it, what those who drafted this resolution meant by the use of this language was simply that while in principle the bill is, for the most part, sound, it does not go far enough in some directions and goes too far in others. For example, as the resolution regarding "cost of capital" shows, the Club evidently believed that more definite and comprehensive instructions as to how rates should be regulated should be given by Congress to the Interstate Commerce Commission than are given in the Esch-Pomerene bill. There is hardly a provision of the Esch-Pomerene bill that would not make some improvement in the present system of regulation; and yet if it were adopted as it stands the improvement in regulation it would effect might be so small as to prove almost valueless.

Electric Operation Data

The subject of electric operation is constantly demanding more attention. Its consideration has been forced upon a few roads by terminal and trunk line congestion and many more are considering it on a basis of ton-mile costs. The design of electric traction equipment is an exact science. An electric locomotive is essentially a constant speed machine. It is possible to design one for hauling a train of a given weight over certain curves and grades and have the actual operation agree with the predetermined schedule within two or three per cent. This means better handling of traffic and a general tuning up of operating conditions. More freight can be hauled on a given piece of track and there are many other points of advantage. On the other hand, it is not possible to design flawless equipment or to predetermine what the cost of electric operation will be with the same accuracy that running schedules may be adhered to. Even a new type of steam locomotive must be thoroughly tried out before it can be considered dependable. In the same way it is necessary to give electric locomotives a thorough work-out, so that imperfections of design can be corrected. Outside of the United States electrification is being considered in Brazil, Chile, France, Belgium, England, Australia, Italy, Jamaica, Switzerland and Sweden. The operating men in these countries are desirous of obtaining any operating data that may be available. During the war no one felt it his privilege to give out any such information and American railroad officers seem still to be wondering if the data belongs to them or not. When this question is decided they will be in a position to render a great service to operating officers in this country and abroad who are considering electrification projects by making public the operating results of electrified lines.

Gen. Atterbury's Social Platform

Brigadier General W. W. Atterbury has delivered two addresses which fully justify the title of doctor of laws, which has been conferred upon him by the University of Pennsylvania; one on the need of compulsory military education and one advising the wives and daughters of Pennsylvania Railroad employees to continue, for the benefit of railroad men, the welfare work which they have been doing for soldiers and soldiers' families. This commendation is predicated, not alone on the soundness of the views presented—there is room for discussion on some of them—but on the scholarly character of the essays and on the frank way in which General Atterbury acknowledges his indebtedness to the experiences of the past two years as an education for his mind and his heart. Our immediate point is his platform or six "points," for guidance in dealing with "labor" controversies which he has laid down in the last-mentioned essay, and which is quoted on another page. This is a liberal platform proposed by a strong-minded conservative. Who will say that it is not well-balanced, with the maximum of reasonableness? The force of the sixth point—fair division of profits—wholly depends of course, on the interpretation of "fair"; and it will be noted that the officers of a corporation, up to the president himself, are classed as laborers. The fifth point—the employee's participation in fixing working conditions—deserves the attention of all railroad officers. Attempts of officers to take the employee into their confidence have often been marred by clumsy work. On the other hand, those leaders of employees and those theorists who aim to lead public sentiment, who vaguely demand a "voice in the management" should be sharply challenged to give a more precise meaning to their words. Has not General Atterbury given full recognition to the real desire of all right-minded employees?

Baltimore & Ohio Financing

The passing of the dividend on Baltimore & Ohio common stock follows a long uphill financial fight in which a procession of difficulties came one after another with fateful persistency. Baltimore & Ohio, organized in 1831, has paid dividends on its common stock every year since and including 1859 with three exceptions. It is essentially an investment stock and on this ground the directors were justified in continuing the payment of dividends through periods of temporary depression, and, where necessary, out of accumulated surplus. The government's guarantee of rental would, under ordinary circumstances, be sufficient for the continuance of 4 per cent dividends on Baltimore & Ohio common stock, but the Baltimore & Ohio is in a peculiar position. When Daniel Willard went to the property in 1910, the balance sheet showed $18,121,000 surplus. This was largely a bookkeeping surplus, as is evidenced by the fact that in the first year of Mr. Willard's administration $8,516,000 was written off the equipment account as representing an excess of book value over appraisal value. At that time, the Baltimore & Ohio had the millstone of the Cincinati, Hamilton & Dayton hanging around its neck. The financial structure of the Cin-

cinnati, Hamilton & Dayton was topheavy enough in 1910 to make it a source of danger to the Baltimore & Ohio, and the floods which washed out stretches of the line added greatly to the burden of high fixed charges. The Cincinnati, Hamilton & Dayton went into the hands of receivers and the Baltimore & Ohio took a loss on its books of $10,892,000. The Baltimore & Ohio property, itself, needed tremendously costly addition and betterment expenditures, and the state of the railroad bond market made it so difficult to do permanent financing that a $40,000,000 note issue was resorted to. This fell due in the midst of the European war, but the company managed to refund it with $60,000,000 5 per cent bonds. In the years 1914 and 1917, the company failed to earn its full common dividends but they were made up from surplus. Much of the Baltimore & Ohio stock is owned by conservative investors of the class who own New York, New Haven & Hartford stock. These investors are, in many cases, dependent for their living on their income from investments. To such as these the passing of the Baltimore & Ohio common dividend comes as a blow. Unlike the New Haven case, the blow cannot be attributed to ambitious or mistaken policies of expansion except in regard to the loss through the Cincinati, Hamilton & Dayton purchase and guarantee. This, of itself, would not have been fatal, and since 1910 the history of the Baltimore & Ohio, in regard to financing, has been an open story of a hard struggle against circumstances which have proved irresistible.

A Commission Expert on Railroad Troubles

The *Railway Age* has long contended that the railroad troubles of the country, and especially the decline of railroad expansion, which has been the immediate cause of many of our worst railroad troubles, have been due chiefly to the fact that the regulating authorities have steadily refused to permit the railways as a whole to earn adequate revenues. Support for this view has come from an unexpected but highly expert source. We publish elsewhere in this issue a letter from W. J. Meyers, formerly statistician of the Interstate Commerce Commission. Mr. Meyers was in charge of the Division of Statistics of the Interstate Commerce Commission during the years 1910-1915, inclusive. It was principally during these years, according to our contention, that the decisions of the Interstate Commerce Commission and the state commissions reducing or preventing advances in rates caused the decline in net operating income and the railroad bankruptcies, which, in turn, caused the decline of railroad development. No other man living knows as well as Mr. Meyers what the statistics of the railways, as compiled for the Commission showed during that period; and the opening sentence of Mr. Meyers' letter to the *Railway Age* is, "According to my view of the matter the fundamental cause of the difficulties in which our railway system is now involved is to be found in inadequate revenues." Elsewhere Mr. Meyers says: "The Act to Regulate Commerce declares that all rates charged by railways shall be just and reasonable, . . . but . . . it contains little to guide an administrative commission in determining what constitutes a just and reasonable rate, and the Interstate Commerce Commission, lacking statutory guidance in this regard, has been largely influenced by the dicta in the Supreme Court's opinion in Smythe vs. Ames, a case brought for the prevention of confiscation. It thus has happened that the action of the Commission in disposing of rate cases brought before it has frequently resulted in rates too low to produce the amounts of revenue necessary for efficient operation and development of the railways." This is exactly the contention of the *Railway Age* and the basis of our argument in favor of Congress adopting a clear statutory rule requiring that rates shall be so regulated as to be not only non-discriminatory but sufficient to yield the railways revenues adequate for efficient operation and for needed development.

A Service Record Worth While

No better proof of the value of timber preservation can be offered than the experience of the Southern Pacific in the removal of its wharf on the Oakland shore of San Francisco harbor, described on another page, where 67 per cent of the piling were found in such good condition after 29 years' service in a harbor infested with marine borers, that they are being redriven in other structures. It is only at intervals that records such as this are available. The Southern Pacific has therefore performed a real service in taking advantage of this opportunity to ascertain the actual resistance which the timber in this structure offered to decay and to the attacks of the teredo and limmoria. That the results of this examination are so satisfactory is a source of gratification to advocates of timber preservation. Repeating as this does in large measure the results obtained when the structure crossing Galveston Bay was dismantled a few years ago, it goes far to demonstrate the service which may reasonably be expected from sound timber properly seasoned and treated. With the railways rapidly passing from the earlier period of temporary pioneer construction to that of more permanent structures, knowledge such as is furnished by service tests of this character is of the greatest value to the engineer as a guide in the selection of the materials which will best meet the conditions to which the structures he builds will be exposed.

Why Not Provide for Adequate Revenues?

THERE IS REAL DANGER that private management of railways will not be successful after the roads are returned to their owners, because many leading members of Congress do not appreciate the necessity for making the specific requirement that rates must be made adequate and for providing for such administration of the regulatory laws as will give effect to this requirement.

The shipping and traveling public is as strongly in favor of the return of the railways to private operation as are railway owners and officers. But while the railway owners and officers and many business men want the legislation now under consideration to provide that rates must be made adequate to enable the railways to raise sufficient capital and are opposed to giving to Interstate Commerce Commission exclusive and supreme regulatory authority, some influential shippers are opposed to specifically providing that rates must be made adequate and are in favor of not only leaving the Interstate Commerce Commission all the authority it has, but of greatly increasing its authority.

Doubtless this is a natural division of opinion, but if it continues to exist it may wreck all plans for better regulation, render successful private operation impossible, and finally make government ownership unavoidable.

Those who oppose providing by law that rates must be made sufficient to enable the railways adequately to develop their facilities, and favor giving practically unlimited discretionary authority over interstate rates to the Interstate Commerce Commission, seem to have forgotten the history of railroad regulation in the United States before the war, or to overlook the fact that the conditions under which our former policy of regulation was adopted and the conditions which now exist are widely different.

The old policy of regulation was made effective by legislation adopted in the years 1906 to 1910. For some time before that the general tendency of railway profits had been upward, and the legislation enacted then was predicated on the assumption that one of the main purposes of regulation should be to prevent the carriers from making too much money. Therefore the law provided that the Interstate Commerce Commission should fix only *maximum* reasonable rates, and later, the burden of proving the need for any advance in rates was put upon the railways. Most of the men then and since appointed to the Commission favored administering the law in the spirit in which Congress enacted it. The result, as we pointed out in an editorial in our issue for June 20, was that in the years 1910 to 1915 the percentage of net operating income earned by the railways steadily declined and the new investment made by them declined every year between 1911 and 1916, except 1914, being in 1916 less than one-third of what it was in 1911.

And what is the situation today? Are the railways earning a large and increasing net operating income? On the contrary, after eighteen months of government operation, they are earning at the rate of about 1½ per cent upon the investment. In other words, on the basis of present earnings and expenses, they are bankrupt. Therefore, whatever may have seemed desirable ten or fifteen years ago, it is certain that the thing the public welfare demands today is that the regulatory legislation, and the administration of it, shall be so changed as to permit a large increase of railway net operating income. Some people propose that instead of the rates being made adequate to enable the companies, after private operation is resumed, to earn sufficient profits the government guarantees shall be temporarily continued. But to continue the guarantees will be to leave the future of the railroads in the same uncertainty as now, and as long as that uncertainty exists there will be no substantial revival of the expansion of railroad facilities.

The history of railway regulation during the eleven years before this country entered the war, the conditions which now exist, and statements which recently have emanated from certain members of the Interstate Commerce Commission, constitute an unanswerable argument against giving the Interstate Commerce Commission practically unlimited discretion to determine the standard according to which railway rates shall be regulated in future. The Commission persistently refused, while acting under existing laws, to let the railways earn adequate net returns. That the attitude of some of its members is still anything but encouraging is shown by recent utterances of Commissioners McChord and Woolley. Commissioner McChord has attempted in the teeth of conclusive evidence to the contrary, to show that the Commission did let the railways earn adequate returns. Commissioner Woolley, who is a new member, has argued in a recent public address that rates should not even be advanced enough to prevent the railways from incurring deficits which must be paid from taxes. While it is well known that Commissioner Woolley and his colleagues differ wisely about some important matters, we know of no reasons for questioning that Commissioner McChord expressed the views of most of his colleagues. If a majority of the Commission does not today recognize the fact that the policy of regulating rates which prevailed before the adoption of government control was mistaken and harmful, there is no ground for hoping that without some new and definite instructions from Congress it would regulate them fairly and in the public interest in the future.

The *Railway Age* did not advocate the proposal for the creation of a Secretary of Transportation because it doubted if there was a good chance of its adoption and because it questioned the expediency of giving political government officer such authority over the railways as was proposed. We hoped the Commission, as a body, would make it so clear that it had learned much by the experience of recent years as to convince everybody there was no need of the creation of another body or official to which should be transferred some of its important functions. But recent utterances of Commissioners McChord and Woolley, tend powerfully to justify the feeling of mistrust regarding the Commission which the railway executives and many business and financial interests have manifested. The members of the Commission are intelligent, high-minded men. But practically all of them went upon the Commission either with very little knowledge of the railroad business or with a strong prejudice against the railway companies; in their official capacity they have dealt largely with the pathology of the railroad business; and, therefore, the information they have acquired in the work of regulation does not seem greatly to have increased their knowledge of railroading as a going industry or to have mitigated the hostile feeling toward the companies which some of them had when they were appointed.

In view of these facts the conclusion is unavoidable that the railroad problem cannot be solved by giving the Commission as at present constituted, practically unlimited discretionary authority over the regulation of rates and operation as is virtually proposed by the Esch-Pomerene bill. If the problem is to be solved, either Congress must give the Commission a specific mandate to so regulate rates as to enable the railway companies to raise sufficient capital adequately to develop their facilities, or it must delegate the determination of what return public expediency demands the railways shall be allowed to earn, to some other governmental official or board. If the Commission should regulate rates in the future as it regulated them in the past, the railroad industry would not and could not prosper, and the transportation facilities provided would not be sufficient to handle the commerce of the country.

Do not Congress and the public want rates so regulated as to enable the railway companies to provide adequate facilities and render good service? If they do want rates so regulated, why not definitely say so in the law? It could not do any harm to say so. It may do much harm not to say so.

Thoughts on Maintenance of Way

THE DIRECTOR GENERAL has thrown down the gauntlet to the corporate officers of the railroads insofar as the controversy regarding the adequate maintenance of the fixed properties of the railroads under federal control is concerned, by his recent repeated statements that the Railroad Administration has complied fully with its obligations in this respect. He has gone even further, and implied that the government has exceeded its obligations so far that severe retrenchment is necessary. This position is in such marked contrast with the belief of maintenance engineers connected both with the Administration and the railway corporations as expressed to the *Railway Age* that it demands careful attention.

Maintenance of way expenditures may be divided roughly into two general classes: those incidental to the routine repair and upkeep of the property, which are chargeable entirely to operating expenses, and those incidental to the replacement of the larger buildings or structures, which are chargeable entirely or only in part to operating expenses. The Railroad Administration has concentrated its attention largely on the former class of work, although, even as to this, as noted in previous issues, there have been relatively large deficiencies in the renewal of ties, rails and other basic materials. While better progress has been made this year than last, it is very questionable if the routine work of this

character can be brought up to a full compliance with the terms of the contract by the end of this year.

A more serious deficiency is to be found in the replacement of structures. Many units of railway property wear out, many others require replacement because they become obsolete or inadequate for the service required of them. These latter processes are continuous, and experience has demonstrated the necessity for the railways to make large expenditures for replacements from year to year if their properties are to be maintained in a way to meet the demands upon them. It is possible to postpone replacement work for short periods, but it must be undertaken with redoubled energy later in order to make up for the time which has been lost. The war-time conditions under which we were laboring last year made it necessary for the roads to postpone much work of this character. No criticism is to be attached to the Railroad Administration for this. Our problem then was to win the war and all work which could safely be postponed was properly postponed. As a result, the rebuilding of stations and other buildings not immediately necessary for the handling of traffic, the replacement of steel bridges with those of heavier design, and other similar work was almost entirely suspended. It is work of this character, with its relatively heavy maintenance charges which has been most seriously neglected, and must now be renewed. An investigation of expenditures for replacements in the test period, or in the longer period of ten years before government control was adopted, as has been suggested by some, will show that the roads have in the past spent tremendous sums for replacement work, which is chargeable to maintenance and is considered a part of the normal maintenance program. Any reasonable interpretation of the standard contract must include attention to expenditures of this character, for the fact that they were postponed as a war-time measure does not in any way constitute a release from the obligation to make them good now.

Another condition which must be considered before closing the books is the depletion of the stocks of material. When the government took over the roads on January 1, 1918, most of them had on hand their normal working supplies of ties, rails and other materials. The extreme difficulty of securing materials of all kinds last year made it necessary as a war measure to curtail purchases to the minimum and this resulted in seriously depleting stocks of all kinds. Since that time the financial limitations under which the Administration has been laboring have caused it to curtail purchases still further, with the result that the already depleted supplies on the various roads are being pooled to meet the most urgent needs of all. When the roads are returned to their owners, these stocks must be restored to what they were when government control was adopted, or proper compensation rendered therefor. It is to be assumed that this compensation will be on the basis of the existing prices of materials rather than on the basis of the prices paid for these materials originally, as has been suggested in certain Administration quarters. This restoration of stocks will constitute another large charge to maintenance which the Railroad Administration must bear under the terms of its contract.

Therefore, instead of the railways being over maintained, or even adequately maintained in the broad sense in which maintenance of way should be considered, it is difficult to see how one can arrive at a conclusion other than that, in the aggregate, the government is so far in arrears in its expenditures for maintenance that even by the most strenuous efforts it will be impossible for it to take up during the present working season the accumulation of deferred maintenance which has already occurred. Obviously every effort should now be made to comply in full with the contract requirements in order that the financial adjustment at the end of the period of Federal control may be as small as possible.

Pittsburgh & Lake Erie

THE PITTSBURGH & LAKE ERIE, operating through the heart of the most congested railroad territory in the United States during the war, spent less for coal for locomotives in 1918 than in 1917. The property has, for many years, been remarkable for the low operating ratio which it maintained under difficult conditions of operation. The operating ratio in 1918 was held down to 68 per cent. The property has often been likened to a complicated and extensive yard. The density of traffic is heavy. In 1918, 13,312,000 ton miles were moved per mile of road, an increase over 1917 of 1,543,000 ton miles. The revenue freight haul is comparatively short—an average of 63 miles in 1918 and a little over 61 miles in 1917 . The average train load, however, is extraordinarily heavy; in 1918 it was 1,532 tons which was an increase of 31 tons over 1917.

More than half of the total tonnage of the Pittsburgh & Lake Erie is products of mines. The total tonnage of all commodities carried in 1918 amounted to 45,894,000, an increase of 4,349,000 tons. The increase in bituminous coal tonnage accounted for over three-quarters of the total increase and the increase in the tonnage of ores for the remainder. There were offsetting increases and decreases in other classes of commodities.

Total operating expenses of the property in 1918 amounted $22,365,000, an increase of $5,713,000 over 1917. This increase in expenses, however, was only a little more than commensurate with the increase in revenues. Total operating revenues amounted, in 1918, to $32,992,000, which was $7,371,000 more than the revenues in 1917, or an increase of 29 per cent. The operating ratio (percentage of expenses to revenues) was 67.79 in 1918 comparing with 64.99 in 1917. Railway operating income amounted to $9,743,000 in 1918, comparing with $7,634,000 in 1917 and comparing with $8,980,000, the rental which the government is paying for the use of the property. Leaving aside the question of hire and rentals of equipment, the government made a substantial profit from the operation of the Pittsburgh & Lake Erie in 1918 after paying the company its rental. Setting aside an item—miscellaneous income—with which the Pittsburgh & Lake Erie annual report credits the government income account, non-operating income amounted to about $429,000, and deductions from gross income to $293,000, so that the profit for the government was a little better than the comparison between railway operating income and rental would show.

The particularly interesting thing about the operation of the property in 1918 is the ability which the federal management showed in holding down transportation expenses. These expenses in 1917 amounted to $8,255,000 and increased in 1918 to $10,218,000, or by about 24 per cent; but this was much less than the percentage of increase of wages and of the unit costs of materials to most railroad companies. As previously mentioned, the Pittsburgh & Lake Erie spent less for its locomotive fuel in 1918 than in 1917. The amount spent for fuel for train locomotives was $753,000, a decrease of $117,000, as compared with 1917, and the amount spent for fuel for yard locomotives was $987,000, an increase of only $5,000. The relative amount of fuel used in train service and yard service is a good commentary on the character of the transportation service performed by this property. The largest important increase in transportation expenses was in the wages of yard conductors and brakemen. This amounted to $1,806,000 in 1918, an increase of $422,000 over 1917. Compare this with the increase in wages of train enginemen. These wages in 1918 amounted to $597,000, an increase of only $71,000 over the previous year. The wages of trainmen amounted to $878,000, an increase of $188,000.

The increased cost of maintenance on the Pittsburgh &

Lake Erie is comparable to that of other eastern roads. Maintenance of way cost $4,374,000, an increase of $1,481,000 or about 50 per cent. The cost of maintenance of equipment was $7,038,000 in 1918, an increase of $2,243,000 or about 47 per cent.

The annual rental which the corporation received was ample to continue 10 per cent dividends and to carry a safe amount over into surplus. In deducting interest, war taxes and corporate expenses from rental and about half a million dollars for corporate income, there was $6,825,000 remaining. The 10 per cent dividend calls for $3,599,000. In addition to this, the company also subtracted in its income account $1,767,000 as revenue and expenses applicable to the period prior to January 1.

The government, on December 31, 1918, still owed the Pittsburgh & Lake Erie $7,580,000 out of the $8,980,000 rental, and, in addition, the government owed the company for cash, materials and supplies, etc., taken over on January 1, 1918, $13,333,000. The corporation had in its own treasury $398,000 cash at the end of 1918. The company had loans and bills payable of $5,375,000 at the end of 1918, $1,799,000 of unmatured dividends declared, and owed the government a total of $11,836,000, which included $7,025,000 liabilities of the corporation paid by the government, and $1,786,000 advanced by the government for additions and betterments.

The following table shows the principal figures for operation of the property under federal management. This is not the corporate income account.

	1918	1917
Mileage operated	225	225
Freight revenue	$28,513,514	$21,139,925
Passenger revenue	2,287,179	2,349,133
Total operating revenues	32,992,273	25,621,654
Maintenance of ways and structures	4,374,228	2,893,049
Maintenance of equipment	7,038,496	4,795,678
Traffic expenses	187,253	194,455
Transportation expenses	10,217,617	8,254,964
General Expenses	502,055	452,138
Total operating expenses	22,365,184	16,652,502
Taxes	884,277	1,334,963
Operating income	9,742,766	7,634,163
Gross income	*11,940,692	7,856,878
Net income	11,647,561	7,435,472

*After the company has credited the government with $1,768,848, "miscellaneous income," in addition to the rentals which the government received from equipment.

CORPORATE INCOME ACCOUNT

	1918.
Rental	$8,980,219
Gross income	9,544,051
Net income	6,825,489
Dividends	3,598,560
Surplus	*3,226,929

*The company subtracts from this surplus, on its own income account, $1,767,378 as revenues and expenses applicable to the period prior to January 1, 1918, paid for by the Railroad Administration on account of the corporation.

New Books

Trautwine's Civil Engineer's Pocketbook. Twentieth Edition, by John C. Trautwine, revised by John C. Trautwine, Jr., and John C. Trautwine, third. Bound in flexible leather, 6 in. by 4 in., 1528 pages. Published by Trautwine Company, 257 South Fourth street, Philadelphia. Price $6.

The first issue of the twentieth edition of this well-known reference to civil engineering constitutes the 140th thousand. Aside from a desire to bring the work up to date, the object of this revision is to extend the section on railway engineering. Thus the portion on track and track work has been increased from 35 to 94 pages, the matter on curves from 10 to 108 pages, while the subjects of train resistance, train operating costs (railway economics) constitutes a new department covering 38 pages. Railway construction costs which previously received but minor mention have been extended to 36 pages. The treatment and arrangement of the matter in this issue conform very closely to the typographical standards of previous editions.

Letters to the Editor

Railroad Troubles Due to "Inadequate Revenues"

NEW YORK.

TO THE EDITOR:

According to my view of the matter the fundamental cause of the difficulties in which our railway system is now involved is to be found in inadequate revenues. This is probably due to a long series of historical causes, principal among which is the way in which the problem has been presented to the Federal courts. Owing to the fact that the courts have been resorted to to prevent confiscation it has come to be quite largely accepted that the railways, instead of receiving what their services are fairly worth, should be allowed to charge for them only sufficient to save their properties from confiscation. People who would ordinarily scorn to demand something for nothing have been educated to believe that it is proper to require a railway company to work for a bare living, and many times the wage allowed has been pared so thin as to reduce the railway to poverty and in some cases to force it into bankruptcy.

It is perfectly true that the railway service is so much a part of our present life that it is affected with a public interest, but this does not mean that the railway must work for starvation wages. It means that it must treat all citizens of the country without preference or prejudice—without discrimination as between persons. It must not charge one person one price and another a different price for a like service. It must not render one better service for a given price than it gives another for the same price. It is as much bound to treat all equally as is the county clerk or the judge of the court. Nor can it be allowed to take advantage of its strength and extort or otherwise oppress those who are dependent on it. But if it charges only what its services are fairly worth, it cannot be considered to be guilty of oppression or extortion. And if traffic is freely offered to it at a particular rate the rate surely cannot be considered extortionate.

Many people seem to believe that the fairness or unfairness of a rate of charge for a particular service is dependent on the cost undergone by the servitor in rendering that service, but a moment's consideration should be sufficient to show the absurdity of that view. Very few producers of identically equal services or commodities produce at equal costs, yet this demand that the price shall be based on the cost of the thing offered carries necessarily the corollary that the low cost producer must sell at a correspondingly lower price, and that the high cost producer is entitled to receive a higher price for a product no better. This not only tends to encourage incompetence but directly to promote inefficiency. It is merely another form of the same vice as underlies all propositions calling for a government guarantee.

What should be given the railways and all other public service corporations is not a government guarantee but an opportunity to earn what their services are fairly worth. Let the government get off their backs and give them a chance to render efficient service at a fair price. They need only to be unshackled. It is not necessary to ask the taxpayers to support them. The right rule is to reward the producer in accordance with the value of his product, and the value of his product does not depend on what it cost him to produce it but upon its utility and on what it would cost to duplicate it.

When the foregoing considerations are applied to railway

rates it becomes apparent that whatever else may be said of it, it is not true that a railway rate is extortionate or excessive or unfair if traffic moves freely under it and it bears proper relation to other rates; *i.e.*, does not involve unreasonable preference or discrimination in favor of one class of traffic or one rate payer as against another. There are those who are concerned lest under such a system of rates the carriers should grow too rich. I cannot believe that anybody can become too rich by producing and selling either services or goods at fair prices, and it seems to me that the alarm of these people is based at least in part on envy. However, it is perfectly apparent that none of the railways can operate without enjoying special franchises to cross public highways, and I willingly concede the right of the government to exact for the use of such privileges their fair value, just as I contend that the carrier should receive for its services their fair value.

The Act to Regulate Commerce declares that all rates charged by railways shall be just and reasonable and it prohibits unjust and unreasonable charges and exactions, but aside from the "long and short haul" clause in section 4 it contains little to guide an administrative commission in determining what constitutes a just and reasonable rate and the Interstate Commerce Commission lacking statutory guidance in this regard has been largely influenced by the dicta in the Supreme Court's opinion in Smythe vs. Ames, a case brought for the prevention of confiscation. It thus has happened that the action of the Commission in disposing of rate cases brought before it has frequently resulted in rates too low to produce the amounts of revenue necessary for efficient operation and development of the railways.

I believe that the object which should be principally sought in the revision of the Act to Regulate Commerce is the best method of securing efficient service at fair and non-discriminatory rates, and that the foremost essential to efficient service is adequate revenue. Next in importance perhaps is stability of rates, particularly in freight service, so that the commercial and industrial elements of the community may know what to expect in the way of transportation charges and may be governed accordingly in making their contracts and other business arrangements. The provision requiring thirty days' publication of proposed changes in rates is sound, and if there were any demand for it I see no valid objection to requiring a longer notice, but the provision authorizing the Commission to suspend proposed increases in rates should be stricken out. Such a provision merely invites litigation and controversy. It also operates unequally as between the carrier and the shippers. If an increase in a rate is unjustified the shipper can always recover from the carrier, but if it is justified the carrier is unable to recover from the shipper for the difference between the old rate and the new during the period of suspension.

Another matter of great importance is the prevention of dishonest financing. A large part of the prejudice under which the railways have suffered in times past has been due to the disgust aroused in the minds of the public by scandals such as those resulting from the methods used in financing the Alton, the New Haven, the Rock Island and the Frisco. Many if not all of the breaches of trust found in those cases might have been prevented by thoroughgoing publicity such as is provided for in the British "Companies' Acts," and those statutes should be carefully considered in revising the Federal statutes relating to railways.

I favor the Federal incorporation of railways engaged in interstate and foreign commerce for the reason that the present system of regulating such railways is too cumbersome and it seems to me necessary that railway systems whose lines lie in two or more states be relieved from the complications involved in state control. I do not believe that this can be effectually done while such carriers are incorporated under state laws.

The necessity for Federal incorporation is not so great in the case of a railway whose lines are wholly within a single state. All that seems to be necessary in such a case is that its rate structure shall be harmonious throughout and that the rates for its intrastate traffic shall not be inconsistent with those for its interstate traffic and that of its competitors. Such carriers should be permitted to continue to engage in interstate commerce on condition that they make their intrastate rates conform to interstate rates so far as they affect interstate or foreign commerce.

W. J. MEYERS,
Formerly Statistician of the Interstate Commerce Commission.

S. J. Konenkamp, president of the Commercial Telegraphers' Union of America, addressing a meeting of 175 strikers in New York City last Sunday, declared that the operators' strike was going more successfully in the West than in the East. He said that in one instance strikers had threatened a "scab" with the alternative of leaving town or having a rope put around his neck. He related also how an automobile full of strikebreakers had crashed into a telephone pole in Jacksonville, Fla., and said that seven persons were sent to the hospital. Mr. Konenkamp said he didn't know how it came about, "but that our people were fined $10 and costs." He said the fight now was between unionism and Burleson. "Mr. Burleson's logic is that you must use force. Our fight now is not so much against the telegraph companies as it is against the Government. It was the Government that refused us." Except for the statements of Mr. Konencamp little or no evidence of a strike of telegraphers is published.

Congress' Little Problem of Reconstruction

Grand Trunk 0-6-0 Type Switching Locomotives

Twenty-five Engines, with 36,700 Lb. Tractive Effort, Building at the Point St. Charles Shops

AN ORDER OF 25 SIX-WHEEL SWITCHERS is being filled for the Grand Trunk Railroad at its Point St. Charles shops, Montreal. These engines, which are known as the road's class F9, have a tractive effort of 36,700 lb., and weigh 166,000 lb. in working order. Compared with the next preceding class of switchers, it will be seen in the table that the tractive effort has been increased from 31,460 lb., or 5,240 lb. This has been effected by an increase of 10 lb. in the boiler pressure, one inch in the diameter of the cylinders, and a decrease from 56 in. to 51 in. in the diameter of the drivers. In addition, a boiler of considerably more liberal proportions has been provided; the evaporating heating surface has been increased from 1,423 sq. ft. to 1,945 sq. ft. and the grate area from 27.4 sq. ft. to 50.6 sq. ft.

COMPARISON OF GRAND TRUNK SWITCHING LOCOMOTIVES

	New type	Previous type
Cylinders, dia. and stroke, in.	22 in. by 26 in.	21 in. by 26 in.
Diameter of drivers, in.	51 in.	56 in.
Steam pressure, lb.	175	165
Grate area, sq. ft.	50.62	27.44
Water heating surface, sq. ft.	1,945	1,423
Superheating surface, sq. ft.	408	268
Weight on drivers, lb.	166,000	139,500
Tractive effort, lb.	36,703	31,460

The boiler is of the extended wagon top type, designed for 175 lb. per sq. in. working pressure. It contains 178 two-inch tubes and 28 5⅜-in. flues, 12 ft. 4 in. in length. The firebox has a sloping mudring, which extends forward over the rear pair of drivers. It is 96⅞ in. long by 75¼ in. wide, and is fitted with a brick arch carried on four three-inch tubes. The boiler is fitted with a 28-element type A superheater, and has a power operated firedoor. Other boiler accessories are Hancock lifting type injectors, double turret valves, for the convenience of both the engineman and fireman, and two Okadee blow-off valves, both of which are fitted in the throat sheet of the firebox.

The design of the frames and running gear is straightforward and substantial, and the frames are well braced with cast steel crossties between the drivers. The front ends of the frames are bolted to a heavy cast steel deck plate, and the bumper beam is also a steel casting. The pedestal jaws are fitted with adjustable driving box wedges.

In order to provide for a main rod of ample length with the short wheel base, the main drivers have been placed at the rear. The steam is distributed by 12-in. piston valves driven by the Baker valve gear, and the distribution is controlled by a Ragonnet valve gear. The valve chambers and cylinders are both bushed with Hunt-Spiller gun iron and the same material is used for both piston and valve packing rings. The piston rods are fitted with King metallic packing.

Considerable attention has been given to the design of the cab in order to provide ample room for the crew, and especially to secure ample deck space for the fireman. Care has been used in the location of all of the cab fittings and particularly to the throttle lever, reverse lever and brake valve, and the steam, air and water gages, to place them so that they may easily be read by both the engineman and fireman.

The tender is carried on four-wheel trucks of the equalized pedestal type, with 5½-in. by 10-in. journals. The tender frame is built up of structural section with 13-in. channel center sills and side sills of 10-in. channel section. The rear end of the frame is finished with a cast steel bumper beam. The engine and tender connection is fitted with the Radial buffer.

The tank has a capacity of 6,000 gal. and is fitted with a coal space of nine tons capacity. The tank is of the rectangular type, and has been built long and low in order to provide for an unobstructed view looking forward from the cab. For the same reason the tank has been built with a coal space of the water leg type, the sides of which are built up straight above the top of the tank, thus leaving a clear view over the top of the tank at the sides of the coal space from either side of the cab.

Six-wheel Switcher, Designed and Built by the Grand Trunk Railway

The principal dimensions and data are as follows:

General Data

Gage	4 ft. 8½ in.
Service	Switch
Fuel	Bituminous coal
Tractive effort	36,700 lb.
Weight in working order	166,000 lb.
Weight on drivers	166,000 lb.
Weight of engine and tender in working order	296,000 lb.
Wheel base, driving	11 ft. 6 in.
Wheel base, total	11 ft. 6 in.
Wheel base, engine and tender	45 ft. 9½ in.

Ratios

Weight on drivers ÷ tractive effort	4.5
Tractive effort × diam. drivers ÷ equivalent heating surface*	732.0
Equivalent heating surface* ÷ grate area	50.5
Firebox heating surface ÷ equivalent heating surface,* per cent	7.6
Weight on drivers ÷ equivalent heating surface*	64.9
Volume both cylinders	11.4 cu. ft.
Equivalent heating surface* ÷ vol. cylinders	223.5
Grate area ÷ vol. cylinders	4.4

Cylinders

Kind	Simple
Diameter and stroke	22 in. by 26 in.

Valves

Kind	Piston
Diameter	12 in.

Wheels

Driving diameter over tires	51 in.
Driving, thickness of tires	3½ in.
Driving journals, main, diameter and length	9½ in. by 12 in.
Driving journals, others, diameter and length	9½ in. by 12 in.

Boiler

Style	Wagon top
Working pressure	175 lb. per sq. in.
Outside diameter of first ring	68 9/16 in.
Firebox, length and width	96⅞ in. by 75⅛ in.
Firebox plates, thickness	tube ½ in., crown, sides and back, ⅜ in.
Firebox, water space	front 5⅝ in., back and sides 4½ in.
Tubes, number and outside diameter	178 2 in.
Flues, number and outside diameter	28 5½ in.
Tubes and flues, length	12 ft. 4 in. over sheets
Heating surface, tubes and flues	1,751 sq. ft.
Heating surface, firebox, including arch tubes	194 sq. ft.
Heating surface, total	1,945 sq. ft.
Superheater heating surface	408 sq. ft.
Equivalent heating surface*	2,557 sq. ft.
Grate area	50.6 sq. ft.

Tender

Tank	Water bottom
Frame	Steel channel
Weight	130,000 lb.
Wheels, diameter	33 in.
Journals, diameter and length	5½ in by 10 in.
Water capacity	6,000 gals.
Coal capacity	9 tons

*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

Co-Operation*

By W. W. Atterbury

Vice-President of The Pennsylvania Railroad Company

ORIGINALLY IN DISCUSSING the Women's War Relief it seemed to me that of all the work, that of welfare was the most important, and of such a character as could, after the war, be made of great permanent value. It should be so organized as to permit, after the war, a permanent organization of the women of the Pennsylvania Railroad for welfare work among its employes. As a result of my experience of the last two years I have had no reason to change my mind. The industries of the world have been destroyed. Their immediate rehabilitation is essential. The wheels of industry must be started. The matter is now being studied by our most able financiers, who themselves realize that unless a solution is found our own destruction will ensue. I am confident that in a short time a successful solution will have been evolved.

Many years ago the question was asked "Am I my brother's keeper?" The universal answer has been "Do others or they will do you"—"Each for himself and the Devil take the hindmost." And selfishness—national and individual—was triumphant. The selfishness of one nation got beyond bounds and tried to impose itself upon all the other nations. The war was the result. Blood has washed the slate. What answer to that age-old question will now be written?

For nearly two years I watched with breathless interest labor conditions as they developed on the other side—England in the throes of a social revolution; France with her industrial population ripe for anything; Italy at any moment ready to break into anarchy. . . . In four wars America has fought for life, liberty and for the right to the pursuit of happiness. Trying to put myself in the other fellow's place, I have tried to define what that right means. It seemed to me that the following at least were essentials: (1) Steady employment; (2) At a good wage; (3) Time for recreation; (4) Opportunity to elevate myself in my employment; (5) A voice in determining the rules and regulations under which I should work; (6) A fair division of any profits after a reasonable wage had been earned and a sufficient amount paid to Capital to attract it to an expanding business. Given these, would it mean contentment to me and to my family? Would they enable me to give to my children greater advantages than I had myself enjoyed? Would these principles, if universally applied, give to our country and to the world at large what we believe to be our inherent right?

Society can no longer regard labor as a commodity. I hate the word "Labor" as ordinarily used, as it represents class distinction, for which there is no place in our American life. We all labor—some with our hands; some with our heads. Therefore, when I say labor I mean "all who labor." Heretofore it has been considered a commodity, subject to the law of supply and demand; but from now on we must so set our house in order that all may have steady employment—a difficult job, I grant you, but one not impossible of solution by collaboration between producers, consumers and transporters. . . .

In every man's breast, latent or active, is the desire to improve his condition. It has been our boast that America meant Opportunity. I believe this is as true today as it ever was; but industrial competition has forced us to methods which, as applied to many individuals, have made their work so monotonous and uninteresting that the seed of ambition has failed to germinate. On these the sunlight of opportunity, by education and change of employment, must be allowed to shine.

I asked myself: Ought not I to be taken into the confidence of my employer; be advised as to his aims and his troubles; be permitted to make suggestions in the light of my experience, and conferred with in regard to conditions of work so intimately a part of my every-day life? I could but answer "Yes!"—and with the feeling that I could thereby be a better man for my employer; for thus I become an active, intelligent and willing instrument for the success of my employer, instead of an unintelligent and unwilling tool.

The success of any business is gauged generally speaking, by its profits. There are two elements to an established business: the capital invested and the personnel employed. A stable return to capital is as essential as is steady employment to the individual. Capital has no brains and does not think. To the personnel of the business it is entrusted by its owners, who do think; and what they think gauges their point of view as investors. If stable and certain, a low return is asked. If the business is uncertain, and any return a chance, a high return is asked.

Nor can we change this. By revolution and anarchy we can wipe capital out, but with it go all rights to property of any kind, and even civilization itself.

Therefore, we as individuals, unless we are anarchists, are interested in the success of the business by which we are employed.

It is difficult, however, to make the large mass of those who labor appreciate the truth of this. So something more tangible and direct is necessary to bring about the individual interest so essential to the success of the business, than mere logic and economics. Profit-sharing in a small business is comparatively simple, but with industrial combinations—so essential to modern business life, if we are to meet the world competition—it is difficult to allocate to one efficient man his individual share in the profits, although we know that on the efficiency, or lack of it, of the individuals taken collectively, depends the success or failure of the business. Granting, however, the principle, we shall have taken the first long step, and with mutual confidence established I am certain that the way can be made clear.

*An address given before Department No 2, Pennsylvania Railroad Women's Division for War Relief at Philadelphia, Pa., June 26, abridged.

Tie Purchasing Methods Subject of Conferences

Correspondence Between Producers and Division of Purchases Reveals Positions of Both

THE CENTRALIZATION of the purchase of cross ties for all of the railroads under federal control in the hands of the Division of Purchases of the United States Railroad Administration has resulted in the introduction of many radical changes in the methods of producing and selling ties, as was described in the *Railway Age* of May 30, page 1305. Some of these changes have been opposed by the producers of ties. For the purpose of presenting their views to the Division of Purchases, a committee from the National Association of Railroad Tie Producers waited upon the director of the division on April 15, presenting a brief and certain recommendations, which have recently been made public. An abstract of this brief and of the correspondence which has followed subsequently is given below.

Tie Producers' Brief

The more reputable tie producers have always agreed upon the necessity and desirability of both standard specifications and standard inspection for controlling the purchase of cross-ties. Prior to the creation of the United States Railroad Administration it was impossible to reach any universal agreement upon standard specifications among the producers or the railroads. It is a source of satisfaction to us that standard cross-tie specifications are now an accomplished fact, and we desire to express our unqualified endorsement of the principle of a standard specification.

The purchase of all cross-ties by the line upon which they are produced, and restrictions as to the sale of these ties to the producing road only, is a direct limitation of markets. The effect of this ruling created radical changes in the very fundamentals of operation that had been in effect by numbers of tie organizations for a considerable period in the past, and some small measure of these radical changes can be determined by the realization that if the railroads prior to the war had attempted to decide, by common agreement, with power invested exclusively in themselves, that they would nationally agree on the prices and methods of purchase, there would have been grounds for legal recovery of damages to such concerns as the tie producers.

The producer is told he must absolutely deal with a certain railroad or certain officers; that he must deal with them under their own prices and terms; that the conditions are arbitrarily imposed and subject to change without his partaking in any way in establishing the prices or conditions affecting, very fundamentally, not only his possible profit and volume of business, but also the value of his standing timber, which he has carried on his books as an asset based upon his knowledge of timber values as they have existed in the past.

The limitation of the markets for cross-ties has not only been applied to the disposition of ties for use by the United States Railroad Administration, but producers have also been instructed to refer all inquiries from trolley lines and industries for cross-ties to the United States Railroad Administration for fulfillment. One of the most serious questions that must be answered by co-operation between the tie producers and the railroads is the disposition of cross-ties which do not conform to the present specifications.

The establishing of a proper price, neither too high nor too low, on all of the various kinds and grades of ties, in the numerous and extensive tie-producing territories, is a matter that cannot be brought about by any arbitrary power, no matter in what man or group of men that power might be invested. The real basis for the proper price to be paid for a commodity is the law of supply and demand. The proper price to pay for cross-ties, or any other commodity, must be justified in the final analysis by reconciliation with this cardinal rule of business prudence.

The purchaser of cross-ties must necessarily have for his main objective the obtaining of certain kinds and grades of cross-ties delivered at the lowest possible cost at the point of consumption.

There is a well defined and clearly established basis of comparison of values of certain grades and kinds of cross-ties produced in the various regions. For example, a sap pine tie produced in Louisiana is known to be of the same value to the railroads as a sap pine tie produced in Mississippi. Under the present schedule of prices and freight rates, the purchaser of cross-ties must pay $1 for a No. 3 Louisiana sap pine tie delivered at Chicago, while the same tie when shipped from Mississippi will cost him only 79 cents. This difference of 21 cents per tie cannot be accounted for in service to the railroad, and neither can the producer from either territory justify any reason why the purchaser should be required to make any difference in price as long as there is no difference in value.

The cross-tie circular of the St. Louis-San Francisco, in the Southwestern region, shows prices effective to June 30, 1919. There is no mention made, nor has there been any assurance given, that the cross-ties on hand as of June 30, 1919, made on the basis of the prices published, would be taken up and paid for at prices named in the circular. Cross-ties are not produced in a day, but it takes an average of six months from the stump to the right of way, and often longer. Should producers quit making ties and devote their efforts to hauling their ties, wherever this is possible, so as to deliver them before June 30? Under the former system of purchase of ties, the producer had a contract assuring him of a market for his ties, in most instances before they were produced.

Specific Suggestions

(A) The producing roads should continue to purchase, at the present prices, such ties as are offered up to Nov. 1, 1919.

(B) Any railroad may immediately enter into contracts with individual tie producers at prices not to exceed those prices now in effect at point of shipment for deliveries up to November 1, 1919, providing that the quantities and kinds of ties contracted for are approved by the United States Railroad Administration.

(C) All cross-ties should be inspected by the regional inspectors at point of shipment.

(D) The purchase of cross-ties for deliveries after November 1, 1919, should be made in accordance with the following plan:

(1) All railroads should register their annual cross-tie requirements with a central advisory purchasing committee, and all railroad ties should be purchased in accordance with nationally standard specifications.

(2) All railroad ties should be inspected by regional inspectors, in accordance with standard rules for the application of the specifications.

(3) The individual roads should enter into contracts for their cross-tie requirements directly with responsible tie producers, filing copies of any contracts made with the proper department of the United States Railroad Administration.

(4) All contracts should be awarded only after fair and open competition has developed the lowest price per tie obtainable from responsible tie producers. Reasonable assurance of the producer's ability to meet his obligations in the time required should determine the quantity of the ties to be covered in any contract.

(5) In the event of a producer being delinquent in the specified deliveries of certain kinds of ties, the United States Railroad Administration may prohibit his acceptance of any additional business for the same kind of ties.

(6) The purchase of all cross-ties by the individual roads

should be effected through nationally standard forms of contracts approved by the United States Railroad Administration.

The Railroad Administration's Reply

The reply of the Railroad Administration to this brief was made by H. B. Spencer, director of the Division of Purchases under date of May 29, of which the following is an abstract:

Before answering your various suggestions in detail, it seems desirable to review briefly the situation which led to the conditions which you now seek to improve. The federal authorities took control of the railroads on January 1, 1918. The organization of the Division of Finance and Purchases was completed about ten weeks later. We were immediately confronted with the following situation: For at least two years the production of railroad cross ties in the country had not kept pace with the requirements of the railroads. The business of supplying the railroads with cross-ties was almost entirely in the hands of contractors, who in spite of their best efforts and for reasons which they could only partially control, such as a depleted labor supply and congested transportation conditions, had been unable to supply the needs of the railroads in full. This had brought about a most demoralizing and destructive condition. The railroad companies had repeatedly revised and increased the prices paid under existing contracts, in order to obtain deliveries, and the more aggressive railroads were profiting in that respect at the expense of the weaker lines. Shipments were being held back by producers in the expectation of higher prices and instances were discovered where the same lot of ties had been repeatedly sold to several different roads, each time at a higher figure or under laxer inspection. A survey of the whole situation showed hundreds of unfilled contracts aggregating millions of cross ties, which had been sold by the contractors to individual railroads for delivery during 1915, 1916 and 1917, and which had not been delivered. The production was diminishing instead of increasing and it was vitally necessary that instant action should be taken to correct and improve these conditions.

With the introduction of federal control and operation of the railroads, competition between the individual lines for their supply of cross ties instantly and automatically ceased and the administration's problem was reduced to stimulating and increasing the production of ties as rapidly as possible, establishing a common standard, and distributing the available supply among the individual railroads in proportion to their relative necessities. The steps taken by the administration to solve this problem have resulted in the situation which led to our recent conference.

Proceeding now to answer the specific suggestions presented by your committee: The attitude of the Railroad Administration is not one of antagonism to the large tie producers. On the contrary, it is recognized that their established organizations, their knowledge and experience in the business can be of the utmost assistance to the administration in bringing about the results which are necessary to the proper maintenance of the railroads, and it has been and is the desire of the administration to utilize all of the facilities and the best efforts of the large tie producers to the fullest extent compatible with the best interests of the railroads themselves in securing their supply of cross ties.

In the matter of standard specifications, we were in substantial accord.

With regard to the limitation of markets, we could not agree to the proposition that the individual roads should be released from the regulation of obtaining through the agency of the central administration and the traversing roads such cross ties as they may have to draw from territory beyond that which they themselves traverse, and that they be permitted to deal and contract with any and all tie producers independently of that regulation. The necessity for central control of the distribution of available ties between federally-controlled roads according to their relative needs, as referred to above, is the vital reason for refusing to permit direct contracts between the individual railroads and individual contractors, except on the producing roads.

The so-called fixed prices are maximum ones only and even in that respect they are not absolute and beyond reconsideration. Prices in any given territory have been arrived at after careful consideration and by negotiation between the buying roads and the producers. They may be made the subject of negotiation again if that should become necessary.

The prices originally published obviously were not determined upon to strangle production, but on the contrary were made on a level high enough to induce tie producers of all classes to increase production. It was our belief that production was low rather for want of labor than on account of unremunerative prices. Now when labor recently has become more plentiful, cross tie production has increased remarkably and ties are coming to the roads at present in larger quantities than at any time in the past.

At the moment no objection could be seen to complying with your request that such ties should be bought at an f. o. b. price based upon certain commercial delivery centers to which through freight rates are in existence, but such an arrangement would require a detailed study of each situation. The railroad administration is prepared to consider each locality in detail whenever presented.

Upon the uncertainty as to future prices, it was stated that a duration of time for purchasing ties could not well be given or maintained for purchases made under publicly posted prices. In many cases, however, contracts have been made for a specific number of ties, the delivery of which extends under the contract for a definite period, in some cases to June 30 next, in other cases until the end of the calendar year.

We are not undertaking to dictate to steam roads not under federal control and trolley lines how they should buy their ties, nor to control them in their methods, nor to combine with them. We have consulted with them only where our interests are common and are endeavoring only to increase the output of suitable and satisfactory ties for our respective needs, taking into consideration the interests of all classes of tie producers.

At the end of our interview, we defined our position with respect to the specific suggestions made to you, by summing up as follows:

1: That the administration will not agree to discontinue the purchase of ties direct from the small producer.

2: The price to be paid for cross ties, whether to the small producer or to the larger producer, is a matter of negotiation between such producers and purchasing agents of the roads traversing the producing territory, and that this negotiation is done under the supervision of the regional purchasing committees and in conjunction with them.

3: The administration will adhere to the policy of publishing the prices the roads will pay for cross ties, such prices to have been arrived at by negotiation as above.

4: The director of purchasers will make contracts in the name of the administration with large tie producers for given quantities of cross ties for allotment to the different roads, if satisfactory terms for delivery, prices, quality, etc., can be arrived at.

Tie Producers' Rebuttal

In behalf of the National Association of Railroad Tie Producers, J. W. Fristoe, president of that organization, replied to Mr. Spencer as follows on June 11:

There are certain fundamental principles connected with the purchasing of cross ties that involve the question of how far the concentration of the purchasing power of the government may be developed into one single agency before it becomes an oppressive factor in the conduct of purchases for the railroads. The intent and purpose of well known federal statutes, such as the Sherman Anti-Trust law, and the Clayton law, covering the method of purchasing to be employed by common carriers, has taught us to look upon the limitations of our markets, and the fixing of cross tie prices by the railroads, as the exercising of a power temporarily justified as an emergency war measure, but an authority which would be immediately abolished together with the dissipation of similar restrictions originally placed upon other commodities purchased by the railroads.

We, of course, cannot question your authority to limit our markets and fix cross tie prices, but we feel justified in

questioning the propriety and fairness of any such restrictions. Our attitude in this matter appears to be in substantial accord with the recent statements of the director general in speaking broadly of the purchasing policy of the United States Railroad Administration, which we take the liberty of quoting herewith: "It (the United States Railroad Administration) is trying to handle this purchasing matter in a reasonable, businesslike way largely through the methods which were employed under private management and with an effort to prevent any concentration of the purchasing power by the Government into one single agency in such a way as to be a disturbing or an oppressive factor in the conduct of purchases for the railroads."

The plan we suggested for your consideration surely complied with all of the principles that might be inferred from the statement of the director general, with the added advantage to the administration that the supervision of a centralized purchasing agency was conceded in the hope that this supervision would not become oppressive.

In reference to the definition of your position as summarized in your letter, we wish to make the following statements: We did not suggest, nor do we subscribe to, any plan making a distinction between the large and small producer There is a specific provision in item 4 of the plan we suggested wherein the railroads could purchase in as small quantities as may be desired. The advisability of purchasing from tie producers of various capacities would prove itself in each instance, and the advantages should be so clearly self-evident as to carry their own weight when measured by common business prudence.

We wish to correct at this time any inference that the price to be paid for cross ties is or has been a matter of negotiation, if by negotiation is meant a mutual agreement based upon the usual rights of buyer and seller. The objections to the prices published by the administration arises from the fact that the administration is by far the largest purchaser of cross ties in the United States, and when it establishes maximum prices that will be paid for cross ties, it places our industry in the undesirable and unusual position of having the price of a commodity established by the largest consumer.

Reward of Being Conspicuously Good

By L. F. Loree

President, The Delaware and Hudson

I DO NOT PROPOSE to weary you with a review of the achievements of the railroads. The enormous improvements in the science and art of railway transportation are the product of the managers of the American railways. These men have been pioneers in fields exclusively their own and have so far succeeded that the American railway system fas able at the end of 1917, to handle far greater tonnage with relatively lower expenditure of power, including labor and fuel, at a lower capital cost per unit of traffic, and to carry both passengers and freight at the lowest rates in the world, while paying the highest rates of wages anywhere received by men similarly qualified.

It may well be asked why, in the light of these achievements, the institution should have been for the past fifteen years the favorite object of vilification and abuse.

I cannot help but feel that to a large extent the railways fell a victim of their own virtues The extent to which they energize and stimulate development, the growing dependence of the community on their proper functioning, and the high standard of the conduct of their business, all place them at the extreme on the side of goodness.

Consider the case of Aristides. Here was a man who, 500 years before Christ, was a leader among the Greeks. He had been the strategist of their army at Marathon; he had been archon, the highest magistrate of Athens, and he was standing as a candidate for re-election. A voter, not recognizing him, approached him and asked him to inscribe the name of Aristides on the negative ballot that he was to cast, and the archon put to him the question, "Why are you against Aristides? Has he done you an injury?" And the man said, "No, I do not even know him, but it irritates me to hear Aristides everywhere spoken of as 'the just.'"

The history of twenty-five centuries, the history of a thousand saints and martyrs, all demonstrate that it is at least as hazardous for a man or an institution to be conspicuously good as to be conspicuously bad.

Whatever may be our feeling about this matter, I am sure we will all unite in recognizing as a question of present greatest importance the railroad problems of to-day. The experience of the past 18 months has very definitely cleared away some of the fantasies. We are not going to have government ownership. We are not going to have a five-years continuation of the present impossible conditions. We are not going to have a Secretary of Transportation, with an elaborate departmental staff. We are not going to have federal incorporation and a consequent excessive centralization. With these major suggestions go many and various minor vagaries of the speculative mind, the chief of which was perhaps the notion that the railroads of the country as a whole could be reconstructed new at substantially less cost than the total of their capital securities. The fact is that under present conditions $35,000,000,000 would be inadequate to reproduce the properties that are now represented by about $18,000,000,000 of securities.

In all their variety the railroad problems hang on the one fundamental condition—the credit of the properties. There must be such a basis of rates as will yield a return adequate to command the confidence of the investor whose capital is solicited for new enterprises or for the expansion and improvement of the old ones. To ensure this it will be necessary, in my judgment, to secure the following changes in the present Act to Regulate Interstate Commerce:

1. The power of the Interstate Commerce Commission should be extended to cover state rates which in any way affect interstate commerce.

2. The power of the Interstate Commerce Commission should be extended to labor disputes, so as to require the wages and conditions of employment should be just and reasonable. Employes should be forbidden to conspire to interrupt interstate commerce. Strikes should be permitted only on the condition that the dispute must first have been submitted to the Interstate Commerce Commission and, subsequent to its decision (or its failure to decide within six months), there must be a vote to strike which vote should be by secret ballot on a question defined by the commission, the taking and counting of the vote being supervised by a Bureau of Interstate Transportation.

3. A Bureau of Interstate Transportation should be created to operate under the direction of a chief, to be designated from among the members of the Interstate Commerce Commission, but during the period of such designation not to perform any duties as commissioner; this bureau to take over all the executive and administrative functions of the commission.

4. The Interstate Commerce Commission should become wholly an adjudicating body; the term of office after the retirement of the present commission should be extended to nine years. The country might be divided into five interstate commerce regions, the natural traffic divisions of the United States, and one Commissioner should have his office in each of those regions, leaving three to sit in Washington. Commissioners assigned to regions should perform only such duties as may be assigned to them by the three remaining in Washington, and these three to exercise all the powers of the commission except those thus assigned.

5. The Interstate Commerce Commission should no longer

*From an address at the Scranton Club, Scranton, Pa., June 12, 1919.

be permitted to institute proceedings of its own volition. The Bureau of Interstate Transportation (as well as persons) to be a complainant before the commission.

6. The Interstate Commerce Commission should be required as soon as practicable to fix, either for the United States as a whole or for each interstate commerce region, the percentage by which existing rates ought generally to be increased in order to meet expenses and provide proper revenues. No rates not exceeding the present rates by more than these percentages should be regarded as unreasonable in themselves but any rate may be condemned in case it is found to produce unjust discrimination. Until these maximum percentages are given effect, the secretary of the treasury should pay to each system surrendered from Federal control the difference between the actual income and the standard return under the Federal control act if the actual income proves to be less.

7. The secretary of the treasury should be authorized to settle and pay claims on account of acts or omissions of Federal officers during Federal control, and on account of just compensation for the use of the properties. Many such matters will be left open at the end of Federal control and there should be an expeditious method of obtaining just settlement without litigation similar to that under which the War Department is empowered to settle claims growing out of orders for munitions, etc. Appeal to the court of claims should, however, be allowed in cases in which agreement is found to be impracticable. Provision should also be made for funding of balances due the United States on account of additions and betterments to the properties during the period of Federal control. The acceptance of serial notes payable within fifteen years, and bearing interest at a rate slightly above that which the Government paid on the Victory Loan, would appear to be reasonable.

8. The commodities clause, the anti-pooling clause and section ten of the Clayton act should be repealed, and the Sherman anti-trust law made inapplicable to carriers subject to the interstate commerce law.

9. The power to suspend rates pending investigation should be abolished.

10. Carriers should be given power to exchange passenger transportation for advertising in periodicals. The practice of barter should be recognized to be as legitimate as are cash or credit transactions.

American Concrete Institute Annual Convention

THE ANNUAL CONVENTION of the American Concrete Institute was held in Atlantic City, N. J., on June 27 and 28, 1918, with headquarters at the Hotel Traymore. The Friday morning session was devoted to the presentation of committee reports on plain and reinforced concrete sewers and the treatment of concrete surfaces. On Friday afternoon the members of the Institute attended the session of the American Society for Testing Materials on Ceramics, Lime and Road Materials. On Friday evening a joint meeting of the two societies was held, the session being taken up with committee reports and papers dealing with concrete and gypsum.

Three sessions were held on Saturday, the principal feature of interest to railway men being the paper on Concrete Railroad Track, presented by A. C. Irwin. The report of the Committee on Reinforced Concrete Highway Bridges and Culverts, A. B. Cohen, chairman, while devoted principally to the small highway culverts, developed some very interesting information as to types and design of highway bridges spanning over railway tracks.

Orders of the Regional Directors

VIOLATION OF HOURS OF SERVICE LAW.—Supplement 1 to Order 30 of the Southwestern regional director outlines the plan of the Interstate Commerce Commission relative to administering the 16-hour service law and suggests distributing copies of a letter signed by Clyde B. Aitchison, chairman of the Interstate Commerce Commission under date of June 13, relative to the intention of the Commission to prosecute individual officers and employees responsible for violations of this law.

Western Union Bills Against Railroads.—Order 216 canceling Order 205 of the Southwestern regional director quotes a letter from E. Marvin Underwood, general solicitor, containing an opinion from Commissioner Roper relative to the application of the tax on telegraph messages to messages transmitted under contract between telegraph companies and carriers under Federal control. The general conclusion reached by Commissioner Roper is that telegraph messages directly connected with the operation of railroads under Federal control are not subject to tax. The Northwestern regional director has issued a similar order—Supplement 3 to Circular 59.

Locomotive Maintenance Material.—Northwestern Regional Purchasing Committee Circular 68 states that many locomotives heretofore used on roads other than those to which they belong are now being returned to the owning road and that these locomotives were provided a supply of material for their maintenance peculiar to the individual engine by the using road. It is directed that this material be utilized in lieu of the purchase or manufacture of new material wherever possible.

Deferred Work in 1919 *Carryover Budget.*—Supplement 8 to Circular 25 of the Northwestern regional director outlines instructions for the handling of work reported as discontinued or deferred in the 1919 carryover budget.

Repair of Box and Refrigerator Cars.—Supplement 15 to Circular 70 of the Northwestern regional director contains instructions for the repairing of box and refrigerator cars. Car repairing forces are to be at once put on a 48-hour basis at all points where reduction has been made below that figure. Repairers who have been furloughed are to be returned to service and, where necessary, forces will be increased. After the completion of the cars now in the shops, the rebuilding of box cars of 60,000 lb. capacity or less will be discontinued until the bad order cars on hand have been repaired. The Southwestern regional director has issued similar instructions in Order 215.

Passenger Cars.—The Northwestern regional director, file 119-1-66, outlines a plan for increasing the available passenger equipment. The arrangements suggested include the withdrawal from shops or from storage of all coaches; and that no coaches be shopped during this period that are in a safe condition for service. Coaches assigned to troop movement should not be used for other purposes except by permission and the return movement of these coaches must be expedited.

Floor Racks for Refrigerator Cars.—The Northwestern regional director, file 16-1-65, states that Division of Operation, Circular CS43, has been withdrawn insofar as it applies to floor racks for refrigerator cars, and that authority should be received from the Division of Capital Expenditures before ordering material or beginning the application of floor racks in refrigerator cars not now equipped with them.

The Firemen, at their national convention, are considering a resolution to establish on a large scale co-operative stores for the benefit of all the railroad brotherhoods. The stores will be financed by sales of stock to union members.

The Wanton Destruction of Railways by the Germans*

Much More Than Required by Military Necessity; Varied with Speed at Which Enemy Retired

Translated by P. O. Buttrick

EVERYONE KNOWS THAT IN A BATTLE, a railroad line, be it on an embankment or in a cut, is always used by the infantry as a line of intrenchment or a shelter, that the rails are always employed to cover the abris (dug-out) and observation posts and that the yards and stations are always targets for the artillery and for bomb-dropping aeroplanes.

In most of the territory occupied by the Germans, the destruction has been much more comprehensive than this, and by their direct wish and action has been of a durable character.

It is good military practice for an army in retreat to destroy before the advancing enemy all lines of communications so as to impede his progress. The object should be to cause destruction of such a nature as momentarily to prevent military traffic. Rules for this are promulgated in our military engineering regulations. These covered such cases as the exploding of petards (light explosive cartridges) at certain distances along the rails and the cutting of bridges by the destruction of an arch in their middle. In fact, we have practiced such destruction where we had the occasion, for example, at Dannemarie on August 24, 1914.

The destruction practiced by the Germans was not, however, of this nature, but was carried out according to a deliberate plan, to ruin methodically the industrial regions of France occupied by them. This has been proved beyond doubt by the documents of the German General Staff in possession of the French Ministre of Finances and presented to the Interallied War Council.

The French Ministre of Public Works has stated in a report to the Senate, that there was destroyed a total of 5,600 kilometres (approximately 3,500 miles) of single track; 2,900 kilometres (approximately 1,800 miles) of narrow gage and local (as apart from main lines) track; 1,500 bridges more than 4 meters long (approximately 12 feet) and 12 tunnels.

On the lines of the North Railroad (Chemin de Fer du Nord) which runs through the sections where the fluctuations of the battle line were the greatest and the fighting the most severe (the Somme, Picardy and Flanders) 1,966 kilometres (approximately 1,250 miles) of line have been destroyed, representing a length of 2,950 kilometres (approximately 1,850 miles) of single track; 250 stations have been razed (not counting these destroyed by aeroplanes or artillery fire in regions not occupied by the Germans); all the bridges, culverts, tunnels, etc., have been destroyed, from the great bridges down to culverts of only 60 centimeters (less than 3 feet) span. In all, 860 bridges or culverts of a span greater than 4 meters and 320 of less than 4 meters have been dynamited. In addition to which 6 great viaducts and 5 tunnels have been destroyed.

An example will give an idea of the ferocity of the Germans in this destruction; on the line from d'Anor to Aulnoye (33 kilometres or approximately 20 miles) part of the line from Lille to Valenciennes, 24 works have been destroyed, 2 slightly damaged, and only a single one left intact. The destruction has not been confined to the line, and the right of way, but all the accessories of the yards and stations have also been systematically destroyed, such as signals, water towers, loading cranes and switch towers. (Practically every French railroad yard, even to the smallest, is equipped with hand or automatic loading cranes.—Translator) The switch towers were particularly marked for destruction. On these same Nord lines, there have been counted as destroyed: 1,000 hydraulic cranes, 150 switch towers, 5,400 signals and 15,500 kilometres (approximately 9,700 miles) of telegraph lines. All the buildings of the yards and stations such as waiting-rooms, store-houses for freight and railroad materials and workshops were blown up. (A more serious loss than would be the case in America, due to the fact that in France, practically all these buildings, even to the smallest, are of stone.—Translator). A detail which makes certain that the intention was to ruin everything is that the shelter houses of the watchmen at the grade crossings were demolished. These buildings could not possibly under any condition have any military value.

On the lines of the Eastern Railroad (Chemin de Fer de l'Est) where the fighting was less intense, and underwent less fluctuation, the destruction was less. The length of single trackage absolutely destroyed did not exceed 310 kilometres (approximately 195 miles) that which underwent great damage amounted to 1,475 kilometres (approximately 920 miles) but this damage manifested itself particularly in the neighborhood of the bridges, culverts, etc. Since the region traversed by the Eastern Railroad is somewhat more rugged than that traversed by the Northern Railroad, their destruction amounts to more. Where great viaducts, such as those of the Meuse in the Ardennes, are destroyed, no temporary restoration of the line is possible. This is particularly true of the line from Verdun to Givet which follows this river. There, all the bridges and other works were destroyed. From Bazeilles, near Sedan to Givet, that is to say in that part of the Meuse valley, where its walls are steepest, over a line about 80 kilometres (50 miles) in length, there were destroyed not less than 26 stone bridges, among which were 11 viaducts of more than 30 meters (approximately 100 ft.) span; 12 steel bridges and 2 tunnels. It is naturally the same in Belgium for the valley of the Sambre on the traverse of the rocky hills there. The destruction carried out in the mountains of the Ardennes (just north of the Argonne) which contain many great engineering works and through which pass the great international lines from France into Germany, has created between northern France and Lorraine, an intraversible zone. This barrier will be sooner or later overcome, but at present, one must go around its ends. The result is that although in time of peace, the lines of communication between France and the Rhine valley were numerous and rapid; they are now reduced to the single line which passes by way of Nancy.

On the lines of the Eastern Railroad, a total of about 150 bridges or culverts were destroyed. Eight tunnels were similarly destroyed, and for 2 others, the repairs made by the Germans following their destruction in 1914 give room only for a single track. Of the 8 tunnels totally destroyed, four, those near Liart, are in a soil difficult to work and their reconstruction will require a long time. The signals, the water tanks, the station buildings, the telegraph lines, in a word all the equipment of the yards and stations, were destroyed.

*From time to time the general staff of the French army issues bulletins for free circulation in its ranks. These bulletins deal with military matters or are of an instructive nature concerning certain aspects of French public affairs. This article is a translation of such a bulletin (93 new series, issued March 2, 1919), which was made by an American engineer who is now a lieutenant in a French artillery regiment.

There have been counted 3,200 signals, 100 station buildings and 150 grade crossing watchmen's shelters dynamited.

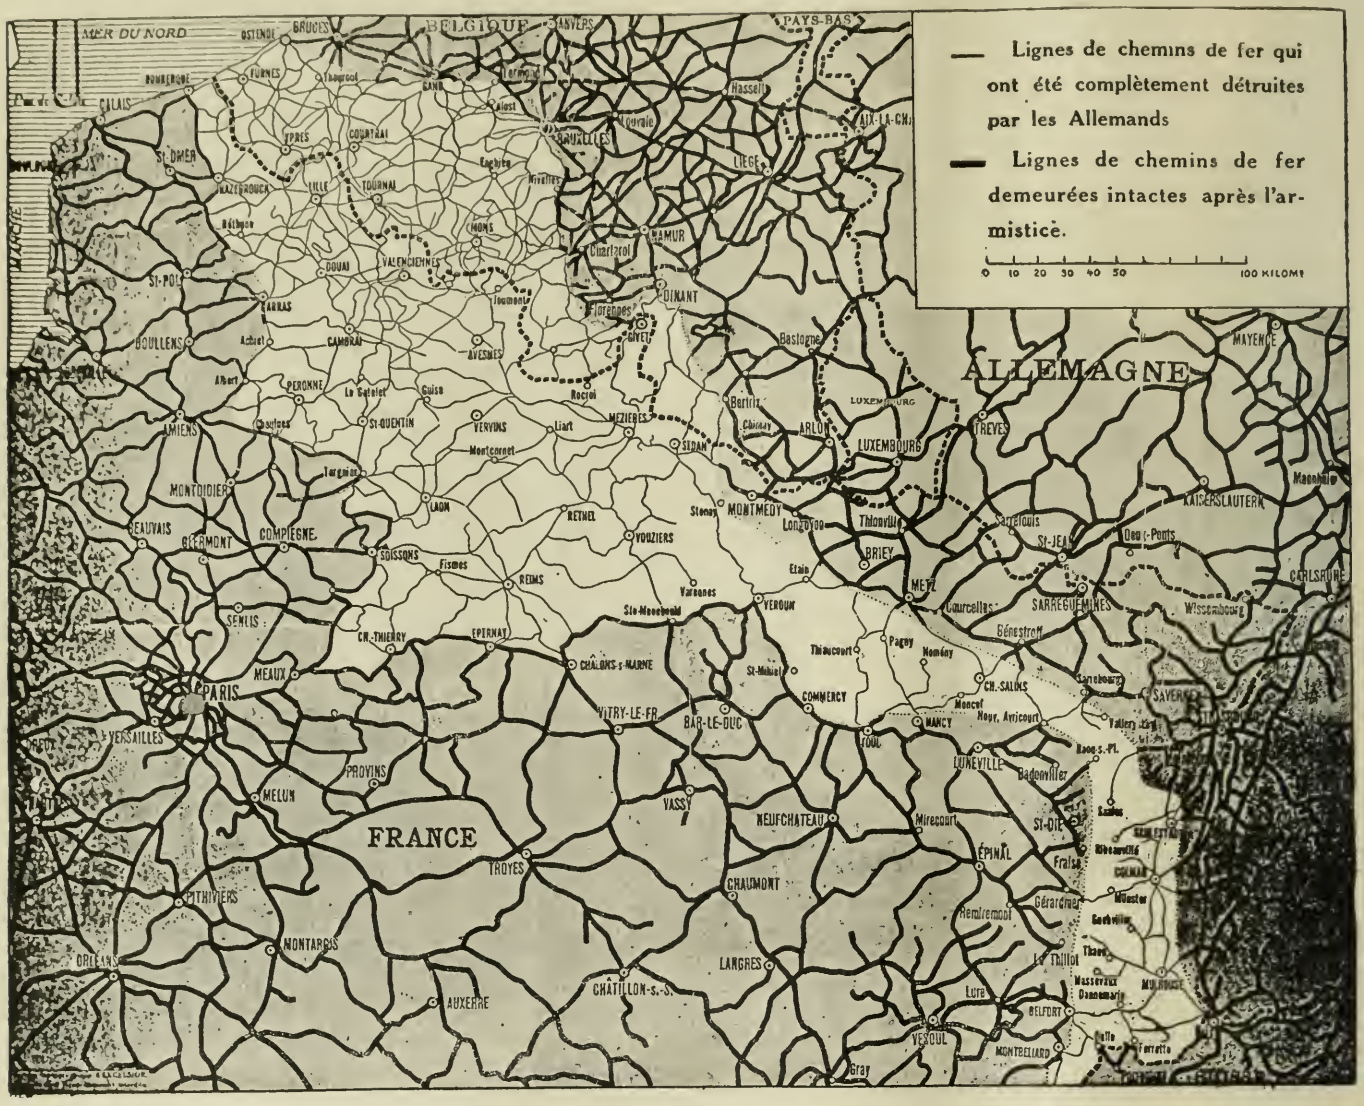
Processes of Destruction

The mere enumeration of such destruction as that of watchmen's houses, station buildings, proves that the Germans had some other object in view than a purely military one. We find still more proof in the methods with which they have conducted this destruction.

Not only have portions of the rails been removed, such as would have been sufficient to prevent the pursuit of an enemy, but often the entire track has been removed or destroyed. To separate the rails from the ties, the Boches used a special torpedoes where any two rails remained joined together, after the charrue had passed. This apparatus was employed principally on the lines of the Northern railroad. On the lines of the Eastern, the Germans confined themselves largely to torpedoing every rail joint.

To destroy the embankments, mines or torpedoes were placed from 50 to 200 metres (approximately 160 to 650 feet) apart with an explosive charge varying from 50 to 100 kilogrammes (25 to 50 lbs.). Holes capable of containing 2,000 cubic meters of material have been found in such places, where, of course, all the embankments have been destroyed clear down to the natural soil.

Toward the end of the war, when the Germans did not



Railway Lines Destroyed in France and Belgium

A map reproduced from the French newspaper Excelsior. As explained by the legend, the light lines show railroads completely destroyed by the Germans, and the heavy lines those that remained intact after the signing of the armistice.

apparatus known as a *"charrue"* (literally translated a plow —Translator). It was composed of 2 rails 6 meters long, bolted close together at one of the ends, the two other ends being separated to form a V, but united by means of two other completely united curved rails. This machine was hitched to the tender of a locomotive by means of a chain attached to the point of the V. The curved rail was then placed under the rails of the track, but above the ties by means of the removal of two rail joints. The engine then started and the charrue ripped up the track as it progressed. During this operation, a crew of men followed the locomotive and placed have time to prepare special mines, nor to carry away their artillery munitions, they made the latter up into bundles which they heaped together loosely along the tracks, in the culverts and the cellars to the stations and then exploded them.

The bridges were not simply blown out in their centre—which would have been sufficient to interrupt our pursuit for the time necessary for the Boches to retire to another defensive position—but the charges of explosive were placed beside the abutments in such a manner as to overthrow not only the masonry, but also the solid earth—natural or arti-

ficial—which supported the masonry and thus to enlarge the opening necessary to be spanned by the bridge. The great size of the charges used (1,000 to 2,000 kilogrammes or 500 to 1,000 lb.) was such that frequently the length of the span was doubled. On the lines of the Northern Railroad, culverts of 60 centimetres (less than 1 yard) were blown up with mines of such strength that the present openings have spans of 13 metres (40 feet).

The tunnels were similarly destroyed, not alone in the view to a momentary interruption, but rather in a manner to close them permanently. Such is the case of the ones at Perthes near Rethel (On one of the great international lines from France into Germany—Translator.) and at the Manse near Challeranges. They were destroyed with such a lavishness of explosives that the soil is pulverized, clear to the surface above the arch. At Perthes, there has already been removed at the two extremities 70,000 cubic metres (87,500 cubic yards more or less) of material, without having yet reached any portion of the vault still standing. At Manse, it is estimated that 175,000 to 200,000 cubic meters will have to be removed before passage can re-established.

Another scheme adopted by the Germans was to leave mines with slow acting fuses which would not cause an explosion until long after the line was again in French possession. On the lines of the Northern Railroad alone, there have been counted 250 mines with delayed fuses, most of which did not explode for several weeks or even several months, after the Germans abandoned the lines. Certain places were mined so as to be destroyed twice or even three times. For example, the Boches on leaving blew up a bridge knowing that the first care of the French would be to re-establish a passage. After the explosion, they would plant a mine with a delayed action fuse, which would explode in the same place a dozen days later. After the explosion of the second one, they figured that the French would consider it as finished this time, and recommence the work in a permanent fashion. So they placed also a second mine with delayed action fuse to explode a month later. The positions of these mines were calculated so as to enlarge each time the mine crater. This system was notably employed at a bridge at Roye, but the French were able to prevent the last explosion. Another stratagem frequently employed by the Germans was to place a mine with a retard action fuse in the crater of one already exploded. They counted upon this not only to multiply the number of victims, but also to cause a state of demoralization such that no one would dare to go near the lines.

Difficulties of Work of Reconstruction

From the extent of this destruction, one may deduce the size and difficulties of the reconstruction of these lines. It is necessary in effect to reconstruct the track *"à l'avancement"* in the same manner as were built the great trunk lines in America or the Transsiberian Railway, that is to say as one proceeds in countries where there does not exist any other means of transportation, the rails already laid, serving to bring forward the materials for the continuation of the line. This is especially true, since the highways are still in too poor a state to permit the bringing up of the heavy materials, even if there were automobile trucks powerful enough to transport the heavy steel girders, necessary for the bridges and viaducts at certain points.

The work of laying the track is not all. Everyone knows that a railroad cannot function without coal and water stations at different points along the line. There is also to be considered the replacing of the signal system. The yards at station at Valenciennes alone, had 272 signals of various kinds, all of which were destroyed and whose replacing is a long and delicate operation.

Supposing the track re-established and the yards re-equipped, can the traffic be easily re-opened? No. There remains to be reconstructed the buildings for sheltering merchandise and protecting it against pillage and for lodging the personnel.

Because of this destruction, certain localities have been and still are completely isolated. When traffic has not been entirely prevented it has been forced to detour. It is thus that all the traffic from France toward Alsace-Lorraine and the Rhine valley, cared for before the war by seven lines, has been reduced to a single indirect line by way of Nancy. The great trunk line from Paris to Metz was destroyed for a great distance in the Argonne and at Verdun, and it will not permit of a heavy traffic for a long time after its re-establishment.

The great viaduct at Dannemarie in Alsace, between Belfort and Mulhouse has not yet been re-established and has been replaced by a detour over an unstable soil which in wet weather can carry only light trains.

The New England District Director

James H. Hustis has resigned as district director, New England district, United States Railroad Administration, effective July 1, and has been succeeded by Percy R. Todd, who has been acting as assistant to the district director.

The New England district consists of all New England railroads under federal control, including such parts of those roads as extend into New York state and into Canada, and Mr. Hustis was appointed to the position when it was created June 10 of l[illegible] year.

Percy R. Todd

When asked as to the significance of the resignation Mr. Hustis said that the probable return of the railroads to private operation on December 31 placed on him a special obligation in connection with the Boston & Maine, of which he has continued to be the receiver. There are many details to be arranged for in connection with the return of the railroads to their owners, as well as in preparing for their organization after their return, and Mr. Hustis will give his entire time to this work as applied to the Boston & Maine.

Percy R. Todd was formerly president of the Bangor & Aroostook. He was born December 4, 1859, at Toronto, Ont., and attended the Collegiate Institute at Ottawa, Ont. He began railroad work as a clerk and telegraph operator on the St. Lawrence & Ottawa, now part of the Canadian Pacific. In 1875 he became the Canadian agent of the Ogdensburg & Lake Champlain. In 1882 he was made general traveling agent of the National Dispatch Line with office at Chicago, and three years later became commercial agent of the New York, West Shore & Buffalo. In December, 1885, he was appointed chief clerk in the general freight department at New York, and a year later was made general freight and passenger agent of the Canadian Atlantic. In 1889 he was made general freight agent of the West Shore and in 1892 was promoted to traffic manager. In 1901 he was elected second vice-president of the New York, New Haven & Hartford and two years later was elected first vice-president. He went to the Bangor & Aroostook as vice-president in 1907 and in 1913 was elected president.

American Society For Testing Materials

A Brief Report of the Proceedings of the Annual Meeting Held Last Week in Atlantic City, N. J.

THE TWENTY-SECOND ANNUAL MEETING of the American Society for Testing Materials was held at the Hotel Traymore, Atlantic City, N. J., June 24 to 27, 1919. The evening session of the opening day was devoted to the annual address by the president, Guilliam H. Clamer, and a memorial session in honor of the memory of Dr. Edgar Marburg, the secretary-treasurer of the society from 1902 until his death on June 27, 1918. The following is a brief abstract of some of the many reports and papers presented at the meeting which are of particular interest to railroad men.

Committee on Steel

The committee on steel made a number of recommendations in reference to changes in both standard and tentative standard specification and proposed a new tentative standard specification for plates for forge welding. Revisions were proposed in the existing standard specifications for open-hearth steel girder and high tie rails by which the present drop test requirements would be replaced by a ball impression test. Sections 7 to 10, inclusive, of the present specifications specifying drop tests requirements were recommended to be omitted and replaced by the following sections 7 to 9 renumbering the remaining sections of the specifications.

7. (a) Four representative sections of rail from each melt shall be selected by the inspector as test specimens.
(b) Excess scale on the head of the section shall be carefully removed.
8. (a) The head of each specimen shall be subjected to a pressure of 50 net tons (100,000 lb.) for a period of 15 sec., applied through a ball ¾ in. in diameter.
(b) The average depth of impression obtained on the four specimens shall not be more than 3.8 mm. for class A rails, nor more than 3.6 mm. for class B rails.
9. If the average of the impression tests from any melt fails to conform to the requirements specified in Section 8 (b), the manufacturer may, at his option test each rail from such melt by making an impression test on the web, as described in Section 8 (a). Rails so tested which conform to the requirements as to depth of impression specified in Section 8 (b) shall be accepted.

The tentative specifications for steel tie plates (A67-18T) and for low carbon steel track bolts (A76-18T) were continued as tentative for another year without change.

Specifications For Plates For Forge Welding

The chairman of the Tank Car Committee of the Master Car Builders' Association, A. W. Gibbs, requested Committee A-1 to issue a specification for forge-welding plates suitable especially for tank cars.

This matter was referred to a sub-committee and initial work taken up with particular reference to the M. C. B. Class V tank car.* The specifications for this car call for a bursting pressure, based on the lowest tensile strength of the plates, of not less than 960 lb. per sq. in., and require that all seams shall be welded. The material specified is steel, complying with the American Society for Testing Materials specifications for boiler plate steel, flange quality, with the lowest carbon content consistent with the strength prescribed for the purpose of welding.

The requirements of the American Society for Testing Materials specifications for boiler steel, flange quality (serial designation: A30-18) are:

Chemical Composition.

Carbon, per cent	0.30—0.60
Manganese, per cent	Not over 0.05
Phosphorus, per cent { Acid	Not over 0.04
Phosphorus, per cent { Basic	Not over 0.05
Sulphur, per cent	

No increase allowed for check analysis.

*See M. C. B. Proceedings, 1918, page 903, for the Class V tank car specifications. This car is intended for the transportation of liquid products, whose properties are such as to involve danger of loss of life in the event of any leakage or rupture of the tank.

Physical Properties

Tensile strength, lb. per sq in.	55,000-65,000
Yield point, lb. per sq. in.	0.5 tensile strength
Elongation in 8 in. per cent.	1,500,000
	Tensile strength

Reduction in elongation allowed for increased thickness. There apparently was some objection on the part of the fabricators to using steel of such high tensile strength for welding; hence it was proposed that a softer grade should be specified. The following specifications for plates for forge welding were recommended to be adopted as tentative.

Chemical Properties

The steel shall conform to the following requirements as to chemical composition:

Carbon	Not over 0.18 per cent
Manganese	0.30-0.60 per cent
Phosphorus	Not over 0.04 per cent
Sulphur	Not over 0.05 per cent

Physical Properties

The material shall conform to the following minimum requirements as to tensile properties:

Tensile strength { Plates ¾ in. or under in thickness	48,000
lb. per sq. in. { Plates over ¾ in. in thickness	45,000
Yield point, lb. per sq. in.	0.5 tensile strength
Elongation in 8 in. per cent.	1,500,000
	Tensile strength

The sub-committee was advised by Mr. Gibbs that "the question of tensile strength is subordinate to that of the welding qualities, for if the chemistry required involves low tensile strength, the specified bursting strength can be obtained by increasing the thickness of the plates." The opinion seems to be unanimous that a soft steel is necessary, the general aim being for a carbon content of from 0.08 to 0.12 per cent for satisfactory welding properties. Having fixed the maximum carbon at 0.18 per cent, and bearing in mind the lower values which are worked to, it was seen that the tensile strength of thick plates would surely drop below 48,000 lb. per sq. in., but that the lowest carbons in the thinner plates would probably not run the tensile strength below 48,000 lb. Therefore, in order to permit designers of welded tanks of this figure, the tensile strengths have been specified at 48,000 lb. for plates ¾-in. or under and 45,000 lb. for plates over ¾-in. in thickness.

Other Committees

The Committee on Non-Ferrous Metals and Alloys recommended that the present tentative specifications for bronze bearing metals for turntables and movable railroad bridges be continued as tentative. The question of revision of the tentative specifications for non-ferrous alloys for railway equipment was considered but since the question is being taken up by the government it was considered unwise to attempt any change at present and the committee recommended that these specifications be continued as tentative.

On Malleable Castings

During the past year criticisms were made of the tentative specification covering malleable castings for railroad, motor vehicle, agricultural implements and general machinery purposes. One was that the castings do not show as high tensile strength and elongations as the test bars. The other was that iron made to these specifications was hard to machine. A sub-committee was appointed to obtain data on the relation of tests from bars and from castings, and to report their findings. The same sub-committee was asked to look

into the necessity of separate specifications for malleable iron where good machining qualities are required.

Cements for Producing Quick-Hardening Concrete

By P. H. Bates

In the course of the investigations which the Pittsburgh branch of the Bureau of Standards has been conducting dealing with the various problems relating to Portland cement, there have been made a number of cements which are characterized by a very high early strength. This is developed when the cements are used either as mortars or concretes. These cements have been made in a manner differing in no wise from that used in the manufacture of Portland cement. However, the composition of the materials entering into their manufacture was decidedly different, limestone and calcined alumina having been used in some of the raw mixes, and in others the alumina was replaced in part by kaolin or bauxite in order to determine the effect of impurities on their general properties. While such materials have been the subject of research by others, their property of developing very high early strengths is not generally known. It is believed that the data presented in this paper, especially that dealing with the concrete, are the first of their kind ever presented.

The data dealing with the aluminates are augmented by some obtained in making concrete from "Sorel cement" which, as is generally known, is light calcined magnesite gaged with magnesium chloride. As it obtains the greater part of its strength within 24 hr. and as this strength equals that obtained by a Portland cement at the end of two or three weeks, the possibility of using it becomes very attractive.

The fact that magnesium oxide when mixed with a solution of magnesium chloride will harden was possibly first known by Sorel in 1853. From him it has at least taken its more common name. At the present time this cement is used in rather large quantities for making a resilient flooring which is usually referred to as "composition flooring." When so used the aggregate is composed of asbestos fiber, sawdust, inert finely ground filler as sand and coloring matter. This flooring is widely used in a monolithic form in office buildings, passenger and subway cars and interior ship decks.

Table Comparison of Compressive Strengths of Sorel and Portland-Cement Concretes

6 by 12-in. Cylinders. Strength in Pounds per Square Inch

Proportions by volume	Percentage of cement by weight: Portland	MgO.	24 hours: Portland	MgO.	48 hours: Portland	MgO.	7 days: Portland	MgO.
GRAVEL AGGREGATE								
1 : 0.5 : 1.5	33.3	20.3	....	1740	1570	3490	2965	2910
1 : 1.0 : 3.0	20.0	11.3	....	1705	1115	2260	2020	2850
1 : 1.5 : 4.5	14.3	7.8	....	1755	680	2145	1430	2240
*1 : 1.5 : 4.5	....	14.3	....	2880	...	3315	....	2720
LIMESTONE AGGREGATE								
1 : ⅔ : 1⅓	35.2	21.8	....	2985	2260	3990	3930	4320
1 : 1⅓ : 2⅔	21.4	12.2	....	1940	1340	2805	2990	2970
1 : 2 : 4	15.4	8.5	....	1935	655	2330	1755	2480
*1 : 2 : 4	....	15.4	....	3270	....	4020	....	4320
COARSE SAND AGGREGATE								
1 : 0.5 : 1.5	34.0	20.8	....	2060	1715	2570	3270	2735
1 : 1.0 : 3.0	20.6	11.6	....	1910	545	2225	1635	2430
1 : 1.5 : 4.5	14.7	8.0	....	935	325	1695	985	1870
*1 : 1.5 : 4.5	....	14.7	....	2555	....	3260	....	3190

Note—The percentage by weight of MgO in 1 : 0.5 : 1.5 and 1 : ⅔ : 1⅓ is but very little greater than the percentage by weight of Portland cement in 1 : 1.0 : 3.0 and 1 : 1⅓ : 2⅔, respectively.

*MgO proportioned by weight, making weight percentage of MgO equal weight percentage Portland cement in 1 : 1.5 : 4.5 and 1 : 2 : 4.

Recently a mortar very similar in nature to the above, excepting the omission of the fibrous material, has been rather successfully used as a stucco.

The Table shows the strength of the concrete made from this mixed oxide and also the compressive strength developed by a Portland-cement concrete using the same proportions of the same aggregates. Notwithstanding the fact that the specific gravity of the magnesia is very close to that of Portland cement (3.08 for the magnesia and 3.12 for the cement), the volume occupied by the same weight of the two differs very materially.

The results show that the Sorel-cement concretes, with but two exceptions, have a strength at 48 hr. greater than that obtained by the use of Portland cement in 7 days. However, there is in general but little increase in the strength of the former between the 48-hr. period and the 7-day period.

Attention should be called to the difference in the manner in which the hardening of the two concretes takes place. In a Portland-cement concrete, the cement hardens by the action of the added water. During the process of hardening it is immersed in an atmosphere containing in a greater or less degree one of the essential elements of the process, that is, water, either as a liquid or vapor. On the other hand, in the Sorel-cement concrete the hardening takes place as a result of the action of the chloride on the oxide.

While the results do show the lack of proper proportioning of both the magnesia and the chloride, yet these poorly proportioned concretes show in 24 hr. as high strengths as the more properly proportioned Portland-cement concretes show in seven days. Another point should be remembered in regard to these Sorel-cement concretes, that is, they cannot be frozen. Temperatures below freezing will retard the hardening to a degree, but the freezing point of the solution is so low that no care need be taken to prevent damage from low temperatures.

The conclusion with respect to the aluminates of lime, even when they contain such amounts of impurities as 10 per cent silica and 3 per cent iron oxide, is that they constitute a material which is a very valuable cementing medium when gaged with water. This particular value lies in the high early strengths which they develop. The greater the amount of the alumina present, as an aluminate of lime, the greater will be the early strength. Under certain conditions of curing there is a marked increase of strength with age, but this does not extend over a very long period of time. It also appears that if the concrete is subjected to an excess of water during curing there will be a decrease in strength. Such amounts of moisture as are usually present in the air do not materially affect the strength. It appears, therefore, that these cements might be of considerable value for certain special uses, where the principal requisite would be quick hardening.

Deep Etchings of Rails and Forgings

By F. M. Waring and K. E. Hofammann

This paper presents the results of some deep etchings with hot acid on both new and old rails and forgings. Under this process defects in the steel, having the appearance of cracks, have been developed to visibility. These defects could not be found with light etching and apparently are caused by actual cracks in the steel extending through solid crystals as well as following the crystallin boundaries.

A slab taken from a rail which had developed 12 transverse fissures when broken under the drop test was etched for two hours in a hot solution of 9 parts hydrochloric acid, 3 parts sulfuric acid and 1 part water. The action of the acid opened up both transverse and longitudinal fissures whose existence could not be detected under the light etching to which this slab had previously been subjected. This specimen was from an old rail which had been in the track for about five years, and the entire heat, consisting of 61 rails, had been removed on account of a number of failures from transverse fissures. Similar treatment of a slab from one of the rails in the same heat which did not contain any transverse fissures showed the section entirely free from any

of the cavities which were opened up in the specimen mentioned above.

This investigation by means of deep etching with hot acid has developed the existence of interior defects in rail heads, which defects appear to be more frequent in rails that have developed a number of transverse fissures than in others which had only a few or no such fissures. They have also been found to exist in new rails which have not been in the track. It appears that these concealed defects cannot be detected by the usual methods of investigation and tests, or even by the usual method of etching.

Microscopical and chemical examination of the sections containing these defects have not, so far, developed the existence of any inclusions between the faces of the cracks and there is no apparent difference in the microstructure of the steel in these locations which would account for the action of the acid. After one of these cracks has been lightly developed and the surface polished and examined under the microscope the defect has been found to extend through the crystals, as well as following the boundary lines.

Discussion

This paper brought on a lively discussion the consensus of opinion being that the cause of the cracks must be sought in the mill during some stage of the fabrication of the material. H. J. Force, chemist for the Delaware, Lackawanna & Western drew attention to the variation in rails of the same heat, some of which develop cracks or transverse fissures while others do not. He suggested that the first rails of a heat were likely to be defective, if any of the heat were, due to the fact that the steel had had less time in the ladle for reaction and purification.

Proportioning Pit Run Gravel for Concrete

By R. W. Crum

The material considered in this paper is pit-run gravel, to be used without change as it comes from the pit, the problem being to establish some relation between grading and the amount of cement such that, for mixtures of the same plastic consistency, concretes of equivalent strength could be designed. The principal conclusion is that the grading of pit-run gravel may be measured by the ratio of fine aggregate to total aggregate (that is, percentage of fine aggregate in total) and by the weight per cubic foot of the material, measured loose. For purposes of commercial convenience the dividing line between fine and coarse aggregates is taken on the common No. 4 sieve. The analysis results in the development of several diagrams for use in proportioning pit-run gravel for various classes of concrete on the basis of the weights of the aggregates in terms of percentages of sand in the aggregates.

Other Business

Among other things considered at the meeting were the topical discussion on magnetic analysis in which Dr. P. H. Dudley presented a paper on Magnetic Surveys on New and Failed Rails; a paper presenting Theoretical Studies of the Surface Method of Proportioning as Applied to Concrete by R. B. Young, which supplements the papers on the same subject presented by L. N. Edwards at the annual meetings of 1917 and 1918.

The following officers were elected for the ensuing year: President, J. A. Capp; vice-president, C. D. Young; for members of the executive committee, Ernest Ashton, H. F. Moore, C. F. W. Rys, and Admiral D. W. Taylor.

The laws to return the telegraph and telephone lines to their owners (July 31) and to abolish the daylight saving law next October, have both been sent to the President.

The Permanent Solution of the Railroad Problem.*

By Walker D. Hines

Director General of Railroads

There is a great deal of discussion amout the merits of private management as compared with interference by the government in the management, and there is a disposition to forget what sort of private management was left in this country before government control began, and to imagine that there was a form of private management free from government interference. The fact, however, is quite otherwise, and we have made great strides in this country toward a condition where the government was directing in a most effective way some of the most vital things with which railroad management had to deal.

We have got to a condition where private management was management only in a partial sense, and where already there was government management through the control which the government had for some years exercised over the railroads in determining the prices charged for the commodity which they had to sell, namely, railroad transportation. In some states, the rates were fixed absolutely by the state authorities. In other states they could only be fixed by the railroad companies with the consent of the state authorities. In practically all states the railroad companies' rates were subject to change by the state authorities. As to the interstate rates, which constitute the great bulk of the business of the railroads, all the rates were subject to the control of the Interstate Commerce Commission, and by a statute passed in 1917, no increase in rate could be made until January, 1920, without the prior consent of the commission. So that we had a situation in this country where prior management had little if anything to do with the rates to be charged. That already, was a matter of public management in a broad sense.

As to service, the states had begun a good many years ago to determine what should be done in the way of service. They prescribed the passenger trains which should be run, the sort of station accommodations which would be afforded. They had begun to make provisions about the operation of freight trains.

Part of these things were for the purpose of affording the public a satisfactory service, and part of them were for the purpose of protecting labor through giving it suitable working conditions. But in these matters affecting service, the state governments for years had taken an active part in the railroad management. So that even there the theory of private management was a theory only.

As to interstate matters the government had not gone so far as to determine service, although it had virtually determined what should be done in safety operation, which had been taken out of the hands virtually of the railroad companies. But we were just seeing the beginning of the government determinations of what should be done in the way of service. We were headed in the direction of a progressively increasing participation by the government in the settling of problems of service, so that we had not only in reference to the rates practically entirely taken it out of the hands of the railroad management, but we had seen the service in a general way taken out of the hands of the railroad management likewise.

As to wages the situation was exceedingly difficult. There were no satisfactory tribunals to deal with the matter. There had been, to be sure, an increasing appreciation of the fact that labor not only asserts but is entitled to a voice in determining these matters which are of fundamental importance

*From an address before the New England Bankers Association, at Swampscott, Mass., on June 21, 1919.

to labor. We had no machinery with which to deal with it, and yet the state governments were dealing with the matter of working conditions in all sorts of ways; the courts had been called on to deal with the matter of wages through the passage of the Adamson act on account of the failure of the machinery to settle that matter, and there again we were headed in the direction where the government must assert itself in the determining of these problems; and therefore must take over to a large extent these problems, out of the hands of private management.

When we remember those matters it will help us to remember that private management does not mean exactly what it says. At the beginning of federal control it was already seriously qualified and the qualifications were becoming more serious. They were simply an expression of the growing appreciation that the interests involved were not merely the interest of the owners of the railroads, but the interests of the public in service and the interests of labor in the pay which it received and the conditions under which work was performed.

When we remember these matters it will help us to realize that it can never be a full private management. That we must find some form of management of the railroads which would go to reflect what the public will insist on in the matter of public control, as to what it pays for the service, as to what service it gets, and will reflect what labor may rightfully insist on, that it is entitled to a voice in determining the wages it shall get and the conditions under which it shall work. So that is our problem, and when we look at it in that way we can see that it is largely a difference in form rather than in substance, between one form of government regulation and another form of government regulation, because in one way or another the government must regulate this matter to protect the interest of all the parties concerned; not merely the owners, but the general public and also of labor.

I have had occasion to give years of study to these problems from the standpoint of private management and I have had occasion to give nearly two years of study to it from the standpoint of the public, and I want to give some of my impressions about public regulation under private management; as to what would be the proper way to solve these problems for the future. We know the old form of private management and the old form of public regulation did not seem to work well together. For years there had been increasing embarrassment on the part of the railroad companies generally in raising money necessary to meet public service and needed for improvements that seemed to be a progressive matter and was getting more and more embarrassing to the railroads that were less able to induce anybody to put more money into the railroads; because the railroads were not able to issue new stock and sell it at par, that was because everybody was afraid of the stock and the railroads were having trouble borrowing the money to go into the property and were having to borrow new money for that purpose. That meant that the debt was increasing out of proportion to the total assets and that means that the margin of safety over and above what went into it was diminishing, so that the situation was that the railroads were constantly having to borrow more money in order to build new lines, new terminals and to make the needed improvements and that the margin of safety was diminishing and gradually being impaired, resulting in the railroads having to pay a higher rate of interest and that situation meant that the railroad enterprise of the country was headed toward failure. Then federal control came along and took charge of the situation.

How are we going to prevent a re-currence of that situation which existed when federal control began? I will try to give you in a few words the situation under the old form of public regulation of railroads. In the first place there was a general rule by which regulation was to be conducted on the general notion of a fair return on a fair value of the railroad property, but the fair value was not ascertained and the fair return was not definite. Every man was entitled to his own opinion on each of these and the result was that it was almost impossible for any tribunal to agree as to how the matter ought to be settled. And the old fight would start over again and all of the plausible arguments would be made. That led to the greatest uncertainty in the administration of railroad regulation.

We have in this country 181 railroads with a revenue of $1,000,000 a year each and several hundred railroads of less revenue than $1,000,000 a year each. All of these railroads, big and little, were necessary in some way to the public service, and anything that might be done in the solution of the rate or wage problems seemed to result in giving some of the railroads more than they needed, and thereby creating popular dissatisfaction and at the same time giving some railroads so much less than they needed that it was almost impossible for them to perform the public service which they were supposed to perform, and therefore, it was almost impossible to fix any rate that would reasonably meet the needs of the strong railroads and the weak railroads and failure to combine and satisfy that situation started a new agitation on both sides.

My idea is that there ought to be a definite statutory basis for the regulation, and it ought to be ascertained what the value of these properties is. There ought to be a prescribed rate return to which they are entitled, and that ought to be assured by some mandatory or statutory provision, and the rate must be so fixed as to produce that return, and beyond that, I think it ought to be provided that if an additional return shall be yielded from those rates, that a sum to be determined for that purpose is to be put back into the property for improving the property in order to keep pace with the increase in demands of business and that the money thus put into the property out of the earnings shall not be capitalized so as to further add to the value of the property. That would provide that the earnings made in excess of what was necessary to operate this property upon a standard return would be put back into the property without being capitalized. This would lead to the question of the public getting the improvements, and they would not have to pay for this exploitation without any limitation of the public having the benefit thereof.

Another thing that I would recommend would be a consolidation of the railroads of this country into a few large competitive systems, all of which shall present a fair average of railroad condition, so that regulation can be applied to them, and we will realize approximately uniform results as to all of them. I believe from 12 to 20 great railroad systems could be created in this country, each one of which would present a fair average of all the railroad conditions, and those railroad systems could be so arranged that every important city that now has competition would continue to have competition between the stronger railroads, and I believe if these things can be done, that will present a remedy.

Another feature that I want to present to you is this, as between regulation of the railroads and the management of the railroads under private ownership, that as a matter of fact, the government is in partnership with the owners of the railroad. The government furnishes the franchises, and the owners furnish the money, and those two things have to be done in partnership. My judgment is this situation ought to be met by having a government representative on the board of directors, and in this way he will come directly in contact with the interests of the private management, so that he will be familiar with the business, and the situation, and will be able to act better in connection with private management, and I think it would be well for the regulating bodies to

have some of its members on the board of directors, so that the regulating body will have in mind the business necessities of the situation, and so that the private management will come in contact with these government directors and the other members of the regulating body, and they will thereby have first hand information as to the legitimate needs of the public and the corporation. I believe these things will make public regulation of private management successful, and I believe when these things are done it will at least go far in correcting the evils, and I think if these are not done, that public regulation of private management is going to be a failure.

Railway Affairs in Congress

WASHINGTON, D. C.

HEARINGS BEFORE THE HOUSE COMMITTEE on the Cummins bill to give the Interstate Commerce Commission power to suspend the director general's rates were concluded on June 27. While Mr. Hines in his first day's testimony had discussed the bill on the assumption that Congress intended to pass it and did not oppose it, in his concluding testimony on June 26, he said he thought it would be a wrong policy to give the commission power to suspend for 10 months rates proposed by the Railroad Administration without any responsibility for substituting rates for those which it might consider unreasonable and that the time required by the commission might so delay a rate advance that the government would not get the benefit. For example, he said that if an advance should be announced in July and the commission should require two months to pass on it, the rates would not become effective until October 1; or only three months before the time set for the return of the roads.

Representative Sims asked a direct question as to whether the Railroad Administration is contemplating a further increase in rates.

"We are giving very careful consideration to that problem," replied Mr. Hines, "but have reached no conclusion."

Chairman Esch asked Mr. Hines to suggest the language of an amendment carrying out his idea that the purpose of the bill could be accomplished by a simple amendment giving the commission the right to suspend rates for a specified time less than that provided in the present law. In connection with the length of this period, Commissioner Hall of the Interstate Commerce Commission remarked that the commission had passed on the first 15 per cent case in 60 days and it was suggested that Mr. Hines and the commission confer on a proper period.

B. B. Cain and B. M. Robinson, of the American Short Line Railroad Association, suggested that the judgment clause of the bill be modified so that the director general could pay judgments out of any funds he might have, because some roads under federal control have no compensation, and that Section 1 of the control act be amended to permit the Railroad Administration to enter into contracts wih electric interurban railways. The latter was opposed by C. E. Elmquist, representing the state commissions, who declared that there was no war necessity for taking over electric lines and that the purpose was to give them the two days free per diem and the advanced rates.

Clifford Thorne, who is credited with sharing with Senator Cummins the authorship of the bill, defended it vigorously against criticism. He thought it would be a very wise policy to restore the state jurisdiction, saying that there is now pending before a district committee of the Railroad Administration a proposal to cancel the Kansas state rates. Because of the uncertainties facing business during the reconstruction period he thought there should be a delay in the return of the roads and that their guaranty should be paid out of the treasury rather than by an advance in rates which would affect shippers differently because many of them cannot pass an advance along to the consumer but must necessarily absorb it.

"The federal control law, as worded today," Mr. Thorne said, "provides that our railroads are subject to the statutory law, state and federal, and to the common law except where they may conflict with orders of the President. According to the decision of several courts, state and federal, this law has conferred upon the President legislative powers. It has made him superior to our state laws, to our federal laws, to our courts and to the United States Congress by its own act. And Mr. Hines has appeared before you requesting that the clause requiring the railroads to be subject to the law of the land except where such law conflicts with the orders of the President should be retained. I could cite to you instance after instance where this enormous power has been exercised. And the President has conferred this colossal power upon the quiet-spoken, courteous gentleman who addressed you yesterday, a gentleman who has no superior in keen, far-sighted, shrewd ability of the very highest type among all the railroad men of the United States with whom I have ever come in contact.

"No organized industry in the history of this nation ever had conferred upon it such colossal power as you have given to the organization of railroads headed by Mr. Hines, formerly of the board of directors of the Atchison, Topeka & Santa Fe, in what is known as the United States Railroad Administration. Now hasn't the war emergency ceased for the present at least, so far as the United States is concerned? And is it not time to put business back on the normal peace basis just as quickly as possible? That is what the American people want. They are begging for it.

"There is a sort of halo around the head of this man Hines. It isn't simply an ordinary crown. It is more exalted than that. Mr. Hines, sitting here in this room, a man who has spent his lifetime in railroad service and who undoubtedly expects to spend the rest of his life in the employ of railroads, has been authorized by the United States Congress and by the President to set aside acts of Congress, legislatures, and decisions of commissions and courts. I think we are pretty well agreed that it is time for crowns and halos and scepters to be put into the discard. We want that clause which says, in effect, that the laws of this country shall apply to our railroads except where such laws conflict with the orders of His Majesty, the Right Honorable Mr. Hines, formerly of the Santa Fe Railroad, stricken from the statute books.

"Not one word of this should be interpreted as a personal attack on Mr. Hines or any of his associates, to the slightest extent. It is simply a criticism of a system, which we believe is fundamentally wrong under peace conditions.

"It is of paramount importance that you immediately restore the full powers of the Interstate Commerce Commission, and of the courts, to the condition existing prior to the war. The railroads are conscious of the fact that they have only a short tenure of the supreme power you gentlemen have granted to them. During this interim of six months you may expect to see sweeping changes in rates and regulations governing transportation unless the power of review of such changes before they become effective is lodged in some disinterested tribunal."

The House committee has tentatively decided to begin hearings on general railroad legislation on July 15. Senator Cummins has not yet appointed a subcommittee to draft the railroad bill.

By a vote of 8 to 6 the Senate committee on June 26 decided to postpone action on the Poindexter long and short haul clause bill for consideration in connection with the proposed bill on general railroad legislation.

Doings of the United States Railroad Administration

New Instructions for Maintenance of Way Expenditures Issued to Regional Directors

WASHINGTON, D. C.

THE BILL APPROPRIATING AN ADDITIONAL $750,000,000 for the revolving fund of the Railroad Administration was signed by the President on June 30 in mid-ocean, having been delivered to him on board the steamship "George Washington" by a courier who had sailed from New York on another boat which met the President's ship. This means that the Railroad Administration will soon have funds to retire its certificates of indebtedness issued to railroad and equipment companies, on which they have borrowed from banks or the War Finance Corporation, and to pay the $441,000,000 balance due the railroad companies for 1918. Funds cannot be paid from the Treasury until the Treasury Department has received a certified copy of the law, but the Railroad Administration arranged to assist the railroad companies in meeting their July 1 requirements by paying out a considerable amount of cash on account of compensation from its working capital in view of the fact that its funds were soon to be available. The estimated requirements of the railroad companies for July 1 were $190,000,000. The War Finance Corporation has announced the following additional loans to railroads: Central Railroad of New Jersey, $768,800; Chicago, Burlington & Quincy, $2,216,000; Delaware & Hudson, $1,000,000; Northwestern Pacific, $540,000; Wheeling and Lake Erie, $24,480.

Railroad Administration Inquiring for Rail

The Railroad Administration is considering placing an additional order for rail. The 200,000 tons recently ordered will be delivered this month and it is expected the new order will be placed soon. Inquiries as to prices have been made of the steel companies.

Car Surplus Reduced

The net surplus of freight cars in the United States and Canada was reduced during May from 385,447 to 301,368, according to the monthly report compiled by the Car Service Section. Excluding the Canadian roads the net surplus was 284,828, as compared with 365,560 on May 1. The latest report represents the average for the month rather than the situation as of the first of the month. Of the total surplus, 145,737 were box cars, most of which are being held in the west in preparation for the grain traffic. There were also 99,974 surplus coal and gondola cars. The shortages are scattering and consist mostly of box cars. On June 1, 1918, there was a net surplus of 71,000 cars; on June 1, 1917, there was a shortage of 105,000 and on June 1, 1916, there was a surplus of about 50,000. The present net surplus represents a reduction of 36 per cent from that of March 1, the high point this year, when it was 473,000. The detail figures by regions are given in the table.

Arrangements to Put Permit System Into Effect

The organization of the necessary machinery for the permit system on grain has been perfected and the system will be put into effect as soon as it appears to be necessary to prevent the clogging of the railroads which has frequently occurred in the past with resulting loss to farmers and grain dealers. In no other way, Mr. Hines says, can the railroads be used to their maximum capacity in times of heavy business. Without such control consignors will load more grain than can be taken by consignees and thus loaded cars will accumulate to such a point as seriously to obstruct transportation, create car shortages and produce widespread inconvenience. Public announcement will be made before the system actually is put into effect.

The following plan has been adopted: Grain control committees will be appointed in each of the following primary markets: Duluth, including Superior, Minneapolis, including St. Paul, Milwaukee, Chicago, Peoria, St. Louis, including East St. Louis, Kansas City, St. Joseph, Omaha, including Council Bluffs, Detroit, Toledo, Cleveland, Cincinnati, Indianapolis, Wichita, and Fort Worth. Each committee will consist of three members, two representing the Railroad Administration and one the transportation division of the United States Grain Corporation.

In lieu of the individual permit system that obtained last year, and which will only be continued this year on a portion of the traffic, a so-called "blanket permit system" will be put into operation this year, at least at the outset, and until it may develop that this plan does not accomplish the desired purpose.

The "blanket permit system" will obtain in connection with the transportation of grain from country stations to the primary markets herein specified, while the "individual permit system" will be continued only in connection with the movement of grain between the primary markets referred to; in other words, grain that originates at one of these primary markets and is consigned for delivery at another of the primary markets. It will also be continued on grain originating at these primary markets and at country stations, when

*Principally automobile box.

the grain shipped is consigned to Atlantic or Gulf sea ports.

The "individual permit system" contemplates that before a shipper of grain may load a car, he shall first have secured an individual transportation permit from the grain control committee at the market involved, which permit becomes the authority of the railroad agent at point of origin to allow the loading and forwarding of the shipment.

The "blanket permit system" contemplates that permits shall be issued by the grain control committees directly to the individual railroads and not to shippers. Each grain control committee will ascertain the number of carloads of grain its market can daily absorb, based on storage capacity, prospective out-shipments, track capacity, etc., and will then allocate this number among the different lines serving the market on a fair and equitable basis, due consideration also being given in the distribution, to connecting lines whose own rails do not reach the market directly. Under this plan, each railroad will only be permitted to *load* daily the number of carloads prescribed by the committee, and each railroad will be expected to distribute its loading as between its shippers in as fair a manner as possible.

This plan, according to the announcement by the Railroad Administration, will obviate the necessity for individual permits to shippers for the transportation of grain from country stations to these interior primary or terminal markets, and should tend to eliminate to a very large degree any grounds for complaints from shippers of delays that were received to some extent last season, when the individual permit plan was in effect. Under the blanket permit system, the producer will apply to the local agent on his railroad in the same manner as he would do were the permit system not in effect.

The circumstances surrounding transportation between primary markets and also to seaports, are so different from the circumstances attending the "gathering service" from country stations to primary markets that to extend the "blanket system" to include this transportation, it is stated, would not effect the proper results. This tonnage is usually offered in large lots by comparatively few shippers, and in the case of seaboard traffic, is subject to individual steamship contracts, which contracts are confirmed by proper railroad authorities before the permits are issued.

At a conference in New York on June 10, at which all grain interests were represented, the producer, the country elevator operator, the miller, the dealer, the terminal elevator operator and the exporter—it was unanimously agreed that some control of transportation of grain would be necessary this coming season if the maximum efficiency of transportation facilities were to be attained and the interests of the shipping public conserved, and the plan as above outlined, seemed to meet with the approval of at least the majority of the representation present.

Proposed Capital Expenditures for 1919

The following estimate of the capital expenditures proposed to be made on Class I railroads for 1919, amounting to $825,715,471, of which $245,585,643 is for standard equipment ordered by the Railroad Administration and $580,129,828 for additions and betterments, was filed with the House appropriation committee by Swagar Sherley, director of the Division of Finance. The estimate of the requirements of the Railroad Administration submitted by Mr. Hines provided for $253,000,000 of the amount, or only $8,000,000 more than the cost of the equipment, to be carried by the Railroad Administration and it was expected that whatever of the balance was actually carried out would be financed by the corporations.

Passenger Traffic in March

The number of passengers carried one mile in March was 3,446,000,000, an increase of 2 per cent as compared with March, 1918, according to the monthly report compiled by the the Operating Statistics Section. For the three months ended March 31 the increase was 7 per cent. In March there were decreases in the Ohio-Indiana district and the Southern and Southwestern regions. The figures follow:

Railroad	Average miles operated	Month of March 1919	Month of March 1918	Per cent increase or decrease	Three months ended March 31 1919	Three months ended March 31 1918	Per cent increase or decrease
Total, New England District	8,116	283,818,779	272,674,457	4.1	823,508,554	761,709,654	8.1

d—Decrease.

Through Export Bills of Lading

An understanding has been reached between the Railroad Administration and practically all the steamship companies operating on the Pacific coast under which those companies will assume any demurrage or storage charges for which they may be responsible in connection with through export bills of lading issued by the railroads under federal control through those ports, that understanding to be effective as soon as tariffs can be published. A similar understanding has been reached with Osaka Shosen Kaisha, which has recently inaugurated service between the port of New Orleans and the Far East. Negotiations to bring about a similar understanding with steamship companies operating from Gulf and South Atlantic ports are being conducted.

In January, 1918, on account of the crucial situation existing as to ocean tonnage, due to the war, through export bills of lading via North Atlantic ports were discontinued, but with the signing of the armistice and the consequent gradual release of shipping, with increased opportunity for export trade, the exporters of the United States have been anxious that through bills of lading through these ports should be reinstated. The through export bill of lading is of no direct value to the railroads; on the contrary, it is a source of expense and increased responsibility, but recognizing the great importance of this document to exporters, the Railroad Administration has been endeavoring for several months to arrange with the North Atlantic steamship lines for reestablishment of the export bill of lading under conditions that will be satisfactory to all interests.

Prior to January, 1917, at the time export bills of lading were being issued, the free time allowed at those ports was 10 days, the tariff providing that unless the cargo was lifted within that period, any demurrage or storage charges which might accrue would be guaranteed by the shipper. These regulations were approved by the Interstate Commerce Commission.

Efforts have been made by the Railroad Administration to bring about the same understanding as to North Atlantic ports as has been reached with regard to Pacific ports, namely, that the steamship companies assume any storage or demurrage charges that might accrue due to their failure to lift the cargo on the contract date, or within the contract period or free time period. To facilitate this understanding, the Railroad Administration offered to extend temporarily or until shipping had resumed normal conditions, the free time period to 15 days. Up to the present time it has been impossible to persuade the steamship companies serving North Atlantic ports to assume this storage or demurrage, as has been done with regard to Pacific ports. In order to go as far as possible in meeting the desires of the exporters, and pending further discussions with the steamship companies, the Railroad Administration has made arrangements to issue instructions to restore through export bills of lading via North Atlantic ports on the basis that prevailed prior to January, 1918, namely, that through bills of lading will be issued to shippers who will agree to assume any demurrage or storage charges which may accrue in accordance with published tariffs.

At the present time all export traffic through North Atlantic ports is handled on permits covering inland transportation, for which permit applications are made by the steamship companies in most instances, such applications indicating the contracted sailing date.

If the cargoes are not lifted by the steamship companies in accordance with their contracts or promises, there will be an effort to handle permits so that congestion of traffic will not result and so that the expense incident to storage or demurrage charges which may accrue due to failures on the part of steamship companies, will be reduced to a minimum.

Organized Draftsmen Ask Increased Pay

At a hearing before the Board of Railroad Wages and Working Conditions of the Railroad Administration recently at Washington, D. C., representatives of the International Federation of Draftsmen's Unions affiliated with the American Federation of Labor and claiming to represent about 2300 engineers and draftsmen employed on railroads, presented a minimum scale of pay which they asked the board to recommend to Director General Hines. The proposed scale is as follows:

	Minimum Salary per Month
Chief Draftsman	$300
Leading Draftsman or Squad Man	250
Draftsman, Class A	210
Draftsman, Class B	175
Draftsman, Class C	135
Tracer, Class A	125
Tracer, Class B	75
Assistant Engineer or Engineer Inspector	250
Assistant Inspector, Class A	200
Assistant Inspector, Class B	150
Instrument Man	210
Rodman, Class A	175
Rodman, Class B	150
Tape Man, Class A	125
Tape Man, Class B	*100

*Salary to increase $5 every six months as long as he continues to improve.

They also asked for the establishment of a 7½ hour day for five days a week and four hours on Saturday, making 41½ hours per week with no overtime except where absolutely necessary, or at the option of the employee, and time and one half for overtime ordered or made necessary; all traveling and other expenses incurred for railroad business and also expenses attached to moving headquaters; civil service rules to apply regarding vacation, holiday and sick leave; no salary now in existence to be reduced. The federation also presented a proposed classification defining the

qualifications for the various positions named in the wage scale.

It was also requested that the director general issue a general order that if any reduction in operating expenses in the engineering department must be made pro rata furloughs without pay be granted in place of discharging forces or reducing the rates of pay and that workers discharged or demoted be reinstated whenever they so desire. A request was also made that machinery be perfected and set in motion for the formation of permanent regulatory committees on each railroad composed of the various heads and sub-heads of the engineering departments to prepare budgets of the work and of the forces in each department necessary for carrying on the work during the fiscal year. It was suggested that representatives of these committees confer with similar representatives of other railroads or with a national committee to be formed to adjust the engineering forces to the work to be done on each railroad so that transfers could be made from roads which had a surplus of men to those which were in need of men.

New Locomotives May Be Shipped Dead

The Railroad Administration has revised the instructions issued early last year that new locomotives being delivered by the builders be sent under steam and hauling tonnage and the regional directors have been given discretion to decide whether new locomotives shall be sent dead in trains or under steam with a load, upon notifying the mechanical department. The question will depend on whether it will be practically useful to use the new locomotives for hauling tonnage that is going in the direction of the locomotives. The use of such locomotives when moving under steam will be accepted as full payment for transportation charges.

Number of Women Employees Reduced

The total number of women employed under the United States Railroad Administration reached the highwater mark on October 1, 1918. At that time there were on the rolls 101,785 female employees. The number of women employed on April 1, 1919, shows a decrease of 14.3 per cent as compared with January 1, 1919.

Statistics compiled by the Women's Service Section, giving the number of women employed and the character of their employment since the roads came under federal control have been made public by the director general.

On January 1 of the present year there were on the rolls of the railroads 99,694 women employees, while on April 1 the number had dropped to 85,393. This was due chiefly to the reduction of labor force which occurred in February and March. It was also partly due to the return of men from military service who were reinstated by the railroads. On the Eastern lines the drop was 17.7 per cent, while in the South it was 6.5 per cent, and in the West 11.4 per cent.

The clerical or semi-clerical occupations, including all the officeworkers, ticket sellers and telephone switchboard operators constituted the largest percentage of the total for the year 1918, being 72 per cent. The statistics show that more than 5,000 women were employed in railroad shops and more than 1,000 in round-house work. The latter included, among others, turntable operators and engine wipers. On October 1, 1918, there were 6 women employed as blacksmiths, helpers and apprentices, while a large number of others worked as boilermakers, coppersmiths, electricians and machinists. There were 377 women employed as station agents, assistants and agent operators on the same date, while 50 were at work as switch tenders. There were 931 pushing trucks and handling freight. Watchwomen to the number of 518 were employed on the railroads, doing duty both day and night.

The report shows that, considered from the point of view of occupation, the greatest reduction of women employees has taken place in round-houses and shops. Their work in these places was in many cases found unsatisfactory, there being too much heavy physical labor involved.

In the clerical occupations best fitted for women, the total number employed at the present time is 68,129. There has been a reduction in this group of 11.2 per cent.

W. T. Tyler, director of the Division of Operation, has addressed the following to the regional directors:

"In a recent case suits were filed against a chief despatcher and two trick despatchers of a certain railroad under federal control for violation of the hours of service law.

"The administration has done everything possible to get the Interstate Commerce Commission to agree to let it investigate complaints of the kind in question, handle them to a conclusion (including disciplinary action), and report the facts and the action taken to prevent similar occurrences to the commission, but without success. The following is the position taken by the commission, as set forth in letter signed by Hon. Clyde B. Aitchison, chairman, under date of June 13:

"'In this connection, however, the commission desires it understood that these suits were instituted solely for the purpose of securing proper observance of the hours of service law and incidentally Order Number 8 of the director general, not only by railroad companies, but also by officers and agents in charge of employees thereof. We are of the opinion that the best way to bring about this result is to allow the law to take its course.

"'In regard to request to permit the Railroad Administration to investigate and to take care of any future violations of the 16-hours of service law that might occur the commission is of the opinion that it cannot delegate this power but must carry out to the letter, the requirements of the law. The commission has no right to waive or evade the administering of this law. Therefore, if cases arise under it in the future, it will handle them in accordance with the facts and circumstances surrounding each case.'

"Please give this information the widest possible circulation among the employees of railroads under federal control in order that they may be forewarned as to the intention of the commission to prosecute the individual officers and employees responsible for violations of the hours of service law."

May Returns Show Addition to Deficit

The railroads in May earned only about half of the standard return guaranteed by the government, according to preliminary returns which have been received by the Interstate Commerce Commission. For 195 roads the net operating income was $38,530,000, a decrease of 46.4 per cent as compared with May, 1918. For the test period the average net operating income for May was $77,000,000, which also represents approximately one-twelfth of the standard return. The operating revenues were $407,943,000, an increase of 9.3 per cent as compared with May, 1918; operating expenses were $350,861,000, an increase of 24.1 per cent, and taxes were $15,612,000, an increase of 1 per cent.

Uniform Rules and Working Conditions

It is understood that the work on the proposed uniform rules and working conditions for maintenance of way employees is well advanced and that they will soon be announced by the director general for application on all roads under federal control, superseding all previous agreements on this subject. Proposed rules and working conditions were recommended to the Board of Wages and Working Conditions by

committees consisting of one representative of each regional director and an equal number of representatives of the employees and the director general's announcement will be based on the recommendations of the board.

Maintenance Instruction for Last Six Months of 1919

New instructions outlining a working basis for maintenance of way expenditures for the last six months of 1919 have been issued to the regional directors by W. T. Tyler, director of the Division of Operation. They supersede to some extent previous instructions, and particularly the order to limit maintenance of way expenditures for June to the average test period ratio of such expenses to operating revenues, which was merely a temporary order intended to hold the situation check until more explicit directions could be issued.

While the new instructions are tentative and temporary, in order to control maintenance of way expenditures month by month during the remainder of 1919 to the end that the contract obligations of the Railroad Administration to the railroad companies may be fully complied with but not exceeded, they provide a definite basis on which maintenance officers may proceed as well as prescribing the character of the information which is to be used as the final standard. In the normal case the program to be followed will be determined tentatively, as it has been in the past, by considering the amount of work necessary to make the average for 1918 and 1919 match up with the average for the test period, but in order to determine whether this is a fair basis the 10 years before federal control are to be considered. Mr. Tyler's letter to the regional directors emphasizes that, whereas there has been a general tendency to accept the test period standard as the yardstick by which to determine the contract obligations, this may not be the proper absolute standard in many instances, and the entire obligation of the government is to make such expenditures upon the properties, equated as to the prices and wages obtaining during the period of federal control, as will result in returning them to the companies at the end of federal control in substantially as good condition and in substantially as complete equipment as when they were taken over. The government has the option to treat the quantities of labor and material used during the test period, modified by the volume of business done, as the maximum of its obligations.

The officers of the Railroad Administration have devoted a great deal of time to the preparation of these instructions, which are based on recommendations made at a conference of the engineering assistants to the regional directors with A. M. Burt and W. J. Cunningham, assistant directors of the Division of Operation, on June 20 and 21.

Instructions are to be issued to the federal managers and through them to the local supervising officers providing for an analysis of the expenditures during the test period to determine tentatively whether they fairly represent the contract obligations and can be taken as a basis for the expenditures during federal control. In making such analysis the expenditures and quantities of the most important materials during the test period, during the seven years prior to the test period, and during the six months between the end of the test period on June 30, 1917, and the beginning of federal control, are to be taken into consideration. It is stated that the maintenance of way expenditures can best be controlled by regulating the number of man hours and also the amounts of the principal classes of materials, such as rails, ties and ballast. The performance of 1918 and 1919 combined should not exceed the contract obligations as tentatively determined by the use of equation factors representing the differences in wages and prices between the test period and the period of federal control. The engineering assistants of the regional directors have already made substantial progress in working out such equation factors for the different roads in their territory. After considering the contract obligations in connection with the expenditures and quantities prior to federal control, each federal manager is directed to furnish a recommendation to his regional director, showing the tentative allowances for 1918 and 1919 as equated, the expenditures made during the period of federal control up to June 30 and the balance remaining for the last half of this year, and to regulate the labor and materials to insure that the expenditures for the remaining period will not exceed the available balance. In special cases where conditions require the performance of a greater amount of work recommendations of the federal managers, if approved by the regional director, are to be submitted to the director of operation.

If the program for 1919 does not, according to this tentative basis, exceed the contract obligations, the regional directors may authorize the federal managers to proceed with the minimum expenditures necessary to insure the return of the property in substantially as good condition and equipment as on January 1, 1918. Distribution of the work by months is to be made by the regional directors, taking into consideration the conditions that may make necessary heavier expenditures for any month than the average.

As soon as figures are available, the regional directors are to submit statements to the director of operation for the roads on which the test period expenditures are considered to have been normal, showing the expenditures and equation factors, together with the program recommended for the last six months of 1919, and whether or not this represents an excess or shortage as compared with the tentative balance arrived at by subtracting the actual expenditures for 18 months from the equated expenditures for the two-year period. In cases where the test period expenditures are considered subnormal, or abnormal, or where the expenditures during the last six months of 1917 were considered subnormal, special statements are to be submitted reporting the facts with recommendations to cover the qualifying factors. These special statements will cover cases where it will be necessary to make expenditures in excess of the obligation in the interest of safety and also special cases where there have been substantial increases in track mileage or abnormal maintenance or traffic conditions.

Supplementary instructions are to be issued covering the subject of tie renewals.

While the Railroad Administration takes the position that an excess of expenditures for maintenance of equipment on any road may fairly be considered together with, and as an offset against, any deficiency that may result in maintenance of way expenditures on that road, it is stated that it is not the purpose deliberately to curtail maintenance of way in any respect with this in view and the new instructions treat maintenance of way expenditures on their own feeting, giving directions for making them comply with the contract requirements independently of the equipment situation. Director General Hines has stated that, taking roadway and structures and equipment together, the average condition of the property as a whole is as well off as it was on January 1, 1918. This is because on some roads the equipment had got into a very run down condition at the end of 1917, as the result of the great pressure that had been put upon railroad facilities, and it was therefore necessary to make very heavy expenditures in 1918 in order to put it in condition for handling the war traffic, at a time when no one then knew how long it would last. Since the armistice traffic has fallen off and there was a mild winter, with the result that a large amount of equipment put in readiness for the winter is now being stored. A reserve of over 4,000 locomotives has been put in storage and every effort has been made to put the cars in good condition to handle the grain crops. Instructions were recently issued that car repair forces be put on full time at all points where a reduction in hours has

been made and special attention is to be given to grain, coal and refrigerator cars in the sections where such cars are most needed.

In connection with figures showing the number of unserviceable locomotives and cars, Railroad Administration officials point to the fact that many locomotives are now reported as unserviceable, which merely require a few hours' work and could be used if necessary and would formerly not have been classified as unserviceable; also that cars which are in storage or are transferred from one region to another to be put in storage for the grain traffic may automatically be transferred to the bad order class because while good for most commodities they require some recoopering to fit them for grain.

The maintenance of way and maintenace of equipment programs are not being treated alike because they represent somewhat different situations. The equipment is being prepared for a possible car shortage this fall, but instructions have also been used to the regional directors to concentrate repairs on locomotives and cars which by reason of their size can render the most efficient and economical service, to discontinue expenditures on small locomotives and cars not necessary for current use, and for the prospective traffic for the balance of the year, and to confine expenditures on small capacity freight cars to those authorized by Circular No. 20.

Contracts Executed

The Railroad Administration has executed a contract with the Baltimore & Ohio, providing for an annual payment of $30,031,009, which includes $2,136,932 in addition to the standard return.

The Railroad Administration has executed compensation contracts with the Hudson & Manhattan, providing for an annual payment of $3,003,362, and the Minneapolis Eastern for $30,332.

Committee on Automatic Train Control

The Committee on Automatic Train Control will go on another inspection trip next week to examine automatic train control devices on the Pennsylvania, at the plant of the Union Switch & Signal Company at Swissville, Pa., and at Indianapolis.

An Unusual Service of Creosoted Piles

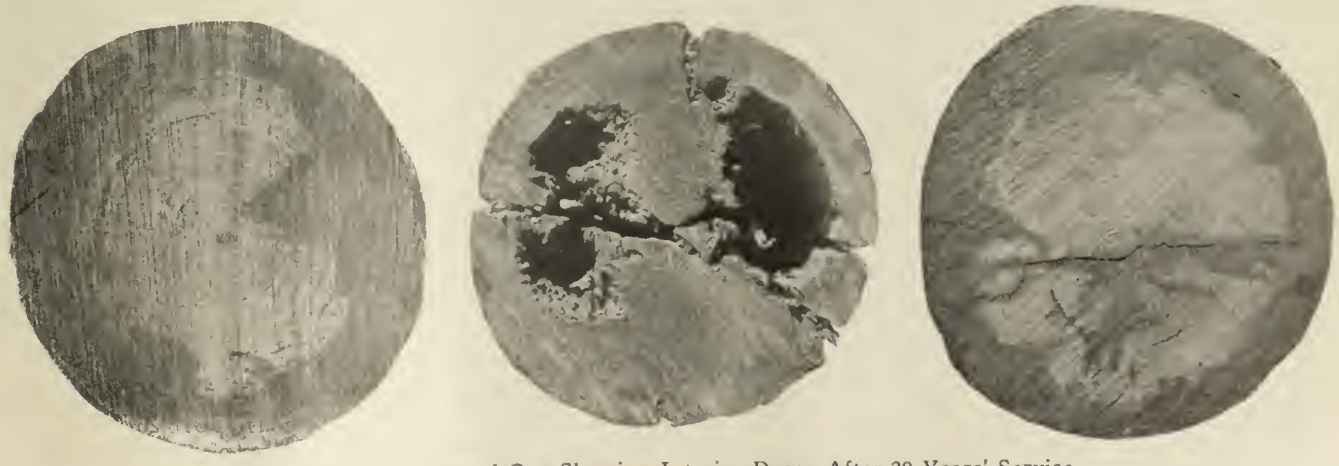
THE PRESERVATION of piling so that 67 per cent were suitable for redriving after 29 years' service in teredo infested waters, is the remarkable record established by the Southern Pacific in its Long Wharf at Oakland, Cal. This structure extends out from the Oakland shore into San Francisco Bay for approximately one mile, terminating in five docks which are used for the transfer of freight between cars and boats. It was originally built of untreated piling but was later rebuilt with creosoted piling, dock "A" being redriven with creosoted piles in February, 1890; dock "B" was redriven in 1898; dock "C" in 1897; dock "D" in 1899 and dock "E" in 1901. It is estimated that over 14,000 creosoted piles have been in service in this wharf for periods ranging from 22 to 29 years.

Because of the expiration of the charter for this structure which could not be renewed because it interfered with plans for municipal waterfront developments, this dock was ordered entirely removed. When wrecking this structure it was decided to examine a number of these piles to ascertain their resistance to decay and to the attacks of the marine borers which infest the waters on the Pacific coast. These piles were of a good quality of Douglas fir and were well seasoned before and after treatment. They were creosoted at the Southern Pacific plant at San Pedro, absorbing 14.17 lb. of creosote for each cubic foot of timber.

The photographs testify to the remarkable resistance of these piles for so long a period of service. The thin shell of treatment around the circumference except where season checks permitted deeper penetration is characteristic of the preservation of Douglas fir. It is noteworthy that this thin shell of timber treatment provided adequately where the timber had not been punctured by accidents or careless handling.

A committee of railway officers and others interested in timber treatment made an examination recently of 600 of these piles which had been withdrawn and found that 67 per cent were in first-class condition, 9 per cent had been slightly attacked by limnoria and teredo, 18 per cent severely attacked and 6 per cent destroyed. A further extensive examination and inspection was made of a number of piles then remaining in the structure. Out of 523 piles examined in dock "C", 333 were free from attack and 74 showed evidence of having been attacked by borers, while 116 were not fit for redriving. An inspection of 1,090 piles in dock "D" showed that 829 were free from attacks, 162 showed evidence of having been attacked, and 99 were unfit for redriving. Similarly out of 2,485 piles inspected in Dock "E", 1,900 were free from injury, 240 showed evidence of attack and 345 were considered unfit for redriving.

The condition of the piles in this structure was so good that the Parr Terminal Company of San Francisco which is now constructing warehouses, ship yards and coal depots on the western waterfront at Oakland not far distant from the Southern Pacific wharf, arranged to use a large number of these piles in its new construction. The United States Government is also using some of the piles from the same structure in wharves which it is building at Goat Island.



Two Sound Piles and One Showing Interior Decay After 29 Years' Service

Railway Developments in Foreign Countries

Several Countries Considering Electrification Projects—British Transport Bill Out of Committee.

The Rio de Janeiro state government has granted concessions for the construction of a steam railroad of meter gage from the port of Manzuinhos, in the district of Sao Joao de Barra, to Porte de Itabapoana, district of Campos. The length is approximately 52 kilometers. Construction must be begun in two years after the promulgation of the decrees, and completed in two more.

Railway Communication Between Lisbon and Paris

According to Lisbon papers, the American Legation has informed the Portuguese Government concerning the scheme for the development of the port of Vigo by an American corporation, together with the construction of the direct railway between Vigo and the French frontier.

Locomotives for Poland

It is reported in Berne that more than 50 German and American locomotives will shortly be sent from France through Switzerland to Rumania and Poland to supply the urgent need for engines in those countries. Rumanian engine drivers have already arrived in France (says a (London) Times correspondent) to take charge of some of these locomotives.

Electrification Considered for Jamaica

The government of Jamaica is reported as arranging to have a survey made of the water power of the large rivers to see if electrification of the railways is feasible. The heavy cost of coal and the necessity of a considerable railroad extension owing to an expected agricultural development explain the proposed change. The local agent of the Westinghouse Company, of New York, is collecting data on which the Westinghouse might tender for laying down the electric railroads.

To Electrify Belgian Lines

Electrification of Belgian railways has been decreed by the Minister of Railways, following a favorable report on such a project made by a committee appointed to investigate such a course, according to a press despatch from Brussels on June 20. The first line to be electrified will be that from Brussels to Luxemburg, and later the Brussels-Ostend railway. Action to this end probably will be taken in August, with the expectation of beginning the reconstruction work at the beginning of next year.

New Congo Railways

A Brussels despatch to the African World states that the railway from Cape Town to Katanga is to be extended northwards from Bukama to Kibombo along the Lualaba (Upper Congo), and that the construction of the Congo-Nile railway is expected to start shortly. The extension of the railway from Bukama is intended to facilitate traffic between Katanga and the more northern regions of the Belgian Congo. Navigation on the Lualaba or Upper Congo, from Bukama northward for 400 miles presents many difficulties, and steamers take a week on the journey. Bukama is 2,600 miles by rail from Cape Town, via Bulawayo, and this is the so-called Cape to Cairo route. The Congo-Nile railway starts from Stanleyville (at the head of the 1,000 miles navigable stretch of the river from Stanley Pool), and will go to Mahagi, on Albert Nyanza, or alternatively to Lado, on the Upper Nile.

Belt Line Around City of Mexico

Plans have just been approved by the Mexican government for the construction of a belt line of railway around the city of Mexico. It is stated that the survey for the proposed road has been made and that the route circles the Valley of Mexico, it being one purpose of the line to afford connection with all of the principal suburban towns and many outlying industrial plants. The government authorities also believe that the road will prove of great military service in the matter of affording means for the quick and easy movement of troops from point to point around the capital.

Mexico to Lease Fifty Locomotives

The commerce department has received from the American consul general in Mexico City, the following statement, which was published in the "Excelsior" of that city:

"The president of the republic has just authorized the director general of national railways to complete arrangements with an American railroad company for the lease of 50 locomotives for service within Mexico. It is stated that some time ago the government received an offer from the abovementioned American company for the rental of engines, instead of their sale. This plan was favorably considered on account of its economy, meaning, as it does, a saving of several millions of pesos.

"Orders have been sent to the purchasing agent of the Mexican railways in New York instructing him to sign the contracts in question. In view of the great need at present of engines it is hoped that, within a month after the completion of these arrangements, the locomotives will be on hand."

Electrification of Railway in Brazil

Recently a director of the Central of Brazil Railway, Government owned and operated, presented to the Minister of Communications plans for the electrification of the suburban lines of the road and the trunk line from Barra to Pirahy, as well as general plans for the suburban service and the closing of the roadbed from the main station to Deodoro, writes Commercial Attaché J. E. Philippi, Rio de Janeiro.

The Commission chose the type of high tension, continuous current for the suburban service, and recommended that the current be purchased from one of the existing power companies rather than have the company install a plant of its own.

The approximate cost of the rolling stock, substations, aerial lines, etc., is estimated at $4,307,377. This does not include the cost of car sheds at the main station and at Deodoro.

The first work to be undertaken will be fencing in and raising the level of the track in order to avoid accidents. It is believed that by closing in the lines the revenues of the suburban service will be greatly increased, as such a step will facilitate a better fiscalization of the passenger receipts. This work will probably cost about $1,398,238, the estimate being based on the prevailing prices of materials.

The director added that in case the total amount required

for this work was not available during the present fiscal year, it would at least be well to begin the work of closing the line, as a half million dollars was appropriated for this purpose in the budget law for this year.

Upon receipt of the plans, the Minister of Communications approved them and directed that the work of closing in the line from the central station to Deodoro be initiated.

Manual Versus Automatic Block Signals

(From the Railway Gazette, London.)

The visions which enthusiasts over American operating methods, after a visit to the United States, had of our lines being protected by automatic signals, and signal boxes and signalmen dispensed with, have never materialized. Conditions in the two countries differed and were not exactly comparable. The main reason for automatic signaling being adopted and making progress in the United States was the scarcity of labor for signalmen, while a factor which led to the growth of automatic signalling was that the concurrent interlocking of the points was ignored. Here, on the contrary, labor was plentiful and cheap; moreover, points and signals on passenger-carrying lines had to be concentrated and interlocked. The compelling argument against any change was, however, the fact that, different to the almost universal condition in the United States, our lines were already signalled—the signal-boxes, signals and signalmen were established. Added to these difficulties in the way of introducing automatic signalling into this country was another, less tangible but harder to overcome. This was the conservatism of the British operating officer. Put before him the suggestion that an intermediate signal-box be closed and replaced by automatic signals and he would at once express his surprise at the suggestion. How useful that box would be in the event of a breakdown! And, proceeding, he would point out that a signalman could see that the tail-lamp was on a passing train, that no passenger was giving signals of alarm, that no loads had shifted and that there was no fire in the train. The fact that an automatic signal would work all night and all day Sunday without extra pay, required no holidays or relief, was never asleep, did the work cheaper than a man and never made a mistake, was not allowed to favor the substitution of the frail human agent by a reliable machine.

The situation is now, however changed. The payment of higher wages to signalmen, the introduction of the eight-hour day and other costly improved conditions of service are making the situation as to the cost of labor more comparable with that to be found in the United States. Consequently some of the objections that led to the rejection of automatic signaling no longer have the weight they had. This is so obvious that there is no necessity for us to labor the point, nor equally, at this present day, is it necessary for us to indicate how the provision of automatic signals would allow for, we should say, one-third of the signal-boxes in this country to be closed either wholly or in part. All those at busy stations and at junctions must be retained, but those where the main duty of a signalman is to put trains "in block" and where not more than a dozen trains have traffic to attach or detach in the 24 hours could, we submit, be closed except when it is necessary to switch them in for traffic purposes. Where, in particular, we think such automatic signaling might be introduced first is on the many stretches of "direct" line opened within the last 15 or 20 years over which there is little local traffic and, consequently, no other work for the signalmen to do than to put the trains "in block."

Automatic signaling differs from that manually operated in that the distance between the signals, and, therefore, the length of the sections, is governed by the placing of the signal-boxes, which are, in the main, determined by other conditions—the locality of a station or a siding—which bear no relation to the volume of traffic, which latter should be the ruling factor. Given automatic signaling and the sections may be of the best length to suit the traffic. Again—and this is important—they can be varied to suit any changes of speed due to varying gradients or the approach to busy centers. Thus, there is obtained fairly uniform running, which is a valuable factor. More than this is gained. Traffic is got over the road quicker. This will be a more valuable asset in the future than in the past, because (*a*) consignments are more costly and all time they spend in travel is capital lying idle; (*b*) locomotive power and rolling-stock are dearer, and the shorter the time per journey the more got out of them; (*c*) the earning power per mile will be increased. In making these claims for automatic signaling we are, we admit, conscious of the fact that in order to win success there must be terminals to suit; it is no use speeding up trains if there be no accommodation at the end of the journey to receive them. This, however, is another story and one that cannot fairly be brought in to condemn automatic signaling.

An advantage we enjoy in urging the adoption of our proposals is that we are recommending something that is an acknowledged success. It may be true that, beyond their use on the rapid transit lines of London, there are but two installations of automatic signals of any length in this country, but these two examples alone are sufficient to secure wider use now that the greater necessity has arisen. We believe that we are safe in saying that the automatic signals between Alne and Thirsk on the North Eastern Railway have postponed the widening between these points, and that had the automatic signals between Woking and Basingstoke on the London and South Western been provided earlier, the conversion of the two lines there to four might have been delayed.

Electric Traction in Belgium

There is probably no country in Europe where railway electrification would be a more paying proposition than Belgium, says the Railway Gazette (London). In view of the large amount of reconstruction work that will have to be done on the railways in any case, the opportunity is a good one for considering whether it is wise to spend money on restoring the steam system. Electric traction has made considerable progress even during the war, and the results of working for several years on the larger schemes in America are now available, especially on that very interesting passenger and express line of the Chicago, Milwaukee & St. Paul. Whatever advantages the single-phase system might offer on a long line, such as the Paris-Marseilles, for a compact area like Belgium, the high tension d.c. system would seem just the thing. We see an announcement in a contemporary that it is proposed to adopt the single-phase system, experimentally, on the Brussels-Antwerp line. In the light of all the most recent experience in electric traction, Belgium would hardly appear to be the country where the system would show to the best advantage. Equally important is the fact that if this single-phase system, which the Germans made specially their own, is adopted in Belgium, it is found to prejudice the British manufacturer.

Four Electric Locomotives for the Swiss Federal Railways

Following a conservative experimental plan, the operating officials of the Swiss federal railways ordered four different types of electric locomotives, two of which have recently been put in service. Two were ordered from the Atelier de Construction Oerlikon of Oerlikon, Switzerland, and two from Brown Boveri & Co., Ltd., London, England. Each company was to supply one passenger and one freight locomotive. The mechanical parts of all of the four locomotives were supplied by the Swiss Locomotive & Machine Company,

Winterthur, Switzerland. The Oerlikon locomotives have been delivered and tested on the Loetschberg Railway.

All of the locomotives are designed to operate from overhead trolleys carrying 15,000-volt, single-phase power. A point of particular interest in connection with the design of these locomotives is that the same general method for transmitting power from the motors to the driving wheels is employed in all of the four designs. The motor pinions engage gears on jack shafts, which in turn are connected to the driving wheels by side rods. The side rod arrangement on the Oerlikon locomotives is quite different than that on the Brown Boveri locomotives. The two Oerlikon locomotives are of the 2-6-2 and 2-4-4-2 type, and weigh 91 and 113 tons, respectively. The two Brown Boveri locomotives are of the 2-4-4-2 and 2-6-6-2 type, and weigh 118.5 and 133.5 tons, respectively.

Chilian Railway Development

The lamentable condition of the Chilian State Railway system, writes George Mallett to the Weekly Bulletin of the Canadian Department of Trade and Commerce, Ottawa, is now universally recognized as being responsible for serious delay in the natural progress of the country. The industries and developing interests are not supported by the necessary railway service, which is practically doing (with difficulty) what it was expected to do some 10 or 15 years ago.

Without the advantages of the necessary modern innovations, there are serious deficiencies in the ordinary indispensable rolling stock, which the general management is absolutely unable to replenish from year to year, owing to the difficulty of making both ends meet. Now with a deficit on the annual budget amounting to $8,000,000 in the face of a national crisis, it is realized that a loan is necessary to place the system in a position to earn expenses and to assist in the development of the nation's trade and industry.

The amount of this loan has been fixed at or about $32,000,000 which it is proposed to distribute as follows: $3,700,000 on the electrification of the first section (Valparaiso to Santiago), $2,400,000 for electric locomotives, $1,820,000 for cost of double lines, $1,200,000 for reconstruction and reinforcement of bridges; $1,000,000 for new branch lines and sidings; $6,600,000 for buildings; $3,100,000 for workshops; $5,200,000 for the purchase of equipment; $1,500,000 for signalling system and points service; $1,120,000 for automatic brakes, $800,000 for mechanical coalers, bunkers, etc.

The British Ways and Communications Bill Out of Committee

[From the *Railway Gazette*, London.]

After being under discussion for 18 days, covering the period from April 1 to May 28, the Ways and Communications Bill has emerged from the committee stage practically unaltered. Despite the strong attacks made by dock, harbor and road authorities they are still included; notwithstanding the powerful arguments that a system of bureaucracy would be installed the powers of the Minister remain unaltered except to the extent that he is to have advisory councils—whose advice he is not, however, bound to follow—and though several speakers found much virtue in the privately-owned railway wagon its sponsors failed to get much support. Numerous concessions, naturally, were made as the proceedings progressed, but once only was the government defeated.

On May 6 the clauses relating to the Advisory Committee as to any revision of rates, fares, tolls, etc., were agreed to. Later in the proceedings other advisory committees were proposed and then—May 13—the Home Secretary, in opposing the addition of further bodies, said that there was a provision in the bill that if injury or loss were caused to undertakings compensation would be paid. There could be no compensations to the public in regard to revision in rates, and it was for that reason that a statutory advisory committee had been given in that case.

On May 6 the government escaped defeat by 18 votes to 17 only on a proposed amendment that, without the consent of any harbor, dock or pier authority, no part of an undertaking should be taken possession of unless the whole were taken. The following day an amendment that the Minister be responsible for the acts and defaults of his servants was accepted, also a provision that the expression "transport services by water" should not include any services that could not be established under existing statutory powers—this disposed of the inclusion of coastwise shipping.

On May 13 a debate as to further advisory councils occurred. Sir Eric Geddes was willing to have such committees "for giving him advice and assistance in connection with such matters affecting the exercise and performance of his powers and duties as may be referred to them by the Minister," but Joynson Hicks would make the reference to the committee compulsory. Sir Eric proposed a modification, but this was rejected by 21 votes to 19 only to be followed by Joynson Hicks' amendment being itself rejected by 22 to 20. All that day and the following Sir Eric Geddes' new clause was discussed, and eventually "a panel of experts" was accepted, also the provision that "Before exercising any of the powers under Section 3 (1) (b) or directing the establishment of new transport services by land or water the Minister shall, provided he considers the question involved to be one of sufficient importance to justify such a reference, refer the matter to a committee selected by him from the said panel." Even to this wording some amendmends were made on May 15.

On that date a new clause was brought up, and read a second time, authorizing the Minister to establish and work transport services by land or water, provided that (1) if the establishment of any such service will involve an original capital expenditure exceeding £1,000,000 an Order in Council, approved by both Houses, would be necessary, and (2) "where it appears to the Minister that the establishment of any such service could properly be undertaken by the owners of any existing undertaking the Minister shall not himself establish the service without first giving to such owners an opportunity of establishing the service. . . ." On May 20, a brief sitting was devoted entirely to a new clause as to the transfer of officers and servants. This covered three points. First, the pensionable rights of an officer or servant with a railway company were to be protected during the two-year period in the event of his transfer to the Ministry; i.e., if the railways reverted to the companies after the two years the man would be in the same position as though he had been continuously in the particular railway company's service. Second, no man should be permanently transferred to the Ministry without his consent. Third, for a temporary transfer the consent of both the railway company and the man was necessary. It is provided that the consent should not be unreasonably withheld, this being necessary in order to prevent a man refusing reasonable work and then claiming compensation for having lost his position. Little of interest happened the following day, but on the 22nd the compensation clause was settled. The question of the privately-owned wagon was discussed later and the following conclusions reached: (1) authority for purchase has to be obtained by an Order in Council, the draft of which has to be approved by both Houses; and (2) that England and Wales, Scotland and Ireland are separated in this matter but, if, in any one of these divisions, wagons used for the conveyance of any particular class of traffic be purchased all wagons so used in the division affected must be purchased.

June Meeting of the Signal Division, A. R. A.

Handling Trains by Signal Indication Without Orders; Contracts and Other Problems Considered

THE JUNE STATED MEETING of the Signal division of the Engineering section of the American Railroad Association was held at the Breakers hotel, Atlantic City, N. J., on June 26 and 27, with 125 active and junior members, 97 associate members and 48 guests in attendance. R. E. Trout (St. L.-S. F.) chairman of the division occupied the chair and H. S. Balliet (N. Y. C.) acted as secretary of the meeting.

R. H. Aishton, regional director of the Northwestern region, United States Railroad Administration and president of the American Railroad Association addressed the meeting on Tuesday morning. Mr. Aishton said in part: "I want to have a little get-together talk with you. I have been a member of your Association for a good many years and I am glad I have been, because I get your proceedings and all the literature you put up. It has been a liberal education for any railroad man and particularly for me because if there was phase of railroad work that I knew nothing about, even though I was a president, it was the signal business. I am familiar with the work you have done. In the matter of standardization alone your Association through deliberations such as are going on here, and often given but little encouragement by the railroads in the past has achieved marvelous results. You have a large number of standard prints and plans and in that direction you have done a great deal in bringing the railroads together.

"There is a tremendous field before you. As I understand it, fully 80 per cent of the railroads in the United States are today taking your dictum as law. If you recommend a thing they take it. I desire to say to you that the underlying thought of the American Railway Association is to make that 100 per cent. I notice that your presiding officer said at the last meeting 'the same old scrappers will be in evidence.' I want to tell you that the scrappers in an association are the ones that make it. One time in the old American Railroad Association we had a fight in the old train rules committee over inviting members of the Train Despatchers Association and the Signal Association to come in and talk to us on some technical points involved. The western idea prevailed and the men were finally called in. Ever since that time they have taken a prominent part in the various matters that come up before the Association."

Speaking of the railroad situation Mr. Aishton said: "We have a pretty hard job ahead of us. But as I look ahead it looks a little different than it did a year or two years ago, the roads are going to be a little bit different and there must be more coordination. There must be more standardization as between railroads and a closer working together on their part. At present the government exercises a big power, and it has been for good. The things accomplished on the railroads during the war could not have been accomplished under private management, simply because you could not coordinate the resources of the entire community, doing the things absolutely necessary in winning the war and so there can be no criticism of what the government has done. But when government control lets go, where are we going? Are we going back to the place we were before? In my opinion no, and I believe this Association and these various sections of the A. R. A. all working together and coordinating, will make a better and more economical transportation machine. A better transportation machine is going to be the one power in the United States that is going to stand between the railroads and government ownership because if railroad men do not control this situation and do not run our roads in the most economical manner to afford the best service to the public, there is only one alternative, and that, in my opinion, is government ownership."

The secretary made a short report on routine matters and explained that due to the labor situation and other causes it had been impossible to mail out the advance notices containing the committee reports prior to the time of the meeting.

The most interesting discussions of the meeting were brought out by the reports on the location of take-siding indicators and upon the standard form of contracts. A variety of opinions were expressed as to the proper location of a take-siding indicator and also as to whether it should be connected with the signal system or considered as an entirely separate adjunct. When the standard form of contract was presented for discussion the manufacturers entered a strong protest against the adoption of the clauses covering risks and indemnities. It was stated that no indemnity company would insure the contractor at any reasonable figure where he is made responsible for consequential damages.

COMMITTEE REPORTS

The first report discussed was that of Committee No. 9—Wires and Cables. W. H. Elliott (N. Y. C. Lines East) chairman of the committee submitted an oral report on the testing of tape in using various size mandrels and stated that it was the intention of the committee to use a ¼-in. mandrel on which to wind tape. It was found that a certain amount of flow in the compound affected the rate of winding and unwinding. This committee expects to present recommendations to the September meeting.

Committee No. 5—Maintenance and Operation, L. R. Mann (M. P.), chairman, submitted a short report on methods of handling trains by signal indication without train orders and the preparation of rules and regulations for signal maintainers. This committee has previously submitted a report on the first subject for single track operation while this report refers to double track operation. The committee said in part: "The operation of trains by signal indications, without the use of written train orders, although practiced on but a relatively small mileage in this country, possesses important advantages which appeal to students of railroad operating problems. It is well understood that under the old train despatching system a good deal of time is lost in slowing down or stopping trains for the issuance of orders. In these days of heavy traffic and other difficulties, in the efforts to secure the largest possible tonnage movement it would seem well worth while for managements to study the advantages of operation by signal indication without written train orders. Automatic block signals promote safety of operation and expedite traffic, but the highest efficiency with such signals is not realized where the train despatching system is retained in the old form. Not only is time lost in slowing up and stopping trains for orders but orders cannot usually be issued at passing tracks and cross overs that lie between train order stations, under the old form." The report on this subject was accepted as information. The committee decided to prepare examination papers with questions and answers based on the rules at present in the R. S. A. manual; any additional rules which may be deemed desirable by the sub-committee to which this subject has been assigned, will be called to the attention of the entire committee. This was accepted as a progress report.

Committee No. 8—Alternating Current Automatic Block Signaling, C. H. Morrison (N. Y. N. H. & H.) chairman, deviated somewhat from its assignments and revised the general provisions, standard sections and general electric requirements and brought up-to-date unit specifications previously submitted and printed in the manual for, as the advance in alternating current signaling has been rapid, it was deemed necessary to bring these specifications up-to-date. In addition the committee submitted a specification for position light signals and also one for color light signals. Considerable discussion arose over the wording of a number of the clauses as certain standard clauses differed from the wording in other specifications. Finally a motion was made and passed that the Committee of Direction appoint a committee to standardize clauses and phrases. It was further moved that the specifications, after revision, be submitted to letter ballot at the September meeting. It was recommended by the committee that the specifications for alternating current electric generators be withdrawn from the manual as a revised specification for alternators covers this subject. The committee also recommended that the specification for single-phase track transformers, 250 volts or less, be eliminated from the manual as this is also covered in other specifications. On a vote these recommendations were carried.

Signaling Practice

Committee No. 10—Signaling Practice, J. A. Peabody (C. & N. W.), chairman, submitted a report on only two of the subjects assigned to it. The report on automatic train control consisted of a list of references on this subject, prepared by the Library Bureau of Railway Economies. The other subject reported on was divided into two parts. (1), the application of aspect indicating that train must take siding at a non-interlocking switch, (2), the application of aspect indicating that 19 or 31 orders are to be delivered. A questionnaire was sent to all the signal engineers of the country and the following questions were asked with reference to the application of aspect indicating that trains must take sidings at an non-interlocked switch:

(1) Is the proper location of the take-siding indicator at a point not less than braking distance from the switch, in connection with whose approach it is used? Answer: Yes, 11; No. 4. Recommend locating take-siding indicators at switch, 17.

(2) If it is convenient to apply the take-siding indicator to an existing signal, shall the signal under which it is applied be caused to display a stop, approach or clear indication when the indicator is displayed instructing train to take siding, or shall this be left to the discretion of the signal engineer to arrange the control according to the local necessities? Answer: Recommend signal above indicator stop, 17. Left to discretion of signal engineer, 6. Recommend signal above indicator indicate proceed, 4.

(3) Shall the signal in the rear of the take-siding indicator be caused to display an approach indication when the indicator is displayed instructing trains to take siding? Answer: Signal in the rear to display caution, 25; non-commital, 8; roads not using take-siding indicator, 35.

Three questions were asked with regard to the application of aspect-indicating what 19 or 31 orders are to be delivered.

Question (1) What aspect is used for the transmission of information that 19 or 31 orders are to be delivered?

Question (2) Is the same aspect used for both?

Answers to questions 1 and 2: (a) Home interlocking or station signal at stop for issuance either of 19 or 31 orders, 37. (b) With lamp or flag displayed in addition thereto, 14. (c) Answers non-commital, 6. (d) Signal displayed at 45 deg. for issue of 19 orders, 10. (e) Signal wigwagged until acknowledged by engineman for issue of 19 orders, 2. (f) Signal at 45 deg. for issuance of caution cards, 1.

Question (3) Do you consider it essential that different aspects be used to indicate issuance of 19 or 31 orders?

Answers: Yes, 21; No, 20; non-commital, 16.

It is the practice on the Baltimore & Ohio to locate a take-siding indicator on the signal governing the switch. If the signal is located at the switch the take-siding indicator is located on it. The signal displays stop while the signal in the rear dsplays caution. If the indicator is located on the signal 1,000, 2,000 or 3,000 ft. away from the switch, the signal above then indicates caution and the signal in the rear also indicates caution. At night a reflected light is used on the take-siding indicator.

On the Erie such an indication is placed approximately 200 ft. in advance of the switch governed and is fixed on the mast above which is an automatic signal. The lower arm is caused to indicate a 45 deg. position by the operator and the top arm then indicates stop.

In the discussion F. W. Pfleging (U. P.) expressed his belief that the take-siding indicator should be placed at the switch with a distant indication. If no distant indication is used it should then be placed at not less than breaking distance from the switch. A. H. Rudd (P. R. R.) considered it a very great problem to determine whether a take-siding indicator should be linked up with the signal system or not and its solution was a very important matter. After the discussion the subject was referred back to the committee for further consideration.

With reference to the aspect indicating that 19 or 31 orders are to be delivered, C. A. Christofferson (N. P.) stated the practice on his road is to give an engineman advance information in automatic signal territory while in other territory a 19 order is indicated by the 45 deg. position of the board.

F. W. Pfleging (U. P.) said that in over 2,200 miles of automatic signal territory the Union Pacific has been using 19 orders for making meeting points for seven years. The 31 orders are used for signing for timetables. Trains to be run against current of traffic are stopped and run on 31 orders. The trains order boards are operated on the normal danger plan and the engineman has to whistle for the signal. A. H. Rudd (P. R. R.) stated that the practice on his road is to hold the block signal at stop and display the order flag or light until the train acknowledges the order board and stops, then the signal is cleared.

A. R. Fugina (L. & N.) said that on his road a normal danger train order signal used independent of the automatic signal system and the train orders boards. The enginemen are required to whistle for the board. About ten years ago they began to make a practice of using the home signal at interlocking plants as the train order signal but a majority of the operating officers were in favor of a separate signal indication for this purpose. In manual block territory a four-arm signal is used, the two top arms governing the block while the two lower arms are used for train orders. A 45 deg. position of the train order arm indicates a 19 order. The report was accepted as information.

Committee No. 6—Standard Designs, F. P. Patenall (B. & O.), chairman, presented three new drawings covering a standard switch lamp, train marker lamp and highway crossing gate lamp. The meeting adopted for submission to letter ballot a design for a switch lamp (cylindrical type). A design of train marker lamp was referred back to the committee after additional information had been received from the meeting. The drawing of the highway crossing gate lamp was also referred back to the committee for further consideration and it was suggested that the committee consider the use or design of a spring on the lamp or handle to prevent the light from being jarred out. It was also suggested that a 5⅜ in. lamp be adopted instead of the 4 in. one and that a hanger should be designed for use on the gate to which the lamp is attached.

The Second Day's Session

Committee No. 7—Direct Current Relays, E. G. Stradling (C. I. & L.) chairman, submitted specification for lifting

armature, neutral type, direct current relays. There was a long discussion over paragraph 2-o, page 189 of the June Journal reading "All moving parts shall be inclosed in a weather-proof dust-proof case, the sides of which shall be of glass of such transparency that the parts within the case may be visible for inspection. A screened breather opening, in the base of the case, adaptable for closing shall be provided." The discussion hinged over whether a relay should be allowed to breathe.

F. W. Pfleging (U. P.) said that in certain mountainous districts on his line extreme changes of temperature occurring in a period of a few hours made relays sweat, causing quite a little water to collect in them. This matter was taken care of by proper ventilation of relays. In other sections where considerable rain existed this trouble was not experienced.

E. W. Kolb (B. R. & P.) said that the breather opening was not for ventilation but was provided to equalize the pressure of air inside the glass case to that existing outside and that it was due to an unequal pressure between the two sides that caused the gasket to allow water to work into the relay. F. L. Dodson (G. R. S. Co.) said that some of his customers preferred to have relays incased air tight.

The wall type is not adopted to the construction of the breathing apparatus, as proposed.

W. H. Elliott (N. Y. C.) has 40,000 wall type relays in wooden cases with no special provisions for ventilation and has had no trouble from water. After many expressions of views F. P. Patenall (B. & O.) moved to eliminate the paragraph requiring a "breather" but the motion was lost by a large majority.

Paragraph 6-b, on page 190, of the June Journal reading "a non-adjustable stop-pin of phosphor bronze shall be placed under each core near the edge furthest from the bearing, protruding .010 in. from the underside of the core or the upper side of the armature for safety purposes" produced considerable discussion. Mr. Dodgson felt it would be a mistake to put this back in the specification as moisture condensing on these pins and cores would allow the armature to freeze fast during cold weather, causing a false clear signal indication. E. G. Hawkins (N. Y. C.) felt there was a necessity for two stop pins to maintain a proper air gap because the trunnions of the relays cannot be relied on to remain as they were when first installed. After relays are old the trunnions become worn so that an unequal bearing or pull may take place.

The chairman moved that the report be accepted as a progress report and the motion was carried.

Standard Form of Contract

Committee No. 12—Contracts, R. C. Johnson (B. R. T.) chairman, submitted a standard form of contract for execution with the contracting signal company for the installation of interlocking plants and block signals. G. A. Blackmore (U. S. & S. Co.) presented a strong protest against the adoption of a clause making the contractor responsible for consequential damages, stating that no indemnity company will insure the contractor at any reasonable figure, for such vague liabilities. No contractor can take such a risk; but a railroad, being a large concern, can establish contingent funds which will cover all risks. As the clause is drawn, a single accident could bankrupt the largest signal company. W. J. Gillingham (Hall Switch & Signal Company), S. G. Johnson (General Railway Signal Company) and Paul Renshaw (the Federal Signal Company) concurred in Mr. Blackmore's statement and argument. The representatives of the manufacturers seemed to think they had not been accorded proper recognition, but Mr. Elliott, speaking for the committee, said that a full conference had been had with them. The members of the committee had been guided largely by the law officers of the railroads; and their proposals were similar to those in the forms approved by the American Railway Engineering Association. It was stated that the New York Central has experienced no difficulty in getting work done under its form of contract, which is fully as rigid as that proposed by the committee.

To the argument that this form was similar to the forms used by contractors for the kinds of work done for railroads, Mr. Johnson replied that the conditions are not parallel; a signal company comes in at the end of the work and has to incur varied dangers because trains are already in operation. Mr. Rudd (P. R. R.) thought Mr. Johnson was rather one-sided, but, he said, the committee has learned the other way and the clause ought to be rewritten.

There was objection to the clause providing for the imposition of a penalty for delay; the general view being that no railroad uses this. The committee had put this in so as to provide a suitable form of words in case the condition should be desired but, Mr. Johnson said, this will encourage some obscure road to insist on the penalty when otherwise it would not have been thought of.

Objection was made to the sweeping character of the paragraph providing that omissions on plans or on specifications should not prevent the purchaser from getting all that was reasonably required; and the meeting finally voted, by a large majority, to cut out the words "or anything not expressly set forth in either plans or specifications, but which nevertheless is obviously necessary or implied."

The report was accepted as one of progress, including also a clause, not printed, requiring the contractor to guarantee not only his own apparatus but any provided by another contractor, or by the railroad company. In this connection Mr. Blackmore felt it unfair for one contractor to guarantee the reliable operation of apparatus manufactured by other contractors when this apparatus was furnished on the express instruction of the purchaser.

It was moved and carried that the report be accepted as a progress report.

D. C. Automatic Block Signaling

Committee No. 4—Direct Current Automatic Block Signaling, C. F. Stoltz (C. C. C. & St. L.) chairman, presented, as information, a proposed specification for direct current motor-operated signal mechanism. After brief discussion this was accepted; also a sketch, on a loose sheet distributed to the members, showing a proposed connection from rail to bootleg which has been developed on the Louisville & Nashville. Mr. Rudd (Penn.), is using in alternating current signaling, a $\frac{1}{4}$ in. sash cord connection. This has proved quite satisfactory. This connection can be hit with a pick several times and yet not be damaged. G. H. Dryden, a member of the committee, thought the proposed design lacked flexibility, for trackmen cannot be made to renew joints without changing the location, sometimes three or four feet, one way or the other. The connection to the rail ought to be made three or four ties away from the joint, and then follow along the rail as shown in the drawing. Mr. Eck (Southern Railway), thought it very desirable to have connection on both sides of the rail. He uses capping of design similar to that shown by the committee. Mr. Fugina (L. & N.) asked members to consider this arrangement with a view to trying it; he desires to learn the results of more extended experience. The sketch was received as information.

Committee 16—Standard Clauses and Sections is a new committee appointed by the Committee of Direction. It will be the duty of this committee to standardize the various clauses and sections in the different specifications as adopted by the association. F. B. Wiegand, signal engineer, New York Central, Lines West, was appointed chairman. W. J. Eck, signal and electrical engineer, Southern Railway and F. P. Patenall, signal engineer, Baltimore & Ohio, were the other two members appointed.

Committee No. 11—Batteries and Switchboards, R. B. Elsworth (N. Y. C.), chairman, presented a specification for primary battery jars, consisting of eight paragraphs. Some of these paragraphs were discussed briefly and were left in the hands of the committee for further conference with the manufacturers. This specification provides that the jars shall be furnished in multiples of the contents of a standard package. Small packages, although costing more than large packages for the same number of jars, are economical in the end by saving repacking in making shipments from the storehouse to the field. The committee proposes that, for testing, the rule shall be one jar in 10 or two in 20.

Instructions for the installation and handling of caustic soda batteries, presented by this committee were discussed at some length. Clause 2-c provides that cells or parts should not be unpacked except as required for use. This was criticised as interfering sometimes with economical handling. Some railroads check material before paying for it; others must unpack because of fire risk.

The rule for setting up new cells refers to the standard jar; but thousands of old jars are in use and there is need of detailed instructions as to right quantity and proportion of solutions for different classes of jars. Mr. Elsworth suggested that committee No. 5 should draft suitable instructions to maintainers.

On motion of Mr. Fugina the meeting voted to eliminate paragraph 7 providing for the use of lamps to keep batteries from freezing in cold weather, the general sentiment being that a rule of this kind needs to be much more detailed. Maintainers are liable to use lamps unnecessarily. After further discussion it was voted to accept this data as information and refer it to Committee No. 5.

Other Reports

Committee No. 2—Mechanical Interlocking, C. J. Kelloway (A. C. L.) chairman, presented a specification for mechanical interlocking machine having improved Saxby & Farmer locking and a specification for locking, establishing uniformity and sequence. After some discussion the report of the committee was accepted to be submitted to the annual meeting for letter ballot and inclusion in the manual.

Committee 3—Power Interlocking, F. B. Wiegand (N. Y. C.) chairman, submitted a report on specification for universal electric motor, switch operating and locking mechanism, first and second range voltage. This had been submitted at previous meetings and consideration has been given to the various criticisms and recommendations made before it has been revised to meet such criticisms and recommendations as, in the opinion of the committee, it thought advisable. The specifications for power interlocking machines were again submitted, after various criticisms and recommendations as made at previous meetings had received consideration. After brief discussion it was moved and carried that the specifications be accepted for presentation to the annual meeting for approval and submission to letter ballot for inclusion in the manual.

How Operating Capacity Can Be Increased*

Terminals Are Limiting Factor. Suggestions for Improving Intermediate Transfer Roads

By E. H. Lee
President, Chicago & Western Indiana, Chicago

IT IS THE OPINION of many well-informed railroad men that the transportation work to be performed by the railroads of the country during the coming winter will be from 20 to 40 per cent greater than that performed last winter, if traffic conditions reasonably to be expected are to be met. This increase is caused largely by reason of the various governmental activities necessary in the work of winning the present war, although the ordinary business of the country is keeping up in surprising volume. The need for fuel is greater than ever, although that portion handled along our eastern seaboard by vessel must now be handled by rail. Prompt deliveries of other war materials in heavy volume are imperative if the work of properly maintaining and supplying our fighting force abroad is to continue. Food materials and products must be moved to the seaboard promptly and troop movements are increasing the demands upon the passenger facilities of the country. It is the purpose of this article to discuss the existing situation on the railroads of the country with a view to determining what can be done within the next four or five months toward improving existing conditions, in order that the railroads may be more nearly able to meet the demands that will then be made upon them.

The transportation work of the country is being handled by the railroads at the present time in greater volume than ever before and with reasonable despatch. It will be remembered, however, that conditions in the summer season lend themselves to maximum transportation effort, whereas during the winter season this maximum effort is necessarily reduced. Congestion on the railways propagates itself rapidly and causes further congestion. In the last analysis congestion is the chief enemy of railroad transportation because it interferes with the one purpose of the railroads—the movement of traffic.

Terminals the Limiting Factor

It will doubtless be conceded that the facilities of the railroads are relatively much greater for handling traffic outside of the more important terminals than within them, and therefore the inference seems plain that in order to secure the maximum improvement, any measures looking toward an increase in their capacity for handling traffic next winter should be directed toward the terminals rather than toward the open country lines.

If prompt authority is secured, yards for the storage of cars may be provided either adjacent to, or at points outside of and beyond important terminals, where land is cheap and construction is easy, and this car storage, if provided, will doubtless be of great value in keeping tracks in working yards sufficiently clear, so that they may be reasonably open for the receipt and necessary classification of business. It seems certain, however, that the only improvements in track facilities which can reasonably be expected to be available next winter within the larger terminals themselves will be

*From an appendix to a preliminary report of the Yards and Terminals committee of the American Railway Engineering Association published in Bulletin 208.

those secured by so-called co-ordination, with the better balanced and therefore more complete use thereby secured. Experience has shown, however, that any rearranged use of existing track facilities should be carefully investigated, and adopted with caution, because many cases have and will occur in which suggested changes are only of superficial advantage and would probably be an actual disadvantage, considering the situation as a whole.

Principal Causes of Congestion

Two of the principal causes of congestion in terminals, which in turn act in a vicious circle with congestion itself, each to cause the growth of the other, are dead time and the rehandling of cars. It is safe to say that any method or practice which secures the maximum reduction in dead time, and in the rehandling of cars, will also secure maximum reduction in the congestion of terminals, and therefore maximum increase in the efficiency of the railroads of the country as a whole.

For the purpose of this discussion, dead time is limited to and may be defined as time spent by the train crew after an engine has been manned, in getting out of the roundhouse, pulling up to and coupling onto the train, testing the air, etc., at the outgoing end of the trip: time lost in setting out and picking up; and time spent in putting away the train, with the various similar attendant operations at the incoming end. This so-called dead time thus defined is to be distinguishable from time spent in actually passing over the road. Its serious effect in terminal operation is not generally appreciated, being of much less relative importance in open country operation than in terminal operation. This is true because dead time remains more or less constant, while running time tends to vary directly with the length of the run. As an illustration, assume an open country division 100 miles long, with the average freight running time over the division eight hours, as compared with a transfer run in a terminal 12 miles long, and an average running time of one hour. If the dead time is in each case two hours, the dead time loss on the country division is only 20 per cent, whereas on the transfer run it is 66⅔ per cent. This comparison may seem exaggerated, but an investigation made by the writer some years ago, which is believed to have been reasonably accurate, disclosed that in an actual case under ordinary conditions and where no undue congestion existed dead time as above defined consumed 65 per cent of the total service time of all trains in transfer service.

Rehandling cars is brought about by a number of different causes. Lack of proper method, as well as lack of careful and intelligent planning on the part of trainmasters, yardmasters, and conductors responsible for transfer movements, is partly responsible, but these causes operate during times of normal movement as well as during times of congestion. The great cause for rehandling is undoubtedly congestion, which is in turn further aggravated by the rehandling itself.

The two chief requisites for the rapid and efficient classification of cars, in so far as facilities are concerned, are sufficient motive power and sufficient open track room. The best results are obtained when these two kinds of facilities exist in a proper ratio. It is well understood that a deficiency in track room may up to a certain point be equalized by a surplus of motive power, but that lack of open track room will not make good a deficiency in necessary active power.

If the foregoing discussion is reasonably accurate as to the facts it may be continued with a view to determining their application and as to what changes may be advantageously made in prevailing methods and practices in order to secure an improvement.

At most minor terminals and junction points, direct deliveries are made between the railroads, and at some points the chief improvement possible is doubtless to be secured by a co-ordination of facilities when practicable, and an improvement in methods, as, for instance, by the reciprocal delivery of cars, thereby eliminating light running. In the case of industries served by more than one line, it has been the general practice in the past for each road to handle its own business into and out of the same, although in one case familiar to the writer all such industrial deliveries have been handled by a terminal railroad for the tenant companies using its line for a period of over 30 years, and with results entirely satisfactory in the way of a reduction of both engine time and cost. Under the new federal operation an arrangement has been inaugurated at various points by which the business of all the railroads to and from a certain industry or group of industries is handled by one company, and this practice may be expected to become general.

On the other hand, in the terminals of many of the larger cities considered as a whole one or more transfer railroads have performed an important part in the process of receiving and delivering cars between the various lines, and these transfer railroads become especially important during times of congestion. The transfer of cars in small terminals and at junction points is relatively a simple matter, and with proper care and attention, on the part of the railroad officers familiar with the conditions, it ought to be put on a more uniformly satisfactory basis. The transfer of cars over a transfer railroad in a large terminal is more complicated, and in view of the difference in the service performed, as between railroads of this kind, an analysis in each case would seem desirable, to determine what changes are needed. One of the broader differences is that some transfer railroads are used entirely for the operation of trains handled by the motive power and train crews of their tenants, while others operate either in whole or in part with their own power and crews. As the more important transfer roads in large terminals are operated in the latter way, what follows in this discussion is considered as especially applicable to them.

Certain principles follow with the reasons therefor which are believed to be particularly applicable to terminal transfer railroads which operate trains with their own power and crews, although some of these principles are of more general application:

Terminal Transfer Railroads

1. The operation of transfer railroads should usually be restricted as much as possible to the transfer of cars as distinguished from the classification of cars. It follows that the through line should so far as practicable deliver its cars to the transfer line, classified and straightened out into cuts for the various through lines to which deliveries are to be made by the transfer line for through line account. Such a transfer railroad as is being considered may be compared to a thoroughfare connecting two camps or cantonments. It may be of ample width to handle all the travel between them, if team and foot travel is kept moving in column formation, at fair speed, and without unnecessary stops, columns having been formed in the streets and areas of the cantonments themselves. But if the thoroughfare is used as a drill ground, for the formation of columns, or as a recreation area, its capacity may be reduced to the vanishing point. The main tracks of most transfer railroads are ample for a larger volume of traffic than is handled over them, but in times of congestion they are frequently blocked at junction points, yard entrances and connections by trains which are unable to get into yards by reason of their crowded condition. These yards, in turn, are congested by an oversupply of cars awaiting classification, which occupy room that should either be reserved for the receipt of main line

transfer trains or be kept for the classifications which are necessary and which cannot be made to advantage elsewhere.

It should be observed that where through lines make direct deliveries to each other, they classify cars straight for the various railroads as a matter of course. There seems no good reason why when delivery is made through the agency of a transfer line the through line should not continue to make the required classifications, at least to a reasonable extent. In so far as the through business is concerned, it is believed that the practice of considering and using the transfer line as an agency for both classification and transfer, instead of restricting its use so far as practicable to the transfer of cars, is responsible for much of the congestion of terminals. The present practice has been the growth of years. Until recently the transfer road depended upon the through lines for much of its business, and felt in no position to object to the dumping of business upon it regardless of congestion or of how badly the deliveries might be mixed. Under the old conditions the responsibility of the through line ceased, once it had delivered its cars to the transfer or belt line, and every effort was accordingly made (the more congestion increased, the more strenuous the effort) to unload on the transfer line, regardless of ultimate consequences, thus "shifting responsibility."

With flat switching ordinarily eight or ten classifications are made without rehandling, a greater number being bunched and reclassified. An analysis will show that in very many cases only few classifications are required to straighten out a large proportion of the business. In one case in Chicago about 50 per cent of the through transfer business in one direction goes to only two railroads. If all cars for these lines were delivered to the belt line in straight cuts, approximately 50 per cent of the classification in that direction would disappear and much of this 50 per cent could be run in straight trains from terminal to terminal, thus eliminating dead time and helping to keep yards clear. Moreover, this preliminary classification could be made with little or no additional expense by the through line, because it must in any event switch out many cars, such as bad orders, holds, and those for other deliveries. Also a considerable amount of this preliminary classification could be done to advantage at the division yards of the through line beyond the large terminals.

The place to control congestion is at or near the various points where business originates. By proper measures the through line may in a degree control congestion in its own important terminal yards, by holding back business, something impossible to the belt line, without the help of the through lines.

Business moving even in heavy volume is not congestion, and where they exist, belt lines if kept reasonably open and uncongested are the best means of keeping cars moving in terminals, thus avoiding congestion and blockades.

Preliminary or advance classification as above described is not a theoretical measure, but has been used many times with success to prevent and to lift blockades in terminals.

2. Where transfer or belt roads are of considerable length and where equipped with motive power to handle transfer trains, it is the better practice to keep foreign engines off the belt line, performing the transfer service with belt crews. Better supervision can be secured where train crews are kept at home. It is difficult, if not impossible, to enforce discipline over crews while operating on a foreign road (particularly against loafing on the job), even though in theory they become the employees of that road while so engaged. Moreover, discipline and standards of performance vary on different railroads, being better on some and worse on others. Where foreign trains and engines operate over a transfer road it ordinarily happens that the general movement is regulated by the slowest and most indifferently operated train. There is also a difference in the standard of power maintenance as between railroads. A stalled train caused by the engine breaking down, not steaming or being overloaded, delays all following trains, and if a foreign crew, the railroad officers who should apply discipline have no direct stake in the failure, and find excuses ready to hand. The practice of using foreign crews on the transfer road is not sufficiently elastic. The crew may have a full train in one direction and a light train in the other, because it runs between two points only. The belt crew may be ordered to any of several points, as the business may indicate.

3. Trains should be so made up that one engine will handle as many cars as far as possible. This principle is used in the operation of through lines very generally. Under the new federal operation trains of war material have been consolidated and run solid over several different railroads without breaking up, with a saving of time and expense. The application of the principle on transfer railroads is even more important than on the through lines, because it is one of the best ways of reducing dead time, which, as we have seen, cuts so much more figure on the belt line than on the through line.

4. Where track facilities permit, the through line engine should make deliveries to the belt line yard and should haul back its own deliveries from the belt line yard. This eliminates light running. It also fixes responsibility, something of great importance during times of congestion because it permits the prompt application of the remedy. This presupposes that the belt line has sufficient tracks for both its receipts and deliveries, which will doubtless be true in most cases, where its yards are kept properly clear. As the receiving road controls its own receipts, this arrangement would give control of both receipts and deliveries to the belt line, because unless the through line keeps its receiving tracks clear by taking its business, the belt line can shut it off, and this is as it should be.

5. Transfer trains should be loaded to capacity so far as practicable, because a light train costs about as much and occupies the track facilities to about the same extent as a full train, while handling less cars. No discussion seems necessary of this rather obvious principle, although it is not always carried out in practice.

As will be observed, the foregoing discussion is largely directed toward an improvement in the operating methods of an intermediate transfer railroad. How important transfer railroads of this type are to the business of the country is shown by figures prepared by the writer in 1915 regarding one of the Chicago belt lines. With a roadbed mileage of only 0.012 per cent of the mileage of the whole country, it handled a tonnage equivalent to 1.03 per cent of the total tonnage of the country. Bearing in mind that terminal congestion retards the flow of traffic for long distances outside the terminals as a dam cuts off the flow of water for miles above it, the vast importance of removing congestion and promoting the flow of traffic through terminals becomes apparent.

Conclusion

It may also be observed in conclusion that some of the improvements suggested as applicable to belt or transfer railroads, will be found of equal advantage in connection with the work of terminal divisions of some of the larger systems.

The three things among those suggested in this discussion which it is believed would have especial effect in controlling congestion are the construction of storage yards, outside the terminals; the advance classification of transfer cars, to the greatest practicable extent; and an extension of the authority of the men in charge of terminal operations, whatever their rank or title, in order that they may better control the flow of traffic to and through the terminals.

One Way to Improve Operating Methods

By Max E. Burk

WHETHER OR NOT the railroads are to be operated by our government; whether or not government ownership of railroads is to be our policy; whether or not the railroads are to be returned to their original owners for operation and some revised form of regulation adopted, this much will still hold true—our present experience in government operation cost us over two hundred million dollars for the first twelve months, and the deficit is still rising. Remembering that government operation was undertaken entirely as a war measure, the cost involved is negligible compared with other war expenditures, but if we can gain something from the present experience that will prove helpful to us in the future, it is up to us to do so.

The present grouping of roads into regions affords the regional directors the necessary means of making extensive studies pertaining to train operation and other problems which we have not so far succeeded in determining to our satisfaction. Now is the time when such studies can be carried on at a reduced expense, for the results may be applied to several roads instead of one. Under present conditions, when the regional director's office acts as a clearing house for several roads, there is more data available for such studies and competition is not keen enough to make unfavorable results too costly.

To carry on such studies it would be necessary to establish in each region an analytical organization whose duties should be confined to the weighing and scaling of operating performances on each road, suggesting improvements, determining results of accepted and rejected suggestions, keeping in touch with improvements on other regions and determining the effects of their application to the region in question or its individual roads, and to establishing such daily tabs of operation as will enable them to detect irregularities, changes or bad practises within a day or two instead of several weeks after they take place.

While few railroad men will fail to realize the necessity for such studies, some may ask the question, Why not make the present operating organizations do this work? Some may even go further and ask whether it does not mean that the operating officers are not credited with enough ability to entrust such work to them. This is not the case. Only ignorance of the conditions with which our railroad managements have had to deal of late would cause any one to criticize or doubt their ability. Our operating officers, however, are overloaded with work and responsibilities and have not the necessary time to devote to this complicated study. We have left the point where our inefficiencies were so apparent that a practical man could detect them with the naked eye. It now requires scientific tools merely to locate those leaks, much less to attempt to devise remedies and to see that they are carried out. Besides it would prove quite advantageous to have an organization that is not responsible for actual operation, for such an organization would be inclined to be somewhat theoretical and would pull upward where the practical operating officer would tend to pull downward somewhat, allowing himself enough safety. The resultant of the two forces would be the happy medium. When we realize that railroad operating expenses alone reach the $400,000,000 mark per month, if we make merely a one per cent improvement, think what this would mean as an investment.

Do our present methods of operation indicate the lack of analytical study? If they do, in what departments? To answer these two questions it will be necessary to make a survey of the workings of our roads in a general way and without hesitation to attempt to interpret the hows and whys, bearing in mind that in almost all cases our railway officers have done the best they could under the circumstances.

How many roads have purchased large locomotives before they were ready for them? These locomotives in many cases could not be used advantageously because of such minor obstacles as inadequate water and coaling stations. The principal obstacle encountered, however, in making full use of the new locomotives was inadequate sidetracks, tracks too short to take care of the new trains. Was there any economy there? Not much. How, then, did it come about? One way of accounting for it is through the fact that the officers who were directly responsible for the buying of those locomotives could not give the question as much study as the men who did the selling.

The fact that about 80 per cent of our yards and terminals have not kept pace with our facilities between terminals pleads very strongly for an analytical organization. Such an organization would have emphasized the fact that our freight is traveling only about 2 to 2½ hours out of every 24 hours, therefore more attention should be given to supervising and improving that part of our system which has most to do with the handling of our business. In making up the plans and estimates for construction work, our engineers have been handicapped by an insufficient knowledge of yard operation. There seems to have been a tendency not to recognize a train until there was a locomotive on one end and a caboose on the other. The real truth of the matter is that when a train reaches that stage most of the difficult work has already been accomplished and there is comparatively easy sailing until the caboose is again taken off or placed ahead of the locomotive. The wind has now started blowing the other way—everywhere one hears about increasing terminal facilities.

Of course, some improvement will be made thereby, but the time is not very far off when it will be recognized that added tracks and buildings alone will not solve the question of congested terminals. It is more of a psychological problem than a physical one, and it cannot be solved until this fact is recognized fully by our officers.

We have reached the time when a new unit has to be added to the consideration of economic railroad operation, i. e., the Unit of Labor. The introduction of a new unit is quite a complicated undertaking, especially in this case, where there are so many artificial barriers. It, therefore, requires constant and careful study by an organization especially fitted for such purposes.

The most successful road will be the one, which—other conditions being equal—will be able to haul more tonnage per unit of labor. In our future estimates of the benefits to be derived from grade reduction and the elimination of curvature more consideration should be given to the importance of being able to operate the road with less specialized labor per ton mile.

While an analytical organization is helpful for special problems, such as those indicated above, it is absolutely necessary for economic, efficient and satisfactory everyday operation. The railroads in the United States have been operating for the last couple of years with limited equipment. At the same time our records show that from 20 to repairs; that the remaining 75 to 80 per cent were actually on the road between terminals only from 30 to 40 per cent fact that our officers had all they could do to handle the current business, and there was no chance of retracing yesterday's work and looking for flaws. Something had to be very much out of line before it was changed. Our supervising facilities have not kept pace with our general progress. The result is that, whenever for some reason it becomes necessary to determine actual conditions in some shop or roundhouse, the management invariably sends special check-

ers for that purpose. Why not refer to the daily report?

To get the best out of our present facilities and to help make improvements in the most economic order we must watch closely our daily performance. Our record-breaking progress necessitated the breaking up of each railroad organization into several departments, each under the supervision of specialists in their respective lines. While the specialization was necessary to increase production, it has resulted in the sad experience that a man expert in his department knows little of the workings of the other departments. The latter means many cross-purpose practices. To offset this condition we are compelled to create an organization whose business should be the constant analysis of the workings of all departments, the determination of the relationship between different orders of the different departments. Such an organization should prove to be the most effective tool for efficient operation to our operating officers. Such an organization under proper co-operation will prevent unpreparedness and will do away with our present apparent necessary evil—that of quantity and lessening quality.

Reasons for the Increase in Employees*

By Walker D. Hines
Director General of Railroads

VARIOUS PUBLIC COMMENTS have been made upon the fact that there were about 140,000 more railroad employees in January, 1919, than in December, 1917. There has been at times a disposition to assume that this fact indicates that under federal control there has been a laxity of supervision on the part of the railroad officials throughout the country as compared with the sort of supervision which would characterize those same officials under private control. It is wholly unjust to attribute to these railroad officials any such failure in their duty to the government because the facts show that this increase in employees was due to entirely different and perfectly justifiable causes. These causes were, first, the establishment of the eight-hour day and, second, the exceptional amount of maintenance work which was performed on roadway and structures in January, 1919.

In December, 1917, many employees worked on the basis of 10 hours per day or longer, but during federal control and before January, 1919, the eight-hour day was put into effect for railroad employees. The adoption of the eight-hour day therefore made it necessary either to work many classes of employees overtime (and frequently at punitive rates of overtime) or to obtain more employees to perform the same number of hours of labor. Overtime is undesirable and costly and hence the proper policy is to obtain enough employees to avoid working overtime except in emergencies. The principal cause, therefore, for the increase in the number of employees, has been the adoption of the eight-hour day. This radical change for the protection of railroad labor makes it necessary to consider the number of hours worked instead of the number of employees worked. While in January, 1919, the number of employees increased 8½ per cent over the number of employees in December, 1917, the hours worked by employees in January, 1919, increased only 1½ per cent over the hours worked by employees in December, 1917. Thus the increase in the number of employees simply illustrates the carrying out of the policy, which I believe is generally endorsed as proper, that employees ought not to be required normally to work more than eight hours per day. The small increase in the number of hours worked reduced the disparity between December, 1917, and January, 1919, to very small proportions. The result therefore is that the principal cause of the increase in the number of employees is not any greater laxity on the part of railroad officials under federal control than was exhibited by those same officials under private control, but the adoption of the eight-hour day.

This entire increase in the hours of work in January, 1919, as compared with December, 1917, can be accounted for by the increase in maintenance work on roadway and structures. January, 1919, was an unusually favorable month for such maintenance work because of the exceptionally good weather and the availability of adequate forces. In December, 1917, severe winter weather began at an unusually early date and labor for maintenance work was exceedingly scarce because of war conditions and especially because the railroad companies were not paying wages adequate to attract maintenance labor. The result was that in January, 1919, an exceptional amount of maintenance of roadway and structures was performed, the expenditure therefor being 245 per cent of the expenditure for the same purpose in December, 1917. That the entire increase in hours worked on the railroads in January, 1919, can be accounted for in the principal classes of employees in maintenance of way and structures (foremen, section foremen, masons and bricklayers, structural ironworkers and section men), is shown by the fact that the increase in hours worked by these classes of railroad employees in January, 1919, as compared with December, 1917, was in excess of the total increase in hours worked by all railroad employees, so there was actually a slight decrease in the hours worked by all other railroad employees. The increased hours worked in January, 1919, by these maintenance forces does not imply any laxity on the part of the railroad officials throughout the country as compared with the attitude of the same officials under private management, but merely shows that these officials were taking advantage of good weather and a good labor supply to do an unusual amount of maintenance work.

Both of these propositions are further illustrated by the month of February, 1919. In that month as compared with December, 1917, the number of hours of work paid for on the railroads diminished 4.3 per cent while the total number of employees had increased 8 per cent, this condition being due, as already explained, to the recognition of the important principle of the eight-hour day. On account of the extraordinarily favorable weather in February, 1919, the expenditures in that month for maintenance of way and structures were 251.6 per cent of such expenditures in December, 1917, and the hours paid for to the principal classes of maintenance employees increased ½ per cent while the hours worked by all other employees decreased 5½ per cent. This situation again shows that the railroad officials in February, 1919, were simply taking advantage of good weather and good labor supply to do a greatly increased amount of maintenance work.

*Extract from address before Philadelphia Chamber of Commerce, June 20, 1919.

Director General Hines gives convincing reasons why the President should have control of railway rates as well as costs, but they are superfluous. One Interstate Commerce Commissioner has argued recently that the rates are high enough, and that the railways are fortunate in being under the protective control that has brought them into a precarious financial condition. Another Interstate Commerce Commissioner has recently argued that rates should not be increased because it would inflate the general price level—as though the Interstate Commerce Commission were charged with the regulation of the price level. It is true that the Commissioners long had company in the idea that the solvency of the railways was not important, and that it was not particularly in the care of the Commission. But that idea is now dead and buried, outside of the Commission. That it should survive there is a good reason for intrusting the regulation of rates elsewhere.—*New York Times.*

General News Department

Representatives of the regional directors will meet at Washington on July 7 with a committee representing the train service brotherhoods to discuss interpretations of the recent wage orders issued by the director general of railroads.

A railroad men's federation is proposed by E. H. Morton, president of the Order of Railway Station Agents and representative of a number of railroad employees' organizations, not including the "big four" brotherhoods of train service employees, met in Washington this week to start an organization.

The Black Tom disaster of 1916 has again been the subject of suits in the court at Jersey City, N. J., and on Saturday last verdicts against the Lehigh Valley Railroad were handed down amounting to $330,881. Most of these suits were those entered by insurance companies. One was for the loss of a schooner and cargo, $100,874

Governor Bamberger, of Utah, with a party of Utah business men recently made a ten-day trip into the Uinta Basin to examine feasible routes for a railroad into that locality. If the territory promises enough present and future business to maintain a new line, the organization of a company to finance the project with Utah capital will be started at once. Three proposed routes were examined, one by the way of Heber, another by the way of Stockmore, and the third over the Soldier Summit pass.

For the Alaskan Railroad the appropriation for the next fiscal year, as fixed by the Senate in the Sundry Civil bill is $12,000,000. The Alaskan Engineering Commission estimates that the railroad will be completed in 1921 at a total cost of $50,436,971, or about $73,200 a mile. It is planned to employ between 5,000 and 6,000 men on the project this summer. In the same bill, the Senate, over-ruling its committee on appropriations, increased the appropriation for the valuation of railroads from $2,000,000 to $2,500,000, which is the sum approved by the House.

New York to Chicago in eight hours, 43 minutes is the latest record of the airplanes carrying mail. This is the time made on July 1, and regular service is promised. The distance is estimated at 750 miles. The airplane started at 5:15 a. m., and flew to Belfont, Pa., at 123 miles an hour; another airplane took the mail from there to Cleveland, at 100 miles an hour, and thence the bags were carried by the regular airplane to Chicago, arriving at 12:58 p. m. The second assistant postmaster general says that on letters to the Pacific Coast about 24 hours will be saved; and he expects to take 12,000 such letters each trip.

A freight train three miles long, is to be run from Washington to San Francisco—a train of motor wagons to be run by the War Department as an experiment in military transportation. According to announcement, these automobile trucks will start on July 7 and will be expected to make 15 miles an hour. The "train" will traverse the Lincoln Highway, and it is calculated that the journey can be made in two months. A full complement of officers and men will travel with the train, which will carry supply and repair units. The War Camp Community Service has been requested to look out for the men along the line. Elaborate ceremonies are being planned to mark the arrival in San Francisco.

Honorably discharged officers in considerable number, many of them experts or technicians, and many with years of experience, are registered at the main office of the War Department at Washington, D. C., for assistance in securing employment fitted to their capacities. All of the men registered have superintended men in the field under trying conditions, and practically all professions and trades are included among them. Arthur Woods, assistant to the secretary of war, says that only about 7 per cent of American army officers need this assistance, and of these, two-thirds of the number have usually found positions before the assistance of the War Department is available.

Samuel H. Barker, of Philadelphia, in a letter to the New York Evening Post, nominates Brigadier General W. W. Atterbury for president of the United States. Republicans in Congress, says Mr. Barker, have demonstrated themselves little men; the nation wants a man who can plan and accomplish big things in a direct, business way. General Atterbury, 53 years old, has never been in politics; has made his own way; has demonstrated that he is a man with broad vision, workable ideas and a mind given to attacking hard problems and getting practical solutions. He comes back from Europe with an open mind on the railroad and other economic problems which are now coming up for attention in new forms.

The Senate committee on banking and currency, which is considering the confirmation by the Senate of the re-nomination of John Skelton Williams to be comptroller of the currency, has listened to charges, presented by Wade H. Cooper, a Washington banker, that Mr. Williams, while Director of the Division of Finance of the Railroad Administration, had sanctioned or acquiesced in the payment of an excessive rental to the Georgia & Florida Railroad, of which Mr. William's brother was one of the receivers. Mr. Cooper said that the road was guaranteed an annual rental of $88,000, although it had had a deficit during the period before federal control. Mr. Williams testified that he had never given his approval to the contract involved, had never even read it, was not present at the conference at which it was passed upon, and had never made any recommendations or suggestions in regard to it.

Heavy loading of freight cars, carried out with a good degree of efficiency during the war, is the subject of a bulletin, which has been issued by the Canadian Railway War Board, calling for the continuance of the efforts which produced such improvement last year and the year before. This bulletin, addressed mainly to shippers, says that the average loaded car in 1919 was 27 tons, as compared with only 20 tons in 1914. Taking the average train of loaded cars this increases the net hauling capacity of the locomotive by 15 per cent. The prompt unloading of freight also worked important savings and consignees are exhorted to continue that economy also. Those who have abandoned their efforts because the war is over are compared to the captain who, after passing through a storm at sea, orders the lifeboats pitched overboard, so as to increase his speed by lightening of the ship.

Safety Record in Northwestern Region

A safety record compiled for roads in the Northwestern region for the four months ending April 30, shows a decrease in casualties of 1,815 or 22.28 per cent, as compared with the records for the same period in 1918. There was a decrease in the number of employees killed of 53 or 36.81 per cent and in employees injured of 1,733 or 34.7 per cent. The record for all persons, including employees, shows that 113 or 33.4 per cent less persons were killed and 1,702 or 21.81 per cent less persons were injured during this period on lines in this region than were injured or killed during the same period last year. On the Fort Dodge, Des Moines & Southern the number of casualties decreased 92.5 per cent.

Deadheads' Names Called For

Senator Newberry has introduced in Congress a resolution calling on the director general for a statement as to the number of annual passes issued for the year 1919, good over all lines, under the Railroad Administration, including passes good for sleeping-car and parlor car accommodations or free dining-car service, the report to include the name and residence of the recipient and the date of mailing, by whose order and for what reason each pass was issued.

Saving Cement Sacks

The Northwestern Regional Purchasing Committee, in advocating the proper care of empty cement sacks and their prompt return to the manufacturers for credit, says that one road has installed a machine, at the cost of $125, for cleaning sacks; and reports that during the year 1918 an average of 8,500 sacks were cleaned weekly. Cement to the amount of 367 barrels was reclaimed, valued at $940. The same road also makes a practice of repairing cement sacks, and reports that during 1918, 19,475 sacks were repaired at a cost of $230, or a little over one cent each, and by making these repairs $375 was saved.

Winnipeg Strike

The general sympathetic strike which has been in progress at Winnipeg since May 15, ended on June 24, according to an announcement issued by the Central Strike Committee, which has been conducting the strike, ordering all men back to work on June 26, exactly six weeks from the time the strike was called. The terms of the ending of the strike are not clearly outlined in despatches from Winnipeg; however, the strike leaders have been unable to obtain any concessions, and the surrender appears to be unconditional. A government commission of investigation will be appointed to conduct an investigation into the strike and to settle all disputes between the employers and strikers.

Administration Equipment Trust Certificates

The committee of the Association of Railway Executives, the Bankers' committee and the Railroad Administration have agreed upon a plan providing for the issue of $280,000,000 six per cent, 15-year equipment trust certificates, the proceeds of which are to be used to pay in part for the $400,000,000 equipment which has been ordered during the period of government control.

An equipment corporation is to be formed with power to buy, sell and lease railroad equipment. This corporation will have $148,000,000 capital stock to which it is proposed that the Railroad Administration subscribe. Of this amount $120,000,000 is to be used to repay the Railroad Administration 30 per cent of the cost of the equipment, and $28,000,000 is to be used as a reserve fund. This company will issue the $280,000,000 equipment trust certificates to the general public and will sell the equipment, costing $400,000,000, to the railroad companies on the installment plan. The installments paid by the railroad companies will be sufficient to provide for the retirement serially of the equipment trust certificates and provide interest thereon and to liquidate the stock.

Progress of Valuation Work

In a statement made recently before the appropriations committee of the House of Representatives, Director C. A. Prouty said that the road and track parties in all districts will substantially complete their work this year, and that four parties have already been disbanded in the Pacific district and five in the Southern district. The land and the field accounting work will be completed in about two years, while the office work will be completed in about three years.

The complete engineering, accounting and land reports for the Boston & Maine system have been received, while the director stated that similar reports had been completed for the Rock Island. It is estimated that the division will receive completed reports from the engineering section on 50,000 miles of road during 1919, similar reports having been received on 25,000 miles of road up to January 1 of this year. The inventory of the Western Union properties has been practically completed, while the most important part of the inventory of the Postal Telegraph properties will be completed in about six months. Work is just about to begin on the properties of the American Telephone & Telegraph Company. Up to December 31, 1918, $13,706,197 had been expended by the federal valuation department, of which $13,206,831 had been expended on the valuation of the railroads. The commission has authorized the appointment of about 1,525 men, and the average force of the division of valuation during 1918 was about 1,325 men.

Rear Collision at Dunkirk, N. Y.

In a rear collision of passenger trains on the New York Central at Dunkirk, N. Y., on the morning of July 1 at 2:20, eight passengers, the baggageman, the engineman and the fireman of train No. 7, and one trespasser were killed, and 17 passengers were injured. A number of others sustained minor injuries. Westbound passenger train No. 41, standing at the station, was run into at the rear by westbound passenger No. 7, wrecking the rear sleeping car. No. 7 struck at 40 or 50 miles an hour. The baggage car of No. 7, a wooden car, was crushed, and the coach next behind it, a steel car, was turned crosswise of the track and its side torn open; and in this car and the rear sleeper of No. 41 the passenger fatalities occurred. The trespasser was riding between the tender and the leading baggage car.

Train 41 had been standing at the station about 47 minutes because of a hot journal. It was properly protected by a home block signal 2,000 ft. back and a distant signal 4,125 ft. farther back; and the flagman was back 1,700 ft. with a red light. There is, however, no question about protection, as the engineman of No. 7, F. L. Clifford, had sounded the whistle for hand brakes, indicating that the air brakes did not properly act. Clifford was alive when taken from his engine and said that the brakes did not hold. This seems to be confirmed by the examination of the wreck, which disclosed that the air-brake angle cock at the rear of the tender was shut; and it is believed that the man riding there had closed it, intentionally or otherwise. This trespasser was identified as Charles Schiller. He was a resident of Dunkirk, which tends to confirm the supposition that, finding that the train was likely to pass through the town without stopping, he decided to himself apply the brakes and mistakenly assumed that he could do this by turning the angle cock.

Western Society of Engineers' 50th Anniversary

The Western Society of Engineers, Chicago, celebrated the fiftieth anniversary of its organization on June 27 and 28. This society was founded in May, 1869, as the Civil Engineers' Club of the Northwest, the name being changed to the Western Society of Engineers in 1880.

The program was opened at 3 o'clock on Friday afternoon with an outline of the history of the society and of the most important achievements, presented by E. S. Nethercut, secretary. This was followed by brief reviews of the developments in engineering progress during the last 50 years in (1) transportation, by Samuel O. Dunn, editor of the *Railway Age;* (2) steam power, by J. R. Bibbins, of the Arnold Company, Chicago; (3) electric light and power, by J. R. Cravath, consulting electrical engineer, Chicago; (4) electrical communication, by F. F. Fowle, consulting telephone engineer, Chicago, and (5) sanitary engineering, by J. W. Alvord, consulting engineer, Chicago.

The evening was devoted to reminiscences of the early days of the society by past presidents, twelve of the 23 living past presidents being present. In all, 39 presidents have served the society. The speakers included Samuel G. Artingstall, Isham Randolph, consulting engineer, John F. Wallace, president, Westinghouse, Church, Kerr & Company, New York; Ralph Modjeski, consulting bridge engineer; W. L. Abbott, chief operating engineer, Commonwealth Edison Company; Charles F. Loweth, chief engineer, C., M. & St. P.; Andrews Allen, consulting engineer; John W. Alvord, consulting en-

gineer; Albert Reichmann, division engineer, American Bridge Company; H. J. Burt, manager, Holabird & Roche, architects, and Charles E. Burdick, consulting sanitary engineer.

Traveling Engineers' Association

The annual meeting of the Traveling Engineers' Association, to be held at Hotel Sherman in Chicago in September, will begin on the 16th instead of the 9th; and will hold through Tuesday, Wednesday, Thursday and Friday, ending on the 19th.

Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

AIR BRAKE ASSOCIATION.—F. M. Nellis, 165 Broadway, New York City. Next convention, May 5-7, 1920, Chicago.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—E. H. Thayer, St. Louis-San Francisco R. R., St. Louis, Mo.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, Chicago.

AMERICAN ASSOCIATION OF GENERAL BAGGAGE AGENTS.—J. E. Quick, Port Huron, Mich.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—J. Rothschild, Union Station, St. Louis, Mo.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—F. B. Burritt, 8 W. 40th St., New York. Next convention, October 6-10, Atlantic City, N. J.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—C. F. J. Dell, 50 E. 42nd St., New York.

AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPE FITTERS' ASSOCIATION.—Otto E. Schlinck, 435 W. 5th St., Peru, Ind.

AMERICAN RAILROAD ASSOCIATION.—J. E. Fairbanks, 75 Church St., New York:

Section I, Operating (including former activities of Association of Railway Telegraph Superintendents and Railway Storekeepers' Association).

Section II, Engineering (including former activities of American Railway Engineering Association and Railway Signal Association).—E. H. Fritch, 431 South Dearborn St., Chicago.

Signal Division.—H. S. Balliet, 75 Church St., New York.

Section III, Mechanical (including former activities of Master Car Builders and Master Mechanics Associations).—V. R. Hawthorne, 431 South Dearborn St., Chicago.

Section IV, Traffic (including former activities of Freight Claim Association).

Section V, Transportation (including former activities of Association of Transportation and Car Accounting Officers).

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W. Ry., 319 N. Waller Ave., Austin Station, Chicago. Next convention, October 21-23, 1919, Cleveland, O.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—(See American Railroad Association, Section II, Engineering).

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—(See American Railroad Association, Section III, Mechanical).

AMERICAN RAILWAY PERISHABLE FREIGHT ASSOCIATION.—F. F. McPike, 135 E. 11th Place, Chicago. Regular meetings, 2d Wednesday in March and September.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—R. D. Fletcher, 6402 Greenwood Ave., Chicago. Next convention, August 27-29, Hotel Sherman, Chicago.

AMERICAN SOCIETY FOR TESTING MATERIALS.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Charles W. Hunt, Engineering Societies Building, 33 W. 39th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 57 W. 39th St., New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN SHORT LINE RAILROAD ASSOCIATION.—T. F. Whittelsey, 708 Union Trust Bldg., Washington, D. C.

AMERICAN TRAIN DESPATCHERS' ASSOCIATION.—D. L. Darling, Northern Pacific Ry., Spokane, Wash.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, C. R. R. of N. J., Jersey City, N. J.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Next meeting, October, 1919, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—(See American Railway Association, Section I, Operating).

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—(See American Railroad Association, Section V, Transportation).

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—M. F. Trees, Chicago. Next annual convention, October 21-23, 1919, Cleveland, O.

CANADIAN RAILWAY CLUBS.—James Powell, 46 Aberdeen Ave., St. Lambert (near Montreal), Que.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

CENTRAL RAILWAY CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November, and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. R. McMunn, New York Central, New York.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S SUPPLY MEN'S ASSOCIATION.—D. B. Wright, Lehon Company, 45th and Oakley Sts., Chicago.

EASTERN RAILROAD ASSOCIATION.—D. G. Stuart, Washington, D. C.

FREIGHT CLAIM ASSOCIATION.—(See American Railroad Association, Section IV, Traffic).

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 5d Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, B. & O., Lima, Ohio. Next convention, August 19-21, Hotel Sherman, Chicago.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, 702 E. 51st St., Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1061 W. Wabash Ave., Winona, Minn. Next convention, October 21-23, 1919, American Annex Hotel, St. Louis, Mo.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION.—F. W. Hager, 1323 Hurley Ave., Ft. Worth, Tex. Next annual convention, October 21-23, 1919, American Annex Hotel, St. Louis, Mo.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next meeting, September, 1919, Chicago.

MASTER CAR BUILDERS' ASSOCIATION.—(See American Railroad Association, Section III, Mechanical).

NATIONAL ASSOCIATION OF RAILWAY AND UTILITIES' COMMISSIONERS.—James B. Walker, 49 Lafayette St., New York. Next annual convention, October 14, 1919, Indianapolis, Ind.

NATIONAL FOREIGN TRADE COUNCIL.—O. K. Davis, 1 Hanover Square, New York.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—George A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Regular meetings, 3d Tuesday in each month, Tenjost Hall, Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, 64 Pine St., San Francisco, Cal.

RAILWAY ACCOUNTING OFFICERS' ASSOCIATION.—E. R. Woodson, 1116 Woodward Bldg., Washington, D. C. Next annual meeting, June 11, 1919, Hotel Commodore, New York.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Nixon, 30 Church St., New York. Next annual meeting, December, 1919, Buffalo, N. Y.

RAILWAY CLUB OF PITTSBURGH.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month except June, July and August, Colonial Annex Hotel, Pittsburgh, Pa.

RAILWAY DEVELOPMENT ASSOCIATION.—D. C. Welty, Missouri Pacific R. R., St. Louis, Mo.

RAILWAY ELECTRIC SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

RAILWAY EQUIPMENT MANUFACTURERS' ASSOCIATION.—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Next annual meeting, September, 1919, Hotel Sherman, Chicago.

RAILWAY FIRE PROTECTION ASSOCIATION.—G. L. Ball, St. Louis-San Francisco Ry., St. Louis, Mo. Next annual meeting, October 21-23, 1919, La Salle Hotel, Chicago.

RAILWAY REAL ESTATE ASSOCIATION.—James P. Nelson, President, C. & O., Richmond, Va.

RAILWAY SIGNAL ASSOCIATION.—(See American Railroad Association, Engineering Section, Signal Division).

RAILWAY STOREKEEPERS' ASSOCIATION.—(See American Railroad Association, Section I, Operating).

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 16-18, 1919, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, West Nyack, Rockland County, New York.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November, Piedmont Hotel, Atlanta.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.

SUPPLY ASSOCIATION OF AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago. Next convention, August 27-29, Hotel Sherman, Chicago.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Next annual convention, September 16-18, 1919, Auditorium Hotel, Chicago.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Cleveland, O. Next annual meeting, September 16-19, 1919, Hotel Sherman, Chicago.

WESTERN ASSOCIATION OF SHORT LINE RAILROADS.—Clarence M. Odell, Mills Bldg., San Francisco.

WESTERN RAILWAY CLUB.—J. M. Byrne, Chief Clerk to Mechanical Assistant, Central Western Region, 547 Jackson Blvd., Chicago. Regular meetings, 3d Monday in month, except June, July and August.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except July and August.

Traffic News

All embargoes in connection with freight shipments on the Canadian Pacific Western lines has been removed as a result of the collapse of the Winnipeg general strike.

O. E. Duggan, assistant traffic manager of the Lutcher and Moore Lumber Company, Orange, Tex., has been appointed traffic manager for the Judson Freight Forwarding Company, at New Orleans, La.

The Missouri Pacific has resumed through freight train service to and from New Orleans and all other points on the Trans-Mississippi Terminal Railroad, and will re-establish a division freight office at New Orleans.

The strike of freight handlers at New York City, was settled on June 26 and perishable freight was moving in normal volume within one or two days thereafter. It is said that the damages by the strike were mitigated by diversion of many shipments of fruit and vegetables to other cities.

The first of the new steel barges under construction for the United States Railroad Administration, for service on the Mississippi river between St. Louis and New Orleans was launched by the American Bridge Company at Pittsburgh on June 26. This is one of 40 similar barges under contract for lower Mississippi river service. One barge is to be launched every two weeks.

The revenue freight loading on roads in the Northwestern region for the week ending June 24 show a decided decrease, when compared with the corresponding period last year. The total number of cars loaded in 1918 was 182,047, whereas in 1919 the total was 156,408. The number of grain and grain products cars loaded show an increase from 7,747 to 10,161, whereas the reports compiled for other classes of freight loading show substantial decreases.

A movement to secure a reduction of 20 per cent in railroad fares by commercial travelers and other large users of mileage tickets was started recently at the thirty-second annual convention of the supreme council of the Order of United Commercial Travelers of America at Columbus, Ohio. Supporters of the movement cited the difference between the special rates for railroad travel in Canada and rates for commercial traveling men in the United States.

Delegates to the thirtieth annual convention of the Travelers' Protective Association, have begun a campaign to have train schedules printed as advertising in newspapers in a similar form to that generally in effect before the outbreak of the war. The Railroad Administration has said that it was problematic as to whether such advertisements did the public any good and that the expense was too great. The Dameron-Pierson Company, a stationery and office appliance firm at New Orleans, has advertised train schedules in the New Orleans papers as a matter of convenience to the public.

The Wescott Express (baggage transfer) Company, New York City, has been doing little or no business for the past week because of a walkout of one hundred wagonmen, although it was said that the assistance of other express companies and taxicabs had prevented congestion of baggage. The general manager of the company said the demands of the men for shorter hours, more wages, and no Sunday work amounted practically to more than 100 per cent increase, and that the company had no intention of granting the demands. Passengers and railroad station baggage men have suffered much inconvenience.

The American Railway Express Company is planning to extend throughout the country the plan for waybilling freight that it has had in operation in the east since 1914. The new plan will be inaugurated about September 1. It is a combination of the coupon waybill and single entry delivery methods and will save labor. It will also have the effect of standardizing practice, as against four or five different waybilling methods of the old express companies which are still being used. Preparations are being made to instruct employees in the operation of the new plan and about 400 men will be detached from their regular work for two months for this purpose.

The Traffic Club of Chicago at a special meeting held on June 24, adopted resolutions endorsing the principles of the Esch-Pomerene bill. It recommends that the words "and the cost of capital" be added after the words "operating costs" in line 15, page 23, of that bill; that legislation be enacted placing under the Interstate Commerce Commission the arbitration and settlement of disputes between railroad managements and their employees over wages and conditions of service, and that the Poindexter long-and-short haul bill be killed. The resolutions are to be sent to Congress and also to other traffic clubs throughout the country with the suggestion that similar action be taken by the latter.

According to a report on overseas traffic for the week ending June 25, on June 25 there were 9,867,640 bushels of grain in the elevators at North Atlantic ports. While there had been received in the elevators 5,701,194 bushels, there had been cleared during the week 5,582,421 bushels, an excess of receipts over deliveries of 118,773 bushels. As to South Atlantic and Gulf ports as of June 21, there were 4,558,603 bushels of grain in elevators divided between New Orleans and Galveston, Port Arthur and Texas City being empty. The total number of carloads of export freight on hand at North Atlantic ports, on June 25, exclusive of bulk grain and coal, was 23,526 cars, as compared with 24,604 cars for the same day of the preceding week. At these same ports there were 6,488 carloads of export food on hand on June 25, as against 6,948 carloads on June 18. Tonnage for the French and British governments, the Food Administration and the Wheat Export Company at the port of New York is ample to supply all demands. At South Atlantic and Gulf ports as of June 21, there were 10,226 car loads of export freight on hand as against 10,894 cars on June 14.

Boatmen on the New York State barge canal, and their friends, declare that the Railroad Administration must take its hands off the canals of the state and "give to those who have their money invested in the floating property that traverses thereon an opportunity to get some business." There is a fixed annual charge imposed upon the citizens of New York State of something like $7,000,000, the annual interest payable on the $155,000,000 canal and terminal bond issue, plus the cost of maintenance. When the Railroad Administration accepted the use of the canals from the State authorities, no provision was made to see that the investors in these state waterways were assured of any returns upon their investment. "These canals," say the boatmen, "should be utilized to their maximum, and to date it is necessary to encourage capital to invest in the flotilla necessary to carry the freight. It is hard enough to get investors in floating property of this kind under ordinary conditions; but it is an absolute impossibility to do so if we are going to continue to compete against Government operators. They can carry freight at a loss. Who cares? Uncle Sam is rich, and he foots the bill."

Charles F. Guggenbuehler, of Newark, N. J., inventor of a lining for bearing boxes on locomotives, which he alleges will save the railroads $25,000,000 a year, has petitioned the Supreme Court in New York City for an injunction restraining the disposition of stock in a corporation formed to exploit the patent. He claims that after the invention had been tried out by Government inspectors in the yards in Jersey City, and they had expressed their satisfaction, C. V. Lutz induced him to assign his patent to Lutz to enable the latter to present it to the Government because it would not be accepted from Guggenbuehler, he being an enemy alien. The plaintiff says Lutz has given him only 25 per cent of the stock.

Equipment and Supplies

Locomotive Deliveries

The following locomotives were shipped to railroads under federal control during the week ended June 21:

Works	Road	Number	Type
American	B. & O.	7	USRA 6W.SW.
	A. T. & S. F.	3	Pacific
	*A. T. & S. F.	1	Mount.
	B. & O.	4	USRA Pac.
	C. B. & Q.	1	Santa Fe
	Erie	2	USRA Pac.
	**N. & W.	1	Mallet
	M. K. & T.	8	USRA 8W.SW.
	Penn.	1	Mallet
	S. P.	2	Santa Fe
	U. P.	1	Santa Fe
		24	
Total		31	

*This locomotive shipped 6/11 19. Information not received in time to include in report of week ended June 14, 1919.

**This locomotive reported shipped by the builder for week ended June 14, in error.

Locomotives

The Boston & Maine is asking for prices on 20 locomotives.

The Texas & Pacific is inquiring for 25 locomotives of the Santa Fe type.

The Havana Central is inquiring for 6 six-wheel sinteling locomotives and one narrow gage Consolidation.

Freight Cars

The Semet-Solvay Company, Harriett, N. Y., is inquiring for three coal cars.

The French State Railways are asking prices in this country for 1,000 freight cars.

The International Shipbuilding Company, Pascagoula, Miss., is inquiring for storage battery cars.

The American Oceanic Corporation, New York, is in the market for 5,000 flat cars for export to France.

The Havana Central is inquiring for 500 30-ton boxcars, 500 25-ton flat cars and 50 15-ton narrow gage cane cars.

The Business Research & Development Company, Chicago, is inquiring for several 5,000 to 8,000-gal. tank cars.

M. A. Hanna & Company, Wilkesbarre, Pa., have ordered 25 mine cars from the American Car & Foundry Company, Chicago.

The Shell Company, San Francisco, Cal., has ordered two 50-ton 10,000 gal. three compartment tank cars from the American Car & Foundry Company, Chicago.

The Cuban Railroad Company, New York, has ordered from the American Car & Foundry Company, Chicago, 150 40-ton box cars and 25 first and second class passenger, baggage and mail and express cars.

Signaling

An interlocking machine, 40 levers, all-electric, was furnished by the General Railway Signal Company, Rochester, N. Y., for the Lehigh Valley, last month, in two weeks from the time the order was received. This machine was for the junction at South Plainfield, N. J., where the tower was destroyed by fire. The order for the new machine was immediately given by telephone, and the first shipment of material was made within one week.

Supply Trade News

George W. Jones, assistant manager of the New York office of the **Pittsburgh Steel Company**, of Pittsburgh, Pa., has been appointed manager of the Chicago office, with headquarters in the McCormick building.

John McConnell, who has charge of alloy steel production for the **Interstate Iron & Steel Company**, Chicago, as assistant to the vice-president with headquarters at Canton, Ohio, has been promoted to vice-president with headquarters at Chicago.

The Sims Improved Rail Anchor Company, Ltd., Toronto, Ont., has been incorporated to manufacture railroad machinery and other devices. The company is capitalized at $100,000 by Mervil MacDonald and Edwin Smily, of Toronto, and others.

Lieut.-Col. Elmer K. Hiles, Engineers, A. E. F., who went over as captain in the Fifteenth Engineers, and who has just returned after nearly two years' service in France, will join the **Pittsburgh Testing Laboratory** on July 15, as manager of laboratories, with headquarters at Pittsburgh.

W. M. Carty, assistant superintendent of the American Brake Shoe & Foundry Company, Chicago, has been appointed superintendent of the Pine Bluff, Ark., plant of the **Standard Brake Shoe & Foundry Company**. The latter company recently purchased equipment to increase its capacity from 350 to 800 tons a month.

J. H. Redhead has been appointed assistant to the vice-president in charge of miscellaneous sales of the **National Malleable Castings Company**, Cleveland, Ohio. **C. C. Gibbs**, until recently associated with the sales department of the Indianapolis plant, has been appointed sales agent of the Cleveland plant, succeeding Mr. Redhead.

E. E. Maher has organized the **Maher Engineering Company**, with office in the Michigan Boulevard building, Chicago, to handle the sales and installation of Erie Engine Works high speed engines, Sims feed water heaters, Dayton-Dowd centrifugal pumps, Wagener steam pumps and Pratt Engineering & Machine Company fertilizer and sulphuric acid machinery.

W. H. Woody, until April 17, 1919, supervisor of the shipfitters and allied trades at the government navy yard, Portsmouth, Va., and before enlistment in government work affiliated with the Chicago Pneumatic Tool Company, Chicago, as special representative, has been placed in charge of the Washington, D. C., office of the **Keller Pneumatic Tool Company**, Chicago.

Major Morrill Dunn, vice-president of **McCord & Co.**, Chicago, has received the decoration of Chevalier of the Legion of Honor from the French government in recognition of his services during the war. Major Dunn was commissioned a captain in the Signal Corps of the United States Army and assigned to overseas duty in October, 1917, where he continued in service until his recent discharge.

J. G. Carruthers, manager of sales of the **Carnegie Steel Company**, the **Illinois Steel Company**, and the **Tennessee Coal, Iron & Railroad Company**, with headquarters at Cincinnati, Ohio, has been appointed manager of sales for the Chicago district of the Illinois Steel Company at Chicago. He has been succeeded at Cincinnati by **George H. Vant**, who has been transferred from the Pittsburgh office of the Carnegie Steel Company.

Wonham, Bates & Goode, Inc., engineers, manufacturers' representatives and exporters, New York, have opened a branch office in the Dominion Express building, Montreal, Que., in charge of **A. G. Nutter**, who was formerly with

Mussens, Ltd. This extension is for the purpose of facilitating business between the United States and Canada, particularly in railway supplies, industrial equipment and iron and steel products.

The Ohio Electric & Controller Company, Cleveland, Ohio, announces that it has appointed as its representatives the following firms: The Iron & Steel Equipment Company, Pittsburgh, Pa.; Williams, Beasley Company, Chicago; Linn O. Morrow, Philadelphia, Pa.; J. W. Dopp Company, Detroit, Mich.; Kelly, Powell, Ltd., Winnipeg, Canada; Wonham, Bates & Goode, Inc., Montreal, Canada; Shook & Fletcher Supply Company, Birmingham, Ala.; Wonham, Bates & Goode, Inc., New York City—London, Paris, Havana and Rio De Janeiro; Mitsui & Company, New York—Japan, China, Philippine Islands and Honolulu; Gustav Neilson A/S Christiania, Norway, Sweden and Denmark.

The Metallo Gasket Company has recently been incorporated to manufacture gaskets and other packings, at New Brunswick, N. J., with the following officers: **Zeno Schultes**, president and treasurer; **George Geipel**, vice-president, and **Stanley S. Geipel**, secretary. Mr. Schultes was manager of the Goetze Gasket & Packing Company for about 14 years. George Geipel has been an erecting engineer for 35 years, specializing in refrigerating and steam power plants, and Stanley S. Geipel has had ten years' experience in mechanical engineering. The company will concentrate for a time on its metallo corrugated copper gasket with asbestos cord inlaid in the copper grooves or corrugations.

Railway Construction

Chicago & North Western.—This company contemplates the construction of an addition of 78 storage bins to its grain elevator at South Chicago, which will cost approximately $1,000,000, and will increase the capacity of the elevator by 3,000,000 bu. Contracts for the work have not been let.

Philadelphia & Reading.—A contract has been given to Charles C. Pace for building a new power house for the engine house, which was recently built in the yard at Reading, Pa. The new building will be a brick structure on concrete foundation, 38 ft. wide and 50 ft. long.

Walker D. Hines, Director General of Railroads, has fought a good fight not merely for the roads operating at desperate losses, but also for the shippers and for the American people, who in the last analysis must foot all the bills. He has never sought to disguise the truth that heavier costs put the brakes on business in general. With the sound sense of the practical railroad man he has wanted reasonably high rates that would permit the carriers to pay their own way with full train loads. He has been wise enough to see that it was economic lunacy to try to force the railroads, bleeding to death, to pay steel and coal prices fixed at inordinately high levels so as to keep the steel industry and the coal industry thriving on an artifical basis. He has been catholic enough to conceive and daring enough to contend that in such a predicament as they are caught—the "vicious circle"—the American people would be better off to stand more taxes to meet the railway deficits than more and heavier rate increases to avoid the deficits. Nevertheless, he feels that the stupendous operating deficit, threatening the very Treasury, may compel the Railroad Administration to fall back on the old, old transportation principle, so notorious in the wicked private management days, of "taxing the traffic what it will bear." In spite of inflated prices there is traffic which flows as abundantly at present high rates as it flowed before at low freight rates. Because of inflated prices there is traffic which will not flow freely at the present freight rates. There is traffic which will scarcely flow at all. So let the traffic that will pay anyhow pay still more. * * * This, then, would be a return to scientific rate making; something we have had too little of, ever since the Interstate Commerce Commission began to work the ruin of the American railway system. * * *—*New York Sun.*

Railway Officers

Railroad Administration

Central Administration

James W. Carmalt has resigned as assistant to the general counsel of the Railroad Administration to engage in the practice of law at Washington, D. C. He was formerly chief examiner of the Interstate Commerce Commission.

L. Yager, engineer maintenance of way of the Northern Pacific, has been appointed chief maintenance of way engineer in the Division of Operation, with office at Washington. Mr. Yager entered railway service in 1899 as chainman on the Minneapolis & St. Louis. In 1900 he entered the service of the Northern Pacific as rodman, and has been with the same road since that time. He later served as inspector, assistant engineer, superintendent of bridges and buildings, division engineer and acting engineer maintenance of way On April 1, 1917, he was appointed engineer maintenance of way.

Regional

L. M. Betts, supervisor of car service, Northwestern region, has been appointed supervisor of transportation, Northwestern region, succeeding **D. B. McIntyre**, who has resigned to become assistant traffic manager of the Simmons Company, Kenosha, Wis.

Federal and General Managers

A. E. Sweet, formerly vice-president of the Denver & Rio Grande, with headquarters at Denver, Colo., has been appointed federal manager of the El Paso & Southwestern and the El Paso Union Passenger Depot, with headquarters at El Paso, Texas, to succeed **G. F. Hawks**, who has resigned.

Engineering and Rolling Stock

J. H. Minton, senior assistant engineer on the Pennsylvania Western Lines, with headquarters at Pittsburgh, Pa., has resigned to accept a position with the United States Steel Corporation at Pittsburgh. The field work formerly handled by Mr. Minton has been placed in charge of **T. M. Bole**, assistant engineer with headquarters at Pittsburgh and the office details and preparation of plans and specifications in connection with new construction work, formerly handled by Mr. Minton has been taken over by L. P. Struble, assistant engineer with headquarters at Pittsburgh.

Purchasing

T. S. Edgell, traveling storekeeper of the Mobile & Ohio, with office at Mobile, Ala., has been appointed division storekeeper, with headquarters at Murphysboro, Ill., vice **E. H. Landers**, resigned to accept service with another company.

The jurisdiction of **W. C. Bower**, purchasing agent of the New York Central, with headquarters at New York, has been extended over the Line West of Buffalo, vice **G. R. Ingersoll**, who has resigned to engage in other business; **C. C. Warne**, assistant purchasing agent, has been appointed first assistant purchasing agent, with office at New York, and **W. P. Winter** has been appointed assistant purchasing agent, with office at Cleveland.

Obituary

Henry E. Graves, who retired from active railway service as commercial agent of the Grand Trunk several years ago, after 26 years of service with that road, died at his home in River Forest, Ill., on June 25.

Railway Age

EDITORIAL

Table of Contents will be found on Page 5 of the Advertising Section

One argument which has been made against another advance in railway rates is that it would open a new cycle of increases in the cost of living. The advances in the wages of railway employees which have been made under government operation are officially estimated to average 52 per cent, and the average increase in the prices of railway materials and supplies since 1917 is estimated at 35 to 40 per cent. The increase in the cost of living between the end of 1915 and the end of 1917 was about 45 per cent, and there has been a still further increase since then. Prior to 1917 there was practically no advance in railway rates, the average receipts per ton per mile in 1916 being the lowest ever recorded. In 1917 and 1918 there was an increase of approximately 40 per cent in freight rates in eastern territory and of about 25 per cent in the rest of the country and an increase in passenger rates of about 50 per cent throughout the country. Passenger earnings are only one-fifth of the total earnings of the railways, while freight earnings are three-fourths. Therefore, while the railroads have had an increase of 50 per cent in the rates from which they derive one-fifth of their revenues, they have had an increase averaging only about 30 per cent in the rates from which they derive three-fourths of their revenues. In other words, during the cycle of greatly increasing wages, prices and cost of living since 1915, railway rates have been advanced relatively only about one-half as much as wages and prices generally and the cost of living. To say that an advance in rates sufficient to make the total increase in rates as great in proportion as has been the increase in prices and in the cost of labor generally since 1915 would open a new cycle is to ignore the facts. Such an advance in rates would merely close an old cycle, not begin a new one. The railways are really suffering in two ways, first, because they were not given the advances in rates which they needed before the end of 1915, and, second, because the advances in rates made since then have not beeen relatively as large as the increases in the wages and prices they have to pay and in wages and prices in general. Let us close the old cycle by establishing a reasonable relationship between railway rates, and wages and prices, before we begin to talk of the danger that an advance in railway rates will open a new cycle of increases in wages and prices and the cost of living

Closing—Not Opening—a Cycle

If one were to speculate on the ultimate limit of power which may be developed in a single unit locomotive, probably the first factors to be considered would be clearance limitations, wheel loads and the possible length of rigid wheel base, all of which are no doubt capable of some increase beyond the limits so far actually reached in most of the locomotives of the Santa Fe type now in service. There is one detail of running gear, however, which seems likely to become a more serious limitation than any of these: that is, the main driving box. Increases in the size and power of locomotives have been accompanied by constantly growing difficulties in the proper maintenance of the main boxes and side rods, due largely to the inability of the box to properly withstand the longitudinal thrusts produced by the increased total piston loads. The demands for greater power have been met only partially by increased wheel loads; the changes in the axle load limits have been kept within a comparatively narrow range, while the number of axles has been increased. The longitudinal loads produced by the piston thrust have therefore increased in much greater proportion than the journal loads due to weight. As the piston thrust must be withstood initially by the main driving boxes, a situation has already been created where the present types of boxes are inadequate satisfactorily to meet the conditions imposed. If further increases are to be made in cylinder loads it seems evident that provision must be made to withstand the increased longitudinal forces by a driving box design considerably different from any of those now in common use. Otherwise we must look to the Mallet type for future developments.

Improved Main Driving Boxes Needed

Colonel James A. McCrea, until the outbreak of the war general manager of the Long Island, has resigned from railroad service to become vice-president of the bankers' Trust Company of New York. It is not that a vice-presidency of the Bankers' Trust Company would not be a worthy goal for an ambitious man of 44, but that a railroad career, such as Mr. McCrea had open to him, should be abandoned for any other work, which makes this announcement peculiarly significant. James A. McCrea is the son of the late James McCrea, who was president of the Pennsylvania from 1907 to 1913. The son had been brought up in the traditions of the Pennsylvania which, in some ways, is the most attractive railroad service in the world, and he had made good. He had risen, step by step, from the position of rodman on the Pennsylvania Lines West to superintendent of the Cincinnati division of the lines west, and was then made general superintendent of the Long Island. In 1911 he was made general manager of that line. He grasped the opportunity to go abroad and his experience with the American Expeditionary Forces in France no doubt greatly broadened his knowledge of railroad operation and construction. There has been for many men a fascination about railroad work, second only to that of the army in war time. A railroad man from the time he becomes a division superintendent, deals in an executive capacity with men and situations. On his sound judgment and quickness of decision depend not only important commercial questions but questions of life and death of employees and travelers. Advancement means greater responsibilities and more extended authority. So great is the responsibility of a railroad executive of a large system that it is essential, if American railroads are to maintain the high standard which has been achieved, that not only large money reward but the opportunity to exercise great responsibility and power should attract into the service men of extraordinary ability. Whatever the personal reasons for Mr. McCrea's retirement from railroad service may have been, it is a fitting occasion to consider seriously whether conditions as they have been

Is Railroad Work Losing Its Attraction

during the last decade may not tend to repel men of extraordinary ability from railroad work, rather than attract them.

Financing the Administration Equipment

Ordinarily, one of the attractive features about equipment trust certificates is the possibility, in the event of default of interest, of foreclosing on a vitally necessary part of the transportation machine. Because of this possibility, interest on equipment trust certificates is generally paid promptly even by a receiver. While the roads are under government control, however, foreclosure cannot be had on locomotives and rolling stock. Had the equipment, therefore, which the government ordered, been assigned to the individual railroad companies, and these companies been called on to finance the purchase, only such companies as had high credit could have reimbursed the government by the issue and sale of equipment trust certificates, since such certificates, during the period of government control, would have been in fact secured only by the general credit of the railroad company issuing them. Moreover, the question of assignment of equipment to individual companies, of itself, presents difficulties. The total cost of the equipment is estimated at a maximum figure of $400,000,000; the actual cost may be somewhat less. Government credit, notwithstanding socialist writings to the contrary, is not inexhaustible, and it was deemed more expedient to finance the purchase of equipment by the United States Railroad Administration in some way other than a government guarantee. The plan worked out is both ingenious and essentially sound. It provides so great a margin of safety for the equipment trust notes that the possibility of any necessity for foreclosure proceedings is nearly inconceivable. Thus one of the inherent difficulties of the situation is overcome. While the plan does not provide for the guaranteeing by one company of any other company's obligations, it sets up a reserve fund of $28,000,000 in addition to the $120,000,000 margin of safety represented by the stock of the equipment corporation subscribed to by the administration, making it impossible for the equipment corporation to be affected by the insolvency of a few roads and making it likely that nothing short of a national calamity would endanger prompt interest payments. As a matter of fact, the investor in these equipment notes, if they are issued as now proposed, will have a security that will be in some ways unique, the chances not only of any impairment of capital value being remote in the extreme, but the chances of any "trouble" such as the delay in the receipt of interest and instalments due on principal and consequent impairment of market value are reduced to a minimum.

Fairness in Preparation of Contracts

A tendency seems to exist at times in more than one department of railroad service to draw up forms of contracts for execution with contractors which are so largely or entirely in favor of the road as to be unfair. In order to protect himself, a contractor making a bid must either make it sufficiently high to protect himself against contingencies or depend upon the fairmindedness of the officer in charge of the work to administer the terms of the agreement fairly. A recent example of the above tendency appeared at the June meeting of the Signal division of the A. R. A. at Atlantic City. A committee to which was assigned the preparation of a standard form of contract for execution with contracting signal companies, covering the installation of interlocking plants and block signals, submitted a proposed form as a progress report. Strong protests were made by the manufacturers against the adoption of clauses covering indemnities and risks, which would make the contractor responsible for consequential damages. As the clauses were drawn the objection was raised that a single accident might bankrupt even the largest signal company. The contractors felt that no equity existed in the contract—that it was all in favor of the purchaser. This view was concurred in by a number of signal engineers. The clause, as drawn, covering the time limit for the completion of the work was also thought to be one-sided and very likely would not hold in court, as a penalty was provided if the work was not completed in the time specified, but no provision was made for the payment of a premium as compensation for completing the work in a shorter time than specified in the contract. If the proposed form of contract were to be adopted by the Signal division the contract price for an installation would necessarily be made high enough to compensate the contractors, insofar as possible, for the increased liabilities assumed under the contract. The committee has done some very good work in the preparation of this standard form, but these sections should be revised and placed on a more equitable basis before the form is again presented to the Division for consideration, as the Association cannot afford to place itself in the position of adopting a form of contract which is unfair to the contractor.

Fusees and the Space Interval

The correspondent whose letter, printed in another column, advocates the more extensive use of fusees, uses in support of his argument, one strong leg; the fact that all of our inventions, measures and proposals for perfecting the block system make progress very slowly—while collisions continue to occur. An order to use ten times more fusees than are used at present, could be carried out with very little delay. Another strong leg is the fact that the locomotive engineer may fairly be presumed to be a much more responsible man than the flagman. Trains are running today—and perhaps in larger number, proportionately, than in former years—on which the engineman is more intelligent, and better trained than the rest of the crew combined, including the conductor. The significant statement of the letter, however, is that concerning the large number of fusees used on the Plant system, a hundred in 24 hours, on one single-track division. It cannot be doubted that fusees would by this time have come into much more general use on our railroads if they did not cost any more than torpedoes. It is true that a fusee is but one of several needed elements in protecting trains against collisions due to "failures in block working." Neither can the most faithful use of visual signals excuse any neglect of the audible-signal principle or of any other promising safeguard. The fusee thrown off by the engineman of a hundred-car train may in some cases be useless because it may burn out before the caboose (delayed) passes it. But these considerations do not lessen the duty to make all possible use of the best-educated brains on every train, and to carefully consider the true economy of preventing collisions. To spend a thousand dollars for fusees rather than $10,000 for a collision is not merely a saving of $9,000; it is an important element in sustaining the railroad's reputation.

Claim Agents and Fair Play

The proceedings of the meeting of the Association of Railway Claim Agents in Chicago on June 25 and 26, which are abstracted on another page of this issue have something of the unusual in that the speakers place so much stress on fair play and co-operation in the work of the members of this organization. Some of the papers, in fact, read almost like sermons, so strongly do they emphasize these elements. The railway

claim agent is in rather an unusual position. He must, for one thing, do his part towards safety first by presenting his observations which will help lead to the avoidance of accidents. He must arrive at that balance between a square payment of a claim and paying out too much of his railway's funds. He must detect and prevent fraud in claims. He must also meet, usually under adverse conditions, human nature at its best and worst, besides which, he must be able if the claim is carried that far, to present an able case before a jury, sometimes only coldly neutral and more often antagonistic to him as the representative of a corporation. The conclusion to be drawn from the stress placed on fair dealing in the papers at the convention, is naturally that the claim agents have come to a clear realization of their duties towards their fellow men and fellow employees and are following out the plan which has been proved to secure the best results. The claim agent who is going to make a success of his work and friends for his railway is going to do so only through co-operation with the other departments of his road, through fair play and through inspiring confidence in his desire to do the right thing. Carrying the matter further, it is pleasing to read of the tendency the claim agents are showing to continue their work beyond the mere payment of a claim—through efforts at securing restoration and re-employment of crippled employees and through efforts to help the claimant secure the best results from his money, safe from "mongrel" investments, loan sharks and the incurring of bad debts.

Mr. McAdoo's Enormous Underestimate of Expenses

When Director General of Railroads McAdoo announced the advances of 25 per cent in freight rates and 50 per cent in passenger rates in May, 1918, he said: "It seems clear that the railroads should be made self-sustaining and that sufficient revenue should be provided to prevent them from becoming a burden on the public treasury. The immediate practical necessity is without delay that increases in rates should be made to provide for these increased costs of operation." In other words, the policy he announced was that of making the rates and earnings high enough to cover all increases of expenses. Many persons, therefore, find it hard to understand why, in view of the advances in rates made at that time, the railways have fallen and are still falling so far short of earning enough to pay their operating expenses and the guaranteed returns to the railway companies.

A review of the estimates of prospective expenses and of expenses actually incurred under government operation throws much light upon this matter, and is highly interesting. As the *Railway Age* has recalled before, when Mr. McAdoo testified before the Senate Committee on Interstate Commerce in January, 1918, he expressed a hope that "very large economies may be practiced." "How far," he said, "they will be offset by increased cost of material and increased cost of labor, I do not know, but perhaps one hand will wash the other."

How little Mr. McAdoo really understood the railroad situation at that time was indicated by statements which he made about four months later when he issued the statement to the public, already referred to, announcing the big advance in freight and passenger rates. In this statement, which was issued on May 25, 1918, he said, referring to the increases in expenses which were occurring: "On account of these extraordinary increases in operating expenses which have come about as a consequence of the war it is estimated that for the same aggregate business as last year and under the same conditions as to prices and wages, the operating expenses of the calendar year 1918 will be from $830,000,000 to $860,000,000 more than for the calendar year 1917." His statement that the railroads should be made self-sustaining indicated that he believed the advances in rates he was about to make, and which were estimated at about a billion dollars a year, would be sufficient to cover all these increased expenses. But even at this time Mr. McAdoo had a very inadequate idea of the magnitude of the increases in expenses which were occurring and were going to occur, because the actual total increase in 1918 was $1,150,000,000, or about $300,000,000 more than his maximum estimate.

As great, however, as was the increase in expenses in 1918, it is being far exceeded by the increase in 1919 over 1917, for many increases in wages and other operating costs which were made in 1918 did not begin to produce their full effects until 1919. The traffic which was handled in the first four months of 1919 was smaller than that handled in the first four months of 1917. The passenger business was larger, but the freight business was 12½ per cent less. On the other hand, while operating expenses in the first four months of 1917 were $880,000,000, in the first four months of 1919 they were $1,378,000,000, an increase of about 57 per cent. If the increase in expenses throughout the year 1919 should be relatively as large as it was in the first four months—and it is safe to assume that it will be—the operating expenses of 1919 will exceed those of 1917 by $1,600,000,000. In other words, although the traffic being handled in 1919 is less than it was in either 1918 or 1917, operating expenses are running about $740,000,000 more than the annual rate at which Mr. McAdoo estimated they would run when he made the big advances in freight and passenger rates a little over a year ago.

When Director General Hines was testifying before the House Committee on Appropriations on June 4, he explained the great increase in expenses which had occurred by referring to the advances in wages and in the prices of materials and supplies which have taken place. He estimated the wages being paid in 1919 are 52 per cent higher than the rates of pay in effect at the end of the calendar year 1917, and the prices of materials and supplies at 35 to 40 per cent more than they were in 1917. He added, "How about the revenues? Should they not be higher? It is perfectly clear to me that a 25 per cent increase in rates is not going to offset an increase of something over 50 per cent in wages and anywhere from 35 to 40 per cent in the cost of materials. * * * Certainly, there is a very strong argument that could be made for the view that an increase in business cannot possibly produce enough additional net profit to make up for this loss of the purchasing power of the dollar. The railroads of the country get $1.25 in revenue where they used to get a dollar, and they have to pay out from $1.50 to $1.70 where they used to pay out one dollar. Therefore, it can be very strongly argued that that condition cannot be fully offset by an increased profit from an increased business."

To state the matter in another way, you cannot offset an increase of at least $1,600,000,000 a year in expenses with an advance in rates which, even though the railways were handling a maximum business, would yield only $1,000,000,000 to $1,200,000,000 additional revenue; and, unfortunately, they are not handling a maximum business. Mr. McAdoo simply underestimated the increase of expenses that was going to occur as a result of the policies he initiated, and the difference has now got to be made up. Many of the things done under government operation which caused this prodigious increase of expenses can never be undone, regardless of whether it would be theoretically right and desirable to undo them or not. The bulk of the increase in expenses is due to the advances in wages; and these will never be undone. Furthermore, there is no present prospect of substantial reductions of the prices of materials and supplies. A return to private operation of railways is desirable mainly, not because of things done under government operation which will be undone—although many things will be undone—but

because of the things which would be done in future under government operation and which it behooves the country to avoid.

Atchison, Topeka & Santa Fe

THE ATCHISON, TOPEKA & SANTA FE earned a profit for United States government after payment of rental to the company. This is a source of satisfaction to the government and President E. P. Ripley also mentions it with satisfaction in his report to stockholders. Railway operating income, as defined in the Federal Control Act in 1918, amounted to $44,206,000 for the 11,456 miles of the Santa Fe system, comparing with $42,885,000, the rental guaranteed to the company by the government. Such a condition, however, might be brought about during government operation through the diversion to the Santa Fe of particularly profitable classes of traffic, which condition would continue only temporarily and would cease to exist when competition was resumed.

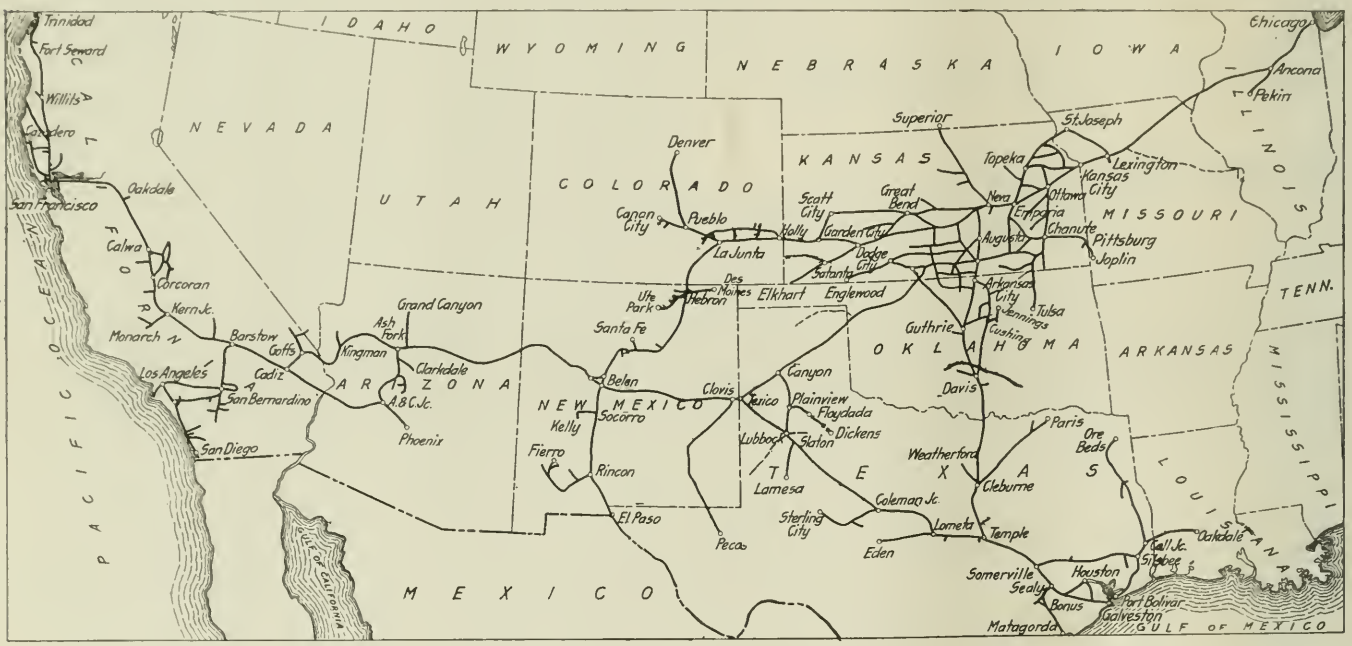
Economy in handling business, as measured by physical units, and adequacy of maintenance of the property, also as measured by physical units, should be scrutinized by railroad security holders with particular attention during the period of government operation. President Ripley strikes a note of warning: "The contract provides that the property shall be returned in substantially as good condition as when taken over, and it is not impossible that this stipulation may be fulfilled, but during the first year of federal control it was not possible for the government to furnish the amount of either labor or material used in previous years. Thanks to the excellent condition of your property when taken over such deterioration as has occurred is not yet serious, but will become increasingly so as time goes on unless checked by large expenditure."

The annual report to stockholders covers the aforementioned 11,456 miles of the system but gives only gross operating revenues and net in regard to the results obtained under the federal manager. The Atchison, Topeka & Santa Fe, itself, comprises 8,624 miles and it is on the basis of this mileage that the federal auditor makes his report to the Interstate Commerce Commission. The total operating revenues for 1918, for the 11,456 miles, was $187,658,000; for the 8,624 miles of the Atchison proper total operating revenues amounted to $160,754,000. The following remarks deal with the 8,624 miles of road of which the report to the Interstate Commerce Commission is available only, except where the contrary is specifically stated.

The ton mileage of revenue freight carried in 1918 was 10,764,000,000 and in 1917 10,790,000,000. The passenger mileage in 1918 was 1,436,000,000 and 1,354,000,000 in 1917. Total freight train mileage in 1918 was 18,612,000, which included 248,000 light train miles. In 1917 the freight train mileage was 20,711,000, which included 227,000 light train miles. Passenger train mileage in 1918 was 17,824,000 and in 1917 20,172,000. Handling nearly the same freight business in 1918 as in 1917 with 2,000,000 less freight train miles is an evidence of economy in operation independent of possibly misleading or confusing dollars and cents figures for revenues and expenses.

It might be that radical changes in the character of traffic carried would help in holding down freight train mileage, but the classification of freight traffic hardly justifies such an assumption. The total tonnage of revenue freight carried in 1918 was 32,943,000, of which 25,306,000 tons originated on the Santa Fe and 7,637,000 tons was received from connections. In 1917 of the total of 31,321,000 tons of revenue freight carried, 23,761,000 tons originated on the Santa Fe and 7,560,000 tons was received from connections. Of the total tonnage 17.46 per cent was of the products of agriculture in 1918 and 16.32 per cent in 1917; 5.63 per cent was products of animals in 1918 and 5.62 per cent in 1917. 47.75 per cent was products of mines in 1918 and 46.86 per cent in 1917; 19.57 per cent was manufactured articles in 1918 and 20.32 per cent in 1917. Bituminous coal and oils were two-thirds of the total tonnage of products of mines.

The average train load of revenue freight in 1918 was 511 tons, comparing with 463 tons in 1917. Better balanced traffic did not contribute to this result. The average number of empty cars per train was 11 in 1918 and 10 in 1917, while the average number of loaded cars per train was 26 in 1918 and 27 in 1917. Car loading was greatly improved, the average load per loaded car being 22 tons in



The Atchison, Topeka & Santa Fe

1918, as against 19 tons in 1917. The percentage of tare weight to revenue train load in 1918 was apparently not greatly different than in 1917. The substitution of the empty car for the loaded car in the average train of 37 cars about offset the increased proportion of revenue freight in each loaded car. The increase in train load, therefore, represents increased work done by the locomotives.

As to maintenance of which President Ripley speaks, only rough judgments can be formed. Maintenance of way and structures in 1918 cost $19,038,000, an increase of $3,040,000 or 19 per cent over 1917. Maintenance of equipment cost $35,100,000, an increase of $11,556,000 or 49 per cent over 1917.

In 1918 there were 112,000 treated oak ties, 1,457,000 treated pine ties, 302,000 untreated soft wood ties laid in replacement and betterment. These figures are included in a total of 2,203,000 laid in replacement and betterment in 1918. This compares with 166,000 treated oak ties, 1,350,000 treated pine ties and 465,000 untreated soft wood ties, included in the total of 2,237,000 ties laid in replacement and betterment in 1917.

The average cost at point of distribution of the treated oak ties was 92 cents in 1918 and 76 cents in 1917, and of the treated pine ties, 86 cents in 1918 and 78 cents in 1916; of the untreated soft wood ties, 81 cents in 1918 and 70 cents in 1917.

The total tonnage of rail laid in replacement and betterment in 1918 was 59,524; in 1917 the total was 72,756. Curiously enough, the average cost per ton at distributing point was apparently the same in 1917 as in 1918. The greater part of the rail put in in both years was 85 lb., costing $20 per ton.

It is rather interesting to compare the number and average pay of employees in service during the two years. The average number of employees in the service in 1918 was 53,124 who were on duty a total of 143,235,000 hours and the total compensation during the years was $73,502,000. This compares with 50,654 employees, 140,086,000 hours with $52,265,000 compensation in 1917.

The largest number of any one class of men employed is section men with 10,445 as an average number for the year 1918, with wages of $8,138,000 as compared with 10,676 in 1917 with $5,492,000 total pay.

Returning for a moment to the 11,456 miles of the system and to the annual report to stockholders, the rental due from the government provided funds for interest payments, 5 per cent on the preferred and 6 per cent on the common stock of the company, sinking funds, etc., and left a surplus to be carried to profit and loss of $8,761,000. A total of $2,526,000 was spent for the acquisition of new mileage and $9,384,000 for additions and betterments to roadway and buildings and $11,753,000 net for additions and betterments to equipment. The additions to equipment, of which the total cost was $12,305,000, and from which $551,000 was subtracted for equipment retired, including 62 locomotives, 2,844 freight cars, 17 passenger cars, 128 work cars and a five-ton automobile truck.

At the end of 1918 the government had paid nothing toward the annual compensation due and the total owed by the government, subject to quarterly settlements, amounted to $65,868,000. This, of course, included cash, agents' balances and assets collected. The company owed the government for additions and betterments, liabilities paid and expenses prior to January 1, 1918, $52,132,000, leaving a net debit against the government of $13,736,000. In addition, the government owed the company $6,000,000 for accrued depreciation on equipment and equipment and property retired.

The following table shows the principal figures for operation for the 8,624 miles of line operated by the government, for which a report to the Interstate Commerce Commission is available:

	1918	1917
Mileage operated	8,624	8,630
Freight revenue	$113,799,881	$96,401,488
Passenger revenue	37,045,791	30,907,445
Total operating revenue	160,754,273	139,303,872
Maintenance of way and structures	19,037,933	15,997,976
Maintenance of equipment	35,100,235	23,544,428
Traffic expenses	1,675,744	2,317,637
Transportation expenses	56,588,997	44,172,068
General expenses	2,830,069	2,711,499
Total operating expenses	114,912,376	88,504,010
Taxes	6,726,927	10,385,159
Operating income	40,708,335	41,869,349
Gross income	45,823,042	53,131,383
Net income	44,171,775	38,504,529

The corporation's income account for 11,456 miles is as follows:

	1918		1918
Rental	$42,885,311	Other charges	$4,056,239*
Other income	4,310,952*	Net income	28,348,433
Gross corporate income	47,196,263	Dividends	19,498,280
Taxes	3,095,398	Surplus	8,760 583

*Other income and other charges include lap-over revenues and expenses of the period prior to January 1, 1918.

New Books

Pacific Ports. Fifth Edition. Bound in flexible leather, 8 in. by 11 in., 552 pages. Published by Pacific Ports, Inc., Seattle Wash.

Pacific Ports in its fifth annual edition has been changed from a book of 500 pages, 5 in. by 8 in. in size to a larger and considerably improved form, with a much larger amount of data and profusely illustrated. The book in addition to giving complete details concerning the dock accommodations, pilotage regulations, port charges, etc., of the ports on both sides of the Pacific, this year gives data concerning their imports and exports and much interesting and valuable information concerning their economic life and business developments. The book also has added various new sections, of value to the exporter or importer. Such are sections on How to Get Into and Succeed in Foreign Trade; South and Central American Trade; Facts that Exporters Should Know About New Zealand Trade; Customs Procedure and Suggestions; Marine Insurance; Weather Predictions at Sea; Countries and States on the Pacific, and many others of like character. As in the past such information is given as comparative tables of coinage details concerning the steamship lines on the Pacific, etc. The book, particularly in its new and improved form, is a valuable addition to the rapidly increasing fund of information available on the subject of export trade.

Passenger Train Resistance. By Edward C. Schmidt and Harold H. Dunn. Bulletin of the University of Illinois Experiment Station; 11 pages; published by the University of Illinois, Urbana, Ill.

This constitutes a report on tests made of passenger equipment on the Illinois Central at all speeds up to 70 miles per hour and covering all ordinary weights of equipment in common use. The tests were all made on well maintained main track laid with 85 and 90 lb. rail and in fair and moderate or warm weather. The results, presented in the form of a series of charts and tables, are considered as applicable without modification to trains running under like conditions of track and weather.

Letters to the Editor

Prevention of Collisions

WASHINGTON, D. C.

TO THE EDITOR:

Your issue of June 20 affords some very interesting reading. Some of the most useful proposals, however, are left in a very unsettled condition and the reader naturally inquires where he ought to look for the next stage of development. Mr. Rhea, in his proposal for the development of automatic train stops, set forth on page 1,553, says that the government—federal or state—ought to take up this question, because of its complicated nature and the inability of the railroads to deal with it. I think he speaks truly when he says that to get the right talent for this experimental work it will be desirable to commandeer the services of railroad men and other engineers.

On another page of the same issue—the article on pages 1528-30—you tell of the impossibility of getting any satisfactory improvement in safeguarding the lives of passengers by trying to improve the work of the flagman. This article sets forth some very old facts in very new language, but the real problem remains just where it was.

In your issue of the following week, page 1,805, you refer to the slowness of governmental functionaries (which suggests one weakness of Mr. Rhea's proposal) and you seem to intimate that railroad directors, just like ordinary people, are governed by temporary impulses. The railroad director, human, like the rest of us, hearing of the slaughter of a carload of passengers on his railroad, is sick at heart but this kind of sickness seems to work just the same now as it did in the sixteenth century, when Rabelais wrote—

> "The Devil was sick,—the Devil a monk would be;
> The Devil was well,—the devil a monk was he."

Reading these somewhat unencouraging items of the most modern thought, I was led to take a short look backward, suggested by another important article in your issue of the 20th, the notice of Colonel Haines' book, "Efficient Railway Operation," page 1526. This book, made up from the rich experience of one of our best railroad officers, contains, on pages 306-309 a brief note on the virtues and vices of the flagman which in some respects is better even than the article on page 1528, referred to above. Colonel Haines recommends the more general use of fusees. I commend to your attention the pages referred to. I am quoting, in substance, the statement of a former division superintendent on one of the roads in the Plant system, operated for years under the direction of Colonel Haines, when I say that, on that road, single track, they moved a heavy traffic in perishable freight, together with some fast passenger trains, with great success in spite of much foggy weather. This was before the days of block signals, and the train-order signal, at each station, was the only fixed-signal protection. The rule proposed by Colonel Haines, in his book,—for the engineman to throw off fusees—was then in force there. An engineman who found that his engine was slipping, on a grade, and that time was being lost, dropped a fusee, which held the next following train until either he got over the summit or had time to send a flagman back. The next train, seeing the lighted fusee, dropped another one and so on, if there were more than two trains. The flagmen were, of course, required to follow the rules about going back. As every one knows, fusees are as easily recognized in the daytime as in the night. On that division they sometimes used as many as 100 fusees in a single night. But would not a hundred fusees daily, or even several times that number, cost less than an automatic train stop system?

Following is the passage from "Efficient Railway Operation" to which I refer:

"One means may be suggested that does not call for more intelligence or for greater devotion to duty on the flagman's part, but which seeks to obtain both from another source—from the locomotive engineer. He is generally the most experienced man in the train-crew, . . . and the best informed; and, when a stop is made or the train is slowed down at an unusual place, he knows the cause and what the probable detention will be, not only after it has occurred but often before, and can usually select a suitable place to stop. It is he then, and not the flagman who should determine when and how the rear of his train should be protected. If the burden were plainly put upon the engineer to determine, and upon the flagman to act, his action would be controlled by the best-informed man in the crew. . . . . Thus the space-interval between trains moving in the same direction might be more securely preserved in an emergency, by a more extended recognition of the usefulness of the fusee, which at present is only permissive as a part of the flagman's equipment. How much more valuable in the hands of the engineer! Whenever he is about to stop or to slow down his train at an unusual place, let him be required to drop a lighted five- or ten-minute fusee by the side of the track one mile before the stop is made; and the interval between that train and a following one will have been positively secured by a sentinel that will not desert its post, by a signal whose unmistakable light will illumine its surroundings, let the wind blow and the rain fall as they may. It will indeed then prove to be a cloud of smoke by day and a pillar of fire by night!

"This statement is not hypothetical, but is founded on ample experience. Such a requirement does not do away with the protection afforded by the flagman, but rather increases it. As the rear of the train passes the blazing fusee, the conductor will have warning to see for himself that the flagman goes back. As the flagman crosses a [slippery] bridge on his way to the rear, he will feel secure against an approaching train when he sees that purple light blazing in the distance. The lighted fusee is as valuable by day as by night, for the smoke from it is so distinctive, and even its light, as to be readily recognizable by a following engineer, and its presence is made evident, even around curves. On double-track, the fusee should be dropped outside of the track upon which the train is running, and on divisions of four or more tracks, it can be dropped in the middle of that track by hand, or perhaps more conveniently through a tube."

E. J. M.

A Trans-Siberian Refugee Train Meets with Difficulties

Illinois Central Will Build New Chicago Terminal

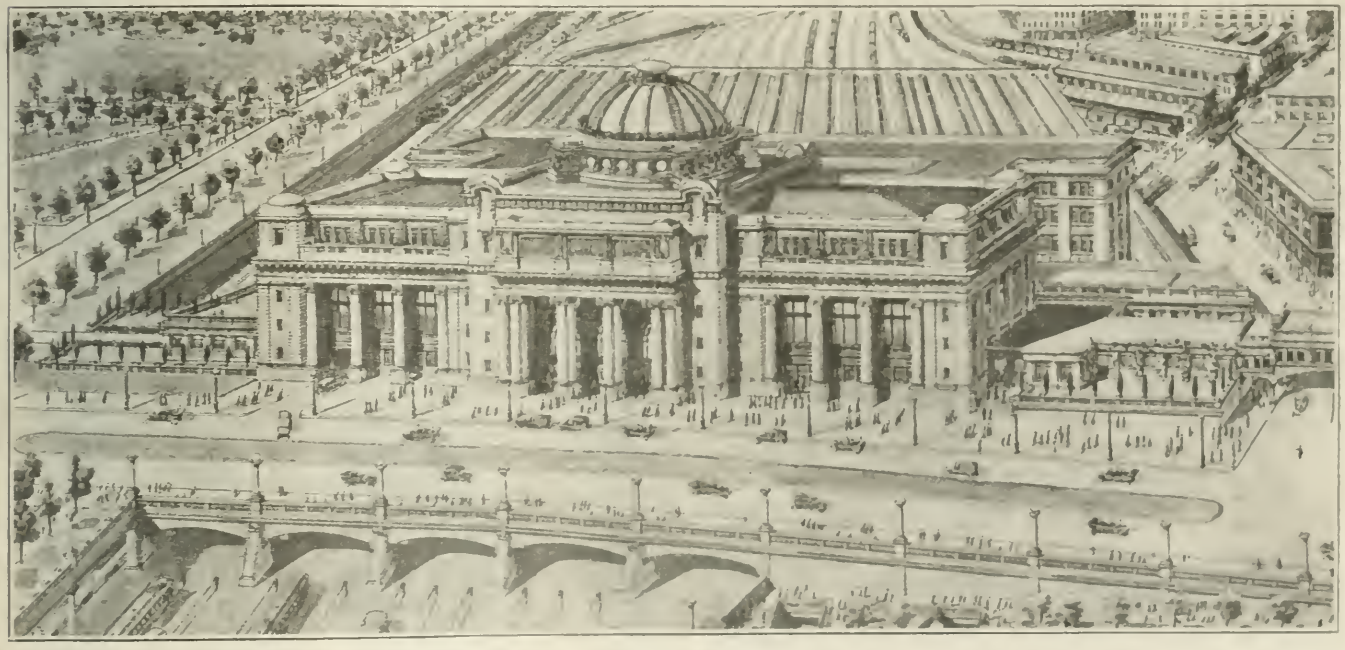
Ordinance Just Passed Provides for Modern Passenger Station and Electrification of All Service

A NEW RAILWAY ELECTRIFICATION PROJECT of first magnitude has been definitely assured as the result of an agreement reached between the Committee on Terminals of the City Council of Chicago and the Illinois Central on July 2 relative to a contract ordinance for a large new passenger station and appurtenant facilities. The project embraces a terminal capable of development to accommodate all railroads at present entering passenger stations east of the Chicago river, and the ordinance makes ample provision for connections with such roads and arrangements under which proper rental charges shall be determined. Under the agreement the Illinois Central is required to start the construction of facilities necessary for electrification within two years, and to institute the electric operation of all of its suburban trains within seven years, of its freight operations north of Twelfth street within 10 years, of all freight service within the city within 15 years, and of all passenger service within 20 years. These provisions apply also to the Michigan Central insofar as it is a tenant of the Illinois Central. Exception, however, is made to the trains of other roads which may be prevailed upon to use the Illinois Central station when completed, neither does it apply to the Illinois Central line extending to the west from the lake front property, connection with which is made by means of the St. Charles Air Line.

Negotiations covering this ordinance will not be entirely complete until it has been formally approved by the officers of the Illinois Central and those of the South Park Board of Chicago, which is also a party to the negotiations, in addition to the Secretary of War, whose permission is necessary for filling the submerged lands. The satisfactory conclusion of these formalities will mark the termination of negotiations which have been under way for nearly 10 years. This long delay has been caused largely by the fact that four parties are involved, namely, the railroad, the city, the South Park board (which is entirely independent of the city authorities, and the United States War Department. In addition to the construction of the new passenger terminal and the electrification of the road within the city, the project embraces the construction of an outer park system along the lake by the park board and provision for a new harbor district extending in Lake Michigan between Sixteenth street and Thirty-first street. The interests of these seemingly independent projects have been so interwoven that it has been impossible to proceed with any one without the satisfactory completion of arrangements for all the others concerned.

Railroad Sought to Co-Operate With City

As owner of riparian rights along the lake from Twelfth street to Fifty-first street since 1852, the Illinois Central became involved with the South Park Board in the determination of the latter to develop a lake shore park system, and in 1912 the road reached an agreement with the park board under which the railroad released its riparian rights to the park board for the right to fill in certain small submerged areas adjacent to its right-of-way, while the park board was to obtain the outer and larger portion of a considerable submerged area to be filled for park purposes. Under this arrangement the park system was to obtain possession of 1,280 acres as compared with 85 acres to be secured by the railroad. However, neither party was able to obtain any immediate advantage from this agreement because the United States War Department refused to grant permission for the extension of the harbor line necessary to fill in the submerged areas, on the ground that the plans accompanying the agreement included no provisions for a harbor throughout the length of shore line affected, or for provision for access to it by means of street or rail connections that would permit of dock development. As a consequence it became necessary to call the city authorities into the negotiations which eventually embraced plans for a complete reconstruc-



Front Elevation of the New Station Building

tion of the Illinois Central terminal facilities north of Fifty-first street.

In 1916 the road presented plans for a general rearrangement and reconstruction of its terminals which conform very closely to the plan as now approved, which was described in the *Railway Age Gazette* for September 22, 1916, page 517. But the city, taking advantage of its strategic position, demanded a great many concessions and arbitrary provisions in the contract which the railroad was in no position to grant. This fact, together with the entrance of our country in the war, caused the negotiations to drag along until the early part of this year, when they were again undertaken with renewed vigor and eventually terminated by the adoption of the present plan. The principal difference between the ordinance as now adopted and as originally proposed by the Illinois Central is that the present agreement definitely specifies the arrangement under which the road shall electrify all of its operations within the jurisdiction of the city.

Project Is Of Wide Scope

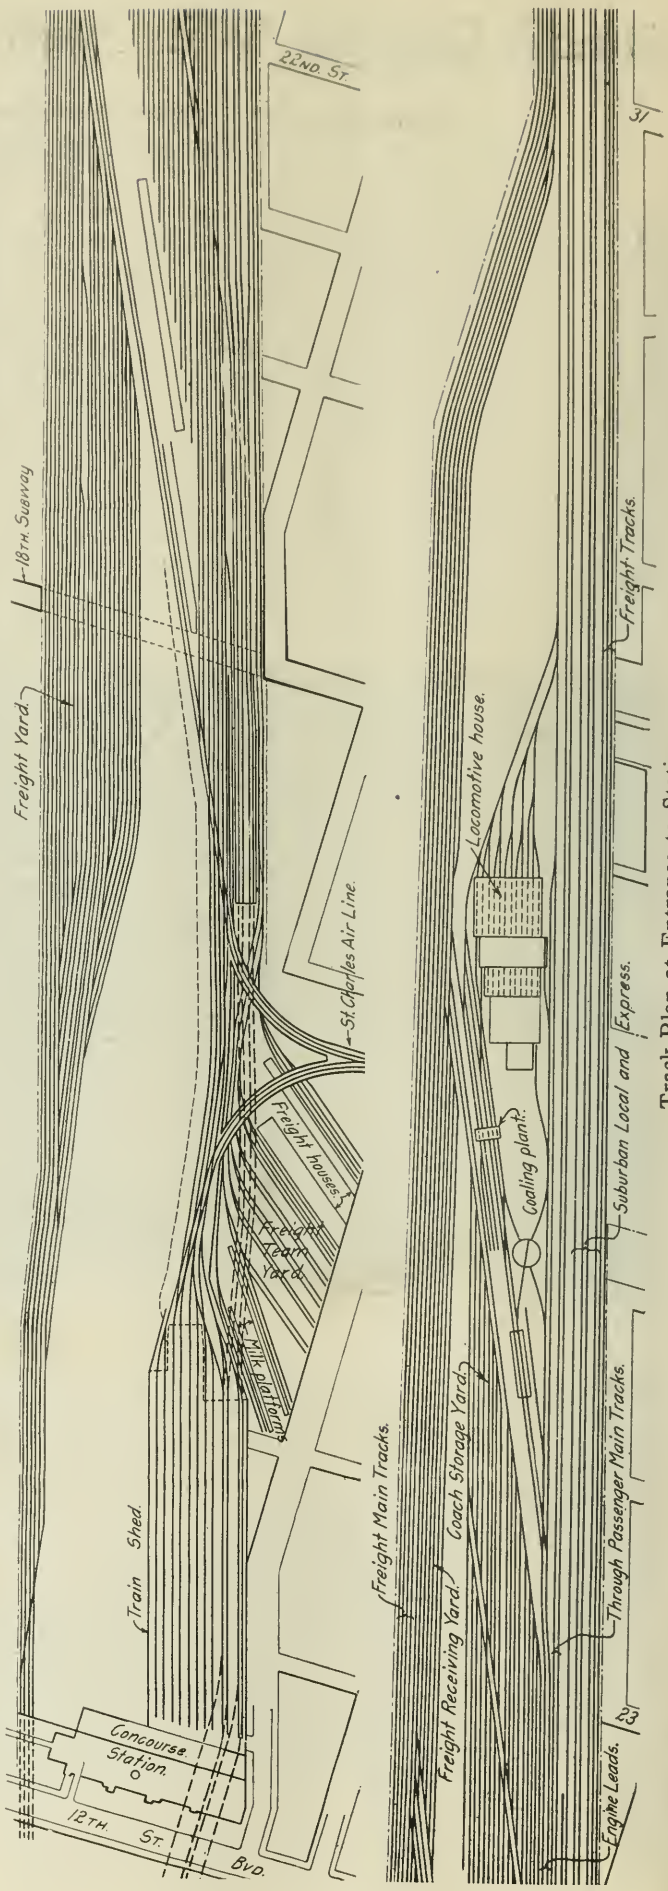
The project now approved may be divided roughly into several parts as determined by the independent ends to be obtained. The terminal project proper provides for the construction of a complete new passenger terminal to take the place of the present Park Row station together with complete coach yard and engine terminals and a small freight house and team yard on Indiana avenue south of Sixteenth street. Provision for access to the new harbor entails the construction of one subway and three viaducts across the tracks. Access to the park property will be afforded by eight viaducts over the railroad. The ordinance also provides for the ultimate development of six double-track rail lines into the harbor district, four of which will make direct connection with the Illinois Central tracks while two are to cross the Illinois Central property with a view to connection with other roads lying west of the Illinois Central. Adequate provision is also made for access to the new passenger station by other roads in the city, either through the use of the existing St. Charles Air Line or a proposed new westerly connection in the vicinity of Eighteenth street. The plan also contemplates the reconstruction of the Illinois Central and Michigan Central freight terminals north of Randolph street viaduct.

A Monumental Station

In replacing the present station on Park Row a change in the site is provided that will accomplish a marked improvement in the relation of the terminal to its surroundings. The obstruction to Twelfth street offered by the existing layout will be eliminated by placing the new station south of the south line of Twelfth street, produced east, so that the extension of this street eastward into the park area will not only give the station a frontage on that important thoroughfare, but will also place it in distinct architectural relation to the new Field Museum now nearing completion in the park to the east of the station site. It is intended to take full advantage of this circumstance by a classic treatment of the station exterior in entire keeping with the design of the museum. Like the old station, the new structure will command the lake, the Field Museum, Grant Park and Michigan avenue.

Unlike the present station all of the tracks for the use of through passenger trains will terminate in the train shed, while the tracks for suburban service, which is treated as an entirely separate feature, and the several running tracks for freight service north of Twelfth street will pass northward under the station.

In the immediate vicinity of the station the tracks will be on three distinct levels. The freight tracks and freight yards will be located along the east side of the layout with the passenger tracks occupying the center on an upper level and the suburban tracks on a lower level on the west side immediately



Track Plan at Entrance to Station

adjacent to Indiana avenue which will be produced northward to an intersection with Twelfth street.

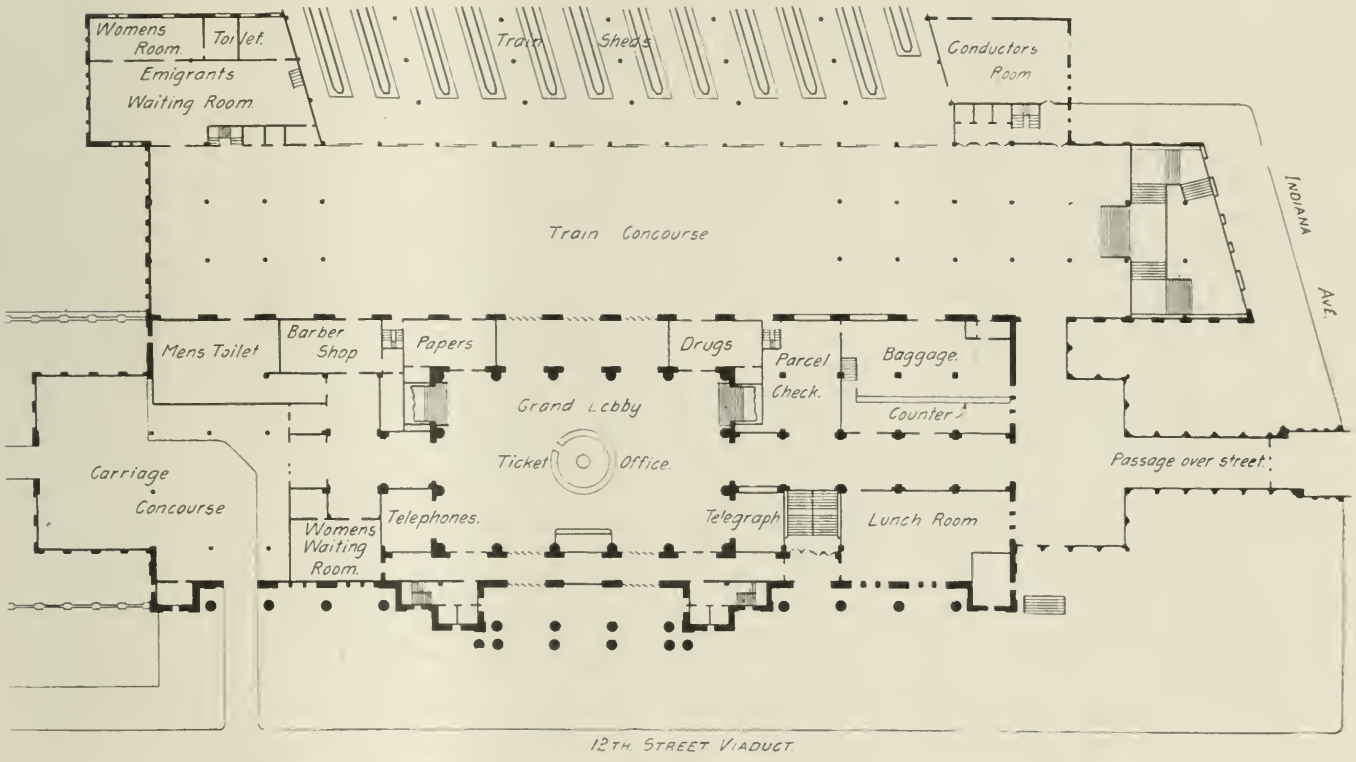
To provide adequate headroom for the tracks which must pass underneath the street, Twelfth street will rise in approaching the station from Michigan avenue to a sufficient elevation to bring it to the same grade as the upper level station tracks. As a result an exceedingly simple station layout is possible insofar as it concerns the through passenger trains. The plan resolves itself into a spacious central waiting room, located between Twelfth street and a concourse serving the ends of the station tracks and platforms. Auxiliary facilities will surround the waiting room and all functions of the terminal with which the passenger must deal in passing from the street to the trains or vice versa are located on a single level.

The design of the track layout is flexible. The ultimate layout provides for 25 tracks on one level, although this may be practically doubled by the use of two levels. The number of tracks installed at first will depend upon the extent to

One of the important features of the project is the large auxiliary terminal contemplated. Like the station this also will develop in accordance with the needs of the traffic using the station. These facilities include coach storage and cleaning yards and a complete engine terminal.

Plan Provides For Grade Separation

The ordinance contemplates the construction of public highways into the area east of the Illinois Central property at Twelfth street, Eighteenth street, South Park Blvd., Thirty-first street, Thirty-fifth street, Oakwood Blvd., Forty-third street and Forty-seventh street. All of these, with the exception of the one at Eighteenth street, are to be carried over the tracks on viaducts entailing the depression of the tracks between Twenty-eighth street and Fifty-first street. These structures, insofar as they constitute entrances into the park area, are to be constructed and maintained at the expense of the park system, but the viaducts at South Park Blvd., East Twenty-sixth street and East Thirty-fourth street will con-



Plan of Main Floor Level

which roads other than the Illinois Central and Michigan Central avail themselves of the opportunity to use this station, the plan showing 12 tracks which will be provided for the traffic now entering the station.

The baggage, express and mail facilities will be provided below the waiting room and track level at about the present grade of Indiana avenue. Direct communication with this level will be obtained by entrances on Indiana avenue. Should it be found necessary to provide passenger tracks on both a lower and an upper level, this baggage and express space will serve both levels and communication will be provided by baggage elevators at suitable intervals.

The Illinois Central owns the property facing on Twelfth street between Michigan avenue and the proposed extension of Indiana avenue. This will be utilized to add a distinct feature to the plan in the form of a large hotel which will be built with an exterior design in harmony with that of the station building. The ordinance permits a connection with this structure at the level of the main waiting room floor by means of a bridge over Indiana avenue.

sist in part of approaches to the harbor district, and such portions of these viaducts as are used for this purpose, together with the Eighteenth street subway are to be constructed and maintained by the railroad, but the city is obligated to pay all damages to property resulting from the construction of the street approaches.

Station May Be Used By Other Roads

The ordinance provides that upon the completion of the station any railroad desiring to use it shall be permitted to do so upon reasonable terms to be agreed upon with it, any disagreements to be submitted to the Interstate Commerce Commission, the State Utilities Commission or other bodies in authority at the time of the controversy. If this option is exercised by only a limited number of roads, the St. Charles Air Line extending west from the Illinois Central property in the vicinity of Sixteenth street will, no doubt, prove adequate for routing the railways to and from the new station and plans for the track layout have been prepared with a view to a ready connection between the Air Line and the sta-

tion tracks. However, should any considerable number of the railroads elect to use the station, the Air Line would be obviously inadequate and this contingency is provided for in the ordinance by authorization for a six-track line extending west from the Illinois Central in the vicinity of Eighteenth street. The Illinois Central is granted authority to construct this connection at any time within the next 20 years, although the initial construction need not be for more than two tracks, the remaining four to be added from time to time as traffic may require. One of the principal advantages of this new connection is that the junction, being somewhat further away from the station layout, permits of a more advantageous track arrangement.

The plans for the harbor cover the right for the city to build four double-track lines across the park area for connection with the Illinois Central and two double track lines across the Illinois Central for communication with the railways to the west. The Illinois Central is given permission to locate, construct, operate and maintain one of the four lines connecting it with the harbor district and one of the lines crossing its right-of-way for communication between the harbor district and the railways to the west, while the city has the option to construct, operate and maintain all of the other proposed lines.

In the case of the harbor tracks the Illinois Central agrees to make connections with its own line and perform switching service for any railroad operating in the city between interchange points and the harbor tracks. In the case of the Eighteenth street railroad connection, on the other hand, the ordinance grants all railroads operating in the city the privilege of using the tracks and making a physical connection with them on terms to be agreed upon, or in accordance with orders by some regulatory body.

Electrification

In requiring the Illinois Central and the Michigan Central to electrify, in accordance with the terms of the ordinance, the words electrification, electrify, electricity, electrical and electric are used with reference to the operation of motive power of train or locomotive engine, and they and each of them shall be taken and understood to include, not only operation by electricity or electrical power, but also by any other motive power, the operation of which is not accompanied by the emission of smoke, cinders, steam, noxious gases or by noises more objectionable than those produced by electrical operation. The terms also provide that nothing in the ordinance shall prevent other railroads not operating by electricity from entering the tracks of the Illinois Central south of East Twelfth street with steam locomotives for purpose of interchange, or prevent the Illionis Central from handling with locomotives similar interchange business to and from other lines not electrified. It also gives the Illinois Central the right to operate with steam locomotives, trains arriving over its tracks at the city limits and destined to points within the city on or over railroad lines not electrified. Any tenant lines using the proposed station for through passenger service which are not operated by electricity under the provisions of the ordinance, may use the terminal with steam locomotives until such time as they are required to electrify.

An interesting feature of the ordinance is a restriction placed on the railroad against the erection of any buildings other than switch shanties, interlocking towers, signals, suburban shelters and the like, in the territory between a point 500-ft. north of Twenty-ninth street and the north line of Fifty-first street, as a means to keep out any obstruction to the view of the park property west of the tracks within these limits.

The road is required to commence work on the construction of the station and office building within six months after the ordinance becomes effective and is required to complete these structures by the end of seven years, which is the time fixed for the electrification of the suburban service.

The Americanization of Railway Shop Men

"A UNIVERSITY for the railway shop man" has been instituted under the auspices of the Young Men's Christian Association for the employees of the Burnside (Chicago) shops, of the Illinois Central. The so-called university training, designed for the making of better citizens and for the creation of a fuller appreciation of American ideals, comprises a series of lectures arranged to cover a wide range of subjects. These talks have been prepared by Y. M. C. A. officers in close co-operation with experts of various Chicago institutions such as the Illinois State Local Hygiene Society, the City Health department and the State Council of Defense, Chicago ministers, the assistant chief naturalization examiner, soldiers who have seen service at the front and Liberty Loan speakers of known reputation.

The popularity of the work is shown by the zest and spirit of enthusiasm with which the men, especially the foreigners, devote 20 minutes of the 30-minute lunch period one day a week to acquiring a greater appreciation for the American language, customs and ideals. Wednesday noon is devoted to this cause by the men of the locomotive department and Thursday noon by the men of the car department. The meetings are held in one of the various shops at the Burnside plant and the men are assembled by means of a bugle call. Interesting educational "movies" are always on hand to be shown in case the speaker scheduled for the day fails to appear, so that the men are never disappointed.

After having interested the alien employee in the advancement of his education and in his self-improvement, the next step in the work at the Burnside shops, was the planning and execution of an Americanization program. This has as its object the idea of implanting in the alien's mind a desire to take out citizenship papers. By close co-operation between the foremen of the shops and the "Y" officers the citizenship status of each employee was determined. This careful checking of each man brought out the information that out of the total number of employees, 52 per cent were aliens, and of this percentage a large majority were totally ignorant of the English language. Ways and means of interesting these men in their first citizenship papers and in teaching them the English language were devised by encouraging the men to enroll in city night schools and offering noon day classes in the study of the fundamentals of civil government. Lectures on the advantages of American citizenship were delivered by the assistant chief naturalization examiner of Chicago. Many pamphlets containing facts and data pertaining to naturalization were especially prepared and distributed among the men who expressed their willingness to take out first papers. As the men progress in their knowledge of the duties, responsibilities and loyalty to the United States government and show by examination sufficient preparation, they are taken to the county building in groups to apply for their citizenship papers. As a result of this careful preparation before they are allowed to appear at court to file their petitions, there has been scarcely a man who has failed to pass the examination by the judge. For those already prepared for full citizenship petitions for second papers and certificates of landing are obtained.

A survey of the 3,048 employees of the locomotive and car departments, the power plants, the store department and the roundhouse, made on June 1, 1919, shows that 1,526 are citizens, 1,196 hold first papers, 294 do not want papers and 32 are off duty with no report. In short only 9.6 per cent of the entire shops are now aliens. Nearly all of the 1,196 employees holding first papers have received personal aid from the "Y," while the completion of the preparation of 348 employees for their second papers has also been accomplished.

When one stops to consider that 20 different nationalities are represented in the employees at the Burnside shops, he can readily understand that the installation of ideals of patriotism and loyalty to the government, especially during the period of the war would prove in itself a difficult task. Yet this has been one of the accomplishments of the "Shop Man's University." The patriotic sentiment and feeling of the men has been aroused to a great degree by carefully planned illustrated war lectures, Liberty Loan speakers, returned soldiers and brass bands. The prompt response of the men to the plea of Liberty Loan workers is shown by their response, as the locomotive and car departments each subscribed $35,000 to the Fourth Liberty Loan in addition to purchasing thousands of dollars worth of thrift stamps. This record not only shows the general attitude created among the employees toward the government, but proves that the men are taught a real lesson in thrift which is a means of constant betterment in living conditions. Since inauguration of the training, many men have applied to the secretary of the "Y" for information concerning the banking of their savings and questions pertaining to other ways and means of taking care of their surplus earnings.

Incorporated in the program that is being carried out at the Burnside shops, is the working up of interest along other lines of endeavor entirely different from their daily tasks. To show the opportunities that existed right at the back door of each and every working man, the "Y" officers scientifically prepared for use as war gardens a tract of several acres within the shop fence. This ground was divided into 100 plots and assigned to men whose home conditions were such that a home garden was impossible. The war garden service did not stop with the preparation of the soil, but the men were given the necessary tools, seeds, garden plants, literature and personal aid free of charge. Aside from the 100 garden plots in the yards of the shops there are between 1,200 to 1,500 home gardens being cultivated. On a personal visit through these gardens one is surprised not only at the pride and interest that the men take in their little plots, but in the practical success made in gardening.

The ideals expressed in the Greek proverb, "Health and understanding are the two great blessings of life," might be considered the basic principles of this educational program. In addition to the blessing of a better "understanding" of the ideals of citizenship, of work, and of opportunities for the enjoyment of a fuller life, the second great blessing, "health" has not been neglected. A series of lectures on health and hygiene has been delivered by the Illinois State Local Hygiene Society and experts from the City Health Department. Dovetailed with these entertaining talks which have done much in the advancement of the living conditions in the home, are lectures by Y. M. C. A. officers dealing with proper housing and sanitation. "Morals and ethics" has been another subject on the program presented to the men under the supervision of Chicago ministers. A moving picture machine has not failed to take its important place in the service rendered these men. Pictures of high rating are offered for entertainment as well as their educational advantages. For the benefit of those who have not had the advantages of traveling, the travelogues are especially appealing. Current events, and pictures showing large industrial plants in detail, are also very popular among the men.

Athletic teams have been organized among the men, not only to stimulate their interest in healthy recreation but to give them an entertaining sport. In the near future two shop teams will be fully equipped with uniforms and sent out to contest for honors with other shop teams of the Illinois Central System and other systems. For those who have not progressed sufficiently to indulge in such athletics as baseball and football, community entertainments are arranged. After faithful, diligent work on the part of both the working man and his wife a pageant was given in one of Chicago's local parks. This community entertainment created such a stir of enthusiasm in the neighborhood that it was necessary to present the "show" the following day to satisfy the overflow of the previous evening. The success that attended the production of this pageant was so great that the men of the Burnside shops have been invited to reproduce the same on the Municipal Pier, Chicago, some time in the fall.

The excellent co-operation between the Illinois Central and the "Y" is what has made this undertaking successful. The Illinois Central has not only encouraged the men to partake to the fullest of the advantages offered by the service, but has gone even farther and financed the entire "university." There have been some who have said that to successfully carry out the work which has been in progress at the Burnside shops for one year, the construction of a "Y" building with expensive equipment near the shop would be necessary. However, this has not proven necessary. What has been accomplished at the Burnside shops has been done with practically no expense excepting the salary of a "Y" secretary and a miscellaneous expense of $75 per month, which has been taken care of by an appropriation made by the road.

Tests of Oroville Automatic Train Stops

The Interstate Commerce Commission has issued a report, dated June 30 and signed by W. P. Borland, chief of the Bureau of Safety, on tests made in California during the last five months of the automatic train-stop apparatus of the National Safety Appliances Company, of San Francisco; and the report has been transmitted to Congress and printed by the House of Representatives as document No. 139. The National Safety Appliance Company, F. F. Bostwick, president, made an elaborate installation at Oroville, Cal., on the Western Pacific about four years ago, and a description of the apparatus was given, with illustrations, in the *Railway Age Gazette* of October 8, 1915, pages 632 and 645. Criticisms and discussions of the system appeared in the issues of October 9 and November 26, of that year. Within the past six months changes and improvements have been made in the apparatus and an installation has been made also on the Southern Pacific between Roseville, Cal., and Sacramento.

This train stop is of the magnetic induction type, employing permanent magnets in both track and locomotive equipment, and an electromagnet for nullifying or neutralizing, when desired, the effect of the permanent magnet forming a part of the track apparatus. The description in the report is quite full and detailed, but the drawings needed to make the text clear are not given. The tests were made for the purpose of demonstrating whether or not it was feasible to transmit by magnetic induction an impulse of adequate magnitude and force from the permanent track magnet to the locomotive, and whether such means was sufficiently reliable.

At Oroville, 1,636 tests were made, which are classified as follows: correct operations, 1,534; unsatisfactory operations, 38; safe failures, 28; false clear failures, 36. The additional tests on the Southern Pacific were made mainly for the purpose of operating the apparatus on trains moving at higher speeds. The report concludes:

"While as a whole the tests made are not considered conclusive, it has been demonstrated that, with the exception of one of the locomotive-control valves used in the tests, the locomotive apparatus, so far as could be determined, operated as intended, and whenever actuated by the track-magnet impulse it accomplished the functions for which it was de-

signed; further, that the transmission of a magnetic impulse from a permanent magnet installed on the track to locomotive apparatus designed to be controlled and actuated thereby is both practical and feasible. The fundamental principles upon which this system are based have therefore been demonstrated to be sound and practicable; but the available working limits, as well as the reliability of the transmission and control of the actuating impulse, remain to be fully established. For these purposes further development work, as well as more extended trials under practical service conditions, are necessary.

"Among the features requiring further attention are the selection and use of track magnets of proper characteristics and composition for the service required; the proper proportion and operative relation of electromagnet, track magnet, and locomotive-control valve magnet must be definitely determined; the available working limits with respect particularly to rates of speed must be definitely ascertained, and a liberal margin of safety must be assured. Data should also be acquired as to the retentivity of the magnets to be used and their dependable working life under service conditions.

"The tests thus far made, records of which are available, should be of material assistance and value to the proprietors of this system in its further development and in adapting its principles to the conditions and requirements of practical railroad service.

"In view of the results obtained under the conditions surrounding these tests, it would appear that this device has such inherent merit that a more extensive installation should be made where the real value of this system can be more fully demonstrated."

Annual Government Signal Bulletin

THE INTERSTATE COMMERCE COMMISSION has issued its annual bulletin showing the mileage of railroad in the United States on which the block system was in use on January 1, 1919, and the total is now 100,000 miles, or something more than one-half of the mileage of road operated for passenger business *by the companies reporting block signals.* The lines, 70,000 miles, more or less, of roads not reporting anything of the kind, do not figure in this record.

The total which we have given, 100,000 miles, is not exact; but it is substantially correct and is an easy figure to remember; the exact total is not ascertainable from the report. There is a considerable mileage of block signaled road operated exclusively for freight trains, and not shown in the tables of the report; while, on the other hand, there is a large mileage of roads of thin traffic, which is included in the table, but on which, for much of the time, the space interval is not in force, as regards freight trains.

The totals shown in table No. 1 aggregate 99,897.7 miles of road as follows:

Miles of Road on Which the Block System is in Use.

	Jan. 1, 1919	Jan. 1, 1918
Automatic	36,989.4	34,799.0
Manual	62,908.3	64,155.0
	99,897.7	
Deduct duplications	639.9	
	99,257.8	98,954.0

The increase as compared with January 1, 1918, is, roughly, as we have shown, 304 miles; but this increase cannot be given accurately, because part of the mileage deducted for duplications is not classified; as given in the bulletin, the net increase is 366 miles, the calculation being made before the duplications are taken out. These duplications—sections of road operated jointly and reported by both of two roads—aggregate no less than 640 miles—397 miles automatic, 217 miles non-automatic, and 26 miles not classified.

The total length of road equipped with automatic block signals, on January 1, for the five preceding years, was:

January 1, 1918	34,799 miles
" 1, 1917	32,557 "
" 1, 1916	30,714 "
" 1, 1915	29,600 "
" 1, 1914	26,570 "

*Roads which have not heretofore reported block signal mileage.

The increase in automatic block signaling in 1918 was 1,796 miles; decrease in the manual system, 1,430 miles. Automatic signals controlled by track circuits, but not included in any automatic block signal system, aggregate nearly 200 miles of track.

The principal roads showing increases and decreases, as compared with January 1, 1918, are noted in the bulletin as follows (miles of road):

Names of railroads.	Increase.		Decrease, nonautomatic.
	Automatic.	Nonautomatic.	
Atchison, Topeka & Santa Fe	40.4		
Atlanta & West Point	62.6		6.0
Baltimore & Ohio:			
Eastern Lines	106.9		359.6
Western Lines	36.5	351.7	
Canadian Pacific		187.4	
Chicago, Burlington & Quincy	7.4		141.4
Chicago, Milwaukee & St. Paul	113.5		195.2
Cleveland, Southwestern & Columbus[1]	1.0	86.0	
Cumberland County Power & Light[1]	32.6		
Dayton, Toledo & Chicago		91.1	
El Paso & Southwestern	79.1		
Erie			21.6
Chicago & Erie	35.0		35.0
Grand Trunk Railway System	13.4		953.2
Great Northern	138.9	31.6	
Illinois Central	185.8		
Los Angeles & Salt Lake	132.6		
Louisville & Nashville	45.2		45.0
Missouri, Kansas & Texas	24.1		
Missouri Pacific			303.4
New Iberia & Northern		49.3	
New York Central:			
Eastern Lines			128.9
Western Lines	3.0		42.9
New York, New Haven & Hartford	26.3		21.1
Central New England		217.8	
New York, Ontario & Western		33.3	
Norfolk & Western	52.0		50.5
Northern Pacific	221.7		57.7
Pennsylvania System:			
New York, Philadelphia & Norfolk	30.6		20.8
Pittsburgh, Cincinnati, Chicago & St. Louis	10.3	101.6	
Pere Marquette	56.0		
Southern Railway	102.3		102.2
Southern Pacific (Pacific System)	11.4	39.5	
Arizona Eastern		251.6	
Houston East & West Texas			188.5
Southern Pacific Lines North of Ashland	162.1		
Texas & Pacific		132.2	
Washington, Baltimore & Annapolis	24.7		

[1]Roads which have not heretofore reported block signal mileage.

Table No. 2 of the bulletin, showing kinds of automatic signals in use, contains no less than 34 items under the head of "not classified." Color-light signals on the Chicago, Milwaukee & St. Paul, account for 403 miles of this total, and position-light signals on roads in the Pennsylvania System, 44 miles; the remainder is mainly or wholly made up of street railroads and interurban lines using color-light signals.

The bulletin shows, by roads, the mileage of telegraph line used for the transmission of train orders, a total of 136,584 miles; and the mileage on which the telephone is used for this purpose amounts to 113,440 miles. Many roads use, on considerable lengths, both the telegraph and the telephone. A number of important roads, for their train despatching, use the telephone exclusively, among which are the Alabama Great Southern, the Cincinnati, New Orleans & Texas Pacific, the Boston & Albany, the Delaware, Lackawanna & Western, the Michigan Central, the New York Central (Western Lines), and the Virginian.

It will be noted that the table showing increases and decreases includes a number of items where the manual block system has been discontinued and no automatic signaling has been provided to take its place.

A New Advocate of Government Operation

Improvement of Present System Is Preferable to Return to Former Methods

Joseph B. Eastman, of Massachusetts, the most recently appointed member of the Interstate Commerce Commission, has addressed a letter to the Senate committee on interstate commerce, outlining his views on the railroad problem, because, when the commission's ideas were expressed before the committee in January, he was not a member. His suggestion is that the present form of government operation, with the modification proposed in the Cummins bill, be continued "for an appropriate period of time," in order that uncertainty as to the immediate future may be ended and sufficient time gained for the deliberate and constructive consideration of the entire problem. The commissioner also indicates a strong tendency toward belief in public operation as the final solution and a distrust of private management. He believes that it would be much easier for the government to finance the roads and to meet deficits by taxation than to try to make them earn enough to attract the necessary capital. An abstract of his letter follows:

I believe that the roads should continue in the possession and control of the nation, for the following principal reasons:

(1) To ensure necessary capital, at low cost.

(2) To avoid unduly high rates.

(3) To solve the problem of the "weak" roads.

(4) To obtain the operating advantages which come from unification.

(5) To promote right relations with labor.

I further believe that while unfavorable criticism may be made of "federal control," as it has been administered, the record is not discouraging and the defects may be remedied. Better results can, I feel, be obtained by maintaining and improving national operation than by returning to old methods in whatever guise.

In the case of capital, national operation has a clear and marked advantage, one of great public consequence. The credit of the United States is squarely behind the roads, and it is certain that capital can be obtained at low cost without underwriting syndicates, commissions, or bankers' profits. The credit of private railroad corporations depends upon ability to issue common stock. Most of our roads are already heavily bonded. Before the war, the roads asserted that new stock could not be sold without income sufficient to pay 6 per cent dividends with a protective margin of 3 per cent on par value each year for reserve. Under present conditions, 6 per cent would probably fall short of making common or even preferred stock a popular investment. Financiers are now claiming that, to insure good credit, net income must equal at least 125 per cent of the amount necessary to pay interest and such dividends, however great, as may be required to market new stock.

We need not accept these claims at face value to prove the serious disadvantage of private railroad credit. To maintain credit and attract capital private operation will, I fear, require either a government guaranty or the raising of rates. A guaranty of dividends is a mongrel and unsatisfactory arrangement. It would impair whatever initiative private management may still possess and it would not be long before complete and direct control over the affairs of the corporations would be placed in the hands of the government.

As for raising rates, there never was a time when conservatism was more desirable. Increases in freight rates affect the price both of the raw material and of the finished product. The director general has felt, and I think wisely, that the present depression may be temporary and that the country can better afford, for a time at least, to carry the burden of insufficient revenues through taxation, as a part of the war cost, than to suffer further advances in rates whose ultimate effects no man can foretell.

Under private operation, it is proposed to meet the problem of the "weak" roads by lowering the bars against mergers and encouraging the strong to absorb the weak. By the same gradual process or by pooling of interests, it is proposed at length to secure the advantages in the handling of freight and in the development and use of terminals which come from unification. Aside from the effect on public sentiment, the practical difficulties in the way of bringing about such mergers on any large scale—in deciding what they are to be, in fixing the terms, in dealing with state laws, in arranging the necessary exchanges of securities—are very great. If experience is any criterion, the chief beneficiaries for some years would be the bankers and lawyers in charge of the negotiations. Under national operation no such difficulties arise. The "weak" roads cease to be a problem, and progress in realizing the benefits of unification need only be continued.

The fact that further raising of rates could more easily be avoided under national operation would make the labor situation less difficult, for advances in rates and wages are apt to go hand in hand. But I also believe that the government can deal with the problem with a stronger and surer hand than private operators and, under present conditions, more easily secure co-operation.

The feeling that the roads ought not to remain under federal control is based upon a belief in "private initiative," strengthened by the impression that the roads have not been well managed since they were taken over; upon the fear that federal control will be used for political purposes; and upon a distrust of what are termed "socialistic" experiments. Faith in "private initiative" springs, I think from experience in competitive industries. Probably it is true that maximum efficiency is a product of the struggle where profits and even the right to live depend, by reason of keen competition, almost wholly upon efficiency. Competition has been a factor in railroad enterprise, but its influence has lessened with the combinations which have been formed and with the public regulation which has been established, and will shrink still more if further extensive mergers are encouraged. The assumption that private railroad owners have a peculiar self-interest in efficient management and economical operation has slender foundation. Those who use the railroads and pay for the service rendered have a greater interest in these matters. The primary interest of a stockholder is in dividends, and these may be obtained under even very poor management, provided rates are sufficiently high. The tendency of railroad stockholders for some time past has been to think more of rates than of management. The control which is exercised by these stockholders is more apparent than real. In practice, actual control usually falls into the hands of bankers, and experience has shown that efficient management and economical operation are not their most immediate concern.

Probably the sentiment in favor of a return to private operation springs chiefly from a feeling that national operation has been a failure. Such discouragement is not justified. So sudden and radical a change in the administration of an immense industry was never before made in this country. It came on the eve of the worst winter in railroad his-

tory, at a time when serious congestion existed in the eastern territory . . . but the Railroad Administration succeeded in relieving congestion and handled both troops and war freight with credit to itself. It is also conceded that it was able, through unification, to bring about improvements in operation and terminal practices which were of substantial benefit.

Rates have been raised, but in less degree than contemporaneous increases in the prices of staple commodities. Increases in wages have been large but I do not believe it will be found that they have been disproportionate, on the whole, to the rise in the cost of living or to the increases granted in most competitive industries. It may be that standardization has been carried too far, but I question whether the situation would have been essentially different if the roads had remained in private hands. The pressure of the cost of living and the rise of wages generally would have made increases on the railroads inevitable. No doubt the process would have been a threatened strike and reference of the matter to the national War Labor Board, or to some special board of arbitration.

During the war, it is probably true that the efficiency of railroad labor decreased, particularly in the shops. But it does not follow that this was the result of federal control. Chiefly it was due to the impairment in personnel and discipline caused by shortage of men, and it was equally marked in the case of street railways, which remained under private management.

I think it is true that certain changes in rate structure and practices have been arbitrarily made, and that there has been over-centralization. Probably the fault sprang from the grant of too unlimited authority and the opportunity which railroad officials, suddenly transformed into government officers, saw to achieve changes which they had long desired, and from defects in organization natural in the inception of the new mode of administration. But these are not faults which cannot be remedied.

Summing up the situation, there are grounds for criticism of operation and policy since the beginning of federal control. But none of them justifies the conclusion that national operation is unsound. The statements that the government never has done and never can do anything well are a slander upon the people of the country, and breed distrust and anarchy. No doubt it is true that we have often been guilty of wasteful, dilatory and unbusinesslike practices in the conduct of our public affairs but one of the reasons has been that so many influential men have preferred to sneer rather than to help in improvement. No greater opportunity for useful and genuinely creative work anywhere exists than in the public service; the great body of employees are faithful, loyal and willing to work; inefficiency in the service springs from the top rather than from the bottom; and all the efficiency that is wholesome and desirable can be developed, without the incentive of excessive financial rewards, if constructive thought and criticism are substituted in sufficient measure for mere cynicism.

Having in mind the conditions by which this country is now faced, it is unwise to return the railroads to the uncertainties of private financing, and the confusion bound to ensue upon the inauguration of new schemes of public regulation, the raising of rates, and attempts at mergers and the pooling of interests. All agree that private operation has had many defects in the past and much thought is being spent on possible means of curing these defects. The mistake lies in assuming that flaws in private operation are less vital and easier of remedy than flaws in public operation. There are patent elements of strength, simplicity and power in national operation and I venture to offer these general suggestions:

(1) Too much power has been granted, especially over rates. This has resulted at times in arbitrary action, and has given rise to the disquieting fear that such actions may be more frequent in the future. No important change should be made without opportunity for full hearing before some disinterested tribunal. The Interstate Commerce Commission has been dealing with rates for years and is well organized for the purpose. It should be given the same power over rates under national as under private operation. The Commission should also retain its control over accounts and its powers of research and investigation. The state commissions should be permitted to retain similar powers and to exercise, in general, the authority over service which they now possess. These local tribunals, easily accessible and independent of the federal government, can be of great public benefit. The more opportunity there is to watch, check and criticize from independent sources, the better national operation will be.

(2) There has been too great centralization of authority. The roads nationally operated should, I think, be divided into regional or other systems, and these should be given a far larger measure of autonomy or "home rule," so that all minor policies and some of greater moment can be determined on the spot.

(3) While the federal government should retain final control, independent interests should have a means of watching and helping in the management, either through advisory committees, or more directly. The two groups which should be particularly considered in this connection are the shippers who use the roads, and the employees by whose labor they are operated. The self-interest of shippers in good service and low rates is obvious. The similar interest of the employees is not so clear, but none the less a fact. Labor is fast coming to realize that increases in wages may not of themselves achieve desired results. So long as only a few trades were organized and increases were confined to small groups, net gains were large but with more widespread organization and more general increases, the gains are small, for prices rise rapidly on the heels of wages and wipe out the advantages secured. Under such conditions, there are probably only two ways in which labor can permanently better its condition. One is to reduce excessive profits and place the burden of taxation where it can most easily be borne; the other, and the more important in its direct results, is to increase the productive power of labor and thus bring down prices. I believe the railroad labor leaders appreciate the situation and are ready to co-operate in promoting efficiency, if given a fair opportunity. No group of men in the country have a greater stake in the railroads than their employees, and they are entitled to be consulted in the management. Such a policy would also, I feel confident, reduce friction and the number of serious labor disputes.

Plans for stimulating efficiency of employees by giving them a share of the profits are unsound, because such profits can more easily be secured by raising rates than by promoting efficiency. Plans whereby increased compensation is made directly dependent upon a demonstrated record of efficiency are more desirable and can be developed, if safeguarded from abuse by proper co-operation.

The problem is really one of organization, and the important thing at the moment, as I see it, is to turn attention in this direction. If this is done, I believe that the director general and his assistants, representatives of shippers and employees, and many others can give you valuable help in devising ways and means for improving the organization and supervision of national operation so that it will better accomplish the purposes which all desire. It is a question which can be dealt with without haste, and the same may be said of the still more difficult question as to the compensation finally to be paid to the owners of the roads if the policy of national operation is permanently adopted, a question which can more wisely be determined, in all probability, in the light of the valuation which is now in process.

Doings of the United States Railroad Administration

Roads Earn $272,000,000 Less Than Guarantee for Five Months. Director General to Confer with President

WASHINGTON, D. C.

DIRECTOR GENERAL HINES expects to have an early conference with the President, who has just returned from abroad, regarding the entire railroad situation and the steps necessary to be taken preceding a return of the roads to private management. The date for the return of the roads is regarded as rather definitely fixed by the President's statement that they would be returned at the end of the year, but the manner of the return involves some considerations aside from the legislation regarded as necessary to put the regulation of transportation on a workable basis. Probably the most important point on which Mr. Hines will desire consultation with the President is the question of an advance in freight rates. This is also an important consideration affecting the return of the roads to corporations that cannot depend upon the taxing power to make up deficits. The possibility of restoring the direction of operation to the corporate organizations as agents for the government for a short time before the actual termination of federal control is under consideration only in a general way. Mr. Hines has indicated that he sees no advantages in such a plan except from the standpoint of the companies that would require a little time to get organized, and that if it is done it is likely to be only very shortly before the end of the year.

Earnings and Expenses of the Larger Roads

The railroads having operating revenues above $25,000,000 for 1918 had a net railway operating income in May of $29,807,312, as compared with $57,107,562, according to a bulletin issued by the Interstate Commerce Commission.

For five months the net railway operating income for these roads, which represent about 80 per cent of the revenues of the Class I roads, was $89,671,612, as compared with $164,690,020 in the corresponding period of 1918. Total operating revenues for May were $326,474,917, as compared with $299,546,065. Operating expenses were $281,209,063, as compared with $227,176,859. Six roads, the Boston & Maine, the Central of New Jersey, the Chicago & Eastern Illinois, the Pittsburgh & Lake Erie, the Pittsburgh, Cincinnati, Chicago & St. Louis, and the Seaboard Air had deficits in May, and nine roads, the Baltimore & Ohio, Boston & Maine, Chicago & Eastern Illinois, Delaware & Hudson, Erie, New York, New Haven & Hartford, Philadelphia & Reading, Wabash, and Chicago, Milwaukee & St. Paul, had deficits for the five months' period.

Certificates of Indebtedness to Be Retired

The $750,000,000 appropriation for the Railroad Administration became available this week upon the arrival of President Wilson with the copy of the bill which he had signed in mid-ocean, but which the Treasury could not officially recognize until after it had received a certified copy. Director General Hines has issued a notice to all holders of the certificates of indebtedness issued by the Railroad Administration giving 10 days' notice, in accordance with the terms of the certificates, that he will pay them all on July 15, in full with principal and interest, upon surrender of the certificates properly endorsed for cancellation. Arrangements have been made for the redemption of the certificates at all Federal Reserve district banks. The total issue of these certificates since March 4 has been $282,511,704.

To assist the railroad companies in meeting their July 1 requirements the Railroad Administration paid out approximately $95,000,000 in cash, which was available without waiting for the President to sign the appropriation bill. Mr. Hines issued a statement denying a story published in a New York paper that he had sent out checks not to be used unless the bill had become a law by July 1. He also denied the reports of an understanding between the Railroad Administration and the Treasury department that the former's demands would be honored upon cabled notification that the President had acted. The Treasury department takes no chances in such cases, and as Mr. Hines pointed out, there was no necessity for it, because with the appropriation about to become available he could draw on his working cash. It is understood that the $441,000,000 balance due the railroads for 1918 is also to be paid up as fast as the contracts are signed. A part of this was represented by the certificates and some of the money is advanced without waiting for the contracts to be agreed upon.

Roads Earn $272,000,000 Less Than Guarantee for Five Months

During the first five months of this year Class 1 railroads have earned $105,000,000 of net operating income or $213,000,000 less than the $318,000,000 earned in the corresponding five months of the test period. As compared with the guarantee accrued for five months, or five-twelfths of the year's guarantee, however, the government's loss is $272,000,000, as the railroad rentals are payable in equal quarterly instalments. On the basis of $904,000,000 guarantee for the Class 1 roads it would be necessary for them to earn $899,000,000 in the remaining seven months to come out even.

Walker D. Hines, Director General of Railroads, has authorized the following regarding the May results:

"Detailed statistics will shortly become available of the operating results for the month of May of practically all the Class I railroads in federal operation. These results will indicate that the net operating income for the month of May, 1919, was about $39,000,000. After allowing for one-twelfth of the annual rental due the railroad companies whose railroads are covered by these statistics, the net loss to the government on account of these properties was for the month of May about $36,000,000.

"The corresponding net loss for these same properties by months of the present calendar year has been as follows:

Month	Net loss to the government after allowing for one-twelfth of the annual rental
January	$56,635,893
February	65,313,327
March	64,576,987
April	49,304,381
May	36,419,595

"The falling off in freight business as compared with the years 1918 and 1917 continues to be an important factor in this unfavorable showing. This is indicated by the following comparison of net ton miles per mile of road per day:

NET TON MILES PER MILE OF ROAD PER DAY
(Revenue and Non-Revenue)

	1919	1918	1917
January	4,275	3,878	4,770
February	4,002	4,591	4,511
March	4,059	5,273	5,192
April	4,134	5,471	5,257
May	4,524	5,226	5,617

"It will be observed that in comparison with the year 1917, the falling off in freight business on this basis in May, 1919, was almost as great as in any preceding month of the year.

"The unfavorable showing also continues to be due in part to the fact that the increase in rates has been on a much lower percentage than the increases in wages and prices of materials.

"In carrying out my policy to keep the public as fully informed as possible as to the cost of government control, I have been endeavoring to bring together for public statement all elements of costs to the government outside of the mere monthly operating results of the principal railroads. These other elements have reference to the smaller railroads, to relations with the short line railroads, to the inland waterways, to the deficit in the express business (due to the fact that the increase in express rates has been very much less than the increase in costs) and to various other elements of liability which will have to be taken into account in the final settlement with the railroad companies. I hope to be able to make a comprehensive statement of these various costs in the near future. The figures above given relate merely to the current operation of the Class I railroads to which especial attention has always been paid."

Freight Traffic Movement and Car Performance

Net ton miles of freight handled by the railroads in May amounted to 32,440,708,000, a decrease of 13.5 per cent, as compared with May, 1918, according to the monthly report of the Operating Statistics Section. The decrease for the five months' period ending May 30 was 14.3 per cent. For May the net ton miles per mile of road per day were 4,527, as compared with 5,219 in May, 1918. Train miles decreased 19.2 per cent and freight car miles decreased 14.5 per cent, while the average number of freight cars on line daily decreased 1.4 per cent. The net ton miles per train mile averaged 708, as compared with 661 in May, 1918, while the tons per loaded car averaged 27.7, the same as in May, 1918. The car miles per car day show a decrease from 26.3 to 22.8. The percentage of unserviceable freight cars was 7.3, as compared with 5.4. The net ton miles per car day increased 12.3 per cent, from 486 to 426.

The five months' figures show that the campaign for heavy carloading is losing ground. The average tonnage per loaded car has been reduced from 28.5 to 27.9. The tonnage per train still shows an increase from 642 to 659. For the five months the net ton miles amounted to 146,129,826,000, a decrease of 14.3 per cent. Train mileage was reduced by 16.5 per cent and freight car mileage by 10 per cent. The percentage of unserviceable freight cars was 6.2, as compared with 5.3. The percentage of loaded to total car miles was 67.4, as compared with 69.3 in the corresponding period of last year. The car miles per car day averaged 21.2, as compared with 23.3, a decrease of 9 per cent, and the net ton miles per car day averaged 398, as compared with 460, a decrease of 13.5 per cent.

Heavy Troop Movements

In connection with the request made by the War Department on June 4 that the use of railroad equipment for excursions and recreation purposes be limited to the absolute minimum during the months of June and July because of the expected heavy movement of troops from France, a report received from the Troop Movement Section of the Railroad Administration shows that during the month of June a total of 342,686 men were returned from overseas service, 92,780 of these men arriving during the last week in June. During the week ended July 7 there arrived a total of 90,084 men.

The War Department estimated that arrivals during the month of June would be 375,000 men, which was reduced to 342,686 men by the actual figures. The arrivals for the two week period ended July 7 by days follow: June 24th, 3,315; 25th, 9,567; 26th, 14,311; 27th, 24,035; 28th and 29th, 18,378; 30th, 23,174; July 1st, 1,613; 2nd, 8,119; 3rd, 6,839; 4th, 12,276; 5th and 6th, 36,742; 7th, 26,495.

In addition there were three ships carrying 5,420 men due July 4 which have not yet arrived. The daily flow of arrivals is not steady owing to the uncertainty of water transportation, which makes it necessary for the railroads to anticipate the maximum daily arrivals and handle them on short notice.

In accordance with instructions of the director general, and upon the urgent request of the Secretary of War that the movement of troops should have preference at all times and particularly that excursions should not be permitted to interfere with such prompt movement, it was found necessary to requisition from the railroads effective June 23 approximately 40 per cent additional coaches over those then in use.

There were approximately 200 special trains operated from the ports alone from July 1 to 4, inclusive. While arranging to fully comply with the request of the War Department that excursion trains not be permitted to interfere with returning troops from overseas, constant efforts were made over the Fourth of July to handle the regular heavy travel taking place at that time. On the afternoons of July 3 and 4 the Pennsylvania Railroad was permitted to use extra troop cars that it had on its own line, numbering approximately 70 cars, for regular passenger business. These cars would have been needed from shipside to port camps except for the light arrivals on July 3 and 4, and in addition there were offered to other lines approximately 150 tourist cars.

In addition to the movements from the East to demobilization camps, there are in progress numerous other troop movements throughout the entire United States, including daily movement of discharged men.

Contracts Executed

The Railroad Administration has executed a compensation contract with the Denver & Rio Grande for $8,319,376. The Baltimore and Ohio contract, which also covers some subsidiaries, is for $30,035,093, instead of $30,031,009, as stated last week.

Railroad Administration Bulletin

The Railroad Administration has recently begun the publication of the United States Railroad Administration Bulletin to be circulated free to employees on all railroads under federal control that do not have employees' magazines of their own. The bulletin is to be issued monthly and the first issue contains eight pages, largely devoted to news of the activities of the Railroad Administration, but including two pages of local matter contributed by 85 local editors on the various railroads. The circulation is 1,000,000 copies a month and the bulletin is printed in six different cities in 85 editions, one for each railroad or group of railroads, each containing the articles prepared in Washington and the distinct local matter. Thomas H. MacRae, formerly managing editor of the Santa Fe Employees' Magazine, is editor in chief of the publication.

A Bit of Modern Construction on the Trans-Siberian

Extensive Electrification Proposed for Sweden

State Railways Are Being Forced to the Consideration of Main Line Electric Operation

FUEL CONDITIONS in Sweden are primarily responsible for the consideration the State Railways of that country have had to give to the project of electrifying a large part of the State-owned railway mileage. The State railways completed the electrification of an 80-mile section from Kiruna to Riksgränsen in the extreme north in 1914 with operating results beyond expectation. Presumably this would have been extended in the normal course of events, but the outbreak of the war introduced an entirely new factor in the way of greatly increased coal costs and a great difficulty in securing coal at all, with the result that the railway administration had to give the matter very thorough consideration. In 1915 a commission was appointed

Map of the Railways of Sweden, Showing in Heavy Lines the Kiruna-Riksgränsen Electrification in the Extreme North

to study the matter in detail. This commission has recently issued a report in which it reaches the conclusion that the entire State railway system can be electrified in 30 years at an estimated cost of 192,000,000 kr.

In 1917 the State railways were paying $20 a ton for coal, but in October, 1918, the price had risen to $46.90. This and the difficulty of securing coal at all led to the use of wood for firing locomotives. This greatly reduced the efficiency of operation, particularly as it lowered the speed of train operation. Furthermore, so serious was the situation that in 1917, even with the use of coal as fuel, 825,000,000 cubic feet of the country's wood supply was used up in locomotives, whereas the annual increase in the supply of timber is between 500,000,000 and 600,000,000 cubic feet. Under these conditions of operation, the fuel cost on the railways in 1918 amounted to nearly 70 per cent of the total transportation charges, with the result that the railroads were operating with an ever increasing deficit. It has been estimated that if electrification had been carried out before 1914 it would not cost more than the actual cost of the fuel burned in 1915.

Sweden has some supplies of coal of a comparatively poor quality, but it is most advantageously situated from the standpoint of water power. Many water power plants are in operation, but these represent only a small part of the possible development.

There is in Europe only one country—Norway—which has a greater supply of water power available than Sweden. It has been estimated that the available water power in Sweden is at least 5,000,000 h.p. Of this total about 1,000,000 h.p. has been developed. Power for electric operation can be obtained from seven principal sources. These are Logan: the Indal river in the central part of the country; the Ume, further to the north; the Dal; power plants already developed on the Lule river, in the extreme north; the Motala in the south, and the Göta, also in the south. Many of the existing installations are already fully loaded. The power plant at Trollhätten on the Göta has been enlarged several times and now develops 150,000 h.p. with normal stream flow. It is hoped that the control of water level in Lake Vänern may increase the capacity of the plant to 300,000 h.p. The Vargön fall and the Lilla Edet, also on the Göta river are expected to yield 40,000 h.p. and 65,000 h.p., respectively. The first installation at Lilla Edet to yield 26,500 h.p. is now under construction and is so planned that extensions can be made when needed.

Typical Catenary and Power Line Construction on the Kiruna-Riksgränsen Electrification

The first installation on the Motala river will develop 10,000 h.p. It is estimated that 600,000 h.p. can be developed on the Lule river. The government plant at Porjus which supplies current for the Kiruna-Riksgränsen line, which is referred to in more detail below, will undoubtedly need to be enlarged to meet future railway and industrial demands. Another power development has been planned

on the Lule river at Harsprånget which will develop 150,000 h.p.

It is further proposed to connect Trollhätten (on the Göta river), and the power system of East Sweden, called the Alvkarleby system, to permit a more complete utilization of all the power generated in these widely separated regions.

The State owns the falls at Vargön and Tyttbo on the Dal, and it is proposed to develop these sites in the near future. Other falls, such as those at Kerseforsen in the Lagan and Ljungsfallen on the Motala river will probably be developed to assist in the electrification of the railroads.

Electric operation seems to be the only solution of the railroad problem, and the problem has become not "shall we electrify," but "how shall electrification be financed and where will the equipment be built." The heavier types of machinery required for railway electrification are manufactured in Sweden, but much railway equipment and electrical material was formerly imported from Germany. There will probably be an increased demand for this kind of equipment, and with Germany out of the field, other countries will be called upon to supply a part of the demand.

The equipment to be used on new electrification projects will probably have to conform to a large extent with that now in use on the one electrified line in Sweden. For this reason a brief description of the equipment on this line is of timely interest.

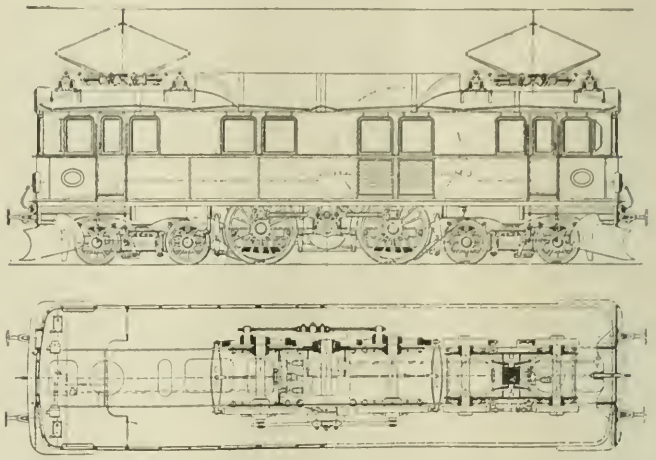
The electrification of the section of the State railways

Contact Wires Overlap at Section Divisions

between Kiruna and Riksgränsen was completed in 1914. It comprises the most northerly part of the Swedish State railways, is entirely within the Arctic Circle, and the electrified section is 81 miles long. The line is of single track, 4 feet 8½ inch gage, and its principal traffic is iron ore.

Power is supplied from the power development at Porjus on the Lule river, five miles south of Lake St. Lule, and the power is transmitted 75 miles to Kiruna, the nearest point of the electrified section. The power line parallels the railroad from Kiruna northward, serving four substations along the line. The equipment in the powerhouse consists principally of four water turbines and five generators. Two of the turbines are direct connected to 4,000-volt, 15-cycle single phase alternating current generators, which develop the railroad power. A third turbine is direct connected to a direct current exciter, and the fourth is direct connected to two generators; a three-phase for lighting and local service and a single-phase for reserve railroad power.

The 4,000-volt power is stepped up through transformers to 80,000 volts and transmitted over a steel tower transmission line to the substations at Kiruna, Torneträsk, Abisko and Vassijaure, where it is stepped down to 10,000 volts, the voltage used on the over-head contact wire. There are two single-phase circuits on the steel towers of the transmission line. At no place is the transmission line but a short distance from the railroad. The towers are from 60 to 73 feet in height and are spaced 660 feet apart. The slack in the transmission wires is from 26½ feet to 33 feet, so that the wires in no place are less than 23 feet above the ground. There are three kinds of towers, one for straight and slightly curved stretches, one for sharp curves and the third for dead-end towers. The dead-end towers are placed at intervals of about one and a quarter miles and are of sufficient strength to hold the strain of all four wires in case the wires

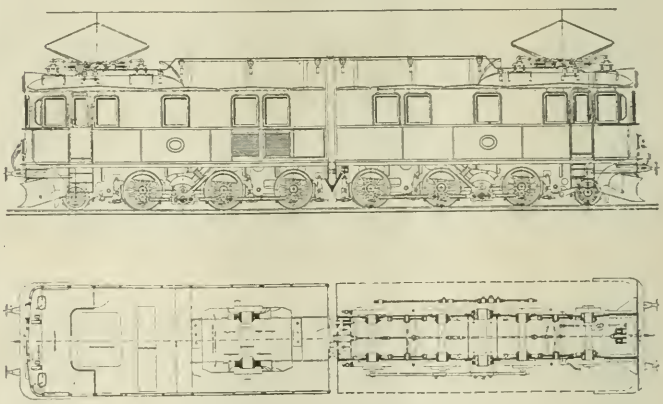


Plan and Side Elevation of the Electric Passenger Locomotive

break on one side of the tower. They are four cornered and are constructed of 90-degree angle iron, whereas the other types of towers are three cornered and are constructed of 60-degree angle iron.

The substations at Torneträsk, Abisko and Vassijaure are each part of the railway stations at these points. In each substation there are three transformers, lightning arresters and the necessary switching arrangement. There is a repair shop in the substation at Kiruna.

The catenary is supported on structural steel poles placed



Plan and Side Elevation of the Electric Freight Locomotive

175 feet apart on tangent track. These poles are always placed on the outside on curves to permit clear vision for the locomotive runner. The contact wire is hard drawn copper of figure 8 section of 80 sq. mm. area. The catenary is a seven-strand copper cable of 50 sq. mm. section. The contact wire is supported at each pole and to the catenary at two points between each pole. The sag in the catenary

between poles is 4 feet 3 inches, and the sag of the contact wire between supports is about 3 inches. The contact wire is divided in sections about seven-eighths of a mile long. The method of paralleling two contact wires at section divisions is shown in one of the illustrations. Over open track the contact wire is 18 feet 6 inches above the rail; in tunnels and snowsheds this is reduced to a minimum of 15 feet. At stations and yards the catenary is supported by overhead bridges.

When the line was put in operation late in 1914, 15 locomotives were provided, two passenger and 13 freight. The passenger locomotives are of the 4-4-4 type, weigh 82 tons and are capable of a speed of over 60 miles an hour. The freight locomotives are of the 2-6-6-2 articulated type, weigh 140 tons, have a tractive effort of 33,000 pounds, and are capable of a speed of 43 miles an hour.

The principal dimensions of these locomotives follow:

	Passenger	Freight
Diameter of driving wheels	62 in.	43½ in.
Diameter of guiding truck wheels	38 in.	28¾ in.
Rigid wheel base	9 ft. 6½ in.	14 ft. 1½ in.
Total wheel base	33 ft. 2 in.	47 ft. 11 in.
Length over all	40 ft. 1 in.	61 ft. 1 in.
Number of driving motors	1	2
Horsepower per motor	1,000	850
Revolutions per minute	170	150
Tractive effort	12,000 lb.	33,000 lb.
Weight per driving axle	33,000 lb.	38,600 lb.
Weight per truck axle	28,700 lb.	38,600 lb.
Total weight	181,800 lb.	308,800 lb.
Weight on drivers	66,000 lb.	231,600 lb.

It has already been decided to extend the Kiruna-Riksgränsen electrification to Svartön on the Baltic Coast. This will mean a 143-mile extension, the cost of which has been estimated at $7,800,000. Another electrification project is proposed in connection with a new direct route between Stockholm and Göteborg. This line will supplement existing steam railway lines and would not only take care of the traffic between England and Finland and the express traffic from Stockholm to Göteborg and from Stockholm to Christiania, but also the express traffic south to Denmark and the continent and between Denmark, the continent and Norway.

Accident Bulletin No. 69

THE INTERSTATE COMMERCE COMMISSION has issued its quarterly accident bulletin, No. 69, dated March 31, 1919, showing the number of railroad accidents occurring in the United States during the months of July, August and September, 1918. In train accidents, 129 passengers, 153 employees, and 66 other persons were killed, and, 1,118 passengers, 939 employees, and 90 other persons were injured; a total of 348 persons killed, and 2,147 injured. Of the passengers killed, 119 were the victims of collisions, and 9 of derailments.

This report includes the following disastrous collisions: Nashville, Tenn., July 9th, 80 passengers killed; Chelsea, Mich., July 20th, 12 passengers killed; Birdsall, Neb., Sept. 10th, and Marshfield, Mo., September 17th, 11 passengers killed in each. The collision at Chelsea, Mich., was on an electric road, the Detroit, Jackson & Chicago. The collision was due to the neglect of the conductor and motorman of a westbound freight car in assuming that two sections of an eastbound train had been met when only one had reached the meeting point. The conductor of the westbound train, seeing the first section of the eastbound train moving away from the station, assumed that it was the second section because he saw no green flags; and the absence of the green flags on the front of the car, where they should have been, was due to the disregard of the rule by the motorman in substituting green lights for green flags before sunset. The weather was clear and bright. The bulletin contains, besides the usual reports of investigations of collisions and derailments, a report also of an accident in Chicago, on September 14, killing five persons, where a switching freight, because of some cars getting out of control of the brakemen, struck a street car on a crossing.

Comparisons of certain totals for this quarter, with the same quarter of 1917, are shown below:

	1918	1917
Train accidents and train-service accidents		
Passengers killed in train accidents	129	39
Employees killed in train accidents	153	108
Total persons killed in train accidents	348	195
Total persons killed, all causes	2,429	2,719
Total persons injured, all causes	...	...
Nontrain accidents		
Industrial employees killed	154	94
Industrial employees injured	28,701	31,377
Other persons killed	17	28
Other persons injured	479	590

The total number of collisions recorded in Bulletin 69 is 2,358, and of derailments, 3,432. Comparisons with the same quarter of 1917 show:

Train Accidents, Three Months, 1918 and 1917

	1918, Bulletin 69	1917, Bulletin 65
Collisions, number	2,358	2,061
Number per million locomotive miles	5.09	4.34
Damage to railway property	$1,844,320	$1,547,620
Derailments, number	3,432	2,556
Number per million locomotive-miles	7.41	5.44
Damage to railway property	$3,153,550	$2,404,450
Locomotive boiler accidents, number	55	77
Number per million locomotive-miles	0.12	0.16
Damage to railway property	$51,670	$9,220
Other locomotive accidents, number	50	80
Number per million locomotive-miles	0.11	0.17
Damage to railway property	$16,270	$27,630
Miscellaneous train accidents, number	562	423
Number per million locomotive-miles	1.21	0.89
Damage to railway property	$189,650	$156,610
Total number of accidents	6,457	5,227
Number per million locomotive-miles	1.21	0.89
Damage to railway property	$5,255,460	$4,144,930
Thousands of locomotive-miles	462,989	475,321

Of the 2,358 collisions, 273 are classed as rear, and 134 as butting; and of the 185 persons (excluding trespassers) killed in collisions, 154 are charged against these 407 collisions; but of the total damage ascribed in the report to collisions, $1,844,320, more than 57 per cent was charged to the 1,951 miscellaneous collisions not included under the head of rear or butting.

Table No. 13 recording statistics of casualties to workmen—mainly men in the shops and on the tracks—engaged in work not connected with the movement of trains, shows the following totals and averages:

Casualties in Non-Train Accidents, Quarters Ending September 30

	1918, Bulletin 69		1917, Bulletin 65	
	Killed	Inj'd	Killed	Inj'd
1—Class 1 roads, industrial casualties	145	27,819	98	30,342
2—Shopmen (included in item 1)	52	16,554	27	17,527
3—Trackmen (included in item 1)	27	4,670	16	5,415
4—Class 1 roads, other non-train accidents	10	432	12	478
5—Class 1 roads, total	155	28,251	110	30,820
6—Roads of Class 2, Class 3 and Switching	16	929	12	1,147
7—Total non-train accident casualties	171	29,180	122	31,967
8—Millions of man-hrs. Class 1 r'ds, shopmen	410.44		350.38	
9—Millions of man-hrs. Class 1 r'ds, trackmen	271.48		271.72	
10—Casualties per million man-hours, shopmen	46.46		56.13	
11—Casualties per million man-hrs., trackmen	17.30		19.99	

As compared with the last preceding quarter (bulletin 68) the totals of the casualties in all of the items are considerably larger, the total number of men killed, item 7, being, in the preceding quarter, 127. The number man-hours worked was more, in the present record, both for shopmen and for trackmen, but the averages shown in item 10 and 11 are lower in bulletin 69 than in bulletin 68. Comparisons with the corresponding quarter one year previous, bulletin 65, are shown in the table. In this latest record (bulletin 69), as in the last preceding one, it is to be noted that the casualties in the shops are much more numerous than on the track; but now, as before, if we take the killed alone, omitting the injured, the differences in the ratios, as between the two classes of workmen, are not so great. The number of trackmen killed on class 1 roads, bulletin 69, was 27, or about 1 in ten million man-hours, while the number of shopmen killed (52, was equal to about 1 in eight million.

Unit Price Versus Percentage Contracts*

By W. L. Darling
Consulting Engineer, St. Paul, Minn.

In the construction of a plant one or more of three different methods are employed: 1. Company force. 2. Unit prices or an agreed sum with a provision for a percentage for increase or decrease, as the cost of the work decreases or increases, compared with the agreed cost. 3. A percentage based on the actual cost of the work.

In the present state of the art I think it can safely be assumed that the first method is to be used only when the work is too small to contract, when the local or emergency conditions are such that it is not practical to contract, or when the owner has experts in a certain specialized line who are superior to those of the contractor's. The main question, therefore is, shall the second or the third method be used and if the third, will its protect the art and consequently the public.

To discuss this question it is necessary to examine the effort of the contractor himself. The great incentive is to make money and it is this incentive that has created his value to the owner and to the public. The overcoming of obstacles, financial as well as physical, has produced energy and versatility that could have been acquired in no other way and to my mind energy is its greatest asset. What use is it if he has all the intellect and physical qualities in existence, if he has not the energy to use them. A contractor must have a knowledge of men and plant; where labor can be readily obtained and the plants available; he must understand about his supplies, where they can be obtained and how best transported; he must know of the market conditions and have an intimate knowledge of the work to be done.

If the work is done on the unit price basis, the owner gets the results of the judgment and the experience of many men and many firms; one will see better where supplies are obtainable; another may have a better plant for the job; another may have a better method of doing the work; it is the pitting of all these men, one against the other, that the owner gets the advantage of. By the other method a man or firm is selected to manage the work, hence the owner gets the benefit of this one man's knowledge and the wrong man may have been selected.

I have known men to make a bid on a piece of work by merely sizing it up and knowing where the necessary outfits were and the men to whom it could be sublet. If he has made a bad guess, he simply has to find some way or means to back up his judgment. I believe some men become so familiar with certain lines of work that their guess is as good, if not better, than some men's figuring. At any rate, the difficult task that they set for themselves brings out all the surplus energy that is in them and this is what the owner gets the benefit of.

The contractor working on a unit price basis has not only his reputation but also his very livelihood at stake. We have often seen men take work at unit prices so low that a heavy loss seemed inevitable, but by using new methods and new tools and exerting surplus energy, they have been able to turn an almost certain loss into a profit for themselves and a much greater profit for the public, as these new methods can be used on further work and by other men.

Looking back over the past 40 or 50 years, one can easily see the march of improved methods and tools. Most contractors can remember the time when the first drag scraper came into use; it was soon reinforced by the tongue scraper. Then came the wheel scraper, then the grader, and then the steam shovel, gradually increasing in capacity to the enormous ones now used and finally the drag pan.

*Read before a meeting of the Northwest Contractors' Association at St. Paul in March, 1919.

Contractors can materially improve the art by drawing closer lines between their business and that of the owners. Unit prices and specifications should be more definite. The question of custom between contractor and owner should be eliminated. The contractor should have better data on which to place his bid. There has been a growing custom to pay less attention to the contract than to the customary settlement. I believe that much better results could be obtained if the contractors would insist on the contract and specifications being followed and, if conditions should arise where the intent of the contract would be materially affected, by having, if possible, a definite understanding as to prices and the conditions before going ahead.

Under past practices, work has been authorized suddenly, with no time for either the engineer or the contractor to determine costs or make intelligent bids. A much smaller margin between the estimate and the actual cost of the work would result if these conditions could be known, for the risk of the contractor would be much smaller and the owner would have more definite knowledge of the cost of his work is going to be to him.

Where the percentage method is used the contractor has few financial troubles to overcome; no particular inducement, except pride, to introduce new methods or tools; no sleepless nights to figure out some new scheme for the next day; no surplus energy to exert in himself or employees. The employee, knowing that his superior is not in financial trouble, does not exert himself unnecessarily. The contractor does not try new methods or new tools, as he may think he has no right to risk a failure. On the other hand, the unit price men must take a risk and bend all their energy to make it successful.

My point is this: that the necessities of unit price men have produced a personnel that could not otherwise have been acquired and that as soon as the incentive is eliminated, progress will slow down if the art does not actually retrograde. There is no question but what there are men doing percentage work who are just as competent and perhaps just as energetic as the unit price men, but I claim that it is because of the state of the art and its personnel and due to previous efforts of unit price men.

The main objection to the unit price method is that in instances contractors make too much money and the percentage method will eliminate that danger. Frequently a large profit is due to the fact that a contract was taken on a high market and the work done as the market fell. If the reverse condition obtained, there would have been a loss and no comment made.

It has seemed to me that the best way to determine the amount of money made by contractors is to compare the work done in the Northwest during the last 40 years with the wealth of the various men who have been engaged solely in that business and who have not lost their money elsewhere. While it is true, perhaps, that in individual cases owners have paid larger sums than by the percentage method, I do not think it is generally true. The largest profits to contractors are generally in pioneer work, where conditions are not well known, or where there are but few firms to undertake it.

I believe that if we give up unit prices or other competitive methods, it will result in a lot of superintendents, or in a few large concerns which will control the business. The great result of the unit price method is in the fact that during the last 40 years, under normal conditions, unit prices have decreased in the face of rising costs of labor and materials, and this method has produced a class of men who, when the emergency came, were able to accomplish things that did not seem possible.

There is a growing disposition all over the country to eliminate competition, but it seems to me that better results will be obtained only where competition produces waste, but not where it is a creator of new methods, inventions and energy.

Railway Claim Agents Hold Annual Convention

Association Has Most Successful Meeting at Chicago with 275 Delegates in Attendance

The Association of Railway Claim Agents held its 30th annual convention at the Hotel La Salle, Chicago, June 25 and 26, R. C. Richards, general claim agent of the Chicago & North Western and president of the association, presided and there were 275 delegates in attendance representing 118 railroad systems.

The meeting was addressed by Charles F. Patterson, assistant general counsel of the Division of Law of the United States Railroad Administration. Considerable attention was given to the relation of the claim agent and other departments of the railroads and to the new developments over the last year in the claim agent's work. Abstracts of some of the papers follow:

Report of Committee on Grade Crossings

This committee of which W. B. Spaulding, claims attorney of the St. Louis-San Francisco is chairman, presented an extensive report on the prevention of accidents at grade crossings in which it discussed the large number of accidents of this kind. It presented figures of such accidents and reviewed at length the investigations and work that have been carried out by commissions, associations and railroads, the effect of statutes, court decisions, etc., and then considered the preventive measures that have been tried. It recommended as remedies, better education concerning care at grade crossings particularly by automobile dealers selling to new owners, and the use of the so-called "bumpers" or impediments necessitating low speed at grade crossing approaches. In conclusion, the report said:

"Your committee has nothing to say against the continuance of the very expensive precautions railroads are taking to prevent people being harmed at highway crossings, nor does it wish to discourage those enthusiasts who believe that every sort of difficulty can be overcome, every evil rectified by passing a law. The committee's duty is performed when it recommends to your careful consideration what it deems the superior efficacy and simple practicability of the attention-compelling 'bumper' and the painstaking auto-selling teacher and scare-thrower. . . . It is remarkable what power to carry conviction of needless sacrifice the mere reading at one time of brief statements of the facts in a dozen of these occurrences has."

Committee on Standard Forms

The committee on this subject, of which B. C. Winston, general claim agent of the Wabash is chairman, presented a number of suggested standard forms for handling claims. The meeting voted to have these printed and to bring them up later for further consideration and adoption.

Co-operation Between Law and Claim Departments

By James C. Davis
General Solicitor, Chicago & North Western

I think there should be a continued interest between the law and claim departments from the time of the inception of the accident to the final conclusion, whether it is settled in court or settled out of court.

I do not mean by that to take away the discretion or the dignity or the judgment of any man like Mr. Richards, but I am a firm believer in the judgment and in the discretion of the man on the ground, and I think that if you have got a man in charge of a district or a territory and he has not got better judgment than the man that is away off 500 or 600 miles, you ought to get somebody else.

The reason I feel that way is I have been a good many years away from headquarters, and I have come in with a very definite conclusion in regard to that. Of course, you do not want to lose the general supervision in the important cases, you want the advice of the head of the department, and I believe that the law department and the claim department ought to have the same general jurisdiction, if you have an attorney for a state, have a claim agent covering the same territory, if you have a district attorney, have a district claim agent covering the same territory, and then when you come to make your adjustments,—I do not mean in trifling cases, I do not mean to carry this to the extreme, but in ordinary cases, take the joint judgment of the man on the ground, the claim agent, and the lawyer I believe it will expedite your work, and I believe that you will ordinarily get better conclusions, I believe that it dignifies the man on the ground and makes him feel his responsibility, and he is more anxious to successfully respond to the same.

There was a time, and very fortunately it is rapidly disappearing, that I am frank to say when I tried cases over in Iowa that I did not care to have the claim agent about because the fellow on the other side usually tried the claim agent instead of the railroad, and in the old days they used to convict him, but that has entirely gone by I think now; I think that wherever a claim agent makes an investigation and takes the statements of witnesses, that he ought to follow that with the law department through to the end. I believe, on the other hand, where your claim agent has adjustments to make, that he ought to have access to the law department so that he may receive advice from them; when you gentlemen pay a man it is your judgment, you have the discretion, generally you are told to pay from $3,000 to $5,000 or from $5,000 to $10,000, why most of you can make your salary on any one settlement that you make, and I believe you ought to have co-operation in that, I believe sometimes that two heads are better than one, therefore I would give some discretion to the man on the ground making the settlement, provided it was endorsed by both the law department and the claim department and then hold that district or territory or state claim agent responsible for the suits that were brought therein. I was looking over our statement the other day, and I think there were 8,900 accidents reported in one year and only 214 lawsuits. I think, of course, that reflects on the efficiency of the claim department and saves the law department a great deal of labor that it would otherwise have, and so, I say to you gentlemen that I am in favor of cordial co-operation, I don't believe that either department ought to be entirely divorced from the other or should lose their interest at any period from the inception to the final conclusion of the controversy.

Mr. Davis then spoke of the general railway situation.

Address of the President

Mr. Richards, in his address spoke of the work of the association over the past year. He noted that there were 302 members of claim departments in military service. He also spoke of the association's bulletin and the furnishing of index cards of the decisions of the Appellate

Courts of the United States on claim questions. "I do not believe," he said, "there is another railroad association or any association of men which has so valuable a publication as the bulletin."

The Claim Departments Under Federal Control

By Charles F. Patterson
Assistant General Counsel, Division of Law, Railroad Administration

Railroading is the most fascinating business in the world, and it has at all times engaged the best intellect of the leading men of all countries. Of all branches of the transportation business, that is most attractive and interesting which has about it the human element, and in the investigation and settlement of personal injury claims this element is more pronounced than in any other. The infinite variety of situations presented and the innumerable kinds and classes of people with whom the claims men come in contact give to each case its own peculiar setting.

To my mind claim work presents more interesting features, has more variety, is more attractive than any other railroad department.

During federal control you have been placed in a difficult and trying position. All of you formerly were connected with individual railroads. With those railroads lay your affections, but during federal control you have been working for one common master, you have been engaged in one common effort, you have served one common cause. And it has not always been easy to lay aside previous ties, to overcome old prejudices, to remember that your duty and your loyalty lay with one common employer. I congratulate you that you have been able to do this with such signal success.

I have felt from the beginning of my service that the opportunity for joint service, for helpful association, for united effort toward raising the standard of claim departments was a splendid one. Never before has the operation of such a tremendous transportation system been combined under one management. Never before has our own branch of the service been so closely inter-related under a single head. We have had the opportunity of exchange of thought one with another without the fear of jealousy. It has been possible for all of us to obtain information from a central source. We have had the benefit of an exchange of experience, and of having that experience freely and always at our command. And I assure you that my observation at the central point of contact has convinced me that we have splendidly grasped the opportunity presented and have in the past profited, as we will in the future be benefited, from the knowledge, information and wisdom which we have gained during the period of unified control and operation.

We will be able, I am sure, when the roads go back to private control, to put to good account what we have learned. We ought to enter upon a period of private control with an enlarged experience, a clearer vision and a broader outlook. I am no idealist, but I have ideals, and I am quite sure that a reputation for fair dealing, squareness and honesty on the part of the claim departments will do as much in aid of any individual road as it has done for the railroad administration as a whole.

Perhaps more than any other branch of the service, we come in contact with the individual. We are able to create in many instances a sentiment favorable to the railroads. We can with tact and diplomacy so run our departments that the indirect influence for good for our railroads will be of enormous help to the other branches of the service.

In a short address that I made some time since at another meeting I instanced a case in which the proper and prompt settlement of a claim has been of material advantage to the railroad involved in connection with other branches of its operation. And the instance to which I then referred is but one of many. Money-making and position are not man's chief end. Honesty, loyalty, reputation, an upright spirit, a consciousness of duty well done—these are the great things in life, and their cultivation in our actions and in ourselves is certain to have resultant effect on all those with whom we come in contact. I appreciate that we do not always deal with the high-minded and the noble. On the contrary, we daily meet the mean, the contemptible and the false. But a continued course of fair dealing, of squareness, of uprightness, is certain unless all human experience is vain, to be of immense help not only in our own departments but in other departments of railroad work. These things must come from above. Your field men must be trained not only in tact and diplomacy but in fair-mindedness. They must receive no conception of duty which involves only the beating down of a claimant to his lowest terms. They must acquire for themselves and the railroad for which they are working a reputation for fairness and squareness, and that reputation when acquired must be maintained. With a reputation for honest dealing a railroad can confidently submit its cause to any jury, but with a reputation for smartness, hardness, indifference to the rights of others, a strict application of legal principles to a case without regard to circumstance, ill results are sure to follow from the jury-box. It is your opportunity to initiate such a course. It is your duty to acquire this reputation. And though the course is hard and discouragement is frequent, in the end beneficial results are sure to follow. You may say I am preaching. But my experience has been that most claimants and most lawyers are willing to meet us half way if we but show them that our hearts are right.

This has been a difficult year. Wages have risen by leaps and bounds. And stock prices are going up. Living is higher and juries are not unmindful of the fact that life is more valuable, gaged by all the elements which enter into modern living. In spite of these facts the results as shown by the solicitors' reports, summarizing the results for the year 1918, are very gratifying and in many respects remarkable. Except in a few cases due to serious and untoward accidents, the aggregate amount of claim payments is not greatly in excess of the year 1917, and even in some notable instances much less. One of the greatest transcontinental systems, with gross earnings of $168,000,000, has shown a decrease in personal injury claim payments of $360,000. One of the great southern lines, with gross earnings of $126,000,000 has shown a decrease of over $112,000. A mid-continental road, with gross earnings of $144,000,000, has shown a decrease of $236,000. One of the greatest systems in the country has a percentage of disbursements on account of personal injury claims to revenue of .0067 per cent. The railroad which has the greatest gross revenue of any one system in the United States has a percentage of such disbursements to revenue of .0052 per cent. These figures are extraordinary. They show the result of the earnest effort put forth by you during the year that is just past.

Whether or not federal control of railroads is on the whole beneficial, and whether government operation is better than private operation, are questions upon which it would ill become me to express an opinion. But I have no hesitation in saying that under federal control claims are better handled, more equitable settlements are obtained, the public is treated with a greater degree of consideration, and the railroads have a fairer chance than under private management.

I propose shortly to have a bulletin prepared which will show in detail the figures of practically all federal-controlled roads. I expect to have these figures analyzed. The results of the analyses will be widely distributed. These figures and the deductions based thereon are thus available for the first time, and they ought to be valuable for future comparison.

I would like at this time to name some of the roads whose work has been particularly efficient and helpful, but to do

so would be merely to give a list of those railroads with whom I correspond. I feel in the position of the schoolmaster who on commencement day has the prizes in his hand and is prepared to deliver them to an expectant and sometimes fearful audience. I would like to publicly commend particular men who have done extraordinarily good work, but it does not seem to me that this is an occasion for such action. I would like to say something of praise and appreciation to everybody, but if I did this meeting would be prolonged until night-fall.

Some of you will say that I am a flatterer. Perhaps so. Nevertheless, I have found that most of us are very much in Fisher's position. One of his friends had been telling him what a splendid fellow he was and had been enlarging on his good qualities. Finally Fisher said: "It's all a damn lie, but tell it to me again."

All men are spurred to higher effort by a judicious praise of accomplishment rather than by blame for things left undone. Nevertheless it is a mistake in order to effect a favorable settlement to inform a poor widow that owing to the fact that the United States is running the railroads she can get little or nothing for the loss of her unfortunate husband and that she may have to wait for the Court of Claims to pass upon her claim. It is poor policy to refuse to pay for decent burial of the dismembered body of even one killed through no fault of the road. I sometimes wonder, although I am told by some railroads it is true, whether or not children of eight years have sufficient intelligence to know that a no-trespassing sign protects a private crossing and if he or she, as the case may be, wanders incontinently upon the tracks his or her fond parents are precluded from recovering anything for the loss of their son and heir or daughter and heiress.

A little more care should be used in handling soldier's claims. I have tried to be helpful, but I do not think that I should be so often called upon to repeat the same advice in similar circumstances.

Federal control, if we may expect Congress to act in time for the President to put into effect his statement that he proposes to relinquish his control at the end of the present year, will shortly cease. We are not perhaps standing around the grave, but at least notices of the funeral have been sent out. When you go back and become once more free and independent, it is my sincere hope that our common association will not have been in vain, that the lessons we have learned will not be forgotten, that the results which we have accomplished will have a permanent beneficial influence, and that we will go on growing bigger and better in our daily tasks, more worthy of the positions which we are called upon to fill.

It is not possible for me in a talk of this length and in a meeting of this character to go into the particulars of the work in which we are jointly engaged. I have studiously avoided that course. I want to direct your attention to the larger aspects of the work. I want to impress upon you the value of co-operation, the worth of spirit, and the great and overwhelming benefit to be obtained from a true enthusiasm for your undertaking. Personal interest and enthusiasm are the vital things that bring success. We must have confidence one in another. We must be willing to exchange information. We must be willing to hold out a helping hand to each other. You must remember when once more under private management that you are all railroad men, and the railroads and their successful operation must be your chief purpose.

The Claim Man—His Relation to the Public and to His Fellow Employees

By C. D. Cary
Claim Agent, Illinois Central

It is my profound opinion and conviction, that above all the claim man should be an exemplary citizen. He is fettered by no mercantile claims or political embarrassments which mitigate in favor of a compromise with those elements of our society that betray and belie us. A casual survey of any community will serve to apprise him where to cast his lot, who it is that represents the secure and substantial men of that locality, who carry with them the moral and mental uplift of that environment. No railway man serves well those who pay him who fails to share with these men in the local community, comradeship in a common enterprise of good citizenship, and such a community will welcome and serve the man who stands true to these ideals.

I believe this to be one office that should be denuded of all mystery or misgivings and the initial impression I would convey to the public is, that he who comes here to display cunning and craftiness, comes at a disadvantage, but for those whose intercourse has the ring of rectitude and uprightness we extend a wholesome welcome to transact his affairs of life with the same well-being he would display at his banking house. We hold no double standard of integrity, things are either done right or they are done wrong, and this applies to all parties to the transaction.

I believe the claim man should have within him a fixed policy and purpose that he may tread unswervingly the pathway of duty, undeterred by doubts, singleminded and straightforward. I believe that the foregoing will be to no purpose unless the private life of the claim man is clean and exemplary in the community where he lives. It is not necessary that he be a saint or puritan, but it is highly essential for all purposes and to himself alone, that he be temperate and well-balanced in his utterances, and upon those questions of public policy in his community that he enlist himself upon the side which appears to be rational, wise and enlightened, though perhaps not momentarily popular, but such as will associate him with those of our citizens who will stamp his judgment with confidence, as a living force for those things which are just and suitable.

No man connected with railway operation touches so closely the domestic affairs of all the employees as does the claim man. To him is related the financial state of the family, to him is computed the burdens of life and where they weigh most heavily, to him is confided private affairs which should have no place in a permanent file. These are those matters which one man trusts to another, and it is here that the claim man is made the confessor of those tribulations which beset humanity in its varied forms. At this juncture the claim man has an opportunity to reveal the true context of his stature, an opportunity that comes to him alone . . .

This is directing his course clear from the shoals of loan sharks and garnishments and those things that perplex and worry an employee and make him that much less efficient. If he is in debt, tell him how to get out and still retain his good name, his self respect and his credit with his creditor. Accompany the downcast man to the grocer and explain the situation to him, how misfortune and injury may have caused a halt in the meeting of the usual payments, but no restraint in the willingness of the man to fulfill his obligations if only some manner could be pointed out.

They are beset by tricky men with wily schemes, which on their face appear genuine and authentic. Spurious securities of a mongrel variety are offered at tempting rates. Most of these are utterly worthless, and I desire to add here that it is my judgment that the wage earner has no place in the stock market, this is not a wage earner's game, his place belongs among those investments that are safe, secure and sound, which tend to enlarge his faith in commercial transactions rather than curtail it. The wage earner has no place in any investment where he loses the absolute control and direction of his savings which is always the case in these stock jobbing investments. I sometimes feel that a moderate curse is extended to the wage earner by the litheral availability of charge accounts and instalment contracts.

These are some of the items that I believe the claim man should discuss with the employee, try and point out to him the pitfalls which sensible men seek to avoid, guard him

against extravagances that he need not bear, hold up the torch of thrift, economy and urge that in all his transactions and affairs that he exercise considerate judgment, and be not moved by rash and dreamy sentiments that have no place in the present judicious parley of mankind.

A mere settlement with a man is a momentary transaction, but to reach out to him with a sustaining force that enables him to hold on and to improve his situation is a perpetuity.

Psychology of Approaching Persons for Statement and Settlement

By W. H. Mooney
Claim Agent, Missouri Pacific

The person with whom we are dealing determines our course. By the very nature of his work a claim agent is being continually educated along the lines of character study, and it is, perhaps, easier for him to determine, or even anticipate, the mental attitude or character of a person than it might be for someone engaged in a different line of business, and he can, therefore, the more readily place himself in harmony with the one with whom he is dealing. The character of a person may be known through a former acquaintance. If not, we should make an effort to "discover" him in the few moments' conversation we have before broaching the subject of statement or settlement. To produce the best results your mind is in full accord and sympathy with his own. We may pave the way through a mutual friend, or, if we have both lived in the community our reputation may have preceded us by his having heard others talk of our methods, which emphasizes the importance of playing the game square. You may not always be able to induce your man to play square but for yourself, you have no excuse to do otherwise.

Our chief thought should be to get in mental harmony and sympathy with our man, listen to and take an interest in his story. After we get this we can then best determine on how to proceed toward approaching him for a settlement. If you take a personal interest in the injured person, see that he has every care and attention and the knowledge that he is indebted to you for such care and attention, you will find it produces much good influence on the subject. You must remember that even though you do desire to be fair and honest, you have still to convince your man of that fact and then prevail on him to reciprocate.

We must remove fear, aggressiveness, vindictiveness, antagonism, combativeness, shyness, trickery. We start wrong if we place a man in an argumentative mood or if we contradict him. We are more apt to place him on his honor, if he has any, if we approach instead in all fairness and honesty.

We must work along the same lines; talk the same language; work in the same environment with the person with whom we come in contact. You find as a rule you work to better advantage with cases of employees, because we are one of them, are more or less associated with them, work in the same atmosphere. We are, to a certain extent, advertised among them. They tell each other how they have been treated by us and have less of the feeling that we are smooth citizens, working for a corporation, who will take advantage of them.

Little acts of attention and kindness do much good. I make it a rule to call on employees both before and after I secure their statement or release. I like to have them feel that I am their friend, and, although a claim agent, am not heartless and can sympathize with and make friendly calls on them. We have often had the physician make extra calls, probably not necessary, because of the feeling of neglect of some injured person. It is surprising how much this is appreciated and what advancement we have made toward friendship.

Report of Committee on Restoration and Re-employment of Injured Employees

New interest has been aroused in the work of restoring or educating injured industrial employees by the splendid work that is being organized by the Federal Government for the restoration and education of wounded men, following the earlier efforts along this line in France and England.

We must remember that we are handicapped by this difference between the government restoration and our proposition in that the government can compel the wounded soldiers to submit to any course of restoration or education, no matter how long or how painful it may be. Of course, we cannot compel an injured man to go to school or take up any specific course of training, and doubtless all of us have had the sad experience of trying in vain to persuade a young man who had lost a leg or arm, and who had received a considerable amount of money in settlement to take up telegraphy, stenography or some other occupation, he was physically able to fill, but who has used his money to purchase a pool room or automobile. On the other hand any claim agent can think with pleasure and even pride of the crippled men he has helped to jobs at which they are earning good wages, enabling them and their families to live in comfort.

In approaching this subject your committee endeavored to learn if there were any general plan of restoration of crippled employees among railroads.

Our investigation indicated that none of the roads have a definite policy in this connection, none of them have schools either connected with the railroads or otherwise, and no specific manner of handling these cases as a whole. Practically all that has been done along this line has been done or at least initiated by the claim departments. The claim agent comes in direct, intimate relation with the injured man as no other official does, and can understand his needs, and sympathize with him. Further he has in mind his instructions, which one general claim agent expresses in the following words: "When spending the company's money, I want you to buy, besides a release, the good will of the claimant."

The following plan which is followed at least in a portion of its cases by one railroad, seems as nearly a general practice of railroads as so far exists. The claim agent writes as follows:

It is the purpose of the claim department, when reasonable and fair settlement has been made, to endeavor, if possible, to secure a position, which the injured individual may be able to handle. In some cases we talk the matter over, and if he seems particularly fitted for, or if his injured condition limits him to, some special line of work on the road, we endeavor to make arrangements through the operating department for a place where he can learn the duties connected with that position. As an illustration, in some places where men have lost legs or arms, we have arranged so that they might study telegraphy, and when they are sufficiently advanced, secure positions for them. In some of these instances we have made station helpers out of them, in order that they might earn wages while learning this new occupation. In other instances we have taught the men yard clerical work, or had them placed in some mechanical office, if their education was sufficient to handle such positions.

When special or difficult operations are essential it will be found easy to place the patients in private hospitals where such operations are performed. Eventually as an outgrowth of the government hospitals and work, we believe large numbers of institutions will be established for doing this work.

We would, therefore, recommend.

1. That for the present every railroad so far as practicable follow out some plan like the one indicated above. A representative of claim department who handles a particular case should discuss with the injured party, and decide what work the man can do, and what he would like to do, and when it is decided what work the injured man shall be trained for, the matter should be taken up by the claim man with the department, where his changed life will be worked out. The claim agent must have the hearty co-operation of all departments in order to replace all men. The request of the claim department should not be pigeon-holed or side-stepped. The plan will not be a success until every officer, from the general manager to the heads of the various departments has been convinced as to the wisdom of the policy.

2. When any special education is required in a particular case, that this be obtained from existing educational institutions and practical training

schools, a list of which should be kept on file and up to date. In most cases somewhere on the lines of every railroad are available opportunities in almost any direction. If a settlement has been made with the injured man for a substantial sum, and an allowance made in the settlement to cover the needed education, the injured man should then be put on his own resources. If he is not interested enough in himself to follow out the training at his own expense he is not mentally fit to succeed in the work that will follow.

3. When difficult and complicated operations are indicated, that these should be obtained at private or public hospitals, government hospitals, if possible, where such special surgical work is done. If the railroad has a complete staff of surgeons, and especially if it has its own hospitals, it is probable that it will not be necessary to send any cases, except at rare intervals, to outside hospitals or specialists. The time spent in the company hospital will undoubtedly be very beneficial to the injured man, mentally and physically.

4. That as the government and private institutions for the training and restoring of cripples are developed, further study be given to the subject by this association with the view of the adoption of some general plan by all railroads which may appeal to the injured men and secure their willingness to submit to the course of training and help minimize the great economic waste, and the pain and suffering caused by injuries to the injured ones and their families. That to this end a permanent committee on this subject be created.

We believe that the carrying out of the plan suggested will from the outset be an economic step, and that all money expended will more than come back to the railroads in better services and in the loyalty of the restored men. The work should be done on wise and well considered business principles. It might be well to take the matter up with the railroad administration to see if a department could not be created for all the roads, or in view of the possible return of the railroads to their owners at an early day it might be better to, at least, consider and take up with the various claim men the idea of establishing some central schools or shops for training of injured men after they have graduated from the hospitals, and it is believed that these schools or training shops could be very nearly self-sustaining. If a machine shop, as an illustration was established at some central point for educating the injured, work might be done for roads which would otherwise be given to outside plants.

We believe that such joint efforts on the part of the claim departments will induce the railroads to take up this work unitedly and carry it to the height of success which it should attain.

The committee which presented the report has as its chairman John S. Rockwell.

Co-operation Given "Safety First" by Claim Departments

By F. A. Hruska
Chief Claim Agent, New York Central

"Safety First" had its inception in the claim department. Now that it has become so popular it must not forget from whence it came and, on the other hand, the claim department must not be satisfied to sit by with folded arms and puffed out chest taking unto itself all credit for creating such a swell kid now so able to take care of himself. Neither should ever become too old or too self important to give and to take good advice, and they should be continually telling each other what is going on in their respective fields, they should trust each other and they should of course co-operate on a 100 per cent basis.

General information of value should be freely interchanged between officials and members of the claim and safety departments. I believe most of the claim departments make the monthly reports of accidents to the I. C. C.—if they don't they ought to. Copies of these reports should be furnished the general safety agent, with such other "classified as to cause, locality and occupation" reports as he may require to compare the results on his road to those published by the I. C. C. for all roads. On the other hand, copies of all posters, notices, instructions, and of any other form of "safety first" literature should be furnished each and every claim department office, so the members of the claim departments may have them close at hand for boosting purposes, and they should lend their eyes and ears to note the effect and report it to the general safety agent.

Instructions now provide claim department membership on every safety committee. The claim agent should be active in the committee meeting, and that means first of all he should be sure to attend them. So many accidents come under his daily observation he should be able to give valuable suggestions.

Every claim agent should be observing, and furthermore, he should be thinking and talking safety. He should write special letters about pertinent points brought out in his investigation or otherwise noticed by him, to the chairman of the local committee, sending a copy to the general safety agent, and, if he desires, to the chief claim agent. The head of the department should make it a point to know whether or not his field men are properly interested in "safety first." If they show unusually well they should be commended and if they seem to lack interest they should be encouraged.

Experts tell us one of the best ways to spread the doctrine of "safety first" is by personal contact. The claim men come in contact with many employees and outsiders and their special training undoubtedly ought to make them good talkers; in other words they should be good missionaries to carry the gospel of safety into the darkest corners.

Federal Employer's Liability Act

In an extended paper, F. Markhoe Rivinus, assistant general solicitor of the Norfolk & Western and editor of legal notes in the association's bulletin, presented a review of the past year's decision concerning this law.

The Use of Motion Pictures in the Investigation of Claims

V. J. Waltz, manager of the claim department of the Toledo Railways & Light Company, spoke of the successful use his company had made of motion pictures in the investigation of claims. He showed pictures of one particular case in which a claimant secured a judgment of $15,000 principally on evidence that he would be unable to pursue his usual occupation. By means of good planning motion pictures were taken of the man which showed him at work without crutches, and showing no apparent effects of disability. On a petition of fraud and the showing of the pictures a new trial was ordered, and the verdict considerably reduced. Mr. Waltz emphasized, however, the difficulties of using motion pictures as evidence and said that the juries were not always as readily convinced as might be expected.

Other speakers in discussing Mr. Waltz's remarks spoke along similar lines, particular reference being paid to the fact that the effect on juries was not always completely favorable. It was agreed, however, that the pictures had great value, as for example in grade crossing accidents where questions of obstructions to view, etc., came into consideration.

Election of Officers

The association elected as president for the ensuing year, John S. Douglass, general claim agent of the Gulf, Colorado & Santa Fe. A. H. Mansfield, claims attorney of the Missouri-Pacific; D. H. Kimball, general claim agent of the Great Northern, and D. Harrison, claim agent of the Seaboard Air Line, were elected vice-presidents; and W. H. Failing, assistant claim agent of the Central of New Jersey, was re-elected secretary-treasurer.

Atlantic City was chosen by a narrow vote over San Francisco as the place for next year's meeting, the convention to be held in May.

The Gospel of a Good Package*

By K. H. Gillette
Atchison, Topeka & Santa Fe

THE INTERSTATE COMMERCE COMMISSION at one time made an extended study of the many angles of the loss and damage problem, and I am going to quote one extract from a published report, which reads:

"The railroads of this country paid out $32,000,000 for loss and damage in the year 1914, and about one-half of this could have been saved had more suitable containers been used."

The total claim payments of 26 Eastern and Western roads during 1917 is $26,628,069.12, something like $10,000,000 in excess of the payments they made in the previous year. From the best information obtainable we learn the payments on all lines in the United States will reach and possibly exceed $100,000,000 in 1918.

Our efforts to reduce the total losses in carload freight should probably be directed in two ways: First, in inducing our shipping friends to load, stow and brace their consignments in a thoroughly competent manner and, second, to inculcate in the minds of all transportation employees "The Gospel of Careful Handling." Prevention work, while including, should neither begin nor end with the railroad employee in the occupation of receiving, handling, moving, or delivering of freight. It must begin with the construction of the package itself. Because of the need for a clear understandable rule, applicable at all points in the United States, this recommendation has been made:

"That each container shall be constructed of material of sufficient quantity and quality to adequately protect that which it is called upon to contain."

A rule of this sort is needed and can be defended on the ground of prevention of waste and damage in transit, and because the carriers are urged and, in fact, required to increase their tonnage on less-than-carload shipments, and this latter is accomplished only with great danger of additional loss and damage when fragile containers are permitted. It has been suggested that any package reforms that may be necessary in order to insure safety to the contents during the period of transportation, can be accomplished by the appointment of committees in localities whose duty it will be to study the package conditions on the commodities which originate in their territory, and, after a comprehensive survey in each instance, submit definite recommendations that have met with the approval of the interested shippers, and themselves, so that the package suggested may be adopted—and such committees have been appointed by the Railroad Administration. Of these the committees' work has been confined to foodstuffs but in the course of time it will broaden out to the extent of making a survey of the package used on each commodity originating on the committee's territory, and if this idea is carried out generally throughout the United States, and it is to be hoped it will be, it should not be long before our package troubles are out of the way.

Perhaps it might not be amiss to call your attention to another angle of our expenses which is represented in the column of claim payments for loss of entire package. On the Santa Fe, in a period of January to June, 1918, inclusive, there were received at stations on the Pacific Coast and returned to correct destinations, 133 shipments, weighing 15,070 lb. on which in returning to correct destination, an excess mileage of 453,047 miles was incurred with an average delay to each shipment of 20 days, the total excess mileage exceeding 18 times the distance around the world.

The carriers assume responsibility of insuring the contents as well as the condition of the contents of every package they handle, and because of this, the shippers and consignees should become willing participants in any efforts that are made to insure; (1) the use of a good package; (2) proper marking; and (3) careful checking at both ends of the journey.

Moving freight promptly is good business; moving it safely is a science; railroad carriers owe it to the shippers, the consignees, Uncle Sam and themselves to make a specialty of handling it both ways at once.

In round numbers there are 1,800,000 railroad employees in the United States, all of whom are concerned, and the majority actually engaged, in the handling of freight. The use of a poor container and the improper handling of freight in transit does more to destroy the peace of mind of the consignee and the charm of the day's work for the delivering agent and these other employees, than any two things we have.

Every shipping point in the United States is served by a representative of a railroad company, and if each of them could be impressed with the necessity of carrying to a conclusion the idea of taking his package troubles in person to the shipper, inviting the latter's transportation troubles in return, nothing would stand in the way of eliminating every faulty package from the commerce of this nation, and curing the transportation troubles that have done so much to swell the loss and damage bill.

A package that looks all right at the beginning of a journey but is all broken up at the end, is, until acquitted, under suspicion. A package that looks wrong at the beginning and is wrong at the end, is already convicted, and should forever be ostracized from the society of those of proper construction. A package that looks all right at the beginning and is all right at destination, puts joy into the dealings of the railroad agent, and the consignee.

The carriers have been unfortunate in having lost and damaged a great many packages during the huge congestion of the past two years because "Speed Up" was the slogan and the economic feature of care was automatically shelved while the great bulk of commerce was pushed forward to the seaboard or to the manufacturing hives of industry. Disruption of the existing car and train schedules, focused the attention of the transfer forces at concentration centers on a class and volume of business, unprecedented in the annals of railroad history. This, at a time when the flower of America's manhood was serving the country at the front, threw the burden of handling on inexperienced transportation forces, both in the shipping room of the consignor and the freight houses of the carriers; so, perhaps, the 1918 high-water mark in the national loss and damage account can be explained partly; (1) by faulty container; (2) by faulty handling; and (3) by inexperienced workmen.

If it has become the duty of the railroads to furnish larger and heavier cars does it not follow that the package for the shipment itself should be strengthened, and that our loading, stowing, bracing and handling methods should be made to conform?

And who is better qualified to collect and distribute the precise information necessary to secure a needed better package, or a necessary reform in the loading, stowing, bracing or handling of freight than the receiving agent at the end of the journey or the receiving merchant to whom he delivers the goods? Team-work between those two at this point, represented by joint, intelligent and constructive criticism, addressed to the shipper at point of origin, if the package is indicated, will invariably find the latter in a receptive frame of mind and accomplish a result that can be attained in no other manner. If it be that the loading, stowing, bracing or handling has caused the trouble, then the same quality of criticism should be directed through the proper officers that the practices which are wrong may be corrected.

*Abstract of an address delivered before the Pacific Railway Club, San Francisco, Cal., May 8, 1919.

Railway Developments in Foreign Countries

Reconstruction in Balkans—Americans Not Successful in Railway Building in China, Says Correspondent

ACCORDING TO DUTCH REPORTS, Holland intends to purchase American steel rails on a larger scale during the next few years, says the *Railway Gazette*, London. They ill be mainly used for the extension of the railways in the Dutch Indies, with a view to benefiting the sugar industry. The annual purchases will probably amount to 50,000 tons.

Railway Strike in Portugal

Advices from Lisbon to the state department on July 5 eported that the general railroad strike called last Tuesday ad affected the greater portion of train service in Portugal, xcept on the lines to the south and southwest of the capital. ome sabotage has been reported.

The Minister of Labor told a meeting of strikers and raiload representatives that the men need expect no assistance rom the Government as long as they countenanced sabotage.

Railway Strike in Brazil

Press despatches from Rio de Janeiro dated July 6 report iat a strike was declared Saturday night by the employees f the Central Railroad of Brazil, all traffic stopping. The ailroad, which is under government ownership, is the largest nd most important in Brazil. It is reported unofficially iat all the shopmen and other workmen struck, forcing the rain operators to abandon work.

The strikers ask increased pay, with an eight hour day, ie despatch says. No definite word has been received from ie States of Sao Paulo and Minas Geraes, but it is reported iat work in these States also ceased.

Americans Not Successful in Chinese Railway Building

[Special Correspondence from Peking]

There is some evidence that American prestige is recovring somewhat from its almost complete eclipse which folowed the decision of the peace conference with respect to hantung. Japanese propaganda did not fail to help along ie Chinese impression that the result is another evidence f the inherent incapacity of the Americans in Far Eastern olitics. Chinese were reminded that America had led hina to declare war on Germany (which has been the ccasion of her internal disturbances for the last two years) n the promise that in the peace conference to ensue China ould be dealt with not on the basis of power but on the asis of justice, that America has utterly failed to make ood, as she always has and always will.

In the words of the Japanese Consul-General at Canton, You see, might is still right." Chinese politics have been nd still are railway politics, and in the railway field the merican record has been one of consistent failure. First n the ground for contracts after the Sino-Japanese war wakening in 1895, the Americans have yet to complete a ne in China. Practically every principal route has at ome time experienced an American contract, but invariably ie American contractor has backed down before the opposion of representatives of other nations, or Chinese backed y other concessionaires. On the Pekin-Hankow line they ere outbid by the Belgians, who with the backing of the rench and the Russians insisted upon and secured improved terms as soon as the Americans gave up the fight. n the Canton-Hankow they succumbed to Chinese opposion cleverly aroused by Belgian intrigue, a certain amount of bad luck, and American desire for a quick "turn-over." On the Tientsin-Pukow they were balked by the Germans. Willard Straight's Aigun-Chinchow concession together with Senator Knox's proposal to "neutralize" Manchurian railways brought the Russians and Japanese together in such a way as to defeat the Americans and further confirm foreign control over Manchuria. Russian opposition prevented the Siems Carey extension to the Peking Suiyuan line. French opposition did the same to its south China line. A British protest stands in the way of its Szechuan line. Altogether these agreements cover some 7,000 miles of line,—equal to the entire length of line in China and extending almost without break from Siberia to Indo-China and from tidewater to the continental plateau. If these lines had been built and built by the Americans it is conceivable that there would be no Far Eastern question today. If American interests held such a line of communications would France and England have bought Japan's assistance by permission to plunder China? Would Ishii have presumed to ask Lansing to recognize Japan's "special interests" in China? But America gave up all of these routes out of "friendship" for China. Has it proven to be *friendship?* Hence the charge that Americans are too inexperienced to do anything but *muddle* in Chinese affairs. But the Chinese still say that Japan's present press abuse of America and all things American proves that America is still at heart China's friend.

* * *

The British are the first in the field, signalizing the resumption of railway construction activities in China. Mr. Whitelaw, engineer-in-charge, has just arrived in Peking and is recruiting his organization for the building of the Menghsien extension of the Taokow Chinghua line—otherwise known as the Peking Syndicate line. This extension has been noted in these columns before and being only 30 miles long, is important rather as a harbinger of things to come than for its place in the Chinese system.

* * *

Work is under way toward the raising of the north end of the Tientsin Pukow line. The surrounding country is subject to almost yearly inundations, during the late summer. Two years ago the Tientsin terminal and nearly one-fourth of the rolling stock was cut off from the remainder of the line for a period of nearly three months. The damage was done by the water over-topping the embankment rather than by any force of current, hence the present project offers hope for permanent improvement.

* * *

After a surcease of several weeks from the soldier nuisance upon the Peking-Hankow, matters have lapsed into the old condition. Following the diplomatic corps memorandum, the managing director, General Ting, secured the assistance of his former military associates in cleaning up the situation. But about a fortnight ago five trains with locomotive attached, steam up, were held by the military over a week at a small station just north of Hankow. At the same time passengers reported that their meals had to be served to them in their coupes, the dining car being absolutely full of soldiers. As a further evidence as to who is in control, at every station of importance there may be observed piles of iron ore which has been thrown out of passing trains commandeered by the military. This ore is from a mine of which General Ting, the managing director, is co-director, and in which Tsao Ju-lin, minister of communication, is

a principal shareholder. One further symptom of the demoralization of this important line is to be noted in the effect of a washout about 100 miles north of Hankow. The steel bridge at this point was washed out two years ago by the floods of that memorable year. The pile trestle which has done service since was again washed-out by a freshet about a month ago. Although the waters had subsided within a few hours so that a man could wade across, through movement of trains was not provided for two weeks.

All plans for additional construction and purchases of equipment have been held in suspense for over a month, ever since the attack by students upon the house of Tsao Ju-lin, minister of communications. Tsao offered his resignation the next day, but as the "Shuentien Shih Pao," the Japanese newspaper published in Pekin, stated, "The Japanese government will not allow the president to accept his resignation." Tsao accordingly was granted three weeks' leave of absence to "recuperate his health," which he spent in the Japanese hospital. In the meantime the tension became stronger and no one in minor authority has dared make any move, for fear of repudiation.

* * *

Peking newspapers have contained the allegation that Japanese authorities have demanded that the American Adviser to the Ministry of Communications, Accounts department, shall be superseded by a Japanese at the conclusion of his term this fall. The name associated with the position thereafter is that of Mr. Nagao, at present the Japanese representative upon the Inter-Allied Technical Commission serving under the chairmanship of John Stevens upon the Trans-Siberian railway. It is pointed out that the Japanese banks have advanced in the neighborhood of Yen 100,000,000 ($50,000,000) upon the security of the new railway lines, that this money has been dissipated upon military expenditure so that there is no property underlying the mortgage security, and that for these reasons in view of the imminence of Allied assistance to China it would be very valuable to Japanese interests to have a friend at court in the accounts department of the Ministry of Communications. It is a fact that an oral contract made with the American adviser as long ago as December providing for an additional term of three years has not yet been put into writing.

June 10 President Hsu signed the mandate permitting the resignation of Tsao Ju-lin, minister of communications. The attempts to crush the student strike proved abortive, for immediately over 10,000 students offered themselves for arrest, while from all the outlying provincial capitals they began to move in by hundreds so as to fill the places of those who became impounded. The Government University was turned into a prison, the streets have been placed under martial law, all attempts, however, to provoke the students to violence were fruitless, and finally the government decided to release the imprisoned numbers. These refused to come out, however, until the chief of police should come and make an apology. This was done and at eleven o'clock Sunday, June 8, they came out. On the next day coolies on the south end of the Tientsin Pukow went on strike and the Shanghai Nanking management was forced to publish an announcement that it could not guarantee movement of trains.

The shops in Tientsin closed, and in desperation the president accepted Tsao's resignation and offered his own as well. The latter is only Chinese good form, but the further move of Japanese interests to protect their favorite is awaited expectantly. In the meantime the Vice-Minister Tseng Yu-chung is acting minister. With the help of General Ting, managing director of the Peking Suiyuan and Peking Hankow lines, he will most probably continue the policy of the Ministry along former lines.

Reconstruction of the French Railways

M. Claveille, minister of transportation, has made a report to President Poincare showing marked progress on the reconstruction of the French transportation systems, according to a press despatch.

The report shows that since the signing of the armistice 564 miles of double-track railway lines and 567 miles of single-track lines have been restored on the Northern and Eastern Railways.

Of 645 miles of canals that were closed to navigation, 198 miles have been opened to commerce.

Seven thousand miles of highway have been put in good condition out of 24,000 miles of roads that were damaged.

British Railroad Accidents

Eight passengers, five employees, and six other persons were killed in train accidents on railroads of Great Britain and Ireland in the last calendar year, and 463 passengers, 146 employees and 25 other persons were injured. Casualties in other classes,—including 393 employees killed and 267 trespassers, including suicides, killed,—bring the total casualties for the year up to 870 killed, and 4,184 injured. The number of employees killed is 38 less than in the preceding year, and 94 less than the average in the years 1907-1916; and the number of trespassers killed, 267, is 163 less than the average in 1907-1916.

Increased Freight Rates Possibility in England

The Railway Executive Committee, which has been operating the British railways since the outbreak of the war on June 13 issued a statement complaining that the relation of railway fares to the difficulties in railway working and the financial burdens of the railways do not seem to be fully understood by the public, and announce that the 50 per cent addition to passenger fares must be continued, at any rate until freight rates are increased.

The difficulties in restoring pre-war train services are gradually being overcome, the statement continues, but a graver problem affecting railway fares has arisen through the enormous increase in the cost of railway working. Owing to the increase in railwaymen's wages and cost of materials, it is estimated that the expenditure of the railways during the current year will be more by $500,000,000 than it was in 1913, when the net revenue from all sources came to about $250,000,000.

Revenue and expenditure will have to be made to balance by some means or other. The total railway expenditure of all the railways in 1913 was, roughly, $400,000,000, and any savings that may be made as a result of central management can only go a very short way towards meeting the deficiency referred to. The balance of receipts and expenditure, including the payment of the meagre dividend on the railway stocks, which amounted in 1913 to 3.8 per cent, less income-tax, can only be adjusted by an increase of passenger, merchandise, and mineral rates.

During the war the government traffic (which was not carried at excursion rates, as has been stated) enabled the railways to maintain their pre-war profits without increasing the rates for goods train traffic. When the government traffic seriously fell off it was the intention to increase the rates for merchandise and mineral traffic, but nothing can be done in this direction owing to the introduction into Parliament of the Ways and Communications Bill. There will be still further delay owing to the decision of the committee dealing with the Bill that an Advisory Committee is to be set up, to whom all such questions must be referred.

In the meantime there is no alternative but to continue the 50 per cent addition to the passenger fares. It remains to be seen whether any reduction in this 50 per cent can be brought about when the freight rates are increased.

Now Rebuilding Serbian Railways

The American Relief Administration has made public the report sent to Herbert Hoover, director general of relief in Europe, by Colonel William G. Atwood, director of the Division of Communications in Central Europe. He reported that he found railroads generally in fair condition when he began work last March, except in Serbia, "where the destruction was almost complete." The report says in part:

"When the American Mission began operations Trieste was clogged with 41,000 tons of relief supplies, and Fiume with 12,000 tons, and the daily movement was only 700 tons from Trieste, and nothing from Fiume. Since March 23 the mission has moved from Trieste 178,000 tons, a daily average of 2,100 tons. Some days we exceeded 4,000 tons of supplies. About 125,000 tons were delivered to the Austrian Republic, and 52,000 tons to Czechoslovakia. The American Mission has furthered reconstruction and the rehabilitation of railroads and their equipment, and has given the Serbian railroads technical advice and aid in purchasing $11,000,000 worth of plant and equipment from American army stocks."

With American railway material arriving and American army engineers in the Balkans there is now a prospect that railway conditions in the Near East may soon be bettered, says a correspondent to the Philadelphia *Public Ledger,* writing from Saloniki on May 10. Heretofore the work of rebuilding the thousands of dynamited bridges and of repairing the hundreds of miles of twisted, uptorn track in Serbia has progressed slowly.

Serbian railroad engineers have been handicapped by lack of labor and material. At present it is a matter of from ten to fifteen days to cross Serbia from Salonika to Belgrade. If one link of the motor truck service breaks down because of washed out roads or floods carrying away bridges the whole work of the American Red Cross, the American food famine commission and the Serbian relief fund workers is held up and a through journey to Belgrade or Saloniki across the country may require from fifteen days to a month.

American importers, the correspondent says, should not figure on transporting freight overland through Serbia at this time. Railroads probably will not be regularly running until early in 1920. Belgrade is best reached via Trieste and Fiume rather than from Saloniki.

France Sends Locomotives to Roumania

There were only 84 locomotives available in all Roumania after the invaders withdraw from the country, according to Lieut.-Col. H. Gideon Wells of Chicago, the Red Cross Commissioner who returned from abroad last week. At the request of Queen Marie of Roumania France has loaned the Balkan state 50 locomotives, and supplies are now being sent by rail from Paris to Bukarest, the trip taking three and a half days.

When the Red Cross Commission arrived in Roumania early in 1919, Col. Wells says, there was an area of about 30,000 square miles with Bukarest, the capital, as its centre, in which the population was close to starvation when American relief arrived. Through the co-operation of the government with several Red Cross officers who preceded the Commission, preliminary arrangements for the receipt and rapid movement of the supplies were so complete that within twenty-four hours after the relief ship docked, supplies were being forwarded and in ten days every part of the country was receiving its quota. There were 50 workers in the Red Cross party, who in the absence of railroad facilities for transportation, carried the supplies long distances by motor. The commission had twenty automobiles.

"American food provided through the generosity of our people saved the day for Roumania," said Col. Wells. "She was in pretty bad shape when relief finally reached her. We have been successful in getting food, medicines and the needed surgical supplies, in some measure, to all parts of the country. When I left a few weeks ago, work on the restoration of the transportation facilities was progressing finely."

Louis A. Van Norman, trade commissioner for the Department of Commerce, who was sent abroad to investigate conditions and opportunities for American trade in the Balkan countries, has submitted his first comprehensive report on Rumania.

"The chief difficulty in the economic situation of Rumania is the lack of transportation facilities," reports Mr. Van Norman. "The Germans removed practically everything they could lay their hands on—some 2,800 out of 3,000 locomotives and all the railroad cars, particularly those used for hauling freight. The lack of locomotives and railroad cars makes it very difficult, almost impossible, to distribute the supplies the American Relief Commission sends in, to say nothing of the other necessities of life.

Shimonoseki Tunnel Has Been Decided On

The Government railways, says the Japan Advertiser for May 2, as reported in a recent issue of Commerce Reports, have decided to cut a submarine tunnel under the Shimonoseki Strait, according the chief of the construction bureau. It will be started this year and it is planned to complete it in 1928. At present the railway systems in Honshu and Kyushu are connected by ferryboats, but when the tunnel is completed the connection of the two systems will be much improved. The Advertiser continues:

According to the official, this is to be completed at the expense of 20,000,000 yen ($9,960,000). The first two years will be spent in studying the geological formation of the sea bed in the strait, drafting the general plan of work in preparation for the actual undertaking of tunneling. Experts and workmen engaged in the undertaking will be dispatched to Europe and America, where they will personally study what has been achieved over there.

In 1921 the actual work is to be begun. The official states that much depends on the geological formation of the sea bed, which is not so simple and well known as is that of the English Channel. Therefore, no definite plan of work can be established as yet. It has, however, already been planned that the tunnel line is to start far back of the Shimoneseki station. On the Moji side, also, the tunnel line will be connected with the Kyushu line at Dairi or its vicinity. This renders the level of the line low. The whole length of the line will be 7 miles, of which 1 mile will be completely under the sea.

According to this official, the completion of the tunnel will make it possible to start a through service between Tokyo and Kagoshima, and the transportation system of the country will be materially improved.

On the Docks at American Bassens Near Bordeaux

Orders of Regional Directors

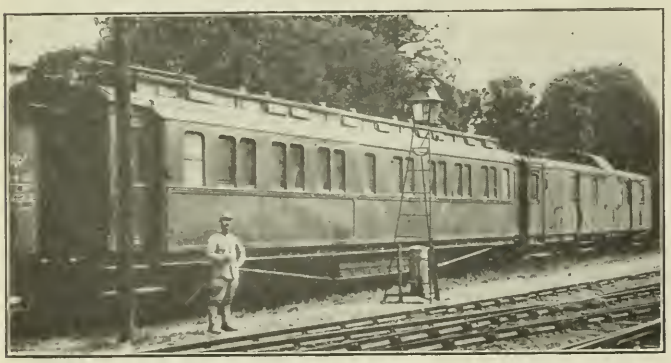
REDUCED DEMURRAGE RATES.—A. T. Hardin, regional director, eastern region, by circular 600-2-5, advises that the modified national demurrage rules which go into effect on July 20, are to be adopted also railroads not under federal control, the Interstate Commerce Commission having granted special permission No. 48001. Federal managers are to advise their non-federal connections.

Double and Triple Loading of Carload Shipments.—The regional director, eastern region, by circular 500-1.3-1, promulgates a letter from the manager of the car service section calling attention to neglect of the rules providing for loading two or three minimum carload shipments in a single car. Agents do not always make proper endorsements on the bills, conductors do not observe the instructions, and agents do not properly supervise the unloading at intermediate and final destinations. Shippers must not be allowed to gain the impression that the railroads are indifferent about this matter.

Safety Appliances on 80,000 Freight Cars.—The regional director, eastern region, by circular 500-92, promulgates a letter from Frank McManamy, assistant director of operation, calling attention to the importance of having all freight cars equipped with United States standard safety appliances by September 1. About 80,000 freight cars now in service need the equipment. These safety appliances are all of standard dimensions, therefore all cars, both home and foreign, should be equipped; there is no loss either of time or material in equipping foreign cars. These appliances constitute a betterment in the interest of safety which can properly be billed against the owners of the cars. Federal managers are called upon to report what progress they are making.

Postponement of I. C. C. Hearings.—The regional director, eastern region, by circular 1500-130, promulgates a letter from R. V. Fletcher, assistant general counsel, division of law, relative to making requests upon the Interstate Commerce Commission for the postponement of hearings in pending cases. The commission is ordinarily averse to granting such applications, as such action disturbs the itinerary of its examiners. All applications of this character should be made through the office of the General Counsel of the United States Railroad Administration so that a uniform policy may obtain. Applications should be accompanied by affidavits setting forth the facts justifying a continuance.

The contract between the States of New York and New Jersey, for the construction and operation of the highway tunnel beneath the Hudson river, between New York city and Jersey City, has been approved by both houses of Congress.



German Telegraph and Telephone Train in Use as Central Communication Headquarters for the German Emissaries at Versailles

House Committee to Begin Railroad Hearings

WASHINGTON, D. C.

CONGRESSIONAL consideration of the big problem of what kind of regulation the railroads are to have after they are returned to private management is about to begin in earnest. The House committee on Interstate and Foreign Commerce begins public hearings next Tuesday on the general railroad question, and Senator Cummins, chairman of the Senate committee on Interstate Commerce, has announced the membership of a sub-committee which he has appointed to draft a tentative railroad bill, consisting of himself and Senators Kellogg, Pomerene, Poindexter and Robinson. This sub-committee will probably hold some hearings later, but its first efforts will be devoted to a careful consideration of the material already at hand.

While various Senators and Representatives who are especially interested in the railroad problem have devoted a good deal of attention to the subject in an informal way and the House and Senate committees have devoted some attention to side issues, such as the Poindexter and Cummins bills, what has been done thus far has been largely of a preliminary nature. The Senate committee held protracted hearings during the early part of the year and to that extent has made more progress toward legislation than has the House, but the Senate hearings have served principally to arouse general discussion and to bring out various plans for the future status of the railroads and it will be necessary for the House committee to go over most of the ground again, so that the hearings will probably run through the greater part of the summer. While many of the ideas advanced and the material presented at the Senate hearings will be useful, they were directed principally at the idea of a five-year extension of the present system of federal control proposed by Mr. McAdoo, which is now an issue of the past, and many of the principal alternative plans presented at that time have since undergone considerable modification. Director General Hines at that time was primarily advocating the five-year plan which he had inherited from Mr. McAdoo, but since that was tabled he has turned his attention more specifically to a permanent plan for private management. The committee hoped to have him for its first witness but other engagements may make it necessary to defer his appearance. In that event the Interstate Commerce Commission, whose ideas are embodied in the Esch bill, will probably make the first appearance. The Esch bill represents the only concrete plan now before the committee but the various interests that appeared before the Senate committee will be given a chance to bring their plans and arguments up to date. The Association of Railway Executives, which presented a statement of principles at the former hearing, will have its ideas in more definite shape this time, among the changes being the abandonment of the idea of a secretary of transportation and the substitution of a proposed department of transportation. The Transportation Conference called by the Railroad Committee of the United States Chamber of Commerce will have an entirely new plan to present, which is in a way a composite of the plans already suggested by various interests, and its representatives are expected to be among the first witnesses. The railroad labor organizations, the only prominent remaining advocates of government ownership, will have the Plumb plan in the definite language of a bill, instead of in the tentative form in which it has been presented heretofore

Director General Hines, in his recent speeches, has dropped the word "guaranty" in describing his ideas for the permanent solution of the railroad problem. Heretofore, in advocating "a definite government guaranty" he has given to many an impression that he favored a specific percentage to be paid from the Treasury in case it were not earned, but in his

last two speeches he has changed his phraseology to make clear that he means merely that there should be a definite statutory assurance that rates must be so fixed as to produce a prescribed rate of return. In his address before the Bankers' Association of New England he said:

"We ought to have a standard to determine what the railroad companies are entitled to. It ought to be fixed with such certainty that it will constitute an assurance to the railroad companies that they will be permitted to earn a sufficient amount to attract new capital. In order to do that it will be necessary, I believe, to have an official valuation of the railroads and a specified return upon that valuation Whatever return is earned in excess of the standard return should be divided between the public and the railroad, leaving enough for the railroad company to stimulate its initiative and its desire to economize, and yet giving the public a portion of it to get rid of this feeling that if there are undue profits they will inure exclusively to the private owners."

In reply to the argument that to complete the valuation and to work out his proposed consolidations of the railroads into a few systems will take too much time, Mr. Hines proposes an interim form of regulation of the railroads after their return to private management. On this point he says:

"I do not believe there was ever a better time in the history of the country than now to get a really constructive form of railroad regulation. And I think that the fact that it is going to take time to do it should not operate to defeat the purpose to do what the situation will require. It will take time; it can not be done this month or next month, it can not be done completely this year. There may have to be some interim form of regulation. The railroad systems ought to be turned back to the private management at the end of this year, as already indicated by the President, and yet an interim form of management and control could be devised which would carry forward the railroad operations until this thoroughly necessary and important constructive program can be carried out. But the machinery for carrying out the constructive program, the principles upon which it shall be carried out, ought, in my opinion, to be determined now while the public throughout the country has its mind centered on the problem and is trying to get a genuine and permanent solution."

Non-Lifting Injector Indicator

THE USUAL FORM OF tell-tale for non-lifting injectors warns the engineer by discharging a jet of steam into the cab when the injector blows back. An indicator has been developed by William Sellers & Company, Inc., Philadelphia, Pa., which not only performs the function of the tell-tale without discharge of steam into the cab, but in addition advises the engineer if the injector is wasting water at the overflow.

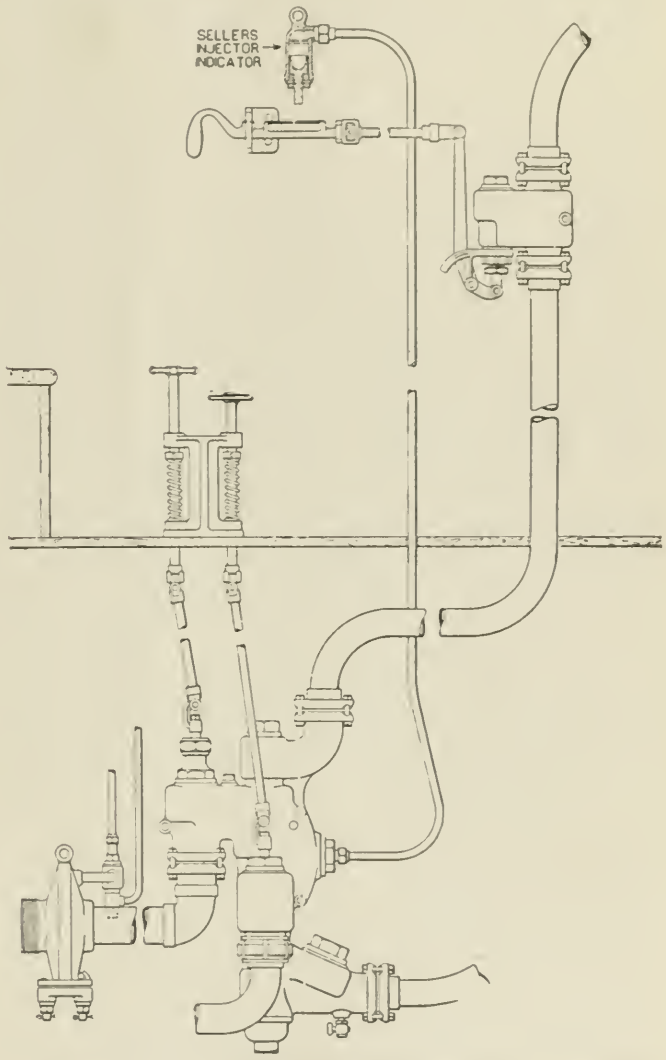
The device consists of a vertical cylinder 4 in. long, containing a loosely fitting piston, seating at each end of its stroke and provided with a projecting end, visible to the engineer when resting on its lower seat. The upper end of the cylinder is connected by a ½-in. copper pipe with the overflow chamber of the injector.

Its action depends upon the well-known principle of the working of the injector, that when feeding without waste there is always a partial vacuum within the overflow chamber of an injector of the gravity overflow type. This vacuum is utilized to raise the loosely fitting piston to its upper seat, causing the projecting plug to disappear from view.

If for any cause the injector starts to waste, the vacuum within the overflow chamber is broken, the piston drops and seats at the lower end of its stroke, exposing the projecting plug. The operator is thus warned and will partially close the lazy cock, stopping the waste. If there is interruption of the water or steam supply, and the injector "flies off," the piston will instantly drop to its lower seat, preventing outflow of steam and warning the engineer of the danger.

When the injector operating valve is open, the end of the piston must always be invisible, unless heating the water in the tank. If steam is blown back into the tank in winter, the position of the projecting plug of the indicator is a continuous reminder that the injector is not operating and there may be danger of overheating the water.

A further advantage of this form of indicator is that it enables the engineer or fireman to obtain the actual minimum capacity. Most operators do not regulate the water supply closely, fearing that the injector may break off without warning or waste at the overflow. The indicator is so sensitive to conditions in the overflow chamber of the injector that the exact minimum can be obtained by regulating the lazy cock until the end of the piston appears, due to the loss of vacuum in the overflow chamber. It is claimed that a very slight opening of the lazy cock will cause the piston to rise and the exact minimum to be obtained.



Application of the Sellers Non-Lifting Injector Indicator

The application of the indicator also will reduce the tendency of the engineer to close the heater valve, which prevents the injector from restarting automatically. It is designed to make the non-lifting injector as safe and certain to operate as an open-overflow lifting injector.

The indicator is applicable to the Sellers, Nathan WF, Nathan Simplex, Chicago and other forms using an overflow chamber which contains the combining tube and is closed against the atmosphere by a gravity overflow valve.

Reducing Live Stock Losses in Transportation

THE PROPER HANDLING and loading of livestock was the subject of an address by Dr. W. J. Embree, veterinary, Western Weighing and Inspection Bureau at the National Stock Yards, Ill., before the St. Louis Railway Club at its annual meeting. The speaker was introduced by W. H. Hunn, of the Western Weighing and Inspection Bureau, who stated that at the St. Louis and East St. Louis Stockyards the inspection bureau handled 949,556 cars of live stock received, and 205,715 cars forwarded during the year 1918, and passed upon 154,293 dead and crippled animals during the same period. During the same year there were 18,745 dead animals received, which meant a loss of approximately $560,000, figured at the market prices at the time they were moved. As the death loss is greater in the shipment of hogs than in other live stock and because much of this loss could be avoided if shipments were properly handled, especially at the time of and immediately before loading them into car, the paper given by Dr. Embree, and abstracted below, dealt almost entirely with hogs.

The great loss in the shipment of live stock can be traced to two causes, disease and injury. More than half of the losses involved while in the carriers' hands can be traced to the character and condition of the hogs at the time of loading, since a checking of cars in the same train shows that some hogs hauled a much greater distance than others arrived without loss when proper treatment is afforded before loading, while other cars traveling shorter distance arrived with heavy loss due to mistreatment prior to shipment. This is explained by the fact that many feeders place their hogs in small enclosures for a period prior to shipment to markets, and feed them with fattening foods of which corn in some form is the most common.

If the weather is hot and sultry when hogs are moved to the loading chutes for shipment, the necessity for oxygen in the air cells of the lungs to purify the blood causes the animals to inhale and exhale very rapidly, and in this condition they are placed in the stock pens where the breeze is shut off or they are crowded into a stock car where the close contact of heated bodies gives them no chance to cool. The heart is exhausted from its exertion, and the lungs, being the only organs through which the surplus heat of the body can be removed are engorged with blood, and death from suffocation is the result.

Hot and tired animals are especially susceptible to diseases of any kind. It is the history of swine plague that animals attacked will seldom develop fatal cases unless their vitality is weakened, or their resisting power lessened by some free disposing cause or some other disease. This being the case, the animals in a congested and weakened condition are excellent subjects for bacillus to work on and fatal cases of swine plague may develop in a few hours with the result that hogs will frequently develop this disease and die before they reach market, while a portion of the herd left at home will not be affected.

During the first hot weather in the spring of 1918 there were heavy losses in shipments consigned to the East St. Louis market. One day's loss alone amounted to over $11,000. The losses on six other days amounted to from $7,000 to $10,000. Ninety per cent. of the carcasses of these hogs showed death had been caused by acute congestion of the lungs, called suffocation from overheat, and in nearly every case the dead hogs were the best in the load.

Hogs should never be loaded into cars when hot or panting. If they have been driven on foot or excited when loading or unloading from a wagon, or have been hauled far in the hot sun, they should be given time to cool before being loaded. The cars should be clean, the floors sanded and thoroughly wet down before the hogs are placed in them. One place where the carrier is at fault is the inadequate supply of water that is furnished at the loading pens of the average country station. Especially is this true of non-agency stations at most of which the water supply comes from a pump, and if we are to believe the shippers' reports these pumps are always in a questionable state of repair, and the pail which should be there is usually missing. At stations where the water supply is drawn from a supply tank or from the city pressure, a pipe connected with this and so placed on or near the loading dock that water from it could be thrown directly into the car, would make it so accessible that a shipper would use it. If the train is late the water may be easily sprayed on the floor of the car under the hogs, and in this way they will not be allowed to get hot.

If the hogs are not overheated when picked up for shipment they will not suffer severely during any of our ordinary summer weather while the train is in motion. When a division or terminal point is reached at which the train is to remain for some time, the hogs should immediately be drenched with cold water, because they are in a cool condition from riding, and the cold water applied to their heads and back will not likely injure them. However, the practice of drenching hogs with cold water after allowing the load to stand until they are ready for the road and are hot, is very bad, as many hogs are instantly killed by having cold water sprayed over them while hot. When it becomes necessary to cool off hot hogs, the water should be allowed to run on the floor of the car so they will have a cool place to lay; it should never be applied to the heads and backs of hot hogs.

One of the most successful methods for keeping hogs from getting overheated in hot weather is to hang ice bags to the roof of the car; these will cool the air of the car, and the constant drip from the melting ice will keep the floor damp and cool. In checking cars of hogs arriving at the National Stock Yards, when ice bags were used there was not a single case found where hogs were dead from overheat. The most satisfactory method seems to be to hang six burlap bags containing 50 pounds of ice each in the car, two at each end and two in the center.

At all times of the year cars should be cleaned before stock is placed in them. This is especially true for hog shipments in spring and summer as a heavy collection of straw and manure that has been left in the car will develop heat which, with the gases that arise, will cause the hogs to become restless and nervous and undo all other good care that may have been given them. Sand makes the best floor covering for all shipments of live stock during the summer months. In winter the cars may be matted with straw, but too much should never be used as it is likely to heat when it becomes damp.

Another cause of loss is that of overloading cars. The minimum of 17,000 pounds that is applied to a 36-foot car seems to be taken by a great many shippers to mean that a car will transport that many pounds of hogs regardless of their size, while in reality the smallest hogs that can be loaded to this minimum are those averaging 240 to 250 pounds.

It is especially necessary when cattle are moved in mixed shipments that they be always partitioned or tied, as owing to their unusual viciousness they are almost sure to cause a great amount of damage unless so protected.

Improperly fastened doors are a cause of injuries and deaths to cattle. Shipments should not be accepted with the doors wired, as these wires will slip enough to let a foot through and a broken leg is the result. Shippers should not be allowed to build a double deck in the car, as in one instance one of these broke down and 16 head of sheep, 4 head of cattle and 3 hogs were found dead in the car, while in another case a hay-rack broke loose from its fastenings, causing serious injuries to the live stock in the car.

General News Department

The commercial telegraphers' strike was formally called off on July 2, by S. J. Konenkamp, president. In issuing the order, he admitted that the nationwide strike had been a failure.

The twenty-five-hour express of the Pennsylvania Railroad, between New York and St. Louis, discontinued last year, is to be restored shortly. The extra fare on this train will be three dollars.

The headquarters of the accounting department of the International & Great Northern, the Galveston, Houston & Henderson and the Houston & Brazos Valley have been moved from Houston, Tex., to Palestine.

Six hundred and ten miles, without a stop, at 148.44 miles an hour, is the latest reported airplane record. This was made between San Francisco and San Diego on July 7 by Captain Lowell H. Smith, of the Army Air Service.

The Veterans' Association of the Great Northern Railway recently held its annual reunion at Duluth, Minn. Over 500 members were present. All of the men, who are also known as "James J. Hill's Boys," have been in the employ of the Great Northern for 25 years or longer.

Tex Rickard, promoter of the Willard-Dempsey heavyweight championship fight at Toledo, Ohio, on July 4, denounces the Railroad Administration because of its alleged refusal to place enough coaches at the disposal of the fight fans, so that 20,000 persons were unable to attend the show.

The sundry civil bill, as finally passed by Congress on July 2, includes the proposed appropriation of $2,500,000 for the Interstate Commerce Commission's valuation work and $2,038,029 for the Alaska railroad. This was the amount adopted by the House, although the Senate made an effort to increase it to $12,000,000.

The United States Senate, on Monday, adopted without discussion the resolution proposed by Senator Newberry calling on the director general for a statement regarding the issuance of Railroad Administration annual passes good over all lines. It is said senators' curiosity was aroused by seeing such a pass bearing a serial number over 10,000.

Railway express employees of the United States and Canada, formerly members of two unions, the National Association of Expressmen and the Brotherhood of American Railroad Express Employees have organized one union, the Order of Railway Express Men. The amalgamation was completed at a joint convention held recently at Chicago. One of the first moves of the new brotherhood will be an agitation for increased wages.

The "Safe Practices" pamphlets, issued by the National Safety Council (168 North Michigan avenue, Chicago), have now reached their 24th number. These excellent pamphlets are prepared by the Council and sold without profit. The last six numbers are as follows: Nos. 19 and 24, Protection of Life Against Fire; No. 20, Woodworking Machinery and Equipment; No. 21, How to Compile Accident Records; No. 22, Shop Lighting; No. 23, Gas and Electric Welding.

Senator Sheppard, of Texas, has introduced as a bill, S. 2295, an amendment to the commerce law which he sought to have adopted as an amendment to the Cummins bill, to provide that a railroad may not be absolved from obeying any rate, rule, regulation or practice of any state with respect to transportation wholly within a state, until it shall have secured the judgment of a court of competent jurisdiction holding the rate, rule, etc., to be unreasonable.

"No-accident week" in the Northwestern region, June 22 to 28, inclusive, resulted in a decrease in casualties of 78 per cent. Of 63 roads, 50 completed the week without an accident of any kind to an employee.

During the week of the campaign, five employees were killed and 111 injured, as compared with 6 killed and 482 injured during the corresponding period last year. These figures represent decreases of 16.67 per cent in killed and 76.97 per cent in injured. The number of men employed (274,100) was about the same in both years.

The Associated General Contractors of America will contest a recent ruling of the Comptroller of the Treasury to the effect that the form of cost-plus contracts in use by the Construction Division of the War Department does not authorize the reimbursement to contractors of the cost of premium on their bonds, according to a special bulletin issued by the organization on July 2. The bulletin says that "upon inquiry of representatives of the Construction Division, it is ascertained that it is quite certain that all contractors having unsettled contracts for work under that division and money due them under such contracts will now have deducted from any balance due them the sum of all payments heretofore made to them covering reimbursement of premium on bonds." The plan of action to be taken by the Associated General Contractors of America was decided upon after a conference between the association's officers and their attorneys. The latter hold that the contracts entitle the contractor to reimbursement of these premiums, that the deduction is unlawful and that it can be recovered by future proceedings in the Treasury Department or before the Court of Claims. The plans of the association also provide for a test case before the Court of Claims if the comptroller adheres to his recent decision.

American Railroad Association

C. W. Crawford, assistant to the chairman of the general committee of the Transportation Section of the American Railroad Association, with headquarters in Chicago, has been promoted to chairman of that committee with the same headquarters.

Dirigible Airship Crosses the Ocean

The British super-dirigible R-34, the first lighter-than-air machine to cross the Atlantic Ocean, arrived at Mineola, Long Island, 20 miles east of New York City, on Sunday morning, July 6, at 9:54, completing a voyage of 108 hours, 12 minutes, from East Fortune, Scotland. The distance covered was about 3,600 land miles. The R-34 is 640 ft. long, 79 ft beam, and 79 ft. in vertical measurement. She has five motors with an aggregate of 1,000 h.p.; gasoline tank capacity of over 7,500 gal., and a cruising radius of 4,900 nautical miles. Her lifting capacity is 59 tons.

American Association of Engineers

The Pennsylvania Railroad Section of the American Association of Engineers held its first annual meeting at the Fort Pitt Hotel, Pittsburgh, on June 28. C. V. Potter, of the Chicago Terminal division, spoke on the subject "What Can Be Done to Make the Railroad Engineer's Position More Attractive?"; H. M. Sommerville, of the Lines East, and C. W. Haasis, of the Western Lines, on "What Can the Railroad Section Do Towards Increasing the Professional Abilities of Its Members?"; S. O. Klinger, of the Eastern Lines, on "Should Construction Work Be Handled by the Division?" and C. E. Adams, of the Lines West, Akron, Ohio, on "The Schedule of Salaries of the American Association of Engineers." At a dinner held in the evening addresses were made by A. M. Schoyer, assistant to the federal manager, Pennsylvania Lines, Pittsburgh; W. C. Bolin, supervising

pilot engineer, Baltimore & Ohio, Chicago and F. H. Newell, president of the American Association of Engineers.

"Some Safety Don'ts"

By Ira W. Enos, Locomotive Engineer.

DON'T say that when our time comes we shall get it. That is not good logic and leaves a wrong impression with the fellow who likes to find an excuse for taking chances.

DON'T jump into dangerous places, then look to see what the conditions are afterwards, and when you see you are wrong, depend on your legs to get you out. You might better look first and save all the trouble and perhaps an accident.

DON'T get down on the engine, tender or caboose step, while train is moving, to see what is wrong. If you have reason to believe there is something wrong, the thing to do is to stop your train and find out before it is too late.

DON'T stand close to moving cars when your duty does not require it. Something falling off, sticking out—or worse, a derailment—puts you in a very dangerous place, and there is always plenty of landscape where you can look on in safety.

DON'T think because you have practiced a thing all your life that you are always going to get away with it. When you climb on top of a tank to take water or coal before the engine has stopped, you are saving but little time and are running the risk of getting hit by a low spout or chute, or perhaps falling off.

DON'T stand near or pass close to the end of standing cars. Sometimes they make very quick moves, and if you are in the proper place for them to get you, you are "got." You would not pass close to the heels of a kicking horse—why give the cars a chance that you would not give a horse?

Shippers' Record Book

Clarence F. Pratt, of San Francisco, has got up a handsome bound blank book of 306 pages, about 12 inches square, for use by merchants or manufacturers making numerous shipments of freight in recording, in convenient and accessible shape, all desirable information about each shipment. The book is for sale by the Pratt Building Material Company, San Francisco, of which Mr. Pratt is president, and in whose business the usefulness of the book has been tested. The most prominent feature of the book is its provision for keeping track of carload shipments and the pages are so numbered that records can be kept as in ordinary car record books. The book is divided into nine sections. Section 1 is for freight paid on carloads; section 2 is for payments on other shipments; 3 is for a record of claims; 4 is for record of demurrage, etc., and so on. One section is for the names and addresses of railroad officers.

To arouse interest in his book, Mr. Pratt, in his circular, asks the following questions: "Can you tell instantly whether you have paid a certain freight bill, either carload, l. c. l. or steamship? Can you check your demurrage charges? How much switching, diversion, demurrage, express or storage charges do you pay per year? Have you a record of your claims against carriers? Can you find a rate that was quoted weeks or months ago?" In the front part of his book he shows sample pages, from actual records, to convince the reader that it is by the use of his scheme that satisfactory answers can best be given to these questions.

Does Safety First Pay?

The Santa Fe System's record for "No-Accident Week," June 22-28 inclusive, is none killed and 20 injured, as compared with four killed and 132 injured during the corresponding period last year.

Starting with the above caption, Isaiah Hale, safety superintendent of the road, says, in a bulletin:

"Here is food for reflection. Many men have questioned the statement, frequently made, that 85 per cent of injuries to Santa Fe men were avoidable, yet here is a concrete example of where, for a priod of seven days, by an implied mutual understanding, by co-operation, by team work of an admittedly high order, our record of a year ago was reduced 84 8/10 per cent. Further, 60 per cent of the remaining 15 2/10 per cent were avoidable; so, as a final analysis, we can say that only 6 per cent of our injuries to employees are unavoidable. If this be true, and it is true, then out of the 80 of our employees killed and 10,995 injured during 1918, 75 deaths and 10,245 injuries might have been avoided, and therefore must forever stand as a blot on our intelligence, our efficiency and on our interest in and regard for our fellow workmen."

One of the devices used to stimulate interest in "No-Accident Week" was a placard bearing a huge watch face, indicating 12:40 o'clock and inscribed:

This is
WATCH OUT WEEK
If you will keep yourself
WOUND UP
It is 20 to 1
We shall lead all other lines.

In the Central Western region as a whole the campaign resulted in a record of four fatalities and 94 injuries (90 per cent of which were minor), as compared with nine fatalities and 447 injuries during the same period last year. The roads in the Central Western region employ about 327,000 men.

Signal Division

H. S. Balliet, secretary, announces the nominating committee's nominees for offices of the American Railroad Association—Signal Division—for 1920. The candidates for chairman, for first vice-chairman and for second vice-chairman are, respectively, as follows: C. J. Kelloway, Atlantic Coast Line; F. W. Pfleging, Union Pacific, and F. B. Wiegand, New York Central (West).

For members of the Committee of Direction, to serve three years, the following five members are nominated: W. H. Elliott (N. Y. C., Eastern Lines), C. H. Morrison (N. Y., N. H. & H.), J. A. Peabody (C. & N. W.), F. P. Patenall (B. & O.), R. E. Trout (St. L.-S. F.); to serve two years, the following four: C. A. Dunham (G. N.), G. E. Ellis (U. S. R. A.), H. K. Lowry (C. R. I. & P.), E. E. Worthing (S. P.); to serve one year, the following four: J. H. Cormick (C. N.), W. J. Eck (Southern), A. H. Rice (D. & H.), E. G. Stradling (C. I. & L.). For members of the Nominating Committee, the following ten names are presented, five men to be elected: C. A. Dunham, W. H. Elliott, R. E. Trout, John Leisenring, B. H. Mann, D. M. Case, W. E. Boland, T. S. Stevens, W. M. Vandersluis and C. A. Christofferson.

International Railway General Foremen's Association

The annual convention of the International Railway General Foremen's Association will be held from September 2 to 5, inclusive, 1919, at the Hotel Sherman, Chicago.

Master Car and Locomotive Painters' Convention

The forty-eighth annual convention of the Master Car and Locomotive Painters' Association will be held at the Hotel LaSalle, Chicago, commencing September 9. The association has held no meetings during the past two years, and the program for this year's convention is practically the same as that selected for 1917. The following papers will be presented: The Advantage of Using Pure Paints and More Time in the Painting of Steel Equipment, by Warner Bailey (B. & M.); What Quality and Size of Sand Pebble Are the Best for Blasting Paint or Corrosion From Steel or Iron, Preparatory to Painting, by J. W. Gibbons (A. T. & S. F.), S. E. Breese (N. Y. C.) and Geo. M. Oates (Pressed Steel Car Company); The Record of Our Association, by Charles E. Copp (B. & M.); What Standardization of Painting Railway Equipment Is Necessary, Based Upon the Experience of This Association? by W. A. Buchanan (D. L. & W.), H. M. Butts (N. Y. C.) and W. O. Quest (P. & L. E.); Is the Demand for Linseed Oil as a Paint-Making Oil in Excess of the Supply; If So, What Other Oils Are Most Acceptable Substitutes for the Railway Paint Shop? by A. H. F. Phillips (N. Y. O. & W.), P. J. Hoffman, (Hocking Valley) and F. B. Davenport (Penn. Lines).

Traffic News

Grain Traffic Week Ending June 30

The Director General reports that for the week ending June 30 the grain movement in the Southwestern, Central Western and Northwestern regions showed increases over the same period a year ago; but the movement of coal in the Southwestern, Central Western, Southern and Pocohontas regions still was decidedly below a year ago. In most of the regions passenger traffic showed a heavy increase over the preceding week and over the same week a year ago.

Export Bills of Lading

The issuance of through export bills of lading via North Atlantic ports is to be resumed at once. They will be issued only when founded on written ocean contracts, and then only when shipper gives written guarantee that any storage charges accruing at the seaboard will be paid. For commercial export freight a "G. O. C. permit," issued by the traffic control manager at port of export (on application from the agent of the steamship line booking the cargo, or from representatives of foreign governments or from the United States Food Administration), must be presented by the shipper.

Arrangements for Movement of Farm Laborers

About three months ago, it was suggested to the Railroad Administration that a special rate of one cent a mile be made for the movement of farm laborers into the Kansas wheat fields during the harvest season. This was denied because it was deemed impracticable to make such reduced rates for one class of labor without making similar rates for other classes of labor and therefore the effect would have been a serious diminution of the revenues of the railroads. Such special reduced rates had not been given in the past, even by single railroad companies, for more than ten years. The Railroad Administration is ready to cooperate in every practical way to facilitate the prompt movement of unemployed men from Chicago or St. Louis or other industrial centers to the Kansas wheat fields provided the normal tariff fare is paid or a reasonable guarantee provided. The Railroad Administration agencies will assist in gathering the men and forwarding them to the wheat fields. A representative of the Railroad Administration stationed at Topeka, Kan., has been instructed to get in touch with Governor Allen, of Kansas, to arrange details.

Fourth-of-July Holiday Traffic

The Fourth-of-July passenger traffic between Philadelphia and Atlantic City was the heaviest on record. Passengers gathered in the station of the Pennsylvania at Camden, from the Philadelphia ferryboats, faster than trains could be made up to take them away. Because of some slight accident in the yard some of the trains were not ready promptly, and, according to Philadelphia papers, three trains of ten cars each, filled with passengers, stood in the station for more than an hour waiting for locomotives. Both of the roads to the shore kept all available passenger cars busy throughout the rush; yet the hotel keepers and other entertainers at Atlantic City are reported as claiming that that resort lost $400,000 to $500,000 because of the decision of the railroads to run no excursion trains—meaning no trains at reduced rates. All passengers paid the regular fare of $3.24 for the round trip. In former years, one-day excursion tickets have been sold at $1.35. The Long Island Railroad carried the largest seashore traffic in its history; the estimated number of passengers between New York (Pennsylvania station) and Rockaway and Long Beach was 350,000 each way, on the Fourth. It was estimated that 275,000 passengers were handled at the Brooklyn stations of the Long Island road.

Commission and Court News

Interstate Commerce Commission

A hearing was begun on June 27 before a board of referees appointed by the Interstate Commerce Commission to determine the just compensation of the Arkansas & Louisiana Midland, one of the short line railroads that was relinquished by the Railroad Administration in June, 1918. The road claims it was under federal control for six months. The Railroad Administration, which claims it never exercised any direct control over the road, entered a motion denying the jurisdiction of the board.

The Commission has created a new division, No. 4, consisting of Commissioners McChord, Myers, Daniels, Aitchison and Eastman, which is given authority to hear, determine, order, certify, report or otherwise act in considering and deciding proceedings relating to the valuation of railroads, except those cases comprised in dockets 1 to 6, in which tentative valuations have already been served and which are reserved for further consideration and disposition by the commission. Division No. 1 will continue to exercise authority over the conduct of the bureau of valuation, including the preparation and submission for consideration by the commission of tentative reports.

Investigation of Lake Coal Rates

The Commission, at the request of the director general of railroads, has ordered an investigation into the relationship between the rates on coal to Minnesota, North Dakota, and the northern portion of Wisconsin from mines in Ohio and West Virginia, via the lakes, and the rates to the same destinations from Illinois and Indiana, all rail, with a view to advising the director general whether the relationship heretofore existing should be restored and if so in what manner the restoration should be accomplished. The rates by lake were increased by the Railroad Administration by 52 cents a ton and the all rail rates were increased by 55 cents and after receiving numerous complaints, particularly from dock operators, that the changed relationship will seriously restrict the shipment of coal by the lakes the director general has requested the assistance of the commission.

State Commissions

A Troublesome Station Agent

The station agent at Pembroke, N. Y., on the New York Central, receives, under the orders from Washington, such a large salary that the officers of the road decided that economy demanded the abolishment of his position; and the difficulties encountered in carrying out this purpose are shown in the decision of the New York State Public Service Commission, which reported as follows:

Petition of the United States Railroad Administration, New York Central Railroad, as to changes at Akron Falls and Pembroke stations. [Case No. 6827.]

When a public utility corporation is not a success financially, care and attention must be given to its management for the purpose of correcting any deficiency in income, and an interference with the convenience and necessities of the public should be one of the last and not one of the first means employed to correct the situation. Decided June 3, 1919.

This is an application to dispense with the services of an agent at Pembroke, on a branch line running from Canandaigua to North Tonawanda. Pembroke is a village of about 250 inhabitants, surrounded by a rich and prosperous farming community. The station has been established for a great many years. The Railroad Administration proposes not to abolish the station, but to dispense with the services of the station agent. It is claimed that the public can be well served if the station is put in charge of a caretaker.

The business transacted at Pembroke station from 1913 to 1917, inclusive, appears by the following table furnished from the records of the company:

Year	Number shipments l. c. l. sent and received	Car lots sent and received	Freight earnings	Ticket revenue
1913	1,309	114	$4,300	$909
1914	1,377	151	6,071	892
1915	1,256	110	3,968	803
1916	1,300	87	3,296	773
1917	1,202	100	2,430	730

In 1918 the freight business amounted to $14,007, passenger tickets to $571, milk business, $2,429. The express business amounted to about $520.80 per year. Of the freight business, $8,736.24 was received for road material used in the repair of state roads in that vicinity, leaving $5,271.50 received from ordinary freight. The present agent also acts as express agent and telegraph operator. If the company dispenses with his services, the telegraph office must be closed. It was suggested that the caretaker to be employed in place of the agent might act as express agent, but there is no assurance that such will be the fact. The present agent is paid the amount fixed by the United States Government officials: 48 cents an hour for eight hours, and 72 cents an hour for overtime; and the station is open for practically twelve hours and thirty minutes daily, making a daily wage for the station agent of $7.08. Besides, he draws a small amount as agent for the express company, and for the month of April, 1919, received $164.50. The first proposition of the petitioner proposed to employ a caretaker in place of the agent during the winter months, whose duties would principally consist of caring for the lighting and heating of the station whenever necessary. Later, as the case developed, the proposition was changed, and it was proposed that the caretaker should do everything but bill the freight and sell the tickets. If the caretaker is to perform substantially the duties of the agent, and the salary now paid to the latter is reasonable in amount, it is quite difficult to understand how much money will be saved simply by changing the title of this representative of the road.

Under the proposed new system, all passengers from Pembroke must pay their fare on the train; all baggage to be checked must be placed where it can be readily reached by the train crew; and the passenger must, after boarding the train, reach the train baggagemaster in order to procure a check. All incoming freight must be prepaid; outgoing freight will not be billed until it reaches a point where there is an agent, who will be expected to make out the proper receipt and return it by mail to the shipper. A substantial interval must elapse between the time the shipper surrenders the possession of the property and the time when an agent returns the receipt by mail, and it might be very difficult to establish any claim for damages. Naturally, the patron of the road depends upon the local agent to adjust claims and other troubles; a letter to the company would not bring very speedy results. It appears that the freight service is so bad at the present time that shippers have been compelled to patronize the express company with its higher rates. One florist testified that his shipments and receipts of freight are mostly by express on account of the condition of the freight service. His shipments weigh at times from one thousand to fourteen hundred pounds; one in value was worth $28. Without pursuing the details further, it is quite evident that to dispense with an agent at Pembroke would seriously inconvenience the public in its use of that station.

The rates charged by the railroads for both passenger and freight service have been enormously increased within a very short period of time. If with such added burdens upon their patrons the roads are not now a success financially, the first thought should not be to add still further to the load of the public by decreasing the quality of the service. During the period of the war every patriotic citizen was not only willing but anxious to undergo inconveniences and privations if they were deemed necessary or helpful by the public authorities in reaching a successful issue of the conflict. Now that business matters are resuming their normal condition, more care and attention must be given to the management of public utilities for the purpose of correcting deficiencies in income, and an interference with the rights and conveniences of the public should be one of the last and not one of the first means employed to correct the situation.

Equipment and Supplies

Locomotives Shipped Week Ended June 28

The following new locomotives were shipped to railroads under federal control during the week ending June 28:

Works	Road	Number	Type
American	P. L. W.	1	USRA Santa Fe

Cars Built in Railroad Shops in May

The Railroad Administration has issued the following statement of new cars constructed in railroad shops during the month of May. The statement shows that 575 freight cars were built in railway shops during May, but no passenger cars. Of the freight cars, 491 were box cars.

Freight Cars

Purity Ice Cream & Dairy Company, Jacksonville, Fla., is inquiring for refrigerator baggage cars.

Oscar B. Cintas, Havana, Cuba, has ordered 10 cane cars from the American Car & Foundry, Chicago.

The Carribean Petroleum Company, Philadelphia, Pa., is inquiring for two gasoline inspection cars.

The Central Railway, Argentine, has ordered 20 tank cars from the American Car & Foundry, Chicago.

Kelly's Quick Colliery Company, Ward, W. Va., has ordered one eight-wheel wooden underframe caboose passenger car, from the American Car & Foundry, Chicago.

Passenger Cars

The Canadian National Railways have ordered 18 new steel sleeping cars and 9 steel dining cars from Canadian firms and deliveries are expected to be made during the autumn. The sleeping cars are of one drawing room, 12 section plan and are intended for first class passenger traffic.

Miscellaneous

Catalogues Wanted.—F. P. Hoeck, superintendent of materials and stores of the International Railways of Central America, writes that the material department and commissary stores of his railroad requires new catalogues to replace those destroyed during the recent earthquake. Those desiring to furnish such catalogues are requested to send them to the purchasing department of the International Railways of Central America, 17 Battery place, New York, for enclosure.

Signaling

The Long Island has placed an order with the Union Switch & Signal Company, Swissvale, Pa., for a Saxby & Farmer interlocking machine to be used at Hempstead—38 working and two spare spaces.

War-time in England.—The London & Southwestern reports that in the second week of June, for the first time since August, 1914, no ambulance trains were run over the road.

The railway mail clerks at the annual meeting of their association, discussed a proposal to ask for a standard day of 130 miles, or six hours. The clerks hope to get a proper advance in pay for all who have not had their salaries raised within the last five years and to have all increases dated back to the time when former regulations were suspended by the Postmaster General.

Englishmen, in pre-war days, wasted a great deal of eternity in walking up and down railway platforms looking for empty carriages, and when they found one, triple brass must be the armor of the traveller who evinced a desire to disturb their privacy. Whether it is the sociability of common danger or only the shortage of rolling stock, certain it is that the Englishman since the war has perforce acquired the habit of travelling more like a sardine than a lonely autocrat, and, making the best of a bad job, he has fallen into the habit of conversing with his neighbors. In fact, the Englishman, since the war, has found his tongue, just as many Frenchmen, since the war, have lost theirs.—From "The Changing Englishman," by St. John Irvine.

An American Built Car on the Trans-Siberian Converted Into an Armored Car

Supply Trade News

The Edison Storage Battery Company announces the removal of its district office in Pittsburgh, Pa., to Room 431 Union Arcade building.

The Walter A. Zelnicker Supply Company, St. Louis, Mo., has added 2,000 sq. ft. to its present office space at 325 Locust street, St. Louis, an increase of 33⅓ per cent.

David F. Jennings, who for the past 14 years has been the Chicago representative of **Guilford S. Wood,** Chicago, died suddenly in New York city, on June 26, at the age of 64 years.

Arthur Osmore Norton, president of **A. O. Norton, Inc.,** Boston, Mass., died while writing a letter, on June 8, in his home at Coaticook, Que. He was born on February 17, 1845, on a farm in Barnston township, about ten miles from Coaticook. The family moved to a farm in Coaticook when he was a small boy, and he began his business career as a clerk in the country store. When he was about 30 years old, he started a jewelry business in Coaticook, later doing a wholesale business, and subsequently was in the wholesale jewelry business in Boston under the firm name of Norton Brothers & Butters. In 1888, he started the manufacture of the Norton ball-bearing lifting jacks produced in two factories, one in Boston and the other in Coaticook. Mr. Norton was the first to make non-fluid self-lowering jacks; he was also the pioneer in the making of ball-bearing screw jacks.

A. O. Norton

T. J. Hudson, Jr., district manager of the **Chicago Pneumatic Tool Company** at Chicago, has been appointed manager of the pneumatic tool sales division, effective July 1, 1919.

L. C. Murray, for many years connected with the Carnegie Steel Company, has joined the selling forces in the "Knox" department of the **Blaw-Knox Company,** Pittsburgh, Pa., with headquarters at Pittsburgh.

Samuel O. Dunn, editor-in-chief of the *Railway Age* and other publications of the **Simmons-Boardman Publishing Company,** has been made also a vice-president of this company. His headquarters will remain at Chicago.

The **B. W. Parsons Company,** St. Paul, Minn., has been designated as northwestern sales representative of the **Pollak Company,** Cincinnati, Ohio, handling the latter's products at St. Paul, Minneapolis and Duluth and in the Iron Range district.

William B. Scaife & Sons Company, Pittsburgh, Pa., has opened a Chicago sales and engineering office. The new office will be in charge of **Charles F. O'Hagan,** chief engineer of the company at Pittsburgh, who has been appointed resident engineer and manager.

Corporal William A. Nugent, who served during the war in Company I, 21st Engineers, has returned from France, and resumed his duties with the **Independent Pneumatic Tool**

Company, Chicago, as traveling representative. He has been assigned to his former territory in Indiana.

William Holmes Black, secretary of the **Standard Scale & Supply Company**, Pittsburgh, Pa., died at his home in that city on June 30, at the age of 57. He was associated with the Standard Scale & Supply Company for over 20 years and took a prominent part in the building up of the selling organization of that company.

The Pollak Steel Company, Cincinnati, Ohio, is making tentative plans for an increase in the capacity of the company's works at Cincinnati and at Chicago. The company is about to begin work on some new buildings, including a rolling mill at the Cincinnati plant and a large drop forge plant at the Chicago works.

Charles G. Du Bois, vice-president of the **Western Electric Company**, was elected president, with headquarters at New York, on July 1, to succeed H. B. Thayer, who has resigned after 38 years of service to assume the presidency of the American Telephone & Telegraph Company. Mr. Thayer was elected chairman of the board. Mr. Du Bois was born in 1870, and after his graduation from Dartmouth College in 1891, he joined the Western Electric Company in New York as a clerk in the accounting department. In 1896, he was appointed chief clerk at the New York office, and in 1898 he was elected secretary, with office at Chicago. Shortly after assuming the duties of secretary, Mr. Du Bois was also made supervisor of branch houses. In 1907, he was transferred from the Western Electric Company to the American Telephone & Telegraph Company as its controller. In 1917, shortly after the entry of the United States into the war, he went to Washington to serve as controller for the American Red Cross, and after systematizing the Red Cross accounting work and organizing a department to carry it on, he resumed his duties with the company. On October 1, 1918, Mr. Du Bois rejoined the Western Electric Company as vice-president, which office he held until his election on July 1, as president of the same company.

C. G. Du Bois

The business of the **Gauld Company**, Portland, Ore., has been taken over by the **Gauld Supply Company**, incorporated under the laws of Maine. The directors of the new company are as follows: Wm. P. F. Ayer, president; Thomas Nickerson, vice-president; G. A. Ricker, treasurer; Theodore W. Little and Carl T. Keller, all of whom are connected with the Walworth Manufacturing Company, Boston, Mass.

The Blaw-Knox Company, Pittsburgh, Pa., has opened branch offices in the Little building, Boston, Mass., and the Owen building, Detroit, Mich. **A. W. Ransome**, formerly in the New York office of this company, has been appointed New England manager, with headquarters at Boston, while **H. J. Desson** has been transferred from Pittsburgh to Detroit, where he will become manager of the Michigan district.

The Massey Concrete Products Corporation, Chicago, announces the following appointments: **Paul Kircher**, resident manager of the Eastern district including Eastern Canada, with headquarters at 50 Church street, New York; **G. H. Redding**, resident manager, in charge of sales in the Central district, with headquarters in Chicago; **H. E. Burns**, resident manager in charge of sales in the Southwestern district, with headquarters in the Sumpter building, Dallas, Texas.

Bertram Smith, assistant general sales manager of the Edison Storage Battery Company, Orange, N. J., has resigned to become president and general manager of the **Automatic Electrical Devices Company**, Cincinnati, Ohio, effective July 15. Mr. Smith has had more than 20 years' experience in the storage battery industry. He formerly served as secretary and treasurer of the old National Battery Company, which sold the Sperry plate, and after the absorption of this company by the United States Light & Heating Company, he was for a number of years manager of the western territory, with headquarters at Chicago. In 1913, he resigned to become assistant manager of the Edison Storage Battery Supply Company, with headquarters at San Francisco, and in 1915 was appointed manager of the Detroit sales district for the Edison Storage Battery Company. In September, 1918, Mr. Smith was made assistant general sales manager of that company, with headquarters at Orange.

Trade Publications

ASH DISPOSAL.—The American Steam Conveyor Corporation, Chicago, has issued another booklet on the question of ash handling facilities, entitled Reducing Ash Disposal Costs. Of special interest is a diagram and description of a steam ash conveyor installed by this company that saved over three dollars a day in ash handling costs. The experiences of a number of other users in securing ash disposal economies are described, and the text is illustrated with a number of diagrams and photographs of actual installations.

CHAIN DRIVES.—The Morse Chain Company, Ithaca, N. Y., in a 12-page pamphlet has reprinted from the 1919 Year Book of the National Association of Cotton Manufacturers an article by J. S. White, entitled Chain Drives, which explains the advantages which may be secured in the textile industry from the use of chain drives in general power transmission work. This is a short synopsis of the general subject of chain driving and does not exploit any particular make or type of power chain, and includes engineering data useful in designing silent chain drives.

LEATHER BELTING.—A 20-page pamphlet issued by the Leather Belting Exchange, Philadelphia, Pa., contains information obtained during the course of an investigation on power transmission by belting conducted by the Mellon Institute of Industrial Research of the University of Pittsburgh for the Leather Belting Exchange. The booklet is entitled A Study of Various Types of Belting and was written by Professor Ernest D. Wilson of the Mellon Institute. It describes the equipment used in the tests and the results obtained and is illustrated with several photographs.

AMERICAN INSURANCE FOR AMERICAN SHIPS.—The desirability of insuring the American merchant marine in what would amountto an American Lloyds was indicated by Edward N. Hurley, of the United States Shipping Board, testifying Wednesday before the House Committee on Merchant Marine and Fisheries. According to Mr. Hurley a profit of $27,000,000 was made during the war by the Advisory Insurance Committee of the Shipping Board, which protected all government ships, both owned and commanded, at a rate about 3 per cent under the market rate. It did business at from 25 to 30 per cent less than other such agencies, he said. Owing to the fact that insuring agencies learn the particulars of every ship's cargo and the condition of the ship itself, Mr. Hurley said, the nation represented by the insuring agency had a tremendous opportunity to profit by the information gained. This advantage, he said, was of great benefit to Germany, which did a heavy marine insurance business prior to the war, and also to England. "If we hope to develop our merchant marine," said Mr. Hurley, "we must maintain an American bureau, and American insurance and American registry."

Financial and Construction

Railway Financial News

CHICAGO, ROCK ISLAND & PACIFIC.—With the approval of the director general of railroads, this company has declared the regular semi-annual dividends of 3½ per cent on the 7 per cent preferred, and 3 per cent on the 6 per cent preferred stock, both payable July 31 to stock of record July 19.

GARDEN BAY.—This 16-mile road with headquarters at Escanaba, Michigan, was sold at a receiver's sale on June 26. Hyman Michaels and Company, Chicago, purchased the road's equipment for $40,300 and the balance of the property was sold in small lots to various bidders.

GEORGIA COAST & PIEDMONT.—This road has been sold to Gordon & Freedman of New York, dealers in radiators and boilers, for the upset price of $300,000. There is some doubt as to whether or not the sale will be confirmed, for it is pointed out that the rail alone on the road, which has a length of a hundred miles, is worth more than the price bid on the property. The waterfront terminal property in Brunswick, Ga., is worth about a hundred thousand dollars and the ferry across the Altamaha river is valued at at least $200,000. The purchasers announced that in the event the sale is confirmed, they will sell the road to suit any purchaser as a going railroad in part or in any shape purchasers may desire.

PITTSBURGH & SHAWMUT.—The Interstate Commerce Commission has appointed Commissioner E. E. Clark, A. G. Hagerty, attorney-examiner, and J. C. Fort, assistant chief of the bureau of inquiry, as a board of referees to pass on the amount of the just compensation to be paid, under the federal control act, to the Pittsburgh & Shawmut. This system was in process of construction and was operated as a common carrier only 303 days of the test period and therefore has no standard return. The company claims $613,261 as certified by the commission and also has special claims amounting to about $150,000 more, while it declares the Railroad Administration has ignored the Interstate Commerce Commission certification and offers it only $461,241.

TEXAS STATE.—Tom Cronin of Palestine, president of the Bartlett Western, has offered to purchase the Texas State Railroad. The State road has cost nearly $1,000,000 and there is an annual deficit.

Railway Construction

LOUISIANA RAILROAD & NAVIGATION COMPANY.—The rebuilding of this company's car and repair shops at Shreveport, La., which were recently destroyed by fire with a loss estimated at $100,000, will begin in the near future. The construction of the buildings will be done by the company's bridge and building forces.

TEXAS RAILROAD.—Frank Kell, president of the Clinton & Oklahoma Western, J. A. Kemp, of Wichita Falls, Tex., and associates, are constructing a railroad from Newcastle, Tex., through Breckenridge, Stevens County, to Ranger, Eastland County, which will connect with the Texas Central and the St. Louis-San Francisco in Erath County, Tex. The new road will be approximately 150 miles long.

Agricultural representatives of the railroads, who have been carrying on farming campaigns, co-operating with state and federal authorities, chambers of commerce and farmers' associations, report that more local shipping associations have been formed by farmers this year than ever before. The plan of the California fruit growers is followed to a considerable extent. Farmers are paying particular attention to grading and standardizing products wherever it is possible to do so.

Railway Officers

Railroad Administration

Federal and General Managers

Col. James A. McCrea, formerly general manager of the Long Island Railroad, who recently returned from France, has been elected a vice-president of the Bankers' Trust Company, New York.

G. F. Hawks, whose resignation as federal manager of the El Paso & Southwestern and the El Paso Union Passenger Depot, with headquarters at El Paso, Tex., was announced in the *Railway Age* (July 4, page 44), has retired permanently from railroad service and will devote his time in the future to personal business affairs. Mr. Hawks will make his home in the vicinity of Los Angeles, Cal.

Operating

G. B. Obey, general superintendent of the Monongahela Railroad, with office at Brownsville, Pa., has resigned and the office of general superintendent has been abolished; **D. K. Orr,** assistant chief engineer, has been appointed superintendent, with office at Brownsville, and his former position has been abolished.

I. B. Richards, general superintendent of the Western district of the Northern Pacific, with headquarters at Tacoma, Wash., resumed his duties July 1, after a temporary leave of absence. **J. E. Craver,** who had been acting general superintendent of the Western district during Mr. Richard's leave, has resumed his duties as superintendent of the Seattle division, with headquarters at Seattle.

Col. C. L. Whiting has returned from overseas military service and has been reappointed superintendent of the Northern Montana division of the Chicago, Milwaukee & St. Paul, with headquarters at Lewistown, Mont.; **A. C. Bowen,** superintendent at Lewistown, has been transferred to the Musselshell division, with headquarters at Miles City, vice **J. P. Phelan,** who has been appointed assistant superintendent of the Rocky Mountain division with headquarters at Three Forks, vice **A. O. Veitch,** who has been appointed trainmaster of the Trans-Missouri division, with headquarters at Mobridge, S. D.; **E. L. Cleveland,** trainmaster at Mobridge, has been transferred to the Columbia division with headquarters at Malden, Wash., vice **W. S. Johnson,** who has been assigned to other duties.

Traffic

William G. Brown, manager of the Consolidated Ticket Offices at Cincinnati, will resume his duties as assistant general passenger agent of the Baltimore & Ohio—Western

L. M. Hogsett, assistant general freight agent of the International & Great Northern, the Missouri, Kansas & Texas, (Trinity Branch), the Beaumont & Great Northern, the Galveston, Houston & Henderson and the Houston & Brazos Valley with headquarters at Houston, Tex., has been appointed assistant general freight agent in charge of interstate commerce matters of the Texas & Pacific, the International & Great Northern, the Galveston, Houston & Henderson, the Houston & Brazos Valley, the Trans-Mississippi Terminal, the Weatherford, Mineral Wells & Northwestern, the Gulf Texas & Western, the Denison & Pacific Suburban, and the Fort Worth Belt, with headquarters at Dallas, Tex. Lines.

Engineering and Rolling Stock

T. J. Bivens, assistant engineer in the maintenance of way department of the Union Pacific, with headquarters at Omaha,

Neb., has been promoted to assistant division engineer, with the same headquarters.

H. H. Maxfield, acting works manager of the Pennsylvania Railroad, Eastern Lines, with office at Altoona, Pa., has been appointed works manager, in charge of the Altoona shops, with office at Altoona.

Thomas Holt, signal inspector on the Pennsylvania, Lines West, with headquarters at Pittsburgh, Pa., has been appointed signal engineer for the Chicago Union Station Company with headquarters at Chicago.

Frank Lafond has been appointed road foreman of engines of the Los Angeles division of the Southern Pacific, (lines south of Ashland), with headquarters at Los Angeles, Cal., vice **R. N. Richardson,** assigned to other duties.

B. Blum, district engineer on the Northern Pacific, with office at St. Paul, Minn., has been promoted to engineer of maintenance of way, lines east of Paradise, with headquarters at St. Paul, vice **L. Yager,** who has taken a position in the office of assistant director, Division of Operation, Washington, D. C., and **J. T. Derrig** has been appointed district engineer, lines east of Mandan, with headquarters at St. Paul, vice Mr. Blum.

H. P. Anderson, mechanical superintendent of the Missouri, Kansas & Texas and the Missouri, Kansas & Texas of Texas, with office at Denison, Texas, has been transferred to the staff of the federal manager, at St. Louis, Mo., in charge of executive and administrative matters of the mechanical department on the roads under the jurisdiction of **C. N. Whitehead,** federal manager at St. Louis and **C. I. Evans,** chief fuel supervisor, has been appointed chief assistant mechanical superintendent with office at Denison, in charge of maintenance of equipment.

Corporate

Executive, Financial, Legal and Accounting

Serapio Aguirre has been appointed general treasurer of the National Railways of Mexico (Government Administration), with office at Mexico, D. F., in place of **A. G. Roel,** who has been promoted.

J. M. Rosevear, general auditor of the Grand Trunk and the Grand Trunk Pacific, has been appointed auditor of the Toronto Terminals Railway Company, with headquarters at Montreal, Que., vice **W. H. Ardley,** retired.

Operating

Col. Paulino Fontes, general manager at Mexico City of the southeastern lines of Mexico, including the Mexican Railway and all other government controlled lines south of Mexico City, has had his authority extended to include the management of the National Railways of Mexico, which includes all the lines operated by the Mexican government. He succeeds **F. Pescador,** director general of the National Railways of Mexico, who has resigned. A portrait of Mr. Fontes and a sketch of his career were published in the *Railway Age* of May 23, 1919, on page 1277.

Traffic

A. G. Roel, general treasurer of the National Railways of Mexico (Government Administration), has been appointed traffic manager, with headquarters at Mexico, D. F.

William Baird has been appointed general agent in the passenger department of the Canadian Pacific Ocean Services, Ltd., with headquarters at the Pier Head, Liverpool, England.

Engineering and Rolling Stock

J. McWood has been appointed master car builder of the Grand Trunk, Eastern Lines, with headquarters at Montreal, Que., succeeding **J. Hendry,** assigned to other duties.

Carl B. Andrews, for the past ten years chief engineer of the Oahu Railway & Land Company of Honolulu, Hawaii, has resigned this position to take up the work of planning and constructing a railway system for the Pampanga Sugar Development Company of Manila, Philippine Islands. He left Honolulu on July 6 for Manila to take up this work, which is expected to require about a year and a half for completion.

Obituary

Arthur Wray Street, formerly general eastern freight agent of the Great Northern, with office at New York, died in that city on July 9, at the age of 71.

Walter E. Beecham, formerly car accountant of the Chicago, Milwaukee & St. Paul, died on July 3, at Elmhurst, Ill., after several months' illness. Mr. Beecham was 73 years old.

Joshua A. Leach, founder of the Brotherhood of Locomotive Firemen & Enginemen, died on June 27, at Denver, Colo., where he was attending the organization's triennial convention Mr. Leach organized the Brotherhood of Locomotive Firemen & Enginemen at Port Jervis, N. Y., in 1873. He was 76 years old.

Frank T. Crandon, formerly tax commissioner of the Chicago & North Western, died on July 4, at his home in Evanston, Ill., at the age of 84 years. Mr. Crandon was one of the pioneer tax commissioners in the United States, having held that position with the Chicago & North Western for 42 years. He was retired at the age of 70.

Augustus C. Doan, secretary and assistant treasurer of the Minneapolis & St. Louis Railroad Company, with headquarters at New York, died on July 5, at the age of 50. He was born on January 10, 1869, at Edgewood, Pa., and was educated in the public schools. In 1889, he began railway work with the Pennsylvania Railroad as a clerk in the assistant engineer's office. From June, 1892, to May, 1901, he served as a clerk in the office of the assistant treasurer of the Southern Pacific Railroad and was then to March, 1902, a clerk in the traffic department of the Southern Pacific Company, at New York. In 1903, he was appointed assistant secretary of the Minneapolis & St. Louis, and later was promoted to secretary and assistant treasurer. At the time of his death, Mr. Doan was also secretary and treasurer of the Shippers' & Manufacturers' Export Corporation, New York.

The Ohio Bankers' Association, at its 29th annual convention, held recently at Toledo, adopted resolutions expressing disapproval of government control of railroads and urging their early return to their former owners.

George F. Conroy, a conductor on the Erie Railroad, has received notice of a legacy of $15,000 in the will of J. J. Adams, a shoe merchant who died recently at Allendale, N. J., "as a mark of appreciation of his kindly treatment of me and other passengers."

Mystery Solved.—Walker D. Hines, United States Railroad Administrator, has reported deficits of half a billion dollars in the operations of the railroads since the first of the year, and has informed Congress that it will take a billion two hundred thousand dollars in excess of receipts to keep the roads going until the end of 1919. This satisfactorily solves the mystery surrounding the resignation of Mr. McAdoo as Secretary of the Treasury and Railroad Administrator.—SAMUEL G. BLYTHE, in The Saturday Evening Post.

Forgetful Fans.—The President (President Wilson) descended to the train level from the main level of the station in an elevator and went immediately to the parlor car that had been assigned to him and Mrs. Wilson for the trip. He had been in his car but a few minutes when he emerged again, hat in hand mopping his head with his handkerchief. "It's a little too hot there for me," he said. Then, after some scurrying around, several electric fans were set in motion and he returned to the car. . . .—*New York Tribune*, July 9.

The Builders Suggest Oriental Labor

The suggestion made by builders testifying before the legislative committee on housing, that millions of Japanese and Chinese should be brought into the country to relieve the shortage in the ranks of unskilled labor is food for thought. The consensus of opinion seemed to be while skilled workmen could be secured in sufficient numbers, that the insoluble problem is the securing of unskilled labor. Without discussing pro and con the desirability of importing Oriental labor this testimony adds weight to the opinion of many railroad engineers that the day of unskilled labor in railway construction and maintenance of way is past and that the successful carrying out of work of this character hinges on radical departures from the present practice in the method of its prosecution. In fact, it seems to be the one best argument for the necessity, on the railroads, for increased supervision and the development of labor saving devices.

A Problem for the Valuation Engineer

There has probably never been a time since the Civil War when railway construction has been so nearly at a standstill as now. Almost no new projects of any magnitude are being authorized, while activities on a large part of those which were started last year have been held up, and work on the remainder is fast drawing to completion. As a result, more extension and improvement projects are standing in an incomplete state today than ever before. The amount of money which has already been spent on these projects aggregates hundreds of millions of dollars on which no return is being earned. The drain on railway revenues for the interest on these unproductive investments is correspondingly large. This creates a problem for the valuation engineers to consider. One of the points of controversy between the railways and the federal engineers has been the length of the construction period to be allowed for the determination of interest during construction, one of the elements entering into the cost of reproduction of the property. In general, the engineers of the railways have contended that the government employees have not allowed for the delays which may and do occur in the construction of large projects. While the repetition of the stagnation in construction activities resulting from government control may be a remote contingency in the future it is an established fact that such delays do occur from one cause or another and that regardless of the causes, they contribute to the ultimate cost of the project.

The Flagging Zeal of the Flagman

The incurable propensity of the American flagman to put forth the "minimum effort," noticed in our issue of June 20, is a subject which touches a responsive chord in many minds. H. E. McGee, general superintendent of the Missouri Kansas & Texas, at Dallas, writes: "I have read in your issue of June 20 the editorial note on the Fort Washington collision and the article by Commissioner McChord on the flagging rule. The 'minimum effort' on the part of the flagman, referred to by him, certainly was exemplified in the Fort Washington collision. The history of American railroads records many collisions due to the failure of the flagman to go back a proper distance. The proper method of flagging is a question of the greatest concern to operating officers. Many ideas prevail as to the right and wrong way to flag. The rules of many roads [and of the American Railroad Association, supposed to represent the majority of all the roads] instead of definitely providing a minimum distance which the flagman shall go, leave this question to the flagman's judgment and discretion. Does not this encourage the 'minimum effort' on the part of the flagman?" The words, in brackets, which we have added to Mr. McGee's letter, will serve to remind the reader, if he needs a reminder, that this question has been asked (and answered) a hundred times before. The only way to settle the question and have it stay settled is to abandon our reliance on the time interval system and to perfect the space interval system. For a temporary answer the suggestion concerning fusees, printed in our last issue, may be worth our correspondent's attention. To Mr. McGee's specific question, Does the rule encourage laziness? the members of the committee, which, after days of discussion, adopted the present phrasing, "go, immediately, a sufficient distance to insure full protection" might answer in the negative; but even if their opinion were to be disputed as wrong they would, no doubt, reply that they had been no better off when the rule specified a distance. The trouble is that the more specific the rule the more numerous must be the exceptions; so we are back where we started; the flagman must exercise discretion. A rule forbidding the exercise of discretion would have to provide for a dozen flagmen on each train.

Politics as Usual

The proposed contract ordinance between the City of Chicago and the Illinois Central for extensive terminal improvements in that city described in the *Railway Age* of July 11, page 51, is now being subjected to the usual rough handling in the council chamber after a tentative agreement had been reached between the council's Committee on Terminals and the railroad company. The form of the ordinance as presented to the council was not arrived at until after exhaustive study and discussion between officers of the company and members of the committee and their technical advisors. The hearings before the committee were open to the public and furthermore were given ample publicity by the daily papers, so that members of the council and the public at large were afforded opportunity to become conversant with the limitations as well as the possibilities of the project. This, however, has not deterred a number of aldermen from coming forward later with numerous proposed amendments which would increase the cost of what, even in its present form, promises to be a very expensive undertaking for the Illinois Central. The disregard of the economics of the problem evidenced by the spirit in which many of these amendments are submitted savors of a form of politics which fortunately is not so prevalent at the present time as in the past. The serious phase of the matter is that it threatens to jeopardize the entire undertaking.

Attitude of Interstate Commerce Commissioners

THE NEWEST MEMBER of the Interstate Commerce Commission, Joseph B. Eastman, has struck a blow which is adapted to shatter any hope the optimistic might still have had that the Interstate Commerce Commission, as now constituted, would in the absence of specific instructions from Congress to do so, so regulate rates as to enable the railways under private operation to prosper and adequately develop their facilities. Mr. Eastman has sent a letter to the Senate Committee on Interstate Commerce, in which he says: "I believe that the roads should continue in the possession and control of the nation." He makes clear that he has no confidence in private management and is unqualifiedly in favor of government ownership and operation.

The law provides for the Interstate Commerce Commission to have nine members. It has only eight members now, because Commissioner Harlan's term expired some months ago and no successor to him has been appointed. The attitude of a majority of the present members of the Commission regarding the matter of adequate rates is indicated by a brief review of their records.

Commissioner Meyer has opposed advances in rates in every important advance rate case. He rendered a dissenting opinion in the 15 per cent case, the original decision in which was rendered on June 27, 1917, in which he opposed even the comparatively small advances favored by the majority of the Commission at that time. He declared he did not believe an emergency existed "in regard to carriers in the Eastern district of such a character as to make it imperative to authorize at this time the increase of class rates sanctioned by the majority." Within eight months, however—after government operation had been adopted—the Commission itself silently granted the rest of the 15 per cent advance in Eastern territory; within three months more the Railroad Administration advanced freight rates 25 per cent and passenger rates 50 per cent throughout the country. All these advances in rates, amounting to perhaps $1,200,000,000 a year, are proving unequal to the extent of several hundred millions of dollars a year to the increases in expenses which have occurred since Mr. Meyer said two years ago that he could see no conditions justifying any advance.

Commissioner McChord also dissented in the 15 per cent case and opposed the advances in rates then granted. Recently he has attempted to show that the railways before government operation was adopted were allowed to charge adequate rates, and has even contended that no considerable advance in rates may be necessary to save the railway companies from bankruptcy after the roads are returned. How much reliance may be put upon Messrs. Meyer's and McChord's foresight and judgment in future is indicated by the extent to which they have shown these qualities in the past.

Commissioner Woolley, in a recent address, has opposed any further advances in rates and has argued that any deficiency of railroad revenues should continue to be made good from taxes.

Commissioner Aitchison was formerly a member of the Oregon Railroad Commission, served as the solicitor of the National Association of Railroad Commissioners, and always has been hostile in his attitude toward the railroad companies.

Commissioner Eastman, as we have seen, is an advocate of government ownership, and a man who has no faith in private management and favors government management, can hardly be relied on to help to so regulate the railways under private management as to enable them to prosper and furnish good and adequate service.

So much for the attitude of a majority of the present members of the Commission.

Commissioner Harlan favored a larger advance in rates than was granted in the five per cent case and advocated a larger advance in rates than was made in the original decision in the 15 per cent case. He said emphatically: "The record, in my judgment, demonstrates a proposition that has long been clear to me, viz., that a rate is a public question and that the existing rates, aside from any interest that the owners of the railroads may have in the matter, could well be advanced in the public interest, in order that assurance may thus be given for the early enlargement of our transportation facilities." Subsequent developments have shown that Commissioner Harlan had more foresight than either the members of the Commission who favored granting only part of the 15 per cent increase or those who opposed any increase, but he has not been reappointed by President Wilson.

The Cummins bill, which is pending in Congress, provides for the restoration of its old power of rate regulation to the Interstate Commerce Commission before government operation is abandoned. The Esch-Pomerene bill, which has the backing of the Interstate Commerce Commission, provides that when the railroads are returned to private operation the Commission shall exercise practically supreme power in the fixing of rates, and gives it no instructions as to how it shall regulate them except that it shall make them "reasonable" and in doing so shall take into consideration the cost of labor and other operating costs.

The *Railway Age* long was disposed to favor the concentration of all authority for the regulation of rates in the Interstate Commerce Commission, under instructions, however, that it must make the rates sufficient to enable the railways adequately to develop their facilities. We supposed that the members of the Commission had learned as much about the regulation and operation of railroads from the experience of recent years as had other people. The recent utterances of Commissioner McChord and Commissioner Woolley had greatly reduced our optimism. The recent statement of Commissioner Eastman has destroyed it.

The present crisis in the railroad industry demands frank speaking. The members of the Commission deserve commendation for having told just where they stand. With the past record and present views of the members of the Commission before it, Congress can have no excuse for acting on any false assumption as to what the Commission will do with any authority which it may be granted. It should be plain beyond peradventure to Congress, in the light of these things, that if the Commission is given, as proposed in the Esch-Pomerene bill, complete authority over rate-making, with no express instructions to make rates sufficiently high to enable the carriers adequately to develop their facilities, or to so make them as to enable the roads to earn an average of, say, at least six per cent, it is as certain as any future thing can be that the Commission, as at present constituted, will not make rates that will be adequate. If the Commission does not make rates adequate the expansion of railroad facilities will not be revived and private management will break down.

But if private operation is to be foredoomed to failure from the start, why return to it? Private ownership and operation will be as harmful to the country as government ownership and operation unless private operation is allowed to be carried on under a policy of regulation which will enable the railways to earn adequate net returns. The *Railway Age* is opposed to government ownership and operation. It is also opposed, however, to a return to private operation under legislation such as the Esch-Pomerene bill, which, instead of causing a revival of the prosperous operation and adequate development of our railroads, would merely insure that their prosperous operation and adequate development would be made impossible.

If we cannot get needed reforms in our policy of regula-

tion now, after 18 months' experience with government operation, we never shall be able to get them; and if we are never going to be able to get them we should frankly recognize the fact that government ownership sooner or later is inevitable. If government ownership sooner or later is inevitable, let us take it now. If we don't want government ownership either now or later, let us adopt a policy of regulation under which private management can be made successful.

Government Ownership in Canada

CANADA IS DRIFTING into a policy of more and more extensive government ownership and operation of railroads. "Drifting" is the right word, because its extension of this policy is not the result of thorough and intelligent consideration by either public men or the public. Canada has had a good deal of experience with government ownership, and yet its people, if one may judge by what is said by most of the newspapers and by persons met casually on trains and in hotels, know little about what that experience has been. Furthermore, the Canadian public, although it is being committed to a policy of extensive government ownership, seems to know almost nothing about the question of principle involved or the experience of other countries with government ownership.

Referring in a recent article in the *Railway Age* (June 20, page 1155) to the trend toward government ownership in Canada, J. L. Payne, Comptroller of Statistics of the Department of Railways and Canals of that country, said: "The point to keep definitely in view is that the far-reaching changes of 1918 and the current year came about without a direct decision being reached by either the government or the people on the underlying principle. Nobody may say at this moment that the judgment of either the administration or the voters of Canada has been declared in favor of or against state ownership of railways as distinct from corporate ownership. Whatever may happen in that regard in the future, scarcely a single aspect of the whole matter has been presented as a clear-cut issue." Mr. Payne was careful to state that he did not write as an advocate or an opponent of government ownership, but merely to present the facts.

While Canada is thus drifting into the extensive adoption of a policy to the probable consequences of which neither her public men nor her people have given much consideration, it is worth while to recall some of the history of government ownership in that country. The people of Canada don't seem to know it, but the history of government ownership in their own country is as replete with evidence and arguments against that policy as that of any other country in the world. It is a remarkable fact that in a land where some of the most conspicuous successes of private management have been achieved and some of the most conspicuous failures of government management have occurred, there should be a strong and steady drift toward more and more extensive government ownership.

Canada now has about 40,000 miles of railway in operation. Of this, about 17,000 miles, or 44 per cent, is being operated directly or indirectly by the government. Recently —and especially since the Canadian Northern was taken over—the management of the government lines has been left very largely in the hands of experienced railroad men appointed on their merits. If this should continue to be the case the results of government management in the future would be much better than in the past. There is much ground for fearing, however, that in the future, as in the past, political changes in Canada will have evil effects on railroad management; and if the losses incurred in the operation of the present and prospective very large government railroad system should be as large in proportion as have been those incurred in the past by the Intercolonial, the Prince Edward Island, and other government lines, the burden imposed upon the taxpayers of Canada by the railway deficit would be so huge as very seriously to interfere with the progress and development of the entire Dominion.

In order to give the people of both the United States and Canada more information than they have had regarding the past history of government ownership in Canada, the *Railway Age* begins this week the publication of a series of three articles regarding Canada's experience which have been written by Harold G. Villard. In the article which we publish this week Mr. Villard goes back about 70 years, to the time when Nova Scotia began the construction of the first government line in Canada—a provincial line, which is now a part of the Intercolonial. He shows that the time it took to build this railway was greatly underestimated, that it cost more than twice as much as was originally expected, that it steadily failed to earn its fixed charges and usually failed to earn its operating expenses, and that it was the cause of serious political scandals.

It may be said that this is all ancient history and that government management would not be conducted now as then. The fact is, however, that the Intercolonial, of which Nova Scotia's Provincial Railway became a part, always has lost money as steadily as did the Provincial Railway. Besides, railways which have been constructed in Canada much more recently under government auspices—notably, the National Transcontinental, which cost three times the amount estimated—had had somewhat similar results. In a later article Mr. Villard will review briefly the history of the Temiskaming & Northern Ontario, which was built in comparatively recent years by the Province of Ontario, and which at times has been held up as a good example of successful government construction and operation.

Perhaps by reviewing the history of government ownership in Canada we may strengthen the opposition to it in the United States, and at the same time reduce Canada's tendency to drift into it. If, however, nothing can prevent Canada from drifting farther and farther into government ownership, it is at least desirable that its true history in that country should be told as a means to helping government management to avoid in future the mistakes of the past. Our readers in the United States, Canada and elsewhere will find Mr. Villard's chapters on Canadian government ownership both instructive and highly entertaining.

The World's Coal Shortage and Electrification

THE PRESS DESPATCHES from London, quoted in the Foreign Railway News column of this week's issue, indicate that there is in the United Kingdom a serious condition, which, if it is not promptly remedied, is going to prove of world-wide importance. England is on the point of giving its coal miners increased wages, and effective July 16, 1919, it will, through the so-called Sankey award, also reduce the coal miners' day underground from eight to seven hours, and "subject to the economic position of the industry at the end of 1920," the hours of labor underground are to be reduced to six. This has already resulted in an attempted increase of six shillings in the price of coal to British industries, and Sir Auckland Geddes has expresed the fear that this increase may have to be made nine shillings, two pence. Combined with this there has been a very considerable decrease in the output of coal.

Sir Auckland Geddes has estimated that with the seven-hour day there will be produced in the year beginning July 16, the effective date of the reduction in hours, only between

214,000,000 and 217,000,000 tons, whereas in 1913 the output was 287,000,000 tons. An increase in the price of coal to British industries is handicap enough in the competition which Great Britain has to meet as the greatest export nation of the globe. But the shortage of coal is even more serious and is of even greater world-wide importance. Coal has always been one of Great Britain's greatest factors in export trade. In 1913 her exportable surplus was 77,000,000 tons. In the twelve months beginning in July, 1919, it is estimated that there will be only 20,000,000 tons available for export. This means that South America, Italy, Spain, South Africa, as well as many other countries, are going to be short of coal and that prices for coal in these countries, already twice as high as before the war, are going still higher. Considering that the mines of France were destroyed by the Germans and the fact that the product of the mines of the Ruhr and the Saar will be needed in Germany and in France, it is evident that America is the only other country that can supply coal for the countries mentioned, as not having suitable supplies of their own. This, if it works out as expected, will give the United States the great export trade in coal that Great Britain formerly had, but from the international railroad point of view it is going to mean much more.

The *Railway Age* has had articles recently on the consideration that is being given to electrification in Sweden, Brazil, Italy, France, Belgium and other countries. With the high price of coal, even if large supplies are secured from America, the use of hydro electric power must increase. That electrification is on an upward trend and that great extensions of electrified line are to be expected in many countries in the near future, seems a natural conclusion.

Wabash

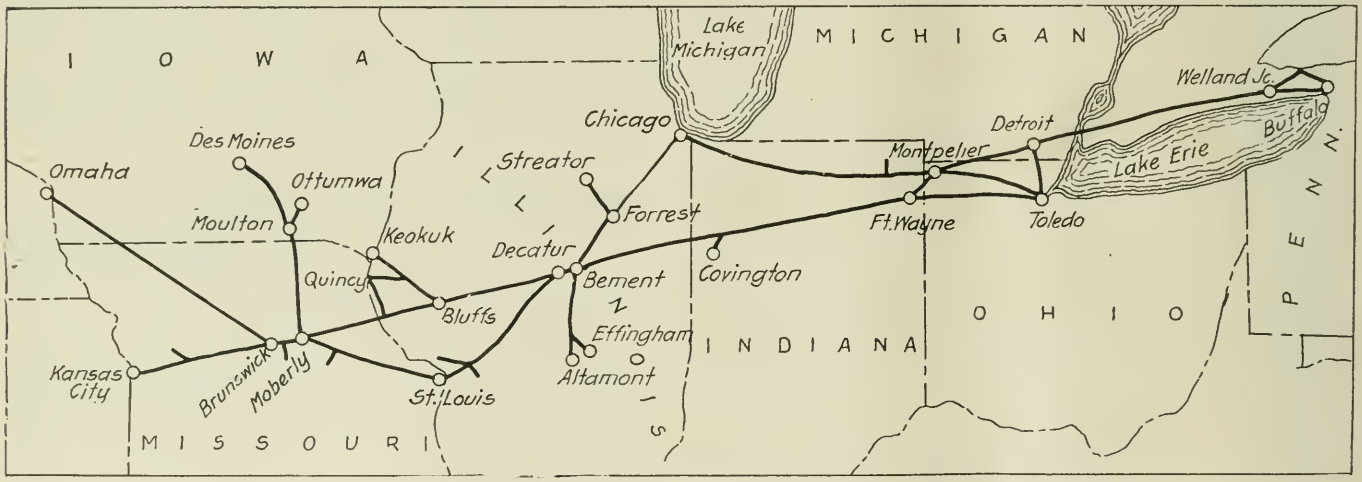
The Wabash was reorganized and taken out of the hands of receivers November 1, 1915. Prior to the receivership, which took place in 1912, the company had struggled along for a number of years, just scraping off the rocks of receivership, without money for wholly adequate maintenance, much less for keeping abreast of the development of modern railroading. During the receivership the property was greatly improved. The reorganization was a drastic one and the new company, except for a rather small working capital, entered into possession with good prospects of successful operation. Insofar as gross earning power was concerned the property more than justified the predictions of the reorganization committee. The earnings for the calendar year 1917 amounted to $40,472,000, as compared with the estimated earnings on which the reorganization was based of $37,659,000 for the fiscal year ended June 30, 1917. In 1918 the property earned $48,246,000.

During the receivership and in the following period up to January 1, 1918, $15,840,000 had been spent for additions and betterments from the sums provided for this purpose in the reorganization plans. In addition $5,860,000 surplus earned after payment of dividends on the preferred "A" stock since November 1, 1915, to January 1, 1918, was spent for improvements and $2,258,000 interest bearing securities were retired. A total of $2,310,000 was paid out in dividends during this period.

In addition to the extra heavy charges for maintenance during the receivership necessitated by deferred maintenance and improvement work which tended to bring down the operating income for the first part of the test period on which the government rental is based, the expenditure of the large sums for additions and betterments during 1916 and 1917 tended to increase the earning capacity of the road in 1918, for which increase in earning capacity no allowance is made in the standard rental contract. Since the receivership the company has bought 25 Santa Fe type locomotives, 2,300 steel underframe freight cars and placed steel underframes and steel draft gears on 7,000 additional freight cars and installed superheaters on 150 locomotives. The government in 1918 got the benefit of all these improvements. It is rather interesting to note that Chairman W. H. Williams in his report to stockholders estimates that the installation of superheaters on 150 locomotives increased "the operating efficiency over 15 per cent."

Notwithstanding the war conditions, the operation of the property in 1918 strongly reflects the improvement in its condition during and since the receivership. With total operating revenues of $48,246,000 in 1918, as against $40,472,000 in 1917, operating income amounted to $6,785,000. This compares with $10,539,000 operating income in 1917. Net income amounted to $5,668,000 in 1918, comparing with $4,227,000 in 1917. This net income (to the government) in 1918 compares with an average net operating income for the test period of $5,867,000. The company claims that instead of this latter amount it is entitled to $8,681,000 rental.

As an indication of the benefit which the government received from improvements made during the test period, the increase in trainload is striking. The average revenue trainload in 1918 was 606 tons and in 1917 568 tons. This was in spite of the fact that there was an average of 10.07 empty freight cars per train-mile in 1918, as against 9.37 in 1917. A big improvement in car loading is to be noted.



The Wabash

The tons of freight per loaded car averaged 24.40 in 1918, as against 21.79 in 1917. The loaded car mileage was reduced from 219,393,000 in 1917 to 188,961,000 in 1918, and empty car mileage from 78,180,000 in 1917 to 75,752,000 in 1918.

There was a falling off in freight tonnage, due apparently to a deflection of traffic to other lines. The total tonnage carried in 1918 amounted to 17,106,000 tons and in 1917 to 18,156,000 tons. Of the total tonnage in 1918, 8,421,000 tons originated on the Wabash and 8,685,000 tons was received from connections. Of the total in 1917, 8,420,000 tons originated on the Wabash and 9,736,000 tons was received from connections. The principal changes in the character of the commodities carried were an increase in the proportion of products of agriculture in 1918 and a decrease in the proportion of products of mines. Thus, in 1918, the total tonnage of products of agriculture was 3,321,000, or 19.4 per cent of the total tonnage carried, whereas in 1917 the tonnage of products of agriculture amounted to 2,791,000, or but 16.4 per cent of the total tonnage carried. Products of mines amounted to 6,544,000 in 1918 and to 7,202,000 tons in 1917, these being, respectively, 38.3 per cent of the total tonnage in 1918 and 39.8 per cent in 1917.

Handling a smaller freight tonnage and running a less number of both freight train-miles and passenger train-miles, the Wabash under government operation had an average of 17,332 employees in service in 1918, as against 16,563, the average for the previous year under private operation.

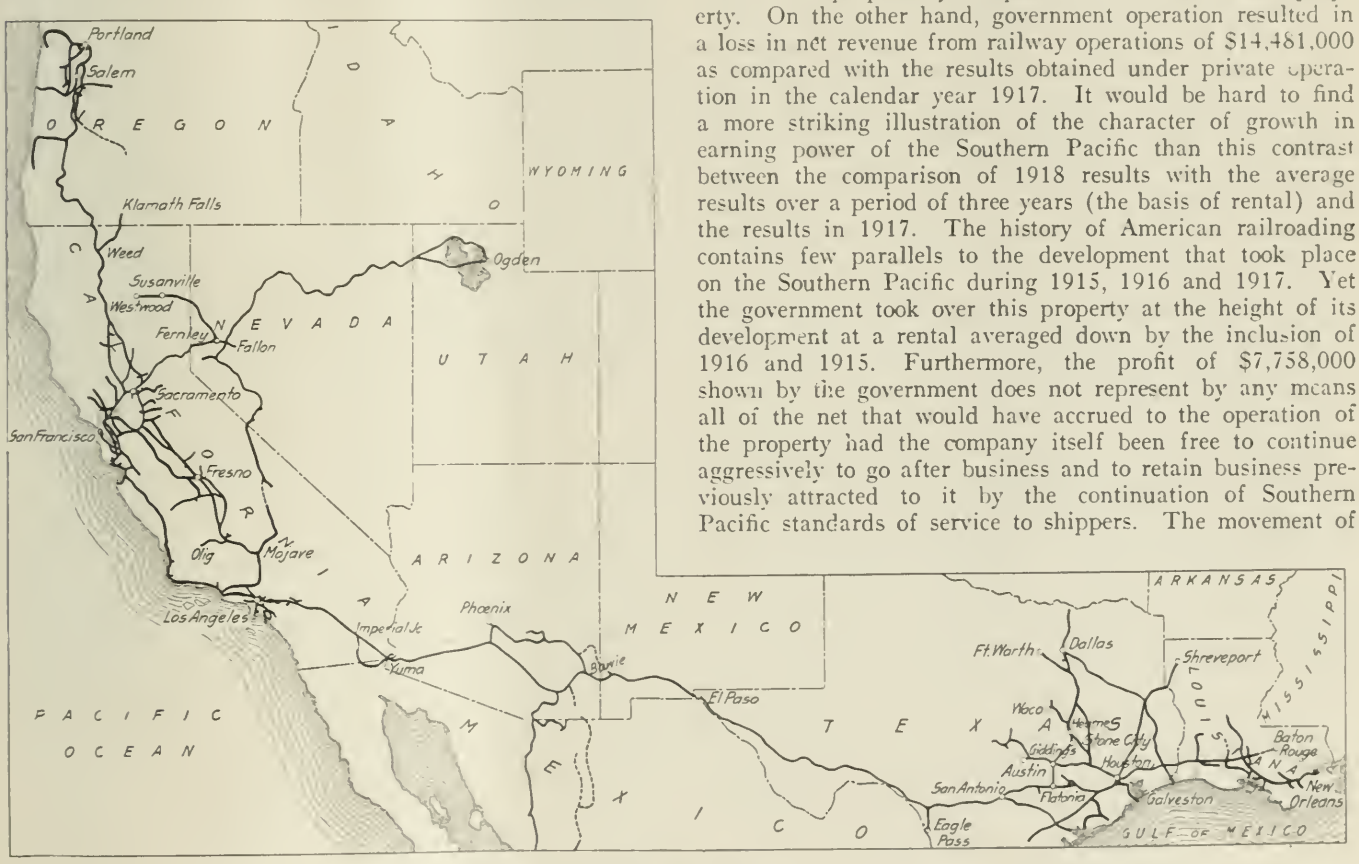
The Wabash was hard hit in 1918 by the increase in cost per ton of fuel. In 1917 coal averaged $1.977 per ton. This low cost was probably due to the hold over of contracts made in previous years. Apparently these contracts ran out, or many of them did, in 1917, for in 1918 the average cost of coal was $2.639.

The following table shows the principal figures for the operation of the property by the government in 1918 and the corresponding figures for private operation in 1917. This is not the income account of the company in 1918:

	1918	1917
Total mileage operated	2,519.49	2,519.06
Freight revenue	$34,498,242	$29,342,855
Passenger revenue	9,993,359	7,673,810
Total operating revenues	48,246,411	40,471,998
Maintenance of ways and structures	6,104,353	3,961,075
Maintenance of equipment	9,497,765	5,466,120
Traffic expenses	711,877	1,039,212
Transportation expenses	22,489,629	16,888,331
General expenses	1,099,241	918,040
Total operating expenses	40,124,609	28,468,896
Taxes	1,334,103	1,458,624
Operating income	6,785,398	10,538,851
Gross income	9,653,173	11,098,969
Net income	5,668,339	4,227,105

Southern Pacific

GOVERNMENT OPERATION of the Southern Pacific in 1918 netted the government a profit of $7,758,000, over and above the rental which the Administration paid the Southern Pacific and proprietary companies for the use of the property. On the other hand, government operation resulted in a loss in net revenue from railway operations of $14,481,000 as compared with the results obtained under private operation in the calendar year 1917. It would be hard to find a more striking illustration of the character of growth in earning power of the Southern Pacific than this contrast between the comparison of 1918 results with the average results over a period of three years (the basis of rental) and the results in 1917. The history of American railroading contains few parallels to the development that took place on the Southern Pacific during 1915, 1916 and 1917. Yet the government took over this property at the height of its development at a rental averaged down by the inclusion of 1916 and 1915. Furthermore, the profit of $7,758,000 shown by the government does not represent by any means all of the net that would have accrued to the operation of the property had the company itself been free to continue aggressively to go after business and to retain business previously attracted to it by the continuation of Southern Pacific standards of service to shippers. The movement of deciduous fruit from the Pacific Coast and of live stock and packing house products were very large in 1918, and the demand for California canned goods for shipment overseas was very great. The lumber business was good and the shipbuilding activities on the Pacific Coast increased many classes of traffic in addition to the movement of raw materials used specifically in the building of ships.



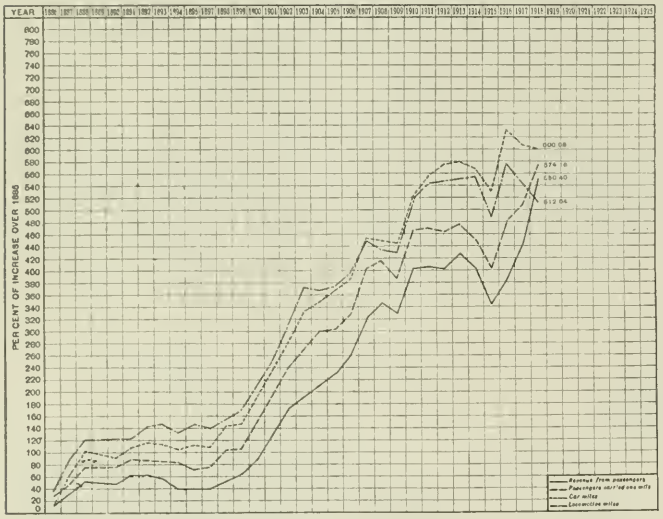
The Southern Pacific

In commenting on these conditions, Julius Kruttschnitt, chairman of the executive committee, in his annual report to the stockholders, says:

"These conditions, combined with the absence of regular steamship service through the Panama Canal and along the Pacific Coast, would have insured to your lines under the management of your own organization a volume of traffic at least equal to that of the calendar year 1917, which

produced the largest gross earnings in the history of the company; but, after the management of your lines was taken out of the hands of your officers, the closing of the traffic agencies through which daily intercourse with your patrons had been maintained, the disturbance of the relationship of both rates and service to the disadvantage of your lines, and the diversion of traffic to competitive routes, resulted in your rail lines transporting 653,707,093 ton miles of freight less than handled during the preceding year, a decrease of 4.87 per cent."

In 1918 total operating revenues amounted to $221,611,000, comparing with $193,971,000 operating revenues in 1917. Total operating expenses in 1918 amounted to $162,722,000, compared with $120,602,000 in 1917. Tons of revenue freight carried in 1918 totaled 44,014,000, a decrease of 964,000 tons, or 2.14 per cent. Ton mileage of revenue freight was 12,765,000,000 in 1918, a decrease of 654,000,000 ton miles or 4.87 per cent. Freight train mileage decreased in even greater proportion, amounting to 20,417,000 in 1918, or 2,467,000 less than in 1917, a decrease of 10.78 per cent. Freight locomotive mileage totaled 26,091,000 in 1918, which was 2,730,000 less than in 1917, a decrease of 9.47 per cent. The average number of loaded cars to a train was the same in the two years, an average of 24 cars each year. But there was on an average almost one more empty car per train, making the average of the total number of cars per train between 34 and 35 in 1918, and less than 34 in 1917. The revenue freight train load averaged 577 tons in 1918, an increase of 5.59 per cent over 1917. The average load per loaded car was 24.29 tons in 1918 and 22.97 in 1917, an increase of 5.75 per cent.



Passenger Service and Traffic

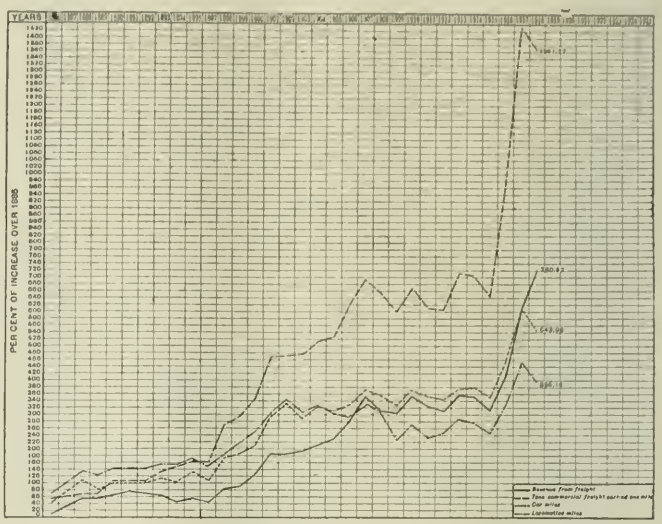
Showing by Years to December 31, 1918, the Per Cent of Increase Over the Calendar Year 1885

The revenue per ton per mile of freight was 1.113 cents in 1918, as against 0.923 cents in 1917, an increase of 21.59 per cent.

Mr. Kruttschnitt brings out in a striking way how small a part of the increased cost of living to the consumer is made up of increased transportation charges. He says: "In the period from 1910 to 1919 the price of dressed beef originating in Chicago and transported to New York increased from 22½ cents to 40 cents per pound, or, expressed in our smallest unit of value, 175 mills, while the freight rate increased 2.4 mills, or only 1.4 per cent. The price per pound of ham and bacon transported between the same points increased 205 mills, whereof the increase in freight rate was responsible for 1½ mills, or only 0.73 per cent. The increase in the cost of a suit of underwear transported from Boston to Chicago in the period 1910 to 1919 was 1,250 mills, to which the increase in freight rate contributed 3 mills, or 0.25 per cent. A pair of shoes, transported from Boston to Chicago in the same period, increased in price 3,500 mills, of which the increase in freight rate was responsible for 6 mills, or 0.16 per cent.

"No coin is small enough to represent any of these increases in cost, but if the dealer should add one copper cent in each case to the 1910 prices, to reimburse him for the increased cost of his commodity due to increased freight rates, he would grossly overcharge the purchaser in every case.

"He would make him pay nearly double the proper amount in the case of a pair of shoes, and over six times the proper amount in the case of a pound of ham or bacon."



Freight Service and Traffic

Showing by Years to December 31, 1918, the Per Cent of Increase Over the Calendar Year 1885

Passenger business was helped by a considerable troop movement, and revenues were increased somewhat through the establishment of the three-cent-a-mile rate, although this did not help western lines as much as it did eastern lines. Passenger revenue in 1918 amounted to $52,995,000, an increase of $8,120,000, or over 18 per cent. The number of passengers carried was 26,624,000 (excluding ferry suburban passengers), an increase of 12 per cent. The average journey per passenger, however, was slightly shorter, being 42.21 miles in 1918.

Increases of 47 per cent in expenses of maintenance of way, 81 per cent in expenses for maintenance of equipment exclusive of depreciation and retirements, and of 27 per cent in the cost of transportation seem high, although the increase in transportation is lower than that of many other large American systems. It is rather interesting to compare these percentages of increase in 1918 over 1917 with the percentages of increase in 1918 over the three-year test period. Maintenance of way increased 48 per cent, maintenance of equipment 83 per cent (including depreciation), and transportation expenses 70 per cent. It would appear that either transportation expenses in 1918 were held down remarkably well as compared with 1917, or that maintenance expenses were comparatively more liberal in 1918 than in 1917. This latter assumption, however, is by no means borne out by the figures for units of work done in maintenance.

In 1917 473 track miles of new 90-lb. steel rail was used for renewals, as against 373 miles in 1918. In 1917 1,200,000 burnettized ties were used in renewal, as against 1,473,000 in 1918, and 1,877,000 untreated ties were used

in renewal in 1917 as against 2,417,000 in 1918. The number of tie plates used in 1917 was 2,644,000, in 1918 1,910,000. The number of continuous rail joints used in 1917 was 522,000; in 1918 302,000. The number of feet of untreated timber used in repairs and renewals in 1917 was 15,978,000; in 1918 5,822,000. At the end of 1917 43 per cent of all locomotives were in thorough order, 31 per cent in good order, 15 per cent requiring repairs and 11 per cent in shop, while at the end of 1918 46 per cent were in thorough order, 29 per cent in good order, 14 per cent requiring repairs and 11 per cent in shops, and yet the cost of repairs per locomotive, exclusive of replacements and depreciation, was $4,758 in 1917 and $8,804 in 1918. It is hard to readjust one's ideas of maintenance costs to appreciate what it means for repairs of locomotives to average nearly $9,000 per locomotive. Repairs of passenger cars is almost equally bad insofar as increase in cost is concerned. In 1917 the average cost for repairs alone averaged $826 per car; in 1918 the average was $1,426. Repairs of freight cars averaged $104 in 1917 and $194 in 1918. The cost per hundred miles run was 62 cents in 1917 and $1.34 in 1918.

The Southern Pacific has been very liberal in expenditures for maintenance of its equipment in years past. It has been liberal also in providing ample equipment for the business to be handled, and at the time the government took over the road the company had orders outstanding for 57 locomotives, 41 passenger cars and 718 freight cars, and was building in its own shops 56 locomotives and 3,808 freight cars. The director general, however, refused to sign a contract with the Southern Pacific unless the company would agree to buy 1,000 box cars at a cost of over $3,000,000. The Southern Pacific Company claims, apparently with a good deal of justice, that the design of these cars was poor and their cost was excessive and that in buying them they yielded only to major force.

In 1918 there was a total of $20,188,000 spent for additions and betterments on the Southern Pacific system Taking into account the equipment retirements, etc., the net increase in investment in road and equipment was $14,714,000.

In 1909 the Southern Pacific issued $81,814,000 four per cent 20-year convertible bonds. The holders of these bonds had the privilege of converting their bonds at par value into common stock at 130 up to June 1, 1919. Of the total issue of bonds, $26,657,000 or 33.39 per cent were converted up to the day of the closing of this privilege. Taken in its full significance, this is a remarkably comprehensive commentary on the success of the Southern Pacific in the face of conditions generally adverse to railroad development and profitable operation.

The following table shows the principal figures for operation in 1918, 1917, and the average for the three years of the test period:

	1918	1917	Three Years' Test Period
Mileage Operated	11,181	11,127	10,978
Freight Revenue*	$142,030,791	$123,845,562	$101,747,123
Passenger Revenue*	52,965,302	44,875,012	39,561,045
Total Railway Operating Revenue	221,611,206	193,971,400	155,148,196
Maintenance of Way and Structures	25,824,726	17,522,352	17,454,799
Maintenance of Equipment	40,747,835	28,261,507	22,266,503
Traffic Expenses	2,244,269	3,121,417	3,075,421
Transportation Expenses	86,184,508	68,778,430	59,449,283
General Expenses	4,925,247	4,584,982	4,127,596
Total operating expenses	162,722,372	120,001,823	99,469,518
Operating Income	49,430,475	58,505,253	47,736,670

CORPORATION INCOME ACCOUNT FOR 1918

Standard return (rental)	$38,421,846
Miscellaneous operating income	4,317,995
Non-operating income	28,448,906
Gross income	71,188,748
Net income	24,000,529
Dividends	16,404,055
Surplus	7,686,474

Delaware & Hudson

THE DELAWARE & HUDSON carried less freight in 1918 than in 1917. The falling off in tonnage occurred almost entirely in the freight received from connections. In 1918 24,934,000 tons of revenue freight were handled by the Delaware & Hudson and of this tonnage 14,231 tons originated on the company's own lines and 10,703,000 tons were received from connections. In 1917 the total tonnage handled was 26,748,000 tons, of which 14,396,000 tons originated on the company's lines and 12,352,000 tons were received from connections. Under private operation, the Delaware & Hudson is a competitor of the Rutland and the New York Central for business from Albany to Canada. Less directly it competes with the Boston & Maine route to Canada. Under government operation freight was routed in accordance with regional orders irrespective of the wishes of shippers. Other roads in eastern territory showed large increases in freight business and it is safe to assume that the Delaware & Hudson, under non-competitive conditions and government operation, did not handle the business that it could have handled under private management and competitive conditions.

Total operating revenues in 1918 amounted to $34,790,000, comparing with $29,936,000 in 1917. Freight revenue amounted to $30,105,000, in 1918 and to $25,323,000 in 1917. The increase in freight revenue was, therefore, but 19 per cent or less than the average increase in freight rates alone.

Without large increases in gross to offset increased wage schedules, net was hard hit. In 1918 the operating ratio was 90.12 per cent; in 1917 this raio was 78.08 per cent. Total operating expenses in 1918 amounted to $31,354,000 as compared with $23,375,000 in 1917. Transportation expenses amounted to $16,556,000, an increase of 30 per cent over 1917. This is not abnormally high as compared with other eastern roads.

The freight train mileage in 1918 totaled 5,173,000, of which 93,000 was light as compared with 5,180,000 in 1917, of which 105,000 was light. The number of loaded freight cars per train was 23 in 1918 and 24 in 1917. The number of empty cars was 12 in 1918 and about the same in 1917.

The average revenue train load was 770 tons in 1918 and 748 tons in 1917. The number of tons of revenue freight per loaded car mile was 34 in 1918 and 32 in 1917. The average haul of freight was 163 miles in 1918 and 148 miles in 1917.

Although much larger sums were spent on both maintenance of way and maintenance of equipment, the physical units, showing the amount of replacement in maintenance of way, were smaller in 1918 than in 1917. Maintenance of way and structures cost $3,738,000 in 1918, comparing with $2,501,000 in 1917.

The total number of ties laid in replacement and betterment in 1918 was 242,000, of which 187,000 were untreated pine ties and 36,000 untreated oak ties. This compares with a total number in 1917 of 335,000, of which 225,000 were untreated pine and 70,000 untreated oak.

The total tonnage of rail laid in replacement and betterment in 1918 was 12,614 comparing with 14,952, in 1917. The cost averaged from $32 per ton for open hearth 90-lb. rail to $20 per ton for second-hand 90-lb. rail in 1918, and prices were about the same in 1917.

The number of locomotives in service at the beginning of the year, 1918, was 474; 23 were added and 6 were destroyed during the year. The number of freight cars at the beginning of the year was 18,295 and 244 were added and 478 retired during the year. The number of passenger cars at the beginning of the year, 1918, was 468; none were added and 14 were retired.

Maintenance of equipment cost $9,536,000 in 1918, com-

paring with $6,055,000 in 1917. Of course, repairs to equipment and renewals of equipment are distinct, so that the much larger sums spent for maintenance of equipment may reflect not only higher wage costs but actually more work done, although no data is available to make an accurate comparison.

The rental which the government is to pay the company is $7,415,000. In 1918, operating income amounted to $2,585,000, and gross income to $4,050,000. Disregarding any adjustments which may be made, the amount which the government will receive from the operation of the Delaware & Hudson will be somewhere between these two income figures. The road, therefore, has been operated during 1918 at a considerable loss. In the *Railway Age* of May 9, an extended comment was made on the development of the property as described in the annual report of President L. F. Loree to his stockholders. The figures used in the present comments are those reported to the Interstate Commerce Commission by the federal auditor. The record of the development of this, one of the oldest American railroads, compared with the record of the results of government operation in 1918 makes a striking contrast, explainable in part probably because of abnormal conditions, but, nevertheless, an interesting contrast.

The following table shows the principal figures for operation of the property under the government in 1918 and under private management in 1917:

	1918	1917
Mileage operated	910	879
Freight revenue	$30,104,926	$25,322,988
Passenger revenue	2,804,056	3,020,185
Total operating revenues	34,789,864	29,935,625
Maintenance of way and structures	3,737,523	2,501,166
Maintenanceof equipment	9,536,063	6,654,710
Traffic expenses	254,673	325,557
Transportation expenses	16,556,076	12,702,049
General expenses	1,052,963	1,071,236
Total operating expenses	31,353,784	23,374,755
Taxes	849,289	855,551
Operating income	2,585,123	5,701,869
Gross income	4,049,526	.....
Net income	3,577,217	.....

The corporation income account is as follows:

	1918
Rental	$7,415,149
Gross income	10.602,781
Net income	4,714,792
Dividends	3,825 272

New Books

Cambria Steel Handbook. Prepared and compiled by George E. Thackray, C.E. 603 pages, illustrated, 4½ in. by 6¾ in., flexible binding. Published by the Cambria Steel Company, Philadelphia, Pa.

This is the twelfth edition of the Cambria handbook and in addition to a thorough revision of all data pertaining to the various structural steel sections manufactured by the Cambria Steel Company, it contains a large amount of new material covering the wider range of structural steel sections now manufactured, and includes additional tables of use in calculations involved in the design of structures in which the sections are used. Among the new sections for which illustrations and properties are included in the new edition are a number of bulb angles, small channels for cars, ship channels, T-bars and three sizes of rolled steel car stakes. Among the large number of new tables which have been added are weights of flat and corrugated steel sheathing, roof truss dimensions and stresses, sizes of spikes and wood screws, square roots and cube roots of fractions, weights of circular steel plates, trigonometric formulae, and similar information.

Letters to the Editor

The Dunkirk Wreck and the Deadly Angle Cock

New York.

To the Editor:

Nearly forty-seven years have passed since the automatic air brake came into use as a means for controlling the motion of railway trains, and for over thirty years it has been in general use on both passenger and freight trains, yet it still retains that fundamental element of danger—the closed angle cock.

With the automatic brakes now in general use, the train may be charged, the brakes tested and everything put in working order before leaving the terminal, and yet before or after the train departs, an angle cock may be closed between the engine and tender, or elsewhere in the train, without the knowledge of the engineman or of any member of the train crew and thus deprive them, at the critical moment, of the only means on which they rely for safely controlling the train. This may be caused accidentally through something falling upon the angle cock, by a tramp accidentally or maliciously, or by an employee forgetting to open a closed angle cock. There have been many cases of the last.

No more convincing evidence of this truth is required than that furnished by the investigation of the recent rear collision at Dunkirk, resulting in the loss of many lives, the serious injury to a score or more of passengers and a heavy loss in property damage, due to an angle cock being closed between the engine and the first car.

It is reported as a result of the investigation that the engineman of the second train shut off steam probably half a mile east of the distant signal, and that he began to sound the whistle signal for brakes at about the time the locomotive passed the distant signal, which was some 6,000 ft. east of the point at which the collision occurred. The evidence indicated quite positively, therefore, that the angle cock on the rear of the tender must have been closed before passing the distant signal, or at any rate but very little later. The engineman probably realized he was powerless to stop his train fully a minute and a half before the collision occurred.

It has remained for the Automatic Straight Air Brake Company to provide against this menace to the safety of the movement of passenger and freight trains by the development of a brake designed on superior principles, in which, when an angle cock is closed, the brakes apply within a few seconds. On the other hand, a sluggish feed valve does not cause the brakes to apply.

The application of the A. S. A. brake depends merely upon a brake pipe reduction being made, and is positive and precise regardless of the *rate* of reduction, which is such a vital element in the operation of other types of brake equipment. With brake pipe leakage of, say, two pounds per minute, which is a reasonable assumption for a train of that character, it may be positively asserted that had A. S. A. brake equipment been in use on Train No. 7, the train brakes would have been applied before the collision occurred, with the result of, if not entirely preventing the accident, at least greatly mitigating the severity of the collision and reducing the extent of the disaster. Had the angle cock been as far back as the water station pans the A. S. A. brake would have stopped the train without any collision whatever. It is obvious that the improved brake is an urgent necessity for the protection of lives and property in the daily operation of the railroads.

Spencer G. Neal.

Railway Electrification in France and Belgium

Important Plans Under Consideration in Both Countries—Especially Desirable in France, with Large Water Supplies

By Robert E. Thayer
European Editor of the *Railway Age*

Paris, June 16, 1919.

Along with other matters of railroad construction in France and Belgium due to the devastation caused by the war, very serious consideration is being given to line electrification. In France this is particularly desirable on account of the increased cost of coal, and because of the fact there are in certain sections of the country large water supplies, which can very easily be used for the operation of hydro-electric plants.

Committees of railway men and engineers have been formed in both countries, and a committee of French railway engineers has already arrived in America to study the situation there.

Electrification in France

M. Claveille, Minister of Public Works and Transports of France, in a report made on the future development of French railways, states that it is highly important for France to make the most of its vast resources in water power for generating electricity, particularly at a time when its supplies of mineral combustibles are not going to be sufficient to meet the needs of its industries. With this end in view, he had an inventory made, at the end of 1916, of the available hydraulic power of the public water courses, and later reports were requested for each region, showing exactly the quantity of hydraulic energy which could be used by the public services, employing the most modern methods, without completely using up the energy of the watercourses. A particular study was to be made of the economical use of electricity for motive power on railroads, the kind of traffic, its density, the grade of the lines, and the difference in cost of each region being considered.

The Service of the Control of Railroads, in agreement with the technical services, is in charge of the studies to be made regarding the use of hydro-electricity on the railroads. Particularly attention is to be paid to the fair division of electric power between the public services and agricultural and industrial interests, and committees were formed made up of officers of the Government, manufacturers, etc.

The special committee appointed to draw up a program for the electrification of the principal railroads has pursued its studies with energy and by the end of March, 1919, had been able to gather together much valuable data concerning the use of hydro-electricity. Its program proposes the electrification of 5,220 miles of lines as follows:

Paris-Orleans	1,926 miles out of a total of 4,839 miles
Paris, Lyons & Mediterranean	1,367 miles out of a total of 6,040 miles
Midi	1,926 miles out of a total of 2,524 miles

With the traffic of 1913 the kilowatt-hour consumption would have reached:

Paris-Orleans	280 millions kw-hr.
Paris, Lyons & Mediterranean	550 millions kw-hr.
Midi	330 millions kw-hr.
Total	1,600 millions kw-hr.

With the estimated traffic in the immediate future the consumption is estimated at:

Paris-Orleans	560 millions kw-hr.
Paris, Lyon & Mediterrean	1,100 millions kw-hr.
Midi	600 millions kw-hr.
Total	2,260 millions kw-hr.

In determining upon lines to be electrified, the Midi and the Paris-Orleans considered the relation of the cost of electric power as compared with the cost of power with steam locomotives, and the comparison showed that mountain lines with sufficient traffic should be among the first to be electrified. They also considered the location of the source of hydro-electric energy in relation to the lines, and the importance of this power to other industries.

On the Paris, Lyons & Mediterranean, however, the possibility has been considered of using electricity on lines of low grade where there is a heavy traffic, even before putting it on mountain lines where the traffic of these lines is very small.

The proposed sources of electric power are the following:

For the Paris-Orleans—The Upper Dordogne River and its branches.
For the Midi—The Pyrénées.
For the Paris, Lyons & Mediterranean—Certain waterfalls in the Central Plateau and in the Alps, and the enormous reservoir of energy formed by the great plants at present existing or going to be constructed in the region.

The probable cost is estimated as follows, based on prices before the war:

Paris-Orleans	$94,000,000
Paris, Lyon & Mediterranean	93,000,000
Midi	148,000,000
Total	$335,000,000

With the traffic of 1913, electrification would save 1,500,000 metric tons of coal, and in the near future the economy should not be less than 3,000,000 metric tons.

A special committee has been formed for the purpose of studying the use of electric energy. It at first obtained all the information possible from the principal electric companies, and it will use this as a basis for improving the present legislation, if necessary, in order to promote the development of the distribution of power. Members of the committee have already visited America to study conditions there. The committee has also had a general map made of France, showing the present plants and the lines for distribution of electric power.

Electrification in Belgium

The plans for electrification on the Belgian State railways has not progressed to the same extent as on the French railways. An extensive commission has been formed, however, for consideration of the work. This commission is under the direction of Le Baron Ancoin, a member of the Belgian Senate, with M. Jacquin, who carries on the active work of the committee, as general secretary. He is located at 25 Rue de la Charité, Brussels. The commission has been divided into three sections, one considering the distribution of power, which is under the direction of M. de Loneux, Director General of electric power of Belgium; a second section to consider the rolling stock to be used, which is under the direction of M. Gerard, General Secretary of the Belgian State railways; and a third section on the management, which is under the direction of M. Tondelier, who is President of the Belgian State railways. Both English and French expert engineers are included in this commission; two of the members are, at the present time, in America with the French commission.

While no definite plans have been adopted, a direct current system, using the third rail with 1,500 volts, and a three phase alternating current system with 50 cycles, is being considered.

The plan under consideration now is to electrify important

lines radiating from Brussels. The first line to be considered will probably be that between Antwerp and Arlon, a distance of about 147 miles. Consideration is also being given to electrification of the line from Brussels to Louvain, a distance of about 18.5 miles; from Brussels to Charleroi, a distance of about 35 miles; from Brussels to Braine-le-Compte, a distance of about 18.5 miles; from Brussels to Enghien, a distance of about 18.5 miles; and from Brussels to Ghent, a distance of about 36 miles.

Government Ownership a Dead Issue

Charles E. Elmquist, president of the National Association of Railway and Utilities Commissioners, has written a letter to Joseph B. Eastman, of the Interstate Commerce Commission, taking issue with the position assumed by Mr. Eastman, also a former State railway commissioner, in his letter to the Senate Committee, published in last week's issue. Mr. Elmquist says:

"I agree with many of your statements, but must reject some of your conclusions, because the logic of your argument leads to immediate acceptance of the permanent policy of government ownership and operation.

"It is conceivable that the people may in the future declare for such a policy, but not, I take it, until they have become convinced that it will afford better and cheaper service than private operation, under strict regulation. Before we determine on the policy of government ownership and operation, however, the people of the country are entitled to have our regulating system rounded out and made adequate to cover all phases of the relations between the public service agency, the public it serves, and its employees. Just now the practically unanimous opinion of statesmen, economists, business men, shippers, stock-owners and bankers, railroads and regulating commissions, both state and federal, is that the hour has struck for the enactment of legislation which will strengthen the arm of regulation so as to prevent well known abuses, financial and otherwise, and give the public adequate service at reasonable rates, and at the same time enable the carriers to so function as to ensure a proper return upon capital, invite credit, make natural approved consolidations in the interest of the public, and secure the equipment, terminals and extensions necessary to the development of the country.

"In my judgment, Congress is preparing to take action along these lines. It should receive from regulating commissions that full measure of assistance which their wide experience and diligent study so well qualify them to render. Your communication raises an economic question of profound importance. This we need not now discuss, as there is one practical objection to your proposal which to me appears insuperable:

"The fact is that the railroads are going back to private operation. The President so stated in his message last June, and set the time at the end of the year. This harmonizes with the purpose of war-time government operation. It was as a war measure that the carriers were taken over. But the war emergency ended, apparently when the armistice was signed, and beyond all question with the signing of the treaty of peace. The President's decision is in accord with the overwhelming sentiment of the country. This sentiment is a natural reaction from the tremendous expansion of governmental activities during the war. That expansion devitalized business initiative outside of its own sphere, causing the curtailment of production and the interference with long established customs, usages and practices.

"The sentiment against government ownership and operation has been crystallized by the experience in shipbuilding and aircraft production, futile in results and appalling in losses; by the oft-repeated charges of extravagance in the ordnance and other war departments; by the unhappy and costly experiment in the operation of the wire systems with its largely increased charges and inferior service; by the character of the freight and passenger service rendered during government operation; repeated orders that ultimately increased wages about a billion dollars, although the Railroad Administration knew that it was facing a large deficit in operation; the extraordinary increases in freight and passenger rates at a moment's notice and without giving a hearing to those from whose pockets the money was to come; and the dreary story of losses ranging from $36,000,000 to $60,000,000 a month since the first day of the year, accompanied by the uninviting prospect of still another large increase in rates.

"The tide against government ownership and operation is practically irresistible. We are facing a condition, and, since private operation is inevitable, all students of regulation should join forces to secure the most helpful and constructive legislation.

"Advocates of government ownership and operation present very persuasive arguments. Equally persuasive arguments against such proposals can readily be suggested. In the present state of mind, however, the public will not give the subject fair consideration. And yet the proper determination of the question is so vitally important to the American people that it should not be considered until they are ready to listen to all arguments, give to them proper weight, and determine the question after frank and thoughtful discussion.

"It is apparent, therefore, that this is not the time to consider the question."

Casualties to Railroad Employees in April

The Safety Section, Division of Operation, of the United States Railroad Administration, has issued Bulletin No. 5, giving a summary of the statistics of persons killed and injured on Class 1 railroads for the month of April, 1919. The totals for each of the seven regions are given in a large table, and the aggregate for the whole seven is: Employees killed, 131; injured, 9,057; all cases, including employees, killed 511, injured 10,032. The same totals for April, 1918, are 229 employees killed and 11,706 injured; all cases, killed 685, and injured 13,143. The net decreases are employees killed 98, injured 2649; all cases, killed 174, injured 3,111.

The number of meetings held during the month by general and local safety committees was 2,089; attendance, 31,555; absentees, 5,921. The number of papers read and specific topics discussed aggregated 2,859; illustrative accidents, specifically discussed 4434. Safety rallies held, 189.

With this bulletin the manager of the Section, A. F. Duffy, sends to the safety supervisors copies of resolutions praising the work of the Section which have been adopted by the brotherhoods of conductors, brakemen, firemen and clerks. Among suggestions for improvement which have been received by Mr. Duffy is one that pictures used for interpreting methods of safety, should be those of real persons, not exaggerated imaginary pictures.

W. H. Moore, claim agent of the San Diego (Cal.) Electric Railway Company, was elected president of the Pacific Claim Agents' Association at its recent annual convention at Oakland, Cal. Other officers elected were: First vice-president, C. A. Blackburn, Butte, Mont.; second vice-president, J. B. Mills, Oakland; third vice-president, F. B. Oakley, Tacoma, Wash.; secretary-treasurer, D. F. Boynton, Portland, Ore.

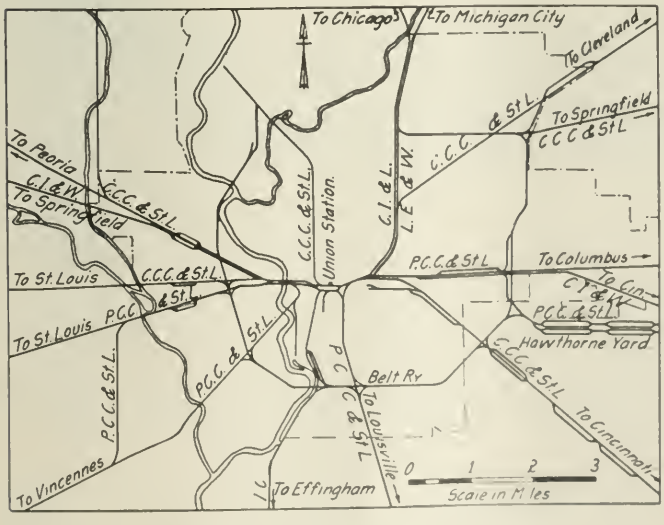
The Pennsylvania Lines and the Indianapolis Union Bridges Over South Street

Extensive Grade Separation Work at Indianapolis

The Improvements Embrace a Four-Track High-Level Line and Additional Station Facilities

IN ORDER TO COMPLY with an order of the City of Indianapolis requiring the elimination of all the street crossings at grade with the tracks in the business section of Indianapolis, Ind., the Indianapolis Union Railroad now has under way one of the most important track elevation projects undertaken in recent years. The improvement will, at the same time, provide adequate facilities for handling the large and rapidly increasing passenger and freight traffic in this city. This project involves all of the six railways having lines in the city and resolves itself into two sections.

The most important part is the work undertaken by the Indianapolis Union itself. This includes the substitution of a four-track, high-level line for the old two-track line at the street grade, eliminating all crossings at grade with the intersecting streets, and improved facilities at the Union passenger station, including a new high level train shed having a track capacity twice that of the old. The estimated cost of this portion of the work exceeds $8,000,000 and involves 110,000 cu. yd. of excavation, 105,000 cu. yd. of concrete, 500,000 cu. yd. of embankment and more than 50,000,000 lb. of structural steel. The second part of the project consists in revising the lines of the other railways concerned to conform to the new conditions created by the changes made by the Indianapolis Union.



Railroad Connections at Indianapolis

The Railroads of Indianapolis

As shown on the map of the city, the lines of six railways enter Indianapolis. Of these roads the Big Four has six divisions, the Chicago, the Peoria and the St. Louis divisions entering the city from the west, and lines from Cleveland, Springfield and Cincinnati from the east. The Pennsylvania has five divisions converging at Indianapolis, consisting of the St. Louis and Vincennes divisions from the west, the Louisville division line from Louisville, Ky., entering from the south, the Columbus division from the east and the Michigan division from Chicago from the north. The Cincinnati, Indianapolis & Western has a line extending from Springfield, Ill., on the west through Indianapolis to Cincinnati on the east and the Chicago, Indianapolis & Louisville, the Illinois Central and the Lake Erie & Western each has one line entering the city.

The Indianapolis Union railway was organized to provide both freight and passenger connections between these various lines. It was first formed in 1850, and in 1883 the present operating agreement was established. It operates a belt line for freight traffic 14 miles long and a passenger line 1.23 miles long. The belt or freight line is located in the outskirts of the city, thus avoiding the necessity of moving freight trains through the busy downtown section, but the passenger line passes through the heart of the business section of the city. All of the passenger lines of the six railways entering Indianapolis converge on this line and all of the passenger traffic into and through the city is handled over it into the Union station, which is also operated by the Indianapolis Union.

Under normal conditions the passenger line handles 87 trains into and 85 trains out of the Union station every 24 hours. The busiest periods are between 10:40 a. m. and noon and between 2 and 3 p. m. Between 10:40 a. m. and 11 o'clock five trains arrive at the station and three depart, while at 3 p. m. four trains depart and two arrive. The

Union station furnishes the only passenger terminal facilities in the city and serves as a through station for the Big Four, the Pennsylvania and the Cincinnati, Indianapolis & Western and as a terminal for the Illinois Central, the Monon and the Lake Erie & Western. Prior to Federal control through trains were also operated from Chicago to Cincinnati over the Chicago, Indianapolis & Louisville and the Cincinnati, Indianapolis & Western.

Prior to the present project the grades of the streets and the passenger tracks had been separated at West street and at the joint crossing of Kentucky avenue and Missouri street, in both cases the streets being depressed somewhat and carried under the tracks. An undercrossing at Illinois street had also been provided about 30 years ago and a steel viaduct at Virginia avenue carried the traffic of that street over the tracks, thus leaving grade crossings at Senate, Capitol, Meridian, Pennsylvania, Delaware, Virginia, New Jersey, East, Washington and Noble streets on the main line and at Pennsylvania and South streets on the wye connection to the Louisville division of the Pennsylvania.

The objectives of the improvements undertaken by the Union Railway were (1), the elimination of the crossings at grade with the streets enumerated above; (2), to provide additional line facilities for handling the heavy traffic for which the old two-track line was, and had been for years entirely inadequate, and (3), the provision of amplified station facilities, those of the old station being insufficient to handle satisfactorily the large transfer of mail, express and baggage between the 16 separate divisions converging at the station and between the railroads and the various city post and express offices.

The necessity for this improvement had long been apparent but had been deferred because of a law, recently amended, which limited the city to an annual expenditure of $100,000 for grade separation and the impracticability of undertaking the project in other than the comprehensive manner of the present plan, which was impossible under the old law if the municipality were to bear its just proportion of the expense of grade separation.

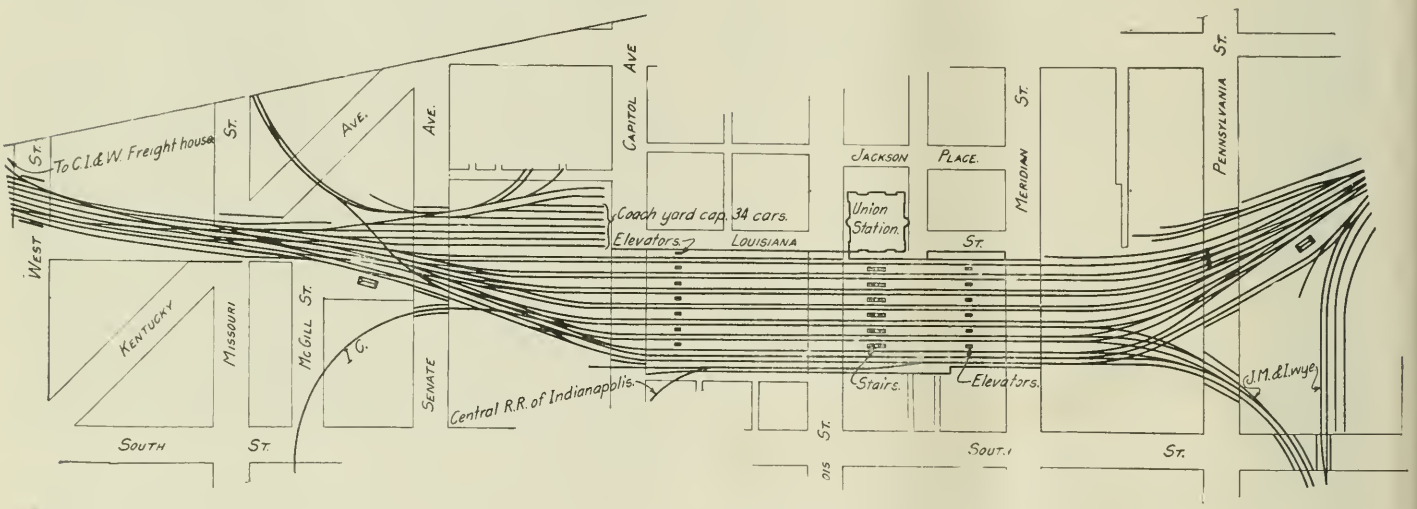
The amplification of the line facilities is provided for by the construction of two additional main tracks and the grade separation is accomplished by the elevation of the tracks, the grade of the streets remaining unchanged except as herein mentioned. The elevation of the tracks makes it possible to amplify the station facilities by utilizing the space under the new train shed tracks as the site for new baggage, mail, express, milk and other auxiliary station facilities. The present station will remain practically unchanged and it provides space for waiting rooms, ticket and restaurant facilities, telephone and telegraph, news stands, toilets, etc.

The present elevation work is confined to the district between Missouri street, where the grades had been separated previously and Washington and Noble streets. The plans provide for the closing of New Jersey street across the tracks, restoring Illinois street to its old level, removing the steel viaduct at Virginia avenue and the depression of this street to permit the construction of a subway and the carrying of all other intersecting streets under the tracks by means of subways.

Between Capitol avenue and Meridian street the new train shed extending between these streets will provide the support for the high level tracks. Outside of the train shed limits the general plan for the elevation is to support the track on fills, providing retaining walls where the width of right-of-way is insufficient to permit of slopes.

All of the retaining walls are of concrete and mass section design. The subways consist of steel bridges of trough floor construction supported on concrete abutments also of mass section design.

The first work done on the project was the diversion of Pogues run. Originally this creek flowed in an open channel closely paralleling the tracks in the district east of Meridian street. By its diversion into a double box concrete sewer (each box being 8 ft. high by 18 ft. wide) the old creek bed was made available for the additional right-of-way required through this section. This work was done by the city at a cost of $1,079.852, part of this cost being borne by the various railroads. Wherever the drain crossed under the location of a subway, foundations for the bridge supports were provided by placing three lines of columns, one on each side of the drain and one in the wall between the boxes. The girders resting on the columns spanning the drains were then placed.



Plan of the Station Layout

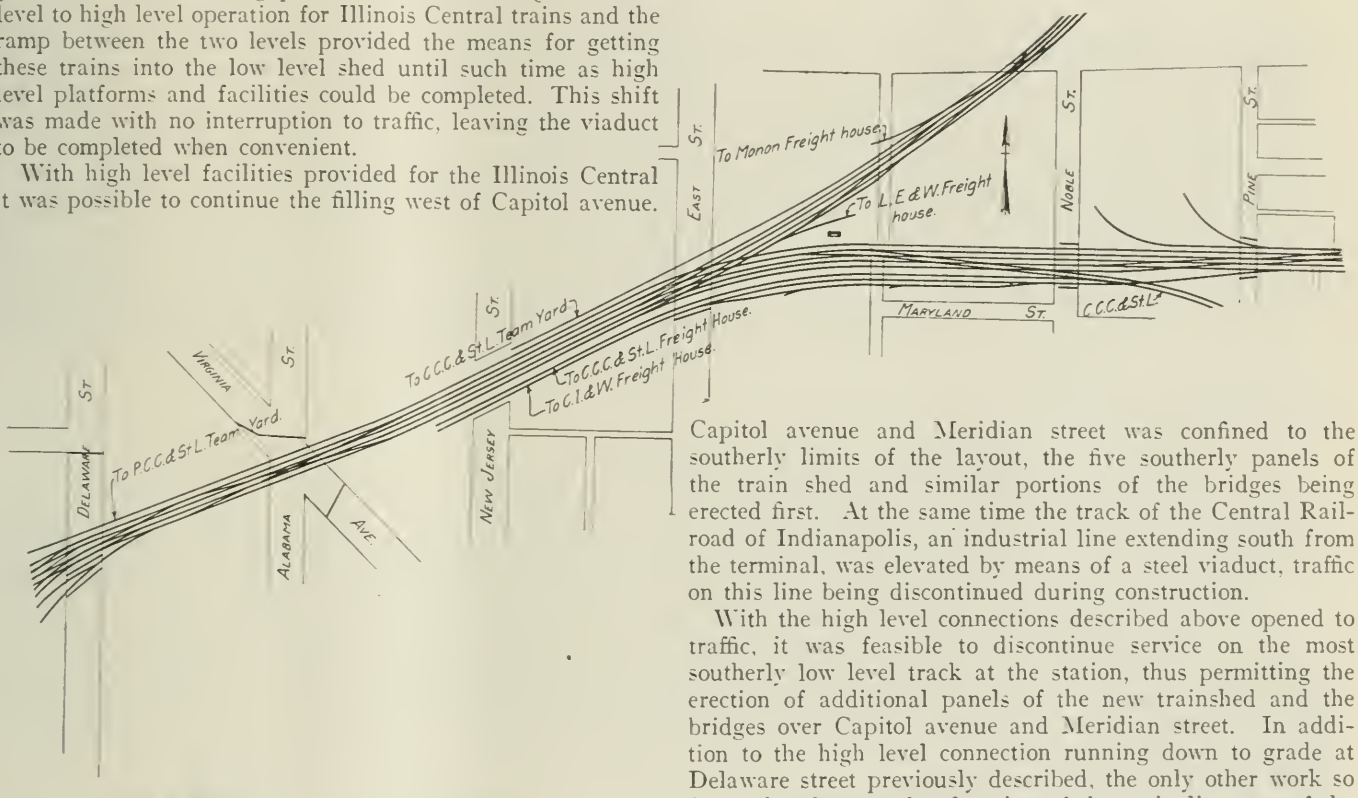
Construction Plan

The controlling factor in the construction program for this project was that of handling traffic and all of the work has been so planned as to interfere as little as possible with traffic during construction. After the completion of the Pogues run diversion had made available all of the property owned, work was begun on the construction of the subways at Senate avenue, Capitol avenue and Meridian street, on the train shed which extends between the latter two streets and on the fill west of Capitol avenue, enough of this embankment being placed to permit the construction of a ramp track between the level of the new train shed and that of the tracks at Missouri street.

At this same time the Illinois Central was engaged in the construction of its high level line between the new train shed and Henry street, about one-half mile south of the station, where it joined with previous elevation work thus completing the separation of grades for that railroad. The Illinois Central track was elevated by the construction of a reinforced concrete viaduct built approximately on the location of the old line.

During this period traffic over the Illinois Central was diverted to a temporary line built free of the new work except where it crossed under the new line to permit a connection being made with the low level tracks. This crossing necessitated the leaving of a gap in the viaduct. With the viaduct completed both ways from the gap and a track installed on the train shed connected with the ramp mentioned above to permit the Illinois Central trains to pass from one level to the other, it was only necessary to set in temporary bents to support the rails across the gap in the viaduct to change from low level to high level operation for Illinois Central trains and the ramp between the two levels provided the means for getting these trains into the low level shed until such time as high level platforms and facilities could be completed. This shift was made with no interruption to traffic, leaving the viaduct to be completed when convenient.

With high level facilities provided for the Illinois Central it was possible to continue the filling west of Capitol avenue.



East Approach to the Passenger Station

It also relieved the congestion at the low level to an extent and made possible the next step in construction, that of building the high level tracks on the west leg of the wye construction to the Louisville division of the Pennsylvania.

Prior to the present work and in connection with the recently completed Pittsburgh, Cincinnati, Chicago and St. Louis local freight facilities in Indianapolis, the tracks of the Louisville division had already been elevated south of South street. The present work comprised the construction of a high level line between the new train shed and these elevated tracks and included subways at the crossings of Pennsylvania and South streets.

The construction of this high level connection necessitated the wrecking of the boiler plant which furnished the steam for heating the station building and the installation of a new heating system which will be described in connection with the new station facilities. It also necessitated the construction of a temporary low level line over which the high level tracks were carried by means of a pile bridge. With the temporary bridge in place the embankment could be placed without interference with traffic.

This was followed by the construction by the Pennsylvania of a reinforced concrete viaduct south of South street and a steel bridge over South street to carry the tracks of the east leg of the wye and the placing of the fill for the high level tracks. A temporary low level track connection to carry the traffic was again necessary in this work and a run-off was installed between the viaduct and the low level tracks at Delaware street where the low level tracks had been raised about 7½ ft. under traffic to make this connection possible of operation. A fill was also made to carry two elevated tracks on the main line to the east, from the station running off to the partially elevated grade at Delaware street. These tracks are carried over Pennsylvania street by a temporary pile trestle. With these connections made it was possible to route any train into the station at either level as desired.

In order to interfere as little as possible with the operation of the low level tracks the first work in the district between Capitol avenue and Meridian street was confined to the southerly limits of the layout, the five southerly panels of the train shed and similar portions of the bridges being erected first. At the same time the track of the Central Railroad of Indianapolis, an industrial line extending south from the terminal, was elevated by means of a steel viaduct, traffic on this line being discontinued during construction.

With the high level connections described above opened to traffic, it was feasible to discontinue service on the most southerly low level track at the station, thus permitting the erection of additional panels of the new trainshed and the bridges over Capitol avenue and Meridian street. In addition to the high level connection running down to grade at Delaware street previously described, the only other work so far undertaken on the elevation of the main line east of the train shed, is another high level, single track connection which starts at grade on the main line just east of Virginia avenue, runs to the East and connects with the high level line of the Pittsburgh, Cincinnati, Chicago & St. Louis Railroad at Noble street, being carried over East street on a temporary pile trestle.

The Structures

The bridges at the various streets are of steel, trough floor type with concrete deck, supported by concrete abutments at the property lines and steel bents of columns and cross girders at the curb lines and center of roadway. All bridge floors are provided with membrane waterproofing.

The Meridian street bridge is somewhat different from the others and is the largest on the line, having a total weight of 3,800,000 lb. It consists of a main span 60 ft. in the clear and two sidewalk spans. The center span consists of forty-two 63-ft. girders, 5 ft. 4 in. in depth, each weighing 26.5 tons. A buckle-plate floor carries the concrete deck.

The train shed, which extends between Capitol avenue and Meridian street, provides space on the upper level for 12 passenger tracks with a combined capacity for 203 cars and

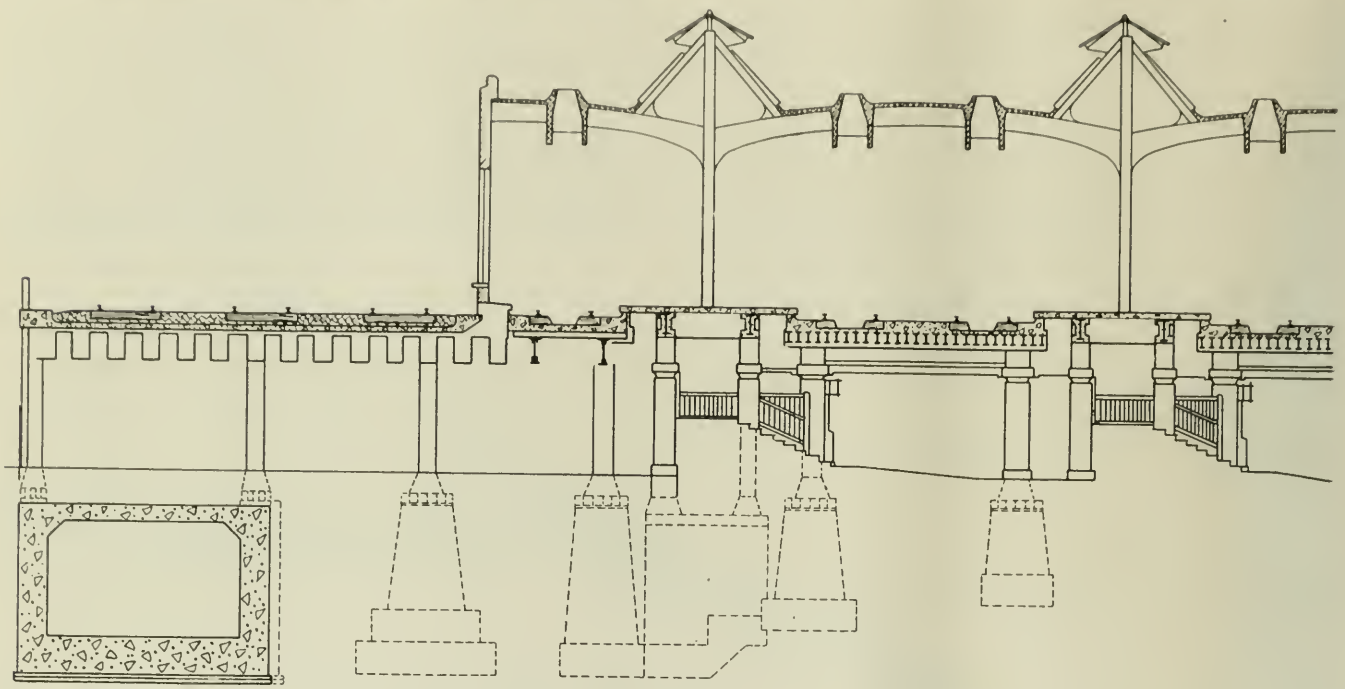
for two through freight tracks and a siding for mail, express milk, etc. The freight tracks are located on the southerly panels and are not covered. The passenger tracks are placed in pairs and are spaced 12 ft. 6 in. center to center between concrete platforms 16 ft. 7½ in. in width with the roof supports in the center of the platforms.

The lower level provides the space for station facilities. It includes a passenger concourse located symmetrically with the station building and extending the full width of the shed. Stairs lead from this concourse to each platform at the track level. This low level is divided into two sections by Illinois street which is bordered by drives reaching the various station facilities. A baggage tunnel under Illinois street connects the two sections.

The general baggage room, railway mail, telegraph office, baggage master's office, milk room, lamp room, and the power room for the hydraulic elevators are located in the easterly section of the low level, and the westerly section is devoted to facilities for handling express and United States mail. Loading platforms and elevators between the two levels are provided in each section.

The baggage tunnel is of reinforced concrete construction with the top consisting of encased I-beams under Illinois street on account of limited clearance. The bottom slab is over 3½ ft. thick and acts as an inverted beam for the purpose of transmitting to the soil heavy column loads super-imposed on the walls of the tunnel, this construction being made necessary by the fact that the south wall of the tunnel coincided with the property line. The floor slab on the inclined approaches, independent of the bottom slab, are eight inches in thickness including a two-inch wearing surface. The grades on the inclines are easy, all being less than 8 per cent. The artificial lighting in the tunnel is indirect, thus doing away with glare in the faces of truck operators, the electric lights being recessed into the side walls.

The heat for the entire layout including the station, is purchased from the Indianapolis Light & Heat Company, a commercial concern which supplies steam to various down-



A Part Cross-section of the Trainshed and Station Track Layout

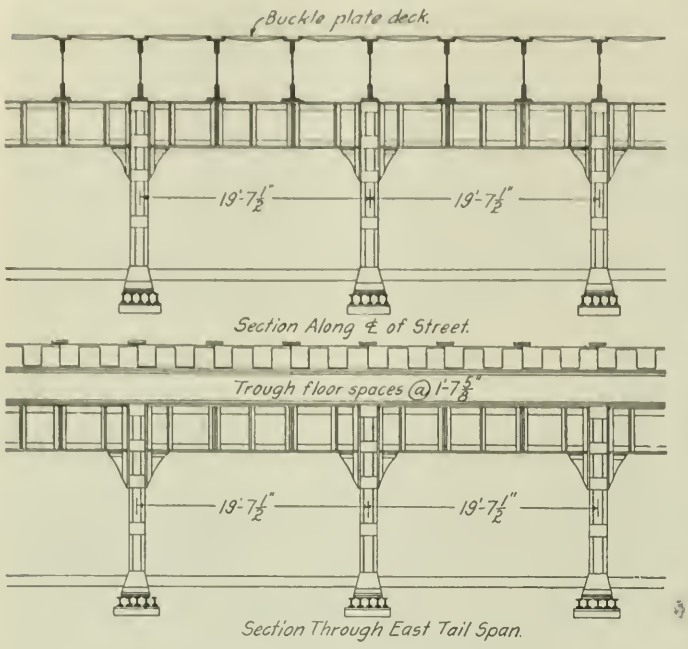
town buildings in Indianapolis. For this layout a combination of exhaust and live steam is used. The steam is carried from the commercial plant to the station, a distance of about



Typical Subway Construction

900 ft., in log insulation and then into a concrete tunnel provided for steam and other pipe lines, electric cables, etc. The main tunnel is 1500 ft. long with branches to the main building, elevators, power room, etc.

The power room contains the control apparatus for the hydraulic elevators and the main switchboard for the electrical system. The coils and fans for the special heating plant for the concourse are located in a room below the ground floor. The mail, express, baggage room, etc., and the building are heated by direct steam heat with the pipe radiators placed overhead to conserve wall space.

In all, 13 baggage elevators are provided, two in each long platform and one in the west end of the platform on the north side of the shed. These are all of the hydraulic type furnished by the Abell elevator company. The power plant for the elevators is designed to operate six elevators at one time and spring cushions are provided to take up the pulsations of the pumps.

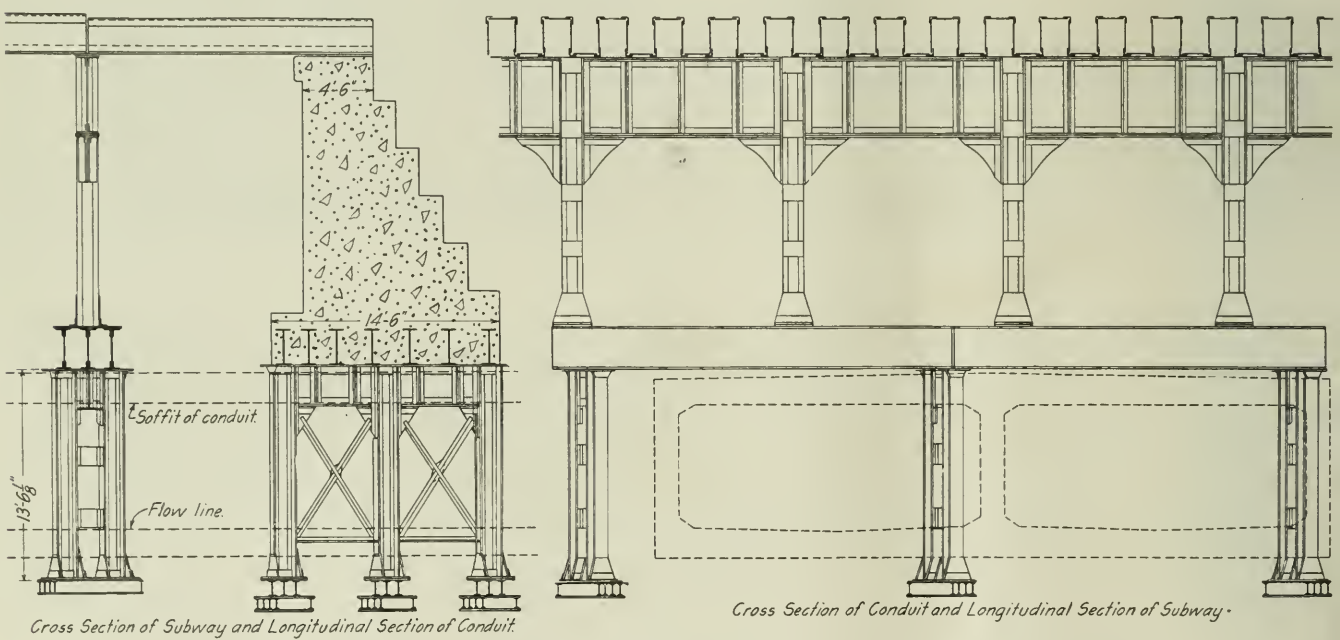
The erection of the steel work supporting the train shed was begun on the east end with the derricks placed on the Meridian street bridge. In placing the steel in that part of the floor of the trainshed structure carrying freight tracks, the ends of the troughs were shored up and brought to the proper level by means of jacks.

A ballasted deck floor is provided under the freight tracks. Under the passenger tracks the track structure was applied directly to the concrete floor. Both methods of track construction are shown in the cross-section of the trainshed.

New and interesting methods were developed in the construction of the passenger tracks. The track structure consists of short ties with standard screw spike construction. The tracks were assembled on the sub-floor as a base for the blocking and were then swung on a timber structure, consisting of a series of trusses spanning two tracks and extending 106 ft. longitudinally. These trusses were supported on the longitudinal dividing girders provided in the floor and the track was suspended from them by means of clamps and bolts, the bolts allowing for vertical adjustment. The tracks were lined by lining the trusses and when the proper grade and line was secured the finished floor was poured, the concrete being of the proper consistency to be worked thoroughly around and under the ties. Drainage is provided by means of a gutter in the center of each track leading to specially made down leaders provided with grate coverings.

Other Roads Affected by the Central Improvement

The new arrangement of the Union Tracks makes necessary extensive changes in the Big Four layout. The present line on its Chicago division east of Indianapolis occupies Louisiana street to a point just west of East street and extends in a northwesterly direction to a connection with the Indianapolis Union Tracks at Delaware street. This is a double track line and will be abandoned as a main line, but will be retained in service as a switching lead for industrial and team tracks located at New Jersey and East streets. By abandoning this line as a main line and constructing a new route a satisfactory grade will be obtained on



Details of the Structural Steel Frame to Carry Subway Over the Pogues Creek Conduit

the ladder track leading into the Big Four freight house, after it crosses Virginia avenue on a bridge adjoining that of the Indianapolis Union Railway. The new route connects with the Union tracks east of Noble street. By this scheme the elevation of the Big Four tracks will be confined to a distance of about 2,000 ft. as contrasted with approximately two miles of elevation work required if the old route were improved, including an additional bridge over Virginia avenue which would have rendered that street less passable. The relocation of the main line made necessary the purchase of considerable additional right-of-way in a residential section of the city, and while the line is to be generally carried on fills, retaining walls will be necessary at intersecting streets and alleys to allow the continuation of street traffic.

The Indianapolis division of the Big Four is affected by the improvement from a point west of the line of East Michigan street extended to an intersection with the tracks. From this point west the tracks will rise on an ascending grade, crossing over Market street and joining the general project at Washington street. In connection with the Indianapolis division work, the Alabama street team yards are to

The Baggage Tunnel Under Illinois Street

be elevated, crossing East street on the elevation and then descending to Alabama street. This is made possible by the closing of New Jersey street.

The Peoria & Eastern, one of the western divisions of the Big Four, is affected by the improvement at Capitol avenue, where a small team yard was elevated. This work is now completed. The changes in the St. Louis division and the Chicago division tracks west of Union Station are minor and confined to a distance of two blocks, where the Big Four owns trackage rights.

The Pittsburgh, Chicago, Cincinnati & St. Louis railroad is affected more than any other road by the elevation of the Union tracks. New inbound and outbound freight houses have been built, fronting respectively along Pennsylvania and Delaware streets and extending south to South street. This work was done in connection with the elevation of the Louisville division. The sites of the old freight houses, north of the Union tracks extending between Pennsylvania street and Virginia avenue will be utilized for elevated team yards. Extensive retaining walls are being built in connection with the latter work. Some elevation work will be required on the Columbus division which will join the elevated Union tracks east of Noble street and run off to present grade east of Cruse street.

The Lake Erie & Western, the Monon and the Cincinnati, Indianapolis & Western are indirectly affected by the improvement, certain rearrangements of local freight facilities being necessary because of the changes made in other lines. The Central Railroad of Indianapolis has elevated its tracks on a steel viaduct for a distance of approximately one-fourth mile to conform to the new arrangement.

The Indianapolis Union project is being carried on under the direction of T. R. Ratcliff, engineer maintenance of way of the Indianapolis Union Railroad at Indianapolis.

Plumb Plan Propaganda

The Plumb Plan League, organized to promote the adoption of the plan for government ownership of the railroads proposed by Glenn E. Plumb, counsel for the organized railroad employees, has embarked on an extensive campaign of propaganda for the plan and to secure members for the league to pay $1 a year dues. The plan was outlined in a statement before the Senate committee on interstate commerce by Mr. Plumb and has since been put in the form of a bill, with the co-operation of the officers of the railway labor organizations, the Non-Partisan League, the Farmers' National Council and various agricultural and civic bodies. Some of the details of the plan which were not specifically stated before the Senate committee have been made definite in the bill and are described in circulars distributed from the office of the Plumb Plan Lecture Bureau at Washington.

It is provided that the government shall buy the railroads on the basis of the actual number of dollars invested therein, paying for them either in cash or bonds bearing not over 4 per cent interest. Future extensions are to be built at the expense of the territory to be benefited, with such government help as may be deemed proper to be paid for out of railroad income. It is proposed that the railroads shall be operated by a corporation to be known as the National Railways Operating Corporation, without capital other than the operating skill and ability of the directors, officers and employees, who will constitute the corporation. Fifteen directors are to be chosen, one-third by the classified employees by election, one-third by the officers by election, and one-third by the President of the United States. Elected directors are to be subject to recall and appointed directors to removal by the President. It is proposed that the government shall lease to this corporation all railroad properties, to be operated as a single system divided into operating districts, managed by district railway councils representing the board of directors in local matters, and elected one-third by the classified employees within each district, one-third by the official employees, and one-third by the board of directors. The income of the operating corporation is to be applied to operating and maintenance expenses, renewals, interest and sinking fund payments of one per cent for the retirement of the bonds issued to pay for the properties. This, the circular says, "assures the early retirement of the bonds, after which the government will own the railroads free of debt." The net earnings remaining are to be divided equally between the government and the operating corporation and the corporation's half of the profits is to be declared as a dividend upon the amounts paid in wages, every classified employee receiving that proportion of the fund which his annual compensation bears to the total compensation of all classified employees and every official employed receiving that proportion which his annual compensation bears to the total compensation of all official employees, but every employed officer is to receive twice the rate of dividend that is given to the classified employee. The reason for this apparent generosity is explained in the circular, which states that the principal argument offered against the plan is that it would be pos-

sible for the officers and employees to combine and by raising wages absorb all profits so that there would be nothing to be divided between the corporation and the government. The bill proposes to provide against the possibility of such collusion by giving the official employees the double dividend rate on the ground that any increase in the level of wages would immediately wipe out the chance of an extra dividend for the official employees. The circular says their interest can be preserved only by maintaining the fixed wage level allowed the classified employees and obtaining for them the highest possible rate of dividend. The possibility of management and wage earners uniting to raise wages and salaries and thus absorbing profits and perhaps creating a deficit thus wholly disappears, the circular says. Apparently it is not considered necessary to provide such safe-guards against combinations of the employees to raise their own wages without the collusion of the management.

To protect the public from the payment of rates resulting in excessive profits, it is provided that whenever in one year the net profits received by the government shall equal or exceed 5 per cent of the gross operating revenues, the Interstate Commission shall immediately reduce the rates by an amount sufficient to absorb these profits and it is argued that every such reduction in rates will tend to increase the flow of traffic and again restore profits to their former level, again insuring a further reduction in rates.

The board of directors, according to the plan, would create, by negotiation with the employees, not less than three boards of adjustment of not less than eight members each, half from the classified employees coming within the jurisdiction of the several boards, and the other half from the official employees. These boards would decide all questions arising from the interpretation of established wage rates, wage awards, working relations, discipline cases and other disputes between the two classes of employees. Their decisions would be final except that where no majority decision can be obtained an appeal would lie to the board of directors. The board of directors would also create a central bi-partisan board of wages and working conditions to determine matters of salaries, wages, hours and other conditions of employment when brought before it by official and classified employees.

It is stated that over six million American citizens and voters have endorsed the plan. A saving of $250,000,000 a year is promised as soon as the plan goes into effect.

A million and a half copies of the circulars are being distributed by the league and membership applications are invited, both individual and lodge memberships. Membership buttons are to be given and "all individual members are authorized and expected to greet all fellow members wearing the insignia without further introduction" and all are asked to co-operate in the important task of educating public sentiment to the supreme importance of the plan. The object is to secure the enactment of the Plumb plan bill by Congress. This, the circular says, can only be accomplished by awakening public sentiment and securing public approval and endorsement. "Already Congress is aroused to the gravity of the crisis. Good work has been done in Washington during the present year. The first line trenches have been taken. The Senate and House are alert and watching. Government ownership of railroads has never been tested in this country. In 1918 amid war-time difficulties when Wall Street broke down Washington stepped in. After shifting its load to the government Wall Street continued to exercise its influence in railroad control. Private operation at public expense was the result. Extravagance and economy went hand in hand. Government administration worked wonders but it could not change human nature. Every railroad man knows the facts."

Another circular gives the A. B. C. of the Plumb plan by means of a series of questions and answers. This explains further how it is proposed to save $250,000,000 a year. For instance, the circular says, if the entire surplus is $500,000,000 and this is 10 per cent of the gross operating revenue, the government receives $250,000,000 and because this is 5 per cent rates are decreased 5 per cent and without new economies or new business the profits the next year would be only $250,000,000, but decreased rates mean more business and the prospect of a reduction in dividends would stimulate the employees to improve their operation by applying better methods.

Samuel Gompers, president of the American Federation of Labor, is honorary president of the league; A. B. Garretson, ex-president, Order of Railway Conductors, is honorary vice-president; Warren S. Stone, grand chief, Brotherhood of Locomotive Engineers, is president, and the vice-presidents are executive officers of 14 railroad labor organizations.

Elkhart to Toledo, 7 Cars, 70 Miles an Hour

EASTBOUND EXPRESS TRAIN No. 4, of the New York Central, on Sunday, May 14, being more than an hour behind time, traversed the division from Elkhart, Ind., to Toledo, Ohio, 133.01 miles, in one hour, 54 minutes, or at the rate of 70 miles an hour. From Millersburg, Ind., 18 miles east of Elkhart, to Nasby Tower, about 4 miles short of Toledo, a distance of 111.31 miles, the time was one hour, 27 minutes, equal to 76.76 miles an hour.

The train, in charge of Conductor Cantrick, consisted of 7 steel cars, weighing about 940,900 lbs. The engine, No. 4853, weighs, with its tender, about 250 tons, and it was run by H. Evans. The weather was clear.

This division of the New York Central, is as nearly straight and level, probably, as any road of equal length and importance in the United States, there being one tangent about seventy miles long. The time of the train, as reported by C. V. Cook, is as follows:

Miles from Elkhart	Station	Schedule time a. m.	Actual time a. m	Altitude
	Elkhart Station	10.40	11.47	764
.15	B Tower, Elkhart	....	11.48	764
10.23	Goshen Tower	10.55	12 00	798
18.03	Millersburg	11.05	12 08 p.m.	879
25.08	Ligonier	11.13	12.14	895
34.91	Brimfield	11.24	12.21	952
41.63	Kendallville Tower	11.33	12.27	976
48.00	Corunna	11.41	12.32	967
54.35	Waterloo Tower	11.48	12.37	916
62.26	Butler	11.57	12.43½	869
62.89	WB Tower, Butler, Ind.	....	12.44	864
67.84	Edgerton Switch, Ohio	12.03 p.m.	12.48	862
79.93	Bryan Tower	12.16	12.57	764
92.60	Archbold	12.31	1.07	739
100.88	Wauseon Tower	12.41	1.13	774
114.58	Swanton	12.56	1.24	....
124.06	Holland	1.06	1.31	637
129.34	Nasby Tower	1.13	1.35	....
133.01	Toledo, Union Station	1.20	Arr. 1.41	587

Railroads were crossed at Goshen, Kendallville, Waterloo, Butler, Bryan and Wauseon; at the crossing two miles east of Wauseon, and at Nasby Tower. Water was taken from track pans at Grismore, east of Millersburg; at Corunna, and at Stryker, about seven miles east of Bryan.

The principal significance of this record of speed is in the weight of the cars. Equally good time was made over this division, westbound, by the Twentieth Century Limited, sixteen years ago, (May 25, 1903,) but that train had only four cars. On June 8, 1905, a train of the Pennsylvania Lines, Western division, No. 18, eastbound, second section, three cars, was run 50 miles at 79 miles an hour; 100 miles at 77.2 miles an hour; and 200 miles, including two stops, at 71.3 miles an hour. On October 24 of the same year, a Pennsylvania special train of four cars, westbound, weighing 260 tons, was run from Crestline, Ohio, to Clarke Junction, Indiana, 257.4 miles, at 74.55 miles an hour. In this run a distance of 131 miles was covered at 77.81 miles an hour.

Doings of the United States Railroad Administration

Railroads Carried 4,276,949 Troops During the First Six Months of 1919—I. C. C. May Figures Issued

DURING the first six months of 1919, the railroads of the United States carried 4,276,949 troops on special and on regular trains. In addition, something like two million officers and enlisted men made railroad trips while on furlough. There were also approximately one million men who traveled to their homes from the camps where they were discharged. The aggregate, therefore, was approximately seven and one-fourth millions of military passengers who, in addition to the civilian passengers, were carried by the railoads from January 1 to June 30, 1919.

The average journey of the troops carried on special trains during that period was 660 miles. For other military passengers the length of the average trip is not available, but it was probably shorter than the average trip on special trains. Assuming that the general average journey was 500 miles, the seven and one-fourth millions of soldiers made approximately 3,625,000,000 passenger miles. While the final figures for June are not yet available it is estimated that the passenger miles of civilian passengers in the six months' period were approximately 17,737,000,000. The addition of the 3,625,000,000 military passenger miles will give an aggregate of approximately 21,362,000,000 passenger miles, an increase of 20 per cent. over the total of civilian traffic alone.

The military traffic during the first six months of 1919 required something like nine millions of train miles, or approximately one hundred million passenger train car miles for the one-way journeys. As in practically all cases the equipment had to be sent light in one direction, either going or returning, these figures should be doubled to express the aggregate transportation demand of our military traffic.

During the first two weeks of July, 160,633 soldiers returned from Europe, practically all of them being moved for long or short distances by railroad. The number arriving during the first week of July in which civilian passenger travel was also unusually high because of the occurrence of the Fourth of July, was 92,084, while the second week of July the number was 68,594.

The extraordinary demand on the passenger carrying equipment of the country explains why the Railroad Administration has not been able to meet all of the requests for excursion trains, and why in some cases the cars on regular passenger trains have been crowded. In the month of June alone the railroads transported 914,314 troops, not including men discharged or on furlough, most of them over relatively long distances, and the totals for July, when they are available, will probably be nearly as large.

As these returned soldiers must be moved long distances from the Atlantic ports to all sections of the United States, the passenger cars assigned to their trains are necessarily withdrawn from regular service for comparatively long periods.

Of the troops carried during the first six months of 1919, 1,642,348 were discharged soldiers who are carried at a rate of approximately 2 cents a mile. The approximately 2,000,000 officers and enlisted men who made railroad trips while on furlough during the first 6 months of 1919, traveled generally on a rate of approximately 1 cent a mile. Land grant reductions applicable to some railroads, particularly in the west, also resulted in some of the regular troop movements being made at less than the standard rate of 3 cents per mile, applicable to civilian travelers.

WASHINGTON, D. C.

The Compensation of the Georgia & Florida

In answer to the charge made by Wade H. Cooper before the Senate committee at the hearing on June 30, that John Skelton Williams, as director of finance of the Railroad Administration had ratified and approved a contract by which the government was required to pay that road "the sum of $88,000 per year net rental when that road had sustained a net loss of about $513,000 for the year previous," Mr. Williams has submitted to the Senate committee a letter from Director General Hines showing that the railroad referred to, instead of showing a net loss of about "$513,000" for 1917, had actually made in 1917, $105,643 net, and that Mr. Williams had had no part whatsoever in connection with the taking over of that road or the fixing of its rental. The letter is in part as follows:

"You did not have anything to do at any time with the negotiation of the contract which the director general made for the Georgia & Florida Railroad, or with the fixing of the amount of compensation, or any other term of the contract, or with determining whether or not the railroad should be under Federal control at all. From the very outset of the Railroad Administration you made it clear that you did not wish to have anything to do with the matter and your wish was strictly respected.

"I notice that Mr. Cooper's testimony refers to certain deficits with respect to the Georgia & Florida Railroad. The deficits stated by him are altogether different from the figures with which the Railroad Administration had occasion to deal. Under the federal control act the Railroad Administration's starting point in dealing with these questions was the operating income or deficit, i. e., the balance or deficit remaining after deducting from the operating revenues the operating expenses, taxes, car hire, joint facility rents, etc. I state in parallel columns the deficits mentioned by Mr. Cooper and the actual figures of net operating income or deficit with respect to this railroad:

Mr. Cooper's statement of deficits		Net operating income or deficit
1917 ..... $518,991	1917	(net operating income) $105,643
1916 557,408	1916	(net operating deficit) 10,472
1915 636,558	1915	(net operating deficit) 96,862
1914 461,197	1914	(net operating income) 57,397
1913 403,234	1913	(net operating income) 33,584
1912 245,277	1912	(net operating deficit) 13,806

"In conclusion permit me to say that you had no responsibility, either directly or indirectly, by affirmative action or by acquiescence, in dealing with this matter. Other members of the staff, including myself, assumed and discharged the entire responsibility of making the recommendation to the then director general, and he acted upon that recommendation."

Contracts Executed

The Railroad Administration has executed co-operative short line contracts with the Pelham & Havana and the Delaware Valley.

The Railroad Administration has executed co-operative short line contracts with the Pelham & Havana, the Delaware Valley, the Kentucky & Tennessee, the Augusta Railroad, the Rapid Railroad, the Live Oak, Perry & Gulf, the Tuskegee Railroad and the California & Southern.

Revenues and Expenses for May

The Interstate Commerce Commission has issued the following compilations, subject to revision, from reports of revenues and expenses of steam roads having operating revenues above $1,000,000 annually, including 184 Class I roads and 17 switching and terminal companies:

22—Railway operating income	42,428,688	76,635,033	182	327	118,934,028	231,757,814	509	990
23—Equipment rents (Dr. Bal.)	1,788,975	2,613,951	8	11	7,808,787	11,204,088	33	48
24—Joint facility rents (Dr. Bal.)	1,177,346	686,597	5	3	5,909,791	5,173,524	25	22
25—Net of items 22, 23 and 24	39,462,367	73,334,485	169	313	105,215,450	215,380,202	451	920
26—Ratio of operating expenses to operating rev., per cent.	85.91	75.62	...	...	89.83	81.85	...	...

NOTE.—The average railway operating income corresponding to item No. 22 above for the month of May in the three years 1915, 1916 and 1917, included in the "test" period of three years ended June 30, 1917, was $351 per mile of line for the United States.

The increase in earnings for the five months period is 14 per cent as compared with 1918. As compared with the corresponding five months of the test period the increase is 41 per cent. The expenses, which increased 25.1 per cent as compared with last year, was 79 per cent higher than for the test period. Maintenance of way and structures shows an increase of 38 per cent over last year but 88 per cent as compared with the test period. Maintenance of equipment increased 33.6 per cent as compared with last year and 98 per cent as compared with the test period. Transportation expenses were 18.4 per cent higher than in 1918, but 74 per cent higher than in the test period.

The Railroad Administration statement regarding the May figures, says that inasmuch as the present rates are considered to be approximately 25 per cent. higher than they were last year, the increase in operating revenues of not more than 98 per cent would seem to indicate that total traffic as expressed in ton miles and passenger miles has fallen off approximately 12 per cent. The falling off in freight traffic alone amounted to 13.5 per cent. This decrease was partially offset by an increase in passenger traffic, the complete figures for which, however, are not yet available. In making further comparisons with 1918, it should also be borne in mind that the increased wages for May, 1918, were not charged into operating expenses until subsequent months.

It must also be remembered that the comparison between the five months' periods is substantially affected by the fact that the wage increases for these five months in 1918 could not be included in the accounts until later months, and that the rate increases approximating 25 per cent, which were in effect this year, were not effective during these five months last year.

Thousands of returned soldiers are being put back in their former positions on the Baltimore & Ohio, the Western Maryland, Pennsylvania and other railroads, according to a press despatch from Cumberland, Md. This is one result of the tremendous exodus of foreign railroad men and laborers to their own countries. Foreigners who are said to have moved in large numbers from West Virginia, when that State went "dry," to Pennsylvania and to Maryland have been leaving this country at a high rate for the past month, anticipating country-wide prohibition. They expect to secure lucrative work in their native lands and also have alcoholic stimulants. Six new coal mines have been opened or have resumed work on the Cumberland division of the Baltimore & Ohio, since June 15, increasing the demand for trainmen.

A Comprehensive Revised Interstate Commerce Law

Suggestion for Law Which Shall Correlate Laws Passed Since and Including That of 1887

L. F. LOREE, president of the Delaware & Hudson, has drawn up a revised Interstate Commerce law which has been sent to legislators and others interested, and which occupies about 95 printed pages. The provisions of the Act of 1887 and subsequent amendments are given in full, with those portions which it is proposed to omit placed in brackets, in italics, and the words which it is proposed to add shown in capitals. In a brief introduction Mr. Loree summarizes his purposes as follows:

"The act to regulate commerce of February 4, 1887, has been so many times amended that it is not possible to determine with certainty what the law now is without recourse to many volumes and much study. For this reason alone, a comprehensive revision and consolidation of the existing law, with the repeal of the original statutes, is desirable.

"Moreover, it is recognized on all hands that the law had become oppressive rather than remedial; that it tends to deprive the public of needed facilities and service and denies to legitimate investors the fair returns to which they are legally and morally entitled.

"The statute here proposed follows the present law as closely as the necessities of the situation permit. It is offered in the hope that proposals based upon 40 years' service, involving personal acquaintance with problems dealt with under many and varied conditions and in many aspects, will prove to be suggestive and helpful.

"It proposes extension of the power of the Interstate Commerce Commission to cover state rates which in any way affect interstate commerce.

"It proposes extension of the power of the Interstate Commerce Commission to labor disputes, requiring that wages and conditions of employment shall be just and reasonable. Employees should be forbidden to conspire to interrupt interstate commerce. Strikes should be permitted only on condition that the dispute must first have been submitted to the Interstate Commerce Commission and, subsequent to its decision (or its failure to decide within six months), there must be a vote to strike, which vote should be by secret ballot on a question defined by the Commission, the taking and counting of the vote being supervised by the Bureau of Interstate Transportation.

"It proposes that the Interstate Commerce Commission shall become wholly an adjudicating body, the terms of office of the commissioners, after the retirement of those now in office, to be extended to nine years; and the division of the country into five interstate commerce regions, following the natural traffic divisions of the United States one commissioner to have his office in each region, leaving three to sit in Washington. Commissioners assigned to regions should perform only such duties as may be devolved upon them by the three remaining in Washington, these three to exercise all the powers of the commission except those thus provided for.

"It proposes that the Interstate Commerce Commission shall be required, as soon as practicable, to fix, either for the United States as a whole or for each interstate commerce region, the percentage by which existing rates ought generally to be increased in order to meet expenses and provide proper revenues. No rates not exceeding the present rates by more than these percentages should be regarded as unreasonable in themselves, but any rate may be condemned in case it is found to produce unjust discrimination. Until these maximum percentages are made effective, the Secretary of the Treasury should pay to each system surrendered from Federal control the difference between the actual income and the standard return under the federal control act, if the actual income is less.

"It proposes that the power to suspend rates pending investigation should be abolished.

"It proposes to create a Bureau of Interstate Transportation to operate under the direction of a chief, to be designated from among the members of the Interstate Commerce Commission, but this commissioner, during the period of such designation, not to perform any duties as commissioner. This bureau should take over all the executive and administrative functions of the commission.

"It proposes that the Interstate Commerce Commission shall no longer be permitted to institute proceedings of its own volition, but provides that the Bureau of Interstate Transportation, as well as state commissions, trade organizations, individuals, firms and corporations may be complainants before the commission.

"It proposes that carriers shall be given power to exchange passenger transportation for advertising in periodicals. The practice of barter should be recognized to be as legitimate as are cash or credit transactions.

"It proposes to provide for immediate judicial review of findings under the 'Valuation Act.' The law already provides for such review, but does not clearly provide that it may be obtained immediately, and unless this is possible, it might not be obtainable until much of the evidence had disappeared.

"It proposes to repeal the commodities clause, the anti-pooling clause and section 10 of the Clayton Act and that the Sherman anti-trust law shall be made inapplicable to carriers subject to the Interstate Commerce law.

"It proposes that the Secretary of the Treasury shall be authorized to settle and pay claims on account of acts or omissions of federal officers during federal control and an account of just compensation for the use of properties. Many such matters will be left open at the end of federal control and there should be an expeditious method of obtaining just settlement without litigation, similar to that under which the War Department is now empowered to settle claims growing out of orders for munitions, etc. Appeal to the Court of Claims should, however, be allowed in cases in which agreement is found to be impracticable. Provision should also be made for funding of balances due the United States on account of additions and betterments to the properties during the period of federal control. The acceptance of serial notes payable within 15 years and bearing interest at a rate slightly above that which the government paid on the Victory loan would appear to be reasonable.

"It does not propose anything which would increase the number of federal officers and employees or the expense, to the taxpayers, of federal regulation.

"It does propose a restoration of the American concept of healthy competition with private responsibility and private reward, subject to affective means for the prompt correction of any rates which are found to be unreasonable in themselves or unjustly discriminatory. It would establish an impartial tribunal which would exercise powers that are judicial in their essential character and provide a separate executive, administrative and prosecuting agency, available to any interest requiring relief, while giving to the same impartial

tribunal power to determine labor controversies, thus protecting industry against unnecessary interruption of service.

"It does propose a desirable decentralization of regulative power and the prompt and equitable adjustment of claims arising out of federal control."

The bill is drawn in a form with which congressmen are entirely familiar and its comprehensiveness and form are both integral parts of the work. It is impossible, however, to print the bill in full in the *Railway Age* and a summary only, therefore, can be given of how the present laws are revised to accomplish the 11 purposes which Mr. Loree has attempted to accomplish. The following is such a summary:

In section 1-A of the new law the words "and to every employee of any such common carrier or carriers" are added to the original Interstate Commerce Commission Act in order to bring labor disputes within the purview of the law, and in the same section the clause describing an interstate shipment is amended so as to read "from any place in the United States to any other place in the United States;" and the clause excepting intra-state traffic from the jurisdiction of the Interstate Commerce Commission is limited by adding the words "unless in a particular case the Interstate Commerce Commission shall be of the opinion and shall find that the application thereto of the provisions of this act is necessary to prevent undue or unreasonable preference or advantage and to relieve a particular person, company, firm, corporation, or locality, or a particular description of traffic otherwise subject to said provisions, from undue or unreasonable prejudice or disadvantage."

To section 1-B, which defines common carriers, is added, "and the owners of all cars or other rolling stock, whether for passenger or freight, used in interstate commerce," so as to bring the owners of rolling stock clearly within the law.

To section C, which provides that charges for service shall be reasonable, is added the provision that "all rates of wages and hours of service and conditions of employment of all employees engaged in transportation subject to this act shall be just and reasonable * * * * and every unjust and unreasonable rate of wages or requirement or condition of employment is prohibited."

A new section, E, is added, which makes it binding on the Interstate Commerce Commission to fix the percentages of increase of present rates which shall meet expenses and provide proper revenues. This section contains the following paragraph:

"Except as hereinbefore provided all rates and charges for any service rendered or to be rendered in the transportation of passengers or property and all classifications of property for transportation and all tariffs, regulations, and practices affecting such transportation lawfully in force 60 days before the end of federal control, as defined in the act entitled 'An Act to Provide for the Operation of Transportation Systems while under Federal Control, for the Just Compensation of their Owners and for Other Purposes' approved March 21, 1918, are hereby declared to be prima facie, reasonable, just and lawful and no common carrier shall be required to reduce or to modify any such rate, charge, classification, regulation or practice unless the Interstate Commerce Commission shall be of the opinion and shall find that such rate, charge, classification, regulation, or practice is in violation of the third section of this act."

To section F, which prohibits passes, etc., is added the following provision:

"Nothing in this act shall be construed to prohibit common carriers from transporting passengers in consideration of the publication of advertisements in periodicals admitted to the mails as second class matter, but such passengers shall be carried only on tickets accounted for at the rates lawfully in force and advertising paid for in this manner shall be charged for at the regular rates of the respective periodicals."

This section is amended so that tariffs shall be filed with the Bureau of Interstate Transportation instead of with the Interstate Commerce Commission, and this section is further amended by the striking out of the so-called commodities clause which forbids a common carrier to transport commodities which it owns in whole or in part, or in which it has an interest direct or indirect.

Section G is so amended as to provide for a complaint being made to the Commission by any person, firm or corporation and striking out the provision limiting the power to make complaint to a shipper or owner of a lateral branch railroad.

Section I is amended so as to provide that complaints may be brought by the Bureau of Interstate Transportation and the provision that the Interstate Commerce Commission can act on its own initiative without complaint is stricken out.

In section 3-B the clause exempting common carriers from being required to give the use of tracks or terminals to other carriers is stricken out and a new clause C is added as follows:

"That it shall be unlawful for any employee, subject to the provisions of this act, to combine with any other employee or employees for the purpose of preventing, interrupting, or impeding, whether by concerted action in ceasing to work or abandoning employment or otherwise, any transportation of persons or property or the operation of any common carrier by railroad or partly by railroad and partly by water when both are used under a common control, management or arrangement for a continuous carriage or shipment, and every contract, combination, or agreement between any two or more persons for the purpose of preventing, interrupting, or impeding, as aforesaid, such transportation or such operation, is hereby declared to be a conspiracy in restraint of interstate commerce and every person who shall make any such contract or enter into any such combination, agreement, or conspiracy, or commit any act in furtherance thereof, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by a fine not exceeding $2,000 or imprisonment for not more than one year or both said punishments in the discretion of the court: Provided, however, that no strike or agreement to strike shall be held to be within the prohibition of this paragraph if, previous to such strike or agreement, the Interstate Commerce Commission has rendered its decision with reference to the matter or matters in dispute or, having had such matters or matters in dispute under consideration for more than six months from the filing of a complaint covering such disputed matter or matters, has not rendered its decision, and if, in addition thereto, previous to such strike or agreement, the parties thereto or a majority of them have voted to strike or to enter into such agreement, the question having first been submitted to them in a form determined by the Interstate Commerce Commission and; provided, further, that it shall be the duty of the Interstate Commerce Commission, on the written request of any party or parties in interest submitted not more than 60 days after the rendering of any opinion involving a dispute as to rates of wages or hours or conditions of employment or service or within 60 days after any such complaint has been before said Interstate Commerce Commission for more than six months without decision, immediately to define and submit for the vote of the employees designated in any such written request, the question whether they will strike or enter into an agreement to strike and thereupon the persons so designated shall be permitted to vote by secret ballot 'Yes' or 'No,' upon the question so defined, and the taking and counting of every such vote shall be under the supervision of the Bureau of Interstate Transportation and the ballots cast shall be counted by the Bureau of Interstate Transportation which shall forthwith announce the result. Any person or persons voting or attempting to vote fraudulently upon any question so submitted or attempting by bribery, intimidation, or other corrupt means to influence the result

thereof or in any way contributing to or participating in any false or fraudulent statement of the results thereof, or disclosing the manner in which any person or persons voted, shall be deemed guilty of a misdemeanor and, upon conviction thereof, shall be punished by a fine of not exceeding $2,000 or by imprisonment for not more than one year or by both said punishments in the discretion of the court."

In section 5 the anti-pooling clause is stricken out and certain formal changes are made.

Section 11 is amended so as to extend the term of office of Interstate Commerce commissioners from seven years, as provided in the Hepburn law, to nine years, and that one commissioner only should be go out of office at the end of each year and that, "Said commissioners shall be appointed without regard to political affiliations. If at the time of any appointment to fill any vacancy in said commission, there shall be one or more among the Interstate Commerce regions, hereinafter provided for, which is not represented on said commission by a commissioner who at the time of his appointment was entitled to vote for members of the most numerous branch of the legislature in some state or territory lying wholly or partly within such Interstate Commerce region, the appointment shall be made from among the persons so entitled to vote in one of said Interstate Commerce regions. There shall not be at any time among said commissioners more than two commissioners who at the time of their appointment were so entitled to vote within the same Interstate Commerce region, but this provision shall not be construed to compel the retirement of any commissioner now in office during the term for which he has been appointed. All appointments made after the passage of this act shall be from among the persons so qualified that, as soon as practicable, not less than three of said commissioners shall be persons broadly experienced in the financial, engineering, or operating management of extensive railway undertakings, but no person in the employ of or holding any official relation to any common carrier subject to the provisions of this act, or owning stock or bonds thereof, or who is in any manner pecuniarily interested therein, or who, within three years next preceding the date of such appointment has been defeated for election to any office of the United States or of any state or territory or any political subdivision thereof, shall enter upon the duties of or hold such office."

To this section is added the following:

"For the purposes of this act, the United States shall be divided into five regions to be known as Interstate Commerce regions, as follows:

"Interstate Commerce Region No. 1. This region shall include the states of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, West Virginia, Ohio, Indiana and Illinois and the District of Columbia, and the lower peninsula of the state of Michigan.

"Interstate Commerce Region No. 2. This region shall include the states of Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama and Mississippi and that portion of the state of Louisiana which lies east of the Mississippi river.

"Interstate Commerce Region No. 3. This region shall include the states of Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, Kansas and Colorado and the northern peninsula of the state of Michigan.

"Interstate Commerce Region No. 4. This region shall include the states of Arkansas, Oklahoma, Texas, New Mexico and Arizona and all that portion of the state of Louisiana not included in region No. 2.

"Interstate Commerce Region No. 5. This region shall include the states of Montana, Wyoming, Utah, Idaho, Washington, Oregon, Nevada and California, and the territories of Alaska and Hawaii."

Section 13 is amended so that the Interstate Commerce Commission shall no longer be empowered to institute complaints for its own adjudication and the Bureau of Interstate Transportation is empowered to make complaints to the commission.

Section 15-A is amended so that the commission is authorized to declare unjust or unreasonable "any rate or rates of wages or hours of service or condition or conditions of employment or service" and to determine and prescribe what shall be just and reasonable, rates of wages, hours of service, etc. Section 15-A is further amended so as to omit the paragraph which gives the Interstate Commerce Commission the right to suspend rates.

Section 15-D is amended by the addition of the following: "And provided further, that in order to prevent or to relieve congestion of freight or facilities which the Bureau of Interstate Transportation shall find to exist or to be threatened, the bureau shall have power to order the movement of any shipment or shipments over such route or routes as it may designate."

Section 17 has added to it the following: "Within 90 days next following the passage of this act, the Interstate Commerce Commission shall designate one member of the commission who shall be and act as chairman of the commission and another member of the commission who shall be and act as chief of the Bureau of Interstate Transportation hereinafter provided for and may, from time to time, change such designations, or either of them, but no person shall act as chairman of the commission, or as chief of the Bureau of Interstate Transportation, for more than five out of any six successive years. The commissioner designated as chief of the Bureau of Interstate Transportation shall not, while so designated or acting, exercise or be authorized to exercise any other authority or power whatsoever as a commissioner or as a member of said commission. Within 90 days next following the passage of this act, the Interstate Commerce Commission shall designate and assign a member of the commission to each of the Interstate Commerce regions provided for in section 11 hereof, and each commissioner so designated shall have his principal office at a convenient place, to be designated by the commission, within the Interstate Commerce region to which he has been assigned, but the Interstate Commerce Commission shall have power from time to time to change these designations. The commissioners not designated or assigned to particular Interstate Commerce regions, but not including the chief of the Bureau of Interstate Transportation, together with the chairman of the commission, shall be authorized and empowered to perform all the acts and duties required by this act to be performed by the commission except that they may, by general or special order, authorize and require any commissioner assigned to an Interstate Commerce region to exercise any of the powers of the commission, and any act performed by any commissioner, in accordance with any such general or special order, shall have the same force and effect as though performed by the commission; provided, however, that commissioners assigned to Interstate Commerce regions, while so assigned, shall be authorized to participate in the designation of the chairman of the commission, and the chief of the Bureau of Interstate Transportation, and in the designation or assignment of commissioners to particular Interstate Commerce districts, but shall not exercise or be authorized to exercise any other powers except as provided in such general or special order or orders. Every commissioner shall be assigned to an Interstate Commerce region for at least one year during each successive six years. Whenever necessary to facilitate the public business the commission may transfer temporarily and for a stated period, one or more commissioners assigned to particular districts to any other districts. Any one of the commissioners, including the chairman of the commission or otherwise, but not including

the chief of the Bureau of Interstate Transportation, not assigned to particular judicial circuits, shall constitute a quorum to do business. Whenever any matter shall be pending before any commissioner assigned to any particular Interstate Commerce region, and at any stage in any proceeding before such commissioner, the commission may require the entire record in such proceeding to be transmitted forthwith to the principal office of the commission in the District of Columbia and thereupon the record shall be transmitted as directed and the proceeding shall be transferred and shall proceed before the commissioners, including the chairman of the commission, but not including the chief of the Bureau of Interstate Transportation, or any one or more of them, not assigned to particular Interstate Commerce regions, and shall be determined by them and their determination shall be the determination of the commission. Such order for the transfer of any proceeding may be entered at any time before the day fixed for the taking effect of any final order entered therein and the commission may postpone the effective date of any order pending the final determination."

Section 19-B is amended so as to transfer the valuation work from the Interstate Commerce Commission to the Bureau of Interstate Transportation and to provide for an immediate judicial review wherever necessary to protect the property interests affected.

Section 22 is amended so as to provide that "there shall be in the office of the Interstate Commerce Commission a bureau to be called the Bureau of Interstate Transportation which shall be exclusively directed by a member of the Interstate Commerce Commission, designated as hereinbefore provided, who shall be the chief of said bureau and shall perform no other functions as a member of said commission. There shall be in said bureau such clerical and other assistants as may, from time to time, be authorized by Congress. It shall be the province and duty of said bureau to foster, promote and develop the interstate transportation industries of the United States and their efficient, reasonable and proper adaptation to the service and promotion of the interests of the consumers and producers of all articles carried in interstate and foreign commerce, as well as the interests of those who use or desire to use such agencies of interstate transportation for purposes of travel or shipment, and of interstate and foreign trade and commerce."

The remainder of section 22 is amended so as to transfer the executive duties heretofore performed by the commission, such as requiring operating statistics, annual reports, etc., to the Bureau of Interstate Transportation and providing penalties for the violations of the orders of the bureau.

Orders of Regional Directors

STANDARD CROSS TIES; SPECIFICATIONS.—Supplement 18 to Northwestern Regional Purchasing Committee Circular 19 contains diagrams of certain types of ties that will be acceptable under the United States Railroad Administration specification; also some that should be rejected.

Fire Prevention.—Northwestern Regional Purchasing Committee Circular 70 contains suggestion for fire prevention around storeshouses, lumber yards, etc.

Waste of Ice.—Northwestern Regional Purchasing Committee Circular 69 states that there is a serious shortage of ice, that the cost is very high and that every precaution should be exercised to prevent loss and conserve the supply. Ice houses should be examined for leakage, service buildings should be provided with insulation and openings kept closed, careful supervision should be given the issuing of ice to trainmen; ice should be kept under lock and key.

Routing Instructions, Pocahontas Region.—Routing Circular 1-A canceling Routing Circular 1 issued by H. P. Hathaway, Chicago representative of the traffic assistant to the regional director of the Pocahontas region contains routing instructions applying on carload freight originating in the Chicago switching district or in territory west thereof, moving through Chicago or Chicago junctions to the Pocahontas region. These instructions do not apply when in conflict with current embargoes.

Interchange Records.—The Northwestern regional director, File 20-1-37, states that since per diem settlements were discontinued a feeling has prevailed that interchange reports, junction records and car records of foreign cars are not of the same relative importance as before. However, the opportunity afforded by reduction of labor in connection with per diem accounts has been utilized by some roads to give special attention to improving all car records and reports. In view of the fact that some form of accounting for car hire will presumably be made effective on or before January 1, 1920, it is important that: (1) Close attention be given to interchange of cars at junction points. (2) The records kept by those handling the cars be accurate to the last degree. (3) Permanent records of car location and movements be maintained in the same complete and accurate manner that would be the case were actual settlements being made for car hire. (4) Careful attention be given to reports to car owners of junction movements of cars. (5) The forces engaged on car accounts be so organized that actual car hire settlements can be undertaken when necessary and on proper notice. It is suggested that a system of checking errors in the records of cars handled at junction points through a system of compiling monthly a statement showing conditions at each point, be instituted.

Traveling Engineers' Association.—The Northwestern regional director, file 77-1-100, suggests that where it is deemed advisable, traveling engineers attend the convention of the Traveling Engineers' Association at Chicago commencing Thursday, September 9. Transportation should be furnished to the men attending and reasonable expenses allowed.

Safety Appliances on Freight Cars.—The Northwestern regional director in a letter to Northwestern railroads dated July 2, gives orders similar to those issued by the regional director of the Eastern region in Circular 500-92A767 (*Railway Age,* June 6, page 1383).

Routing Instructions, Eastern Region.—Circular 71-N gives routing instructions for carload shipments of fresh meat and fish originating in the Chicago district or beyond and moving by way of Chicago or Chicago junctions to destinations in the Eastern region or neutral territory as described in Eastern and Allegheny region Joint Circular 1 of April 7, 1919, including Cincinnati, Ohio, and Louisville, Ky. Circular 74-J, superseding Circular 74-I and Supplement 1 thereto, contains similar routing instructions for perishable freight in carloads. Circular 78-C, superseding Circular 78-B, contains similar routing instructions for other freight (carloads).

Passenger Cars.—Order 214 of Southwestern regional director similar to orders issued by the Northwestern regional director, file 119-1-66 (Noted in the *Railway Age* of July 4, page 12).

Application of Floor Racks to Refrigerator Cars.—Circular 225 of the Southwestern regional director states that the Division of Capital Expenditures will approve forms for the application of standard floor racks to refrigerator cars not now equipped with such floor racks and which are used for the transportation of perishable freight requiring floor racks for their proper refrigeration, provided such forms are approved by the corporation, with a commitment that it will take care of the finances. This is not to be construed, however, to require application of standard floor racks to cars now equipped with floor racks, except as renewals are required.

Railway Developments in Foreign Countries

Export Figures for May Show Large Increases—Britain Faces Reduction of Coal Output

Locomotives to the value of £10,000 were imported into Australia during the year ending June 30, 1918, as compared with £78,000 in the previous year, and £425,000 in 1913. Also the importations of insulated wire and cable declined from £637,000 in 1913 to £181,000 in 1918.

Glasgow, Scotland, it is reported, has placed an order for 5,000 tons of tramway rails with the United States Steel Products Company, which has promised an earlier delivery than can be guaranteed by Scottish or English firms. The price quoted is £17 9s. per ton, as compared with £19 1s. 3d., the lowest British offer.

The Government of Jamaica, a British Dominion, is to buy 90 cane cars, 40 box cars and 5 locomotives. The Government is seeking to supply these needs with second-hand equipment used by the American military forces in France. In commenting on this order, the London *Times* stated that the manufacturers of railway trucks in England have orders which will take them five years to fill.

Proposed Railway From Algeciras, Spain, to French Frontier Abandoned

The American embassy at Madrid, Spain, has been informed, says Commerce Reports, that the Spanish Government has abandoned the project of constructing a direct railway from Algeciras to the French frontier. This railway was intended to form a link in the proposed Paris-Dakar line.

Belgian Railways Bill

The Belgian government has introduced into the chamber a bill placing the management of the railways in the hands of a self-governing body to be known as the National Belgian Railways Administration.

In a memorandum explaining the objects of the bill the government states that the chambers will supervise the activities of the administration and the parliamentary responsibility of the minister of railways will remain unaffected. The bill lays down in broad outline the legal status of the personnel of the administration, who will be in a position similar to that of civil servants. The right of all members of the personnel to unite for the defense of their interests is explicitly recognized, and both the lower employees and the members of the council of administration will have an interest in the results of the working of the railways.

The government asks for a speedy passage for the bill so that the new administration may begin its activities by January 1, 1920.

Japanese Developing Steel Industry

The American Chamber of Commerce in London understands that a British naval correspondent in Japan foresees the end of Japan's dependence on imported steel from the United States and from Great Britain. The Japanese are said to be exploiting on a large scale the ores which they have discovered in Korea, and to be making extensions of their industries to handle this new source of supply. Ore concessions in China will further increase the Japanese raw material.

This British correspondent predicts not only that Japan will soon be independent of outside sources of supply, but that in another ten years' time she will be exporting cheap steel to the Pacific markets and even breaking into more distant markets.

The return to lower ocean freight rates together with the development of the Japanese merchant marine, may make it possible for Japan to sell her steel even on the British market.

Exports of Locomotives in May

The exports of locomotives in May numbering 97, of a total value of $4,040,551, were nearly double those of April when 55, of a value of $2,193,168 were exported, and considerably in excess of those of any previous month this year. Italy took over half the May shipments. The figures as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce were as follows:

Countries	Number	Dollars
France	4	189,800
Italy	45	2,115,000
Canada	4	40,656
Costa Rica	14	796,600
Guatemala	2	2,100
Mexico	2	20,188
Cuba	1	23,700
Dominican Republic	1	16,900
Brazil	4	157,000
Chile	1	18,650
China	3	107,257
Russia in Asia	11	495,000
Philippine Islands	2	6,500
Belgian Kongo	4	51,200
Total	97	4,040,551

Exports of Cars in May

The exports of passenger cars and freight cars in May reached totals several times in excess of previous months. The exports of passenger cars totaling 44 at a value of $960,616, compared with 8 at a value of $1,913,728 in April, while the exports of freight cars in May totaled 3,008 at a value of $6,268,078, as compared with 1,005 at a value of only $1,913,728 in April. Canada took 39 of the 44 passenger cars and the larger number of freight cars were consigned to France. The figures for May as compiled by the Division Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

	Passenger cars for steam railways		Freight and other cars for steam railways	
Countries	Number	Dollars	Number	Dollars
Denmark	1	2,800	...	.....
France	...	.....	2,317	5,022,119
Italy	...	.....	450	772,200

Locomotive Conditions in England

London, July 1, 1919.

The conditions of the locomotives of the London, Brighton & South Coast Railway, which is considered indicative of the general conditions throughout the country, was made a matter of comment in the London Post of July 1.

It is reported that out of about 600 locomotives there are 166 awaiting repairs. At the same time the traffic conditions of this road has increased from 80,000,000 passengers a year before the war to 100,000,000 passengers a year at the present time, or an increase of 25 per cent. This is being

handled with a 25 per cent reduction in service and a 20 per cent reduction in force. This company released 5,263 men or nearly 33 per cent of its total force for war service, out of which 2,279 have returned. A large number of those who have not as yet come back are men of technical skill, and this is largely responsible for the retarded repairs. Also many of the skilled workmen have left the railroad to go to the ship yards. This is particularly the case with the boilermakers. At the repair shops at Brighton in July, 1914, there were 70 locomotives under repair with only seven awaiting shop. In May of this year there were 107 locomotives under repair with 59 awaiting shop. The situation is so bad that this company has found it necessary to have locomotives repaired in contract shops. One shop promised to repair two engines a month, beginning with January of this year, but as yet none have been delivered. In addition to the shortage of men, a reduction of working hours has accentuated the difficulty. With the present situation the company does not expect to get back to pre-war conditions for at least another twelve months.

There is considerable pressure brought to bear for the reduction in fares, but if this were done, traffic would increase beyond the capacity of the company to handle it. The increase in the cost of wages and materials is more than 50 per cent of pre-war conditions.

Exports of Car Wheels and Axles in May

The exports of car wheels and axles in May, totaling $769,733, were less than in April, but in excess of those in March. Russia in Asia, France and Japan took the greater share of the shipments. The figures as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Car wheels and axles. Dollars
France	159,972
Iceland and Faroe Islands	157
Italy	14,276
Norway	426
England	400
Canada	46,776
Panama	2,072
Salvador	14
Mexico	2,284
Jamaica	4,096
Other British West Indies	500
Cuba	9,013
Dominican Republic	56
Brazil	11,566
Chile	4,906
Columbia	5,161
Peru	10,119
Uruguay	1,100
Japanese China	43,392
British India	840
Straits Settlements	21,900
Dutch East Indies	20,879
Japan	154,234
Russia in Asia	236,794
Australia	3,949
Philippine Islands	14,017
British South Africa	840
Total	769,733

Proposed Swedish Ferry Line to England

The Swedish Railway Board, says an article quoted in Commerce Reports, has just submitted a report relative to the establishment of daily connections between Sweden and England, by a steam-ferry line between Goteborg and a harbor on the Humber, either Hull or Immingham.

After discussing the relative advantages of a steam vessel or a steam ferry line, the board decided upon the latter, as a ferry line to the Humber can count on a higher income, as well as lower costs of operation, than an ordinary boat line, if the vessels are of equal size.

As the intention is to construct ferries with four tracks, it would be possible to carry across on every trip 50 cars, corresponding at a low estimate to a yearly cargo of 126,000 tons. As it has been considered necessary, however, to get space for more cargo, the ferries would also be furnished with holds, of 500 tons each. It is intended to take coal from England when there is a lack of cargo. The coal is to be considered as supplementary cargo, as the freight rates must correspond to those of general coal steamers; when higher paying goods are available the coal cargoes will not be accepted.

The ferries are to be seaworthy and comfortably fitted up. They will accommodate 454 passengers.

The transit traffic between England and eastern Europe has also been taken into consideration for the new line. This traffic can probably be developed, as England, through the possibility of sending goods in direct cars to Russia, will have the same advantages that Germany had before. As conditions are now, however, the Railway Board thinks this traffic should not be counted on, but attention concentrated on Swedish traffic requirements with England.

Lack of Railroad Facilities Hampers All Eastern Europe

"Transportation is the chief difficulty alike in relief work and reconstruction throughout eastern Europe. Adequate railways in the Balkan states would unlock great natural resources and open up endless possibilities. The next decade in this part of the world must be an era of railroad building if the people are to live and prosper."

This paragraph, quoted from the monthly report of the American Red Cross mission at Bucharest, says a correspondent to the Philadelphia Public Ledger, points out the most serious problem which faces the new governments of the countries of eastern Europe. There are at present fewer than 100 trains in the whole of Rumania and no more than 400 locomotives, counting every available engine—good, bad and indifferent.

The most luxurious train in Rumania today includes one first-class coach and three coaches of a nondescript third-class type. Thousands of men are at work repairing the lines, but their work is hampered by lack of material. Bridges by the score were destroyed during the war by both Rumanians and Germans. These have been repaired in part only. Trains in Rumania creep along at one-third the old-time speed, with peasants and other travelers riding wherever they can find foot room, either on the steps of the coaches, on the couplers or on the roof.

As a rule, about 50 persons are accommodated on the roof of each coach. This is fine enough in fair weather, until the train pulls into a tunnel, when the roof-riders and those on the steps are half asphyxiated by the thick black coal smoke that pours from the locomotive. The locomotives used fuel oil before the war, Rumania being an oil-producing country; but the Germans took away all the oil burners from the engine fire-boxes and the locomotives have to get along now as best they can with whatever fuel is available.

Plans for English Channel Train Ferries

The train ferry service that was worked out by the British military authorities between Richborough, England and Calais, France, is going to be followed by a permanent commercial service, if plans of French business men work out as hoped.

Long before the end of the war plans had been completed for the installation of an English Channel ferry for the transport of goods and passenger cars between England and France. The interest centered in this project was largely due to the efforts of Michel Mercurio, the Paris banker, and organizer of the Societe Francaise d'Action Economique, under whose leadership there was formed the Societe Centrale des Ferry Boats. As a first step, this company bought the Inter-Continental Railway Co., Ltd., which had perfected rights for the installation of train ferries between New Haven and Dieppe.

An intensive study has already been made of the opportunities for developing train ferries, both from the engineering and commercial points of view, the Societe Centrale bringing together a consulting council for the purpose.

Beginning with the New Haven-Dieppe ferry, the Societe Centrale has now organized two other undertakings, one of which is known as the North of France and Orient ferry,

which has the full co-operation of the International Sleeping Car Co., and the approval of the French government, which has already assured a subsidy for the carrying of mails by this route. By this means trains will be operated without change from England to Brindisi and Constantinople.

A third train ferry project, also mothered by the Societe Centrale, will run between Harwich and Ostend. This latter project has already gained the co-operation of the Great Eastern Railway. In Belgium the Harwich-Ostend ferry is actively supported by Monsieur Paul Siegers, late Minister of Marine, and at present holding another portfolio in the Belgian government.

The specification on which tenders have been asked from English shipbuilders call for boats of 21 knots speed, the "utilizable" length of rails on ferry to be 210 meters. This trackage would accommodate 22 freight cars of 20 tons each or 10 freight cars and a train comprising 7 passenger cars of 15 meters in length, and one luggage van. The draught of the boats is not to exceed 4.80 meters.

Inter-Allied Railway Systems

The map accompanying this article shows in very graphic form the extent to which international transit between Western and Eastern Europe depended before the war on the railway systems of the German and Austro-Hungarian Empires. It was necessary, says the Railway Gazette, London, from a recent issue of which the map is reproduced, to make use of these systems in order to obtain the shortest routes available for such diverse journeys as England to Denmark

Map of Central European Railway Connections in August, 1914, Showing the Pre-war Dependence on German and Austrian Railways

and the Scandinavian Kingdoms; England and France, to Russia, Greece, Turkey, Serbia, Bulgaria and Roumania; Italy to Scandinavia and Russia; and from Scandinavia to the Balkans. But for the war and the resulting check to Germany's near and middle eastern ambitions, this dependence on the railways of the Central Empires would have undergone a very important increase, inasmuch as these railways represented the bulk of the mileage of the only land route to Constantinople, which in its turn is the gateway to the Bagdad Railway, as well as to Egypt, and thus, eventually, to the Cape-to-Cairo route.

In discussing post-war schemes for eliminating this dependence on the German-Austrian railways, it has to be borne in mind that the results of the Peace-Conference are likely to accentuate the necessity for the creation of Inter-Allied routes, owing to the detachment from the Central Empire and the handing over to Allied nations or those in sympathy with the Allies of such territories as Prussian Poland, Galicia, Bosnia-Herzegovina and the Trentino. A glance at the map will make this position clear, and the situation will be understandable to any newspaper reader who has followed recent discussions in regard to the future of Poland, a country whose economic freedom from Germany is as necessary as its national independence. It will thus be seen that this whole question of new international railway routes is bound up with economic and political problems whose solution is by no means easy and will call for no small measure of international goodwill and co-operation.

The precise "lay-out" of the proposed new Inter-Allied routes, avoiding the former dependence on the Central Empires will, of course, depend on the Peace Conference settlement of new international boundaries. An example is East Prussia, which it is proposed to set up as a German State between Poland and Russia. This arrangement, and the proposed status of Danzig as a free port, will have an obvious bearing on the establishment of new through routes between Russia and Western Europe, and other instances could be cited.

Britain Faces Reduction of Coal Output

Increased wages of coal miners, shorter hours, reduction of output, discussion concerning the nationalization of coal mines, and increased prices for coal, are leading factors confronting the users of coal in the United Kingdom, and in the countries that have in the past depended upon British coal mines for their fuel.

For America the situation has special importance not only because of the fact that America will probably be called upon to supply a large share of the coal that England will be unable to supply, but also because in many countries coal has become so high in price and hard to obtain that electrification of railways through the use of hydro-electric developments may prove an absolute necessity.

Press despatches from London on July 14 refer to the latest step in the difficulty in the form of the government's desire to increase the price of coal 6 shillings a ton, which, however, was so strongly opposed as to result in a postponement for three months. In seeking to justify the attempted increase, Sir Auckland Geddes, president of the Board of Trade, not only said that the increase was necessary but expressed the fear that the increase might have to be made 9 shillings 2 pence unless England could maintain her output, her markets and her prices for export in the face of American competition in coal and the use of oil. The situation is felt to be serious also in that the increased price of coal may prove a great handicap to industries manufacturing for export trade.

Perhaps the worst feature of the situation is the reduction in output not only because of shorter hours, but also because of decreased output per man. One coal mine owner presented figures at a recent meeting of the National Association of Colliery Managers, at Glasgow, showing that whereas from 1886 to 1914 the production of coal per person in the United Kingdom fell from 315 tons to 252 tons, in the United States from 1886 to 1912 it rose from 400 to 600 tons, and has since advanced to nearer 900 tons. He explained, of course, that this was partly due to the thicker and more accessible seams in America. It is a fact, however, that the output per man which in 1913 was one ton per shift is now only 0.88 tons, while absenteeism has risen to from 10.7 per cent in 1913 to 13 per cent during the past few months.

The British government has now announced that it will put in effect the Sankey award, which was a report of a

Parliamentary committee, called the Coal Industry Commission, headed by Justice Sankey. The award in addition to increasing wages 2 shillings per shift, also calls for a reduction in the hours of labor underground from eight to seven hours effective July 16, 1919, and provides for a further reduction of hours to six, "subject to the economic position of the industry at the end of 1920."

The output of British coal for the 12 months from July 16, 1919, when the 7-hour working day comes into effect, is estimated at between 214,000,000 and 217,000,000 tons, as compared with 287,000,000 tons in the year 1913, says the American Chamber of Commerce in London, quoting the figures announced in the House of Commons by Sir Auckland Geddes after the conference with the Controller of Coal Mines.

In 1913, the British coal production of 287,000,000 tons allowed an exportable surplus of 77,000,000 tons. In 1918, with the war still going on, the production was 230,000,000 tons, of which 34,000,000 were exported. The drop in output to 214,000,000 tons for the coming year, becomes all the more serious, when it is realized that there is no longer any shortage of miners, many thousands having been demobilized and returned to work since the armistice. The outstanding fact is the decline in the production per man.

Even if the amount of coal kept for home consumption is kept down to the amount used last year on a strict rationing basis—196,000,000 tons—the export surplus available will amount only to about 20,000,000 tons. This will have most serious results, the American Chamber in London points out. Not only must Great Britain's continental allies go without the coal for which they almost are entirely dependent upon Great Britain, but Great Britain herself will be tremendously handicapped by the fact that she will no longer be able to rely upon coal, which for years has been her stand-by in foreign trade as a substitute for currency. She will now have to pay for her imports in other goods or sterling. Furthermore, the increase in the price of coal for domestic consumption will increase prices in practically all branches of industry and living. The coal problem affects Britain's entire national life and its world position as a trader. The whole nation is now becoming aroused to its alarming seriousness.

The situation is further complicated by talk of nationalization of the coal industry, but the opposition to that step will no doubt prove very formidable. It is felt on many sides that the government has gone too far already and is truckling to the miner's union.

The threatened shortage of coal in Great Britain is as serious for the countries that formerly secured coal from Great Britain as for the United Kingdom itself. These countries include France, Italy, Sweden, Norway and Spain as well as South America and South Africa. These countries are now paying practically double the price for coal they paid in 1914; and during the war, as has been noted from time to time in the *Railway Age* recently, coal was almost unobtainable and the burning of wood had to be resorted to.

The United States Bureau of Mines in a report issued last week summarizing the investigations of George S. Rice, chief mining engineer of the bureau, explains the situation in the following words:

"In 1913, Great Britain supplied 31,000,000 tons to north Europe, 32,000,000 tons to France and south Europe; that is, 63,000,000 tons to the above named countries, and others, in Europe, in addition to which about 9,000,000 tons was sent to South America; and 5,000,000 tons to other parts of the world.

"If the statements made before the Parliamentary Commission are correct, from the most favorable point of view, as estimated by Sir Richard Redmayne, conditioned on maintaining of war time restrictions on domestic consumption, Great Britain will be able to supply only 23,000,000 tons of coal for export during the coming year, dating from July 16. If, on the other hand, the domestic consumption was on a pre-war basis, there would be but 7,000,000 tons available. But, on the basis of Sir Redmayne's figures, if all the coal were shipped to western and southern Europe, there would be a deficiency of over 25,000,000 tons without considering the 14,000,000 tons that Great Britain, in 1913, supplied for other parts of the world. There is thus a total deficit of approximately 40,000,000 tons, which if it is to be supplied at all, can be supplied by America only, on the assumption that Westphalia and Belgium are unable to materially increase production for several years. At best, there is evidently a very large amount of coal that the United States could and should supply to relieve the situation in Europe and in South America, now that there is likely to be enough shipping flying the American flag to take care of the business."

Cost of Freight By Motor Truck

R. E. Fulton, vice-president of the International Motor Company, in a comparison of railway freight charges with motor truck costs, says that he finds that, as compared with first-class freight rates, the motors often have the advantage on distances as great as 100 miles; and he calls attention to factors which often are overlooked. A railroad freight rate of 50 cents means just the bare transportation; it ignores the expense of making the shipment, starting with the boxing or packing cost, and all other expenses incurred until delivery is made to the receiver in good order. In figuring railway freight cost, says Mr. Fulton, there should always be included the first class freight rate plus 15 cents per 100 lb. cartage to freight house, plus 15 cents per 100 lb. to receiver's warehouse, plus 24 cents per 100 lb. increased cost of boxing and to cover increased weight caused by increased boxing.

Without including several other items of expense, he figures out the following comparisons per 100 lb.:

From	To	Approx. distance miles	By railroad freight	By motor truck
Yonkers, N. Y.	New York	14	$1.04	$0.20
New York	Newark, N. J.	9	.91	.15
New York	New Brunswick, N. J.	33	.91	.40
New York	Trenton, N. J.	58	.98	.60
New York	Philadelphia, Pa.	90	1.02	.80
New York	Greenwich, Conn	30	1.02	.63
New York	New Haven, Conn.	75	1.13	.73
New York	Hartford, Conn.	110	1.21	.90
New York	Springfield, Mass.	135	1.25	1.00
New York	Worcester, Mass.	180	1.31	1.50
New York	Boston, Mass.	230	1.36	1.50

Again, it is necessary in practically every case, says Mr. Fulton, to prepare material for freight shipment in a way entirely different from that employed when it is shipped by motor truck direct from shipper to receiver. There is a considerable additional expense for crating, for by motor truck the packages only need protection for loading at shipper's warehouse, in transit without transfer, and unloading at receiver's warehouse. In shipping by motor truck, "a great amount" of clerical work is eliminated. Where extra packing is necessary extra room is required for the boxing department. If railway freight shipments are delayed there is the additional trouble of tracing them. If the shipment arrives in damaged condition there is the further difficulty of collecting from the railroad company. Marshall Field & Company, Chicago, guarantee to make delivery within 50 miles of their store within 24 hours. Boxing often carries from 10 per cent to 20 per cent of its weight in moisture, unless it is kiln dried prior to boxing. The Otis Elevator Company estimates that by the use of motor trucks it saves $100,000 a year in lumber alone.

Often trucks will do unusual mileage at surprisingly small costs for repairs. The 2-ton Mack operated by M. Mauro, of Plainfield, N. J., has traveled 45,000 miles with practically no expense for repairs.

Personal Injuries Due to Locomotive Failures

Suggestions for Their Reduction Based on a Review of I. C. C. Locomotive Inspection Reports

By John L. Mohun
Assistant to Consulting Engineer, Union Pacific System

By presenting the personal injury accidents, as listed in the several annual reports of the Chief Inspector of Locomotive Boilers to the Interstate Commerce Commission in a comparative graphic form, with an analysis of the cause of the principal locomotive failures which caused these accidents, it seems possible that means may be devised whereby accidents due to such failures may further be reduced.

As these reports emanate from a source independent of the railroads and are national in scope, tendencies toward faulty construction or improper maintenance are naturally more forcibly brought out than in the case of the usual railroad mechanical department reports covering locomotive failures, which are confined to a single or a system of roads. Therefore, all concerned should give serious attention to these reports and the recommendations as to improvements made by the Chief Inspector.

The Federal Locomotive Boiler Inspection Law enacted February 17, 1911, made it unlawful to operate a locomotive with its boiler in an unsafe condition and prescribed rules and regulations for the inspection and test of the boiler. The law further requires the railroads to report to the Interstate Commerce Commission all accidents resulting from locomotive boiler failures or their appurtenances causing serious personal injury or death. The Commission considers a serious injury as one causing the person involved to be incapacitated for more than three days in the aggregate within ten days immediately following the accident. The law also requires the facts concerning such accidents to be investigated by the Chief Inspector of Locomotive Boilers or one of his assistants.

The Congress on March 4, 1915, amended the original Locomotive Boiler Inspection Law by making its provisions apply to the entire locomotive and its tender and all their appurtenances. The features as to reporting and investigating accidents remain the same.

Attention is invited to the charts, which present the personal injury accidents in a comparative graphic form for the years 1912 to 1918, inclusive. As the law at first related solely to the locomotive boiler, Fig. 1 lists the personal injury accidents chargeable to the failure of locomotive boilers and their appurtenances only, for the years 1912 to 1915. As the law was later amended to cover the locomotive and its tender, Fig. 2 covers all personal injury accidents chargeable to the entire locomotive and tender, and their appurtenances, for the years 1916 to 1918 inclusive.

It is obvious that certain tendencies indicated by these charts must be interpreted with reservations, as there are a number of conditions varying from time to time which should be given consideration before drawing definite conclusions, such as the amount of traffic, number of locomotives in service, weather and labor conditions, and the very abnormal state of affairs brought about by the world war in the past few years. However, these charts and the information given in detail, covering individual accidents in the annual reports of the Chief Inspector, bring out certain features in such a pronounced manner that quite definite conclusions can be drawn notwithstanding the effect of these variable conditions.

The predominating feature in Fig. 1 is the consistent reduction each year in the total number of accidents, number killed, and number injured. In a majority of cases this is also true of the number of accidents chargeable to the failure of individual parts of the boiler or its appurtenances. Evidently the material falling off in traffic during the years 1912 to 1915 had considerable to do with reducing the number of accidents, but undoubtedly a large amount of this improvement was directly attributable to the rules and regulations governing the inspection and testing of locomotive boilers and their appurtenances, put into effect in 1911 and 1912 by the Division of Locomotive Boiler Inspection of the Interstate Commerce Commission, and the general co-operation of the railroads, locomotive builders and the railway supply companies.

Fig. 2 shows a reverse state of affairs, with the exception of the number killed, in this respect 1918 showing an improvement over 1917.

The increased number of accidents between the years 1915 and 1916 was primarily due to the extension of the law to include the entire locomotive and tender; and the increase each year from 1916 to 1918 no doubt was principally caused by the abnormal condition the railroads were working under during these years, resulting from the war and the severe winter of 1917-1918. It is obvious that even if conditions had been normal during these years the same ratio of reduction in accidents which occurred in the first few years after the Locomotive Boiler Inspection Act went into effect, could hardly have been expected.

The principal accidents causing personal injuries shown by these Charts were due to the failure of the following locomotive parts or their appurtenances:

Boilers, flues, grate shakers, injectors and connections, injector steam pipes, reverse levers, squirt hose, lubricator glasses and water glasses.

Boilers and Their Appurtenances

Of these items, boiler failures are, of course, the most serious, both in the loss of life and damage to property. Fig. 1 shows a large reduction in the number of boiler explosions from all causes, there being 97 in 1912 as compared with 25 in 1915. Fig. 2 shows just the reverse, there being an increase in the number of boiler explosions from all causes from 41 in 1916 to 90 in 1918.

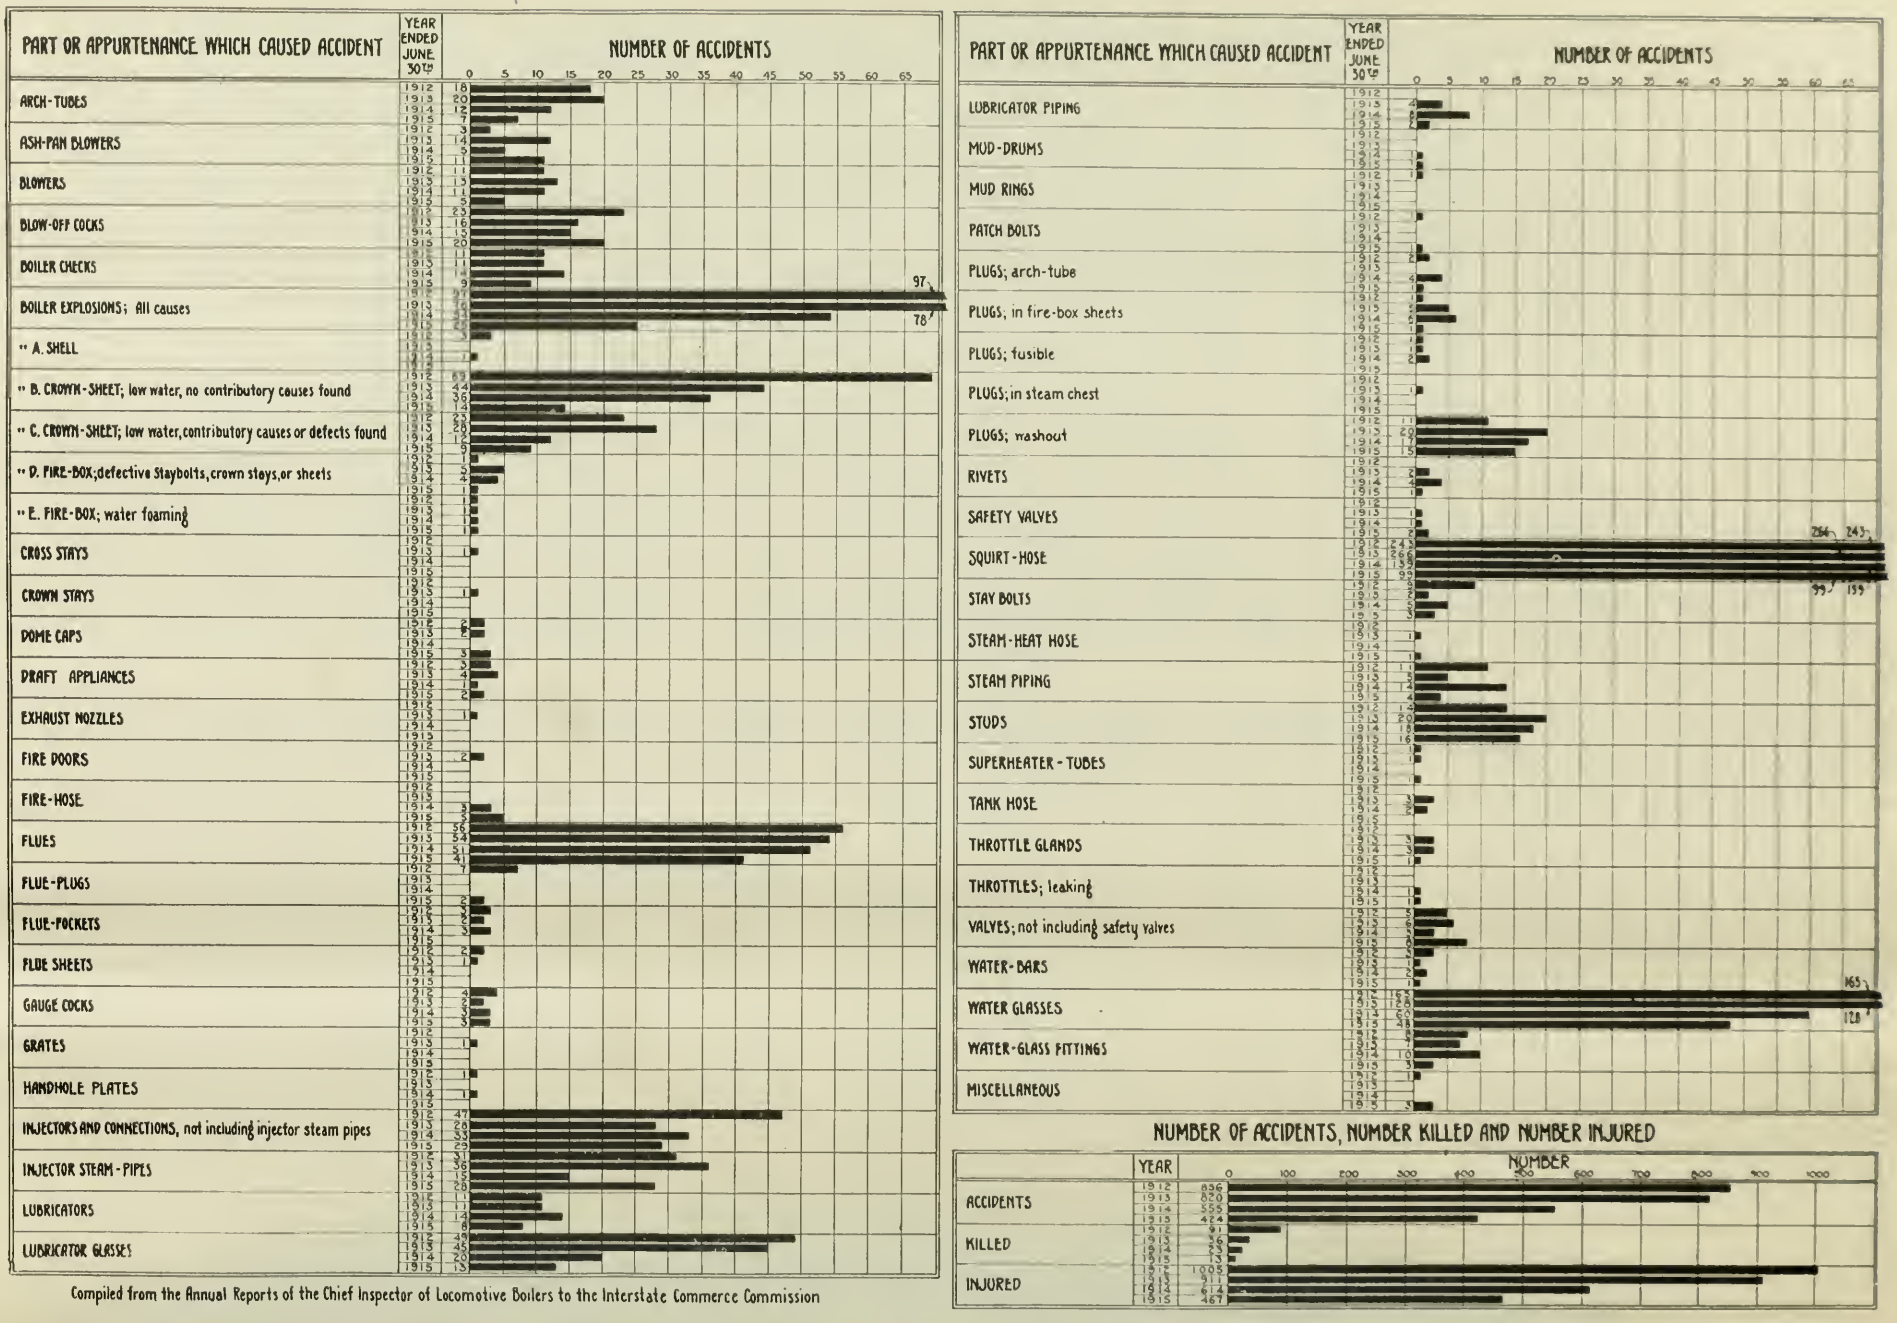
As will be seen by these charts, boiler explosions due to low water, no contributory cause, fell off fairly constantly from 69 in 1912 to 34 in 1918, but explosions due to low water contributory causes or defects found, increased during the same period from 23 to 51.

The following cases of contributory causes to boiler explosions are taken from the Chief Inspector's reports for the years 1912 to 1918, and a considerable percentage of all boiler explosions disclose similar self-evident defects:

"A bad leak was found in packing nut of top water glass cock; no packing in nut at all, and valve handle was wired to prevent it from being blown out. Union nut in steam pipe to water glass was very loose and had been leaking badly. Such leaks cause water to raise in the glass and show an incorrect water level. These leaks had been reported four times previous to accident."

"Improperly located water glass and gage cocks; lowest reading of water glass one-eighth inch above highest point of crown sheet; bottom gage cock 1⅛ inches above highest point of crown sheet; locomotive received new fire box nine months before accident and had evidently been operating in this dangerous condition for that length of time."

"Obstruction in bottom water glass fitting; bottom gage cock stopped up



Compiled from the Annual Reports of the Chief Inspector of Locomotive Boilers to the Interstate Commerce Commission

Fig. 1—Personal Injury Accidents Resulting from Failures of Locomotive Boilers and Their Appurtenances—1912 to 1915 Inclusive

with solid scale and inoperative and water glass cocks and three gage cocks not extending through reinforcing plates."

"Both injectors defective; injectors reported 14 times previous to accident."

"The failure occurred along the edge of the longitudinal seam where a crack had formed completely through the plate in several places, and more than half-way through for the entire length of the course. The engineer had reported a leak under the jacket at this point three times immediately prior to the accident."

"Crown bolt heads defective and excessively calked, due to having been overheated some time previous."

"Crown sheet failure, overheated; water foaming badly; reported six times by different engineers prior to accident, but boiler not washed."

"Twelve crown bar braces were defective on account of seven pins missing, four pins broken and one brace broken. Scale was found in the crowfoot holes, where pins should have been, showing that pins had been out for some time."

"Mud ring cracked and leaking badly; reported 18 times, and crown bolts reported leaking badly 16 times within 30 days prior to the accident."

"Opening in fusible plug filled with sediment or slag, rendering it inoperative; report of inspection made three days before accident occurred shows fusible plug removed and cleaned, yet it was found in this condition and had to be cut out of the sheet."

It is realized that quite often locomotive running repairs have to be made from day to day, under the most trying circumstances as to constant demand for and shortage of power, lack of proper facilities, and other unfavorable conditions. These facts should not, however, be considered valid reasons for placing locomotives in service without knowing that such serious defects as those listed above do not exist.

Boiler Studs

The charts show a yearly average of about fourteen personal injury accidents chargeable to the failure of boiler studs, but the Chief Inspector's reports disclose many times this number found by the district inspectors in a leaky or defective condition. A large number of accidents are shown to be due to studs blowing out on account of improper application, in some cases not more than two or three threads having entered the sheet. A number of accidents were also caused by studs failing, while being tightened, under pressure. The Chief Inspector in his sixth annual report states that studs should not be repaired by calking and under no circumstances should an attempt be made to tighten them while there is steam pressure on the boiler.

An effort should be made to reduce as much as possible the large number of studs now being placed in the boiler for attaching various parts and auxiliary devices, especially when the device produces vibrations or shocks on the studs, such as is the case with air compressors and reverse lever quadrants.

In connection with large Mallet locomotives, several railroads and the Railroad Administration have placed the air compressors on the front of the locomotive and it is believed that this should be followed generally with respect to all large locomotives for the reasons that all boiler studs are dispensed with, the compressors can more readily be looked after by the engine crew when running and as two compressors are usually used on large locomotives, by placing one on each side of the center line an equal weight distribution is obtained. By placing the compressors on the front, instead of on one side of the locomotive, more free air would be passed over the air cylinders when running, thus securing a better cooling effect.

The reports show a number of failures of studs which attach the reverse lever quadrant, undoubtedly due to vibration set up in the reach rod. The use of a power reverse gear wherein the shocks or vibrations are cushioned by the air in the cylinder, would seem to offer means for avoiding this trouble.

There are also a number of minor parts fastened to the boiler by studs which by a little study on the part of the designer, could be avoided; for example, usually two steps are provided in connection with the sand box, requiring altogether four boiler studs. A light ladder could readily be substituted; secured at the top to the base of the sand box, and at the bottom to the running board.

On all of the locomotives recently ordered by the Railroad Administration, with the exception of the switchers, the bell stand is attached to the front end. This is good practice, as it is not only the logical place for the bell, but all boiler studs for attaching the stand are dispensed with. Such matters as the fastening of sand box steps and bell bases may seem of little moment, but there are many such parts which may be similarly treated to eliminate boiler studs, which taken in the aggregate assume considerable importance.

When a new firebox, back end or an entire boiler is applied to an old locomotive it is generally renewed in kind, with the possible exception of the application of a superheater and a brick arch, and certain improved features of construction developed in the past few years are not usually employed, although such improvements may cost little or nothing. In renewals of this kind where boilers have originally been attached to the frame by means of pads and clamps in connection with which a large number of studs are placed in the firebox sheets, it would seem advisable to substitute furnace bearers or furnace expansion plates attached to the mud ring of the firebox, thus dispensing with the troublesome boiler studs. If the side grate bearers had originally been supported by studs placed in the side sheets of the furnace, it would also seem desirable when renewing a firebox or back end to substitute the more modern method of supporting the grate bearers; that is, by brackets fastened by studs placed in the mud ring, thus further dispensing with boiler studs.

When a firebox, back end or a new boiler is installed, the steam turret and possibly the injectors could be placed outside the cab; thereby reducing the possibility of accidents due to the failure of their steam connections.

Boiler Washout Plugs

These reports show that quite a number of accidents are caused by boiler washout plugs being tightened while under pressure. After a boiler has been washed, filled with water and fired up, if a washout plug should be found leaking it is a very natural temptation, in order to save time and labor, to attempt to tighten the plug while under pressure. But the very fact that the plug is leaking indicates that the fine threads may have been crossed and it should in no case be touched with a wrench while the boiler is under pressure.

Arch Tubes

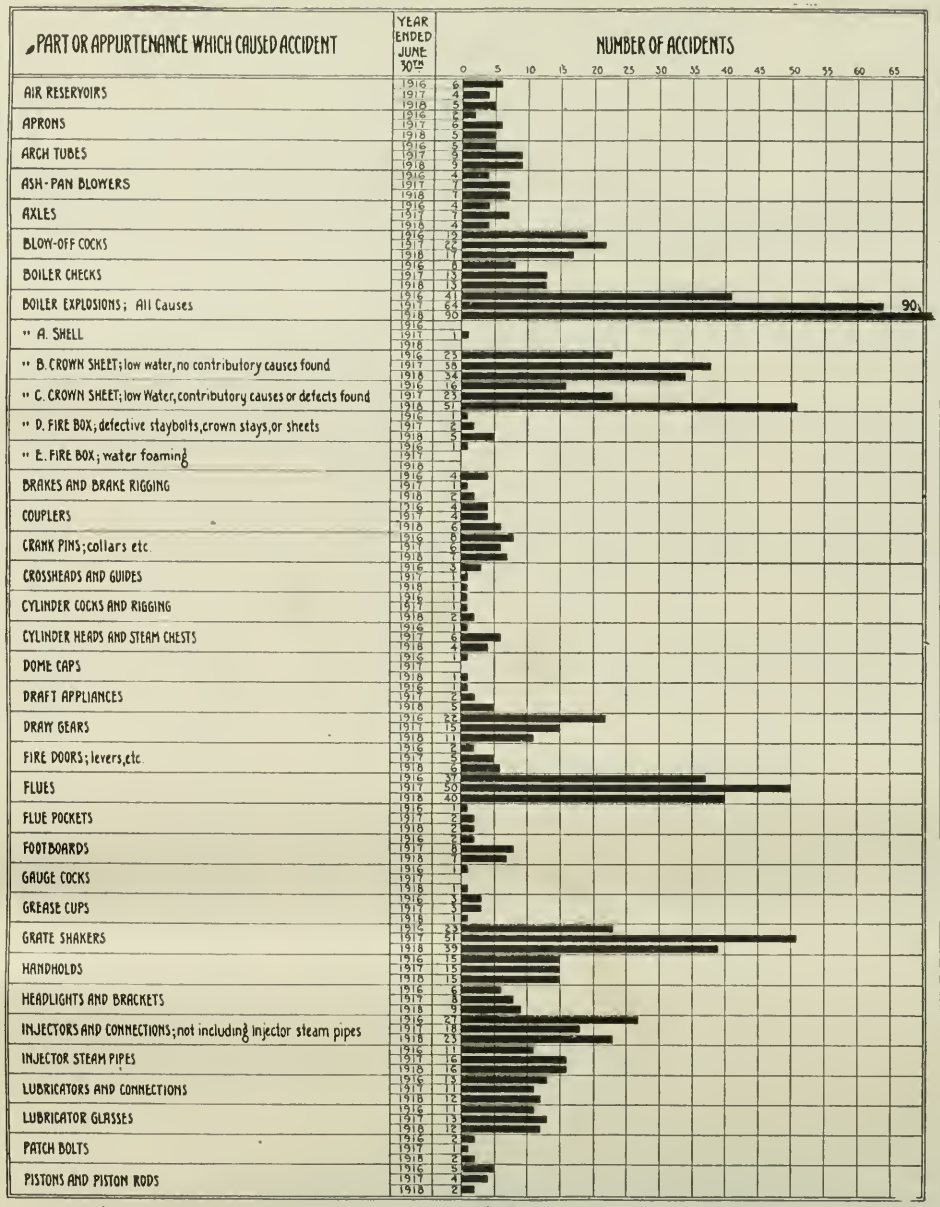
The charts indicate a yearly average of about 11 accidents caused by the failure of arch tubes. The reports show the major number of failures due either to an accumulation of mud within the tubes or faulty setting. In 1912 there were 18, and in 1918 only 9 accidents chargeable to arch tubes. Considering the fact that the number of arch tubes in service increased in this period from approximately 40,000 to 100,000, the showing may be considered a very satisfactory one and indicates that those concerned realize the importance of keeping arch tubes free from obstructions in order to obtain proper circulation through the tubes and thereby prevent them from being burnt.

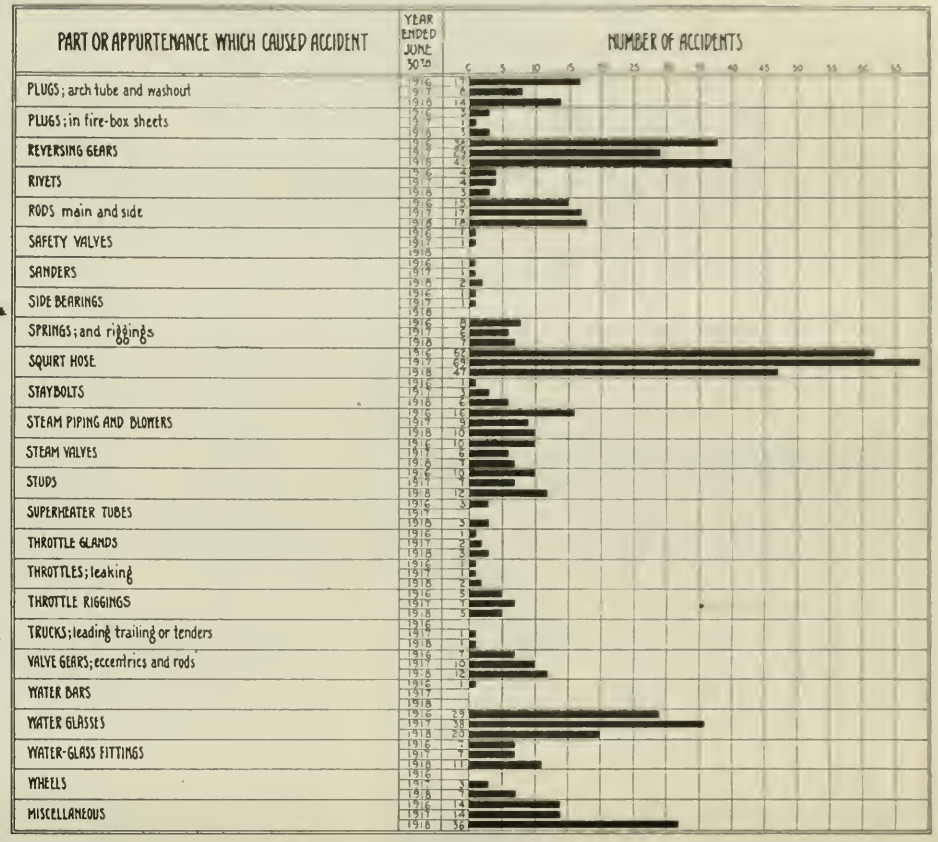
Tubes

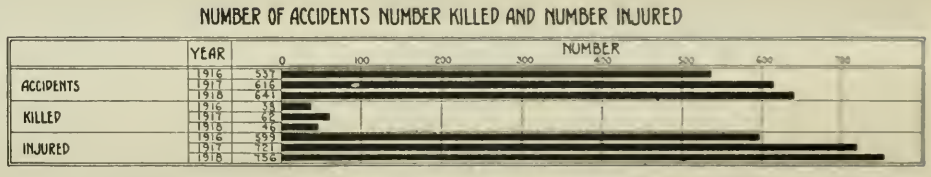
By referring to the charts it will be noted that personal injury accidents due to the failure of tubes fell off quite consistently from 56 in 1912 to 40 in 1918, most of the failures being due to poor welds; but the reports show a much greater improvement in the number of defective or leaky tubes found by the district inspectors, the decrease being from about 2,270 in 1912 to 565 in 1918. Unquestionably this improvement was largely due to better methods of setting tubes, electric welding of beads, and the rule of the Commission limiting the use of tube plugs and specifying, when they are used, they must be tied together with a rod through the tube.

Superheater Flues

Only nine accidents are shown by the charts for the years 1912 to 1918, due to the failure of superheater flues, which







Compiled from the Annual Reports of the Chief Inspector of Locomotive Boilers to the Interstate Commerce Commission

Note: Record for 1916 includes accidents due to failure of locomotive boilers and their appurtenances for the entire year and accidents due to failure of parts of locomotives and tenders covered by the amendment to the law for 9 months and 26 days only

Fig. 2—Personal Injury Accidents Resulting from Failures of Locomotives and Tenders and their Appurtenances—1916 to 1918 Inclusive

indicates that these tubes are being well maintained, especially when it is considered that the total number of superheater tubes in service increased from about 125,000 in 1912 to 980,000 in 1918.

Automatic Fire Doors

In order to reduce as much as possible the serious consequences of firebox, flue, and arch tube failures, the Chief Inspector in his annual report for the year ended June 30, 1917, recommends that all new and all locomotives then in service, when receiving general repairs, be provided with a mechanically operated fire door, so constructed that it is only open when the operator places his foot on the pedal. He further states that with the ordinary swing door, such boiler failures invariably result in blowing the fire door open and discharging steam and boiling water, together with the contents of the firebox, into the cab of the locomotive, seriously or fatally burning persons therein. He also directs attention to the fact that with the automatic fire door, the door will remain closed if the failure occurs while it is closed, and if the failure takes place while it is open, it will automatically close the instant the fireman's foot is removed from the operating device, thus preventing the direct discharge of steam and scalding water into the cab of the locomotive.

From the above it would appear that the automatic fire door is a most important safety device, and its use is well warranted solely for this reason and regardless of its coal saving features, which are generally recognized.

Grate Shakers

As disclosed by Fig. 2, personal injury accidents chargeable to grate shakers amounted to 23 in 1916; 51 in 1917 and 39 in 1918. Reports show these accidents principally due to improper maintenance of the grate shaker mechanism, such as worn or missing pins and hand shaker bars slipping off staff, due to wear in the socket and the lever stub. The use of steam operated grate shakers should preclude the possibility of such accidents.

As a large number of grate bars on old locomotives are connected by single rods placed on one side of the lug on the grate bars and employ rather small pins, lost motion is soon set up and the whole grate shaker mechanism becomes loose and wobbly and when in this condition is liable to cause an accident.

It would appear advisable in such cases to substitute a more modern method consisting of double connecting rods, one placed on each side of the grate bar lugs with large, substantial pins. This change could be made at a relatively small cost. If it should require a change in, or relocating of, the lugs on the grate bars, this could readily be taken care of at practically no increase in cost, as grate bars have to be renewed constantly. At the same time it might be found expedient to redesign the grates in order to conform to more modern practice, especially as to providing maximum air openings obtainable without the loss of coal, thereby increasing the coal burning efficiency of the grates. This can be done at small cost due, as stated before, to the fact that grates have to be repeatedly replaced.

As coal dust frequently accumulates on the top of the grate lever stubs, the socket of the detachable hand bar should be so arranged that there would be at least one inch clear space between the bottom of the socket and the top of the stub lever when the socket is placed home on the stub. Further, a hole should be drilled through the sides and at the bottom of the socket in order to allow any coal which may have lodged on the top of the lever to fall out.

Injectors and Connections

The charts show that personal injury accidents chargeable to the failure of injectors and connections (not including injector steam pipes) decreased almost constantly from 47 in 1912 to 23 in 1918 and accidents chargeable to injector steam pipes fell off in the same period from 31 to 16. The reports indicate that practically all of these accidents were due to the union nuts or brazed on collars. Failures of union nuts were due in most cases to threads stripping, nuts too large or broken by the use of improper tools, such as hammer and chisel. A large number of accidents are shown to be due to the failure of union nuts while being tightened under pressure. This is, needless to say, a dangerous undertaking and should be avoided. Failure of the brazed collars and sleeves is generally due to poor brazing. The district inspectors' reports disclose the fact that there were 26,342 injectors and connections found defective in 1913 and that there was practically a consistent reduction to 5,803 in 1918. Even the latter figure seems to indicate a rather bad state of affairs as to the proper maintaining of so important a piece of apparatus, especially in view of the Commission rule requiring the injectors to be tested before each trip.

Undoubtedly the use of non-lift injectors placed outside of the cab, and the so-called "mechanical" pipe joints in place of brazed collars, both of which are now coming into general use, will materially improve conditions in this respect.

Reverse Levers

Fig. 2 shows that there were 38 accidents in 1916, 29 in 1917 and 40 in 1918 chargeable to the failure of reverse levers.

District inspectors' reports disclose that there were 60 defective levers found in 1916, 380 found in 1917 and 308 in 1918. Practically all of these accidents are shown to be due to the reverse lever slipping out of the quadrant, caused by the worn condition of the teeth of the quadrant or lever latch, defective latch springs or dirt in the quadrant. On account of the incessant vibrations which the valve motion sets up in the reach rod it is very difficult to keep lost motion out of the teeth of the quadrant and reverse lever latch. The writer believes that the most practical way to reduce accidents of this kind is by the use of a power reverse gear in which the vibrations in the reach rod are cushioned and absorbed by the compressed air within the reversing cylinder.

Squirt Hose

There were 266 personal injury accidents in 1913 due to squirt hose. The number has quite consistently been reduced to 47 in 1918. District inspectors' reports show 3,711 squirt hose or applications found defective in 1913, which was consistently reduced to 511 in 1918. Practically all of these accidents are shown to be due to the squirt hose blowing off, parting at splice or bursting caused by defective hose or clamps. These accidents usually resulted in scalding the fireman, as until recently the water for the squirt was generally taken from the delivery pipe of the injector. Undoubtedly the very satisfactory improvement in the number of accidents chargeable to this device is due to the fact that the attention of all concerned was focused on the large number of accidents caused by such an insignificant piece of apparatus, with the result that a one-piece hose of better quality, sometimes armored, was used and more substantial clamps and attachments generally provided. A considerable amount of credit for this improvement is also due to the several injector manufacturers who have developed squirt hose attachments which deliver water cool enough to be handled safely.

Lubricator and Water Gage Glasses

Accidents chargeable to the failure or breaking of lubricator glasses fell off quite consistently from 49 in 1912 to 12 in 1918, and those due to the failure of water gage glasses from 165 in 1912 to 20 in 1918. The decided improvement between the years 1912 and 1918 must be largely attributed to the Commission's rule requiring all tubular water and

lubricator glasses to be provided with a suitable shield, although the reports indicate that there are still occurring a number of accidents chargeable to inefficient shields. The more general use of the "bulls-eye" type of lubricators and the "reflex" type of water gage also probably contributed to this improvement; however, the reports show that the glasses in these two devices are failing and causing accidents to a considerable extent.

Air Reservoirs

Fig. 2 indicates that there were from four to six accidents each year chargeable to the failure of air reservoirs generally caused by corrosion through the underside of reservoir. In at least one case the material had wasted away until only 1/64 in. remained at the time of bursting. Possibly these reservoirs were old and had not been enameled and baked inside and out, as has been the practice of the air-brake companies for the past several years. However, it would seem that if these reservoirs had received the proper hydrostatic and hammer tests, as prescribed by the rules of the Commission, the thin sheets would have been detected and the accidents avoided.

Blow-Off Cocks

The number of accidents chargeable to the failure of blow-off cocks is shown to have been from 15 to 20 each year since 1912 and to have been due to defective threads, cocks, or their operating mechanism. This would seem to indicate that these parts are not being maintained as well as their importance requires. As the cocks which are now generally being used in connection with modern locomotives are of an improved type and of more substantial construction than those formerly used, an improvement in this respect may be looked for in the future.

Draw Gears

Personal injury accidents due to the failure of draw gears fell off from 22 in 1916 to 11 in 1918—probably the result of the rigid rules of the Commission governing the proper maintenance of draw gears. These accidents are generally shown to have been due to the pins or holes in the bar being worn, or to flaws or defects in the materials of which they are made. A number of these accidents are also reported as due to excessive lost motion between locomotive and tender and in several cases the safety chains are stated as having been too long. When one of the pins or the drawbar breaks, the entire shock due to the momentum of the locomotive is taken by the safety chains or safety bars, and on account of the slack which it is necessary to provide in these parts, they generally fail to hold the locomotive and tender together. Naturally the results of such accidents are usually of a serious nature. The type of gear whereby a single heavy safety bar is placed directly under the drawbar and on the center line of the locomotive, thus requiring a very small amount of slack, would seem to offer means whereby accidents of this kind could practically be avoided.

Ceneral Conclusions

The writer is unable to say to what extent the annual reports of the Chief Inspector are in the hands of mechanical department employees, but all such employees as general foremen of locomotive department, roundhouse foremen, foremen boiler makers and their subforemen should be supplied with them as issued, for the reason that they not only list and classify all accidents, but the cause and circumstances under which they occur are clearly stated. They should also be of considerable value to the several locomotive builders and to all companies furnishing locomotive appliances.

The intelligent interpretation of the causes of these accidents should not only reduce their number, but it should also tend to improve the efficiency of the men and equipment, which is of the utmost importance at the present time on account of the prevailing high cost of labor and material.

The Chief Inspector's reports reveal the fact that personal injury accidents due to the failure of certain locomotive parts are occurring to a much greater extent on some roads than on others, in proportion to the number of locomotives operated by each road and allowing for other varying conditions. This prompts the suggestion that the mechanical department of each railroad check the design, material and maintenace methods of all parts which are shown by these reports to be causing them an excessive number of failures, with the design and maintenance practice of similar parts showing the best performance on locomotives of other roads operating under approximately the same conditions.

When the Congress passed the original Boiler Inspection Law in 1911 it was thought unnecessary by a number of railroad men, and resented by some as an unwarranted interference with their prerogatives, but largely due to the practical manner in which the provisions of the law have been administered by the Division of Locomotive Boiler Inspection under the Interstate Commerce Commission, its beneficial results are now fully recognized and railroad men generally are heartily co-operating with the Commission.

The writer has had roundhouse experience and fully realizes that it is a very simple matter to analyze locomotive accidents and to offer suggestions for their avoidance in the future, in comparison with the very difficult problem of actually maintaining running repairs in a thoroughly practical manner under the quite common conditions of shortage of power and inadequate facilities. He therefore trusts that any criticisms made in this article will be understood in this light, and as having been offered solely as constructive criticism for the possible betterment of the future service.

House Committee Begins Railroad Hearings

THE HEARINGS on the general question of the future of the railroads after their return to private management were begun before the House Committee on Interstate and Foreign Commerce on Tuesday, July 15. While the Esch-Pomerene bill to amend the act to regulate commerce is the only bill now before the committee and, therefore, in a way the basis for the hearings, Chairman Esch, of the committee, in a preliminary statement, said that other bills would doubtless be introduced and that the hearing would cover a broad field of inquiry. Because the field is so broad, however, he thought that witnesses in their testimony should keep within it and he suggested that, in view of the widespread sentiment throughout the country against government ownership, much time ought not to be spent on that proposition and, in view of the President's statement that the roads would be returned at the end of the year, it would not be necessary to spend time in discussing the proposed five-year extension of federal control. Representative Sims objected mildly to excluding consideration of an extension of federal control, saying that it had been proposed with the approval of the President. He asked if the chairman had any information that the President had changed his mind. Mr. Esch said he had no information other than the President's statement in a message to Congress that the roads would be returned this year. Mr. Esch said the important problem the committee would have to consider is the matter of railroad credit and rates and the regulation of stock and bond issues. He said there seems to be a general desire to perfect the system of regulation before government ownership is considered and he hoped it would be possible to so perfect the regulatory system as to remove any necessity for government ownership.

Commissioner Clark of the Interstate Commerce Commission was the first witness and it was announced that he

would be followed by the representatives of the United States Chamber of Commerce and later probably by S. Davies Warfield, president of the National Association of Owners of Railway Securities. It was stated that Director General Hines might appear before the committee next week. The principal interests that have proposed plans will also be heard and Mr. Esch said that it is expected the hearing would continue for about a month.

Commissioner Clark referred to previous statements made by the commission with reference to the subject under consideration, including its annual reports, its special report to Congress and its statement before the Senate Committee on Interstate Commerce, and said he would not attempt to discuss the other plans that have been proposed, at least until after they have been presented by their proponents. Therefore he devoted his statement principally to an analysis of the detailed provisions of the Esch bill, which embodies the views of the commission.

This made rather a tame beginning of the consideration of the important subject of the disposition of the railroads. Mr. Clark spent the two morning sessions on Tuesday and Wednesday in going over the details of the bill, giving the reasons for the proposed changes, with very few interruptions by members of the committee. He was to return for cross-examination on Thursday. In discussing the proposed amendment to Section 5 of the Commerce Act, he said that the shipping public has received absolutely no benefit from the provisions of the Panama Canal Act designed to divorce the railroads from ownership of competing boat lines, because, he said, strict compliance with the purposes of the act would merely result in depriving the shippers of service.

Regarding the provision to allow increased rates to go into effect after a suspension of 120 days, if the commission has not yet reached a decision, Mr. Clark said he would not concede that the commission had been dilatory but that the amendment had been proposed in recognition of the fact that if a carrier proposes rates that are later held to be reasonable it is not exactly fair to suspend them for 10 months.

After he had concluded his discussion of the bill he reverted to the provision he had passed over, requiring the commission, in reaching its conclusion as to the justness and reasonableness of any rate, to "take into consideration the cost of labor and other operating costs in so far as they become material." Chairman Esch remarked that the Traffic Club of Chicago had adopted resolutions urging that the cost of capital be also taken into consideration. Mr. Clark said such an amendment would be entirely appropriate but he could not conceive of the commission ignoring it.

Some Chapters in Canadian Government Ownership

Nova Scotia's Experience with Incompetency and Politics on the Provincial Railway, Now Part of the Intercolonial

By Harold G. Villard

I

[*This is the first of three articles Mr. Villard has written for the Railway Age regarding Canada's experience with government construction, ownership and management of railways. His material is all based on official reports and parliamentary debates, and is especially interesting at this time when Canada seems to be preparing to engage in government ownership and operation on a very large scale. In future articles Mr. Villard will deal with "Prince Edward Island's Burdensome Railway," "Ontario's Unremunerative Railway" —the Temiskaming & Northern Ontario—and "Disfranchisement of Railway Employees."—Editor.*]

Nova Scotia enjoys the distinction of having been the first of Britain's North American colonies to undertake the construction and operation of a state railway. Toward the middle of the last century Joseph Howe—who has been termed the province's greatest statesman—began to advocate the construction by the government of railway lines across the peninsula, formed by his native land. Asserting that such roads could be built for a very moderate outlay and would prove highly profitable, he eloquently urged state ownership of these proposed highways on the ground that a dangerous private monopoly of transportation and an unfair manipulation of rates could not otherwise be prevented.

Instead of following Howe's counsel, however, the Provincial Legislature in 1853[1] passed an act incorporating a company to build a railway between Halifax and New Brunswick. As the outbreak of the Crimean War rendered it impossible for those willing to engage in such a venture to raise the necessary capital within the six months prescribed by the law, the charter was allowed to lapse. Since no further hope remained of the projected line being built in the immediate future by a private corporation, the supporters of Government ownership succeeded in putting through a measure[2] at the next session of Parliament authorizing the construction of railways as provincial public works. In order to provide the funds required to build the contemplated main and branch lines, the government was empowered by a subsequent act[3] passed at the same session to issue provincial debentures, bearing 6 per cent interest and payable in twenty years. Not more than $800,000 of these debentures were to be issued in any one year. It was not realized apparently that the proposed Provincial Railway, which would have to traverse a sparsely settled country, could not be made to pay until connected through to tidewater, and that its speedy completion would have been the wiser policy under the circumstances. The plan actually pursued of building by slow degrees considerably delayed the completion of the road and postponed the time when this state undertaking could reasonably be expected to meet the interest on the money borrowed for its construction.

By the terms of the Railway Act, the completion and management of these intended railways were entrusted to a Chief Engineer and to a Board of Railway Commissioners not to exceed six in number, who were appointed by the cabinet and were removable at any time by the government. While the statute provided that the location of the line should be fixed by the commissioners in conjunction with the Chief Engineer, certain members of the House of Assembly claimed for themselves nevertheless the right of determining where the railroad should be run. Thus, at the 1856 session of Parliament,[4] it was contended in all

[1] Chapter 1, Laws of 1853.

[2] Chapter 1, Laws of 1854.
[3] Chapter 2, Laws of 1854.
[4] Nova Scotia House of Assembly Debates 1856, p. 9, et. seq.

seriousness that legislators were "best acquainted with the best localities for this great public work and should instruct the ministry accordingly." The House was earnestly urged not to permit itself to be denuded of its power of regulating the route to be chosen. Fortunately, this view of the functions of lawmakers did not prevail, and the railroad commissioners continued as the law clearly intended to direct the location of the line.

As was quite fitting, Howe was made head of the first board which began its labors in April, 1854. None of the commissioners had any practical knowledge of railway building, and construction made slow headway. During the first year only ten miles of the projected main line between Halifax and the Bay of Fundy were contracted for. Apologizing in their first report for the little progress made, the board complained that "they had an engineering staff to organize and constructors and skilled workmen to discover." Nevertheless, the commissioner anticipated having over fifty miles completed by the end of 1856, and announced that the cost of the railway when finished would not exceed £5873[5] per mile, exclusive of depots and equipment.[6]

Roseate Predictions Not Fulfilled

These roseate predictions were far from being fulfilled, however, for at the close of 1857 only 22 miles of railway were in operation. The first part of the line from Halifax north traversed a rugged and uneven country, full of rocky gorges and deep bogs, and proved both difficult and expensive to build. Railroad construction costs were further enhanced "by the rise in the price of labor and of all other commodities in the general markets of the world" caused by the Crimean War and the influx of gold from California and Australia. Furthermore, owing to the mistakes of the government engineers, unnecessary expenditures were made at many points. Under these circumstances, it is not surprising that a much greater outlay than was originally estimated was required to complete the Provincial Railway.

When, therefore, a change of government took place in 1857, and Howe's opponents came into office, the Prime Minister of the new administration after a brief period of investigation made this frank confession, concerning the outcome of his predecessor's railway policy:

"In an evil hour for Nova Scotia, the people were deluded into the belief that he (Howe) could construct railways for £5,000 a mile, and that they would be highly profitable and remunerative. Year by year the truth has been gradually breaking upon us, until at last we know that Mr. Howe has misled the public mind on this subject to the extent of nearly half a millions of money—that the road instead of being built for £5,000 a mile, will cost us over £11,000. Enormous as the miscalculation with reference to the cost has proved, I fear that we will not soon be able to realize greater accuracy in the estimation of profits." [7]

With the advent of this new administration, the Board of Railway Commissioners was reconstructed and reduced to a membership of three. An outside engineer, namely, James Laurie, was also appointed to investigate the status and the cost of completing the Provincial Railway. In the written report which he afterwards submitted this official drew a not very flattering picture of the work of the government's engineering staff.

"I consider the engineer department of the road as having been organized on too limited a scale, originating, no doubt, in the laudable desire of economy, but in this it is quite possible to go too far. The force employed has not been sufficient to give the requisite levels and stakes during the progress of the work, and we consequently find at several places the grading out of line—the excavations and embankments too wide and at others not wide enough; improper ballasting used and other matters of detail imperfectly executed. Some of the bogs and lakes which have swallowed up large quantities of material could have been partially or wholly avoided, and no doubt would have been, had proper soundings been taken to determine their depths on the original surveys. The services of one or two well qualified assistant engineers, in addition to those who have been employed on the road, would have saved large expenditures at many points." [8]

The inadequate engineering force had not only caused unnecessary expenditures to be made on the road, but had resulted in an underestimation of the quantities of material required to be removed by the contractors. "So far from every care having been taken to insure accuracy in the quantities" as the specifications calling for bids read, it appeared that "no cross sections or proper soundings had been taken." In view of the large discrepancies between the amount of work represented as needed and that actually required to complete the line, the railway contractors asked for extra compensation. They claimed with some justification that they had a right to rely on the soundings made and the quantities estimated by the government engineers. These demands for extra compensation amounted to no inconsiderable sum. While the cost of the road up to September 30, 1857, had been £627,653, the claims for extra allowances actually allowed and in dispute at the close of the same year amounted to no less than £111,000.[9]

Indicative of the general laxity of the government officials, it also appeared that a much larger number of sleepers "had been received and paid for than went into the work." As against 31 miles of completed road in the early part of 1858, there were over 14,000 sleepers "or sufficient to lay seven miles of road"[10] unaccounted for. In view of all these disheartening revelations, the Conservative government—following the presentation of the Laurie report—decided to place its author in charge of railway construction and to remove for incompetency the Chief Engineer whom the Liberals had originally appointed. This change occurred in August, 1858, and was bitterly but unavailingly assailed by Howe and the opposition press, who sought to make a party issue out of it.

Under the direction of the new engineer, the Provincial Railway attained completion. The close of 1858 witnessed the finishing of the main line to Truro, while the Windsor branch had been opened to traffic in the previous June. In the following October, the Chief Engineer at the request of the government submitted a written report on the management of the railway. This throws an interesting light on the manner in which the Provincial Railway had been constructed and operated under the Conservative regime and that of the preceding administration. Concerning the letting of contracts and the purchase of supplies, he had this to say:

"On the Nova Scotia Railway many agreements are made without proper specifications of the work to be performed. * * * For want of proper specifications also, many things, when delivered, are found not suitable or adapted to the road; thus, side tipping cars are ordered without plans or specifications, and come not suitable to the material or purposes intended. Snow ploughs come too wide for the platforms, and can not pass over the road until they are altered; switches, also, but come imperfect and for a different size of rail than in use on the Nova Scotia railway." [11]

In place of contractors being exclusively subject to the orders or under the control of the Chief Engineer, "which is the common and usual course in railroad construction," it appeared that the Railway Commissioners had "carried on communications directly with the contractors."

"The result was a mass of conflicting agreements, counter demands and allowances, but neither energy in the management nor the progress in the construction of the works. * * * The right claimed and used, on the part of commissioners to give directions to inferior officers, contractors and employees, independent of those over them is fatal to all systems of management, and at once leads to confusion and antagonism. The instant an intermediate officer is passed over, and directions given to those under him, he ceases to have control or responsibility." [12]

At the close of 1859 when its construction had been completed, the cost of the Nova Scotia Railway, which then comprised 93.8 miles of main and branch lines, was officially reported at $4,197,602.79,[13] or at the rate of $44,760 per mile. These figures include the amount paid by the Province

[5] £ equals $4 in Nova Scotian, and $3.89⅔ in Canadian currency.

on the various sums borrowed for railway construction purposes during the four and one-half years required to complete this comparatively short road. Except in a few instances, they exclude all sums paid for right of way and for damages to property caused by the building of the railway. The act authorizing the construction of the road provided that such damages should "form a county charge, to be assessed, apportioned and paid for, according to the relative benefits derived from the railway by the several sections of the country[14] traversed by the new artery of communication.

High Cost Due to Faulty Contracts

In the opinion of Mr. (later Sir) Sandford Fleming, who was one of Canada's foremost railway engineers, the high cost of the Nova Scotia Railway was in a large measure due to the awarding of lump sum contracts for its construction instead of paying "by the quantity and measurement" for all work actually done. According to the very stringent specifications contained in these contracts, a lump sum was to be paid per mile of completed road and "no claim for extra work" was to be allowed "for any real or supposed inaccuracy" in the quantities estimated to be contained in each cutting or embankment.

"Yet, when the contracts came to be closed, every contractor had his claim for extras on the very point of quantities which he had expressly engaged to risk. Irrespective of large amounts paid for extras by the Board of Commissioners, further claims were made and pressed. The government and the legislature, relying on the terms of the contracts, fought off these claims for a year or two, but in the end, both government and legislature had to succumb, after an infinite amount of trouble and agitation, and the contracts, let by lump, had in the end to be paid for by measure.

"This system proved an utter failure in Nova Scotia, and notwithstanding that every precaution was taken in framing the contracts, it resulted in the construction of a very indifferent and unfinished road, with many perishable and now unsafe structures; in some cases even the masonry has already fallen into ruins. The system further resulted in the ruin of the Chief Engineer, an honest and estimable gentleman, the withdrawal of public confidence from the commissioners; it broke up one government, led to the destruction of another, and the work, although never properly completed, cost the province a very large sum for extras, and nearly double the amount of the original estimate." [15]

The statement of Chief Engineer Fleming that the Provincial Railway—notwithstanding its high cost—was very imperfectly built—cannot be deemed overdrawn. At the time the Nova Scotia Railway was under construction rails of a T pattern were almost universally being used in the United States. Instead of choosing this same form, which required no chair plate under the ends of the rail, the mistake was made of modeling the superstructure after that in vogue on the railways of Great Britain. Except for fourteen miles of its length, the Provincial Railway was laid with rails of the H pattern weighing 63 pounds to the yard. These were supported at intervals of 2½ feet by ponderous cast iron chairs or fastenings weighing from 29 to 37 pounds each. Wooden side keys were used to secure the rails to the chairs. While this system was found to answer well in the comparatively mild climate of Great Britain, the wide variations in temperature experienced made it both unsuitable and unsafe for the northern portion of the American continent.

Under the great heat of the summer and the marked cold of the winter months, the wooden keys employed shrank and worked loose. To replace and tighten them entailed therefore much additional labor and expenditure. As for the chairs, they had to be constantly wedged up and broke easily whenever a heavy frost occurred.

"In the month of February, a searching thaw occurred which was succeeded by one of the coldest nights of the season. The ensuing morning exhibited the permanent way greatly disturbed and racked. Several thousand joint chairs, a quantity equal probably to the entire breakage since the opening of the road, were destroyed by a single night's frost."[16]

In the words of Nova Scotia's last railway commissioner, the rails and fastenings originally placed on the Provincial Railway "were probably the worst that could have been adopted in this (Nova Scotian) climate."[17] Furthermore, as their upkeep was very expensive and as they cost one-fifth more than the better suited American rail and appendages,[18] good business judgment demanded their prompt elimination from the government's road both in the interest of safety and of economy. Yet, although Mr. Laurie had called their attention as far back as 1858 to the unsatisfactory nature of the superstructure used, the unprogressive government officials failed to make any change. It was not until after the road had passed into the possession of the Dominion in 1867 that the "cumbersome, expensive and ill-adapted" chairs began to be discarded and the steel scabbard joint substituted in their place.[19]

Despite the fact that it was of the broad gage of 5 feet and 6 inches, the Nova Scotia Railway had altogether inadequate and poorly drained embankments and cuttings. Through an unwise economy, the openings of the culverts were frequently too small.[20] In many instances, the embankments were less than the specified width of 18 feet. The slopes of the earth cuttings were originally 1½ horizontal to 1 perpendicular and were too high to permit of an economical operation of the road. Owing to the peculiar qualities of the clay soil, these slopes became undermined from the action of the frost and rain and would slip. These slips occurred every spring and fall and filled up the drains alongside of the track with a mass of material, which had all to be removed in order to maintain the road in operation.

"The absence of a thorough system of drainage and the severe action of the frost, all tend to cause slipping in nearly every clay cutting on the line. In some instances, the slopes have run so much that the original slopes of 1½ to 1, are now reduced to three and four to one." [21]

As was to be expected under these circumstances, the Provincial Railway proved expensive to maintain. At the same time, its gross earnings were very meagre and totaled less than $10,000 a month for the first few years. The road had no station in Halifax itself, but stopped at Richmond on the outskirts of the city. This lack of a terminal in the provincial capital affected unfavorably both the freight and passenger earnings.

"To make the railway already built properly available and adaptable to the wants of the public, the extension into the city becomes a necessity. People are not prone to avail themselves of a convenience by which they are only partially accommodated; farmers within a certain distance often preferring to drive their own teams between their respective homes and the city, to being obliged to transport them to Richmond in order to haul their produce from thence to Halifax." [22]

"The (railway) freight has also been subject to heavy charges for cartage between the city and Richmond, a distance of from two to three miles. The cost of this cartage on heavy freight is a serious item, and as regards the coal traffic, it is prohibitory. Shippers encounter the risks and delays of sending coal by water rather than pay the costly item of cartage. We believe that similar considerations have great weight in determining the route of other freight, which, but for this, would pass over the railway." [23]

Although recommended as of pressing importance in 1861, this so urgently needed extension into Halifax was not opened to traffic until October 2, 1876.[24] Every impartial critic must admit that the government railway officials showed great inertia and dilatoriness in carrying out this highly essential improvement.

The freight rates on the Nova Scotia Railway were appreciably lower than those prevailing in other parts of Canada.

"In order to develop business and bring as much as possible on the railway, the Nova Scotia freight tariff has been put, especially as regards

agricultural produce and articles of general consumption, about 20 per cent. lower than tariffs in the adjacent Provinces." [26]

These freight rates were not prepared according to a fixed plan and were not always published.

"All these (freight) rates have come gradually into use and are the result of precedents rather than of principles. It is desirable in all cases, but especially in a railway worked by the government, that the tariffs should be computed on some principle of general application so that as far as possible, special rates may be avoided and it is above all important that every rate should be published. It is only by pursuing this course that the imputation of favoritism can be avoided." [26]

Freight Rates Totally Inadequate

In some cases, the freight rates were totally inadequate to cover the cost of the service rendered. This was especially true of the important horse and wagon traffic, which at first yielded nearly one-fourth of the annual freight earnings.[27] While discouraged elsewhere because unremunerative, it grew to large proportions in Nova Scotia through the desire of the authorities to assist farmers seeking to market their produce in Halifax. Instead of being obliged to unload and to ship the contents of their vehicles as freight, countrymen were permitted to board trains with their horses and wagons. The rates charged for this service were entirely too low, and 30 per cent less than in New Brunswick.[28]

"This (horse and wagon) business is conducted at a loss to the department, besides being a source of detention to the trains, and cannot at all times be provided for at Way Stations without a large supply of plant. I consider the tariff on this traffic must be increased in order to make it self-sustaining." [29]

At intervals, the railway commissioners expressed their minds freely in regard to this undesirable and unprofitable form of traffic.

"Under the Tariff Regulations which have been in operation for years, a horse, wagon and driver are carried over the lines at the same rate charged for a passenger. * * * There is neither reason nor justice in this arrangemet, and as it is attended with serious loss to the Department, it ought to be at once abolished. * * * No valid excuse can be urged in favor of encouraging persons to encumber the cars with horses and wagons, for the carriage of which little or nothing is received." [30]

"In 1866, the number of teamsters carried free amounted to 11,420 (out of 160,953 total passengers transported). If these concessions could be confined to those seeking a market for their produce, it would not be so objectionable; but a great many persons travelling thus merely for convenience or pleasure took advantage of it. For instance, a person is desirous of going into the country a distance of 10 or 20 miles beyond or from some point on the railway, and as it virtually cost him nothing to take his horse and wagon along, he naturally does so. If his be the only horse and wagon to be carried, a box car and a flat car must be added to the train, and a few shillings in many cases is all that is obtained in the way of compensation, although $1,500 worth of rolling stock, to say nothing about the additional motive power required, is put into requisition for his special accommodation. It is a matter of surprise that even such an arrangement should have been made and it is equally strange that it should have been tolerated so long." [31]

Although this horse and wagon traffic was carried at a loss, the provincial authorities—perhaps for fear of alienating the farming interest—never had the courage either to raise the rates charged for or to do away with it. Not until some years after the Nova Scotia Railway had passed into the possession of the Dominion government was it finally abolished.

Completed as before stated in 1858, the Provincial Railway in the following year failed to earn its operating expenses by $8,397.31.[32] In February, 1860, another change of government took place. The new administration abolished the Board of Railway Commissioners and placed the government road under the charge of a single commissioner. One of the first acts of this new official was to remove a railway employee who had had the temerity "to appear at the hustings to poll his vote against the Attorney-General."[33] Shortly afterwards he dismissed the superintendent appointed by the former administration for inefficiency and on the ground of "the necessity of having as government employees parties who are not acting hostile to the department or the government in whose employ they are, and with whose confidence they are supposed to be entrusted."[34]

Maintenance of Way Let to Contractors

In order to make the railway pay its way, its new head felt obliged to reduce expenditure "promptly within the narrowest limits compatible with the safe working of the road." As one means of securing this desired end, he conceived the novel idea that a great saving could be effected if the maintenance of the permanent way were let out to outside contractors instead of being looked after by the railway officials themselves as heretofore. To cite his own words:

"The upholdence of the permanent way is a very large item of expenditure on every line of railway. * * * I was impressed with the belief that if the road were put up to tender and contract for upholdence, leaving contractors to find their own men and tools, the work might be more efficiently performed." [35]

Accordingly, the railway commissioner drew up specifications and contracts "of the most stringent character," and which appeared "to embrace all the conditions and stipulations necessary to insure an efficient upholdence of the road,"[36] and from August 1, 1860, on let out to contractors the maintenance of the permanent way and the fencing of the whole line in sections varying from 4½ to 11¾ miles in length.

At the same time, he sold to the contractors all the tools belonging to the railway department which had been used in keeping the track and road bed in good order.[37]

This singular plan of entrusting the maintenance of the permanent way to outside contractors remained in force for three full years. At first, it appeared to work well. In the last year, when the road was upheld by the old or day labor system under the direction of roadmasters, the maintenance of the road cost $108.74 per mile per quarter as against $67.90[38] under the tender and contract method. The resultant annual saving for the whole line was $15,151.64. Instead of incurring a good sized deficit, as in 1859, the Provincial Railway during the years the contract upholdence system was in force showed a respectable surplus above operating expenses.

When, however, the Railway Department was reorganized in June, 1863, as a result of another change of government, the new railway commissioner speedily came to the conclusion that "an efficient and economical upholdence of the road" was impossible under the contract system. As the following official utterances will show, this system had resulted in a marked deterioration in the condition of the road.

"It is quite clear that fencing, for several years was a mere nominal affair and what with fires, decay of material, and other deteriorating causes, the fencing had come to be in a most dilapidated condition." [39]

"The present system of upholding the road by contract is very unsatisfactory, and contractors are unwilling to clear out cuttings and ballast the road to the extent necessary to be done." [40]

"It was apparent to the most inexperienced observer that, whatever the cause, the work undertaken by these contractors had not been performed. The contracts and specifications, as I before remarked, are very precise and stringent in their terms and obligations, and a strict or even a reasonable compliance with these terms would, I think, have sustained the road in a condition far superior to what it was found to be on the 1st of July last. That, however, it has been found impossible to secure. Contractors, in their efforts to underbid each other, had taken the work for less than would pay the necessary labor, and they were driven to the necessity of slighting their work or doing nothing more than was barely sufficient to keep the trains on the track." [41]

[41] Railway Report N. Scotia Journals 1864, App. No. 1, p. 1.

On August 1, 1863, therefore, the upholdence contracts were terminated and railway road masters again appointed to look after the maintenance of the permanent way. "To bring the road up to a safe and serviceable standard," it was found necessary to make large expenditures. As against $22,381.78 spent for maintenance of way in 1861, $42,004.47 had to be thus expended in 1864. Ditches and drains were cleaned out "which had been neglected for years," and an unusually large number of sleepers laid "to replace old ones so decayed as to render their retention dangerous to life and property."[42] Thus, although of brief duration, this experiment, unique in railway history of farming out the upkeep of a road, had a disappointing outcome and proved in the long run neither a safe nor an economical arrangement. Nor was it ever tried again in Canada.

Undeterred by the meagre earnings of the Provincial Railway, the Nova Scotia House of Assembly on March 14, 1864, voted to extend it from Truro to the town of Picton on the Gulf of St. Lawrence. The contracts for this new link were let on the schedule of prices plan and in the following manner:

"Soon after the Legislature had decided to build the railway, the public and intending contractors, more especially perhaps the latter, became exceedingly impatient to have the work commenced, they could not wait until the survey was properly completed. Tenders were actually invited before the line was located. A great number of persons expected or desired contracts." [43]

Doubtless, to satisfy the clamor for contracts, the Government let out the work in ten small sections of about five miles each. The contractors had little experience in railway building and had bid altogether too low prices for masonry and earth work.

"The work went on for a time, but it was soon discovered that the prices were altogether too small. The specifications were strict, the system would not admit of extras, and the work in consequence came to a stand." [44]

As the contractors were unable to go on, the government in the fall of 1865 relet the completion of the Picton line to Sanford Fleming, who agreed to finish the extension for a lump sum and within a period of seventeen months.

He made the further proviso, however, that he should be at liberty to employ whatever man he liked free from all political interference.[45] The insistence on this wise stipulation was beyond all doubt very helpful in enabling him to perform his contract satisfactorily and within the time limit specified.

Railway Run at a Heavy Loss

As before intimated, the Nova Scotia Railway—which cost the Province over a quarter of a million dollars annually in the shape of interest—was anything but a money-maker. During the twelve years, June 30, 1855, to June 30, 1867, the total gross earnings of the road was only $1,423,381.75.[46] What kept down these gross receipts was the practice inaugurated in 1861[47] of requiring the railway to transport legislators, school teachers and members of the militia free of charge. The objections to such and similar free service on the part of a government owned transportation line were forcibly stated by a Nova Scotian railway commissioner as follows:

"Exactions are made upon the railway to the extent of thousands of dollars annually for the performance of a variety of services for the various departments and general purposes of government, without the remuneration of a dollar. * * * It may be said that it makes no real difference, as the railway is a government one, and it is as well to make use of it in this way as to add directly to the cost of the services enumerated, but on the other hand, it may more appropriately be said that the railway, if paid for all the work performed, would add 10 or 15 per cent to its present receipts, and would thus enrich the provincial treasury to the same extent that it would be taxed were the system changed; with this additional advantage, that it could then be ascertained to what extent the department could legitimately swell its receipts, and what percentage of interest it would pay upon the capital invested after meeting working expenses." [48]

Whether the Provincial Railway earned enough during the period 1855-67 to meet its operating expenses appears rather doubtful. It is true that the net earnings for the twelve years mentioned were nominally $228,023.32[49] Yet, as the following extract shows, the road had in reality a much smaller surplus when it was taken over by the Dominion Government: "On the 1st of July, 1867, the revenue account was opened with a credit of $45,345.41. This sum purported to represent the net earnings of the railways up to that date, or to speak more accurately, the sum earned toward the payment of interest on capital."[50]

But, in the opinion of the railway experts appointed by the Dominion Minister of Public Works in the summer of 1868 to report on the status of the railway which had failed to meet its operating expenses during the fiscal year just passed, even this small profit and loss surplus had not been earned, as a matter of fact. As no proper allowance had been made for depreciation of rolling stock and as the inadequate stations were in a most dilapidated condition, they arrived at the following conclusion:

"In view of the number of cars which have disappeared altogether, and of the state of the existing stock, we are of the opinion that the rolling stock has lost fully one-half of its existing cost. This taken in connection with the state of the way and works and buildings justifies the conclusion that the roads have not been worked at a profit, but that on the contrary, a large sum in excess of the apparent profit with which the Revenue account was opened when the Dominion came into possession, will have to be expended in order to restore the ways and works, the stock and equipment to a satisfactory and serviceable condition." [51]

This same body of experts found further that the books of the railway "had never been properly audited," and that the salaries paid many employees were too low to secure the services of competent men. In partial explanation of the lax discipline prevailing on the road, they had this to say: "If a conductor, an agent, a driver or other subordinate knows that he can only be dismissed after tedious inquiry, proof and disproof as to alleged misconduct, it will almost be impossible to assure that degree of discipline which is essential to the safe and economical working of a railroad."[52]

Political Interference—Obsolete Operating Methods

Neither in the appointment nor removal of subordinates were the higher officials in a position to act freely. On the contrary, they were unable to disregard the wishes of the local politicians in such matters.[53]

Finally, the committee characterized the opening methods employed on the government railway as obsolete and out of date in various respects. Lack of initiative on the part of the leading officials was deemed to be the main cause for this failure to keep abreast with the times in matters pertaining to railway management.[54]

With these excerpts, this sketch of the inception and the first decade of the Nova Scotia Railway may properly be closed. Upon the formation of the Dominion on July 1, 1867, the railway became an asset of the new federal government, and shortly afterward lost its separate identity through being made a part of the Intercolonial railway system. It should be borne in mind, however, that all the defects and drawbacks which have attended government ownership of railways in Canada were revealed in connection with the building and operation of the Nova Scotia Railway. Instead of being done away with, these various evils appeared again and at times in a more aggravated form when the dominion government undertook the management and construction of railways.

General News Department

The firemen's brotherhood, in convention at Denver, Colo., has adopted resolutions in favor of the establishment of municipal markets and cold storage houses; and has endorsed the "Plumb plan" for public operation of railroads.

The National Service Committee, of Engineering Council, with headquarters at Washington, D. C., has started a weekly bulletin of developments in governmental engineering work. It will contain information regarding progress in legislation, and other activities of federal agencies, of interest to engineers.

S. M. Felton, president of the Chicago Great Western Railway Company, has been given the title of commander of the Legion of Honor by the French Government in recognition of his work as director general of military railways in France. Mr. Felton has also been decorated by the United States Government with the distinguished service medal for his efficiency in connection with the same work.

The Brotherhood of Railroad Signalmen, in convention at Kansas City, Mo., proposes to open negotiations with the Railroad Administration concerning wages. These men are now rated as belonging to "shop crafts," but they maintain that their duties are more responsible than those of shop workmen, and they have called on the director general for a different classification, with wages and working conditions adjusted accordingly.

Lieutenant-Colonel T. H. Lantry, formerly division superintendent on the Northern Pacific, with headquarters at Glendive, Mont., has been appointed district inspector of the Trans-Baikal district of the Siberian Railways, and **Lieutenant-Colonel B. O. Johnson,** formerly superintendent of the Montana division of the same road, at Livingston, Mont., has been appointed district inspector of the Omsk district of the Siberian Railway.

"Two Popular Methods of Getting Killed," is the title of the latest safety-first pamphlet issued by George Bradshaw, safety supervisor of the Pere Marquette and other Michigan roads under Federal Manager F. H. Alfred. The two methods are the highway crossing method, and walking along railroad tracks. Interesting comparisons are drawn between these American methods of getting killed and ancient methods of accomplishing the same purpose; and the ancients are believed to have had the better way.

The Air Mail Service between New York and Washington is reported as having been operated during the month of June at 99 per cent. efficiency; the miles flown being 11,118, and the weight of mail carried, 15,643 lb. Between Cleveland and Chicago the percentage of efficiency is given as 100; total miles 19,825; weight of mail 19,603 lb. The average speed on this route was 97.8 miles an hour. The route from New York to Cleveland, crossing the Allegheny Mountains, has been operating successfully since July 1.

Machinists of the St. Louis-San Francisco are considering the question of striking, over the controversy which has arisen because of the appointment of W. J. Foley as general roundhouse foreman at North Springfield, Mo., and the General Committee has sent out strike ballots. The contract between the company and the machinists states that a machinist shall be placed over machine men, and it is this clause of the contract that the men claim has been violated in the appointment of Mr. Foley, who was formerly a locomotive engineer. He was later promoted to road foreman of engines and then was acting assistant superintendent in the operating department until the return of the assistant superintendent from Government service. In defense of the appointment of Mr. Foley, officers of the road say that no portion of the contract between the machinists and the company has been violated, because the duties of the general foreman cover not only machinists but boilermakers, pipefitters, electricians, tank men and miscellaneous repairmen as well as engineers and firemen. Mr. Foley has been a member of the Brotherhood of Locomotive Engineers.

Complete reports of "No Accident Week" in the Northwestern region, June 22 to 28, illustrate in several interesting ways the practical results of the campaign. Of the 62 roads competing in the campaign, 50, or 79.36 per cent, had clear records. A reduction in accidents was made from 481 (of which 6 were fatal) in the week of June 22 to 28, 1918, to 119 (of which 5 were fatal) in the corresponding week this year; a decrease of 362 accidents, or 75.46 per cent. Based on the number of accidents per hundred men employed there was accomplished a reduction of 77.78 per cent. Based on the figures for 1919 there was one accident for every 2,304.481 men employed in the region; in 1918 one accident for every 568.563 men employed, a decrease of 1,735.918, or 305.5 per cent. There was one accident to 444.269 miles of road operated in 1919, and one accident to 109.913 miles operated in 1918, a decrease of 34.356, or 304.2 per cent. The road employing the largest number of men which operated with a clear record was the Chicago Great Western. The road having the largest operated mileage and making a clear record was the Oregon-Washington Railroad & Navigation. This road also had the largest number of accidents last year. The Chicago, St. Paul, Minneapolis & Omaha made the largest reduction in accidents based on 100 men employed.

The Clover-Leaf Accepts 350 Cars

The controversy between the Toledo, St. Louis & Western and the Railroad Administration over the latter's allocation of freight cars to the road has been settled without a court trial, with the result that the company will accept 350 of the 1,250 freight cars originally allocated to it by the Director General. When this allocation was made, the receivers asked for instructions from the court, and the stockholders' and bondholders' committees filed statements setting forth that the number of cars allocated was excessive, that the road needed no new cars and that the cost of these cars was excessive. The receivers then asked the court (the Federal District Court in Ohio), for an injunction, and the court subsequently granted a preliminary injunction restraining the receiver from accepting the allocation. The Railroad Administration then suggested a compromise, and the matter was ultimately settled by the acceptance by the receiver of 350 cars.

She Got the Pass*

I understand you hold the key of the way to the shining tracks that tempt us in the spring—to wander out in some strange unknown, where the charm of the unexpected will happen.

That is what we think, but, of course, what does happen is the customary dirt and cinders—the sight of ordinary ways—and the same people in a coach instead of an office.

As I said before, desiring to wander in the spring, I have filled out the attached form.

Wish to explain to you my sudden mania for visiting all these relatives, as you may have noticed from my various requests for transportation, and which may have caused you some perplexity as Sam probably told you I was an

* Copy of request for a pass from an administration employee in Chicago.

orphan and all my relatives so nearly as he could ascertain died rather than be bothered with me.

It is because—I state again—I just want to wander in the spring, but it seems the Administration objects to our traveling unless it's a case of death, sickness, want, woo, or relatives. Not having many relatives, I may be pardoned for wondering why relatives are put in this unhappy category. But going over the list under which it seems I must put my reason to travel—or be scornfully refused by you—I chose relatives.

As if I had some charming ones, I certainly would visit them.

The desire of the Administration to encourage dutiful journeys and to foster the kindly feelings which should come from ties of blood appeals to me. But what I want to know, having the passion for knowledge that prompts so many of our fellow countrymen to write the papers to learn why we are here, and why everything happens that does happen because we are here—being animated by a similar impulse, I rise to inquire—most respectfully, most respectfully—

WHY don't you want us to travel for a good time?

You know, being deadheads, we never would travel if we paid our way. So the roads are not out anything by giving us the pass. Trains you let me ride on are rarely patronized by other than pass holders—

Please Mr. ....., why can't we ride just to

Take a Trip
And see the sights
And delude ourselves
With the thought
That we are going
Down the world
and
Having experiences.
And get a little
Mental tonic
and Pep.

Surely you don't think we should always stay at home unless

someone dies
and besides
you make
people like myself
who have no relatives
Tell lies.

The United States Circuit Court of Appeals recently handed down an opinion in the controversy between the Cincinnati, Indianapolis & Western Railroad Company as the successor of the Cincinnati, Indianapolis & Western Railway Company and the Cincinnati, Hamilton & Dayton Railway Company, its receivers, Judson Harmon and Rufus G. Smith, and the Toledo & Cincinnati Railroad Company, successor of the old Cincinnati, Hamilton & Dayton lines. The opinion affirmed in part and modified in part a decree previously issued by United States District Judge Hollister, relating to the ownership of the bulking yard in Indianapolis, Ind. This decree held that the bulking yard belonged to the Chicago, Indianapolis & Western, even though it has been in the name of the Cincinnati, Hamilton & Dayton since 1898. Judge Hollister required the Cincinnati, Indianapolis & Western to pay the future installments on the mortgage as the only payment required in order to get its title. The parties have agreed to value the property at $96,000. The decision of the Appelate Court affirms the decision that the property belongs to the Chicago, Indianapolis & Western and also held that the payments made by the Cincinnati, Hamilton & Dayton before its receivers were appointed could not be recovered. The payments made by the receivers of the Cincinnati, Hamilton & Dayton on account of the mortgage on the property, according to the Appellate Court opinion, were made under mistake of fact and must be repaid without interest by the Cincinnati, Indianapolis & Western. Under this ruling the Cincinnati, Indianapolis & Western will be required to repay $1,450 paid by the receivers and pay the remaining installments of the mortgage note, amounting to $22,000, thereby obtaining clear title to the property.

Traffic News

Grain loading, in the Central Western region in June aggregated 29,704 cars as compared with 22,853 cars June last year, an increase of 30 per cent. Coal loading (67,979 cars) decreased 42.4 per cent from the 118,111 cars loaded in June last year. Live stock shows no change.

H. L. McReynolds, chief clerk of the Kansas City (Mo.) District Freight Traffic Committee and formerly chief clerk in the general freight office of the Chicago, Rock Island & Pacific at Kansas City, has been promoted to secretary with the same headquarters, succeeding C. P. Dowlin.

Railroads bringing cattle into this country from Canada have been notified by the Secretary of Agriculture that, beginning August 1 all cars containing animals for immediate slaughter must be so carded ("Canadian Cattle for Immediate Slaughter"), and the fact must be noted on waybills.

A strike in New York harbor has this week tied up about 300 freight ships, mostly privately owned coastwise vessels. The strikers are firemen, oilers and water tenders, and they want higher pay and recognition of their union. The United States Shipping Board, owner of a large proportion of the 300 ships, is reported to have taken a firm stand, making no move to start its ships except in a few cases where new men could be secured.

The Long Island Railroad, during the war and since demobilization began has moved between 4,000,000 and 5,000,000 soldiers to and from the camps on Long Island, besides carrying tens of thousands of visitors. Even now from 10,000 to 20,000 troops are being carried daily. The regular business of the railroad has grown rapidly. There are 5,000 more persons commuting daily than last year at this time, requiring several additional trains of eight cars each, morning and evening. Between July 3 and July 7 the road broke all records by carrying 1,433,600 passengers. This is 28 per cent. more than were carried in the same five-day period of 1918. This traffic is being handled with practically the same number of coaches and engines as were in service in 1918.

Louis F. Swift, president of Swift & Company, Chicago, in denying charges recently made against the packers by the National Wholesale Grocers' Association in a complaint filed with the Interstate Commerce Commission, said in part: "I cannot find that Swift & Company enjoys one special privilege, nor does it participate in one special rate, which cannot be secured by any other shipper in the United States. I welcome this investigation. We certainly do not wish to have any unfair advantages or discrimination and predict that the finding of the Commission will be that we have none. The route cars which we operate are operated under specific railroad tariffs which have been repeatedly approved by the Interstate Commerce Commission and which call for a certain guaranteed minimum or penalty in case of a lightly loaded car. Similar cars may be operated by any one who is willing to agree to this penalty provision. We have built up over a long period of years an efficient transportation department which looks after our shipments. It is a part of that department's duties to follow every shipment of goods to its destination and to see that there is no unnecessary delay. I understand that one of the complaints made is that we enjoy the benefits of our refrigerator cars. We do, but the building of these cars was forced on us by the refusal of the railroads to build them. Any shipper of goods who cares to tie up his money in that way may build his own cars and have his own transportation department look after them. I might add here that for a number of years our refrigerator cars have been operated at a loss. We do not benefit by any 'unlawful, unreasonable, unjustly discriminatory rates, rules, mixtures, minima. and other carload tariffs, and we do not seek special privilege."

Texas Oil Traffic

The congestion of freight traffic continues to be a serious problem in the newly developed oil regions of Central West Texas. Several hundred additional cars of oil would be shipped each day from Burkburnett, Ranger and other fields if cars and other facilities were available. The Texas & Pacific is crowded from Fort Worth westward to Sweetwater, 202 miles. At Ranger, 95 miles west of Fort Worth, the yards resemble those of a large city, and the freight receipts of the station are reported as larger than those at Dallas or any other city on the Texas & Pacific. A double track is needed between Fort Worth and Ranger. On the Fort Worth & Denver City and the Missouri, Kansas & Texas traffic conditions in the oil fields reached by those lines are little better than on the Texas & Pacific.

I. C. C. Bill-of-Lading Declared Illegal

Circuit Judge Henry G. Ward, in an opinion filed in the United States District Court in New York City, July 12, granted the petition of the Alaska Steamship Company, the Central of Georgia Railway Company, the Clyde Steamship Company, and other steamship and railroad companies for a decree setting aside an order of the Interstate Commerce Commission requiring them to use forms of bills of lading, for domestic and export shipments, prescribed by the Commission. The decision says: "Congress has unquestionably the power to declare what terms common carriers, subject to the Interstate Commerce act, may insert in their bills of lading. Examination of the statute does not convince us that Congress had any intention to confer upon the Commission the right to prescribe the terms of the bills of lading." Judge Julius M. Mayer concurred in the decision, but Judge Learned Hand dissented.

Anthracite Shipments for June

Shipments of anthracite for the month of June, as reported to the Anthracite Bureau of Information, Philadelphia, amounted to 5,619,591 tons, as compared with 5,711,915 tons in the preceding month, and with 6,867,669 tons in the corresponding month of 1918. As was the case in May, the larger part of the decrease in June of this year as compared with last was due to the smaller output of steam sizes from the washeries, more than two-thirds of the decrease being in the steam sizes.

The shipments by companies were as follows:

	June, 1919	June, 1918	Coal year, 1919-1920	Coal year, 1918-1919
Phila. & Reading	1,084,635	1,345,079	3,284,946	3,935,469
Lehigh Valley	1,041,696	1,352,820	2,937,780	3,856,311
Central of N. J.	508,702	622,005	1,489,004	1,717,865
Del., Lack. & W.	903,306	1,015,438	2,702,822	3,061,059
Del. & Hudson	661,991	773,691	1,932,697	2,371,234
Pennsylvania	372,658	482,737	1,157,826	1,424,491
Erie	616,939	756,257	1,819,718	2,212,879
N. Y., O. & W.	167,327	186,948	479,586	549,670
Lehigh & N. E.	262,337	332,694	751,842	994,320
Totals	5,619,591	6,867,669	16,556,221	20,123,298

Gasoline Transportation Dangerous

The Bureau for the Safe Transportation or Explosives and Other Dangerous Articles has sent to the shippers of gasoline, and owners, lessees and builders of tank cars, a circular calling attention to the fact that accidents and carelessness in the transportation of gasoline during 1918 caused many times as much loss and damage as the transportation of the unusually large volume of explosives required to meet war condition.

In eight years, 1910 to 1917 inclusive, 78 people were killed, 607 were injured and a property loss of $1,626,000 resulted from the transportation of gasoline on railroads, while during the same period, only 3 people were killed, 30 injured and property loss of $147,000 resulted from the transportation of explosives on the railroads.

In 1918, under war conditions, 16 deaths, 46 injuries, and a property loss of $881,000 resulted from the transportation of gasoline on railroads, while for the same year there was 1 death, 4 injuries and property loss of $33,000 resulting from the transportation of explosives alone.

Commission and Court News

Court News

Aggravation of Previous Incurable Disease

The Alabama Supreme Court holds that a railroad may be liable, under the Federal Employers' Liability Act, for the death of an employee from injuries caused by the sudden stop of a train, although the employee was suffering from a slow, but incurable and fatal disease, and although the shock received would have been of no serious consequence to a man in sound health.—Louisville & Nashville vs. Wright (Ala.) 80 So. 93. Decided November 21, 1918.

Posting of Tariffs

The Mississippi Supreme Court holds that the Interstate Commerce Rule adopted October 12, 1915, amending Rule 52 as to posting of notice of change in tariffs by dispensing with the necessity of posting notice, applies to excursion fares for which only a three-day posting of notice was necessary under the amendment of Rule 52, adopted December 2, 1912.—Mississippi Central vs. Graham (Miss.) 80 So. 66. Decided December 16, 1918.

Assault on Passenger By Newsboy

The South Dakota Supreme Court holds that a railroad, permitting a news agent on its train under contract with another, was liable for his assault on a passenger in the course of and within the scope of his business, as he was its agent in respect to the carriage of passengers.—Blankenbaker vs. Chicago, M. & St. P. (S. Dak.) 163 N. W. 744. Decided September 2, 1918.

Initials on Bills of Lading

The Maine Supreme Court holds that if the initials "O R S L & C" (Owner's Risk, Shipper's Load and Count) on a bill of lading following a description of the goods were within the general information of the court, and were in themselves plain enough to permit of judicial construction, it would be unnecessary to prove their import; otherwise it would be competent to do so, the words being of particular significance in freight transportation.—Lewis Poultry Co. vs. New York Central (Me.) 105 Atl. 108. Decided December 12, 1918.

Indemnity from Loss of Goods Being Returned

A railroad attempted to deliver goods, but the consignee obtained an order of attachment against them. The consignor thereupon requested the railroad to return them. The railroad required the consignor to sign a contract holding it harmless from liability in returning them, and constituting the railroad or connecting road the consignor's agent. The New York Appellate Division holds that the railroad was not liable for the loss of the goods while being returned.—Peugot, etc., Co. vs. New York Central, 173 N. Y. Supp. 455. Decided January 2, 1919.

Federal Employers' Liability Act—Assumption of Risk

The engineer of a freight train started the train on an interstate journey while the fireman was in a lunchroom eating. The fireman came out and, seeing the train in motion, climbed on top of a car. He stumbled and fell between cars and was killed. He was an experienced and competent fireman, and knew, or should have perceived, the dangers which he would normally and necessarily encounter in passing over the train. In an action for his death the Kansas Supreme Court held that, under the Federal Employers' Liability Act, he assumed the risk.—Briggs vs. U. P. (Kan.) 175 Pac. 105. Decided April 1, 1918.

Equipment and Supplies

Locomotives

The Dorada Extension Railway (Chile) has ordered two Prairie type locomotives from the American Locomotive Company. These locomotives will have 15 by 20 in. cylinders, 40 in. driving wheels and a total weight in working order of 85,000 lb.

The Java State Railways have ordered 12 compound superheater 2-8-8-0 type Mallet locomotives from the American Locomotive Company. These locomotives will have 17½ and 26½ by 24 in. cylinders, 43⅜ in. driving wheels and a total weight in working order of 198,000 lb.

The Imperial Railways of Formosa have ordered three Consolidation locomotives from the American Locomotive Company. These locomotives will have 20 by 24 in. cylinders, 49 in. driving wheels, a total weight in working order of 134,000 lb. and will be equipped with superheaters.

The Cordoba Central Railway (Argentina) has ordered six superheater Mikado locomotives from the American Locomotive Company. These locomotives will have 21½ by 24 in. cylinders, 48 in. driving wheels and a total weight in working order of 165,000 lb.

[The Cordoba Central is a British-owned railway, is of metre gage and about 1,200 miles in length.]

Passenger Cars

Frank M. Saunders, New York, is inquiring for 5 railway inspection trolley cars for export.

The Pennsylvania Equipment Company, 1420 Chestnut street, Philadelphia, Pa., is in the market for a second hand standard gage 40 ft. to 60 ft. baggage and express car of steel underframe or all steel construction.

Freight Cars

Thomas W. Simons, New York, is inquiring for 10 steel side-dump cars for export.

Swift & Co., Chicago, has issued an inquiry for 400 40-ton refrigerator cars.

Strong & Trowbridge Company, New York, is inquiring for 6 flat cars and 2 tip cars for export.

The Cerro De Pasco, New York, has ordered 20 40-ton steel ore cars from the American Car & Foundry Company, Chicago, for export to Peru.

The Clearfield Bituminous Coal Corp., Clearfield, Pa., has ordered 100 steel mine cars from the American Car & Foundry Company, Chicago.

The Commercial Bank of Spanish America, New York, has ordered 12 gondola cars and one observation car for the Columbian Northern from the American Car & Foundry Company, Chicago.

Oscar B. Cintas, Havana, Cuba, has ordered from the American Car & Foundry Company, Chicago, 30 cane cars for export to Cuba, 20 of which are for the Central Cunagua, and 100 flat cars and 250 box cars for the Cuban Northern.

A battleship of 43,000 tons, with 16-inch guns, has been ordered by the Secretary of the Navy, the contract having been awarded on July 10 to the Newport News Shipbuilding Company. Mr. Daniels will award a contract for another ship of the same type next week. These will be the largest battleships in the world.

Supply Trade News

Edward Law, son of the late Ernest Law, was admitted on July 1, as a partner to the firm of **Ernest Law & Co.**, iron and steel merchants, Philadelphia, Pa.

J. E. Slimp has been appointed general manager of the **United Railway Car Company**, Boston, Mass., manufacturer of interurban and short line railway cars.

J. L. Dahl has been appointed manager of the New York office of the **Gregg Company, Ltd.**, Hackensack, N. J., effective July 15. He succeeds **C. R. Gier**, who is no longer in the employ of the company.

The Liberty Car Wheel Company, Hammond, Ind., has been incorporated with $500,000 capital stock and the following officers have been elected: President, **Patrick H. Joyce**; vice-president, **F. O. Bunnell**; treasurer, **John E. Fitzgerald**; secretary, **Charles Aaron.**

L. H. Elliott has been elected vice-president and secretary of the **Upson Nut Company**, Cleveland, Ohio, succeeding Norris J. Clarke, who has resigned. Mr. Elliott will retain his former position as secretary and treasurer of the Bourne-Fuller Company, Cleveland.

The Anglo-Saxon Trading Corporation, 114-A Pitt street, Sydney, Australia, advises through its New York office that it desires to receive catalogues and full particulars from manufacturers of all kinds of devices relating to the mechanical side of railway transportation.

Elliot Reid, assistant to general manager of the **Westinghouse Lamp Company**, 165 Broadway, New York, has been appointed sales manager, and will have charge of the commercial activities of the company in both large and miniature classes of lamps in domestic territory.

Arthur S. Lewis, formerly with the Chicago, Cleveland Car Roofing Company and more recently with Flint & Chester, New York, has become associated with the **Barco Manufacturing Company**, Chicago, and will for the present be located at New York City, and cover Southern territory.

L. D. Winters, representative at Chicago of the **W. S. Tyler Company**, Cleveland, Ohio, wire netting manufacturers, has opened an office in the Peoples Gas building, Chicago, for the purpose of conducting a railway specialty business. Mr. Winters will continue to represent the W. S. Tyler Company.

H. B. Barbee has been appointed manager of eastern railroad sales for the **Chicago Pneumatic Tool Company**, Chicago, and **Nelson B. Gatch**, district manager of sales at Chicago, has been appointed district manager of sales, with headquarters at 52 Vanderbilt avenue, New York City, to succeed **L. C. Sprague**, who has been appointed manager of western railroad sales, with headquarters at Chicago.

The Interstate Iron & Steel Company, Chicago, has started work on the installation of a new 75-ton open hearth furnace and a continuous bar mill at South Chicago, Ill. In addition to this construction the company plans to rearrange its tracks and improve its facilities for handling scrap. The addition of this furnace will make a total of five at the South Chicago works.

C. D. McClary, who has been with the **Western Electric Company**, New York, since February, 1910, has been made sales manager of the Pittsburgh office. Mr. McClary was first connected with the Philadelphia office and was transferred to Pittsburgh the latter part of 1910. In April, 1916, he joined the sales force, and in April, 1918, was promoted to assistant sales manager, which position he held until his present promotion.

The Railway Motor Car Company of America, Chicago, plan to construct a manufacturing plant at Hammond, Ind., at an approximate cost of $80,000. The building will be 300 ft. long by 100 ft. wide, 50 ft. of which will be two stories high. The superstructure will be of brick construction.

The Q & C Company, with general offices at 90 West street, New York, announces the formation of **The Q & C Packing & Lubricator Company**, with general offices at the same address and a factory at 70 Pearl street, Jersey City, N. J. **Charles F. Quincy** is president of the new company; **W. W. Hoit** is vice-president, and F. F. **Kister**, treasurer, all of the present Q & C Company organization. **S. S. Whitehurst**, vice-president, and **J. G. Smaltz**, secretary, are now officials of **Steele & Condict, Inc.**, Jersey City, N. J., where increased manufacturing facilities are being provided to care for the Q & C piston rod packing and lubricator.

William Barlow Ross, assistant to the president of **Mudge & Co.**, Chicago, with headquarters at Washington, D. C., has been appointed district manager of the same company, in charge of eastern and southeastern sales, with headquarters at New York. Mr. Ross was born on December 24, 1868, at Belfast, Ireland, and was educated in Manchester, England. He came to America in April, 1889, and began railway work with the Burlington, Cedar Rapids & Northern, as a trucker and checker at Cedar Rapids, Iowa. He was later transferred to the auditor's office where he served in various capacities until December, 1892. He was then appointed timekeeper in the superintendent's office, and later chief clerk. From June 30, 1895, to August 31, 1901, he was utility clerk to the vice-president and general superintendent, and then was promoted to car accountant. When the Burlington, Cedar Rapids & Northern was absorbed by the Chicago, Rock Island & Pacific, in June, 1902, he became car agent, and the following January was appointed statistician to the general manager of the system. In September, 1903, he was appointed transportation clerk to the third vice-president and subsequently was consecutively transportation clerk to the president, statistician to the president and chief clerk to the standardization committee. On January 1, 1910, he was elected secretary of the board of pensions, and later was made secretary of the pension and personal record bureau. In July, 1916, he resigned his railway position to become secretary and assistant treasurer of Mudge & Co. The following April he was promoted to secretary and treasurer, and since May, 1918, served as assistant to president, with headquarters at Washington, D. C.,, in charge of securing priorities, etc., and also in charge of southeastern sales.

W. B. Ross

The Midwest Engine Company, Indianapolis, Ind., has opened new offices in the Florida Life building, Jacksonville, Fla., in charge of **D. J. Carrison**, formerly with the Busch-Sulzer Brothers Diesel Engine Company, St. Louis, Mo.; in the Caples building, El Paso, Tex., in charge of **Chester B. Loomis**, formerly consulting engineer and later major of engineers, of the Purchase, Storage and Traffic Division of the General Staff, U. S. A.; at 111 Broadway, New York, in charge of **B. H. Downing**, who for seven years has been engaged in the marketing of pumps and condensers; and in the Maison Blanche building, New Orleans, La., in charge of **J. R. Lowe**, who has been engaged in the marketing of prime movers and pumps for several years.

Financial and Construction

Railway Financial News

Baltimore & Ohio.—President Daniel Willard has issued a lengthy letter to stockholders in which he intimates that with early restoration to normal conditions, dividends on his company's common stock may be resumed.

On that point he says: "If federal control of the railroads is terminated on December 31 next, and if Congress in the meantime provides a wise and constructive policy of regulation for the future, and if the director general of the Interstate Commerce Commission will authorize and make effective before that date such additional advance in the rates and charges as may be necessary to restore proper relation between revenue and operating expenses, and I believe that we may reasonably expect all of these things to be done, I can see no reason why the railroads generally may not thereby be placed upon a sound and self sustaining basis or why the Baltimore & Ohio in particular may not look forward with confidence to an early restoration of normal conditions, which should, of course, be accompanied by a return of reasonable dividend payments to holders of Baltimore & Ohio common shares."

He reviews matters which led up to the necessity for passing the dividend on the common stock, which in substance are familiar. He argues that a further increase in railroad rates and charges of substantial character are imperative.

Delaware & Hudson.—See editorial elsewhere in this issue.

Georgia Coast & Piedmont.—The Brunswick Board of Trade is making a stubborn fight to prevent the confirmation of the sale of this road to Gordon & Freedman, a salvage firm of New York, which purchased the property on July 2 for $300,000.

Southern Pacific.—See editorial elsewhere in this issue.

Wabash.—See editorial elsewhere in this issue.

Railway Construction

The Edward Rutledge Timber Company Railroad, Coeur D'Alene, Idaho.—This company will build an eight-mile railroad with branches from Clarkia, Idaho, to its large timber holdings in that state. The new road will be extended gradually through its timber property.

Texas & Pacific.—The reconstruction of machine shop facilities at Marshall, Tex., to replace those destroyed by fire during 1918, will consist of extensions to the present buildings and boiler shops, one part of which will be set aside for machine shop purposes. The cost of the building work proper is estimated at $250,000, in addition to which new and improved machinery will be installed.

Seaboard Air Line.—A contract has been given to C. E. Hillyer, Jacksonville, Fla., for the reconstruction of the burned portion of the Hutchinson Island Terminal facilities of the Seaboard Air Line, near Savannah, Ga., destroyed by fire on February 14. The work will consist of the restoration of sheds, docks, wharves, and other facilities, and is expected to be finished in time to handle the fall business at these terminals.

The Whitney Company Railroad, Detroit, Mich.—This company has awarded a contract to Rajotte, Fobert & Winters, Spokane, Wash., for the construction of a 12½-mile standard gage railroad extending from Tillamook Bay, Ore., along the Kilches river to a tract of timber owned by the Whitney company. It is estimated that the work will involve 152,000 yards of excavation. About 507,000 feet of lumber will be required for trestles and bridges.

ANNUAL REPORT

Southern Pacific Company—Report of the Board of Directors

New York, N. Y., July 10, 1919.

To the Stockholders of the Southern Pacific Company:

Your Board of Directors submits this report of the operations and affairs of the Southern Pacific Company and of its Proprietary Companies for the fiscal year ended December 31, 1918.

On December 28, 1917, the President of the United States took over the possession, control, and operation of your Company's railroad and steamship lines, under terms and conditions which thereafter were embodied in the Act of Congress of March 21, 1918, which was printed in full in the annual report for 1917, and briefly summarized on pages 24 and 25 of that report.

This Act authorized the President, or his representative, the Director General of Railroads, to enter into an agreement with the individual railroads whose properties had been taken over, to fix the compensation and to provide also for up-keep, betterments and additions, accounting, payment of compensation, deductions from compensation, etc. Soon after the passage of the Act, representatives of the Director General and of the railroads began a series of conferences in the effort to agree upon appropriate standard clauses for such agreements. As a result of prolonged discussion a standard form of contract was drafted, which the representatives of the railroads reported to be the best obtainable. The directorates of substantially all other railroads reached the same conclusion as did your Directors after careful consideration; that this standard form of contract was the best that could be obtained, and was far preferable to the alternative of possession and operation of your properties until the end of Federal control without any agreement whatsoever; your compensation to be determined thereafter in a suit to be brought in the Court of Claims.

Resolutions authorizing your Board to enter into an agreement with the Director General along the lines of the standard form of contract were adopted at a Special Stockholders' meeting on October 9, 1918, and similar action was taken by the stockholders of Proprietary Companies.

It remained to negotiate an agreement with the Director General on the basis of the standard form, with such modifications as the special features in the case of our properties rendered necessary or desirable. After protracted negotiations we reached a form of agreement as satisfactory as could reasonably be expected. Accordingly, on February 19, 1919, an agreement was duly executed between the Director General of Railroads, on the one part, and, on the other, the Southern Pacific Company and the following Proprietary Companies: Arizona Eastern Railroad Company; Houston & Texas Central Railroad Company; The Galveston, Harrisburg & San Antonio Railway Company; Texas & New Orleans Railroad Company; The Houston, East & West Texas Railway Company; Houston & Shreveport Railroad Company; Morgan's Louisiana & Texas Railroad & Steamship Company; Louisiana Western Railroad Company; Lake Charles & Northern Railroad Company; and Iberia & Vermilion Railroad Company. For mutual convenience the Southern Pacific Company and the Proprietary Companies were united in one contract.

The departures in the agreement from the standard form were made at our suggestion, and were generally in accord with our contentions. For example, special clauses inserted in the standard form secured a continuance during Federal control of our hospital system, and provided in a satisfactory way for the up-keep and return of the steamships. We succeeded in securing $100,000 per year, in addition to the "standard return," on account of new ships acquired between July 1 and December 31, 1917, and a fair rental to be paid by the Director General for such space as his operating force may occupy in the new office building at San Francisco.

The Federal Control Act provides that the annual compensation (called "standard return") shall not exceed a sum equivalent, as nearly as may be, to the average annual railway operating income for the three test years ended June 30, 1917, unless, because of exceptional conditions, such basis of earnings is "plainly inequitable as a fair measure of just compensation." Such Act further provides that the Interstate Commerce Commission shall ascertain and certify to such standard return. This certification has been made "subject to such changes and corrections as the Commission may hereafter determine and certify to be requisite in order that the accounts and reports of the Company used by the Commission as the basis of computing said average annual railway operating income may be brought into conformity with the accounting rules or regulations of the Commission in force at the time of such accounting, or in order to correct computations based on such accounts or reports."

In making its certificate, the Interstate Commerce Commission has arbitrarily reduced the amount of the standard return of the Southern Pacific System lines by $328,487.22 on account of war taxes, and by $65,569.83 on account of payments to employees under the Adamson law, or a total deduction of $394,057.05. Although these deductions *represent amounts entered in the accounts subsequent to the test period*, the Commission takes the position that such amounts are applicable to that period. As a *determination of these amounts was not possible during the test period*, and as the same action was taken by the Commission with respect to the standard return of all railroads under Federal control, vigorous protest was made at a public hearing against the making of these deductions. This arbitrary act will have the effect of reducing the compensation of your Company by $394,057.05 for *every year of Federal control.*

The standard return as fixed in the agreement with the Director General was arrived at as follows:

Average annual railway operating income, years ended June 30, 1915, 1916, and 1917	$47,955,769.87	
Rental for ships not in service during test period	400,000.00	
		$48,355,769.87
Less:		
Arbitrary deduction by Interstate Commerce Commission, as explained above	$394,057.05	
Operating income of Inter-California Railway in Mexico, not taken over	1,814.74	
		395,871.79
Amount of standard return		$47,959,898.08
Divided as follows:		
Southern Pacific Company	$38,421,846.79	
Arizona Eastern Railroad Company	1,242,474.82	
Houston & Texas Central Railroad Company	1,717,505.76	
Galveston, Harrisburg & San Antonio Railway Company	3,230,644 60	
Texas & New Orleans Railroad Company	715,135.69	
Houston, East & West Texas Railway Company	375,565.53	
Houston & Shreveport Railroad Company	85,031.76	
Morgan's Louisiana & Texas Railroad & Steamship Company	1,188,525.58	
Louisiana Western Railroad Company	895,178.49	
Lake Charles & Northern Railroad Company	73,493.70	
Iberia & Vermilion Railroad Company	14,495.36	
Total		$47,959,898.08
The contract of the Southern Pacific Terminal Company, which owns the dock and wharf facilities of your Company's lines at Galveston, Texas, has not yet been executed. Based on the operations for the three test years, the standard return to be paid by the Government for the use of such property would amount to	207,444.48	
Making the total standard return on account of your Company's transportation system taken over by the Government		$48,167,342.56

Note: It is now probable that all the properties of the Southern Pacific Terminal Company (those leased to the Public as well as those operated by the Government) will be treated as under Federal control. In this event the standard return of that company will be increased by the average annual rentals received from leased properties during the test period, and its other corporate income will be decreased by the amount of rentals received during the year.

To December 31, 1918, $16,000,000.00 was received from the Director General of Railroads on account of the above-mentioned standard return. Between December 31, 1918, and July 10, 1919, further payments have been made aggregating $24,375,000, of which $14,000,000 was paid in cash and $10,375,000 in certificates of indebtedness.

Under the agreement with the Director General of Railroads, the Railroad Administration took over certain operating assets, and assumed the collection and payment for account of the corporations of certain other assets and liabilities. The state of the accounts between the Director General of Railroads, and the various corporations as a whole is shown in the combined balance sheet.

The table showing the results of Federal operations during 1918 compared with the standard return agreed upon with the Director General shows that the Federal income for 1918 exceeded the standard return by $7,757,935.04, or 16.11 per cent.

In order to preserve the continuity of statistics of operations for historic purposes, statements, in the usual form, covering operations by the Government of Southern Pacific System lines during the calendar year 1918, have been embodied in this report.

As a rule, the officers having immediate supervision of the maintenance and operation of your Company's lines at the time such lines were taken over by the Government, continued, as Federal appointees, to supervise the maintenance and operation of your properties under Federal control. The principal exceptions to this rule were (*a*) the Houston, East & West Texas Railway, and the Houston & Shreveport Railroad; and (*b*) the Houston & Texas Central Railroad. In June, 1918, the President of the Kansas City Southern Railway was appointed Federal Manager of the former, and the President of the Gulf Coast Lines was appointed Federal Manager of the latter. On March 1, 1919, however, these three lines were restored to the jurisdiction of Mr. W. B. Scott, their former President, who is now Federal Manager of all your Company's lines in Louisiana and Texas.

The Board takes this opportunity to express its appreciation of the courtesies extended by Federal officers and employees, in furnishing your Company with information concerning the maintenance and operation of your properties by the Federal Administration.

The operating revenues, operating expenses, and net revenue from railway operations of the *first year of Federal control*, compared with the *last year of private control* are:

	1918	1917	+ Increase — Decrease	Per Cent
Operating revenues	$221,611,206.21	$193,971,489.54	+$27,639,716.67	14.25
Operating expenses	162,722,371.84	120,601,822.82	+ 42,120,549.02	34.93
Net revenue from railway operations	58,888,834.37	73,369,666.72	— 14,480,832.35	19.74

The operating revenues in 1918 exceeded those of 1917 by nearly $28,000,000, the effect of 25 per cent. increase in Southern Pacific freight rates and 14 per cent. increase in Southern Pacific passenger rates (following orders of the Director General for a general advance of 25 per cent. in freight rates and in passenger rates to a minimum of three cents per mile, made in June, 1918), an increase of 9.85 per cent. in passengers carried one mile, and a decrease of 4.87 per cent. in ton miles of revenue freight.

The movement of United States troops contributed substantially to the passenger revenue which was augmented by the additional rates of fare that were charged to passengers traveling in Pullman cars, established June 10th, but withdrawn December 1st.

While the citrus fruit crop of California and the cotton crops of Louisiana and Texas were less than normal, the Pacific Coast crop of deciduous fruit was unusually large—so were the movements of live stock and packing house products. Prior to the armistice there was a great demand for the canned products of California; the copper mines and smelters were operating at their maximum and consuming a heavy volume of fuel; the lumber business was stimulated by the construction of war plants and aeroplanes; and a substantial traffic resulted from shipbuilding on the Pacific Coast and other activities of the war. During the year 1918, the ton miles of freight handled by western lines were 1.6 per cent., and, by all lines under Federal control, 1.8 per cent., in excess of the preceding year.

These conditions, combined with the absence of regular steamship service through the Panama Canal and along the Pacific Coast, would have insured to your lines under the management of your own organization a volume of traffic at least equal to that of the calendar year 1917, which produced the largest gross earnings in the history of the Company; but, after the management of your lines was taken out of the hands of your officers, the closing of the traffic agencies through which daily intercourse with your patrons had been maintained, the disturbance of the relationship of both rates and service to the disadvantage of your lines, and the diversion of traffic to competitive routes, resulted in your rail lines transporting 653,707,093 ton miles of freight less than handled during the preceding year, a decrease of 4.87 per cent.

The increase of $42,120,549 in operating expenses absorbed not only all of this increase in revenue but over $14,000,000 more, resulting in a decrease in net revenue from railway operations of $14,480,832, or 19.74 per cent. In other words, *it cost* $1.52 *to earn every additional dollar of operating revenues.* The very heavy increase in operating expenses is attributable largely to advances made in the rates of pay of employees and to increases in the cost of materials.

These increases itemized are:

Increased wages	$23,658,000
Increased prices paid for fuel	6,141,000
Increased prices paid for other materials	4,539,000
Total increases in wages and material prices	$34,338,000

The difference between the total of these items and the total increase of

UNITED STATES

Authorities:- "Cost of Living" Reports of National Industrial Traffic Board. Other Data:- Reports of I.C.C. and U.S. R.R. Administration

$42,120,549 in operating expenses was caused, in the main, by reductions in hours of service, fall in efficiency, etc.

The effect of increases in rates on revenues was felt in the last half of the year only. Many of the increases in rates of pay were made retroactive to the 1st of January, 1918, but as many demands for increased pay were pending at the close of the year and have since been granted in whole, or in part, it is evident from the net income derived from the operation of your properties by the United States Railroad Administration in the first quarter of 1919 that the increases in passenger and freight rates made in 1918 are not sufficient now, and probably will not be sufficient when the properties are returned to their owners, to pay operating expenses, fixed charges, taxes, and reasonable dividends. A further increase is necessary, unless the volume of traffic should increase to an extent that cannot reasonably be expected.

The popular impression of the effect of an increase in rates on living costs is grossly exaggerated, and there is no doubt that the fear of greatly increasing living costs influenced the public and the Interstate Commerce Commission, through the pressure of public opinion, to deny the petitions of the carriers for higher rates to produce an increase in revenue commensurate with the rises in costs of labor and material. To show how slight a foundation exists for this belief, and how exaggerated is the popular conception of this influence, the following figures are adduced:

In the period from 1910 to 1919 the price of dressed beef originating in Chicago and transported to New York increased from 22½ cents to 40 cents per pound, or, expressed in our smallest unit of value, 175 mills, while the freight rate increased 2.4 mills, or only 1.4 per cent.

The price per pound of ham and bacon transported between the same points increased 205 mills, whereof the increase in freight rate was responsible for 1¼ mills, or only 0.73 per cent.

The increase in the cost of a suit of underwear transported from Boston to Chicago in the period 1910 to 1919 was 1.250 mills, to which the increase in freight rate contributed 3 mills, or 0.25 per cent.

A pair of shoes, transported from Boston to Chicago in the same period, increased in price 3.500 mills, of which the increase in freight rate was responsible for 6 mills, or 0.16 per cent.

No coin is small enough to represent any of these increases in cost, but if the dealer should add one copper cent in each case to the 1910 prices, to reimburse him for the increased cost of his commodity due to increased freight rates, *he would grossly overcharge the purchaser in every case.* He would make him pay *nearly double* the proper amount in the case of a pair of shoes, and over *six* times the proper amount in the case of a pound of ham or bacon.

The accompanying diagram illustrates the slight influence of rates on the cost of living, as to all railroads in the United States. It shows no substantial *increase* of rates from 1916 to 1917, yet the cost of living *rose* rapidly; there was a large *increase* of rates from 1917 to 1918, yet the speed of rise in the line of cost of living *was perceptibly checked.*

Although at the time your property was taken over by the Government your Company had orders outstanding for 57 locomotives, 41 passenger-train cars, and 718 freight-train cars, and had under construction in its own shops 56 locomotives and 3,808 freight-train cars, making a total of 113 locomotives, 41 passenger-train cars, and 4,526 freight-train cars, for which provision had been made, it was, nevertheless, forced to agree, as a condition precedent to the execution of its contract with the Director General of Railroads, to purchase from the Director General 1,000 box cars, at a total cost of $3,050,000. In the standard contract agreed to by him with the carriers, the Director General obligates himself not to "acquire any motive power, cars, or other equipment at the expense, or on the credit, of the Companies in excess of what in his judgment is necessary, in addition to their then existing equipment, to provide for the traffic requirements of their own systems of transportation." Notwithstanding the Companies' books showed that traffic requirements of their own system larger than those of 1918 had been provided for, and that in addition its freight equipment had earned net rentals enough on other lines to average $1,227,533 annually for the four years next preceding the date of Federal control; this and all other arguments presented to the Director General were met by a refusal to execute the contract with your Company unless

†Represents principally, rental for steamships under charter to U. S. Shipping Board, the earnings from which steamships during the test period were included in railway operating revenues. *Debit.

it accepted the allotment of cars that were clearly not needed for the traffic of their own system. As your Directors were compelled to make the sorry choice between Government operation of your properties without a contract, and consequent litigation in the Court of Claims after the end of Federal control for compensation during Government possession; or to accept and pay for 1,000 cars of poor design and excessive cost that your Company did not need, they yielded to major force and accepted the allotment of 1,000 cars as the lesser of the two evils.

The table on the preceding page shows the results of Federal operation of your Company's lines during 1918, compared with the standard return payable by the Government for the use of such property:

PROPERTIES AND MILEAGE

The transportation lines, herein referred to as "Proprietary Companies," constituting the Southern Pacific System, operated by the Government at December 31, 1918, were as follows:

Divisions	First main track	Additional main track	Sidings	Ferries	Water lines
A—Mileage of lines owned by or leased to Southern Pacific Company:					
1. Owned lines	537.46	15.35	203.02	.....	4,400.00
2. Leased lines:					
(a) Central Pacific Railway	2,288.97	431.15	932 58	9.90	125.00

OPERATING INCOME.

Miscellaneous Operating Income (line No. 15), substantially all of which represents the operating results of the California Fuel Oil Department of Southern Pacific Company, shows a decrease of $1,254,360.70. This decrease is made up, principally, of a decrease of $3,449,321.43, due to a decrease in the net operating income for the eight months to December 31, 1918, compared with the corresponding period of last year, less an increase of $2,195,522.16, representing the net operating income for the first four months of this year, last year's figures having included operations only for the eight months following April 30, 1917, when the Fuel Oil Department was taken over from the Kern Trading & Oil Company. The decrease of $3,449,321.43 is due, principally, to a decrease of $1,656,757.02 in net revenue from produced oil, and to an increase in operating expenses, the result of including therein this year drilling expenditures for the year amounting to $1,773,820.50, similar expenditures theretofore not having been included in operating expenses.

NONOPERATING INCOME.

Of the increase of $262,607.80 in Miscellaneous Rent Income (line No. 18), $156,188.72 represents the amount due from the United States Railroad Administration for rental of that portion of the office building at San Francisco occupied by Federal forces; and $33,994.08, represents similar rentals collected from others for space occupied in such building, corresponding rentals received last year for space in the Flood Building having been dealt with as an offset against the rent paid for the latter building.

The increase of $157,306.55 in Miscellaneous Nonoperating Physical Property (line No. 19) is due, principally, to an increase in the net income from lands belonging to the Central Pacific Railway Company.

The increase of $29,215.90 in Separately Operated Properties—Profit (line No. 20) is due, principally, to this Company's proportion of increased profits from operation of Pintsch gas plants at Houston and Portland.

The decrease in Dividend Income (line No. 21) is due, principally, to the fact that last year's income included $64,405.16 representing liquidating dividends of companies whose properties were sold to Central Pacific Railway Company and to Southern Pacific Railroad Company as set forth on page 6 of last year's report.

The increase in Income from Funded Securities—Bonds and Notes (line No. 22) is due, principally, to the increase in interest received on Liberty Loan bonds.

The decrease in Income from Funded Securities—Investment Advances (line No. 23) is the result, principally, of including in this account last year interest previously held in suspense, on construction advances repaid last year.

The decrease of $488,917.57 in Income from Unfunded Securities and Accounts (line No. 24) is the result, principally, of the decrease in interest received on surplus funds, the surplus funds on hand at December 31, 1917, having been exhausted in payment of interest, dividends, and other obligations of the Company before any advances on account of our standard return were received from the Government. As complete data necessary for the computation of interest on the accounts with the Government have not been furnished by the Federal Administration, the income account on page 13 does not include such interest. It is estimated, however, that the interest due to the Company is in excess of the interest due to the Government.

The credit to Revenues Prior to January 1, 1918 (line No. 27), is explained below in connection with the debit to Expenses Prior to January 1, 1918 (line No. 40).

DEDUCTIONS FROM GROSS INCOME.

The increase of $161,273.02 in Rent for Leased Roads (line No. 30) is the result, principally, of a rental payment amounting to $135,000, covering the period from January 1, 1912, to December 31, 1917, in controversy for several years, which was paid during the year.

DEDUCTIONS FROM GROSS INCOME.

The increase of $71,339.82 in Miscellaneous Rents (line No. 31) is due, principally, to the fact that last year, following the taking over of the Company's ships by the U. S. Shipping Board, as explained in the tenth paragraph under "Operating Income" on page 8 of last year's report, the rental for piers at New York, New Orleans, and Galveston was charged to the account of the Government.

The increase of $54,284.22 in Miscellaneous Tax Accruals (line No. 32) is due, principally, to an increase of $43,386.65 in taxes on lands covered by Central Pacific Railway Company Three and One-Half Per Cent Mortgage.

The increase of $1,707,269.24 shown against Railway Tax Accruals—War Taxes (line No. 33) is caused by the fact that the war taxes for last year are included in the item of $13,792,176.17 reported against Railway Tax Accruals (line No. 5).

The decrease of $451,971.59 in Interest on Funded Debt—Bonds and Notes (line No. 34) is due, principally, to the conversion of $3,619,500 of Five Per Cent Convertible Bonds into common stock; to the redemption of $1,841,000 of Equipment Trust Certificates; and to the acquisition by the Southern Pacific Company of the $3,839,000 of Morgan's Louisiana & Texas Railroad & Steamship Company Main Line First Mortgage Seven Per Cent Bonds, which matured April 1, 1918, the interest on which has been excluded, in the income statement both from Interest on Funded Debt (line No. 34), and from Income from Funded Securities (line No. 22).

The decrease in Interest on Funded Debt—Nonnegotiable Debt to Affiliated Companies (line No. 35) is the result of reductions in the indebtedness of Southern Pacific Company to Affiliated Companies.

The increase in Interest on Unfunded Debt (line No. 36) represents, principally, the interest paid on funds borrowed for the purchase of Liberty Loan Bonds.

The increase of $69,749.01 in Amortization of Discount on Funded Debt (line No. 37) is the result, principally, of the retirement during the year of $3,619,500, par value, of Five Per Cent Twenty-Year Convertible Gold Bonds in exchange for a like amount of common stock issued.

The amount shown in the column for last year as Corporate Operating Expenses (line No. 38) was dealt with last year as Maintenance of Investment Organization. The increase of $587,454.41 represents the salaries and expenses of corporate officers and employees at New York, San Francisco, Houston, New Orleans, and Tucson necessary to administer the corporate affairs of the companies and to protect their interest during Federal control. Although the salaries and expenses of such officers and employees were charged to operating expenses during the test period, thereby reducing the average annual railway operating income upon which the standard return was based, the Director General refused to bear any portion thereof after the appointment of Federal Managers.

The increase in Miscellaneous Income Charges (line No. 39) is the result of an adjustment on account of Federal income taxes, payable by the companies, on the interest on tax-exempt bonds.

The credits to Revenues Prior to January 1, 1918 (line No. 27), and the debits to Expenses Prior to January 1, 1918 (line No. 40) represent, respectively, the collection and payment during the year, through the Federal Administration, of revenues and expenses, commonly called "lap-over" items, applicable to the period prior to January 1, 1918. As these lap-over items represent assets and liabilities of the corporation, the Interstate Commerce Commission instructed that they be taken into the Corporation's income account and this has been done. Inasmuch, however, as the standard return is based on the average annual railway operating income for a three-year period the Corporation's income for the year is complete without including these lap-over items, and it would seem, therefore, that such items either should be held in suspense to be included in the operations in the year following the end of Federal control when similar lap-over items will be credited or charged, as the case may be, to the Government, or should be dealt with as profit and loss items. The effect, therefore, of obeying the Commission's instructions is *to understate the income for the year by* $2,533,000.13. This, added to the effect of excluding Corporate Expenses from Operating Expenses during Government Control, *reduces the income account by* $3,120,454.54. Otherwise stated the addition of this amount to Net Income (line No. 42) *would increase it* 10.87 *per cent.*

DEDUCTIONS FROM GROSS INCOME

On December 31, 1918, the principal of advances to the Southern Pacific Railroad Company of Mexico amounted to $39,792,065.33. Interest accruing on these advances has not been taken into the income of the Southern Pacific Company.

CAPITAL STOCK

The capital stock of the Southern Pacific Company outstanding at the beginning of the year amounted to		$272,823,405.64
Issued during the year:		
Common stock issued in exchange for a like amount of Five Per Cent Twenty-Year Convertible Gold Bonds surrendered and cancelled		3,619,500.00
Amount of Southern Pacific Company capital stock outstanding December 31, 1918		$276,442,905.64
The common and preferred capital stocks of Proprietary Companies outstanding at the beginning of the year amounted to	$349,082,400.00	
Add:		
Capital stock of Marion & Linn County Railroad Company, which has not heretofore been dealt with as a Proprietary Company.	250,000.00	
	$349,332,400.00	
Deduct:		
Capital stock of Inter-California Railway Company, which company is dealt with this year as an Affiliated Company	2,500,000.00	
Total capital stocks of Proprietary Companies outstanding December 31, 1918		$346,832,400.00
Capital stocks of Proprietary Companies outstanding December 31, 1918, were held as follows:		
In hands of public		$76,100.00
Owned by Southern Pacific Company	$346,456,300.00	
Owned by Morgan's Louisiana & Texas Railroad & Steamship Company	300,000.00	
		346,756,300.00
		$346,832,400.00

FUNDED DEBT

The funded and other fixed interest-bearing debt of the Southern Pacific Company and of its Proprietary Companies, outstanding December 31, 1917, was as follows:

Southern Pacific Company	$206,657,610.00	
Proprietary Companies	456,471,651.33	
Total outstanding December 31, 1917		$663,129,261.33
Deduct:		
Funded debt of Inter-California Railway Company, which company is dealt with this year as an Affiliated Company		850,000.00
		$662,279,261.33

		10,295,874.25
SOUTH PACIFIC COAST RAILWAY COMPANY.		
First Mortgage Four Per Cent Bonds:		
Purchased from payments to sinking fund		8,000.00
SOUTHERN PACIFIC RAILROAD COMPANY.		
First Refunding Mortgage Four Per Cent Gold Bonds:		
Purchased from payments to sinking fund		14,000.00
TEXAS & NEW ORLEANS RAILROAD COMPANY.		
Payment to State of Texas account of School Fund Debt		4,987.30
Total retired during the year		15,790,761.55
Amount of funded and other fixed interest-bearing debt of the Southern Pacific Company and of its Proprietary Companies, outstanding December 31, 1918		$646,488,499.78
The outstanding securities are held as follows:		
In hands of public		$544,298,283.36
Owned by Southern Pacific Company	$87,342,216.42	
Owned by Proprietary Companies	2,544,000.00	
Held in sinking funds of Proprietary Companies	12,304,000.00	
		102,190,216.42
Total		$646,488,499.78

Under the terms of the indenture of June 1, 1909, securing the issue of Southern Pacific Company Four Per Cent Twenty-Year Convertible Gold Bonds, the holders of such bonds were given the privilege of converting their bonds at par into paid-up shares of the common stock of the Company at $130 per share of $100 par value on or before June 1, 1919. As such date, however, fell upon a Sunday the privilege was extended to and including June 2, 1919. Up to December 31, 1918, there had been converted bonds to the amount of $662,090, and from January 1, 1919, to and including June 2, 1919, bonds to the amount of $26,657,150 were converted, making a total of $27,319,240 par value of bonds (or 33.39 per cent. of the $81,814,000 of bonds issued), converted into $21,014,800 par value of stock.

LIBERTY LOAN

To enable the employees of your Company and of its affiliated companies to subscribe for Liberty Loan Bonds, they were permitted to subscribe through the Company for an amount of such bonds not exceeding twenty-five per cent of their yearly salaries, the Company advancing the subscription price of the bonds and charging interest on such advances at the bond rate, the amounts so advanced to be repaid to the Company by monthly salary deductions. The following statement shows the bonds of each issue subscribed for on behalf of employees and on behalf of the Company:

	First loan	Second loan	Third loan	Fourth loan	Fifth loan
Total number of employees subscribing	19,973	19,078	64,129	†9,474	†8,412
Per cent of employees subscribing to total employees	27%	27%	81%	†64%	†55%
Total amount subscribed for on behalf of employees	$1,918,800	$1,843,700	$5,019,400	†$1,154,050	†$996,050
Amount subscribed for on behalf of the Company	*$5,000,000	5,000,000	2,000,000	7,000,000	.....
Total subscriptions of employees and Company	$6,918,800	$6,843,700	$7,019,400	$8,154,050	$996,050

*Of the amounts subscribed there were allotted to the Company $850,000 of First Loan bonds, $4,018,750 of Second Loan bonds, $2,000,000 of Third Loan bonds, and $7,000,000 of Fourth Loan bonds. †Represents corporate employees only.

THE SUIT INVOLVING THE RIGHT OF THE SOUTHERN PACIFIC COMPANY TO OWN THE STOCK OF THE CENTRAL PACIFIC RAILWAY COMPANY

In the last annual report, after stating that the decision of the United States District Court at Salt Lake City in favor of the Southern Pacific Company had been appealed by the United States to the Supreme Court of the United States, it was said: "It may be that the appeal will not be brought on for hearing by the Supreme Court so long as railroads are being operated by the President." This forecast has proven to be correct. The case has twice been continued for the term, along with other important trust cases, on motion of the Attorney General. At the next term of the Supreme Court, beginning in October, 1919, if a return of the railroads has taken place or is reasonably certain in the near future, it is probable that the case will be set down for an early hearing. If so, a decision may be expected in the first half of 1920.

CONTROVERSY ARISING OUT OF THE OREGON AND CALIFORNIA RAILROAD'S LAND GRANT

At the time of the last annual report there had been recently instituted an accounting suit by the United States, seeking to offset against the compensation of $2.50 per acre for the unsold lands moneys received by the Company, in excess of $2.50 per acre, by reason of past sales, leases and otherwise, as well as State taxes levied since the forfeiture decision in 1913 and voluntarily paid by the Federal Government to the State of Oregon. That suit is now at issue, and both parties are engaged in preparing for the trial.

THE SUITS INVOLVING TITLE TO THE OIL LANDS

The suits involving title to the productive oil lands, which more than a year ago were argued and submitted in the United States District Court in California, are still being held under advisement by that court. A decision is looked for any day. The suit to cancel patents to certain other lands alleged but not proven to be oil lands, known as the Elk Hills case, was argued in March last before the Supreme Court of the United States, and is now awaiting the decision of that court.

GENERAL

Dividends on the capital stock of your Company were declared during the year, payable as follows:

1½ per cent paid April 1, 1918	$4,092,351.08
1½ per cent paid July 1, 1918	4,092,351.08
1½ per cent paid October 1, 1918	4,092,351.08
1½ per cent payable January 2, 1919	4,127,002.01
	$16,404,055.25

As stated in the last annual report revolutionary disturbances on the line of the Southern Pacific Railroad of Mexico, with the exception of occasional bandit and Indian raids, practically ceased in the early winter of 1916-1917. A revised estimate places the cost of property destroyed from the beginning of the Madero Revolution, in 1910, to December 31, 1918, at approximately 4,864,700 pesos, equivalent to $2,432,350. The formation of the Government commission for the investigation and adjustment of claims for damages suffered on account of revolutionary disturbances, mentioned in last year's report, has been completed by the appointment of a president and four members; but thus far it has made little progress, and has taken no action upon our claims, although our fiscal representative in Mexico City has, periodically, filed with the Mexican Government statements showing the amounts due the Company. In addition to the claims for property destroyed there is due the Company approximately 8,460,000 pesos for freight and passenger service performed, for rental of road and equipment, and for material furnished to or confiscated by the various military authorities, bills for which will be filed with the Mexican Government as soon as conditions permit. The average mileage of road operated during the year was 1,007 miles. On account of the unsettled conditions, however, only such maintenance work was done during the year as was absolutely necessary to render it possible to operate trains over those portions of the line that were open for traffic.

The general railroad law of Mexico, under which the several concessions covering the construction and operation of the railway of the Southern Pacific Railroad Company of Mexico were granted, provides that at the end of the ninety-nine years' life of each concession the property embraced thereunder shall pass in good condition without encumbrance, and without further consideration, into the ownership and control of the Mexican Government. Under this law, however, the Mexican Government is required to purchase the rolling stock and material and supplies owned by the railroad company at the time the Government takes over the property, paying therefor in cash the value placed thereon by two appraisers. In order to provide for the loss on the property which will thus pass into the control of the Mexican Government at the end of the concession period, the Board of Directors of the Southern Pacific Railroad Company of Mexico authorized the creation of a reserve, by charging to Profit and Loss the amount estimated to have accrued from the beginning of the concession period to December 31, 1917, the remainder of such loss to be amortized by charges to income during the remaining life of the concessions. A reserve, amounting to $4,004,476.70, was therefore created during the year, $3,545,680.48 thereof, representing the proportion of the loss accruing to December 31, 1917, being debited to Profit and Loss, and the remaining $458,796.22, representing the proportion of the loss accruing during the current year, debited to Income Account.

In addition to the completed lines of railway reported under Properties and Mileage, and the still incompleted line of the Southern Pacific Railroad Company of Mexico, construction is progressing on the lines of the following companies, viz.:

	Length of projected line.	Track completed.	Grading completed.	Grading progressing
	Miles.	Miles.	Miles.	Miles.
SOUTHERN PACIFIC RAILROAD:				
Harrington to Hamilton, Cal.	*61.18	61.18	....	....
HOUSTON & TEXAS CENTRAL RAILROAD:				
Dallas, Texas—Belt Line around city	15.54	....	....	15.54
VISALIA ELECTRIC RAILROAD:				
Exeter to Strathmere, Cal.	†16.36	16.36	....	....

* Line will not be opened to public for traffic until ballasting is completed. †Opened to public for traffic June 1, 1918. ‡Opened to public for traffic January 12, 1918. §Jointly controlled through ownership of capital stock in equal proportions with Spreckels Brothers.

By order of the Board of Directors,
JULIUS KRUTTSCHNITT,
Chairman of the Executive Committee.

Railway Officers

Railroad Administration

Central

R. M. Robinson, traffic manager of the Dayton (Ohio) Chamber of Commerce, has been appointed traffic assistant in the Division of Public Service, succeeding **Charles B. Heinemann**, resigned to resume his former position as secretary and traffic manager of the National Live Stock Association.

John Barton Payne, general counsel of the Railroad Administration, has been nominated by the President for appointment as a member of the United States Shipping Board, succeeding **E. N. Hurley**, resigned. Before going to the Railroad Administration Mr. Payne was counsel for the Emergency Fleet Corporation.

Financial, Legal and Accounting

L. R. Wood, has been appointed auditor, of the St. Joseph & Grand Island; and the St. Joseph Terminal Railroad, with headquarters at St. Joseph, Mo., to succed **J. A. Quinn**, transferred.

G. W. Oliver, statistician of the Atchison, Topeka & Santa Fe with headquarters at Chicago, has resigned to establish an office in Chicago as a railroad analyst. Mr. Oliver will specialize in cost analysis and statistical work in connection with freight litigation before the Interstate Commerce Commission, state commissions and the courts.

C. W. Crow, chief clerk to the auditor of the Trinity & Brazos Valley, at Houston, Texas, has been promoted to auditor, with the same headquarters. Mr. Crow was born in Texas and began his railway career in the service of the Fort Worth & Denver City, with which road he remained for 20 years. In January, 1916, he resigned from his position with the Fort Worth & Denver City to become chief clerk to the auditor of the Denver & Salt Lake, with headquarters at Denver, Colo. He continued in this capacity until June, 1918, at which time he entered the service of the Trinity & Brazos Valley as chief clerk to the auditor, with headquarters at Houston. He succeeds **L. H. Attwell, Jr.**, who recently tendered his resignation to become receiver and corporate auditor of the Trinity & Brazos Valley Railway Company.

C. W. Crow

Operating

Captain S. L. Racey, recently discharged from military service, has resumed his duties as superintendent of the Green River division of the Denver & Rio Grande, with headquarters at Helper, Utah.

H. R. Davis, general yard master of the Covington, Ky., and Silver Grove terminals of the Chesapeake & Ohio, with headquarters at Covington, has been promoted to assistant trainmaster of the Cincinnati and Northern divisions of the Chesapeake & Ohio, the Chesapeake & Ohio Railroad of Indiana, the Ashland Coal & Iron, the Sandy Valley & Elkhorn and the Long Fork, with the same headquarters.

Traffic

Edward P. Hennessey, commercial agent of the Chicago, Rock Island & Pacific, with headquarters at Omaha, Neb., has been promoted to division freight agent with the same headquarters, succeeding **John E. Udd**, who has retired.

Engineering and Rolling Stock

E. H. Roelofs, assistant engineer of motive power on the Philadelphia & Reading, with headquarters at Reading, Pa., has resigned to enter the service of the Baldwin Locomotive Works.

Purchasing

H. G. Davis, acting storekeeper on the Toledo, St. Louis & Western, with headquarters at Frankfort, Ind., has been promoted to general stores agent, with the same headquarters, in charge of the inspection of ties and other forest products. **C. N. Thacker** will succeed Mr. Davis as storekeeper, with headquarters at Frankfort.

Corporate

Executive, Financial, Legal and Accounting

William Magivny, president of the St. Paul Bridge & Terminal Railroad Company for the past 12 years, with headquarters at St. Paul, Minn., resigned on July 1 to engage in private business at Portland, Ore.

Obituary

John Bentley Sheldon, bridge and building supervisor of the Providence division of the New York, New Haven & Hartford, with headquarters at Providence, R. I., died at his summer home at West Kingston, R. I., on July 2.

Arthur Wray Street, formerly general eastern freight agent of the Great Northern, who died in New York on July 9, as was briefly noted in our issue of July 11, was born in October, 1847, at London, Ont., and began railway work in August, 1859, as a clerk in the general freight office of the Michigan Central. He later served as chief clerk in the same office and then was made assistant general freight agent. In December, 1888, he was appointed assistant general freight agent of the Toledo, St. Louis & Kansas City, at St. Louis, Mo., and later served first as a commercial agent, and then as assistant general freight agent of the Missouri Pacific. From June, 1891, to October, 1898, he was general manager of the Hoosac Tunnel Fast Freight Line, with office at Chicago, and in April, 1899, became commercial agent for the Great Northern, at Cleveland, Ohio. Mr. Street was later general freight agent of the Northern Steamship Company, and from March, 1903, until the Great Northern Railway was taken over for government operation, he served as general eastern freight agent of that road.

Matthew J. McCarthy, superintendent of maintenance of equipment of the Baltimore & Ohio, Lines West, with headquarters at Cincinnati, Ohio, died at his home in that city on July 12. He was born at Susquehanna, Pa., in 1868, and began railway work in 1889 as an apprentice on the Erie, and subsequently worked in a number of railroad shops in the West and Southwest as machinist and foreman. He was for ten years in the service of the Chicago, Burlington & Quincy, at Burlington, Iowa, as machinist, inspector and general foreman, then was with the Michigan Central, as division master mechanic at St. Thomas, Ont., for four years, and during the next two years served as division master mechanic on the Lake Shore & Michigan Southern. Mr. McCarthy then went to the Cleveland, Cincinnati, Chicago & St. Louis, as superintendent of shops at Beech Grove, Ind., and later was assistant superintendent of motive power at Indianapolis, on the same road. In January, 1913, he was appointed superintendent of motive power of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton, at Cincinnati, Ohio, later his title was changed to superintendent of maintenance of equipment of the Baltimore & Ohio, lines west.

The Results of Thoughtlessness

Thoughtlessness on the part of passengers in throwing material of all sorts out of windows of passenger coaches frequently results in serious injury to railroad employees standing along the tracks. The records in the office of the superintendent of insurance and safety of the Pennsylvania Railroad, show that in 1918 twelve employees were injured in this manner, the injuries resulting in a total of two hundred and twenty days' disability. This is a matter which particularly concerns the maintenance departments of the railroads, as by the character of their work, trackmen and bridge men are daily exposed to this menace. While it is of course a difficult matter to locate the persons in a crowded train who have caused injuries, if they are not seen in the act of throwing the articles out of the windows, prompt action in reporting such incidents together with the co-operation of the police department will result in a fair proportion of the guilty persons being apprehended and disciplined. Aside from the needless suffering caused by such thoughtlessness, with the possibility of fatalities, the loss in time which results is sufficient to warrant vigorous measures being taken to discourage this practice.

The Closed Angle Cock

The need that something be done to remove the menace of the closed angle cock requires no more striking evidence than that afforded by the circumstance of the rear collision which occurred on the New York Central at Dunkirk, N. Y., on the morning of July 1. With the standing train, No. 41, protected by a home block signal 2,000 ft. back and a distant signal 6,000 ft. back of the point at which the collision occurred, the evidence indicates that the engineman of the following train, No. 7, first attempted to control the speed of his train on approaching the distant signal, only to discover that he had no control of the train brakes. The evidence further indicates that he lost his control of the train brakes probably only a few seconds before the need for their use arose, due to the closing of the angle cock at the rear of the tender by a trespasser riding the "blind baggage," who wished to leave the train at Dunkirk. The loss of train control through the closing of an angle cock, generally that at the rear of the tender, has for years been of too frequent occurrence. This has been caused by carelessness or forgetfulness on the part of employees, by trespassers and by other accidental means not always easily identified. As long as the safety of the train may thus be jeopardized without warning the absolute removal of this menace is probably impossible. As long as human fallibility must be depended upon without check, failure to provide an unrestricted brake pipe through carelessness or forgetfulness will occasionally occur. There is no inherent reason, however, why some protection against the tampering of trespassers riding on the trains cannot be provided and some means should be evolved to prevent the possibility of moving the angle cock except by a person on the ground. Further protection at the most vulnerable point in the train might be provided by placing the control of opening and closing the brake pipe passage on the locomotive and tender in the hands of the engineman. These suggestions apply to passenger service. The means which might be justified by the terrible consequences in loss of life and personal injuries from a failure of the brakes on passenger trains, might not prove equally practicable when applied to freight equipment. The menace in the latter case, however, although perhaps not as serious as in the case of passenger trains, is great enough to demand consideration and persistent effort in the development of means for its removal.

Daylight Saving and the Milk Trains

The president has vetoed the rider which would have repealed the daylight saving bill. The chief opponents of the law which provides for setting forward the hands of the clock one hour during the summer months, are the lighting companies and the farmers. The farmers deserve consideration. They claim that their milk schedule is fixed by time of departure of milk trains which is an hour earlier (sun time) in summer than in winter, but that milch cows are not amenable in their habits to the daylight saving law. The result is a loss of milk. Could not milk train schedules be changed? There is a certain amount of expense connected with a change in time-tables and some roads, especially single track roads, might find difficulties in running milk trains an hour later (clock time) in summer than in winter. Would it not, however, be well worth while to incur this additional expense and trouble for the good that will accrue to railroad employees together with all classes of urban citizens through the retaining of the daylight saving law? Furthermore, a great number of people to whom the daylight saving law has been of inestimable value should appreciate such an act as is here suggested on the part of the railroads. Where milk is carried in passenger trains difficulties in the rearrangement of train schedules might, in some instances, be insurmountable, but if a country-wide effort were made by the railroads to accommodate the farmers during the summer months in milk train schedules it is probable that their grievances against the daylight saving law could in part be removed.

The Conservation of Ice

The conservation of ice is one of the numerous minor details incident to railway operation which is seldom given detailed attention, although when there arises an acute shortage of this material, such as exists in many localities at present, this presents a problem of real importance. The amount of ice used for drinking purposes in offices and on trains is large in the aggregate but the quantity required in the transportation of perishable freight is far larger. The railways must have ice, for its use is imperative in all of these services. The recent mild winter cut down the pack materially, with the result that many roads are now hauling ice long distances while others are buying it locally where formerly they drew on their own supplies. Both of these conditions have added materially to the cost of railway operation. Prompted by

this fact and by the present inadequacy of the supply, many roads have found it necessary to give increased supervision to the use of ice in order to curb the waste and to reduce losses which in certain forms tend to increase as the shortage elsewhere becomes more acute. This has also been the subject of recent instructions by certain of the regional directors. One road which found recently that its monthly consumption increased from 1,600,000 lb. at a certain terminal to approximately twice that figure for the same month this year under similar weather and traffic conditions, has since effected a large reduction in this consumption by increasing the supervision of the use of ice and enlisting the co-operation of employees in eliminating waste. The lesson which is now being gained can be observed with special economy this year, but it is worthy of more consideration than has been given it even in normal times.

The British Transport Bill

On July 10, the bill to establish a Ministry of Ways and Communications for the United Kingdom was passed by the House of Commons which has had it under consideration since the end of February, this year. The bill, as has been noted from time to time in the *Railway Age*, is characterized by its all-inclusiveness, for it practically puts in the control of one man—Sir Eric Geddes, the minister designate—nearly all the modes of transportation in the United Kingdom—railways, light railways, canals, waterways, inland navigation, roads, bridges, ferries, harbors, docks and piers. The government has stood up stoutly for the bill since its introduction and for that reason the bill has come through to its present stage with but few changes, these being in the form of concessions to the powerful dock and highway interests. Labor has stood with the government throughout the discussion both in the House and in the standing committee, and has especially opposed any steps that might in any way take from the bill its all-inclusive character. It has similarly made no attempt to hide its feeling and hope that the bill would eventually lead to nationalization on a large scale. It is surprising at first thought that with this in mind the railway managers and stockholders have not opposed the bill, but when it is realized that the railways of the United Kingdom are in a most serious condition financially and that the bill continues for an additional period the guaranty of dividends, the reason for their lack of opposition is plain enough. They also regard with favor the fact that Sir Eric Geddes, the minister designate, is a railway man and that five of his seven principal assistants will be railway men. Of course, it goes without saying that other interests have opposed this state of affairs, for they feel that the other modes of transport will be operated for the benefit of the railways, rather than otherwise. The term of the bill is for two years. The railway men of the world will watch with great interest to see how Sir Eric Geddes works out the problem of the eventual disposition of the British railways in the time he has available to arrive at a definite policy.

Block Signal Mileage Statement

The discontinuance of the use of the block system on American railroads in the year 1918, because of falling off in business, or for some reason, which was shown in the government report noticed in the *Railway Age* of July 11, page 56, seemed to be very extensive, the total length of road affected being over 2,000 miles; but this seeming recession in our safeguards against collisions is not so bad as it looks. Some of the statements can be explained. The large deduction to be made on the Baltimore & Ohio's eastern lines is offset by the increase on the western lines, the change being due to the transference of two divisions from the "Eastern" to the "Western" section of the system. The Erie advises us that the statement of that road as published is wrong—because, no doubt, of a clerical error. The Burlington informs us that the 141 miles shown in the table against that road is "purely a paper decrease," produced wholly by the exclusion of lines of joint track operated by other companies and erroneously reported in former years. On the Missouri Pacific, one piece of road 4½ miles long comes out because of the discontinuance of the electric train staff; but the rest of the mileage, six sections, ranging from 18 miles to 104 miles, was eliminated because the volume of traffic fell off; either all passenger trains were discontinued or the whole business of the section was done with one locomotive. The statistics of the block signal mileage of the country ought to be put on record somewhat more in detail. The totals which have been published in the last dozen years have served a good purpose in helping to keep up progress in this field, and the number of roads reporting 100 per cent. of their passenger line mileage worked by the block system is, undoubtedly, larger than would have been the case if no table had been issued; but there is room for further progress. Roads which provide the most complete safeguards should have due credit, and the facts should be lucidly shown. Roads which employ the space interval on lines of light traffic should have their enterprise recognized, and where a line is very "thin," requiring only one locomotive, that explanation should be set forth plainly. The extent to which permissive blocking is allowed on long block-sections ought to be known. In view of the bigness of the country and the impossibility of grasping the facts as a whole, it might be a good thing for the Interstate Commerce Commission to conduct an intensive study of a few typical roads, and make public a full and detailed report.

Accident Record Under Government Operation

THE ADVOCATES of government ownership of railways probably have criticised private operation of railways in this country more fiercely because of our railways' deplorable accident record than for any other cause. They have argued that the large number of casualties has been principally due to the fact that under private ownership our railways have been operated chiefly for profit, not to give the best and safest possible service; that under government operation they would be operated to give good and safe service; and that in consequence there would be a large reduction in accidents.

The *Railway Age* always has contended that this country's bad railway accident record has not been due to private operation, but to causes which would exist under either private or government operation; that the principal of these causes is the inability of the railway managements, under the conditions existing in the United States, to enforce such discipline as was enforced before the war on the railways of Germany, France and Great Britain; that discipline would be impaired rather than improved under government operation; and that therefore there would be more likely to be an increase than a reduction of accidents under that policy.

The Railroad Administration recently has issued statistics showing that there was a substantial reduction of accidents in the first three months of 1919 compared with the corresponding months of 1918. These statistics are gratifying, but not surprising, since the better weather conditions in 1919 and the smaller traffic handled were bound, other things being equal, to cause a reduction of accidents. The reduc-

tion doubtless was due both to these conditions and to the efforts to increase safety made by the officers and employees under the supervision of the Railroad Administration.

However, in order that the advocates of government ownership and operation may not base upon these statistics arguments which would be misleading, it is desirable to call attention to the fact that government operation has not by any means resulted uniformly in a reduction of accidents.

The Interstate Commerce Commission has recently issued "Accident Bulletin No. 69" which gives statistics of accidents for the nine months ending with September, 1917, and the nine months ending with September, 1918. These are the latest statistics available comparing accidents under private and government operation. Throughout the first nine months of 1917 the railways were privately operated, and were handling the densest traffic ever known up to that time. During six months of this period the country was at war and the railways were suffering from numerous changes in their employees and were losing many of their best men. During the first nine months of 1918 the country continued to be at war; the railways continued to suffer from changes in and losses of employees; they were handling almost the same volume of traffic as during the corresponding period of 1917; and they were operated by the government. A comparison of the railway casualties in these two periods is therefore interesting and may have some significance.

The accompanying table gives statistics taken from Accident Bulletin No. 69. Only statistics relating to fatal accidents are included, as the definition of an "injury" is so broad and flexible that statistics regarding injuries are much less significant than statistics regarding fatalities.

KILLED IN TRAIN OR TRAIN SERVICE ACCIDENTS

	Nine months ending Sept., 1917	Nine months ending Sept., 1918	Increase
NON-TRESPASSERS			
Employees on duty	1,879	2,089	210
a Trainmen	1,058	1,197	139
b Other employees	821	892	71
Employees not on duty	122	126	4
Passengers	192	394	202
Passengers carried under contract	33	38	5
Other non-trespassers	1,564	1,506	58*
TRESPASSERS			
Total trespassers	3,406	2,442	964*
a Employees	124	40	84*
b Other persons	3,282	2,402	880*
NON-TRAIN ACCIDENTS			
Industrial employees	308	389	81
Other persons	73	72	1*

*Decrease.

The table shows that there was an increase of 210 in the number of employees killed in train or train service accidents while on duty, and of 4 in the number of employees killed in such accidents while not on duty. The increase in the number of ordinary passengers killed in train or train service accidents was 202, or over 100 per cent. There was a slight reduction in the number of other non-trespassers killed in train or train service accidents, these being chiefly persons killed at highway crossings. There was also an increase of 81 in the number of industrial employees killed in non-train accidents. "Industrial employees" are chiefly employees working in the shops and therefore not directly engaged in train operation.

These statistics may not show the government operation increased accidents, but they certainly do show that fatal train and train service accidents increased either because or in spite of government operation.

The table also shows that the number of trespassers killed was reduced by 964, or from 3,406 to 2,442. This large and gratifying reduction in the number of trespassers killed undoubtedly was due chiefly to conditions produced by the war, and particularly to the enforcement of the "work or fight" rule. A large part of the trespassers killed under normal conditions are tramps, and the "work or fight" rule kept many tramps off railroad right-of-way. The reduction in the number of fatalities to trespassers is a striking indication of what could be accomplished by strict and consistent enforcement of laws prohibiting trespassing upon railway property.

"The 'A B C' of the Plumb Plan"

THE "PLUMB PLAN LEAGUE" has been organized to promote adoption of the plan of railroad ownership and management devised by Glenn E. Plumb. Warren S. Stone, Grand Chief of the Brotherhood of Locomotive Engineers, is president of the League, and the heads of fourteen other railway labor organizations are vice presidents. A pamphlet entitled "The A B C of the Plumb Plan" is being widely distributed by the league. It gives in question and answer form the details of the plan and the arguments in favor of it.

Any plan for the future ownership and management of the railways which the organized railway employees support is entitled to respectful consideration and to discussion upon its merits. The railway employees are a numerous body of American citizens, and because they are employees of the railways they will be as much affected, perhaps more affected, by the future of the railroads than any other class.

The "A B C," which apparently was prepared by Mr. Plumb, affords a basis for the discussion of his plan. It claims that enormous economies will be effected if the plan is adopted; that in consequence it will be possible to pay railway employees higher wages, to make large reductions in freight and passenger rates, and at the same time earn a surplus, which it is proposed should be divided between the officers and employees and the government. It is time to measure these claims and arguments by the standard of actual conditions and facts in order to determine what validity they have.

Under the Plumb plan the public would buy the railways, issuing bonds in payment for them. It would delegate their operation to a board of fifteen members, five appointed by the President of the United States, five by railway officers, and five by the classified railway employees. The board of directors would fix wages and salaries, as well as manage the roads, while the Interstate Commerce Commission would continue to fix passenger and freight rates. Disputes between officers and employees would be adjusted by boards to which the officers would elect five members and the men five. In case of failure to reach adjustment of a dispute it would be appealed to the directors. One-half of any surplus over interest charges earned would, as already stated, go to the government, and be invested in improvements and extensions and used to retire the bonds issued to buy the roads. The communities benefited would be required to pay for extensions if they could. Where, however, the general public and not a local community would be benefited the government would pay for the extensions. Doubtless, also, the government would have to pay for all improvements which could not be made from surplus earnings.

It is claimed that this is "a plan for the public ownership and the democracy in the control of the railroads." It is hard to see how it can be seriously claimed that it provides for "democracy in the control of the railroads," since it contemplates the purchase of the roads by all the people and their management by a board two-thirds of whose members would represent only that approximately one-fiftieth of the people who are employed by the railroads.

One ground upon which it is claimed that a large saving would be made under this plan is that "the public can obtain the money to purchase the lines at 4 per cent., whereas

the public is now charged rates to guarantee the roads 6 1-2 per cent. on their money. The saving on the present capital account of the railroads would be about $400,000,000 and on an honest valuation would be nearly twice this sum."

These sentences contain several statements which are erroneous. The public has never been "charged rates to guarantee the roads 6 1-2 per cent. on their money." The last year for which there are complete statistics of the Interstate Commerce Commission showing the property investment, the net capitalization and the net operating income of the railways, is the year ended December 31, 1916. In that year the percentage earned by the railways on their property investment was 5.8 per cent., and this is the largest percentage they ever earned. In the preceding five years the average earned, as reported by the Interstate Commerce Commission, was 4.56 per cent. However, it is undoubtedly true that the companies should be allowed to earn an average of at least 6 per cent on their property investment in order to enable them to operate successfully and raise sufficient new capital for extensions and improvements.

It is also incorrect, however, to say that the public can obtain money to purchase the lines at 4 per cent. The government finally had to pay as much as 4 3-4 per cent to raise about as much money to carry on the war as the reported property investment of the railroads, which is approximately $18,000,000,000. Since it was finally forced to pay 4 3-4 per cent to raise money to carry on the war, it cannot be assumed that it could raise enough to buy the railroads for less than 5 per cent. Now, if it allowed the railroads to earn 6 per cent. upon $18,000,000,000 this would be $1,080,000,000 a year, while if it bought them for $18,000,000,000 and paid five per cent. upon it, the interest would be $900,000,000 a year, or only $180,000,000 less than the net operating income of the properties would be at 6 per cent. Furthermore, if past experience is any criterion, if the railways earned 6 per cent they would put part of it back into improvements and extensions, while if the government earned only 5 per cent on the purchase price mentioned it would have to pay it all out in interest.

But, the "A B C" adds, a much larger saving even than $400,000,000 a year would be made if the roads were bought "on an honest valuation"; and elsewhere it asserts "the public will probably pay less than two-thirds of what the railroads claim as their value." The only foundation for this assertion is that some railroads are known to be over-capitalized. But other railroads are known to be under-capitalized. For example, the Pennsylvania System is capitalized at $430,000,000 less than the actual investment in it. Other large systems also are under-capitalized. The under-capitalized roads will more than offset the over-capitalized roads. Furthermore, the cost of reproduction must be given great weight in valuation; and the cost of reproducing the roads on the basis of present wages and prices would be vastly greater than their book cost. The "A B C" says that the courts would decide the value of the railroads if the public bought them; and the courts unquestionably would hold that the value which must be placed on them is not their original cost, but their present value. Instead of paying less than their present capitalization the public undoubtedly would have to pay much more for them than their present total capitalization or total reported property investment. Any person who really believes that under government ownership large savings in the capital charge of the railroads would be made is either ignorant of the facts or is deliberately misleading himself.

Besides reducing the capital charge, the "A B C" claims that the adoption of the Plumb Plan would result in a large reduction of operating expenses. For example, "A further saving" it is asserted, "would be in the operation of the roads as a unified system, which permits the interchange of equipment, the end of wasteful competition, and greater economy in buying supplies." But the roads have been operated as a unified system under government control for a year and half and are still being so operated. The present director general of railroads, Walker D. Hines, recently stated in testifying before the House Committee on Appropriations: "I think we have already gotten the benefit both last year and the early part of this year of the economies from unification." Mr. Hines doubtless knows as much about this matter as the author of the "A B C"; and the only way he intimated greater economy could be secured under unified operation is by getting a better class of labor, especially skilled labor.

Another argument made for the Plumb Plan is that it would give officers and employees an increased incentive to efficiency. As already indicated, officers and employees are to receive one-half of any surplus over interest charges that may be earned. Their share of the surplus is to be divided pro rata according to their salaries and wages among the officers and employees except that the officers are to receive twice as great amounts of "dividends" in proportion to their salaries as the employees receive in proportion to their wages. But salaries and wages are to be fixed by the board of directors, two-thirds of whose members will be elected by the officers and employees. How can it be assumed that under this arrangement salaries and wages would not be raised so high as to prevent any surplus from being earned? If a surplus were earned it would have to be divided with the government, while if salaries and wages were raised enough to prevent a surplus from being earned the officers and employees would get all of what would otherwise be earned as a surplus.

The answer made by the "A B C" is that the officers would be prevented from entering into collusion with the employees to advance salaries and wages because under this plan the officers would get twice as large a proportion of the surplus as the employees, while, on the other hand, if salaries and wages were raised so much as to prevent a surplus from being earned, the officers would be prevented from getting their "large dividends." But if a raise in salaries and wages were made the officers would know just how much they would benefit by it, while they would never know in any year how much they are going to get from the surplus at the end of the year, or, indeed whether there would ever be any surplus. Therefore the officers as well as the employees would have a far stronger incentive to raise salaries and wages than to try to earn a surplus. Certainly, this would be true at the start; for, if the roads were turned over to the officers and employees for operation under this plan without an advance of rates they would start with a deficit of one-half to three-fourths of a billion dollars a year. This would afford little ground for hope of a surplus.

Not only would this plan not afford any special incentive to officers and men to operate the properties efficiently in order to earn a surplus, but the plan itself would make efficient operation impossible. Two-thirds of the members of the managing board would be selected by the officers and the employees. But the officers are scattered all over the United States and are of many ranks and classes. The same thing is true of the employees. No means is conceivable by which men of so many ranks and classes, scattered all over the country, could possibly know and select as their representatives on the board of directors the men most competent to manage the railroads. A board thus selected would be certain not to be composed of men of the great knowledge, experience and ability needed. The board, in turn, would have to select the officers of the individual lines. But a board composed of men themselves wanting in needed knowledge, experience and ability; would be incapable of selecting or indisposed to select men of sufficient knowledge,

experience and ability to manage the various railway lines.

It may be said that the present officers of the railways would be retained. But it is doubtful if a board composed one-third of government appointees and one-third of labor appointees would be disposed to keep the present officers. Furthermore, it is certain that most of the present higher officers would not consent to work under the direction of such a board. They would quit the railroad business and go into other lines. Even if the present officers did stay they are not immortal.. Successors to them would have to be chosen from time to time; and competent successors could not and would not be developed and chosen under the organization proposed in the Plumb Plan. This ought to be plain to every intelligent railway employee. But if the railroads did not have competent officers they could not and would not be efficiently managed. If they were not efficiently managed, expenses would constantly increase, and service constantly deteriorate.

As a logical conclusion to the argument that vast economies would be effected under the Plumb Plan, the "A B C" makes the following statement: "Under this plan passenger rates of 1 1-2 cents a mile and the reduction of freight rates by 40 per cent. would be reasonable."

Just how much dependence railway employees and other persons can safely put upon the arguments and statements of fact made in the "A B C" will be indicated by the following analysis of this particular statement, which evidently was made to forestall opposition to the plan by travelers and shippers. During the first five months of 1919 the passenger earnings of the railroads were 50 per cent greater and the freight earnings 20 per cent. greater than in the corresponding months of 1917. Total earnings were 25 per cent greater and total operating expenses 57 per cent greater than in the same months of 1917. If these items of earnings and expenses shall throughout the year 1919 bear the same ratio to the similar items for 1917 as they did during the first five months of this year, passenger earnings for the entire year 1919 will be $1,238,000,000; freight earnings will be $3,395,000,000; total earnings will be $5,051,000,000; and total operating expenses will be $4,479,000,000. Now, passenger rates at present are 3 cents a mile. Therefore a reduction of them to 1 1-2 cents would reduce passenger earnings per year approximately $614,000,000. A 40 per cent. reduction of freight rates would reduce freight earnings per year approximately $1,358,000,000. These reductions in passenger and freight rates, on the basis of present business, would reduce total earnings per year from about $5,051,000,000 to about $3,075,000,000. But as we have seen, total operating expenses are now running at the rate of $4,479,000,000 a year. Therefore, after the reductions in earnings caused by these reductions in rates had been made, the total operating expenses of the roads would exceed their total earnings by $1,405,000,000 a year. But railway taxes as well as operating expenses must be paid. Taxes and operating expenses together would exceed total earnings by about $1,600,000,000 a year. Then if in addition there was, say, $900,000,000 a year interest to meet, the deficit to be paid by the public from taxes would be $2,500,000,000 a year. Talk about the "surplus" to be divided between officers and employees and the public! And while the "plan" proposes that the public should get only one-half of the surplus, if there should be one, it also proposes that the public should get all of the deficit, if there should be one. It would be a singular kind of "democracy in the control of the railroads" which would make the public pay the entire bill for buying the roads, give it only one-third of the managing directors, give it only one-half of the surplus if there was any, and send it the entire bill for the deficit if there was one!

But, it is said, the reduced rates would cause an increase of traffic. No doubt. But any increase in the traffic to be handled would also cause an increase of expenses. We are curious to know how much of an increase of traffic the author of the Plumb Plan thinks would be sufficient to offset the increase of expenses which would be caused by an increase of business and in addition a deficit of about $2,500,000,000 a year.

It can hardly be necessary to carry the analysis of the Plumb Plan and its "A B C" any further to show how preposterous they are. In fact, we have taken the trouble seriously to analyze them at all only because earnest and honest people have been misled in the past by equally preposterous arguments and assertions. We have repeatedly recalled that, in December, 1917, within two weeks of the time that government operation was adopted, an advocate of government ownership, in testifying before a Senate Committee in Washington, estimated that under unified government operation a reduction of $400,000,000 a year in railway operating expenses could be made. The country has now had one and a half years of government operation; and at present operating expenses are running $1,600,000,000 a year more than they were when this advocate of government operation made his estimate, and $2,000,000,000 a year more than he estimated they would run. Yet there were many people who accepted such arguments of advocates of government operation before it had been tried. It is to be feared that unless they are answered again and again, such assertions and arguments as those advanced in support of the Plumb Plan also will be seriously accepted.

Railway employees are contributing money to pay for the circulation of the "A B C" and other literature advocating the ownership of the railroads by the public and their management by the employees. It will be wise for the employees to study for themselves the statements made in this literature and test it by the facts, before they help in its distribution. Doubtless many employees are supporting the Plumb Plan because they believe its adoption would inure to their special benefit as a class. They could not be more mistaken. A plan better adapted to cause inefficiency and waste in the operation of the railroads could hardly be devised; and no class have more to lose in the long run by inefficient management of the railroads than the employees.

Besides, railway employees have nothing to gain and much to lose by supporting a plan of railroad ownership and management which is adapted, as this one is, to give the public the impression that it is intended to promote the selfish interests of the employees regardless of its effects upon the public. No plan which gives this impression will be adopted; but its support by the employees is sure in time to create public opinion hostile to them and their organizations.

Great Northern

If James J. Hill were alive one can imagine what his feelings would be in regard to an operating ratio for the Great Northern of 84. The ratio of transportation expenses (the cut of pocket cost of moving the freight and passenger business) was 43 per cent in 1918. On the Great Northern the ratio of transportation expenses to total operating revenues increased from 36 in 1917 to 43 in 1918 and the ratio of maintenance expenses, including both way and equipment, to total operating revenues increased from 26 in 1917 to 38 in 1918. For all the roads of the country transportation expenses increased from 38 per cent in 1917 to 42 per cent in 1918 and maintenance expenses increased from 28 per cent to 36 per cent of total operating revenues. The operating ratio and especially the ratio of transportation expenses to gross operating revenues of the Great Northern was

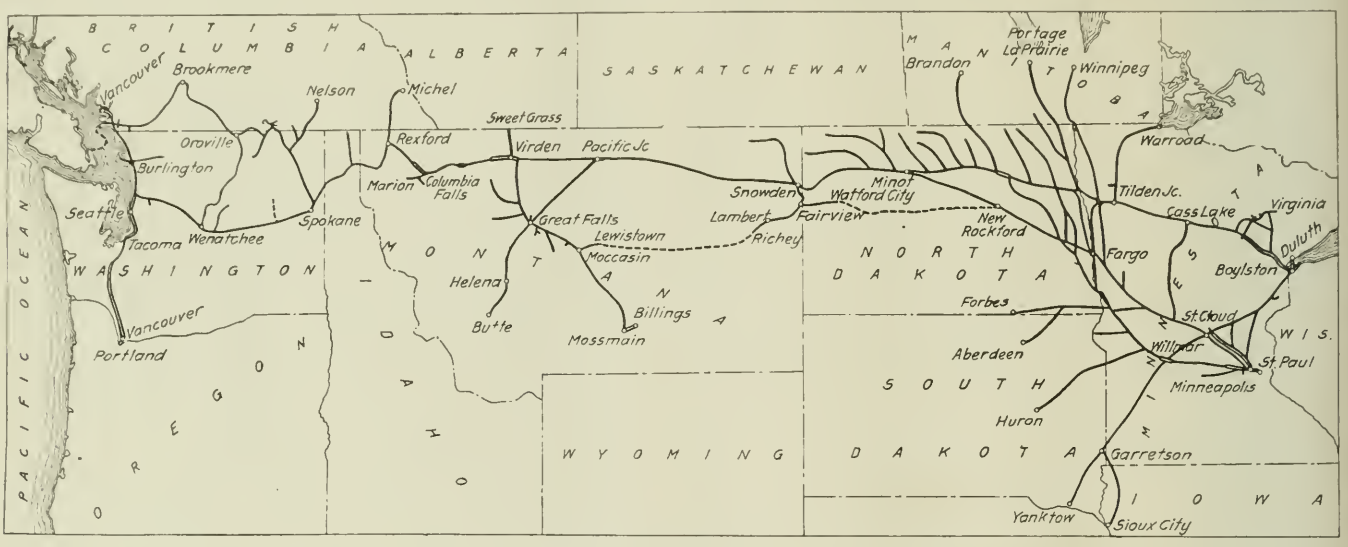
something of which in his later life James J. Hill was particularly proud. In the ten years prior to 1917 the operating ratio varied from 54 to 61 and the ratio of transportation expenses to operating revenues varied from 29 to 27. In 1917 expenses had begun to run up rather rapidly. In that year total operating revenues amounted to $88,599,000 and total operating expenses to $59,282,000, an operating ratio of 67. In 1918 total operating revenues amounted to $100,699,000 and total operating expenses to $84,429,000, an operating ratio of 84. The increase in revenues was due to a slight increase in ton-mileage of revenue freight and to an increase in the revenue per ton-mile of 14 per cent, making the average revenue per ton per mile in 1918, 8.699 mills. There was a decrease in passenger business (passengers carried one mile) of 10 per cent, the passenger mileage being 601,000,000 in 1918. This loss in passenger business was not completely offset by an increase of two mills in the average passenger mile rate. The average received per passenger per mile on the Great Northern in 1917 was 2.4 mills, in 1918 it was 2.6 mills. In other words, the increase in regular fares, exclusive of troops, etc., to three cents a mile for the whole country affected the Great Northern very little.

The rental which the government pays to the Great Northern Railway Company is $28,771,000. In addition the company had in 1918 $1,072,000 other income, making a gross corporate income of $29,758,000. After the payment of interest, sinking fund and corporation taxes there was $20,063,000 available for dividends and the regular seven per cent dividend on the stock calls for $17,463,000.

Whereas the rental which the government guarantees was $28,771,000, the net operating revenue before the payment of taxes by the government was $16,269,000. The taxes which the Railroad Administration had to pay in 1918 are not given except on a per mile basis, but apparently the operating income, exclusive of rentals in 1918 was approximately $10,600,000. This is a heavy loss, indeed, from the operation of a property which has generally been regarded as one of the most perfectly developed transportation machines in the world. Even with ample facilities for a detailed study of the operations of the Great Northern in 1918 an "explanation" of the showing would be little better than a guess. On the other hand, even without such detailed information, it is possible to name some of the factors which may have entered into the situation. Under Hill the Great Northern was developed to meet a particular set of conditions. The old man used to remark that to be a successful railroad manager one had to guess right to a copper cent in estimating the cost of moving a ton of freight one mile. The nice adjustment of the Great Northern's operations to its traffic conditions was an important factor in the financial success of the operation of the property. Traffic conditions in 1918 were no longer under the control of the Great Northern's own organization, much less under the control of the great railroad genius who built up the property.

The Great Northern lies in the Northwestern region, of which R. H. Aishton, formerly president of the Chicago & North Western, is regional director. The federal manager of the Great Northern is W. P. Kenney, who was president and before that vice-president in charge of traffic of the Great Northern and whose railroad experience has been in the traffic department and in office work. The general manager was J. M. Gruber, formerly vice-president of the Great Northern in charge of operation, and with the reputation of being one of the best operating men in the west.

The falling off in passenger traffic and the very slight gain in freight traffic has already been mentioned. As a matter of fact, had it not been for an average haul of freight of 286 miles or four per cent longer in 1917, freight traffic would have increased less than one per cent. On the other hand there was an increase in freight train miles of four per cent, the total freight train miles in 1918 being 12,111,000. Furthermore, there was an increase of 12 per cent in helper locomotive mileage, the total in 1918 being 531,000 miles.



The Great Northern

Car loading improved, the average tonnage of revenue freight per loaded car being 26, as against 24 in 1917, an increase of nine per cent, thus making a decrease of 3½ per cent in the loaded freight car miles. On the other hand, empty freight car mileage increased 21 per cent, totaling 147,521,000 in 1918.

The Great Northern spent a total of $6,799,000 during 1918 for additions and betterments. Included in these additions and betterments was the building of 52 miles of additional side tracks and 38 miles of second track, and the installation of automatic signals on 120 miles.

The following table shows the principal figures for operation for the Great Northern as operated by the Railroad Administration. It is not the company's income account.

	1918	1917
Mileage operated	8,260	8,233
Freight revenue	$76,937,445	$64,300,666
Passenger revenue	15,672,420	15,836,341
Total operating revenues	100,698,520	88,598,735
Maintenance of way and structures	17,405,470	11,570,157
Maintenance of equipment	20,757,399	11,890,989
Traffic	778,989	1,336,870
Transportation expenses	43,024,345	32,262,501
General expenses	1,246,744	1,133,911
Total operating expenses	84,429,245	59,282,156
Taxes*	5,525,060	6,306,478
Operating income	10,744,215	23,010,101

* Estimated from the per mile figures given in the 1918 annual report.

Railroad Hearings Before House Committee

U. S. Chamber of Commerce Presents Comprehensive Plan for Remedial Legislation

WASHINGTON, D. C.

A COMPREHENSIVE PROGRAM of remedial railroad legislation adopted by the National Transportation Conference called by the Railroad Committee of the Chamber of Commerce of the United States, which represents a sort of composite of the views held by the principal interests that have been devoting their efforts to a proper solution of the railroad problem, was presented to the House Committee on interstate and foreign commerce on Tuesday by Harry A. Wheeler, chairman of the conference, and supplementary statements relating to various phases of the subject were to be presented by Paul M. Warburg, formerly vice-chairman of the Federal Reserve Board; W. W. Salmon, representing the Railway Business Association; Alexander W. Smith of Atlanta, Ga., and Emory R. Johnson, professor of transportation and commerce, University of Pennsylvania. Before outlining the plan Mr. Wheeler gave an explanation of its origin to show the representative character of those who took part in formulating the program.

The National Transportation Conference was called together in December, 1918, "to consider the broader aspects of the transportation problem and the formulation of a basis for the control and operation of the transportation facilities of the United States after the conclusion of the present government control." At 5 meetings, each lasting 2 days, the conference has held 22 general sessions and numerous sessions of sub-committees appointed to report on special phases of the transportation problem. In calling this conference the Chamber of Commerce recognized that many different interests are affected by transportation and that each important interest should have a voice in determining what should be done with the railroads. It therefore invited prominent men belonging to each important interest to attend the conference and take part in its deliberations. All of the important plans were presented either in the form of printed documents or by speakers who addressed the meetings or took part in the discussions.

The shippers' and manufacturers' point of view was presented by Walter S. Dickey, of the W. S. Dickey Clay Manufacturing Company, of Kansas City; Edward J. Frost, vice-president, William Filene's Sons Company, Boston; George A. Post, president Standard Coupler Company, New York; Charles E. Lee, of Ford, Bacon & Davis, Consulting Engineers, New York City; W. W. Salmon, president of the General Railway Signal Company; Charles S. Keene, vice-president of the American Tobacco Company, and Frederick J. Koster, president of the San Francisco Chamber of Commerce.

The measures in which farmers are interested were outlined by H. C. Stuart, chairman of the National Agricultural Advisory Committee; R. L. Munce, president of the Pennsylvania Good Roads Association, and Eugene D. Funk, of Funk Brothers' Seed Company, Bloomington, Illinois.

Important financial aspects of the railroad problem were discussed by Paul M. Warburg, formerly vice-governor of the Federal Reserve Board; Harry A. Wheeler, vice-president, Union Trust Company, Chicago; Nathan L. Amster, president of the Investors' Protective Association of America, and Luther M. Walter, general counsel of the National Association of Owners of Railroad Securities.

The views of labor were presented by Frank Morrison, secretary; Henry Sterling, legislative representative, and Martin Ryan, of the Railroad Employees' Department of the American Federation of Labor; and those of the Railroad Brotherhoods by A. B. Garretson, president of the Order of Railroad Con-

Grounds for Business Confidence; Importance of Labor Situation*

By E. H. GARY,
Chairman of the United States Steel Corporation.

Never before in the history of our country has the outlook for future business been so bright, the opportunity for success so great. We are rich, we are prosperous, our resources are enormous. There is no doubt as to our financial security or our commercial progress. I predict that the next five years on the average will bring to our country the most progressive and prosperous period in its history.

There is a large and fairly profitable business ahead, but we need to be conservative, thoughtful, fair-minded. There should be no danger of business depression if the return to a peace basis is accomplished methodically and with justice to all. It is a time for constructive thought; for courage, even for sacrifice, for our problems are numerous and difficult.

FOREMOST in importance is the labor situation. Wages during the war increased materially. I believe we have not been paying more than is right and proper. The cost of living has increased and unless it is reduced wages cannot be lowered.

Employers insist they cannot reduce their selling prices; many hold they should have a higher scale. Prices generally in this country are abnormal; but simultaneous reductions in all directions would be impracticable. Reductions, therefore, must be gradual. And we should not begin with wages.

With respect to their compensation our workmen must be treated liberally. We must consider them as our valuable associates, give them no reason for complaint. If they are treated fairly they will give fair treatment in return; if their confidence is retained their loyal support is assured.

As I have said before, business conditions are good. The needs of the buying public are increasing. The enormous wheat crop, which exceeds by far the first calculations, will soon be harvested. Other crops, too, are coming on, and from all appearances the yield this year will be a record one.

Witness the crowds at the large new hotels. It is next to impossible to obtain a room. They are thronged with travelers from all parts of the land. From all sections—the South, Southwest and the Far West—they bring good reports. Their confidence in the future has charged them with optimism.

Consider the great number of purchasers to be found in retail stores. Try to rent a house in New York; they are scarce, and prices are mounting. Gaze upon the great crowds of busy people upon city streets and the constant stream of motor cars in city and country.

EVIDENCES of business activity and prosperity are everywhere. The estimated wealth of our country is more than equal to one-third of the total wealth of the world; our banks hold $15,000,000,000 or $16,000,000,000; the money in circulation is approximately $56 per capita; before the war it was $34.

Confidence is justified. And confidence, with patience, assures prosperity.

*An article in the New York *Evening Mail*, July 16, 1919.

ductors; W. G. Lee, president, and W. N. Doak, vice-president, of the Brotherhood of Railroad Trainmen; and S. E. Heberling, international president of the Switchmen's Union of North America.

Director General Hines appeared before the conference twice and explained the plans of the Railroad Administration and his own personal views in regard to the desirable solution of the railroad problem. Commissioner Winthrop M. Daniels, of the Interstate Commerce Commission, and President Charles E. Elmquist, of the National Association of Railway and Utilities Commissioners, participated actively in the deliberations of the conference.

The plans proposed by the Railway Executives' Association and by leading individuals among the executives were outlined by Daniel Willard, president of the Baltimore & Ohio; S. T. Bledsoe, general counsel of the Atchison, Topeka & Santa Fe; and E. G. Buckland, president of the New York, New Haven & Hartford; The views of the electric railway men were presented by P. H. Gadsden, chairman of the Committee on National Relations of the American Electric Railway Association, and W. V. Hill, manager of the Washington office of the association; and those of the advocates of highway transport development by John T. Stockton, president of the Joseph Stockton Transfer Company, Chicago.

H. A. Wheeler

The economic aspects were discussed by E. R. A. Seligman, professor of economics, Columbia University; Emory R. Johnson, professor of transportation and commerce, University of Pennsylvania; W. Z. Ripley, professor of Transportation, Harvard University; John R. Commons, professor of economics, University of Wisconsin; Henry W. Farnam, professor of Political Economy, Yale University, and Frederick A. Cleveland, formerly chairman of President Taft's Commission on Efficiency and Economy; and the civic and social aspects by R. G. Rhett, formerly president of the Chamber of Commerce of the United States; Alexander W. Smith, of Atlanta, Georgia, formerly president of the Georgia Bar Association; Judge F. C. Dillard, of Sherman, Texas, and Charles P. Neill, chairman of Board of Adjustment No. 1, United States Railroad Administration, and formerly commissioner of labor under the Roosevelt administration.

The conference gave careful consideration to the various plans with a view to developing a program that would include the most desirable features of each plan, combining them with new features proposed by the conference itself into a consistent harmonious whole. Some of the representatives of the railroad brotherhoods and a few of the other participants attended only one or two meetings for the purpose of presenting their views, and did not take part in the resulting action. Others attended all of the sessions and voted on all questions brought before the conference, occasionally reserving the right to dissent from some particular decision with which they could not agree. The majority of the members, however, attended practically all of the 22 sessions held and voted in favor of the program finally adopted.

Program of Remedial Railroad Legislation Adopted by the Transportation Conference

The program adopted by the conference is as follows:

Section 1. The Transportation Conference favors corporate ownership of the railroads in the United States; and is therefore opposed to government ownership of the roads and to their operation either by the government itself or, under lease from the government, by corporations whether organized as regional monopolies or as large competing systems.

Section 2. The conference favors the enactment of remedial railroad legislation at the earliest possible date. It favors the continuation of the present government possession and operation of the railroads only until such legislation can be enacted and made effective. If possible, legislation should be enacted within the present calendar year.

Section 3. The conference is in favor of permitting and facilitating the consolidation, in a manner to be approved by the government, of existing railroads into strong, competitive systems so located that each of the principal traffic districts of the country shall be served by more than one system.

Section 4. The conference favors action by Congress that will bring all interstate railroads as corporations under the jurisdiction of the United States either by federal incorporation or in such other manner as Congress may determine, the matters of local taxation and police regulation to be reserved by the States.

Section 5. The conference favors federal regulation of the issuance of securities by all railroads engaged in interstate commerce. This regulation should be exclusive and should be exercised in the following manner: Such federal agency as Congress may designate, shall be authorized to pass upon the public necessity for expenditures of capital (in excess of a stipulated amount) by carriers engaged in interstate commerce and to determine the amount and to regulate the conditions of the issuance of securities to obtain the funds required to cover authorized capital expenditures; a railroad company applying to the federal agency for authority to make capital expenditures, or to issue securities, shall be required to file with the proper authorities of the states in which the railroad is located copies of the original petition; and the federal agency shall be required to notify said state authorities of the hearings upon the petition.

Section 6. The conference favors the sole regulation by the Interstate Commerce Commission of all railroad rates and of all rules and regulations bearing thereon affecting interstate commerce. For the performance of its duties the commission should be given power to organize in the manner it may deem best, and be given authority to function through

such local officials or agencies as it may deem necessary to create or designate.

Section 7. The conference favors the creation of a Federal Transportation Board of five members. It shall be the general duty of the board to promote the development of a national system of rail, water and highway transportation, to inquire into and propose measures for preventing abuses therein, to pass upon the public necessity for capital expenditures and to regulate security issues as provided by Section 5. The Federal Transportation Board shall act as the referee in cases of the disagreement (deadlock) of a board entrusted with the adjustment of wages, hours of labor or other conditions of service of railroad employees. It shall, also, be the duty of the Federal Transportation Board to administer and enforce the means and measures that may be provided for strengthening and stabilizing railroad credit; it shall determine the grouping or consolidation of railroads deemed to be in the public interest, and carry out plans authorized by Congress for merging all railroads engaged in interstate commerce into strong competing systems severally owned and operated by companies subject as corporations to the jurisdiction of the United States.

Section 8. The conference favors the adjustment of wages, hours of labor and other conditions of service of railroad employees by boards consisting of equal numbers of representatives of employees and officers of the railroads, with appeal, in case of the disagreement (deadlock) of an adjustment board, to the Federal Transportation Board as referee.

The conference favors the adoption by Congress of the plan contained in the following Sections, 9 to 19 inclusive, for the purpose of strengthening and stabilizing railroad credit, of protecting the interest of the investing public and of promoting, in the highest degree both legal and moral accountability upon the part of railroad directorates and of railroad executive officers, and of bringing about as promptly as practicable the consolidation of existing railroads into such number of competitive systems, owned and operated by companies subject as corporations to federal jurisdiction, as shall be found to be in the public interest.

Section 9. The conference recommends that a statutory rule be enacted by Congress requiring that railroad rates and fares, to be established by public authority, shall be designed to yield the railroad companies in each traffic section of the United States (as shall be designated by federal authority) aggregate revenue sufficient to produce, after proper provision has been made for renewals and depreciation, a net return (which shall be available for interest and dividends) of not less than six (6) per cent. per annum upon the aggregate fair value of the property of the railroads devoted to the public service in each of the several sections. The items of "renewal and depreciation" shall also include unproductive improvements not properly chargeable to investment account and against which no capital or capital obligations shall be issued.

Section 10. The net return to be obtained by the railroads as a result of the enforcement of a statutory rule of rate making shall be based upon a fair value of the railroad property devoted to the public service, as ascertained by the Interstate Commerce Commission, such valuation to include a consideration of physical property, earning power, and such other elements as may be proper in determining fair value.

Until such valuation shall have been determined, the valuation to be adopted for the railroads in the United States as a whole, and by traffic sections, shall, for the purpose of making the rates that yield the aggregate net return to be provided by statute, be their aggregate railway property investment accounts.

For the purpose of ascertaining excess income, the valuation of any individual railroad system, pending the completion of the said federal valuation, upon which it shall be entitled to retain six (6) per cent. per annum, shall be that proportion of the aggregate property investment accounts of all the railroads of the traffic section in which it is located, which its average annual railway operating income (computed for the period and in the manner prescribed by the federal control act of March 21, 1918) bears to the aggregate annual railway operating income of all the railroads of such traffic section, computed in the same manner; provided, first, that if the use of the above stated formula shall produce a valuation of any particular railroad system, greater than the amount of its average property investment account for the three year period ending June 30, 1917, the amount of such property investment account shall be used instead of the valuation derived by the formula; and provided, second, that nothing herein contained shall operate to reduce the railway operating income which any particular railroad system shall be permitted to retain below its annual average railway operating income, or compensation as computed or allowed to it under the federal control act of March 21, 1918. To such valuation as shall be derived for any railroad system in the manner above stated, there shall be added all increases of property investment made by such system after June 30, 1917.

The Federal Transportation Board shall be vested with the same power to make such specific adjustments, in particular cases, as it may deem requisite and equitable, as is conferred on the director general of railroads under the railroad control act, March 21, 1918.

Section 11. All railroad companies engaged in interstate commerce shall be required to observe the following regulations under the direction of the Federal Transportation Board:

(a) Whenever the net railway operating income of a railway company available for the payment of interest and dividends (after provision has been made for renewals, depreciation and unproductive improvements as defined in Section 9) shall exceed six per cent upon the fair value of its property, or upon its temporary valuation as determined by Section 10 (the "fair value of property" being used in this section to include both temporary and permanent valuation) one-half of the said excess railway operating income above six per cent shall be placed in a contingent fund of the company until such amounts to six per cent of the fair value of the company's property. The remaining half shall be turned over to a general railroad contingent fund as provided by Section 12.

(b) A railroad company may draw upon its own contingent fund whenever, and to the extent that, its said annual railway operating income shall fall below six per cent of the fair value of the property as determined by Section 10; but whenever the railroad's contingent fund is thus drawn upon, the fund shall be replenished from the company's share in subsequent excess earnings until the fund is restored to six per cent of the fair value of the company's property.

(c) When any individual railroad company earns an annual railway operating income of six per cent upon a fair value of its property and has established and is maintaining a contingent fund of its own amounting to six per cent on the fair value of its property, the company shall turn over to a general railroad contingent fund, two-thirds of the company's railway operating income in excess of six per cent, the remaining one-third of said excess to be retained by the railroad company for distribution among its stockholders or for such other lawful purposes as it may determine.

Section 12. There shall be established a general railroad contingent fund for the purpose of making good any deficiency in any year below six per cent upon the aggregate fair value of the properties of the railroads of a section. The amount of such deficiency shall be drawn from the general railroad contingent fund for distribution among the railroads in any traffic section, upon the basis of the

gross earnings from railroad operations of the railroads within such section; and if the result of this distribution causes the railway operating income of any individual railroad to exceed six per cent this excess shall be applied as provided in Section 11.

Section 13. In any year, following the completion of the mergers hereinafter provided for, when the yield from rates established by federal authority equals six per cent upon the aggregate fair value of the property of the railroads in any traffic section, and the total contribution made in any such year to the general railroad contingent fund amounts to less than five per cent of the aggregate net earnings from operation in that traffic section, then the railroads in that section shall contribute to the general contingent fund the sum necessary to bring the contribution for the year up to five per cent of the aggregate net earnings from operation—each company being required to contribute for this purpose pro rata to its net earnings from operation for that year.

Section 14. The general railroad contingent fund shall be managed by trustees appointed by the Federal Transportation Board from men nominated by the railroad companies. Moneys turned over to the fund shall be invested by the trustees in United States Government securities, or shall be deposited in the Federal Reserve Banks.

Section 15. The general railroad contingent fund shall be accumulated by its trustees until it amounts to $750,000,000, and be maintained at that sum for the purpose hereinbefore provided, and any excess thereafter acquired shall be used when and as directed by the Federal Transportation Board for the development of the railroad transportation system of the country, or for the increase of transportation equipment and facilities, or for the pro rata reduction of the capital or capital obligations and property investment accounts of the railroads, or, if so ordered by Congress, the excess shall be turned over to the Treasury of the United States.

Section 16. To facilitate the prompt stabilization of railroad credit and such consolidation of railroads as the Federal Transportation Board shall decide to be in the public interest, it is recommended that Congress create a railroad reserve fund and appropriate for this purpose the sum of $500,000,000. This fund shall be administered by the Federal Transportation Board which shall invest it in United States bonds or notes, the interest accruing from such bonds or notes, or the earnings upon the proceeds thereof, to be paid annually into the United States Treasury. In case, at any time during the first 10 years after the enactment of this legislation, the general railroad contingent fund, provided by Section 12, shall not be sufficient to make good deficiencies as described in that section, then the Federal Transportation Board shall pay into the general railroad contingent fund, as far as the board's available funds permit, the amount necessary to enable the trustees of the general railroad contingent fund to make over to the railroads the sums due them for that year under the stipulations of said Section 12; provided, however, that any sums so paid by the Federal Transportation Board shall be repaid with interest by the trustees of the general railroad contingent fund from contributions received from the railroads after the general railroad contingent fund shall reach and be maintained at the amount of $500,000,000.

Section 17. The consolidation of railroads into a limited number of strong competitive systems under conditions to be prescribed by Congress is believed to be in the public interest and should be carried out as promptly as practicable, in accordance with plans to be submitted by the carriers and approved and announced by the Federal Transportation Board. In order to bring about this consolidation of railroad companies, jurisdiction of which has been perfected as contemplated in Section 4, the Federal Transportation Board shall determine for itself and announce the grouping of railroads in case such railroads have not within a reasonable time submitted plans for its approval for consolidation in any given section and the Board deems such consolidation to be in the public interest.

If the consolidations thus announced by the Transportation Board shall not have been affected or well advanced within five years after announcements the Board should be given power to carry through such mergers by compulsory proceedings, if in its judgment the public interest would be thereby advanced.

Section 18. Any railroad corporation, that may be allowed by the Federal Transportation Board to acquire the securities or properties of other railroad companies and to form a consolidated railroad system under the jurisdiction of the United States, shall be required by the Board to organize with a board of twelve directors, one of whom shall be a representative of the employees of the system and nominated for that position by such employees, and three of whom shall be selected by the Federal Transportation Board to represent the principal interests involved in the territory served by such system. The board of directors thus selected shall make such regular and special reports to the Transportation Board as that Board may require.

Section 19. Should it be found by the Transportation Board to be in the public interest to protect the credit and financial operations of some railroads pending the completion of the railroad consolidations herein contemplated, it is recommended that one or the other of the following plans be adopted:

1. That the Transportation Board be endowed with power, and granted the necessary funds to extend credits to such railroads during the period of consolidation; or
2. That the existing machinery of the War Finance Corporation be employed for this purpose.

If the second recommendation is adopted, appropriate legislation should be enacted to enable the War Finance Corporation to advance funds to railroads under terms that may be approved by the Federal Transportation Board.

Statement by Harry A. Wheeler

An abstract of Mr. Wheeler's statement follows:

Return of the Railroads to Corporate Operation

Necessarily, the first question considered by the conference was whether it favored corporate or government ownership and operation of the railroads. After full consideration the conference, with but few dissenting votes, decided in favor of corporate ownership and operation, and the return of the roads to their owners as soon as possible after the enactment by Congress of appropriate remedial legislation. The conference was in favor of the continuation of government operation until such legislation had been enacted and made effective, but felt that this legislation should, if possible, be enacted within the present calendar year.

A Statutory Rule of Rate-Making, Without Government Guarantee

The most fundamental problem to be solved by the legislation that must precede the return of the railroads to their owners is the adoption of measures that will give the carriers reasonable assurance of revenues sufficient to enable them adequately to perform the services required by the public. In the interest of the carriers and the public the authority which determines rates must adopt measures that will afford the carriers reasonably adequate revenues.

One method is to provide a definite government guarantee of a fixed minimum net return. A government guarantee is not favored by the conference. It believes that it will be possible for Congress to adopt a policy of rate-making

and control that will give the carriers reasonable assurance of adequate revenues without involving the government in the obligation of guaranteeing the net return of private corporations and without imposing upon the public the burden of unreasonable transportation rates.

Briefly stated, it is recommended that Congress adopt a statutory rule of rate-making requiring the Interstate Commerce Commission to be responsible for railroad rates and fares designed to yield the carriers in each designated traffic section not less than 6 per cent net upon the aggregate fair value of the property of the railroads. The statutory rule recommended by the conference provides that it shall be the duty of the commission to authorize or establish rates and fares that will produce, not for each railroad company, but for the railroads in the aggregate in each natural traffic section of the country, aggregate revenue sufficient to yield a net return of not less than 6 per cent upon the aggregate fair value of the property of the railroads devoted to the public service in each of the several traffic sections. It is recommended that "fair value" shall be ascertained by the commission by giving consideration not only to physical property but also to earning power and such elements as may properly receive attention.

The determination of the fair value whether for rate-making or for other purposes, has unavoidable difficulties. When the Interstate Commerce Commission completes the valuation it is making that will, of course, be adopted; but during the next three to five years some temporary method of determining "fair value" must be followed. The recommendation is that, pending the completion of the valuation now being made, the fair value, for rate-making purposes, of the railroads as a whole and by traffic sections, shall be their aggregate property investment accounts; while the fair value of the property of an individual railroad shall temporarily be taken to be that share of the aggregate property investment accounts of all the railroads in the traffic section in which the road is situated which the particular road's annual railway operating income bears to the aggregate railway operating income of the railroads in its traffic section—public authority having power to make equitable adjustments in special cases.

Plan for Strengthening and Stabilizing Railroad Credit

From the rates made in carrying out the foregoing statutory rule, the best situated, or most ably managed, railroads will receive more than 6 per cent net, while the less favorably located or less efficiently managed roads will obtain less than 6 per cent. By the plan adopted by the conference, each of the railroad companies that receive a net return of more than 6 per cent are to be required to put half of the excess into a company contingent fund until that fund shall amount to 6 per cent of the fair value of the company's property, while the other half of the excess is to be turned over to a general railroad contingent fund administered by trustees appointed by government authority and maintained and used for the benefit of all the railroads of the country.

When any railroad company has brought its own contingent fund up to 6 per cent, the company shall increase its annual contribution to the general railroad contingent fund to two-thirds of its net income in excess of 6 per cent, the other third of the excess being retained by the company for distribution among the stockholders or for other lawful purposes. This plan would keep the profits of individual railroad companies within reasonable limits without taking away from the management of the companies the incentive to effort and efficiency.

The purpose of the general railroad contingent fund is to assure to the railroads in the aggregate, by traffic sections, a return of 6 per cent. The fund is to be the means of strengthening and stabilizing railroad credit, and to do this (a) without making the government responsible for a fixed return to individual railroad companies, (b) without imposing unreasonable rates upon the public, and (c) without permitting the railroads that have been unfortunately located or have been over-capitalized or otherwise mismanaged to shift their burdens from their own shoulders onto the government or the public or the other railroads. The general railroad contingent fund, accumulated in the manner indicated, is to be drawn upon by all railroads of a designated traffic section when in any year the net return upon the aggregate fair value of the property of all the railroads in that section falls below 6 per cent., due to the fact that the rates authorized or established by the Interstate Commerce Commission, in consequence of fluctuations in volume of business or of an unexpected increase in expenses, have not yielded the carriers the minimum net return of 6 per cent, provided by the statutory rule of rate making.

As has been explained, the proposed general railroad contingent fund is to be created and maintained by contributions required from such companies as have net returns in excess of 6 per cent, two-thirds of the excess being contributed. The fund is to be drawn upon only when, and to the extent that, the rates and fares, which are controlled by the Interstate Commerce Commission, do not yield the railroads the contemplated annual net return of 6 per cent.

When the general railroad contingent fund is drawn upon for the purpose of bringing the aggregate net revenues of the railroads in any traffic section up to 6 per cent, all of the railroads in the traffic section shall share in the distribution pro rata to their gross earnings. By this plan the weak roads, that will presumably have contributed nothing to the general fund, will receive their share; but they will not be the sole beneficiaries of the distribution. It is not the purpose of the general contingent fund to give to the properties of the weak roads values which they do not possess; its purpose is to assure to the railroads as a whole, year by year, a net return of not less than 6 per cent. upon a fair value of their property; and thus to establish the first condition precedent to stabilizing railroad credit as a whole, and to securing for the public adequate railroad transportation at reasonable capital cost. It is not proposed to provide the weak roads with a net return upon an amount in excess of a fair value of their property.

Consolidation of Railroads Into Strong Competing Systems

The grouping or consolidation of the railroads in the United States, within a reasonable time, into a limited number, possibly 20 to 30, strong competing systems, is essential; because railroad rates must be the same for similar services, whether performed by the weak, necessitous railroad, or by the strong and prosperous one. It is in the interest of the public that railroad charges shall be neither so high as to cause the strong roads to profit unduly, nor so low as to force the weak lines, upon which large sections of the country may be vitally dependent, into bankruptcy or into such a permanently enfeebled condition as to prevent them from serving the public adequately and efficiently. All sections of the country ought in the future to be served by railroad systems managed by companies strong enough to serve the public with progressive efficiency and economy.

It will be necessary for the government to return the railroads to the companies from which they were taken, but the obstacles to the grouping or consolidation of railroads, under conditions approved by the government, should be removed, and provision should be made for bringing all of the railroads in the country within a reasonable time into such a number of strong competing systems as it may be found desirable or necessary to perpetuate in order to secure for each principal district of the country the service of more than

one system. The grouping or consolidation should be about the present strong systems, that is along commercial lines, and not by means of arbitrary territorial sub-divisions of the country.

While presumably it will not be practicable for the government to require the immediate grouping or consolidation of the railroads, voluntary consolidations should be permitted and facilitated. The railroad companies should be called upon to submit, for approval of the government, plans for the grouping or consolidation of the roads, and if the companies do not submit such plans within a reasonable time the government, acting through the appropriate authority, should determine and announce what permanent groupings or consolidations are deemed to be in the public interest. Should the consolidations thus declared to be in the public interest not have been effected, or should they not be well advanced, at the end of a reasonable period, say five years, power should be given the appropriate public authority to carry through the desirable mergers by compulsory proceedings, if in the judgment of Congress such power can be granted, and the public interests will be thereby advanced.

Federalizing Railroad Corporations

As the proposed strong competing railroad systems come into existence by consolidations, approved or required by the government, they should be owned and operated by companies subject as corporations to the jurisdiction of the United States. Congress will presumably provide for permissive federal incorporation of railroads, but it should not stop there. Some effective plan should be devised for changing the allegiance of the railroad corporations from the states to the federal government.

It is argued by some lawyers that the United States cannot compel an existing railroad company to surrender its state charter, take out a federal charter, and transfer its property to the new corporation; but it is also pointed out by others that it is not necessary to adopt this method of converting existing railroad companies from state to federal corporations. It is said to be within the power of Congress to pass an act similar in principle to the national bank act, by which railroad companies may readily transfer their allegiance from the states to the United States.

Either by compulsory federal incorporation, or, if that should not be feasible, in such other manner as Congress may determine, all railroads engaging in interstate commerce should be brought as corporations under the jurisdiction of the United States; but in so doing their powers of local taxation and police regulation should be reserved by the states. By reserving those powers the states will retain the relation to interstate carriers by rail which they should logically possess.

Labor Representatives and Government Directors

It is recognized by everybody that the railroad business is of a public nature. The public is entitled to information regarding the corporate activities of railroad companies, and provision may properly be made for participation by representatives of the government in the deliberations and actions of the directors of railroad companies. Although it may not have been necessary in the past that the public, through the government should be represented upon the directorates of the multitude of railroad corporations, it seems clearly in the public interest that the public shall have a voice in the management of the large and powerful railroad corporations that may be allowed to own and operate the limited number of consolidated systems which it is proposed shall be perpetuated. It is recommended that Congress require these large corporations of the future to organize with a board of 12 directors, 3 of whom shall be selected by appropriate authority of the federal government to represent the principal interests in the several territories served by the different systems.

The public has an especial interest in the maintenance of harmonious relations between the railroads and their employees. There should be mutual understanding and confidence on the part of the employer and the employed. It is believed that this relationship will be greatly promoted by requiring each of the railroad corporations that are to own and operate the large systems contemplated in this plan to include in its directorate one member who shall be a representative of the employees of the system managed by the board and shall be nominated for that position by the employees.

The conference favors the adjustment of wages, hours of labor and other conditions of service of railroad employees by boards consisting of equal numbers of representatives of employees and officers of the railroads, with appeal, in case of the disagreement (deadlock) of an adjustment board, to an appropriate federal authority as referee.

Federal Regulation of Capital Expenditures and Security Issues

Everybody seems to have reached the conclusion that in the future the capital expenditures and the security issues of railroad companies should be regulated by federal authority. The states should be, and apparently are, quite willing to retire from this field of regulation, provided the regulating authorities of the states are officially notified of proposed security issues and afford an opportunity to be heard thereon.

Regulation of Rates By the Interstate Commerce Commission

The Interstate Commerce Commission has performed a task of great magnitude. Its work of regulating rates and of developing and supervising the bureaus connected with rate regulation and railroad valuation has increased steadily until the commission has come to carry a heavy load. It would be unwise to add unnecessarily to its present duties, especially in view of the fact that its responsibilities must unavoidably be increased, should Congress by legislative enactment confer upon the commission such power over intrastate rates, rules and regulations affecting interstate commerce as may constitutionally be granted. It will doubtless be possible, and probably in the public interest, for the Interstate Commerce Commission to enlist the co-operation of existing state commissions in the regulation of intra-state rates affecting interstate commerce.

A Federal Transportation Board—Its Powers

To carry out the plan recommended extensive administrative powers must be vested in some federal agency. Should the commission, as is contemplated, become the authority for the sole regulation of all railroad rates, rules and regulations affecting interstate commerce, its duties will necessarily be enlarged. To require the commission to exercise the administrative functions contemplated in the proposed plan of remedial railroad legislation would be to the detriment of the public interest because it would seriously interfere with the prompt action of the commission as a body for the regulation of rates, the task for which it was especially created and for the performance of which it is peculiarly adapted.

It is recommended that a Federal Transportation Board of five members be established to exercise the administrative functions required for the enforcement of the proposed remedial railroad legislation. The following specific duties should be entrusted to this board:

(a) To pass upon the public necessity for capital expenditures and to regulate the security issues of railroads.

(b) To act as the referee in cases of disagreement (dead-

lock) of a board entrusted with the adjustment of wages, hours of employment and other conditions of the service of railroad employees.

(c) To administer the general railroad contingent fund and to enforce the means and measures that may be provided for strengthening and stabilizing railroad credit.

(d) To determine and announce the grouping or consolidation of railroads deemed to be in the public interest, and to carry out plans authorized by Congress for merging all railroads engaged in interstate commerce into strong, competing systems severally owned and operated by companies subject as corporations to the jurisdiction of the United States.

(e) To promote the development of a national system of rail, water and highway transportation, by providing for the articulation of the railroads with the waterways in a traffic sense, by bringing about the common use and construction of terminal and transfer facilities at the larger centers of traffic, and by such other means as may be found to be practicable and in the public interest.

(f) To inquire into the practices of railroad management and to propose measures for preventing abuses therein.

(g) To appoint the directors that shall represent the government upon the directorates of the proposed consolidated railroad companies.

The board which performs the duties enumerated in the foregoing list will be entrusted with an executive task of the first magnitude. It should be composed of men of the highest character and attainments. It will equal, if not exceed, in importance, the Federal Reserve Board, whose creation was most fortunate and whose services have been of great value to the public. The Federal Transportation Board should be primarily administrative in purpose and organization. It will have the large and exacting task of guiding and facilitating the development of an adequate and efficient national system of transportation.

A Railroad Reserve Fund for Use During the Period of Transition

A severe strain will be placed upon railroad credit and upon the financial stability of the railroads during the period of transition of the railroads from government to corporate operation unless special precautionary measures are adopted. At the present time the railroads are being operated with a large and increasing deficit and it is doubtful whether the deficit can be overcome during the remainder of this calendar year. In all probability many of the railroads now being operated by the government will be showing a deficit at the time they are returned to their owners.

The several railroad companies will resume the operation of their properties under abnormal conditions. Most rolling stock is being used by the railroads as a whole without much regard to individual ownership to some extent terminals are being jointly occupied and used; traffic has been largely rerouted and traffic organizations of the carriers have been to a considerable extent disintegrated. It will take the corporations some little time to readjust themselves to the new conditions and it is evident that the government will need to assist the carriers financially until they can get going.

It has been suggested by the Hon. Charles A. Prouty that "the government should guarantee for one year (after turning the railroads over to their owners) a return equal to 75 per cent of the contract compensation in all cases where contracts have been executed. And the carrier should be required to pay over to the government in all such cases 75 per cent of any excess which it may make over and above the contract compensation." If this suggestion were adopted the government would guarantee to pay the railroad companies during the first year of private operation 75 per cent of over $900,000,000, and would have little assurance that the sums which might be advanced would ever be returned to the government.

Recognizing that it will probably be necessary for the government to assist the carriers temporarily during the first few years of corporate operation while the railroad companies are building up their individual contingent funds and while a start is being made in establishing the general railroad contingent fund, the Transportation Conference recommends that Congress make an appropriation loaning $500,000,000 for the creation of a railroad reserve fund to be administered by the Federal Transportation Board. It is recommended that the board be required to invest the sum thus loaned in United States bonds or notes, the interest on the securities to be paid annually into the United States Treasury. The fund which is to be established for the purpose of bringing about the prompt stabilization of railroad credit and of facilitating such consolidation of railroads as the board shall decide to be in the public interest, may be used as follows:

The reserve fund created by Congressional loan may at any time during the first 10 years after the enactment of the proposed legislation, be drawn upon to whatever extent may be necessary to enable the trustees of the general railroad contingent found to pay over to the railroads the sums which they may be entitled to draw in accordance wih the provisions conrolling the distribution of money from the general contingent fund. The plan provides, however, that any sum advanced by the Federal Transportation Board to the trustees of the general railroad contingent fund shall be repaid to the board with interest as soon as the general railroad contingent rund shall reach, and be maintained at, the amount of $500,000,000. In other words, after the general railroad contingent fund shall, from the contributions received from the railroads, have reached $500,000,000 the first claim upon the fund will be the repayment to the government of the amount loaned at the time of the transition of the roads from the government to corporate operation.

Finally it is recommended that the Federal Transportation Board or the War Finance Corporation (the act creating that corporation having been appropriately amended) be authorized to advance public funds (under terms that will ensure the government against loss) to certain individual roads whose credit and financial operations it may be necessary, in the public interest, temporarily to protect during the transition to normal stable conditions.

Commissioner Clark's Testimony

That the provisions of the Esch-Pomerene bill, which would enlarge the powers of the commission over car service and operation and authorizing it to require joint use of transportation facilities in time of emergency, while freeing the railroads from some restrictions, would enable the commission to deal adequately with any emergency of transportation likely to arise in time of peace or war or at least to take care of the situation as well as possible with the available facilities, was the opinion expressed by Commissioner E. E. Clark in his testimony before the committee on July 17. Mr. Clark opposed the fundamental features of the principal plans for dealing with the railroad problem that have been suggested by other bodies, such as a requirement that rates should be made to produce a certain percentage of return, a guarantee of earnings, a secretary of transportation or a reorganization of the roads into a few companies by consolidation. He declared that if the provisions of the bill advocated by the commission had been in effect in 1917 there would have been no necessity for the federal control act or for the financial legislation that has followed it, and moreover that some of the embarrassments that have resulted from federal control might have been avoided.

Mr. Clark believes in compulsory mergers of operating facilities but he does not believe the government can compel

consolidations of companies. He hoped that a great deal of consolidation would be carried out under the permissive provisions of the bill, which would take care to some extent of the weak lines. He thought there are many cases where the companies would be glad to enter into mergers if they were given the right to do so.

He had not been able to satisfy himself that there is any necessity for federal incorporation. Congress, whenever it chooses to do so, can occupy the entire field and there will be no need for federal incorporation. The railroads cannot be consolidated into a few systems, except by laying a foundation for voluntary action; if compulsory consolidation were attempted the carriers would be very much "up in the air" for several years during the litigation of conflicting interests that would inevitably follow. Regional commissions would be impracticable, for regions could not be established without cutting across traffic territories and transportation systems. Transcontinental rates could not be fixed on a regional basis.

He objected to the plan of a secretary of transportation. One individual would have no better or sounder view than a tribunal whose membership changes gradually. A cabinet officer would probably change every four years or oftener.

To require the commission to establish rates which would produce a given percentage of return would put the commission up against an impossible situation; no man can figure out a level of rates which will produce a given percentage. No man can foresee the volume of traffic and there is a point beyond which an increase in rates will reduce it. A guarantee of earnings is fallacious for the net income is largely dependent upon expenses which are in the control of the carriers: the public could not be protected against improvident and perhaps extravagant expenditures for maintenance. Any government guarantee takes away to some extent the incentive to economy.

E. E. Clark

To put upon the Interstate Commerce Commission the responsibility for regulating wages would be both unwise and impracticable. The commission could not decide either a rate or a wage question without reference to the other. The commission, holding this view, is not influenced by the fear of unpopularity because "it has enjoyed some of that as it is." Regulation of wages ought to be put in the hands of a tribunal that would deal with wages on their own merits and the Interstate Commerce Commission should deal with freight and passenger rates in the light of what was done about wages.

Mr. Clark introduced again the financial statements he had presented to the Senate committee, which he thought demonstrated that the credit of the carriers had not been destroyed by niggardly regulation. He showed that while the length of railroad in receivers' hands had increased to 37,353 miles on June 30, 1916, it had been reduced to 17,366 on December 31, 1917, and he declared that certainly rate levels or regulation had absolutely nothing to do with the receiverships of the Rock Island, the Frisco, the Missouri Pacific, the Denver & Rio Grande, the Western Pacific, the Wabash, Pittsburgh Terminal, the Pere Marquette or the Cincinnati, Hamilton & Dayton.

In discussing the return of the railroads to private management, Mr. Clark said that it would undoubtedly be necessary for the government to lend them some aid and he suggested a loan, on adequate security, at a rate of interest below what could be secured in the open market. The government should pay as a war cost the large losses resulting from war operation. There should be some declaration by Congress as to the rate situation because the state rates will inevitably go back to where they were, in the case of statutory rates, and probably also in the case of rates made by state commissions. Replying to a question, he saw no prospect of any increase in traffic sufficiently to wipe out the present deficits. He assumed that wages could not be reduced and said that under the new conditions of employment established by the government he did not believe the number of employees could be reduced sufficiently to affect the situation materially.

It would be most advisable, Mr. Clark declared, for Congress to enact some temporary legislation which will stabilize the rate situation during a period of months, possibly a year, after the railroads are returned, so as to prevent reductions of intrastate rates; and traffic officers of individual roads should be restrained from cutting rates upon the resumption of competition; there should be some agency by which rates should be passed upon in each ditrict. The commission might appoint committees, composed of experienced traffic men of a judicial temperament, with possibly some representatives of the shippers.

In reply to questions by Chairman Esch as to the effect of various provisions of the bill, Mr. Clark said that while it preserves the right of the shipper to route his freight, that power could bet set aside by the commission in an emergency. The requirement of a certificate by the commission for the construction of new lines would help to stabilize railway securities but existing lines ought to be required to fully develop their own fields. He mentioned the competitive construction of lines down the Des Chutes canyon in Oregon by the Hill and Harriman lines, after the former had once declared the territory not worth building into, and the construction of the Western Pacific, as examples of lines whose building might be prevented.

Replying to a question by Mr. Esch the commissioner thought that there must be an abundance of capital seeking investment but "the railroad executives and financial interests have kept on saying, in season and out of season, since 1910, that they had no credit," so what can they expect?

Mr. Clark elaborated on the increased powers conferred by the bill to enable the commission to deal more adequately with water traffic, and also on the increased powers for dealing with such rate situations as those of the Shreveport rate

case, involving state discrimination against interstate commerce. The "Shreveport situations" are on the increase but the proposed powers would contribute largely to their reduction.

The power to prescribe divisions of rates as between carriers should make it possible to see that the short lines get a fair division, but he would not go so far as to say that they would all be enabled to live. In the course of a discussion as to meeting water competition he said that if the railroads were prevented from doing so the water lines would put the rates as high as possible. The opportunity to grant fourth section relief to the circuitous rail lines is really of more importance than the question of competition with water lines.

In reply to questions by Representative Sims regarding the effect of the bill on the weak lines, Mr. Clark said that if the provisions for supervising security issues had been in effect the "weak sisters" would not be so weak. Some companies must inevitably undergo reorganization under any circumstances. Some roads are weak because they never should have been built, some because they had not been so well managed as their competitors and some because of financial manipulation.

The commissioner said that the bill under discussion had been proposed merely as amendments to the act to regulate commerce; the return of the roads to their owners and stabilization of the rate situation should be covered by a separate measure. The roads should be returned to their owners just as soon as Congress can enact proper legislation. In reply to Mr. Sims, he said that the fifteenth section amendment, requiring the permission of the commission before an increased rate can be filed, is an unwise restriction. New tariffs are likely to be so numerous that the commission could not handle them except in the most stereotyped way.

Representative Cooper asked why no provision for dealing with labor disputes had been included in the bill. Mr. Clark said that wages ought to be dealt with by some other body than that which regulates rates. He did not propose to discuss the question of whether wages ought to be regulated, saying that he had great faith in the possibilities of mediation, conciliation and arbitration; but that a separate tribunal should be charged with administering whatever policy Congress lays down.

Replying to a question by Representative Dennison, Mr. Clark disapproved subsidies and guaranties. "If the railroads cannot be made self-supporting without a government subsidy the government had better take them and see what it can do."

Mr. Clark said that he hoped that one of the results of the bill if enacted would be the organization of joint terminal companies like that of the Terminal Railroad Association of St. Louis. He thought that all of the terminals of an industrial community should be in the hands either of the municipality or of a separate corporation like that at St. Louis. Competition would not be affected in any way, he said.

Mr. Clark's testimony and cross-examination were completed on Tuesday and he was followed by Mr. Wheeler.

Compulsory Federal Incorporation

By Alexander W. Smith

The legal aspects of federal incorporation were discussed by Mr. Smith, who said in part:

Opinions of learned counsel of the National Association of Owners of Railroad Securities have been widely circulated by that association declaring that there is no constitutional method for the creation of federal railroad corporations and compelling transfer to them of their existing properties without the consent of their stockholders, or of the states creating them, and thus forcing abdication of their corporate obligations and duties under their state charters. When we consider that this proposition rests on the premise that separate and distinct federal corporations are to be created and that they are to take over by transfer, either through negotiation or condemnation, the assets of the existing railroad companies, the legal conclusion of the eminent lawyers who have furnished or endorsed these opinions is unquestionably sound.

The country is confronted, however, with the absolute necessity of the federal government being vested with full jurisdiction of interstate carriers *in their corporate functions* in addition to the constitutional jurisdiction now exercised by Congress over the activities of these carriers in connection with interstate commerce. Unless this is accomplished, the proposition that the government shall authorize the consolidation of these existing carriers into large systems which will necessarily interfere with competition in local territory becomes a legal impossibility, because it will run counter to constitutional inhibitions in a large number of states prohibiting such consolidations by the corporations they have severally created.

Aside from the insuperable legal difficulty thus indicated, it is a wholly impracticable thing to transfer and transplant the assets and liabilities of the existing corporations engaged in interstate commerce into new corporations created for the purpose. Take the Southern Railway Company as a concrete example. It is a system made up of more than one hundred separate railroad corporations. It owns some of them; it controls others under long leases, and others by majority stockholding. It has effected their merger by all the known methods of putting one railroad under the operative control of another. Their obligations, under the kaleidoscopic arrangements it has made in bringing the system together, could not be transformed and lifted out of the several state corporations and set down in a new federal corporation.

It is respectfully submitted, however, that the problem is not insoluble, for there lies on the surface a method to accomplish the desired results in a perfectly simple way, viz.: The passage by Congress of a general federal incorporation act along lines parallel to the laws incorporating national banks and nationalizing state banks. This is the basic idea of the recommendation of the conference on this subject, and the idea has been developed in the draft of the remedial railroad law, which will be presented by the representatives of this conference.

If Congress should adopt this bill existing railroad companies engaged in interstate commerce and operating under state charters could take out certificates of incorporation, to be issued as therein provided, under which they would become federal, or national, corporations without destroying their corporate identity and existence; without changing their officers and stockholders; and without disturbing the title to their assets or the integrity of their existing liabilities; and the continuity of their business would not be interrupted.

The authorities conclusively establish that such a proceeding results in a mere transition and not a new creation, and does not destroy previous identity or corporate existence, and simply results in a continuation of the same body, with the same officers and stockholders, the same property, assets and business under a changed jurisdiction. Any interstate railroad thus nationalized would remain one and the same railroad, and would go on doing business uninterruptedly, under existing liabilities and contractual privileges and obligations.

Since no one questions the power of Congress to incorporate interstate railroads, it follows that it can authorize the conversion of such a railroad company from a state corporation into a national corporation. While Congress has no power to compel a state bank to become a national bank, because a state bank is no part of the fiscal machinery of the Nation, it is submitted that it does have the power to compel

a railroad system that is now engaged in interstate commerce to become a federal corporation.

The power of Congress to create a bank at all was contested until it was settled by the Supreme Court that said power was implicit in the power delegated to Congress to issue money and handle its finances. Jurisdiction of Congress over a railroad engaged in interstate commerce is delegated in a specific, plain, explicit, all-inclusive, and plenary paragraph of the Constitution committing to it control over interstate commerce and all its instrumentalities.

If it be true that Congress has only implied power to charter a bank as a piece of machinery in its fiscal system, it must be true that if Congress finds in the development of transportation that state lines have been wiped out, and that commerce disregards artificial obstructions, and that necessary machinery in carrying on interstate commerce is a railroad corporation, the express grant of exclusive jurisdiction over such commerce carries with it the power to create such a corporation.

If that is true, can it compel a state railroad company engaged in interstate commerce to become a federal corporation? No one questions its power to create such corporations, ab initio.

It has been decided by the Supreme Court of the United States that no single state can create a railroad company and endow it, as a matter of law, with the right to operate its lines in any other state. Indiana and Ohio tried to do this conjointly. They created two railroad companies, each endowed with the same name and having the same officers, directors and stockholders. The tracks owned by these two companies came together at the state line. Every effort was made to create a single corporation with the right to do business in states. The Supreme Court held that there were two separate and distinct corporations and that, in the very nature of the case, one state could not give the power to its creature to go into the domain of another sovereignty of equal dignity and do business there, except by permission of the other state. Hence it is that all roads that cross state lines do business outside their native state by comity between the states. Comity is a privilege merely and not a legal right.

The Southern Railway Company was able to merge its constituent lines running through 11 states by reason of the voluntary, but not necessary concurrent, action of the several states and their corporate creatures. First, the states either by special acts or by general laws gave statutory permission for the railroad corporations to combine. Second, all constitutent corporations had to take appropriate corporate action through stockholders and directors according to by-laws and charter provisions, authorizing the particular step necessary to a merger. So that each of the constituent corporations was put into the combination by virtue of its own action taken by permission of its creator. Thus, by virtue of the express consent of the several corporations and of the express legislative sanction of the 11 states in which the Southern Railway system operates, something was created different from the aggregate of corporate powers previously vested in the subsidiary companies. The Virginia corporation known as the Southern Railway Company became an instrumentality of interstate commerce, not by virtue of comity, among these 11 states, but because it crosses the lines of said states and hauls interstate commerce through them as a single entity and by virtue of the action of each of the states, and of the concurrent or supplemental action of the owners of each of the properties. *Whether they intended it or not, it is a fact that every one of those states, and every one of those corporations, by such action, voluntarily submitted themselves to the jurisdiction of Congress through its exclusive control of interstate commerce, whenever it sees fit to act.*

Congress has never exercised that power, but with all due respect to the eminent counsel who have raised legal objection to compulsory federal incorporation, no satisfactory reply has yet been made to the legal conclusion involved, viz., that Congress has the power, if it chooses to exercise it, to say that every system of railroads engaged in interstate commerce by virtue of consolidating constituent lines (and no other such system can legally exist unless originally created by Congress): "You are now an instrumentality of interstate commerce, and in the development of the commerce of this country it has become necessary that full jurisdiction of your functions shall be vested in the federal government. Therefore, you are required to transfer your allegiance from the state of your incorporation to the United States of America, in order that the federal government may take such steps hereafter in the control of your business and in the promotion of the interests of interstate commerce as from time to time it sees fit. Congress could then establish consistent control of all sytems of interstate carriers.

If federal incorporation is made permissive only it is questionable whether Congress will not be embarrassed by some of the lines declining to accept federal charters. Many of them have tax exemptions and special charter privileges which they would hesitate to imperil. Voluntary action would certainly destroy these privileges, while, under compulsory action, these property rights might be preserved under other provisions of the Constitution not necessary to be here elaborated.

It should be repeated that this argument is confined to those lines which, by voluntary action, have been consolidated into interstate systems. They have thereby waived the right (if it exists) to object to Congress doing anything with them that it may desire to do if they expect to continue in interstate commerce.

As to the necessity of federal incorporation, there does not seem to be any room for argument. If the federal government is to vise and control the issuance of railroad securities, upon what principle, without the voluntary cooperation of the state corporation, can Congress interfere with its issue of stocks and bonds expressly authorized under its state charter? They may be not necessarily connected with its interstate commerce. Their proceeds may be needed for other purposes. Many railroad corporations engage in business other than transportation. The exercise of control over the securities of a state corporation by Congress is much harder to justify under existing law than the power to compel federal incorporation by interstate systems. The basis of the securities, especially the original issues, is the charter of the constituent companies, and not of the holding or operating company. Rights in these are vested and protected by the federal Constitution itself. But when the corporation operating the interstate system is compelled to transfer its allegiance to the federal government, subsequent issues of its capital stock and bonds may be regulated as Congress directs.

The contractual relation between a state and its corporate creature presents no obstacles to compulsory federal incorporation of interstate systems hereinbefore described, because the state has consented in advance that that may happen. When the state gave permission to its corporation to become a part of the instrumentalities of interstate commerce by virtue of its legal merger into an interstate system, it relinquished its right to object to any sort of control over that corporation which Congress might choose to exercise. Of course, until Congress exercises control the allegiance of the corporation remains with the state that created it. The argument is that both the states and the corporations, by virtue of the necessities of the consolidation that produced the interstate system, have contracted in advance that Congress may exercise jurisdiction over this legally established

instrumentality of interstate commerce if, in its discretion, such action will promote the interests of interstate commerce. Such jurisdiction has been exercised in numberless ways. *If, without destroying the corporation itself,* it may be converted from a state corporation to a federal corporation, there is no legal reason why Congress may not constitutionally require it to make the change.

Judge Smith's statement aroused a great deal of interest among members of the committee, several of whom are strongly opposed to the idea of federal incorporation, and a desire was expressed to cross-examine him at length, but he was obliged to leave the city at once and promised to return later when it would be possible for him to testify as to the text of a bill being drafted to carry out the provisions of the conference plan. Representative Dennison was particularly interested in the effect of federal incorporation on the provision of the Illinois Central charter providing for a state tax on the basis of a percentage of its gross earnings in lieu of all other state taxes, which he said, was an advantage to the state. Judge Smith had said that railroads would retain the benefits of their charter provisions, but said that if the state tax constituted a burden on interstate commerce the state would have to give it up, although, he said, the conference assumed that the constitutional protection of any property rights would continue to function. Representative De Walt thought a peculiar situation would be created if both the federal government and the states had tax powers. Mr. Smith pointed out that railroads are now subject to both state and federal taxation, but he said that under the proposed plan the state's right of taxation would be somewhat limited by the power of Congress which could prevent it taxing railroad property except on the same basis as the taxation of other property. Representative Sanders asked what could be accomplished under federal incorporation which could not be done without it. Mr. Smith said he had grave doubts as to how the Interstate Commerce Commission could regulate the stock and bond issues of state corporations without it and that it would be necessary to carry out the provisions of the conference plan. He said the greatest benefit would be to get the railroads out from under the irreconcilable regulation of 48 state commissions. Representative Sanders thought it somewhat inconsistent to say that Congress could not regulate security issues, but to say it has the power to compel federal incorporation.

Paul M. Warburg followed Mr. Smith. His remarks will be published in next week's issue of the *Railway Age.*

Proposed Rule on Rate Making

By W. W. Salmon

W. W. Salmon, president of the General Railway Signal Company, and chairman of the Railway Business Association's Committee on Railways After the War, followed Mr. Warburg and introduced a number of charts illustrating the effect of the proposed rule of rate-making. Mr. Salmon said in part:

It was felt that amongst the things essential to restoration and maintenance of railway credit, two of the most important are, first, an authoritative governmental declaration as to what shall be deemed a reasonable minimum rate of net earning upon the aggregate value of railroad properties devoted to public service and, second, a recognition and assumption by the government—which regulates the rates and, in large degree, determines the expenditures of the railroads—of its obligation in fixing rates to so fix them that they shall produce revenues adequate to yield the declared reasonable minimum rate of net earning upon the aggregate value of the railroad properties devoted to public service.

In discussing what might be regarded as a reasonable minimum, attention was strongly directed to the facts that in the three years ended June 30, 1917 (hereafter referred to as the test period), the aggregate net earnings from operations of all of the Class 1 railroads of the United States were approximately 895 millions of dollars, or approximately 5.2 per cent upon their aggregate property investment accounts amounting to 17,192 millions of dollars; that during this period of relatively good average earning, the railroads were unable to secure needed funds on such terms as would warrant the emission of their securities for equipment, improvements and extensions required in the public interest—though industrials were at the same time able to sell their securities on favorable terms, by which it is meant that the funds procured from the sale of such securities would earn, in industry, a profit over and above the interest charges thereon. The conference discussion developed the fact that, in its opinion, the net earnings from railroad operation during the test period were insufficient to attract the capital that must be had if the railroads are to be organized and equipped to adequately serve the needs of the country and that they would continue insufficient unless increased in an amount at least equaling the difference between 5.2 per cent and 6 per cent on the aggregate property investment accounts.

It is the view of the conference that while the railroads as a whole must earn from operations an average aggregate annual net return of not less than 6 per cent upon the aggregate fair values of their properties devoted to the public service, if they are to be able to command the capital required for their needed development, there will doubtless be in the future, as now, substantial differences between the rates of net return of the several railroads. Therefore, in this recommendation the railroads of the country are referred to in the aggregate in each of the traffic sections designated by federal authority and it is the belief of the conference that in this, as in its further recommendations, nothing will be found that will cause lessening of zeal on the part of any railroad officer or employee to so conduct the affairs entrusted to him that his railroad may properly earn the greatest possible share of the aggregate net return of the group of railroads of which his is a part, for the conference recognizes that any rule which has such an effect inevitably decreases the efficiency and increases the cost of service to the public.

The conference discussed at length the elements that should properly be considered in arriving at a determination of the fair value of railroad property and, recognizing that a considerable time must of necessity elapse before such value can be ascertained for all of the railroads of the country, sought to find a basis of valuation which, pending an authoritative, permanent fair valuation, may serve as a fairly satisfactory temporary basis in establishing rates. It reached the conclusion that while doubtless the fair value of the property of certain railroads will be found to be much less than the amount shown by their property investment accounts, the reverse will be found to be true of many other large systems which in the past charged to operating expense large sums which, under the existing accounting rules prescribed by the Interstate Commerce Commission, would have been charged and are properly chargeable to capital account. It is the belief of the conference, based upon a comparison of the book valuation of our railroads as a whole, with that of the railroads of other countries, where labor was much cheaper, that it will be found when the federal valuations are completed that the aggregate property investment accounts of all the railroads of the United States and in each of the existing traffic districts or sections amount to less rather than more than the federal valuations will show.

It is the belief of the conference that while a great majority of the people of the United States should and will ap-

prove of a rule of rate making designed, in their interest, to yield a minimum aggregate net return adequate to attract private capital in quantities sufficient to enable the railroads of the country to economically furnish the facilities required to meet the needs of our great and constantly increasing commerce, there should and would be a vigorous protest against any rule, the effect of which is deemed likely to unduly increase the earnings of railroads whose earnings in the past are quite generally believed to have been ample. The conference therefore considered most carefully what could be done to satisfy this most natural and reasonable view, it being quite certain that if the average net return of all of the railroads of the United States should, in consequence of the proposed rule of rate making, increase from the 5.2 per cent of the test period to 6 per cent per annum on their aggregate property investment accounts, certain railroads, whose earnings in the test period were greatly in excess of 6 per cent, would have a substantial increase over their earnings in the test period and that, so far as they alone are concerned, neither the conference nor the country at large would deem it necessary to fix rates designed to obtain a greater yield than that of the test period.

The conference is of the opinion that all income in excess of 6 per cent per annum upon the fair value of the railroad property devoted to the public service should be regarded as "excess income."

It is an exceedingly simple matter to understand how excess income will be determined when the federal valuation of the railroads shall have been completed since any and all earning over 6 per cent on the ascertained valuation of any individual railroad system will constitute excess income. But the conference formula and provisos for ascertaining excess income, pending completion of the federal valuation, are not equally simple and, for clarification, the following illustrations are cited:

The amount of the average aggregate property investment accounts of the 32 Class 1 railroads of the Southern district for the three-year period ending June 30, 1917, was $2,589,615,640; the average aggregate railway operating income of all these railroads for the same period was $138,820,918. For the same period the average railway operating income of the Tennessee Central was $163,753, equal to 0.11815 per cent, of the aggregate like income of all the railroads of the Southern district. Under the conference formula, the temporary valuation of the Tennessee Central, for the purpose of ascertaining excess income, equals 0.11815 per cent of $2,589,615,640, or equals $3,058,341, instead of the $19,717,592 shown as the average amount of its property investment accounts in the period named. All of its net railway operating income over 6 per cent per annum on this $3,058,341 valuation, or over $183,500, would constitute excess income, unless in the test period its average annual railway operating income exceeded $183,500 and as such was not the case in the test period, any income in excess of $183,500 would actually constitute excess income.

Take another and extremely different illustration, that of the Norfolk & Western. Its average net income from operations for the test period were $20,893,498, equal to 15.05132 per cent of the aggregate of such earnings for all of the railroads of the Southern district during that period. Under the conference formula the temporary valuation derived for that road would be 15.05132 per cent of the aggregate property investment accounts of all of the railroads of the district, or $389,771,475; but, under proviso 1, this derived valuation cannot be used, since it exceeds the amount of the average property investment account of the railroad, which was $264,792,196. On the other hand, 6 per cent upon this last named amount would be only $15,887,532, and as this is less than its average net railway operating income for the test period, amounting to $20,893,498, only income exceeding this latter amount is regarded as excess income.

The effect of proviso 2 is thus seen to be that whereas, pending the completion of the federal valuation of railroad property, no net railway operating income not in excess of the average of the test period shall be regarded as excess income, all railway operating income in excess of such average is treated as excess income when earned by a railroad that earned 6 per cent or more on its property investment account during the test period. The purpose of this provision is that no such railway, whose earnings during the test period were 6 per cent or over, shall even temporarily unduly profit from its increase of earning, growing out of the operation of the proposed rule of rate making.

Upon a careful review of the various plans suggested as to the disposition to be made of excess income, it was the opinion of the conference that it should be used wholly or in major part to establish and maintain certain railroad contingent funds. It is obvious that no matter how honestly and ably the governmental rate fixing agency shall perform its task, there will inevitably be years when, for one or another uncontrollable cause, net railway operating income will fall below the desired and requisite percentage. It was therefore deemed wise that out of its excess earnings each railroad should contribute a part to the establishment of its own individual railroad contingent fund, upon which it may draw in any year when its net railway operating income shall fall below 6 per cent of the fair value of its property; and that it shall also contribute a part to a general railroad contingent fund which can be drawn upon only when the aggregate net operating income of all of the railroads of a traffic section falls below 6 per cent upon the aggreate property investment accounts of the railroads of that traffic section. In this way all earnings from railway operations are available for the maintenance of the credit of the railways.

In the tables are shown the estimated contributions of each of the Class 1 railroads in each traffic section to each of the contingent funds in a year when the aggregate net railway operating income of the railroads of each traffic section equals 6 per cent upon the average aggregate property investment accounts of the test period.

These contributions in such a year, while the individual contingent funds are in process of creation, and prior to the effecting of the consolidation of existing roads into a limited number of competing systems, are estimated as follows:

District	Individual contingent fund	General contingent fund	Total
Eastern	$13,676,562	$13,676,563	$27,353,125
Southern	4,881,539	4,881,539	9,763,078
Western	19,765,944	19,765,944	39,531,888
Totals	$38,324,045	$38,324,046	$76,648,091

Upon the completion and maintenance of all the individual railroad contingent funds, contributions thereto would cease and thereafter, in a year of 6 per cent railway net operating income upon the aggregate property investment accounts the aggregate contributions to the general railroad contingent fund are estimated as follows:

Eastern District	$18,235,413
Southern District	6,508,719
Western District	26,354,589
	$51,098,721

While the aggregate of contributions to the contingent funds, as above shown, are substantial and will serve greatly in the needed establishment and maintenance of railroad credit, it was realized by the conference, that upon the consolidation of existing railways into such limited number of competing systems as may be deemed by the transportation board to be in the public interest, there will of necessity be a great reduction in the amount of such contributions for the reason that as the railroads which have a large rate of net railway operating income and are the chief contributors to the contingent funds, are merged with lines of much smaller earning, there will be greatly reduced excess earnings, out of which contributions can be made.

An Unusual Form of Roundhouse Smoke Jack

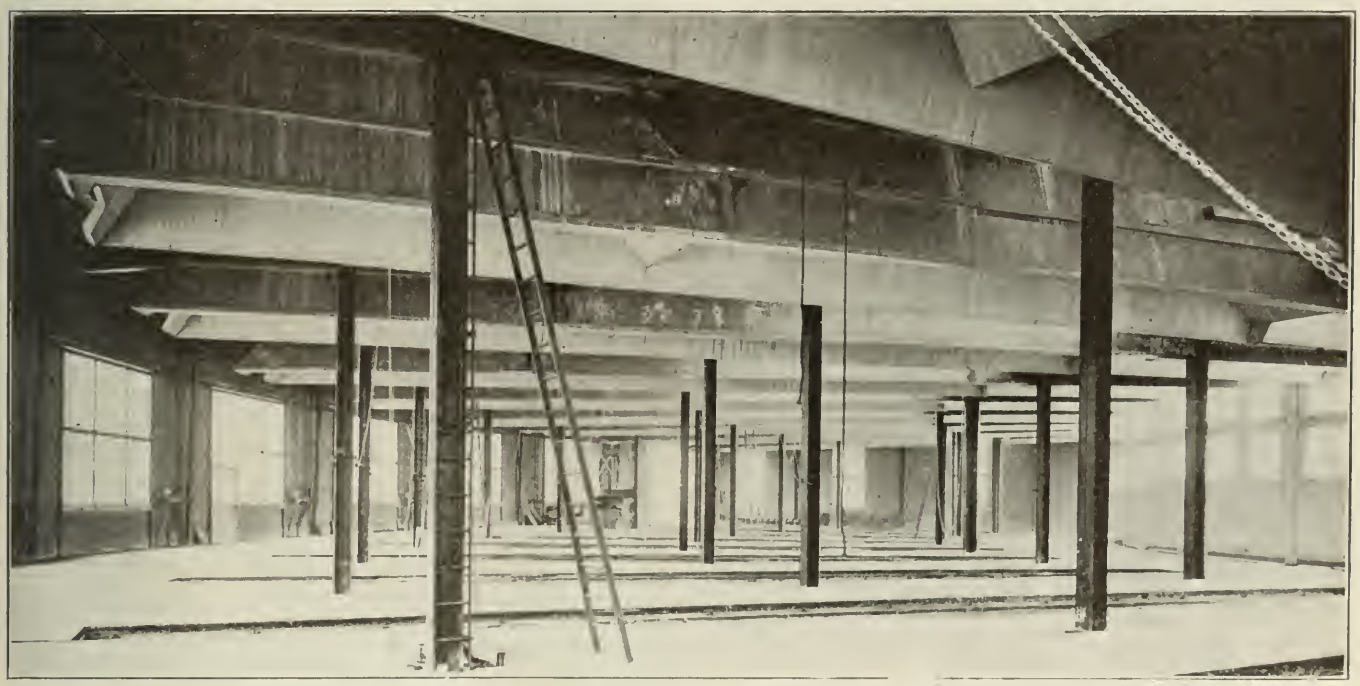
New Pittsburgh & Lake Erie Structure at Haselton Also Embodies Other Unique Features

SMOKE JACKS that cover the entire length of the stalls, a special form of door construction and a reinforced gypsum roof are features in a recently completed roundhouse of the Pittsburgh & Lake Erie at Haselton, Ohio, which make this terminal one of unusual interest to students of engine house facilities. Some of the ideas embodied in this design were applied previously in a roundhouse of this road at Dickerson Run, so while these features are new to most railway men, they bear the stamp of actual service and the form in which they have been applied in the engine terminal at Haselton embodies such modifications as were considered advisable after the experience at Dickerson Run.

The most radical feature in the Haselton house is the continuous smoke jack which may be said to constitute an elaboration of the modern tendency toward smoke jacks having a broad spread in the direction parallel to the track in the stall. Most roads have found it of great convenience to have jacks with elongated hoods so that the stack on the locomotive will be covered for a variation in location of some eight feet or more to allow for a considerable latitude in the position of the drive wheels on the track. However, jacks so designed do not offer any facilities for the collection of steam escaping from the engine at some distance behind the smoke stack or for smoke emitted from the stack while the engine is entering or leaving the house, and it has been found that considerable of the smoke nuisance in roundhouses results from an engine backing out of the house with a green fire. Studies for the elimination of the smoke thus emitted resulted in the special form of jack used in these roundhouses.

This decision was influenced largely by the fact that the officers of the Pittsburgh & Lake Erie have been advocates of the use of structural steel construction in roundhouses for some time, notwithstanding the fact that the practice on a number of other railroads has positively prohibited the use of rolled metal of any kind in roundhouse construction. Proper attention to painting and special efforts to eliminate smoke and secure ventilation in the roundhouses has demonstrated the successful use of structural steel on the Pittsburgh & Lake Erie. The special smoke jack construction evolved is in a certain sense the result of further efforts to improve conditions for the use of steel in these structures.

As shown in the drawings the smoke jacks in the Haselton roundhouse are continuous from the doors to within a few feet of the outer wall of the house, there being three outlets through the roof. Except for the one-inch rods by which the jacks are suspended from the roof and a few other rods serving as horizontal ties, the entire jack construction is of wood, using one-inch sheathing on 2 in. by 4 in., 4 in. by 6 in., and 4 in. by 8 in. wales. Experience in the Dickerson Run roundhouse shows that there is little fire hazard if the design is such that there is little opportunity for the accumulation of soot.

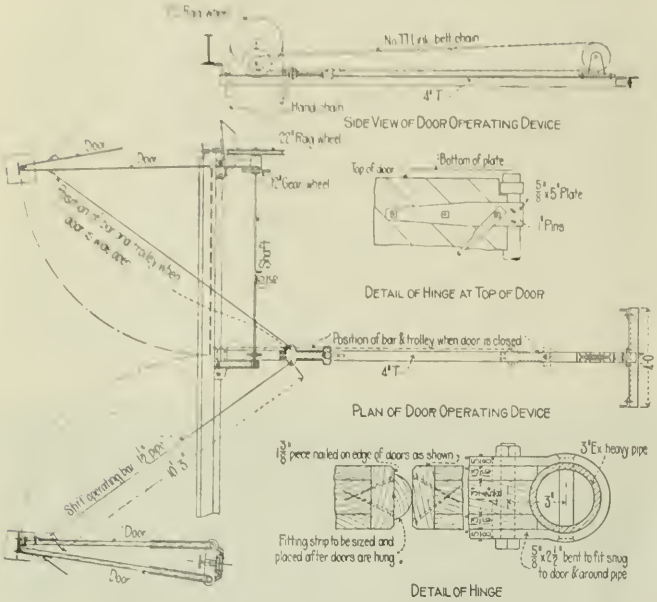


Interior of the Roundhouse, Showing Continuous Jack Construction

The successful elimination of the smoke collected by the long hood of the jacks implies ample vent area through the roof, which to avoid unnecessary heat loss in winter time must be closed by dampers when not in use. The unique design of door adopted may be said to result largely through the simple fact that jack C, i. e., the one nearest the door, is of use only at times when the door is open. In other words, the damper in this jack needs to be open only when the door is. Consideration of this fact led to the design of an operating device that opens and closes the damper of jack C with the opening and closing of the door.

This device is shown in the longitudinal section of the roundhouse stall and in the large scale detail. Each pair of doors is held open or closed and is swung to the open or

closed position by a pair of operating bars which are attached by one end to the outer ends of the doors near the top and by their other ends to a "trolley" that slides on a T-iron placed horizontally on the center line of the track over the door. This trolley is attached to a continuous No. 77 Link Belt chain run over two sprocket wheels so that the movement of the chain over the sprocket slides the

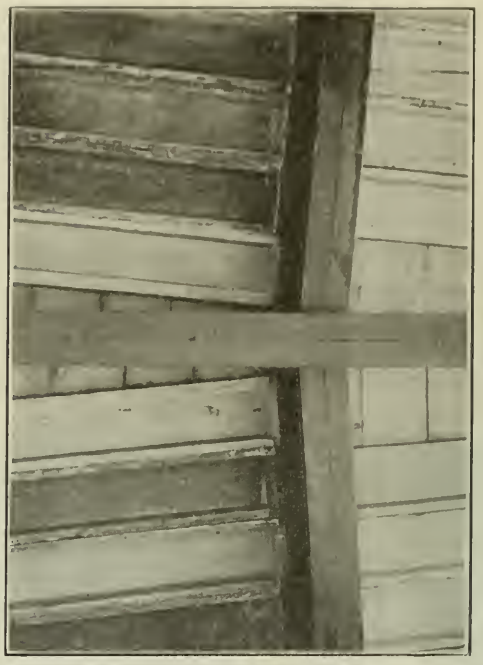


Details of Door-Opening Arrangement

trolley one way or the other and in turn swings the two doors in or out. The power for this movement is supplied by a hand chain hanging from a rag wheel attached to the door post and connected to the sprocket wheel over the door by means of a train of gears. The jack damper is operated by the link motion shown which consists of a Y-frame attached to the damper and a stiff rod attached to the trolley chain. The dampers of the other two jacks in each stall are controlled by hand chains attached to nearby posts and except in severe weather are normally left open.

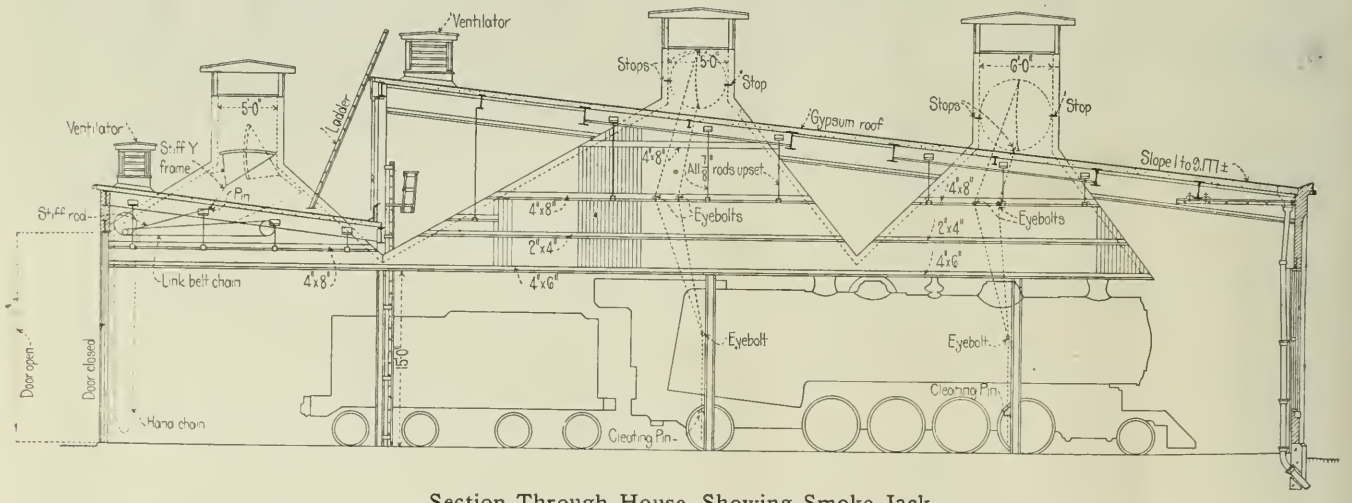
Other features of the roundhouse doors are of interest. The doors have no hinges but swing on three-inch extra-heavy pipe securely attached to the backs of the doors by heavy steel straps and turning in sockets at the top and bottom of the door frames. Owing to the fact that the two doors of each pair are opened and closed simultaneously, the meeting joint is not provided with a weatherstrip, but is equipped instead with a rubber contact as shown in the drawing.

The gypsum roof construction above referred to consists of pre-cast slabs of reinforced gypsum set on the steel purlins of the roof frame. These purlins run circumferentially,



Underside of Roof Construction, Showing Manner of Assembling Gypsum Slabs at the Junction of Two Stalls

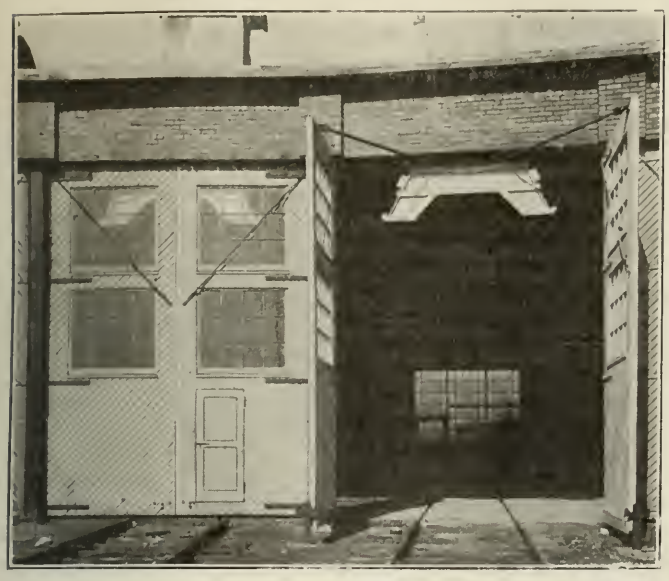
spanning between the girders on the center lines between stalls, these lines of purlins being equally spaced (about 8 ft. 9 in.) The gypsum units are placed in an approximately radial position spanning from purlin to purlin, the uniform spacing of the latter permitting the use of a large number of units of standard width and span while the wedge shaped openings on the center lines between stalls were closed by short pieces of slab spanning circumferentially and cut to fit on the job. This arrangement is readily understood by an examination of the photographs. The standard gypsum units are of a channel section placed with the flanges down. The units adjoining the center line between stalls have a special heavy flange and a recess or seat to receive the special slabs that are used to fill out the wedge-shaped open-



Section Through House, Showing Smoke Jack

ings. These special slabs are of a plain flat construction and were readily cut to fit the odd size openings. All irregularities in joints in this construction were plastered with fresh gypsum.

The reasons given for adopting this form of construction are of interest. Other types of roof considered were timber



Track Doors Opened and Closed

and concrete. As this work was in progress during the war period, heart timber was not available and sap wood untreated was considered out of the question because it would require early renewal, not only of the roof timbers but also of the high grade roofing which it was desired to install. As a consequence timber construction implied the use of cre-

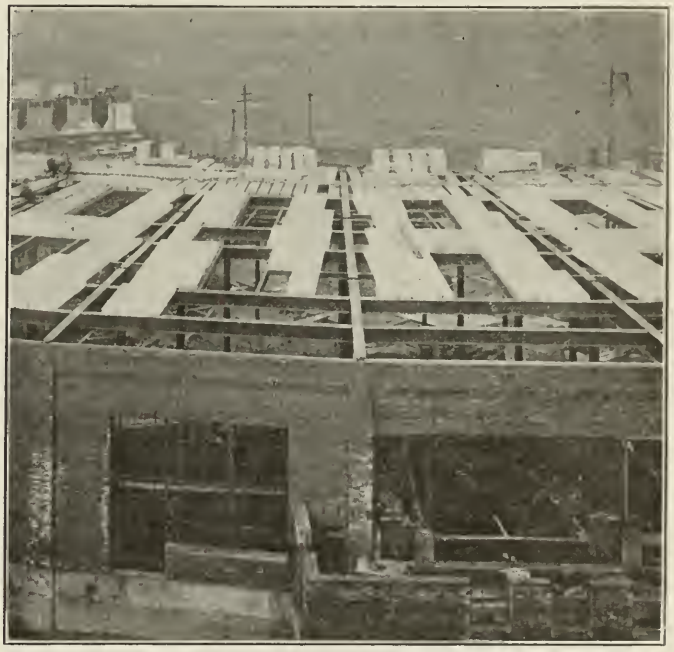
Exterior View Showing the Multiple Vents for the Smoke Jacks

osoted material and comparative estimates showed that the gypsum would be cheaper than the treated wood while the necessity for winter work led to the rejection of the concrete design. The gypsum was supplied pre-cast by the United States Gypsum Company, Chicago, with specifications requiring the gypsum units furnished to withstand an ultimate load of not less than 200 lb. per sq. ft. Tests made on stock specimens both dry and saturated fulfilled these requirements.

Other details of this roundhouse deserve special mention. The floor is of concrete; the portion between adjoining engine pits being pitched from a level coincident with that of the top of the rail near each ends of the engine pits to a level of the base of the rail half way between, where slots in the tops of the engine pits wall afforded drainage from the floor into the engine pits.

Special pains were taken to secure good natural illumination in the roundhouse, taking into consideration the points on the engine where the light is most needed, that is near the front end and inside of the cab. General illumination is afforded by a large area of windows in the outer wall of the house and also in the doors while the roof construction is so arranged as to provide a large area of windows in a position that will illuminate the cab.

The service pipes are carried around the house overhead, being suspended from hangers that permit their swinging in or out with changes in length resulting from changes in temperature. This system includes pipes for hot water, cold



How the Gypsum Roof Slabs Were Placed

water, steam and blow off in addition to a high pressure water system for testing boilers. Pipes for the first four named are connected with a manifold on the outer wall at the rear of each stall from which a service pipe is carried in a conduit to a service connection attached to a column between the stalls. A line from the high pressure water system is also carried to a similar service connection, but is kept separate from the other service pipes because it is not economical to provide and maintain valves in the manifold to withstand the high pressures carried on the boiler testing system.

The house has 24 stalls, this being the net number required for actual roundhouse service for the locomotives. Ample track space for storing engines has been provided outside of the house and a shop with space for five locomotives has been designed to be built adjoining the roundhouse for doing light running repairs. This roundhouse was designed and built under the direction of J. A. Atwood, chief engineer of the Pittsburgh & Lake Erie, and A. R. Raymer, assistant chief engineer, both with headquarters at Pittsburgh, Pa.

Prince Edward Island's Burdensome Railway, Which Never in Any Year Earned Its Operating Expenses

By Harold G. Villard

II

(In the first article in this series Mr. Villard told of Nova Scotia's costly experience in building and operating its Provincial Railway. In his next article Mr. Villard will show what degree of success Ontario has had with its government-owned Temiskaming & Northern Ontario road.—Editor.)

PREVIOUS to 1871 not a mile of railway had been built in the then still independent colony of Prince Edward Island. The Provincial legislature, which met in the spring of that year, had been elected after a close contest in which the subject of a government-owned railway had not even been mentioned. Nevertheless, although the people had had no chance to express their opinion upon such an important proposition, the government caused the House of Assembly to pass a resolution on April 3 approving of the construction under government auspices of a first-class railway through the Island.

Two days later, and without affording the members from the country districts an opportunity of consulting their constituents in regard to its terms, the government jammed a bill[1] through the same Lower Chamber authorizing the building of a provincial railway between certain designated terminal points. While the railway was to be of the first class, the statute directed that no construction contract should be entered into "conditioned for the payment of any greater sum than £5,000[2] per mile" of completed road, including all station grounds and equipment. It also prescribed as "an indispensable condition in construction contracts" that contractors would have to pledge themselves to accept in payment for the work to be performed by them "at par, without any allowance for discount" provincial debentures, payable 30 years after date and bearing 6 per cent. interest.

Thus in this precipitate fashion and without any urgent public demand therefor was Prince Edward Island committed to the construction of a main trunk line to cost when in complete working order not more than $16,200 per mile. As this was the maximum expenditure allowed, it was evident that—although the surface of the island is comparatively level and presents no especial difficulties in the way of railway construction—only a very inexpensive road could be built for the sum named. Hence the first move of the government was to determine on a narrow gage of 3 feet and 6 in. for the railway, which necessitated less deep cuttings and allowed the use of shorter and more frequent curves than if the customary broad gage of 4 ft. 8 1-2 in. had been insisted upon.

Having rushed through their railway legislation[3], the government lost no time in proceeding with the construction of the railway. The authorities were determined to have work on it started before the winter set in. Already on May 23, therefore, and before the first surveying party had been put in the field, advertisements were inserted in British, American and Canadian papers inviting tenders for the construction and equipment of a narrow gage railway between Casumpec and Georgetown, "a distance of about one hundred and twenty miles." On September 11 a construction contract was actually entered into with a Canadian firm for the completion of the line. To it were attached certain schedules specifying the amount of excavation, ballasting, etc., which the contractors would have to perform. All these schedules were left blank, but the contract naively recited that they "will be filled up as soon as the location of the line is approved."[4] Indeed, it was not until November 21 that the final location of the entire line was officially sanctioned by the cabinet as required by the terms of the Railway Act.[5] This action of the ministry in entering into a construction contract before the route, which the road was to follow, had been definitely determined upon, cannot be termed a very businesslike procedure.

Preliminary to agreeing on the line of the railway, the administration appointed a committee of nine legislators from each section of the Island "to attend in their respective counties with the government engineer to advise with him and arrange as to the location of the road."[6]

Passed as Many Places as Possible

This body proceeded on the theory that the main trunk line ought to pass through as many places as possible if it were to be of the greatest utility to the people of the province. Hence, instead of adhering to the plan originally proposed, of running direct between Charlottetown and Summerside by way of Freetown and the Hunter Valley, the road was deflected at the instance of a member of this advisory committee to a place called "Kensington." This detour alone added a great deal to the length of the railway "and the same was the case in bringing it to other points in order that the country at large might be accommodated."[7] In place, therefore, of the main line being 120 miles long as at first estimated by the government, its actual length proved to be over 148 miles, or nearly one-fourth greater.

Besides being made unnecessarily long through this desire "to accommodate the greatest number," the course of the road was necessarily circuitous. For, unless the contour of the ground had been closely followed and all expensive cuttings avoided as far as possible, the line could not have been completed for £5,000 as prescribed in the Railway Act. In after years, the railway was not inaptly described as "a twisting, winding, wriggling road" and at one point was facetiously said to have "so many curves that it passed at almost every man's door." In many cases, the degree of curvature was so great that it was almost unsafe to travel on the road. The following citation gives an instance of this kind:

> "The bridge across the Medgil stream is placed on a curve of a radius of 600 ft., and is approached from the east by a gradient of 58 ft. per mile, or 1 in 91, and from the west by 66 ft. per mile, or 1 in 80, thus forming a most dangerous feature in the railway. It will be necessary, for safety, to bring the trains to a stand before passing on to this structure in either direction."[8]

Nor was the character of construction changed when the

branch lines came to be built. When the Conservatives failed to obtain a majority at the next election following the passage of their railway legislation, they were succeeded by a coalition administration pledged to the construction of fifty miles of branch lines. The new ministry had the good sense to avoid one of the mistakes made in contracting for the building of the main line in advance of surveys by providing that the proposed additional mileage should "be surveyed and located previously to the letting of the contract"[9] for its construction. Nevertheless, as the cost of these branch lines was likewise limited to £5,000 a mile, they had to be built with the same steep grades and short curves which were used on the main line.

In addition to determining the route to be followed, the government which fathered the construction of the railway undertook to decide the position and location of all the stations along the line. In some instances, these sites were selected not from the standpoint of the public interest, but in accordance with the wishes of the administration's most influential supporters. Thus at Summerside six acres were purchased for railway station purposes on the outskirts of the place from an adherent of the government. When the succeeding administration assumed office in 1872, therefore, it obtained authority from the Legislature to change station sites already chosen.[10] Where such changes were thereafter effected, as at Summerside and Alberton, they were made at the expense of the friends of the late government. Just as in the case of that government, however, the incoming administration was not always happy in its selection of a terminal site. For example, the station at Souris—where the Island Railway terminated in a sand pit instead of being completed through to tide-water—"was built where it was totally inaccessible" and in "the most unsuitable place imaginable."[11]

Land Damages Vastly Exceed Estimate

At the time the railway was first projected, the leader of the then Government announced that the right-of-way for the main line would cost less than $35,000.[12] This speedily proved an underestimate and by March 31, 1875, the sum expended for land damages had reached a total of $253,738.86.[13] Where a landowner was dissatisfied—as was generally the case—with the award of the government commissioners, he had the right to appeal to a Board of Appraisers. These appraisers usually found that the land condemned had been undervalued, which in a great measure accounts for the large increase in the right-of-way costs over the amount first estimated. "In every case that was referred to the late appraisers for their decision, they awarded a larger amount than had been allowed by the late railway commissioners."[14]

As has been mentioned before, the construction of the Island Railway was begun in the fall of 1871. A year or so later, one of the principal local banks was imprudent enough to make a loan far beyond its available resources secured by the Provincial debentures issued to the contractors for the railway in payment for work performed by them. The directors of this bank were "curiously intermingled with the public men of the day." When it developed that the debentures thus pledged could not be realized upon except at a heavy loss, these leading citizens saw a chance of averting such a calamity by joining Confederation. They were instrumental in bringing about a union with the rest of Canada, for the people—aware by this time that the railway would prove a burden—preferred "Confederation as a lesser evil than the grinding taxation which would result from the construction of the railroad."[15] Thus, as the direct consequence of its hasty railway legislation, Prince Edward Island—whose House of Assembly had only three years previously passed a resolution reciting "that the people were almost unanimously opposed to any change in the constitution of the colony"—ceased to exist as an independent Province and on July 1, 1873, became a part of the Dominion of Canada.

"Worst Built Road in America"

Besides entitling the Province to charge up against the Dominion a fictitious indebtedness or subsidy of fifty dollars per head of its population, the terms of Union provided that "the railways under contract and in course of construction for the Government of the Island" should become the property of Canada. For the better carrying out of this provision, it was agreed that the cost of the railway should be borne by the federal government and the amount so paid should be regarded as a debt against the Island and as an offset to the subsidy which the Dominion was obligated to pay. When the road attained completion, therefore, in the fall of 1874, it was turned over to the Dominion officials. These speedily discovered that the Provincial Railway was—to use their own expression—"not of a faultless character." The Prime Minister later described it as "perhaps the worst built road ever seen in America,"[16] for which condition of affairs he blamed the Island Government. Exception was taken to the location of the railway which had been determined "independent of any question of directness of route or of grade."[17] The rolling stock was unfitted for the work it was called upon to perform and the engines were of inadequate power. The roadbed was insufficiently ballasted and could not be drained properly, while the masonry was of a poor quality.

In addition to all these defects, the fencing along the line was of a most inferior description. In December, 1871, the island ministers—although in the words of one of their number they all "had then no experience of wire fences"[18]—directed that a system of iron wire fencing should be substituted for the post and board fence which the railway contractors had first been instructed to erect. No sooner had the wire fence been completed, however, than it proved "totally unsuited for the purposes for which it was designed." Equally ineffective against cattle, horses, sheep and hogs, it was carried all over the island by the live stock which ventured to cross the track. At length in 1875, its replacement was decided upon by the Dominion authorities after one of their engineers had reported that "nothing short of an entire change in its character will be effective, a change that will entail an expenditure of not less than from $300 to $400 per mile of railway."[19] The ill-advised action of the local government in insisting on this untried kind of fencing proved therefore a very costly blunder.

Expenses Greatly Exceed Earnings

When the building of the railway was first undertaken in 1871, the government predicted that its yearly gross earnings upon the completion of the main line would be $200,000. Instead of any figures like this being attained, however, the total earnings of both the main line and branches for the first fiscal year 1875-1876[20] amounted only to $118,060.90. Both passenger and freight traffic turned out to be disappointingly small. If the gross earnings fell far short of anticipations, the expenses on the other hand ex-

[20]The railway was first opened for traffic on May 12, 1875.

ceeded all estimates and totalled no less than $214,930.43, or the equivalent of 182 per cent of the gross earnings.

This unusually high ratio of operating expenses, which has remained a feature of the railway down to the present time, was the natural outcome of the faulty construction of the railway by the local politicians who had it in charge. As we have seen, their primary object was to build a cheap railway and one not to exceed $16,200 per mile. This necessitated the laying out of a crooked line with steep curves of short radii. The fact was overlooked apparently that a road of this character must be necessarily expensive to operate and that—even if its first cost had been greater—a good and substantial railway would have been the truest economy in the long run. It is well known that the sharper the curves on a railway,[21] the greater will be the resistance offered to the impelling power with a consequent higher consumption of fuel by a locomotive in overcoming such resistence. Aside from causing an increased amount of wear and tear on rails and flanges and enhancing maintenance outlays, short and frequent curves prevent further any great rate of speed being attained.

Again, in locating the Prince Edward Island Railway, the idea was to furnish as many places as possible with a railway connection even though it resulted in increasing the length of the line. That there is an economy in straightness of route was lost sight of. Where a railway possesses a mileage of needless length, not only do passengers and freight have to be transported over the unnecessary distance for all time to come, but the additional cost in fuel, wages, wear and tear of rolling stock and for the maintenance of the permanent way as compared with a direct line must be taken into consideration. If the Provincial authorities had only taken the following doctrine to heart, the Island railway would have been much less of a losing proposition during the last forty years: "A line ought not to diverge from the direct course between its extremities, and thus increase its distance for the sake of a trade of a small town, for whose benefit the time and fare of all the passengers and freight on the whole line would thus be taxed. It would be preferable to make a branch line to the town."[22]

While the operating expenses were thus unusually high, low rates were charged for the meager traffic which passed over the line. In order to compete successfully with the small coasting vessels which frequented the numerous harbors along the coast and which had hitherto carried on the trade of the island, the railway freight rates were necessarily kept at a low figure. Instead of trying to bring up the earnings of the road by charging comparatively stiff rates for passenger traffic where no competition was to be feared, however, the railway officials were not long in reducing the scale of passenger fares put into force at the opening of the line. This resulted in a decline in passenger receipts, which was mainly ascribable to "the lowering of fares by the introduction of 2nd-class tickets and the issue of return tickets at reduced fares to all stations, both flag and regular, which without increasing the number of passengers materially lessened the amount of revenue."[23]

Unbroken Series of Deficits

Just as at the outset, the Prince Edward Island Railway has been noted throughout its career for high operating costs and scanty earnings. As the road from the time it was first opened has never paid expenses, the federal government has had to make good its unbroken series of deficits which in the forty years 1875-1915 reached a total of $2,453,494.20.[24] At the end of the same period, the railway's capital account had grown to $9,490,899.71, all of which has been furnished by the Dominion taxpayers without their ever receiving a cent of return.

Since the road built and operated under Government direction has not merely proven an unproductive investment from the start but has been a losing proposition as well, it was a fortunate thing for the local taxpayers that the Dominion government was saddled with the upkeep of this incubus of a railway as one of the terms of the Island's entering Confederation. This undeniable truth was succinctly stated by an Island statesman in the following words: "If the railway were not a burden upon our resources as at first contemplated by its projectors, it would be a curse to the country. It is lucky for the country that the Dominion government has agreed to run the road and bear the expense of maintaining it."[25]

[21]The rule reads the resistance due to curvature is in inverse proportion to the radius of the curve.

Hauling Freight on Electric Railways

The Southern Pacific has electrified much of its mileage in Southern California and electric locomotives are used on these lines for hauling freight.

Transport Bill Passed by House of Commons

Will Place Nearly All Transportation Facilities in United Kingdom Under Control of One Man

By Robert E. Thayer
European Editor of the *Railway Age*

London, July 12, 1919.

On July 10, the British Transport Bill, which aims to put in the hands of a single man, the control of all transport facilities in England including railways, light railways, tramways, canals, waterways, inland navigation, roads, bridges, ferrys, harbors, docks and piers, was passed by the House of Commons without substantial modification from the original draft as presented late in February. This bill was strongly backed by the government, which made every effort to put it through. Bonar Law, the home secretary, stated that the sole purpose of the bill is to help re-establish the industry of the country after the war, by means of the best and most comprehensive system of transportation.

While the bill was in Standing Committee the government was disposed to push it through as it stood, but with the signing of peace the only bond which has held the coalition cabinet so firmly has been removed and the government has found it desirable to be more conciliatory. Thus when 24 representatives of the important docks and harbors brought pressure to bear on the government to remove them from the direct jurisdiction of the transport minister, the government felt it necessary to grant their demands, with the proviso that the transport minister may require the owners of docks to make improvements or alterations in the method of working, as may be prescribed for the co-ordination of transport facilities, and that they may appeal in case they feel such orders are injurious to them to the Lord Chief Justice of England.

A change was also made with regard to the control of highways. The authority of the transport minister was somewhat restricted by the adoption of a Road Committee, which shall consist of not less than ten members, five of whom are to be representative of highway authorities and five of the users of road traffic, all of which are to be appointed by the transport minister, after consultation with such authorities.

These two amendments were insisted upon by the representatives of the respective interests, both for the purpose of limiting the possibilities of nationalization as much as possible, and because they have a feeling, on account of the personnel of the transport ministry, that its administration will favor the railways more than any other transport system. In fact statements were made that the railway men backed the transport bill for the purpose of enabling them to get back into shape.

The bill does not yet seem to satisfy the people here that it is not leading directly to the nationalization of England's transport facilities. The matter received the greatest consideration during the recent discussion in the House. Attempts were made to introduce amendments to the bill, to the effect that during the two years the government retained control of the transport facilities, no steps would be taken which would lead towards nationalization. This was done for the purpose of making the government state definitely that it was not seeking this end. The government strongly fought any such amendment with a statement that it was impossible to state whether the question of nationalization would or would not be affected by the bill, but it could be said that the government would not use the powers given it by the bill either for or against nationalization. Sir Eric Geddes said that the question of nationalization was as open as ever it was, and that the government was requesting the control of the transport facilities for two years for the purpose of determining upon the best policy to follow in the future. In fact he said that the situation required either the passage of the bill or nationalization. In this he was sustained by Bonar Law, the home secretary. However, it is rather difficult to imagine how a successful two years of operation of roads by the government would not present a most strong case for nationalization. There can be no question but that the government thinks it can operate the transport facilities of the country successfully for otherwise it would not attempt it.

One curious thing in the whole procedure is the lack of any concerted action by the railways against the bill. It is difficult to find a railroad man that is in favor of nationalization. They all do, however, realize the difficulties they will have to contend with due to present poor physical condition of the roads, and the greatly increased cost of operation. It has been estimated that the cost of operating the roads for the year ending March 31, 1920, will be about $500,000,000 more than in the year 1913, of which $300,000,000 will have to be borne by the state, the balance being made up by increased revenue, this increase being divided somewhat as follows: War wages and other concessions, $280,000,000; the eight hour day and other new concessions recently granted or still under discussion, $90,000,000, and extra cost of materials and coal, $130,000,000. It is believed that the possibility of increasing freight rates (they have not been increased throughout the war although passenger fares were increased 50 per cent) under private management would be much more difficult than under government control, and it is hard to see how the increase in expenses can be met in any other way. The minister designate, however, aims to decrease expenses by eliminating competition in traffic, the common use of equipment (about one-half the freight cars or 700,000 are privately owned), judicious electrification, improved loading, larger freight cars and standardization of cars and locomotives.

The bill provides that the rates established by the government can be held in effect by the roads 18 months after the expiration of the two year control, provided, of course, roads are turned back to their private owners. This also attracts railway men to the bill. The railway stockholders are also well satisfied for they at least will receive their dividends and in event of nationalization they are well protected by existing laws. Thus many of those on the railroad side feel that the transport bill is the easiest way out of the difficulty. In this case the responsibility of rehabilitation and improvement of service, which is so badly needed here, is placed directly on the state. Furthermore, the railways will be strongly represented in the personnel of the transport ministry, for Sir Eric Geddes is a railway man and five of the seven principal assistants to serve under him are professional railway officers.

The attitude of the Labor Party in the House also gives the impression that it believes the bill will ultimately result in nationalization. Labor takes the stand that "the exigencies of the war has made the nationalization of railways, mines and all the key industries of the land inevitable," and believes that the government could not trust private enterprise, without central control, to develop transport in such a way

as to meet the problems of today. It will act with the government on this bill when it works towards nationalization. The policy of the labor leaders is to sit tight, and only fight when the supreme control over transport facilities is menaced. This was well illustrated by their opposition to the amendment introduced which removed the direct control of docks and harbors from the jurisdiction of the transport minister. Labor fought this amendment hard, for it operated against its desire for supreme government control and nationalization. Labor members in the House characterized this action of the government as a "humiliating climb down."

There has been but little concerted action taken against the bill, although fears are expressed everywhere of the fact that it leads to nationalization. At a recent meeting of the Association of British Chambers of Commerce, however, the President of the Association stated that while the above mentioned modifications took some of the sting out of the measure, they did not remove the danger of the bill towards the principle of nationalization, and the adoption of this principle would mean the death blow to individual enterprises.

The newspapers have been quite strong in their condemnation of the bill. The *London Times,* in an editorial published July 3, stated "That their criticism of the bill is based on two main convictions, first, that the bill is not practical, and that its chief result will be eventually to create a vast and costly bureaucracy which, in its turn, may bring about chaos. The second is, that this is a bill framed not to meet the situation, but to fit the ambitions of a single man whose qualifications are questionable, to say the least." The bill does, without question, place a vast amount of power in the hands of one man, and if he be not well qualified to handle the work, great damage can be done. Furthermore, the bill seems to be framed to meet ideas of the minister designate, and the discussion of it in the House has brought forth many promises or statements of confidence from Sir Eric Geddes, which has done much to smooth over many apprehensions. But the fact remains, that after this bill becomes a law, it is so broad in its powers, much damage could be done, if through any reason whatsoever Sir Eric, with his verbal promises and thorough confidence with the House, should be replaced by another man.

The *London Post,* in commenting on the "open mind" of the government regarding nationalization, says: "Surely ministers must hold some opinion on the subject; some among the members of the government at least must believe either that the nationalization of industry is a good thing for the country or a bad thing for the country. But Sir Eric Geddes says they have no views of any sort. In that case they are unfit for their office. No government is justified in keeping silence in respect of a question which is arousing the greatest apprehension throughout the country." In fact there are many who believe that the bill is entirely a failure, because it has not squarely faced the issue of nationalization.

While two months ago, the feeling prevailed that it was only a matter of time before the transport bill would become a law, there was a feeling along towards the last, in some quarters, that there was still much work to be done before it is adopted by Parliament. The question of nationalization is not all settled, and there is a subconscious feeling that if this bill becomes a law, nationalization would be the natural result two years hence.

The bill passed the House of Commons on July 10 and is now to be considered by the House of Lords.

The Telegraph Companies of the United States, according to a report from the Bureau of Census, covering data gathered in 1917, operate 241,012 miles of pole line, comprising 1,888,793 miles of wire. They sent 151,725,228 messages and employed 47,227 persons.

Pennsylvania Women's Uniforms

THE PENNSYLVANIA RAILROAD, Eastern Lines, has adopted, and prescribed for use by its female employees, three uniform suits of clothes, one for each of the three different general classes of women employees. The "work uniform," indicated by "A" in the illustration, is a one-piece dark blue dress with white collar and silver "PRR" buttons, and a dark blue straw sailor hat. This is to be worn by messengers, janitresses, station attendants, maids, stewardesses, gang leaders, elevator attendants, crossing watchwomen and cup tenders (women who go through occupied trains in stations picking up papers, etc.)

The first three uniforms will be supplied to employees at half price and renewals at full price. The first hat will be furnished free of charge, while renewals will have to be paid for at full price.

The "womanalls" (B) are made of khaki. The complete uniform calls for a cap or a hat to match. They are to be worn by lamp room attendants, store room attendants, tool room attendants, crane operators, hammer operators, helpers of all kinds, laborers, machinists, machine hands, oilers, painters, shop hands, sweepers, turntable operators, car cleaners and

Pennsylvania Railroad Uniforms

A—Work Uniform. B—"Womanalls." C—Norfolk Suit.

car repairwomen. The first three of these uniforms, including a hat or cap, will be furnished to employees at half price and renewals at full price.

The uniform for those women employees who regularly have intercourse with the public (C) consists of a dark blue serge Norfolk jacket suit with regulation shirt waist, dark blue silk tie and dark blue straw sailor hat. This is to be worn by Bureau of Information attendants, matrons, elevator operators, gatewomen, baggage room attendants, messengers, Pullman space distributors, ticket sellers and ushers. The Norfolk suit will be supplied to employees at a discount of 15 per cent. The first hat will be furnished free and the first five shirt waists will be furnished at half price. Renewals of hats and shirt waists will be at full price.

For summer use, messengers and ushers will be given their choice between the dark blue one-piece dress or the serge Norfolk suit. In order to have uniformity, however, throughout a division or department, or at division headquarters, this choice will have to be determined by the majority of employees of such division or department.

Mechanical Stoking of Locomotives an Economy*

Factors Determining Necessity of Applying Stokers; Operating Results Secured by Stoker Firing

By W. S. Bartholomew
President, Locomotive Stoker Company

THE FIRING OF MODERN LOCOMOTIVES by mechanical means could properly be separated into four distinct subjects: First, the stokers themselves; second, the locomotives to which they are applied; third, the particular reasons which lead up to any given application, and fourth, the results which were achieved by such application. I assume that you are familiar with all of the stokers which are now being applied to locomotives and shall begin with the second subject.

All locomotives do not require stokers. Locomotives that can be hand-fired to maximum capacity through sustained periods do not require stokers. Locomotives which are of such size as to come within the specifications of those which are regularly being equipped with stokers, but which are not operated beyond the limits of hand-firing, do not need stokers. These statements must lead to the conclusion that only locomotives which are of such size as to bring them regularly beyond the limits of hand-firing, or locomotives of smaller size but which are regularly operated beyond the limits of hand-firing, require stokers. This must mean that we do not need stokers to do a hand-firing job and that the stoker job cannot be done by hand. This means also that stoker-firing and hand-firing are not directly comparable. Up to the present time, no locomotives have been equipped with stokers which do not need them.

Locomotives Which Require Stokers

These statements must bring up immediately the question as to whether such a definite line can be drawn between locomotives which do not need stokers and those to which they could be applied to advantage. To show you that a definite line can be drawn as to locomotives which can be hand-fired through sustained periods and those which cannot, my own convictions are that no locomotive really requires a stoker that does not weigh approximately 200,000-lb. on drivers, have a calculated tractive power of 50,000-lb or over, a grate area of 60 sq. ft. or over, and a coal consumption through sustained periods of 4,000 lbs. or more per hour.

The commercial application of Mechanical Stokers to locomotives really began in 1910. One of the first important stoker applications was made to five very large locomotives which were designed and built originally to be equipped with stokers. This is especially significant in that, in the main practically all stoker applications have been made to date to locomotives without requiring any general modification in the conventional locomotive design. This application was made on a Chicago, Burlington & Quincy M-2 Santa Fe type locomotive which included in its original specifications such details of design as would permit the application of the Barnum under-feed stoker.

The particular point of interest about this locomotive is that in designing such a locomotive it was realized that to put it in service with a tractive effort of about 72,500 lb., a weight on drivers of over 300,000 lb., and with a grate area of 88 sq. ft. would call for a coal consumption beyond the possibilities of hand-firing.

Five of these locomotives were built in the year 1911 and equipped with stokers, which later proved inadequate in capacity for the requirements and were removed, and the locomotives were put in service in such districts as would permit them to be hand-fired. It was found, however, that they could be hand-fired only by reducing the grate area about 25 per cent by blocking off with fire-brick. These circumstances plainly indicate that on such a locomotive a differential is immediately established between hand-firing, and stoker-firing of at least 25 per cent in capacity. A very gratifying development of this particular situation has been that other stokers were later applied to these locomotives with such success that 60 more have been purchased.

The decision reached by the Burlington as to necessity for a stoker on a Santa Fe type locomotive of this size has practically set the pattern for all such locomotives of this type built. During the past five years over 95 per cent of all Santa Fe type locomotives built for coal-burning service have been equipped with mechanical stokers.

Stokers Increase Capacity of Locomotives

Another very early important stoker installation beginning in 1912 was made by the Norfolk & Western on a large number of Mallet locomotives. This installation probably represents the most marked increase in revenue tons per train that has been accomplished by any stoker installation made so far. To make a concrete illustration the tonnage rating for the 12-wheel locomotives in service on the Norfolk & Western between Portsmouth, Ohio, and Columbus, which were standard for that division before the advent of the Mallet locomotives was 3,000 tons per train for one Class M-2 12-wheel locomotive, or 6,000 tons for a double-header, whereas when the Mallets were tried out and rated on that division it was found that one of these locomotives could haul 6,000 tons between those two points in practically the same time that one of the smaller locomotives could haul 3,000 tons or two of them could haul 6,000 tons.

It was also discovered that the coal consumption of one of the Mallets was approximately one and one-half times one of the 12-wheelers, which, with twice the tonnage, would make an immediate saving of 25 per cent in coal consumption for any given number of total gross tons per mile.

There is current gossip to the effect that the application of stokers to locomotives means more coal consumption, which, of course, it does from one point of view, as one of the main purposes of the stoker is to make it possible to burn more coal per locomotive mile or per locomotive hour than would be possible by hand-firing. The benefits, however, from such increased coal consumption are such as to make the proposition attractive from every point of view as "movement of tons per day" over any given piece of track is the most important consideration in railroad operation. You only need to refer to the annual reports of the Norfolk and Western for the past five or six years to see what has been accomplished in this direction through the use of larger locomotives equipped with stokers.

The stoker fired H-2 and H-4 Mallet locomotives on the Chesapeake & Ohio have accomplished very similar results in increased tons per train and the use of over 300 such Mallets in freight service is a further tribute to the value of the mechanical stoker in the assistance it renders in putting

*Abstract of a paper presented before the Western Railway Club.

into service such locomotives which regularly are operated with a coal consumption beyond the limits of hand-firing.

It is not a question of the pounds of water evaporated per pound of coal altogether, although these particular locomotives show an evaporation, stoker-fired, that comes well within the limits of anything that is regularly accomplished on smaller hand-fired locomotives which are operated anywhere near maximum capacity.

Early Installation of Stokers

About the time these Mallets were put in service on the Chesapeake and Ohio 50 heavy Mikados with a tractive effort of approximately 60,000 lbs. were purchased and have now been successfully stoker-fired for over six years. There has been established a differential of 25 per cent between hand-fired and stoker-fired tonnage rating on the division where these locomotives are operated. The rating between Russell, Kentucky, and Silver Grove, is 6,000 tons stoker-fired and 4,800 tons hand-fired.

Another very early and important stoker installation was made by the Virginian on somewhat larger Mallet locomotives. These early stoker installations had to do with coal traffic, which, of course, is a low-grade commodity from a freight revenue point of view and the earnings are in more direct relation to the tons per train than is the case with other traffic. The operation of these locomotives in the coal traffic on the Virginian has been so successful that special track, special cars, special coal-handling devices at the docks and still larger locomotives have been built to make it possible to increase the gross tons per train still further.

The specifications for the stokers for the Virginian 2-10-10-2 Mallets called for an ultimate coal-delivering capacity of 15,000 lb. per hour as a possibility, and in actual service it is not unusual to have a coal consumption of five tons every 60 min.

The locomotives referred to thus far have all had a calculated tractive effort of more than 60,000 lb. However, a Baltimore & Ohio Mikado which has a calculated tractive effort of only 54,000 lb. represents the largest installation of mechanical stokers to any one type of locomotives up to the present time. The Baltimore & Ohio has over 400 of one design stoker-fired and this locomotive really established the point where the Railroad Administration began the application of stokers to the standard locomotives.

This locomotive not only represents a very important early stoker application as to number of locomotives equipped, there having been 50 of these locomotives equipped as early as 1911, but it also represents definitely the point at which we believe the application of stokers should begin to both new and old locomotives.

Stokers Prove Advantageous on Small Locomotives

The reason which led the Baltimore & Ohio to apply stokers to such a large number of these locomotives as early as 1911 had largely to do with the fact that the bridges, track, and sidings on the Baltimore & Ohio were such that a locomotive with a heavier axle load than 55,000 lb. could not be operated at many points on the Baltimore & Ohio system. The traffic conditions, however, especially between Cumberland, Md., and Martinsburg, W. Va., which is the throat of the system between the Lines East and Lines West, were such as to require a maximum tonnage movement for long periods of the year to avoid congestion.

At the time the first 50 of these locomotives were put in service on the Cumberland Division 48 maximum tonnage eastbound drag freight trains were operated daily. It will be immediately appreciated that both time and maximum tonnage per train were of immense importance under such stress of traffic conditions. Immediately upon putting into service the stoker-fired Mikados referred to on this division, where a large number of duplicate locomotives were already in operation hand-fired, the operating department began to load down the stoker-fired locomotives with heavier tonnage than the hand-fired until within six months after they were put in operation more than 500 tons per train were regularly added to the stoker-fired locomotives over and above the tonnage given to the same locomotives hand-fired.

The Baltimore & Ohio at this time owned 160 of these locomotives without stokers and 50 stoker-fired. Since then they have purchased over 300 of these locomotives equipped with stokers which are now in daily service over all parts of the system.

To haul the traffic under the conditions just outlined between Cumberland, Maryland, and Martinsburg, W. Va., an average coal consumption per hour of 6,500 lb. was not unusual for the entire running time between division points, which will readily explain why the stokers have been so successful on the Baltimore & Ohio even on this comparatively small power. When the United States Railroad Administration came to place orders for a large number of locomotives, which included over 600 of this particular type and size, they were also equipped with mechanical stokers

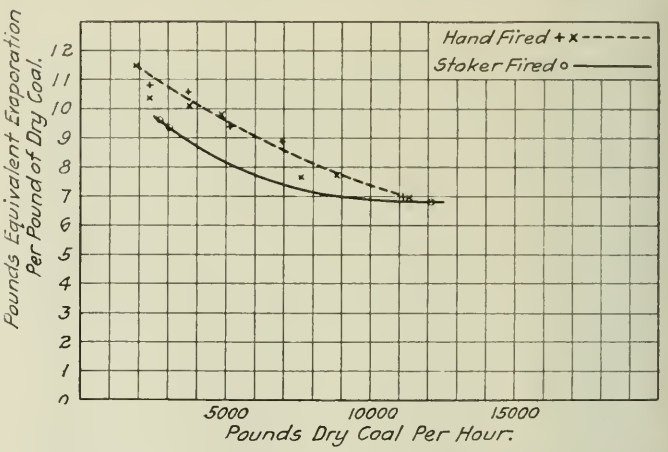

Fig. 1—Comparative Evaporation, Hand and Stoker Firing

which made it possible to use them in such service as I have just described.

The Pennsylvania has a Decapod type locomotive which weighs over 300,000 lb. on drivers; carries 250 lb. steam pressure and has a calculated tractive effort of nearly 90,000 lb. It is of special interest to know that this locomotive was originally designed to be hand-fired and the first one constructed was put in service without a stoker for the reason that it was intended to operate these locomotives only within the limits of coal consumption which could be fired by hand through sustained periods. Over 100 of these locomotives have been built to date and not only the first one which was originally put into service hand-fired, but all of the others have been equipped with mechanical stokers.

Comparative Fuel Economy of Hand and Stoker Firing

The reason which led up to this application was entirely one of capacity rather than what is ordinarily referred to as economy. The first locomotive originally hand-fired was equipped with a mechanical stoker, and extensive comparative tests made to determine the relative economy of stoker-firing and hand-firing. The chart shown in Fig. 1 indicates the result secured, and confirms the statement that a stoker is not needed to do a job which can be done by hand, nor can the stoker job be done by hand-firing.

It will be noted that within the limits of hand-firing, namely, below 5,000 lb. of coal consumption per hour, there was a slight difference in economy shown in favor of hand-firing. It will be further noted, however, that when the rate of fir-

ing in the different tests was increased to where the stoker became a necessity that no difference in economy in favor of hand-firing occurred, and, as a matter of fact, while the hand-firing was of the most expert nature, the capacity was not reached by hand that was easily obtained with the stoker.

A most interesting situation was developed in connection with putting these locomotives into service under actual operating conditions, which was fully to be expected from the re- the hand-fired run was made, the traffic was exceptionally heavy and one manifest and one drag freight train were immediately behind the hand-fired train on the 13-mile grade which would not have been the case had that particular trip been stoker-fired and the 31 min. less time consumed on the hill.

Fuel Economy Sacrificed for Increased Capacity

There has been much discussion in connection with the application of mechanical stokers to locomotives as to the comparative economy between stoker-firing and hand-firing, and I wish to refer again to my earlier statement that stoker- sults shown in this graphic chart. One of these locomotives was put in service with its rated tonnage on a certain division and hand-fired, the coal consumption noted, and other records made of the performance. Very shortly thereafer another test was made with the same locomotive over the same division with similar tonnage, all conditions being duplicated as far as possible except that the locomotive was stoker-fired instead of hand-fired. The coal consumption, the water evaporated and the horse-power hours developed over the division were almost identical in each instance.

The significant fact in connection with the comparative tests, however, is that it required 11 hrs. to develop the necessary horsepower-hours to take the train over the division hand-fired, whereas, practically the same horsepower-hours were developed and the train taken over the division in 7 hrs. when stoker-fired. In other words, taking a maximum hand-firing capacity of approximately 5,000 lb. per hr. as a gage of the limit of hand-firing, this would mean that by firing 8,000 lb. per hr. into the fire-box of the same locomotive with the stoker the same number of horsepower-hours could be developed in 7 hrs. that it took 11 hrs. to do by hand.

From the traffic point of view I believe there would be no argument if there were no other considerations than this marked difference in time saved by developing more horsepower with the stoker on this very large locomotive than was possible to do by hand even with the same measure of economy. One of our engineers estimated the difference in results, however, from another point of view; namely, reducing the tonnage to a point where the train could be handled over the division by hand-firing in seven hours to compare with the heavier train stoker-fired over the same division in seven hours. A very conservative estimate would indicate that on the basis of seven mills per revenue ton income per mile the locomotive would pay for itself in less than 100 trips by being stoker-fired and hauling the heavier tonnage. There has not come to my attention in all of our stoker experience a better example of the real purpose of the stoker than its application to this large lot of locomotives.

Special Service Conditions Make Stokers Necessary

In marked contrast to these large locomotives is a small Consolidation locomotive in service on the El Paso & Southwestern to 21 of which stokers have been applied and which are the smallest locomotives to receive stokers to date so far as I know. They have a tractive effort of but 47,000 lb. The considerations, however, leading up to the stoker application had nothing to do with capacity or economy. The climatic conditions in the desert country during a large part of the year which made it almost impossible to secure firemen to operate such locomotives at all was the main factor so that it was not in any sense inconsistent to apply stokers even to these small locomotives in order to operate them, although I understand the hauling capacity has been actually increased by the stoker application, which it would be very natural to expect under the circumstances.

We come now to a consideration of some of the results which have been achieved by the stoker applications that have been made in different parts of the country and on different locomotives up to this time.

The data shown in Table I. were obtained by the Atchison, Topeka & Santa Fe in tests of a Mikado locomotive having approximately 60,000 lb. tractive effort. This tabulation will serve to bring out some points with regard to coal consumption per hour as related to the hauling capacity of a locomotive of this kind when it is desired to increase the

Table I—Comparative Test Data, Hand and Stoker Firing

Test No.	Tonnage	Cars	Loads	Empties	Running time Hr. Min.	Coal used, lbs.	Evaporation Per lb. coal	1,000-ton miles	Coal per 1,000 T. M.	Coal per hour	Coal per sq. ft. gr. per hour	Average steam pressure	Hand or stoker
7	2,579	65	63	2	6:42	35,000	5.62	281.9	124.2	5,224	78.2	184.3	H

15	2,848	75	73	2	5:38	41,076	4.91	300.1	136.8	7,403	110.8	185.9	S
17	2,896	56	56	0	5:53	43,300	4.73	312.8	138.4	7,360	110.7	185.8	S
19	2,872	71	66	5	6:31	44,890	4.55	310.2	144.7	6,888	103.1	167.5	S
21	2,869	65	65	0	5:28	35,600	4.76	313.6	113.5	6,512	97.7	183.6	S
23	3,059	73	72	1	6:04	37,350	5.03	334.3	111.7	6,156	92.0	179.4	S
25	3,061	65	56	9	6:10	38,250	5.57	334.6	114.3	6,203	92.9	181.2	S
27	2,887	61	57	4	5:27	32,300	5.62	314.6	102.7	5,927	88.7	187.7	S

revenue tons per train. The significant points about this tabulation are that the coal consumption per hour is fairly representative of the difference between the maximum possibilities of hand-firing and the ordinary range of operation when stoker-fired.

It will be noted that the coal consumption per hour on hand-fired run No. 7 was 5,224 lb. per hr. or 78.2 lb. of coal per square foot of grate area per hour. This brought a coal consumption per thousand ton miles of 124.2 lb. and I believe represents maximum hand-firing possibilities. All of the ten other trips shown on this tabulation show a coal consumption of from 6,000 lb. to 7,400 lb. per hour, and taking the high and low coal consumption per thousand ton miles, the average happens to be for the ten trips almost to a fraction the same as the coal consumption per thousand ton miles for the hand-fired trip, the larger percentage of the stoker-fired trips being below the hand-fired trips in coal per one thousand ton miles. A maximum increase of nearly 500 tons per train was secured on some of the stoker-fired trips, and it will also be noted that on no stoker-fired trip was the actual running time as long as on the hand-fired trip.

Speed on Grades Increased by Stokers

At the end of one of the runs I took occasion to go into the train despatcher's office, look over his operating sheet, and make inquiries as to the time required by all of the freight trains westbound on that day to cover a 13-mile and an 8-mile 6/10 per cent grade, which grades are the limiting factor on that particular division. The result of that inquiry is shown in Table II.

Table II—Time on Ruling Grades

Engine No.	Gross tons	13-Mile grade 31.68 feet. Per mile	8-Mile grade 31.68 feet. Per mile
3211	1,800	61 min.	30 min.
3202	2,180	48 min.	27 min.
3207	1,950	63 min.	25 min.
3209	2,900	50½ min.	31 min.
3206	2,120	75 min.	32 min.
3200	1,945	46 min.	31 min.
3121	2,000	58 min.	.....
3192	2,285	82 min.	.....
3193	1,850	54 min.	.....

The 2,900 tons taken up the 13-mile grade in 50½ min. has illustrated better than any description that could otherwise be given the real purpose of the application of a stoker to a locomotive like the Mikado which hauled this train as compared with other similar locomotives hauling from 500 to 1,000 less tons in longer time up the same grade hand-fired. It is true that more coal was consumed in the 50½ min. hauling 2,900 tons in that time up the 13-mile grade than would have been the case if the locomotive had been operated at a less cut-off, less throttle and consequently less speed, but the fact remains that to get maximum tonnage over the

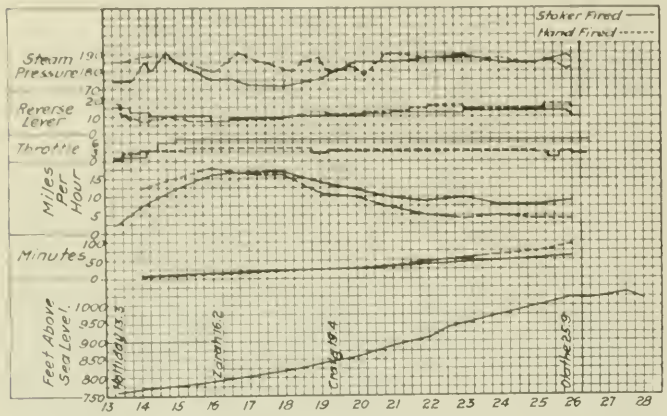

Fig. 2—Hand and Stoker-Fired Tests on 13-Mile Grade

division in the minimum amount of time requires this kind of locomotive performance. In addition to illustrating the main purpose of the stoker it also shows why it is quite often stated that from the point of view of water evaporated per pound of coal the coal consumed per locomotive mile is more when stoker-fired than might be the case when such a locomotive was hand-fired under less strenuous conditions.

In order to get a more direct comparison of the possibility of hand-firing and stoker-firing with the tonnage rating such as shown on the stoker-fired trips of the tabulation, and also

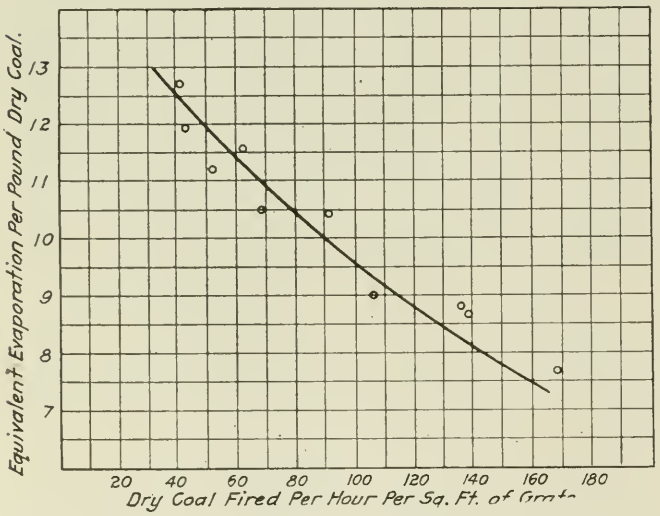

Fig. 3—Effect of Rate of Firing on Equivalent Evaporation

to compare the performance on the 13-mile grade with the 2,900-ton train, a hand-fired trip was made over the division with what might be called stoker tonnage. Fig. 2 is a graphic chart showing the comparative performance between a hand-fired and a stoker-fired trip. It will be noted that the locomotive was worked at a point stoker-fired which was not possible on the hand-fired trip, the result being that 31 min. more time was required to take the train with stoker tonnage up the 13-mile grade with hand-firing than with stoker-firing. I know of no better illustration of the real purpose of the stoker than that shown on this chart.

There are additional points of interest which cannot be plotted by curves namely, that on the particular day on which firing and hand-firing are not directly comparable. The reason for this has really nothing to do with the stokers themselves, but is due to the different points at which the locomotive is worked with hand-firing as compared with stoker-firing.

The diagram shown in Fig. 3 illustrates the rate of evaporation as related to the rate at which dry coal is fired per square foot of grate area per hour. The tests indicated on this diagram were all hand-fired so that this drop in the evaporation rate had nothing whatever to do with hand-firing as com-

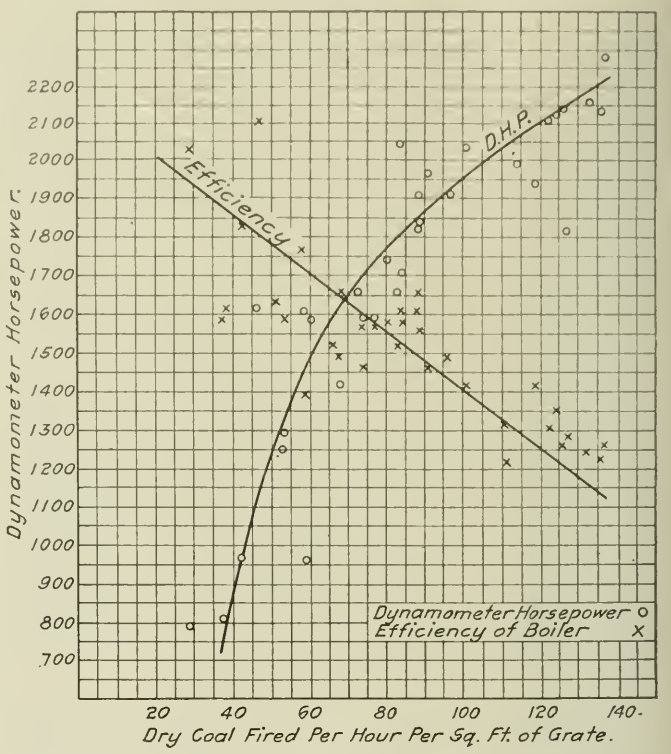

Fig. 4—Boiler Efficiency as Related to Horsepower Chart

pared with stoker-firing, but must be definitely borne in mind as usually being related to the price we must pay when we stoker-fire a locomotive to its maximum capacity; in other words, get a coal consumption rate up to the point shown on some of the tabulations.

The next diagram, Fig. 4, illustrates the point even better. The many tests plotted on this diagram were practically all hand-fired, but no better illustration could be prepared to illustrate the price we must pay for operating the modern locomotive to its maximum capacity.

There are many locomotives being operated at the point where less horsepower output is being secured in order to keep the evaporation of water per pound of coal up to a point shown in the left-hand section of this diagram, but on the other hand there are very many more locomotives being operated under the conditions shown on the right-hand section of this diagram and, of course, from the stoker manufacturers' point of view, this is really where we expect a large locomotive to be operated if equipped with a stoker.

The reason that more locomotives are operated at their highest possible horsepower output, notwithstanding the fact that this brings a decrease in so-called boiler efficiency, is, of course, because a very satisfactory return is secured on the price paid for such operation. This price is represented in

the cost of coal per locomotive mile, and the returns on the investment are represented in the reduced cost of coal per ton mile brought about by the increase in revenue tons per train hauled by the locomotive when operated at its maximum horsepower output. The curves in Fig. 5 illustrate the relation

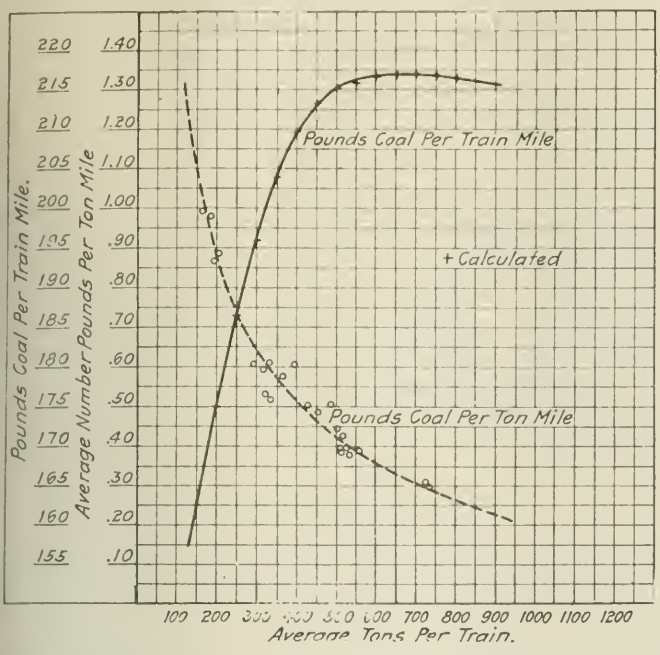

Fig. 5—Relation Between Coal per Train-Mile and Tons per Train

between the increased cost of coal per locomotive mile and the decreased cost of coal per ton in the heavier train so hauled.

This decrease in cost per ton mile is not altogether confined to coal alone as the increased revenue tons per train made possible by the maximum horsepower output of the locomo-

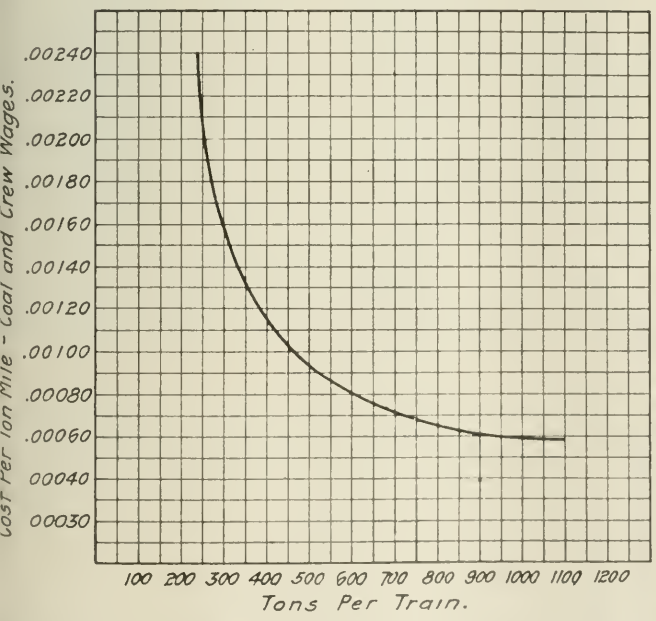

Fig. 6—Cost of Coal and Crew Wages as Related to Tons per Train

ve is directly related to crew wages as well. Fig. 6 illustrates the decrease in the cost per ton mile of both coal and rew wages combined, and further illustrates why it is desirable to operate modern freight locomotives up to their maximum capacity even at an increased cost of coal per locomotive mile.

I have said nothing so far in this paper about the stoker doing the manual work of the fireman or relieving him from the suffering incident to the heat of the fire-box due to opening the fire door when hand-firing, as it has been my endeavor to illustrate the returns which are being secured on the large investment which has been made in mechanical stokers for locomotives during the past six or eight years. It goes without saying, however, that there are many other advantages in the application of stokers to locomotives. One of these is, of course, the relief of the firemen, making the position of locomotive fireman more attractive and, therefore, making it possible not only more readily to secure men for this work, but also to select those men who are particularly qualified later to become locomotive engineers rather than to consider only their physical stamina for the more arduous work of hand-firing.

I have tried to be very frank in my statements and have in no sense endeavored to have you reach a conclusion that it is not necessary to pay a certain price for the use of the stokers on locomotives such as have been equipped with them. On the other hand, it is very plain that whatever the price that it is necessary to pay it brings a most satisfactory return from every point of view. Objections can be raised against the stokers, of course, just as objections can be raised to many of the other modern labor-saving and capacity-increasing devices and features which have been added to locomotives in recent years to enable us to travel the avenues of economy which have brought such large returns in present-day railroad operation. The mark which we are aiming at in the application of mechanical stokers to locomotives is mainly one of capacity; and in the sense that the word economy is ordinarily used, we must conclude that the kind of locomotive capacity which I have pointed out, namely, maximum horsepower output, must take precedence over economy for large modern locomotives.

It is significant that the cost of coal is after all a comparatively small part of the total operating expenses, and as the economies that occur from any increase in revenue tons per train mile have a much larger influence upon the net annual earnings of any given railroad company than does any variation either up or down of the cost of total coal used per annum by that railroad. It follows that what must be accomplished first and above all other things is to increase the revenue tons per train mile.

American Soldier Students at the University of Birmingham, England, Waiting for Their Train

Doings of the United States Railroad Administration

WASHINGTON, D. C.

To satisfy the curiosity of Senator Newberry, who recently had a resolution passed by the Senate calling on the Railroad Administration for complete information regarding the issuance of passes good on all lines under federal control, which the Senator thought also covered free dining car and sleeping car service, Director General Hines has reported to the Senate that all-line railroad passes have been issued by the Railroad Administration to 4,114 persons during the period of federal control, of which 119 have been cancelled in the regular order of business, leaving 3,995 outstanding on July 1, 1919. Also all-line Pullman passes have been issued to 2,418 persons, of which 515 have been cancelled, leaving 1,903 outstanding on July 1. In view of the detailed nature of the information requested, Mr. Hines says the facts cannot be presented immediately but pending a complete report he submitted general facts to the Senate. His letter says:

No passes are issued for free dining-car service.

In issuing passes good on railroads under federal operation and good for sleeping-car and parlor-car accommodations, the Railroad Administration has been guided by the established practices which have been adopted under private control in conformity with the provisions adopted by Congress in the Interstate Commerce Act and in amendments thereto, governing the matter of free passes.

Under private control, it was the general practice for the principal railroad officers to have annual passes on their own railroads and in addition to obtain exchange passes from practically all other railroads in the country, so far as they might be applied for. The result was that each of these general railroad officers had a large number of annual passes covering most of the important mileage in the country. In addition, the chief managing officers very frequently had annual Pullman passes good on all Pullman lines in the United States. The officers who had annual passes for themselves on the railroads generally also had annual railroad and Pullman passes for the dependent members of their families, or could and did obtain trip passes as a matter of course upon request.

The general policy of the Railroad Administration was to take these established practices as its standard and on that basis to give passes good on all lines only on account of representatives of the Central Administration and on account of such railroad officers as had customarily had available to them annual passes good on practically all mileage under federal control.

Annual passes good over all lines have been issued broadly to the following classes of persons:

Officials of the Central Administration which, of course, has jurisdiction over all lines.

The seven regional directors and the principal members of their staffs.

The federal managers of the various railroads and other officials who under private control had at their disposal passes on any line desired, such officers under private control having generally speaking, held exchange passes over practically all railroads in the United States, or over all such railroads as might be included in their request for passes.

The chief executives of the railroad corporations, (including the chief officers of the Association of Railroad Executives and the Secretary of the American Railroad Association), such chief executives having had under private control passes over all railroads, or over such railroads as they might include in the requests therefor.

Dependent members of the families of the foregoing persons.

The chief officers of the American Short Line Association, Western Railroad Association, Railway Accounting Officers' Association, Association of Transportation and Car Accounting Officers, and Association of Western Railroads.

Nearly 98 per cent of the all-line passes issued by the Railroad Administration, are restricted so as not to be good on certain specified limited trains.

Pullman passes, good on all lines, have been issued, broadly, to many member of the same classes mentioned above.

Passenger Traffic in April

The number of passengers carried one mile during the month of April was 3,472,502,638, according to the monthly report of the Operating Statistics Section. This is an increase of 3 per cent as compared with April, 1918. The Ohio-Indiana district and the Southern region show decreases. For the four months ended April 30 the increase in passenger traffic was 5.9 per cent, all regions showing an increase except the Ohio-Indiana district of the Eastern region. The figures follow:

Railroad	Average miles operated	Month of April				Four Months Ended April 30			
		1919	1918	Increase or decrease	Per cent	1919	1918	Increase or decrease	Per cent
Total, New England District	8,116	300,648,425	283,140,522	17,507,903	6.2	1,124,259,418	1,044,850,176	79,409,242	7.6
Total, Central District	22,396	504,917,014	451,520,758	53,396,256	11.8	1,900,954,218	1,695,859,150	205,095,068	12.1
Total, Ohio-Indiana District	6,941	68,996,520	75,993,474	d 6,996,954	d 9.2	271,356,206	275,177,878	d 3,821,672	d 1.4
Total, Eastern Region	37,453	874,561,959	810,654,754	63,907,205	7.9	3,296,569,842	3,015,887,204	280,682,638	9.3

Contracts Executed

The Railroad Administration has executed co-operative short line contracts with the Wabash, Chester & Western and the Willamette Valley & Coast.

Delays Are Dangerous.—More than six months have elapsed since the president passed the railroad question over to Congress for solution. How near is Congress to a solution? Plans for restoring the roads to their owners are so numerous that few persons can remember the salient differences between them. Congress is unlikely to be in a mood to deal with railroad legislation until the peace treaty is disposed of, and autumn may have come before the railroads will be tackled in earnest. The prospect of very high operating expenses seems to have slackened the demand from railroad owners that government operation be terminated immediately. One member of the Interstate Commerce Commission holds that rates should be kept where they are and the railroad deficit loaded onto the federal treasury. If the deficit is to be wiped out, freight rates must go up very soon.—*Springfield Republican.*

Equipment Standardization in Belgium and France

Vast Amount of Equipment Destroyed During War—Changes of Design to Be Made in Replacements

By Robert E. Thayer,
European Editor of the *Railway Age*

PARIS, June 21, 1919.

ON ACCOUNT OF THE GREAT AMOUNT of damage done to the cars and locomotives in the northern part of France and throughout Belgium by the Germans during the war, and also because of the fact that the maintenance of equipment in both of these countries had to be seriously neglected, there is a very large amount of rehabilitation work to be done. Large quantities of new equipment must be built eventually, and vast quantities of equipment must be repaired. The situation thus lends itself admirably to a certain amount of standardization which is being considered in both of these countries.

The work in Belgium has not developed to the extent that it has in France, but the conditions in Belgium are such that until the disposition of the German equipment running on Belgian rails under the terms of the Armistice is known, no definite plans will be formulated. The Belgians, in addition to their varied stock of power, have had to cope with the added inconvenience of some 40 to 45 designs of German locomotives and innumerable designs of German cars. This has accentuated the need of equipment of more unoform design. It is the desire of the State railways there eventually to return the German equipment and receive indemnities with which to buy new equipment. If this is granted—it is doubtful if it will be—some plan of standardization will be formulated as a vast amount of equipment will have to be built to replace the equipment destroyed during the war.

Standardization Plans in France

In France, standardization has been thought of for some time. Last year, M. Claveille, Minister of Public Works and Transports, asked the locomotive builders of France to consider the situation, and seven preliminary designs of locomotives were evolved, but nothing has been done with them. At the present time, however, four of the important French railways, namely, the Paris-Lyons-Mediterranean, the Paris-Orleans, the Midi, and the State railways, have formed a committee for the consideration of standard equipment. Two designs of locomotives are being considered, one of the Pacific type for passenger service, which will have driving wheels of about 78-in. in diameter, and a Mikado locomotive for fast freight and heavy grade passenger service, having driving wheels of about 65-in. in diameter. It is very interesting to note that these locomotives will be of the two cylinder, simple, superheater type. With the improvements in the design of this type of locomotive, it is now generally conceded in France that the economies obtained from the compound locomotives as compared with a good design of two cylinder, simple locomotive using superheated steam, do not warrant the increased first cost, the increase in the cost of maintenance and the added complication of the compound locomotives. Furthermore these standard engines will have a lower factor of adhesion than is customarily used in America. The design will probably not give a factor any higher than 3.5.

The traffic conditions in France are such that a high speed locomotive is needed both in passenger and freight service. The Pacifics will be designed to operate at a speed of about 74 m.p.h. and to work on grades of 0.5 and 0.6 per cent. The Mikado locomotives are to be built for speeds of about 56 m.p.h. and for grades of from one to 1.2 per cent. The axle load of these locomotives will be limited to about 41,000-lb. as that is the limit required by the Minister of Public Works and Transports of France. This limit is set on account of the fact that many of the bridges in France are too weak to carry a higher wheel load, and as a general rule there are two less ties used per rail than in America.

The adoption of these two standard types of locomotives does not mean that other locomotives will not be built. The committee has taken a very sane view of the matter, and is preparing designs to meet conditions common to all of the four roads in question. It is expected that other locomotives will be designed and built by any of the four roads to meet any special conditions they may have. However, as many details as possible will be the same as those used on the standard designs.

There are five standard designs of cars to be built; two types of box cars, with and without screw brakes; two types of coal cars, with and without screw brakes, and flat cars with no screw brakes. The question of power brakes is under consideration. It is the desire of progressive engineers in France to have continuously braked freight trains, but whether this will be permitted with the excessive amount of slack between the cars of the present day French freight train with its present type of coupling, remains to be seen.

Several engineers have expressed a strong desire to use automatic couplers, but with the present screw type of coupler generally used in France, the introduction of the automatic coupler would entail numerous difficulties, and until some design of automatic coupler is made which will readily interchange with the screw type of coupling now used, but little will be done in this respect.

The work on standard passenger cars has not progressed to the same extent as in the freight cars. They will, however, be of all-steel construction. This type of construction is not new to French railways. The Paris-Orleans has built nothing but steel passenger equipment for years, and, in fact, some of our first steel equipment was patterned after the Paris-Orleans designs.

Need of New Equipment in France

The equipment situation in France at the present time is such that they need new locomotives and passenger cars. The locomotive situation was helped out to a certain extent by 2,700 locomotives received from Germany under the terms of the Armistice, and by the U. S. A. Pershing locomotives. There is a need for more locomotives, however, and 1,118 locomotives, which are to be built to existing designs, have been ordered by M. Claveille, Minister of Public Works and Transports, for all French railways. These are supposed to be delivered by the end of 1920, but whether they will or not is a very serious question.

With the German freight cars and the American freight cars, if all of the former are to remain in France, the freight car situation is not bad.

It is interesting to note here that both the orders for locomotives and passenger equipment were placed with French concerns regardless of the fact that better prices and better deliveries could be obtained elsewhere. This has been the policy of the government in practically all of its rehabilitation work and it has been done to give business to the French concerns and employment to French labor.

Railway Developments in Foreign Countries

Swiss Railways Extend Electrification—Railroad Concessions in Mexico to Be Limited in Future

Proposed New Railroad Between Ibague and Ambalema, Colombia

Counsel C. E. Guyant, Barranquilla, reports that the important firm of Pedro A. Lopez & Co., of Bogota, has just signed a contract with the Department of Tolima for the construction of a railroad between Ibague, the capital of the Department, and Ambalema, on the Magdalena River, to connect at its river terminus with the La Dorado Railway and at the other end with the new Girardot-Ibague line, which is a link in the projected Pacific Railway. The importance of the newly contracted line is that it will do away with the necessity for using the upper Magdalena River as a link in the route to Bogota, and will provide an all-rail route from La Dorado (head of navigation on the lower Magdalena) to the capital. It will also give the Department of Tolima direct connection with the main river traffic.

By the terms of the contract (dated May 22, 1919), work must be begun within three months and be completed within four years. Construction materials and rolling stock will most probably be purchased in the United States.

German Destruction of French Locomotive Works

Belgian correspondents call attention, says the Railway Gazette, London, to the damage done by Germans to the famous locomotive works of the Compagnie Fives-Lille. Equipment to the value of $10,000,000 has been removed or destroyed. One item in this list of destroyed apparatus includes 750 electric motors. The Germans employed highly efficient methods of demolition. For example, they introduced the use of massive blocks of iron as battering rams to demolish the machinery that they had not the opportunity to remove. These blocks they swung by chains from overhead travelling carriages, then drove them against the machinery marked for destruction. An alternative method was to hoist the machines themselves as high as possible, then let them crash down on the cement floor. The invaders sometimes coveted the steel construction sheds in which the equipment was housed. Three of these sheds, for instance, were more than 600 ft. long and 120 ft. wide, and yet the wreckers dismembered these sheds, packed them with care, and sent them on their way toward the Rhine. These facts and figures may serve to give some conception of the vast amount of new equipment that will be needed before the factories in the Lille district can be put on a productive basis again.

Government Construction Instead of Concessions in Mexico

Applications filed by American and other foreign investment interests for concessions for the construction of electric and steam railroads and various other kind of industrial enterprises are now pending with the Department of Communications and Public Works of the Mexican government. It is indicated by the attitude of the Carranza administration toward outside capital that these applications may all be rejected. The government has already adopted the policy of not granting any new concessions for the construction of additional lines of steam railroads. It has announced its intention of doing on its own account whatever railroad building may be deemed necessary, adding such lines to the National Railways of Mexico. Recently application was filed with the Department of Communications and Public Works for a concession to construct an electric interurban railway through the oil fields of the Gulf coast region, connecting Tampico and Tuxpam. The proposed line would be about 120 miles long. No action has as yet been taken upon this application. American oil interests are back of the project.

It is announced by the Department of Communications and Public Works of the Mexican government that it has just granted a concession and awarded the contract for the construction of a railroad between Toluca and Zitacuaro, state of Michoacan, about 82 miles. Employment will be given to several hundred native laborers in the building of the road. It will traverse a region that is rich in agricultural resources. At Toluca the line will connect with the National Railways of Mexico.

As a means of affording a transportation outlet for a large tract of virgin timber land and to bring about the agricultural development of the intervening country the Mexican government is constructing a railroad from Saltillo into the mountains, traversing a rich valley region for part of the distance. The new line will be about forty miles long. The timber tract which it will penetrate is owned by E. E. Shaw of the City of Mexico and associates. They plan to build a large lumber mill and to operate the industry on a large scale when the railroad is finished. James F. Martin & Company of Saltillo have the contract from the government to construct the railroad.

The Swiss Railways Extend Electrification

The introduction of electric traction on the lines of the Swiss Federal Railways has, on account of the acute shortage of coal occasioned by the war, received the foremost attention of the authorities and has now emerged as a very practical economic question.

The principal arteries of the Swiss railway system are government owned. The elctrification of thse lines is simplified by the large amount of unused water power which the country possesses. According to an official survey, verified in 1914, including the improvement and water level control of lakes, the water power of Switzerland is capable of producing an energy equal to 2,173,000 h. p. If old plants were replaced by new ones it is even estimated that the total water power could be raised to as much as 8,000,000 h.p. On January 1, 1914, the electric power already in use in Switzerland amounted to 887,000 h.p.

The Swiss Confederation owns some 1800 miles of the entire railway system of the country which covers 3216 miles. Of the 1416 miles owned by private companies 622 miles are already electrical, but only an insignificant percentage of the government railroads is at present operated by electricity.

The first important federal standard-gage road to be chosen for electrification was the Gothard Railway, one of the important international highways. The electrification of the 68-mile section Erstfeld-Bellinzona was approved in 1913 and it is expected that it will be opened this fall. This section, with 28 per cent of its length consisting of tunnels and a grade of 2.5 to 2.7 per cent for 25 miles, was chosen for an experiment because of its enormous traffic with Italy, which caused large consumption of coal with resulting smoke in the tunnels.

The sections Bellinzona-Chiasso and Erstfeld-Lucerne are expected to follow in 1921 and the consulting experts have

found that the big power stations at Amsteg and Ritom, the first yielding 26,000 h.p. and the latter 32,000 h.p., will also suffice for these lines, even if the traffic should increase some 60 or 70 per cent. Another series of plants yielding 70,000 h.p. is planned for eastern and central Switzerland.

The cost of electrification of the Erstfeld-Bellinzona line is estimated at $8,000,000. The cost of electrifying the entire federal railway system is estimated roughly at $200,000,000.

In 1918 the electrification of the following railways using steam traction was decided upon and work on them commenced at once: the sections of the Federal Railroad Sion-Brigue and Berne-Thun; the section Hasle-Langnau of the Emmenthal Railroad and the section Bevers-Filisur of the Rhaetian Railroads.

The Sion-Brigue section which is to be electrified will be a continuation of the electrically operated Simplon tunnel which was opened for traffic in 1906, with its northern exit at Brigue.

The electrified Berne-Thun line, connecting with the electric Berne-Lötschberg-Simplon railway, which latter was inaugurated in 1913, was opened for traffic last May. It now provides excellent and frequent train connections between the Swiss capital, the Bernese Oberland resorts and—in connection with the Lötschberg line—the Valais and Northern Italy.

The new locomotives which are now being used by the Swiss Federal Railroads on the Berne-Thun section, besides those of the Berne-Lötschberg-Simplon line, are each equipped with four single phase-alternate current motors, each of 450 h.p. The electric parts were furnished by Brown-Boveri & Co., Baden, and the mechanical parts by the Swiss Locomotive & Machine Company of Winterthur, Switzerland.

The electrification works on the Bevers-Filisur line were completed by middle of last April and since April 16 steam locomotives have been replaced by electric locomotives, the current being supplied by the power station of Bevers, which furnishes the necessary energy for the Engadine lines which were electrified in 1913.

Exports of Railway Track Material in May

The exports of rails in May, amounting to 76,134 tons of a value of $4,902,970 were considerably greater than those of April but not as large as in February. The exports of railway spikes, amounting to $437,392 and those of frogs, switches, etc., were however, considerably in excess of those of any previous month so far this year. Of the rails, large shipments were made to Japan, France, China, Belgium and British South Africa. Over half the spikes and switches, frogs, etc., were consigned to France.

The figures in detail as compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce are as follows:

Countries	Railway spikes		Rails of steel		Switches, frogs, splice bars, etc.
	Pounds	Dollars	Tons	Dollars	Dollars
Belgium	354,270	16,931	7,932	463,571	24,219

Railroads as a Buying Element

IN SUPPORT OF THE DOCTRINE that "Railway Purchases Measure General Business Prosperity," E. B. Leigh, president of the Chicago Railway Equipment Company, Chicago, has compiled a series of graphic illustrations showing the value represented by the railways of the United States as compared with that of all manufacturing industries generally. The graphics themselves were prepared as a supplement to a recent address by Mr. Leigh on the general subject of railway purchases and business prosperity before the National Industrial Conference Board. However, they are practically complete in themselves and serve to bring into clearer relief the importance of the railways as the largest single buying element in the country.

In the largest circle (Fig. 1), Mr. Leigh compares the

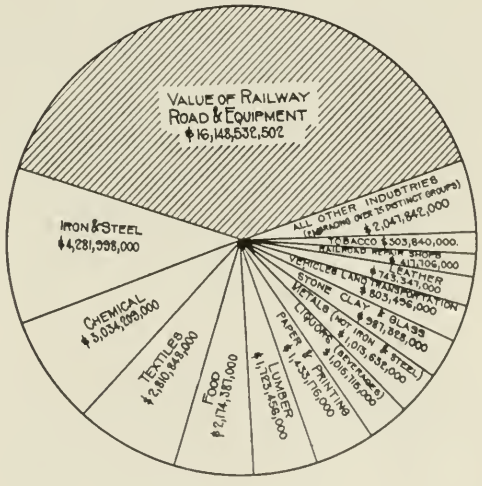

Fig.1

Value of Railway Road and Equipment Compared with Total Invested Capital

value of railway road and equipment, estimated at $16,148,532,502, with the capital of all other manufacturing industries which total approximately $22,790,980,000. The latter division of the circle is in turn subdivided into the 13 leading industries with their respective total capital and the total capital of another division composed of over 75 other industries grouped together.

In Fig. 2 of the accompanying reproduction, the value of railway cars and locomotives, $4,137,318,000, is compared with the total value of the manufacturing machinery,

tools and implements of all other industries, which is $6,091,451,274.

Again in Fig. 3 the value of railway cars and locomotives only, $4,137,318,000, is compared with the total value of all farm machinery, implements and tools, $1,368,224,548. This comparison is perhaps the most striking of the series of graphics prepared by Mr. Leigh in that the shaded area of the circle representing the value of railway cars and locomotives fills practically three-fourths of the total area of the circle.

This graphic method of illustrating the comparative value of railway road and equipment to that of other industries has been further enhanced by the preparation by Mr. Leigh of a series of charts showing similar comparisons by geographical divisions of the United States. These show that in

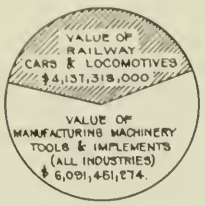

Fig. 2

Fig. 3

Value of Cars and Locomotives Compared with Manufacturing and Farm Machinery

the New England division railway road and equipment, valued at $501,391,191, almost equals the value of manufacturing machinery, tools and implements of all industries, valued at $766,480,256, exclusive of farm implements and machinery, which are valued at $53,648,227. Railway road and equipment in the South Atlantic states is shown to be valued at $1,976,695,855 as compared with manufacturing machinery, tools and implements, valued at $545,733,504 and farm implements and machinery at $107,212,399. In the New England, Middle Atlantic and North Central States the railway road and equipment exceeds in value that of manufacturing machinery, tools and implements by $1,000,000,000, while in all the other states together railway road and equipment exceeds the value of manufacturing machinery, tools and implements by over $10,000,000,000.

The figures for the graphs have all been taken from the United States Census reports of 1912-1914, the latest official compilations which give comparable data.

I. C. C. Serves Tentative Valuations

The Interstate Commerce Commission on July 23 announced its tentative valuation of the property of five small railroads, the Wrightsville & Tennille, the Missouri Southern, the Alabama Central, the Tooele Valley and the St. John & Ophir. Any protests which interested parties desire to make must be filed with the commission within 30 days.

The Wrightsville & Tennille, located in Georgia, owns 120.26 miles of track. Its book investment in road and equipment is stated as $1,039,902, after some adjustment. The original cost, other than land, the report says, cannot be ascertained. The cost of reproduction new and cost of reproduction less depreciation of all common carrier property other than land, owned and used by the carrier, are reported as $1,563,556 and $1,180,617, respectively. The original cost of land is given as $17,999 and its present value as $243,383. The valuation is as of June 30, 1915.

The Missouri Southern owns 70.3 miles of tracks, in Missouri. Its investment in road and equipment as stated in the books is $802,483, but the account is reported to be not reliable. The original cost is not reported. The cost of reproduction new, exclusive of land, is given as $920,912, and less depreciation as $770,945. The cost of lands is given as $24,345 so far as ascertainable, and the present value as $25,168. The report is as of June 30, 1914.

The Alabama Central, with a mileage of 8.79, is given a cost of reproduction new of $85,428 and, less depreciation, of $68,482. The book investment in road and equipment is $96,000. The carrier lands are given a present value of $1,099. The report is as of June 30, 1915.

The Tooele Valley has 7.9 miles, in Utah. Its book investment is given as $346,224. The report finds that this represents the original cost as found on the records. The cost of reproduction new of property wholly owned is given as $255,216, and, less depreciation, as $206,207. The cost of lands owned by the carrier and used solely for common carrier purposes was $5,071. The cost of some additional land is given as $1,000. The present value of land is given as $8,976. The report is as of June 30, 1915.

The St. John & Ophir, with 8.4 miles, in Utah, has a book cost of $139,161. This the report finds to be the original cost to date as nearly as it can be given. The cost of reproduction new is given as $127,414, and less depreciation as $110,103, and the lands are given an original cost of $858 and a present value of $663. The report is as of June 30, 1915.

Some Comments on the Railroad Problem

Strong and Weak Roads—Consolidation, Pooling, Net Earnings and Government Guarantee Undesirable

By Robert S. Lovett
President, Union Pacific System

I

In the discussion of the railroad problem now before Congress, it seems safe to assume that the following propositions are too clear to require or admit of argument:

1. That it is necessary for Congress to enact, at the earliest date practicable, legislation required to develop and continue to provide the railroad facilities which the country must have.

2. That the country has definitely made up its judgment against the ownership and operation of the railroads by the government.

3. That public opinion overwhelmingly favors the continuance, by private ownership, of competition in service and facilities furnished by railroad carriers.

It will be assumed, therefore, that these propositions are established, and they will not be discussed.

The Strong and the Weak Companies

Most of the discussion recently has centered about, and given great prominence to, the supposed difficulty presented by the case of the strong and the weak companies operating railroads in competition.

Now, many of the weak roads are weak because they serve territories which, for various reasons, afford but little traffic—sparsely settled, poor in agricultural or other production, etc.—but which nevertheless are giving the service which the traffic justifies.

I presume no one expects service substantially out of proportion to the traffic.

Some of the weak roads are weak because they are in competitive territory. Their traffic is competitive, and they are not able to get sufficient traffic away from rivals to become prosperous. These roads are not so vital to the community because the competing roads afford the transportation required.

Other roads are weak as a result of mistakes in policy, unsound financing, or bad management; and many because building, in the first instance, never was justified by the traffic obtainable.

All weak roads, however, are put in the same category in the discussion seeking relief for them, regardless of the cause of their condition or the public necessity for more service than they are now performing.

Furthermore, in the discussion little attention has been paid to the fact that the business of the country is not handled by the so-called weak roads. That is generally the reason why they remain weak.

But under the government policy of inflexible or declining transportation rates for a number of years, during which wages and other operating costs have been rising, the strong roads have found difficulty in getting capital to provide the additional main tracks, terminals, equipment and other facilities for handling the growing traffic.

One of the methods suggested for overcoming the difficulty arising from existence of strong and weak roads in competitive territory is by the consolidation of all railroads into a few systems.

The outstanding necessity confronting Congress and the task before it, as I understand, is to enact legislation that will restore the confidence of investors and establish the credit of the carriers, so that the money necessary to provide and keep up the railroad facilities of the country may be obtained.

The advocates of consolidation, however, fail to point out how their plan will accomplish this object.

For example, it is not apparent how the credit of the New York Central, or the Pennsylvania, or the Chicago Northwestern, or the Burlington, or the Union Pacific, or the Atlantic Coast Line would be improved by merging them with their poor and unprofitable neighbors and rivals.

Instead of improving the credit of the weak road the only effect of the project, as it appears to me, would be to impair the credit of the strong road.

The inevitable effect would be to reduce the average of the credit of all the railroads.

Credit of the Strong Roads None Too Good

The credit of the strongest of these roads has not been any too good during the last ten years.

Their credit needs support even more than the weak roads, because they have greater responsibility and greater burdens to bear.

They must provide facilities for the increased traffic they serve, which inevitably goes to them in times of stress.

Such credit as they now have is due to their ability to pay dividends. Falling rates and mounting expenses and the policy of state and national regulations increasingly menaced the stability of dividends, and thus weakened the credit of the strong roads.

* * *

It seems to be assumed that the strong roads have been earning, in excess of what they are legally entitled to earn, an amount sufficient to make up for the inadequate earnings of the weak roads, and that when the properties are consolidated and the earnings of the group thus pooled, the average will provide credit for all.

But this is a fallacy which can be demonstrated at the proper time. In any event, the earnings represent a value which must be paid for by the consolidated corporation when it acquires the properties.

Congress undoubtedly can acquire any or all the railroads of the United States for the government. It may also create corporations with power to acquire them, and consequently it may create several corporations to acquire all the roads in a prescribed territory, or certain specified railroads.

But Congress has no right to compel one corporation to consolidate with another.

It may give one the right to acquire the property of the other by condemnation, but it must pay for it, and (here is the difficulty) pay for it in cash.

Congress has no power to compel the stockholder of the railroads to be absorbed, to accept in exchange the stock of one of the dozen or more companies which are to absorb. When these absorbing companies acquire the railroads assigned to them, they must pay the value in cash to all who demand cash.

Whether this will be few or many, no one knows. It is

certain that many will demand cash; and then it must be provided if the transaction is to be accomplished.

The "underwriting" of a fabulous amount must be provided. Since no one will know in advance how many will demand cash instead of new securities, the underwriting must be for the entire amount.

Will Congress appropriate the billions necessary? Have we bankers enough to provide the money except through a series of years? And what will happen to the financial welfare of the country in the meantime, and what will the money cost?

I may add, though perhaps not relevant to the main point I am discussing, that my judgment is against the consolidation of all the railroads of the country into a few companies, say from ten to thirty, because I believe the companies would be too large and unwieldy for efficient and economical management.

Suggested Consolidations Too Big

I believe that railroad executives generally will agree that railroad systems may be made too big—that there are limits beyond which a railroad system should not, in the interest of economy and efficiency, be extended by consolidation with or acquisition of other lines. I am very confident that this is true.

More important still, consolidation should not be arbitrary. Each should be for a definite purpose and, where the government regulates, for a definite public benefit.

I am entirely in accord with the policy of removing some of the restrictions and permitting consolidations, subject always to approval, after hearing, by the Interstate Commerce Commission.

I believe that the absorption of some of the weak lines by the strong lines, upon fair terms, should be promoted. But competition in service and facilities should not only be preserved, but should be extended, and no consolidation should be permitted which in substantial degree eliminates such competition.

I believe that the existing railroad systems should be taken as a basis, and such consolidation as is desirable should be built up on that basis. This would avoid the insuperable financial difficulty already mentioned, and the disorganization of existing relations, and the disturbance of the billions of securities already outstanding.

The Pooling of Net Earnings

Another and much advertised and discussed method for solving the problem presented by the existence of financially strong and weak lines in the same locality is, in substance, that the Interstate Commerce Commission shall divide the railroads of the country into territorial or traffic groups and take the "Property Investment" account or book value of all the railroads in each group, and establish rates for that group sufficient to yield say six per cent., or some other specified return, on such investment or book value of each group.

Undoubtedly this would result in a much higher yield than the average, for the efficient roads, and much lower than the average for the inefficient, just as has always been the case in the past.

But it is proposed, as a part of this plan, that the most efficient roads shall be limited to the average, and their earnings in excess of the average, shall be set aside for the benefit, in some form, of the unprofitable roads that earn less.

The method of distributing the fund between the different roads varies with the different suggestions, but all contemplate that the law shall limit the earnings of the prosperous roads and increase the earnings of the poor roads.

The advocates of the plan may argue that they do not intend to take any value away from the strong roads except those whose earnings are "excessive," but that the earnings of the weak roads will be provided by increasing rates under an adjustment that will give all the increase to the weak roads.

But many of the roads are already earning in excess of six per cent., the average rate suggested; and obviously the plan proposes to take this excess from the stockholders of the roads earning it for the benefit of the security holders of the weaker roads.

However disguised and in spite of all the refinement of draughtsmanship and legal expression, the substantial object sought is to take, directly or indirectly, from the stockholders of the prosperous roads net earnings of their properties and give the same to the security holders of the weak roads.

Let us consider first who is to suffer and who is to benefit by this arrangement.

The stocks of the prosperous roads—that is, dividend payers—are widely scattered. They afford the only income, and literally the only means of subsistence, of hundreds of thousands of people in this country. They are thus held because they pay dividends.

The poor, who require a return from their savings and who must have some income, cannot and generally do not buy railroad stocks that have not paid dividends.

Who Would Benefit By This Plan

The stocks of the inefficient roads most generally, I believe, are held by small groups, very often by syndicates that accumulated them for speculation, or got them in some reorganization and are holding them with the hope that something will turn up that will let them out without loss, or give them a speculative profit.

Some of the schemes that have been proposed will afford this longed for opportunity to many a weary speculator in inferior railroad securities, but will be very discouraging to the multitude, including a great many women, who have invested their small means in high-class railroad stocks for an income on which to live.

But, I submit that Congress is without power to take the net earnings belonging to the stockholders of one railroad company for the benefit of the security holders of another railroad company.

The Plan Violates the Constitutional Guaranty

The regulation of the business and operations of the carriers and of the rates they shall charge is one thing: the seizure and appropriation of the net revenue of the carrier, realized under rates which the government prescribes, is a very different thing. One is within the power of Congress and the agencies that it creates; the other is the giving of one company's and one stockholder's property to another company and other stockholders against constitutional guaranty and without due process of law.

Those Who Are Most Vitally Concerned

It may seem old fashioned now to plead the Constitution against any action that is convenient and expedient, and especially to invoke it for the protection of property rights.

But I venture to urge its consideration in this behalf, not for the benefit of any rich railroad company, but for the hundreds of thousands of stockholders who look to dividends upon the stock of conservatively managed and prosperous railroads as their only means of support.

And it will not be a sufficient answer to the argument to say that it emanates from one who happens to be connected with a prosperous railroad company.

A Railroad Is Worth What It Will Earn

Now a railroad is worth what it will earn; and the average of its earnings during a series of average years ought

to be a fair guide under the conditions existing at the time.

If this is not taken, then there can be no hard and fast rule, and all the circumstances, some of which were enumerated by the Supreme Court in Smyth v. Ames (169 U. S. 466) must be taken into account.

A hard and fast rule would be convenient, but any that deprives the owner of the value of his property as reflected by its net earnings, is unjust and ought not to be adopted.

But the earnings of the property depend in large measure upon the rates the owner is allowed to charge, and it is suggested that these rates in turn may be fixed by the government; and that is true. Let us apply this to the present situation.

The securities of the good roads were bought and sold at high levels of prices, and the securities of the inferior roads were bought and sold at lower levels; and thus they are held by investors today.

The prices of these securities are the evidence of the popular judgment of the relative value of these railroads, and are the best evidence of such value. These values were based upon the earnings of the railroads under the rates they were allowed by law to charge.

As a matter of common sense, as well as plain justice, what better evidence of the value of these railroads, and of one railroad as compared with another, is possible?

How can the government, consistently with fair dealing, question the value of the railroads as demonstrated through many years by rates established by or under the regulation of its own agencies?

It is upon such considerations as these, and the values established under earnings from rates prescribed or sanctioned by law for years, that rates must be based, and not upon book value, reproduction cost, or any other mere theory. It is the practical situation and existing status that should be dealt with.

Why venture into new fields for rate-making and seek to disturb and unsettle not merely the value of the securities involved, but the business and commerce of the country, which have become adjusted to and in fact made, the present system of rates?

Why not continue the present adjustment of rates, and make such increases as necessary to meet the increased cost of recent years and provide a return on the new capital that has been put into properties in such enormous amounts, and which must be provided for the future, leaving the Interstate Commerce Commission free to reconsider and review rates from time to time, so as to adjust the revenue to the changing expense of operation, the rise and fall of wages and prices, and the expenditure of new capital?

A Guaranty By the Government

Many financiers and railroad men believe that a guaranty of dividends or some definite return on the money invested in railroads is necessary in order to re-establish faith in the railroad securities now constituting such an important part of our financial structure, and induce the investment of the additional capital necessary to provide the railroad facilities which are required.

This leads to the consideration of the question of a guaranty by the government.

Undoubtedly the guaranty by the government of a reasonable return upon the full value of railroad property would be satisfactory to those who consider the problem only from the standpoint of the investor.

But that is impracticable, because it is not believed that the government, as a permanent policy, would guarantee the railroad owners a fair return upon the full value of their property and leave the management in their hands, taking all of the risk and none of the profits: whereas, if the government should take the excess above the guaranty, then it would cease to be a guaranty, and all incentive to competition and economy by the private management would be eliminated. I fancy that the people would prefer to come directly to government ownership, unpopular though it is.

It has been urged, however, that a small return—something less than the full value—should be guaranteed in order to furnish the company financial credit, while still leaving the incentive to competition and economy. I am afraid that plan would not accomplish the object.

The guaranty of a return of two or three or four per cent. upon the value of a railroad might be comforting to the first mortgage bondholders, or the holders of other bonds now outstanding, who would have the first claim upon the fund. But how would it help the corporation to raise more money, which is the object desired?

Of what benefit would a government guaranty of two or three or even four per cent. upon the value of the Pennsylvania, or the New York Central, or the Baltimore & Ohio or the Rock Island Railroad, or most other railroads, be to those companies?

How would it assist them in raising money, since the guaranty would not be sufficient to pay the interest on bonds already outstanding and secured by prior liens?

It would make doubly secure what is already abundantly secured. But it would afford no collateral for new issues nor secure new loans. On the contrary, I believe it would be distinctly detrimental to the company in securing new money, because of the inevitable tendency that such guaranty would have to prompt government officials to interfere and endeavor to shape the policy of the company to extreme conservatism, in order to guard against the possibility of the government being called upon to meet the guaranty.

Moreover, as time passed, the public would be more and more inclined to regard the amount of the guaranty as the measure of the return to which the railroad company was entitled, and in every rate hearing the government guaranty would be dwelt upon by those opposing increases or seeking reductions in rates as the government's judgment of what the company was entitled to earn.

(*To Be Continued.*)

Cummins Bill Delayed

THE HOUSE COMMITTEE is displaying no alacrity to report favorably the Cummins bill, passed by the Senate, to restore the Interstate Commerce Commission's former authority over rate-making during the remaining period of federal control and the arguments made before the committee by Commissioner Clark and Director General Hines made such an impression on the committee that it is reported there is a good chance of its being killed in committee. Hearings on the bill were concluded on June 27 but the committee has not yet reached an agreement on it and its time is now being taken up with the hearings on the general railroad question. Commissioner Clark did not oppose the bill but indicated plainly that the commission was not asking for it and did not believe it necessary. Mr. Hines treated the matter as being of no great importance but declared that it would be wrong policy to divide the responsibility for rates at this time.

Senator Cummins was so anxious to get the bill through that he had it passed without any hearings and so hurriedly that both Mr. Hines and Mr. Clark told the committee it would have to be redrafted to make it mean what it was intended to mean.

The Senate sub-committee appointed to draft a tentative railroad bill has held several sessions giving preliminary consideration to the subject and it is understood that it has now reached the point of beginning to frame a bill along the lines of Senator Cummins' ideas of a guaranty. Some hearings are to be held later.

General News Department

A bill to appropriate $17,000,000 additional for the construction of the government railroad in Alaska has been introduced in the Senate by Senator New.

About half a mile of copper wire, part of a telegraph line of the Western Union Company on the New York Central, in Tonawanda, N. Y., was cut down and carried off by thieves one night last week.

An intoxicated man boarded a locomotive in the Baltimore & Ohio yards at Pittsburgh, Pa., on June 28 and opened the throttle. The engine headed out on one of the lead tracks where it collided with another engine, doing considerable damage. The man was arrested and later sentenced to a term of 90 days in the county work house.

Major Mark S. Watson, who served through the war as assistant chief of the press section of the general staff at American army headquarters in France, has been appointed special assistant on the staff of Thomas De Witt Cuyler, chairman of the Association of Railway Executives. Major Watson has recently been in England making a study of the financial and legislative problems that have grown out of the war control of the English railway lines.

Vacations for railroad clerks have not been entirely cut off. According to general order No. 27, as interpreted several weeks ago, clerks were not allowed the time-honored two weeks' vacation except they were willing to have their pay suspended; but, according to the Nashville Banner, a new interpretation, No. 16, has been made known to clerks in that city and it is to the effect that wherever vacations have been given in former years the prevailing practice will be continued. In most of the large offices clerks receive two weeks off with pay.

Three hundred railroad shopmen, delegates from local unions said to aggregate 28,000 members, held a three-day conference at Atlanta, Ga., last week to formulate plans for asking the Railroad Administration for increases in pay and shorter working hours. The Brotherhood of Railway Clerks on the Southern Railway has laid before the Railroad Administration a proposed new contract, calling for 20 per cent higher wages, a working week of 44 hours, and a provision allowing time and on-half for all overtime beyond ten hours a day. The minimum pay of clerks at present is $87.50 a month.

Representatives of the coal operators, as part of their propaganda to induce the early buying of coal, are already complaining of an impending car shortage and are urging the Railroad Administration to take more active steps to put cars in repair. The directors of the National Coal Association in resolutions recently adopted, declare serious car shortages exist, and that there is an abnormally large number of cars out of service awaiting repairs. George H. Cushing, managing director of the American Wholesale Coal Association, testified at Washington on July 18 before a House committee that there are many idle coal cars in all parts of the country which should be repaired.

The Brotherhood of Locomotive Firemen and Enginemen closed its 36-day triennial convention at Denver, Colo., on July 15. Among the most important resolutions passed were those favoring the municipal market system for reducing the high cost of living, recommending the establishment of a labor party and press in the United States, federal control of the railroads, raising insurance of the order to $4,500, approving standard wages for railroad men employed in France, endorsing the League of Nations, favoring new immigration laws excluding foreigners for a term of years, asking the President to use his influence to release Eugene V. Debs and Thomas J. Mooney, and seeking better working conditions for brotherhood members. Among the men of national prominence who addressed the convention were Director General Walker D. Hines and Governor Henry J. Allen, of Kansas.

On July 21 the City Council of Chicago by a vote of 66 to 2 adopted the enabling ordinance for a new passenger terminal, to be built by the Illinois Central at Chicago. This great project, which is estimated to involve an expenditure on the part of the railroad of over $88,000,000, was described in the *Railway Age* of July 11, page 51. One of the important features of the plan is provision for electrification of the suburban service of the road within seven years, other branches of the service to be transformed to electrical operation in subsequent periods. Following the placing of the mayor's signature on this ordinance it must be submitted to the United States War Department for ratification with respect to lake front developments, which contemplate an outer harbor and an extensive park system.

Air Mail Declared a Success—Rate Reduced

The postmaster general has fixed the rate of postage on mail carried by aeroplanes at two cents an ounce, the regular postage rate for first-class matter, placing the air mail service on the same footing as other means of transportation. He says that the experiments of the past year have demonstrated possibilities beyond expectations. By the use of the Liberty engines now available from the War Department, 10,000 letters a day for San Francisco and other points on the Pacific Coast which fail to connect with the westbound 8:40 p. m. train out of New York are being advanced 24 hours daily to their points of destination. Mail from New York that did not catch the 5:15 p. m. train for the West is now being delivered in Chicago in the afternoon instead of the second morning. Arrangements are being made to place on the New York-Washington route the three fastest aeroplanes in the air mail service, each having a capacity of 18,000 letters and a maximum speed in calm weather of 132 miles an hour.

The following statement says, further: "The great saving of time now effected over the fastest railroad train between New York and Chicago will enable the department to make a saving in car space of more than twice the cost of the operation of an air mail service on that route."

Master Blacksmiths' Convention

The International Railroad Master Blacksmiths' Association has announced the following papers which are to be presented at the convention to be held at the Hotel Sherman, Chicago, August 19-21. Repairs to Locomotive Frames, P. Lavender (N. & W.), chairman; Drop Forging and Its Possibilities, J. D. Boyle (Anderson Drop Forge Company), chairman; Heat Treatment of Iron and Steel, Purposes and Results, Geo. Hutton (N. Y. C.), chairman; Why Railroads Should Adopt Specific Standard Safety Appliances to Comply with U. S. Standards, J. E. Dugan (U. P.), chairman; Making and Repairing Springs, J. W. Russell (Penn.), chairman; Up-to-Date Smith Shop, G. Fraser (A., T. & S. F.), chairman; Scrap Reclaiming by Use of the Oxy-Acetylene and Electric Cutting and Welding Process and Other Methods, Walter Constance (St. L.-S. F.), chairman; the Treatment and Results of Carbon, High Speed and Other Alloy Tool and Tool Steels for Tools, J. H. De Arment (Penn.), chairman; A Modern Hammer and Hydraulic Forge Shop, R. F. Scott (P. & R.), chairman. The officers of the association are: President, W. C. Scofield (I. C.), chairman executive committee, W. J. Mayer (M. C.); first vice-president, J. Carruthers (D. M. & N.); second vice-president, G. P. White (M. K. & T.); secretary, A. L. Woodworth (B. & O.); assistant secretary, C. W. Schafer (C. of Ga.).

Traffic News

A trainload of peanut oil is the latest novelty in the freight ransportation field. It is a shipment which, according to a ress despatch, has started from Seattle, Wash., for Cincinati, Ohio, consigned to the Proctor & Gamble Company, or use in making soap. This oil, 240,000 gallons, came from ie Orient, and is to be followed by further shipments. Shipoads of bean oil and other like commodities are being rought across the Pacific.

The Shipping Brewers' Traffic Committee (Chicago) has sked the Omaha (Neb.) District Freight Traffic Committee or favorable freight rates on non-alcoholic beverages. The rewers say that considerable numbers of their trade are oing to make non-alcoholic beverages, so as to utilize their lants; and their products should make new freight; for the ransportation of these drinks in the past has been largely a ocal proposition. They expect that the quality of their oods, and their advertising, will create a wide demand.

The War Trade Board Section of the Department of State nnounces that export freight may now be consigned "to rder" under special export license R.A.C.-77 and R.A.C.-42. ollectors of customs have been advised that it is no longer ecessary for them to obtain the name of the actual conguee in the country of destination. Exporters desiring to onsign to order shipments which do not fall within the rms of the above mentioned special export licenses may pply to the War Trade Board Section for individual export censes.

The strike of marine firemen and other seamen in New ork harbor continues, with no definite information from ny source as to prospects of settlement. Coastwise freight affic is the main interest affected, but the railroads and the ans-Atlantic steamships suffer because of the congestion the harbor and of the large number of tugs out of service. xport freight is moved only under special permits, as for long time past, and congestion of freight at the railroad rminals is prevented by withholding these permits in all ases where the tying up of vessels makes such action ecessary.

The Board of Railway Commissioners, of Canada, has isued a favorable judgment on the application of the express ompanies of Canada for authority to make considerable inreases in rates for the transportation of merchandise, first nd second classes. Express rates in Western Canada and British Columbia are now considerably higher than in astern Canada; the difference under the new tariff will be uch smaller. Where there is no wagon service at either nd of the route the charge must be 30 cents per 100 lb. less an the ordinary tariff, and where there is wagon service one end of the route but not the other, the difference must 15 cents.

A report on the export freight situation shows that as of ly 9 at North Atlantic ports there were 11,426,714 bushels grain in the elevators. There had been received during e week ended July 9 in the elevators 4,193,350 bushels, nd there had been cleared during same week 3,538,852 ushels, an excess of receipts over deliveries of 654,498 ushels. As to gulf ports, on July 8 there were 4,067,620 ushels of grain in elevators distributed between New Orans and Galveston, the elevators at Port Arthur and Texas ty being empty. On July 9 there were 5,737 carloads of xport food on hand at North Atlantic ports (exclusive of ulk grain) compared with 5,907 carloads on July 2, a decrease of 170 cars.

The threatened heavy loss of live stock brought about by vere drought conditions in Montana, Wyoming and North akota has caused the Railroad Administration to authorize special reduced rates effective immediately, both for the transportation of feed into the affected area, and for the shipment of live stock to other feeding grounds and to market. The rate concessions consist of the application of half the regular charges on shipments of all classes of stock feed into this area and a material reduction in the rates on cattle and sheep moving to outside grazing points and to be returned next spring when grass is again available. It is believed that this plan will result in saving much of the live stock in the area affected and will also permit restocking the ranges next spring.

While the movement of both freight and passenger traffic for the week ended July 14 generally showed some improvement over the week previous, according to a report made to the Director General, there was still a marked falling off in freight business compared with the same period in 1918. Despite the restrictions placed by the Railroad Administration against unnecessary travel due to the movement of returning soldiers from abroad, reports from the Allegheny region show that for the period July 3 to July 6, inclusive, 111,500 passengers were carried between Philadelphia and the seashore resorts, an increase of 112 per cent over the same period last year. While the commercial situation in the Southern region shows an improvement, freight loading for the week of July 14 showed a decrease of 9,171 cars under the corresponding period of 1918. In the Northwestern region the loading of iron ore showed a decrease of 7,000 cars compared with last year. Coal loading, likewise, fell off in this region.

New York Traffic Club

The Traffic Club of New York, 1,200 members, has sent to Congressman Esch, chairman of the House committee on interstate and foreign commerce, a statement of the transportation principles favored by the club. Government ownership is to be declared against the public interest. Remedial legislation is needed at this session of Congress; it should insure early return of railroads to their owners, provide uniform regulation in essentials, insure adequate revenue to provide for the equitable treatment of questions of wages and to attract capital for needed development. Government regulation should be reasonable and should encourage and protect the railroads. Private initiative should be fostered and preserved.

The committee of the club, in its letter, endorses House bill 4378 as regards empowering a governmental agency to require the unified use of transportation facilities, when necessary to cope with a shortage of cars or other emergency, but some of the proposed extensions of governmental authority are not approved; they will not foster private initiative and responsibility. The committee questions the propriety of the grant of unlimited authority to prescribe divisions between carriers; and to require a common carrier to extend its line or lines; the unlimited authority to compel the joint use of freight terminals; the substitution of an indefinite period of time for which the commission may order rates to continue in force in lieu of the period of not exceeding two years which is now provided by the law; and the prohibition against any person holding the position of officer or director of more than one carrier.

The committee believes that carriers should be allowed to agree upon common rates and on the adjustment of train schedules, subject to approval by the commission. The commission should be authorized and required to deal with petitions for correction of inequalities between intrastate and interstate rates. Section 14 should provide for insuring carriers adequate revenue to furnish safe and efficient service and to attract new capital where necessary. Rates in effect when federal control terminates should be continued until thereafter changed by lawful action. Controversies about railroad employees' wages should be taken to a governmental tribunal, upon which the Interstate Commerce Commission should be represented. Application of the long-and-short-haul law should continue to be left in the discretion of the Interstate Commerce Commission.

Equipment and Supplies

Locomotive Deliveries Week Ending July 5

New locomotives were shipped to railroads under federal control during the week ended July 5, as follows:

Works	Road	Number	Type
American	Vgn.	5	USRA Mallet
		5	
Baldwin	U. P.	1	Santa Fe
	B. & O.	4	USRA Pacific
	T. & P.	1	Santa Fe
	P. L. W.	1	Mallet
	Erie	5	USRA Pacific
	C. & O.	1	USRA Mount.
	B. & L. E.	5	USRA Santa Fe
	S. P.	1	Santa Fe
	P. & R.	1	Mallet
		20	
	Total	25	

Locomotive Deliveries, Week Ending July 12

The following new locomotives were shipped to railroads under federal control during the week ended July 12:

Works	Road	Number	Type
American	C. & N. W.	6	USRA 6-w. Sw.
	Virginian	3	USRA Mallet
		9	
Baldwin	A. T. & S. F.	4	Pacific
	A. T. & S. F.	3	Santa Fe
	B. & O.	1	USRA Pac.
	Col. & Sou.	2	USRA Santa Fe
	Erie	1	USRA Pac.
	Ga. R. R.	2	USRA 8-w. Sw.
	N. & W.	1	Mallet
	Penn. Lines	1	Mallet
	Sou. Pac.	1	Santa Fe
		16	
	Total	25	

Freight Cars

The Union Shipbuilding Company, Baltimore, Md., is inquiring for one flat car.

Belasco & Company, New York, is inquiring for 100 to 200 steel dump cars for export to Europe.

The Lehigh Valley Coal Company, Wilkes-Barre, Pa., has ordered 100 mine cars from the American Car & Foundry Co., Chicago.

The Shawmut Mining Company, St. Marys, Pa., has ordered 200 wooden mine cars from the American Car & Foundry Co., Chicago.

The Champion Fibre Company, Canton N. C., has ordered one 50-ton steel hopper car from the American Car & Foundry Co., Chicago.

Miscellaneous

The Canadian National Railways is calling for tenders for 6,500,000 ties, of which 3,525,000 are for use on the Western Lines, 1,400,000 for the Eastern Lines, 1,375,000 for the Central Lines, and 200,000 for the Halifax & South Western (Nova Scotia). These ties are for delivery between October 1, 1919, and October 1, 1920.

Spoil from the Subway.—Over 7,500 pairs of pick-wielding arms deserted America yesterday; each man carried away from $2,500 to $4,000. These arms belong to Italian laborers; and most of this money has been dug out of subways, mines, and railroad rights-of-way. These men sailed on three Italian steamships, and, so far as could be learned, none of them had any intention of returning.—New York *Globe*, July 16.

Supply Trade News

The **Chicago Pneumatic Tool Company**, Chicago, has removed its Minneapolis (Minn.) office from the Metropolitan Bank building to Fifth avenue and Fifth street south.

The **Falls Rivet Company**, Kent, Ohio, has been authorized by the stockholders to draw up plans for the construction of a new building at Kent. It is probable that work on the new structure will not begin before early spring.

The **Chicago Pneumatic Tool Company**, Chicago, announces the appointment of **N. S. Thulin** as special railroad representative on the staff of S. C. Sprague, manager of western railroad sales, with headquarters at the company's office in Chicago.

Kenneth R. Hare has been appointed district manager for the **Transportation Engineering Corporation**, New York, with headquarters at Chicago, in charge of the territory in the middle west, including Chicago, St. Louis and other important railroad centers.

Robert S. Hammond, formerly sales agent of the American Steel Foundries, Chicago, has been appointed Pittsburgh, (Pa.), representative of the **Whiting Foundry Equipment Company**, Harvey, Ill., with office in the Fulton building, succeeding **F. J. Page**.

Samuel F. Joor, who for the past year has been assistant chief engineer of the Semet-Solvay Company, Syracuse, N. Y. and formerly a consulting engineer with offices in Chicago has been appointed sales engineer for the **American Steam Conveyor Corporation**, Chicago.

J. J. Brown, vice-president and general manager of the **Wheeler Condenser & Engineering Company**, Carteret, N. J., has been elected president, succeeding **Charles W. Wheeler**, who died recently. **H. S. Brown** of Boston has been elected vice-president. Mr. H. S. Brown has been associated with the Power Specialty Company, New York, for the past 15 years, the greater part of this time as New England manager, and during the war he took an active part in government war work, with headquarters at Washington and Philadelphia. He is also president of the Brown-Ferries Company, Philadelphia.

Pratt & Lambert, Inc., Buffalo, N. Y., announces that its New York office at 185 Madison avenue, will be moved about November 1 to a new site in Long Island City, where a modern warehouse of brick construction, 200 ft. by 100 ft., consisting of two stories and basement, is now being built, not far from the Bridge Plaza, and **Donald L. Clement**, former railway representative, who has recently returned from overseas service, will be assistant resident manager of the New York office. In order to increase the production at the main factory, Buffalo, a four-story brick building 95 ft. by 45 ft., to be devoted to grinding, is to be put in service on October 1. At Bridgeburg, Ont., a four-story brick building, 85 ft. by 45 ft., is being erected in addition to new chimneys, double the size of the old, thinning buildings, filter buildings and other equipment which will triple the manufacturing capacity of the present factory.

Oscar Otto, general superintendent of the South Philadelphia Machine Works of the **Westinghouse Electric & Manufacturing Company**, died on June 30, as a result of injuries received in an automobile accident near Westgrove, Pa. He was born in Manitowoc, Wis., on January 2, 1859, and after finishing his apprenticeship course as a machinist in the Manitowoc shops of the Chicago & North Western, served during several years at various places in Wisconsin. He then entered the service of the Northern Pacific, at Tacoma, Wash., going from there to the Oregon Short Line, at Salt Lake City, Utah. In 1898 he returned to the service

of the Chicago & North Western as superintendent, at the Chicago shops. Prior to accepting a position as general superintendent of the Westinghouse Machine Works, at East Pittsburgh, Pa., in June, 1909, he was connected with the Chicago & North Western as general superintendent of its Chicago shops. When the Westinghouse Company opened its new plant at Essington, Pa., Mr. Otto supervised the installation of the machinery, and later in February, 1918, he was transferred to the new works, where he remained until his death.

Trade Publications

HEATERS AND BURNERS.—The Macleod Company, Cincinnati, Ohio, has issued Buckeye catalogue B, illustrating, listing and describing the weed burners, ground thawers, flare light, sand blast and cement blast gun, heating torches, incinerators, etc., manufactured by that company.

THE CLARK TRUCTRACTOR.—The Clark Tructractor Company, Chicago, has issued a 16-page booklet describing a three-wheeled industrial truck operated by a gasoline engine of the automobile type. Illustrations and explanations are also given of the application of this burden-carrying and tractor truck to various industrial purposes, both interior and exterior. Several photographs show the special mobility of this machine obtained through the use of only three wheels.

REINFORCED CONCRETE PRODUCTS.—The Massey Concrete Products Corporation, Chicago, has issued a general catalog in the form of a prospectus on the concrete pipes, slabs, piles, poles, posts, battery wells, buildings, etc., manufactured by this company. The booklet is well illustrated with photographs, drawings and tables. This general catalog is a forerunner of a series of supplements containing more detailed information about the individual products. The first two of these, on railway culvert pipe and on pipe for highway culverts and sewers, will be ready for distribution in the near future.

Taking the Count

Financial and Construction

Railway Financial News

OAKLAND, ANTIOCH & EASTERN.—The Oakland, Antioch & Eastern, the Oakland & Antioch and the San Ramon Valley are to be sold to a corporation to be formed for the purpose of operating the three lines as one system. Permission for the sale and amalgamation has been granted by the Railroad Commission of California. Stocks and bonds necessary to finance the reorganization are to be issued. Approximately 82 per cent of the security holders of the three roads have approved the plans for this reorganization. The new company is to have an authorized stock issue of $5,500,000, divided into $4,000,000 of common and $1,500,000 of preferred stock. It is also to have an authorized bond issue of $3,000,000. Creditors who have a first and direct lien on the property are to be paid in cash. This indebtedness, according to exhibits filed in the reorganization proceedings, will total $271,354.

Railway Construction

CANADIAN NATIONAL RAILWAYS.—Contracts have recently been let as follows: Grading for one additional main line track between Truro, N. S., and Belmont, about 7.57 miles, to the Bate, McMahon Company, Ltd., Ottawa; grading for one additional main line track between Springhill Junction and Maccan, about 9.13 miles, to A. Wheaton & Dominion Construction Company, Ltd., Halifax; grading for double track at Moncton on about 3.35 miles to A. Wheaton & Dominion Construction Company, Ltd.; grading for double track diversion from mile 108.21 to mile 112.91, between Ste. Rosalie and Charlotte, about 4.7 miles, to Walters, Doheny & Co., Montreal, and for the substructure for the bridge over Tantramar river, mile 85.6, Truro subdivision, consisting of two 250 ft. double track spans.

MORRISTOWN, SNEEDVILLE & KYLE FORD ELECTRIC.—Organized to build an electric line from Kyle Ford, Tenn., west, via Sneedville, to Briar Creek, thence south, via Luther, Treadway and Mooresburg, to Morristown, about 40 miles. There will be nine steel bridges on the line, also 17 trestles with an average length of 300 feet and two sub-stations. The promoters expect to develop a traffic in farm produce, lumber and ore. George L. Berry is president, Pressmens' Home, and J. N. Adams, engineer in chief, Charleston, Tenn.

NORTHERN PACIFIC.—A contract for the construction of a new passenger station at Brainard, Minn., to replace the one destroyed by fire, has been left to McManis & Tarnoski, St. Paul, Minn. The building will be 40 ft. by 162 ft., two stories high and basement, with a 40 ft. by 30 ft. covered platform at each end. It will be of concrete and brick, with Ludowici green tile roof, and tiled floors with oak finish on the first floor and birch and maple on the second floor. The first floor will contain a general waiting room, women's room, smoking room and baggage and express room; the second floor will be occupied by the officers of the Minnesota and International and the local Northern Pacific officers. The total cost, including track changes, will be about $100,000. Work was started the last week in June.

Losses of gasoline during transit, are estimated by one prominent producer and shipper of gasoline to amount to eight per cent., considering only that shipped in tank cars. During 1918, about 3,500,000,000 gallons of gasoline were produced in the United States and much of it was shipped more than once. A loss of one per cent, at 20 cents a gallon, means a loss to the shippers and to the nation of $7,000,000. The railroad loss and damage figures recently published, are large, but the shippers' probable wastage through leakage and evaporation during transit is larger.

Railway Officers

Railroad Administration

Central Administration

H. P. Dougherty has been appointed assistant director of the Division of Labor.

J. W. Clark has been appointed manager of the Fire Loss and Prevention Section, succeeding **Charles N. Rambo.**

R. C. Mitchell, chief special agent of the Missouri Pacific, has been appointed chief of the secret service and police section of the Division of Operation, succeeding **W. J. Flynn,** who has resigned.

Operating

F. R. Bartles, superintendent of the Rocky Mountain division of the Northern Pacific, with headquarters at Missoula, Mont., who was granted leave of absence in September, 1918, to enter military service, has resumed the duties of superintendent; **W. C. Showalter,** division superintendent, with office at Missoula, has been transferred to the Montana division, with headquarters at Livingston, vice **T. F. Lowry,** who has been transferred to the St. Paul division with headquarters at Minneapolis, Minn., and **J. H. Johnson,** acting superintendent of the St. Paul division, with headquarters at Minneapolis, has resumed the duties of assistant to the general superintendent, with office at St. Paul.

David Kirk Orr, whose appointment as superintendent of the Monongahela Railroad, with headquarters at Brownsville, Pa., has already been announced in these columns, was born on November 24, 1865, in Allegheny City, Pa. He was educated in the Allegheny High School, the Western University of Pennsylvania and Geneva College, receiving the degree of A. B. from the latter institution in 1889. He began railway work on June 10, 1889, with the Norfolk & Western as a topographer's assistant, remaining in that position until September, 1890, when he went to the Pittsburgh & Lake Erie as transitman. He later served as assistant engineer on that road. In August, 1903, he went to the Monongahela Railroad as engineer, and subsequently served consecutively as chief engineer, assistant engineer and assistant chief engineer until his recent appointment as superintendent of the same road as above noted.

Lieutenant-Colonel G. E. Votaw has received his discharge from the army and resumed his duties as superintendent of the Portland division on the Spokane, Portland & Seattle with headquarters at Portland, Ore. He entered military service on April 1, 1918, as a captain in the railway transportation corps. On May 5 of the same year he arrived in France where he served as superintendent of the American service on the Paris & Orleans between Saumur and Gievres with headquarters at St. Pierre Des Corps. On Aug.ust 13 of the same year he was transferred to the American terminal at Is-Sur-Tille, serving there as terminal and division superintendent and commanding officer of the 58th regiment, transportation corps, until January 15, 1919. From that date until May 10, he acted in the capacity of general superintendent of the 13th Grand division in the Zone of Advance with headquarters at Commercy. Captain Votaw was commissioned major in the transportation corps on February 15, 1919, and a few months later was promoted to lieutenant-colonel.

Traffic

M. J. Ormond, assistant manager of the lighterage and foreign freight department of the Lehigh Valley, has been appointed foreign freight agent, with headquarters at New York.

Engineering and Rolling Stock

Bernard Blum whose promotion to engineer of maintenance of way of the Northern Pacific lines, east of Paradise, Mont., with headquarters at St. Paul, Minn., was announced in the *Railway Age* of July 11 (page 84), was born at Chicago, on February 12, 1883. He received his education at the Massachusetts Institute of Technology, graduating in 1904. He entered the railway service in 1905 with the Chicago Junction where he remained until March, 1907, at which time he joined the construction department of the Northern Pacific as an assistant engineer in Montana. In December, 1909, he was promoted to assistant division engineer at Livingston, Mont., and in October of the following year he became roadmaster at Duluth, Minn. Later he was promoted to assistant district engineer with headquarters at St. Paul, Minn., which position he held until January 1, 1917, when he was promoted to district engineer, of the lines east of Mandan, N. D., with headquarters at St. Paul, in which capacity he served until his recent promotion to engineer maintenance of way.

B. Blum

Obituary

John W. Evans, superintendent of the St. Lawrence division of the New York Central, with headquarters at Watertown, N. Y., died on July 23, in the city hospital at Watertown, following a stroke of apoplexy. He was born in 1864, at Remsen, N. Y., and in 1884 began railway work with the Utica & Black River, now a part of the New York Central. He later served as despatcher and chief despatcher on the same road until December, 1895, and subsequently served on the Choctaw, Oklahoma & Gulf, and the Atlanta & West Point. In November, 1900, he returned to the New York Central and was appointed train despatcher. He was promoted successively to assistant trainmaster, trainmaster and assistant superintendent; and since April, 1911, had been superintendent.

Kansas and Its Opportunities is the subject of a comprehensive booklet which has been issued by the agricultural section of the United States Railroad Administration. It sets forth in a striking manner the wonderful agricultural opportunities of the Sunflower State. Governor Henry J. Allen, in an indorsement of this publication, tells of the state's leadership in agriculture, her inestimable wealth of underground treasures of coal, salt, lead, zinc, oil and gas, and invites everybody to come and share in the large prosperity that comes through the development of the state's resources. The total area of Kansas amounts to 82,158 square miles, or 52,531,200 acres. Belgium is only one-seventh the size of Kansas, and the states of Pennsylvania and Indiana, or Maine and Ohio united, or all New England, with Delaware and Maryland for company, could find resting room on her ample bosom. Kansas, last autumn, sowed wheat on an area of 11,000,000 acres. Her wheat acreage alone exceeds, by 2,805,280 acres, the entire area of the Kingdom of Holland. Twenty-one specialists of the staff of the Kansas State Agricultural College have written articles for the booklet.

EDITORIAL

Railway Age

Table of Contents will be found on Page 5 of the Advertising Section

It is unnecessary to mention the fact that the present is a time of great changes. The railroads are entering the period of reconstruction and plans for their future needs and development must be made by those upon whom this responsibility falls. In this work roads having automatic signals already installed are in a more favorable position to meet any traffic conditions that may arise than roads not so equipped. Because of this fact proposed budgets for future work should include estimates for signals on such parts of the systems as are congested or where numerous train delays are occurring under other forms of operation. Before deciding to build a second track on stretches of heavy traffic single track lines not operated by automatic block signals it will be well worth while to study the existing conditions to determine whether the relocation of passing sidings, coal and water stations and the installation of automatic signals will not increase the traffic capacity to such an extent that double tracking may be deferred for a number of years or perhaps indefinitely. Too much stress cannot be placed upon the importance of signals as a means of promoting safety to operation; but certainly too little stress has been placed in the past upon their value as means increasing track capacity and promoting economy.

Prepare for Increase in Traffic

The figures showing the exports of railway supplies compiled by the Division of Statistics of the Bureau of Foreign and Domestic Commerce indicate that the hopes of those who are interested in exports of these commodities are beginning to be realized. The exports of locomotives in May valued at $4,040,551, as briefly noted in last week's issue, were nearly double those of April and considerably in excess of any previous month this year. The exports of passenger and freight cars valued at $960,616 and $6,268,078, respectively, were several times in excess of those of previous months. The exports of car wheels and axles valued at $769,733 were less than in April but above those for March. The exports of railroad spikes were considerably in excess of those of any previous months this year while in the case of frogs, switches, etc., the total exports of $1,881,626 were about 75 per cent greater than those of April, the best previous month. Rails exported valued at $4,902,970 were not as great as in February, but they were considerably in excess of the figures for any other month. The figures quoted, to be sure, are to an extent only history. What counts is the business recently placed or in sight; but it is probable that the figures for May will be sustained and possibly exceeded in the following months. Japan has continued her buying of steel for railway purposes. Last week the Equipment and Supplies Column of this paper reported orders for 23 locomotives divided between four countries, Chile, Argentina, the Dutch East Indies and Formosa, in addition to orders for 432 freight cars for Peru, Colombia and Cuba, and what is more important, Rumania has been ready to place an order for locomotives, depending upon financial arrangements, and Poland is seeking to place in this country orders for a considerable quantity of railway supplies, also depending upon financial arrangements. The fact that the orders placed or pending are from widespread markets, and that some of them are of considerable quantity tends to confirm one's opinion that it is justifiable to feel even more optimistic than ever about export trade in railway supplies.

Our Export Trade

The article on concrete roadbed construction which appears on another page of this issue will be found of interest to all railway officers concerned with the present high cost of track maintenance. The report covers a rather comprehensive variety of special track designs which have been subjected to service of greater or less severity over a period of several years in widely separated parts of this country. Most of these designs were undertaken as a result of special conditions not encountered under the ordinary circumstances of railway building. It is a fact, however, that they have been carrying heavy traffic with low maintenance expenditures, although conclusive figures as to the relative cost of the ordinary track construction and any of the special forms described are still to be presented. After a century of railway development most of the tracks the world over now conform to a single standard of construction comprising three primary features, namely, the rails, the wooden cross ties and a flexible support permitting of more or less ready adjustment to compensate for the disturbances of traffic. Imperfect as this construction may be, it is simple of installation, repair and renewal and any device designed to supersede this established construction must show a definite economic advantage. But the track in the form we now understand it is far from perfect and the cost to maintain it when contemplated in terms of the enormous mileage now in use is very large, consequently there is every inducement for the exercise of inventive genius and outlay for experimental construction from which a pronounced improvement may ultimately be evolved.

Improving the Railway Track Structure

In all probability electrification in foreign countries will advance more rapidly in the next few years than it will here in the United States. There is a crying need for coal in a dozen European and South American countries and the price of railroad coal has jumped to figures varying from $20 to $46 a ton. One of the elements in the electrification question is train mile costs and these prices for coal have made consideration of this element necessary. There are no such prices now in the United States but with present day shipping facilities much American coal can be exported to foreign ports. Agents from the United States are now investigating conditions in many foreign ports concerning prices of coal, its market, port facilities for handling it, facilities for shipping coal to inland markets, etc. Furthermore, American producers are sending letters to foreign consumers explaining what they have to offer and requesting that they be favored with a trial order. The following is an extract from one of these letters:

"Gentlemen:—We are owners, miners and shippers of the very best grades of coal mined in the United States of America. Our produc-

Another Reason

tion consists of the famous 'New River,' 'Pocahontas,' 'Tug River Pocahontas,' and the high volatile, low sulphur gas coals known all over the world as the standard grades of quality. In addition to our own guarantee, all shipments pass the United States Government inspection at the loading piers."

In the past the principal reasons demanding the adoption of electric operation in the United States have been terminal and trunk line congestion. It was considered cheaper to electrify than to lay additional tracks and to expand existing terminals. Now another possible reason has appeared on the horizon. No railroad can be electrified over night; and before much progress can be made with foreign electrifications it is possible that the price of coal in the United States will be increased to a point at which consideration of electrification will be more necessary than it is at the present time.

The Transportation Conference Plan

THE PLAN for railroad legislation submitted to Congress by the National Transportation Conference called by the Chamber of Commerce of the United States was outlined in the *Railway Age* for last week (July 25, page 143). This plan is especially interesting and significant because it is the product of careful deliberation and thorough discussions carried on for several weeks by an unofficial body of men which included manufacturers, farmers, bankers, labor leaders, college professors and railway officers. The two outstanding features of the plan illustrate strikingly the way in which are running the minds of most men who have thoroughly informed themselves regarding the railway situation and the problems it presents. These two outstanding features are the proposal for the creation of a National Transportation Board and the scheme suggested for assuring to the railways an average annual return of at least 6 per cent upon a proper valuation.

The feeling long has been growing among students of railroad regulation that the Interstate Commerce Commission has been given too much work and also has been given functions and duties which are inconsistent. The Association of Railway Executives proposed that this condition should be remedied by the creation of a Department of Transportation with a Secretary of Transportation at its head to which should be delegated all the administrative work of regulation. The railway executives have since substituted a proposal that a Transportation Board of three members be created. This board would be an administrative body and would have not only the duty of enforcing regulatory railway laws, but also of keeping constantly informed as to the general transportation situation and adopting or recommending to Congress and the Interstate Commerce Commission action needed to promote in the public interest the improvement and development of the country's transportation system. The Transportation Conference also reached the conclusion that a Transportation Board should be created to which should be delegated the purely administrative functions now performed by the Commission and such additional administrative functions as legislation may provide for.

A very strong argument may be made for the creation of a Transportation Board. In Great Britain before the war the judicial function of regulating rates was performed by the Railway and Canal Commission, while all the administrative part of railway regulation was done by the Board of Trade, a government department which has a cabinet minister at its head. The distinction between administrative and judicial functions is clear. Furthermore, it is very difficult for any man or body to perform them both at the same time and perform them both well. The Interstate Commerce Commission was originally created, as in a sense, an administrative body, but the principal duty it was given was the quasi judicial one of regulating rates. The principal administrative work it has done has been to enforce against the railways regulatory laws, such as those regarding rebating and safety appliances. It has long been pointed out that it is impossible for the Commission to perform such duties as these without tending to acquire a bias against the railroads which would influence it in the performance of its quasi judicial function of regulating rates.

Furthermore, there is one most important administrative function of regulation which neither the Interstate Commerce Commission nor any other governmental officer or body has performed. This is the function of studying the transportation situation and basing on the results of this study measures to promote the prosperity and development of the transportation industry of the country. A Transportation Board should be created not merely to perform the administrative functions now performed by the Commission, but above all to work for the improvement of our transportation situation in the same way that the Department of Agriculture works to promote agriculture, the Department of Commerce to further the interests of commerce and the Department of Labor to improve the condition of labor.

In one very important respect the functions of the Transportation Board, as proposed by the Transportation Conference, would differ from them as proposed by the Association of Railway Executives. The Association of Railway Executives would have the Transportation Board certify to the Interstate Commerce Commission on behalf of the public the amount of revenues which, in the public interest, the railways of each territory should be allowed to earn from year to year, and would have the Commission required to so fix the rates as to provide these revenues unless good cause were shown for not doing so. While the Association of Railway

The feeling long has been growing among students of railmust be made sufficient to enable the railways adequately to develop their facilities, it is opposed to legislation which would require that the railways must be allowed to earn a minimum average of 6 per cent or any other specified average. The Transportation Conference, on the other hand, advocates a plan which, in effect, would require the Interstate Commerce Commission to so fix the rates of the railways in each large territorial group as to enable the railways of that group to earn a minimum average of 6 per cent per annum upon the fair value of their properties. Any excess over 6 per cent earned by an individual road would be placed by that road in a special contingent fund of its own until its contingent fund became equal to 6 per cent of its valuation. After that one-third of its excess over 6 per cent would be paid into its own contingent fund and two-thirds in a general railroad contingent fund. These contingent funds would be drawn upon by the railways in lean years to make up for deficiencies in their earnings.

Both of these plans are, in effect, declarations that those who have drawn them up fear that if the country returns to a system of regulation under which the Interstate Commerce Commission would have the same discretion in regulating rates it had in the past the Commission will not let the roads earn adequate returns. Unfortunately, this apprehension is well founded. It is supported both by the record made by the Commission in the years from 1906 to 1917 and by recent utterances of members of the Commission. Even Commissioner Clark, who has long been recognized as one of the ablest, sanest and fairest men on the Commission, indicated by his testimony before the House Committee on Interstate Commerce last week that he believed any harm that had been done to the credit of the railroads under the old system of regulation was due not to the Interstate Commerce Commission but occurred because "railroad executives and financial interests kept on saying in season and out of season since 1910 that they had no credit." There is no ground for hope that the Interstate Commerce Commission with its present

personnel, if given practically unlimited discretion, as is proposed in the Esch-Pomerene bill, to determine what the railroads should be allowed to earn, would in the exercise of that discretion let them earn enough to enable the roads to prosper and adequately develop their facilities. This is the universal opinion among railway financiers and railway officers, and it is justified. This being the situation, if the railways are to be returned to private operation it is imperative that the determination of the amount which they are to be allowed to earn shall not be left entirely in the hands of the Interstate Commerce Commission. The Association of Railway Executives has proposed one plan for dealing with the situation and the National Transportation Conference another. The adoption of either proposal would result in an improvement in our system of regulation.

Labor and Efficiency of Production

One of the most interesting and significant resolutions adopted by the American Federation of Labor at its recent annual meeting at Atlantic City relates to the importance of scientific research as a means of promoting the economic welfare of labor. It is a recognition by organized labor of the fact that increased efficiency of production is essential to the improvement of the condition of labor itself which ought not to be allowed to pass without notice being taken of it and its true significance being emphasized.

The resolution sets forth that "Scientific research and the technical application of the results of research from a fundamental basis upon which the development of our industries—manufacturing, agriculture, mining, and others—must rest." It adds that "The increased productivity of industry resulting from scientific research is a most potent factor in the ever increasing struggle of the workers to raise their standards of living; and the importance of this factor must steadily increase, since there is a limit beyond which the average standard of living of the whole population cannot progress by the usual methods of readjustment, which limit can only be raised by research and the utilization of the results of research in industry." Therefore, the American Federation of Labor resolved "That a broad program of scientific and technical research is of major importance to the national welfare and should be fostered in every way by the federal government, and that the activities of the government itself in such research work should be adequately and generously supported in order that the work may be greatly strengthened and extended."

The broadening vision regarding the fundamental economics of industry which this resolution indicates that organized labor is getting doubtless is due largely to developments of recent years. Heretofore, organized labor has acted mainly, and indeed almost entirely, upon the assumption that all that has been needed to enable labor to better its condition has been to increase its money wages and secure reductions in the hours a day, and improvements in the conditions under which it has worked. Never did labor obtain such large increases in its money wages and such large concessions of other kinds as within the last four years. But every advance in its money wages has been preceded by, or has resulted in, an increase in prices and in the cost of living. The increase in the cost of living has largely, and in many cases wholly, offset the advances in money wages. Therefore, with money wages much higher than they ever were before, many working men find themselves unable to rent any better homes, to buy any more or better food, to buy any more or better clothes, or to provide any more comforts and luxuries for themselves and their families than they were able to before. "The usual methods of readjustment" referred to in the resolution quoted doubtless are these methods which have resulted in advances in wages and then advances in prices to offset the increased cost of production due to the advances in wages, and then in advances in wages to offset the increase in the cost of living, and so on ad infinitum.

The *real* wages of labor consist not of the money it is paid, but of the homes the workers are able to provide, and the food and clothing, the comforts and luxuries they are able to buy with the money that they are paid. Experience is teaching the workers that it does not benefit them to get the amount that they are paid increased if at the same time prices generally are also correspondingly increased, and in consequence they are rendered unable to buy any more with their money than they were able to buy before. It is bringing home to them the lesson, as this resolution shows, that the only way in which *real,* as distinguished from *money,* wages can be increased, is by increasing the efficiency of production. Organized labor has proceeded upon the assumption that a very large part of what is produced is taken and consumed by the capitalists, and that if it could get a big part of what goes to the capitalists its condition would be sufficiently improved. But much the larger part of all that is produced goes to labor already and only a comparatively small part to capital; and so, even if labor should get a much larger part, or even all, of the present total product of industry, the increase in the real wages of the average worker would be very small.

The only way permanently and substantially to increase the *real* wages of labor is to increase the total amount of useful things produced. The only way in which this can be done, especially if increased production is to go hand in hand with reductions in the hours of work of labor, is by increasing the efficiency of production. One of the most important means of increasing the productivity of industry is the one to which the American Federation of Labor refers in this resolution, namely, "Scientific research and the technical application of the results of research." Scientific research and the technical application of the results of research have been the means which have created all the labor-saving machinery in the world, from the spinning jenny to the Mallet locomotive.

While, however, organized labor is right in urging government support of scientific and technical research, it would be a great mistake to rely too much upon government activities for their promotion. All of the great developments along these lines in the past have been the result of the exercise of the inventive genius of private individuals, and of the practical application of their inventions in industry by private capital. Therefore, labor, for its own welfare, should oppose any measures, governmental or otherwise, which would restrict the exercise of private initiative and enterprise.

There is another very important point connected with this matter which labor should not overlook. The most improved machinery and methods which scientific research and inventive genius can devise and capital can provide would be valueless if intelligent workers were not available to use them, or if the workers available should refuse to make good use of them. On the other hand, the more intelligence and energy labor exerts in the use of the methods and machinery developed by scientific research and inventive genius and applied practically to the purposes of industry by business men, the more efficient industry will be and the larger will be the product of industrial operations in proportion to the number of persons employed in industry and to the total population. The larger the product of industry is, in proportion to the number of persons employed, the lower, on any given scale of money wages, will be the cost of production; and the lower the cost of production, the lower

will be the prices which the workers will have to pay for the things produced and the more of them they will be able to buy with any given amount of money wages. In other words, efficiency of production is dependent, not only upon scientific research, but also upon capable management and efficient labor; and greater efficiency in production is the only thing which will ever make it possible to have high money wages and low prices at the same time. If the total production of the industries of the United States should be doubled today without any change in money wages, it would almost immediately become possible for labor, with its present money wages, to buy twice as much of the things it wants—in other words, to provide itself with twice as many comforts and luxuries—as it can now.

While, therefore, organized labor is advocating scientific research as a means of increasing production and thereby improving the condition of labor, it should also be doing all it can to encourage greater efficiency in industrial management and greater efficiency in the work done by labor itself. The result would be an increase in the total amount of things produced; and labor, organized as it is, can rely upon itself to get as large a part of the increased amount of things produced as it is able to get of the smaller amount of things produced now. Unfortunately, organized labor has been very slow to recognize the fact that no substantial and permanent improvement can be made in the condition of labor under the present or any other industrial system except by increasing the efficiency of production, and that increased efficiency in production is largely dependent upon the intelligence and energy of the work done by labor itself. When labor recognizes these facts and acts accordingly increases in the cost of living will cease to follow every advance in wages; and they never will until then under any industrial system.

Improving the Conditions of Track Circuit Operation

PERHAPS NO SINGLE INVENTION in connection with block signals has done more to promote safety and facilitate the movement of traffic in the railway transportation field than the track circuit for the control of automatic block signals, crossing bells and other railway signal appliances. This invention, simple in itself, was first designed 47 years ago by William Robinson of Brooklyn, N. Y. Since that time a great deal has been done to develop apparatus for track circuit use and to further improve the methods of application; yet there seems to be a feeling among some signalmen that the use of the track circuit has not yet reached the point where it can be considered as absolutely reliable and as great an ecoonomic success as it is possible to make it. Some of the conditions which affect the operation of the track circuit are the bonding; the track insulation; the treatment of ties; the ballast; the drainage; the clearance between the rails and the ballast, and foreign current. If any one or more of these does not follow the best practice in providing proper conditions for track circuit operation there is a chance of a failure which may result in at least a portion of the signal system functioning improperly and may even cause delays to traffic or possibly trouble of a most serious nature. An efficient working system of signals is certainly desirable. It is therefore important to have the parts that enter into it operate under conditions that are the most favorable to successful service.

Track circuits form a part of such a system and apparently they require the greatest amount of attention. They therefore need the care of experienced men to keep them in working order. Yet a greater number of inexperienced men are employed in the maintenance of the various parts of the railroad that affect track circuit operation than any other part of the signal system. For instance, section laborers who know little regarding the operation of track and signal circuits are employed to look after the insulated rail joints, insulated switches, ballast, drainage and sometimes bonding, all of which, as pointed out before, influence the operation of the track circuit. It is a significant fact that the track standards on many roads now require not less than one inch clearance between the base of the rail and the ballast, such a clearance being also exceedingly desirable for the proper working of a track circuit. Yet in many cases, it is a difficult matter to get the track forces to maintain their own standards, which would ultimately mean a better working track circuit. Dirty track and ballast have been the cause of many track circuit failures, as, for example, around coal chutes. Wet track naturally creates another very bad track circuit condition, and where it is possible to get drainage for track circuits that otherwise would be wet it is important to do so. The installation of insulated joints is another feature which requires special care, for if they are not properly installed conditions may develop which may result in foreign current or other trouble of no less serious a nature.

It is impossible to get the best results from track circuits unless all the conditions under which they are operated are kept good; and to keep all the conditions good requires the co-operation of all departments concerned with the operation and maintenance of signaling apparatus and tracks.

Should Engineers Be Paid Overtime?

THE TECHNICAL MEN employed by the engineering and maintenance of way departments were for some reason overlooked in the drafting of the supplements to Wage Order No. 27. While nearly all other classes of employees were identified specifically in these supplemental orders, the engineers were not mentioned. Some railroads have corrected this omission by the promulgation of special wage advances for the technical men in their employ. Others have made broad interpretations of certain clauses in the supplements so as to include the engineers in their provisions. As a result there has been no uniformity of action and on some roads engineers with years of experience and responsibility have found themselves in the new and somewhat humiliating position of receiving extra pay for overtime while suffering deductions for lost time. However, this question is one of deeper significance than the mere personal feelings of the men involved and, like the broad question of adequate compensation, should be accorded thorough study.

The question of overtime may be approached from three different angles: (1) justice to the men, (2) its effect on their work, i. e., the psychology of the problem, (3) the practicability of determining the extra compensation on an hourly overtime basis. Another factor not to be overlooked concerns the precedents already established by the Board of Wages and Working Conditions for other classes of men.

The simplest case is that of the draftsman, computor, engineer, accountant or other offce man employed each day at a fixed office with definite hours of service. There would seem to be little question as to the justice of the payment of overtime or the allowance of equivalent time off for any work required of these men outside of the regular office hours. Men so employed are expected to produce results from hour to hour and should be rewarded if additional work is required of them. The same holds true of the field engineer engaged on some massive project requiring his presence at a fixed point. Regular hours of work may readily be instituted for these men although the diversified character of the em-

ployment, the time lost in walking about, the delays incident o working operations, storms, etc., tend to disrupt the daily chedule and it is admitted that the case is not as clear as vith the office man. Nevertheless, the same logic applies n both cases.

Turning now to the man who must put in considerable ime on trains or in waiting for trains, we find that he is sually paid on a monthly basis with the tacit understanding hat the company may have his services for 24 hours each lay, although allowing him a certain amount of time for neals and rest. In most cases, this does not involve as much ardship as may be supposed. The "maintenance" survey arty may be away from Monday morning until Saturday vening with most of the nights spent on trains, yet the time ctually occupied in effective work may not average over six ours daily. To the young, unmarried man this system may nvolve no particular inconvenience. He usually manages to ave as good a time as he would at headquarters and, what nterests him still more, his expenses are being paid while he s away. With the married man the case is different, for he as more inducement to be at home, and he feels it a hardship o be away for a whole week at a time, or what is really arder, to get in each night at 9 or 10 o'clock and leave at an arly hour in the morning.

There is some precedent for paying overtime to engineer arties for time elapsed in traveling, in the rulings on car epairers, pump repairmen, etc. On the other hand, there is distinct parallel between the engineer employed in field ervice on a railroad and the local traveling salesman, especially in the case of the "engineer in charge." By this is neant any man who is master of his own and his assistants' me in the execution of certain assigned work away from eadquarters. He is held responsible for the amount of work e completes, but may arrange his time largely as he pleases. t may, therefore, be argued that inasmuch as the salesman paid for results rather than time employed, the engineer ho is also held responsible for results should be paid on the me basis.

This raises the question of the moral influence of overtime ayment on the man who is responsible for his own working ours. At present no factor, with the possible exception of ne expense account, enters into the arrangement of his hedules for the most expeditious completion of his work. nder the overtime system, it is suggested that he would rofit by staying out on the line until the last train, or by so rranging his time as to be away from headquarters as much s possible. This inference at best seems rather farfetched the case of a man with any degree of responsibility, certainly with the man who has a home. The question of the racticability of applying the overtime system is also important, not only from the standpoint of the clerical labor nvolved, but of the moral influence arising from the fact nat in a large majority of cases each man would be required o make out his own time with small possibility of any accurate check by a disinterested party.

To summarize, it would seem to be to the best interest of ne man who is master of his own time or that of others and ho is held responsible for results that he should receive a alary sufficient for him not to expect overtime compensation. n the other hand, a man in the office or field not away om home who is required *by others* to spend more than the gular stated hours at his employment should receive additional pay for the extra hours worked as his salary is based n his routine employment. In the case of a man traveling n an expense account, it would not seem desirable to pay an ourly overtime. If justice demands that recognition should e given unusually severe conditions of employment, it ould be preferable to do this by proper adjustment of the onthly salary.

Attempting to Discredit Railway Officers

In a recent issue of this paper was published a sample of the Plumb plan propaganda which is being distributed in the interest of the scheme to have the government buy the railroads for the benefit of their employees. We have since come into possession of another type of the propaganda being conducted by some of the railroad labor leaders which, while ostensibly directed at the present form of government control, seems to be intended to discredit railroad officers generally.

Charges that the railroads under federal control are "eating up their earnings" by carrying on the payrolls large numbers of officers "who perform no service whatever" are made by W. G. Lee, president of the Brotherhood of Railroad Trainmen, in a letter to Senator Atlee Pomerene, of Ohio, some portions of which have appeared in Ohio newspapers. Mr. Lee attempts to transfer from the employees' payroll to that of the officers the onus of responsibility for the large deficits being incurred, and says he is in receipt of information "indicating that from 30 to 60 per cent more operating officers are carried on the payrolls today than under private control." He encloses some "reliable information" regarding the officers on the Chicago Great Western as an example, as an aid to the Senator in determining why a deficit "of about $275,000,000" is shown for the first five months of this year. Mr. Lee's information will not be especially convincing to those who have examined the statement compiled by the Railroad Administration and published in the *Railway Age* of April 25, comparing the payroll for January, 1919, with that for December, 1917, which shows an increase in the number of officers from 18,588 to 19,325, or less than 4 per cent, with an increase in compensation for the month from $4,892,945 to $5,497,718, or about 12 per cent, whereas the total number of employees, including officers, had increased from 1,703,748 to 1,848,774, or 8.5 per cent, while the total compensation increased from $153,039,988 to $230,800,589, or 50 per cent. The number of general officers had decreased from 7,451 to 6,851 and the number of division officers had increased from 11,136 to 12,474, and while the increase in the officers' payroll was at the rate of $7,248,000 a year (on the rough basis of multiplying the figures by 12) the total payroll increase was at the rate of $932,000,000 a year.

Mr. Lee, however, is "not surprised that some of the roads failed to earn their guaranteed returns" if the same method was used on other roads as was used on the Chicago Great Western, on which he says many positions were created that were never heard of before on this property. To prove it he lists a federal manager, two assistants, a general superintendent of transportation, a "protector of property," and a "conservor of fuel," and adds that under private control the general manager and his chief clerk "performed all the duties that the above officials are ordinarily supposed to perform."

The Pocket List of Railroad Officials does not list one of the assistant federal managers nor the "protector of property." It does name a supervisor of fuel. But the Pocket List for the last quarter of 1917 lists a president, an assistant to the president, a vice-president and two assistants, a general manager, and an inspector of transportation who were performing the duties now handled by the first four of the six men mentioned by Mr. Lee, although, of course, some of them had other duties. After President Felton went to Washington as director general of military railways, W. L. Park was given leave of absence from the Illinois Central

and appointed first vice-president of the Chicago Great Western. The traffic vice-president and two assistants who were in the 1917 list no longer appear, but their places seem to have been taken by an assistant to the federal manager, who then held the office of assistant general freight agent.

Mr. Lee also mentions five division superintendents, and one assistant superintendent, which is the same number of such officers as was shown in the 1917 list, or one for each 250 miles of line. He also mentions six trainmasters, six road foremen of engines and four traveling firemen. The Pocket List for 1917 showed only three trainmasters and now shows only five. It only shows five road foremen, while it did not list these officials in 1917. Mr. Lee rather objects to the traveling firemen, saying they represent a new position and that they have no new firemen to instruct, "just draw down the salary."

We have understood that some results along the line of fuel conservation have been obtained from the employment of fuel supervisors, road foremen and traveling firemen, even when their instruction was lavished on experienced firemen. We also appreciate that Mr. Lee would like to believe that the employees with the assistance of their labor organizations could run the railroads without officers, but we do not understand that the labor organizations are run that way, and we have also heard of some of their officers having had their salaries raised of late.

Mr. Lee also says that at East Stockton, Ill., there are only two switch engines, but two general yardmasters each drawing $250 a month. He also mentions a number of officers formerly concerned with traffic solicitation, who he says are not performing any service now except that "occasionally one will ride a troop train and make about the same report as the conductor has to make" and that others "ride sleepers at night and spot on the train crews." Former freight solicitors, he says, are "now holding down a desk with nothing to do but watch the eight hours pass away." We are not fully informed as to what all the former traffic solicitors are now doing, but we believe the men who have accompanied the troop trains have been found necessary to do several things that have contributed toward the successful handling of the troop movement which would not have been performed by the conductor and we understand that some at least of the former traffic men have been found rather useful in performing functions not completely provided for in the operating department.

Mr. Lee also informs the Senator that "if the government wants to find many men holding positions, paying large salaries, created since the government took over the roads, and men carried on the payrolls in general freight and passenger departments who perform no service whatever, they can find them if they will only investigate." He wishes it understood that he is not of the opinion that the Chicago Great Western is operated more expensively than a majority of other railroads, because he is "certain a similar or worse condition can be found by the most casual observor on numerous other properties."

The fact that he has selected this road as an example may or may not be due to the fact that W. L. Park, the federal manager, was a member of the board of arbitration on the wage demands of the engineers and firemen in 1915 that rendered a decision that has been bitterly assailed by the brotherhoods ever since. Mr. Lee will have little difficulty in proving that Mr. McAdoo failed to demonstrate any saving in overhead costs by his reorganization of the railroads, but his camouflage is too thin to hang any large part of a deficit running into hundreds of millions on any increase in officers' payrolls.

Letters to the Editor

Valuation ad Absurdum

Chicago, Ill.

To the Editor:

The following interesting and instructive details of the actual cost of driving spikes have been worked out by the valuation department of one of the large railroads. The first question to be solved being track spikes; what they are —their use, etc. A conference was held by the valuation engineer, two assistant valuation engineers and an engineer of unusual ability acting as the advisory board. The conference lasted from April 1 to June 15 and many interesting points regarding track spikes, their life and habits, were brought out. The cost of working up data for this inquiry was as follows:

Valuation Engineer, 2½ months at $350	$875.00
2 Assis't Val. Engineers, 2½ months at $250, 5 months at $250	1,250.00
1 Special engineer, 2½ months at $275	687.50
1 Engineer of cost, 2½ months at $245	612.50
1 Pilot engineer, 2½ months at $200	500.00
1 Accountant, 2½ months at $175	437.50
1 Clerk, 2½ months at $150	375.00
1 Clerk, 2½ months at $125	312.50
1 Clerk, 2½ months at $100	250.00
1 Stenographer, 2½ months at $100	250.00
+ 5 per cent, Stationery, printing, etc	277.50
	$5,827.50

The momentous question of what a track spike is, having been decided, the next step was to investigate the cost of driving track spikes. One hundred and seventy-six railroads were written to, asking for details of the methods and cost of driving; the railroads in turn kindly took the matter up with 1,760 roadmasters, asking each roadmaster to obtain the opinion of 5 section foremen.

The detailed expense of this section of the inquiry is given below:

176 Valuation engineers, ½ day each, 3.5 months at $350	$1,225.00
1,760 Roadmasters, ½ day each, 35.2 months at $200	7,040.00
3,800 Section foremen, 1 hour each, 8,800 hours at 45 cents.	3,960.00
Clerical Help Compiling Figures	
4 Clerks, 1 month at $125	500.00
2 Stenographers, 1 month each, at $100	200.00
+ 5 per cent for stationery, printing, etc	696.25
	$13,621.25

Upon the advisory board looking over the figures it was decided after a lengthy discussion that it would be most interesting to have a practical demonstration showing the actual cost of driving a track spike. Invitations were accepted by 50 valuation engineers to be present at the demonstration. Mike O'Reilly was the section hand chosen to drive the spike and the official time was 10 seconds at 40 cents per hour or 1/10 of a cent.

Figuring the average mileage for the valuation engineers as 800, we have

40,000 Miles at 3 cents	$1,200
Time, 2 days each, 100 days, 2 months	700
Expenses $10 per man	500
	$2,400

Therefore it cost $21,849 to ascertain that it cost 1/10 of a cent to drive a track spike.

"A Liar Who Figures."

The American Institute of Mining Engineers expects its Chicago meeting, September 22-26, to be one of the most interesting in its history. Over 150 papers have been submitted to the committee. By a special train leaving Chicago September 25, the members and guests will go to La Salle, Ill., to visit the coal mines, cement works and zinc smelters.

The Reconstruction Program for French Railways

The Minister of Public Works and Transports Outlines Work That Will Cost About $1,000,000,000

By Robert E. Thayer,
European Editor of the *Railway Age*

Part I

ONE OF THE LARGEST PROBLEMS the French government had to face after the cessation of hostilities on November 11, 1918, was the reconstruction of the railways in the war zone, the completion of improvements that were started in 1914 but which were not completed on account of the war, and the development of new lines made necessary by the increased traffic and changed geographical conditions.

Destruction of the Station at Beuvaigue

This work is under the jurisdiction of M. Claveille, minister of public works and transports, who in an endeavor to get the work started promptly has eliminated as much of the red tape common to governmental operations as possible. On the day following the armistice he asked the chief engineer of his organization to obtain reports from the services of the liberated regions showing the work necessary for repairing the damages caused to lines of communication of all kinds. He also asked for a list of work started before the war. He also asked for a list of the projects of equal importance which had been approved but not passed upon; and of the projects not yet approved, but sufficiently advanced to be submitted promptly to the Administration, wherever these projects were really of great utility. At the same time, the engineers were requested to get in touch with the contractors for the immediate resumption of the work they had been executing. Where the work had not yet been assigned, the engineers were asked to make arrangements to allot it to private enterprises, contractors, or have it done under state supervision as seemed best.

Destruction at Condien on the Aisne

Destruction of the Station at Lassigny. In the Foreground is Shown the Remains of a Water Tank and at the Left Is What Remains of the Station. The Brick Structure at the Right of the Water Tank Was a Signal Tower

The cost of the reconstruction work is to be borne by the

government of France under a law which was passed by the Chamber of Deputies in the latter part of 1917. This includes only the cost of putting the lines back into as good condition as they were before the war, and any expenses for improvements are to be submitted for proper action in each particular case.

Reconstruction in the War Zone

The railroads of France are classified under two heads, viz.: Principal railroads; railroads of local interest. The principal railroads are those such as the Nord, Est, Paris-Orleans, Midi, State, Paris-Lyons-Mediterranean, and Cein-

ture. The railroads of local interest are narrow gage lines operated with steam locomotives, and correspond somewhat to the electric interurban lines in the United States. They serve local communities and act as feeders to the principal railroads without competing with them for traffic.

Principal Railroads

The brunt of the damage to the principal French railways caused by the war was borne by the Nord and Est railways, the lines of which extended throughout the war zone. The damage sustained by these lines was appalling. On the Nord it can be said, in a general way, that all railway material, including everything that goes to make up a railway, included between the line of the extreme German front of 1918 back to the frontier, was destroyed in a systematic manner. The vastness of this area is well illustrated by the accompanying official maps which show the extreme German advance, the advance line of 1918, the line existing at the signing of the armistice and the Belgian frontier.

The Germans blew up all the bridges and constructions, big and small, using very heavily charged mines which, in most cases, not only destroyed the vaults or metal flooring of the bridges, but also the piers and abutments to their very foundations. They blew up all the switches and even destroyed the running track along distances of tens of kilometers consecutively, either by blowing up every other joint thus making the rails unserviceable, or by tearing away the rail from the ties by using metal plows* attached to locomotives. This latter method played such havoc with the track that there was nothing left but to completely clear away the

*These plows consisted of a large triangle yoke of heavy steel, one leg of which was placed under the rails.

wreckage and entirely replace the rail and ties. It should be added that the destruction continued for several weeks after the armistice through the use of delayed mines. In the stations of the invaded region, the electric equipment, furniture, tools and supplies of all kinds were destroyed or entirely removed by the enemy.

On the Est there was the same destruction. All the part of the railroad between the line of the extreme advance of the enemy in July, 1918, and the line held on the day the armistice was signed, was destroyed in battle or by systematic devastation. On the line from Rheims to Laon, between Rheims and Guignicourt, the embankment was completely torn to pieces on account of the fact that it was used for shelters, trenches and barbed wire entanglements. The same was the case with the line from Paris to Strassburg beyond Emberménil, and elsewhere. Part of the line from Bazancourt to Challerange marked the battle front for four years, and it was completely torn up. In other places mines left craters 30 to 60 ft. in diameter. Almost everywhere bridges and other constructions were entirely or partly destroyed by the enemy. Even in the region evacuated after the armistice, some of the most important bridges were destroyed by the Germans, whole piers and abutments being blown completely out of the water, leaving openings more than 60 ft. wide.

Eight tunnels were also entirely blocked up. Four of these near Liart will require a very long time to clear out on account of the unfavorable character of the material through which the tunnel was bored. Two others, one near Perthes, and the other at Manre, near Challerange, although in the chalk, were so completely blown up that the earth has sunk down through the whole thickness from the surface to the vault. At Perthes 2,472,000 cu. ft. of debris had already been removed in March, 1919, without yet reaching the parts of the vault still in place. At Manre it is believed that between 6,000,000 and 7,000,000 cu. ft. of soil will have to be removed before the tunnel can be opened.

The tracks in some places were completely removd by the enemy, notably along a distance of 18.6 miles on the Rheims-Laon line, 12.4 miles on the Rheims-Challerange line, and 12.4 miles on the Bazancourt-Sedan line. Everywhere else the destruction was carried out systematically, generally by

blowing up every other rail joint, and occasionally by cutting the middle of each rail. The destruction of the track by using plows, seen so frequently on the Nord, was only employed on the Est along one stretch 2.5 miles long, between Armagne and Charleville. The switches were almost completely destroyed or removed in all the stations of the region, and all apparatus rendered useless.

The water pipes also were almost completely destroyed in all places where they were not underground. The metal or reinforced concrete tanks were also pulled down by knocking out their foundations from under them. The water

cranes are gone. The stations are either destroyed or so damaged that they cannot be used without making important repairs, and the same is often true of the office buildings.

The signal poles have been removed from the whole region, the enemy having used them for his cross-country lines, destroying them when he retired. The signal interlocking

An Airplane View of a Detour Built to Pass Around Two Bridges Destroyed by Explosion

The illustrations accompanying this article, which are reproduced from official French photographs, give an excellent idea of the damage done and some of the reconstruction work done by the military forces during the war.

In the reconstruction of these devastated portions of the railway advantage is being taken of the circumstances to make improvements correcting faults existing in the lines before the war which will better serve the region through which

The following figures will give an idea of the damages caused to the Nord and Est railroads:

	Miles
Length of track destroyed or damaged (Being one-third of the total length operated on the two roads in 1913.)	1,803
Length of single track lines out of service	3,480
Bridges destroyed	1,510
Tunnels destroyed	12
Buildings destroyed	590

The Rail of a Single Track Line Damaged by Breaking the Middle of Every Rail

apparatus has been so damaged or changed that they will almost all have to be reconstructed, even in the region liberated after the armistice. The telegraph and telephone lines, which in many cases had been increased in number by the enemy, have been completely wrecked. The poles are usually still standing, but all the copper wires have been replaced by iron. Everywhere the furniture in the stations, the machinery in the terminals, the cranes and track-scales have been removed or destroyed.

the railroad passes. That is; stations are being more logically located, grade crossings are eliminated where possible and in some cases the position of the line is altered and grades are changed. Often the reasons which prevented these improvements being made before no longer exist now.

The reconstruction of these lines is being done in two stages. The first stage was the laying of a continuous track by the

French and Allied engineer troops in order to re-establish communications. The second stage is the actual reconstruction of the lines which is done by the maintenance of the way department of the railroads and by contractors.

During the war the engineer troops followed up the infantry advances very closely and did excellent work. The

Damage Caused by Blowing Up a Tunnel Between Soissons and Laon. The Force of the Explosion Was so Great That It Will Be Noticed the Earthwork Above the Tunnel Has Settled Down in the Vaults

figures below are given to show the vast amount of material ordered for these engineer troops during the years 1917 and 1918:

Nature of Orders	1917	1918
ool equipment	$180,000	$222,000
otal equipment for work yards	256,000	596,000
lachinery and construction equipment	108,000	574,000
iaterial for construction and repairing of lines	1,590,000	2,646,000
Totals	$2,136,000	$4,038,000

Note—the metal bridges are of the Henry type, 98, 115, 131 and 164 eet long, and also of the Marcille and B. S. Types.

By Removal of Tracks Throughout France Where not Absolutely Needed—

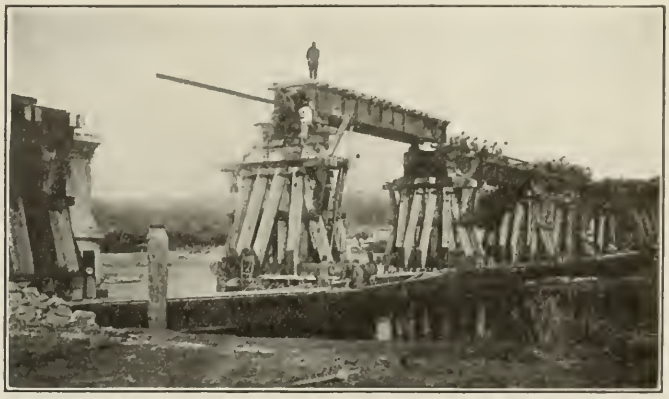
From Principal Railroads	930
From Railroads of Local Interest	308
The American Army ceded to the French Government 7,200 metric tons of 80-lb. rail on stock at Marseilles, making	56
Total amount of rail	5,097

SWITCHES

Ordered in France (1915 to 1919)	14,481
Ordered in America (1917)	500
Ordered in America (end 1918) (and not delivered)	2,500
By removal of rail not needed elsewhere	700
Total number of switches	18,181

TIES

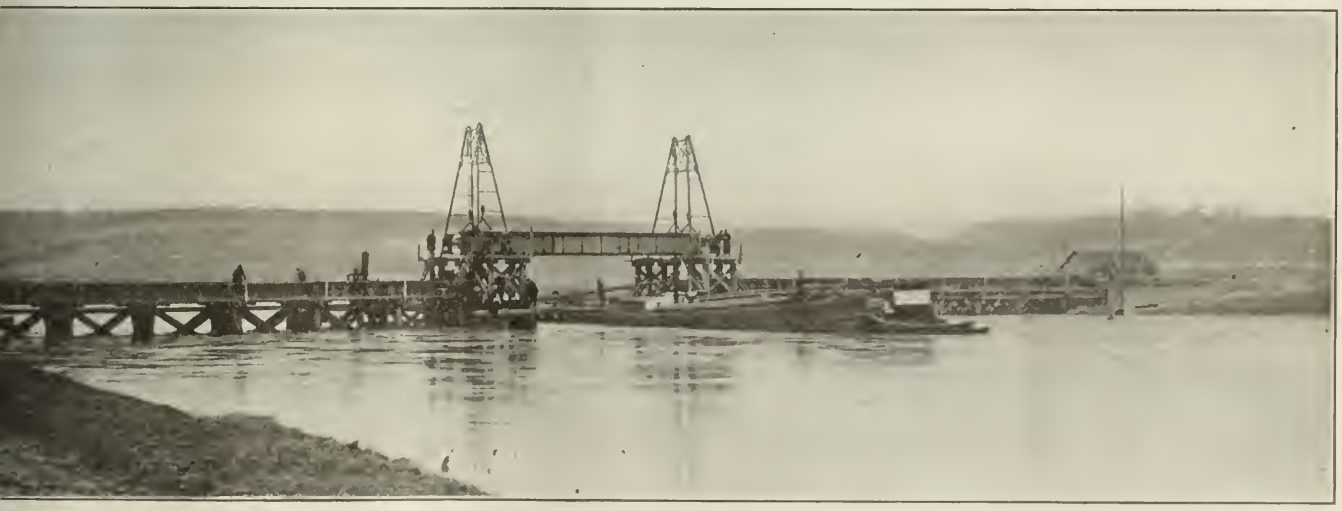
Obtained from existing stocks, production and foreign purchases	7,055,000
By removal of 1,239 miles of track, where not absolutely needed at rate of 1,456 ties to the mile	1,795,000
Total	8,850,000



An Example of the Type of Construction Used in Rebuilding Damaged Bridges

The length of the lines occupied by the enemy or reached by his fire in 1918, and evacuated before the armistice, was 1,803 miles. By February 1, 1919, a continuous track had been reconstructed along 1,339 miles of this distance or 75 per cent of its length. The rest of these lines will require very important work on account of the bridges, tunnels, etc. On the Nord the British have done the reconstruction work of about 50 per cent of the lines rebuilt. On the Est the American army has restored 62 miles of single track line. Elsewhere the reconstruction has been done by the French army, which has executed about two-thirds of the total work done.

For the final reconstruction work, by March 1, 1919, 190



An Improvised Lift Bridge That Was Destroyed by Bombardment

The following listed quantities of rail and track material were obtained during the war, by orders or otherwise, as indicated:

RAILS

	Miles
Ordered in France During 1917 and 1918—	
Isoergues, Pompey, Neuves-Maisons	280
Ordered in America, end of 1915 to end of 1918	3,523
(On February 20, 1919, there still remained 863 miles of this rail to be delivered.)	

projects had been approved by the Ministry of Public Works, 132 for the Nord and 58 for the Est. The contractors doing the work were employing about 30,000 laborers at the end of March, not counting the soldiers and the prisoners. Everything is being done to push the work as methodically and rapidly as possible.

The cost of the reconstruction of the lines and buildings alone on the Nord and Est will reach 250 million dollars, and there will be an expense of 180 million dollars more for rolling stock, furniture, machinery, supplies, and neglected upkeep.

Railroads of Local Interest

The operation of the railroads of local interest was completely stopped in the territory occupied by the enemy and also near the line of fire. Sometimes the Germans used these lines for shipments, but everywhere they prevented the civilian population from using them. Often the enemy relocated these lines and changed their gage. Near the trenches he removed the rail and ties to use them as sheathing or props. In a general way the railroads of local interest and the tramways suffered greatly from the occupation, and in retreating the enemy destroyed the greater part of the lines in the region included between the extreme front and the line which he held at the time of signing the armistice.

About 982 miles of these lines were completely destroyed or damaged, that is to say, 60 per cent of the total length of the lines situated in the invaded region. The probable amount of material damage done to the lines in question amounts to at least 83 million dollars, but this figure comes very far from representing the total damage caused to the railroads of local interest and to the tramways.

The first work of repairing the lines had been begun when the German offensive put a stop to it, but it was taken up again as early as the month of October, 1918. This rebuilding of the lines is being done: (1) By the corporations which own them; (2) by the geographical department of France interested, where the corporations only operate the lines; or (3) by the Service of Bridges and Highways acting at the request of the department or the corporations, or on its own initiative. At the present time contracts have been approved, or are being prepared, in all the interested districts, and important projects are already under way. The biggest ones concern the reconstruction of the lines, from Albert to Doullens, from Albert to Montdidier, from Albert to Ham and to Péronne in the Somme Department, from Château-Thierry to Mareuil-sur-Ourcq and from Soissons to Oulchy-Breny in the Aisne; from Dormans to Rheims and to Fismes, and from Rheims to Ambonney, in the Marne; and from Toul to Thiaucourt in the Department of Meurthe-and-Moselle.

The supply of track material, signals, etc., and of rolling stock needed for the reconstruction of tracks of the railroads of local interest and the tramways will be obtained as follows:

1. By drawing on the resources which the Administration of the Ministry of Public Works has on hand, and on the material obtained by recuperation as well as that abandoned by the enemy.
2. By orders placed with French industries for the rest to complete the amount which is needed to restore the railroads. Up to the present time an order for 20,000 metric tons of 52 lb. rail has been placed with French rolling mills.

An office called the Ordering Office has been created for purchases in the open market. This office has authority to pass on contracts and proceed with all acquisitions of stationary equipment and rolling stock in accordance with the general instructions given it by the Minister to whom the contracts are submitted for approval.

Some Comments on the Railroad Problem*

Congress Should Establish a Rule of Rate-Making—There Should Be Compulsory-Federal Incorporation

By Robert S. Lovett
President Union Pacific

Part II

WITHOUT GOVERNMENT OWNERSHIP or operation, the only reliance for railroad revenue to support railroad credit must be upon the *adoption by Congress of a sound railroad policy* involving absolute justice to railroad capital, and requiring specifically and plainly that the rates to be fixed shall be sufficient to enable the carriers to provide safe and adequate service, to protect existing values, and to attract the new capital necessary in the public interest.

To that end Congress should, among other things, specifically provide that the level of rates must properly reflect the cost of wages, materials and all other expenses incident to maintenance and operation, and a reasonable return upon the new capital invested.

It is for congress to say whether the railroads of the nation shall be publicly or privately owned, and whether they shall be prosperous and efficient or poor and inefficient, for Congress has the law-making, which includes the rate-making power.

True, Congress cannot make a confiscatory rate. That would be unconstitutional, and a judicial question would arise.

The rates which Congress makes—directly or indirectly through a commission or other agency—must be "reasonable." From this I anticipate the usual question: "What is a reasonable rate?"

It is whatever rate Congress may fix; provided it is not so low as to be confiscatory of the carrier's property, nor so high as to confiscate the shipper's property by preventing it from moving. Between those limits any rate the Government fixes is "reasonable" in a legal sense.

R. S. Lovett

Congress Itself Should Declare A National Railroad Policy

The time has arrived for Congress itself to declare by law a national railroad policy, and not leave it to the Interstate Commerce Commissioners or other subordinate officers or agencies to say whether the policy of the national government is to impoverish the railroads to please certain shippers, or to improve and extend railroad facilities for the country by making compensatory rates, or to pursue one policy at one season and the other policy at another.

Congress should itself provide the rule of rate-making and require the commission or other rate-making agency to take into account the increase in taxation, in rates of wages, in cost of materials and other operating costs, and the new capital invested in the property, as well as the value of the property as previously demonstrated.

Our railroad transportation system, which is essentially national, should be rescued from the irresponsible and conflicting state agencies, and brought under uniform control and regulation in the national interest, except as to strictly local matters.

The national agencies necessary for the administration and supervision of the railroads should be created.

It is not enough to create them with *authority* to act, but they must be sufficient in number and character to *act*, for it is worse than idle to confer jurisdiction and authority, as upon the Interstate Commerce Commission, to perform a task which in magnitude is utterly beyond its power to perform.

Among the agencies that should be created is one responsible for the *sufficiency of the transportation facilities* required by the people in general.

Since the creation of the Interstate Commerce Commission, the only concern of the government, as reflected by legislation and commission action, has been to keep down the revenues, prevent discrimination, and generally chastise railroad management.

No sense of responsibility for providing the requisite railroad facilities has been manifested on behalf of the government.

That task has been left to private enterprise, handicapped by the governmental policy of suspicion and repression.

The Interstate Commerce Commission utterly failed to see and meet by rates the demand for increased transportation which was constantly growing until the collapse came.

It is hopeless to put upon the Interstate Commerce Commission the responsibility resting upon the government to see that the railroad transportation facilities essential to the welfare of the country are provided and as needed, and at the same time regulate all the railroad rates and hear and determine all the complaints.

They are entirely separate and distinct functions: one

*Part one of this article, which was prepared for distribution by Robert S. Lovett to Congressmen and others interested, was published in the July 25 *Railway Age*, page 173.

is the executive function of looking after the transportation service, its character and sufficiency, and deciding what is needed, and what amount is necessary to provide it; the other is the legislative function of fixing the rates and the semi-judicial function of determining rate controversies.

The Interstate Commerce Commission is not equipped for the former, and has shown its lack of appreciation of the necessity for and the means of providing and assuring more transportation facilities.

It is not sufficient, therefore, to relegate railroad capital only to the agency that has failed so signally in the past. But *it will be necessary*, if private management is to succeed, *for the government to perform the governmental duty of seeing that the requisite transportation facilities and service are provided*, and to that end create an agency to determine the necessity and the cost, and to advise the measures necessary to provide the capital which the government itself does not propose to furnish.

If Congress will enact the necessary laws giving railroad capital a business chance, I believe that capital will take a business risk, and the money required to provide the requisite railroad facilities for the future will be forthcoming.

But railroad investors and owners will not take all the risks and forego the profits of the business.

Why should they? There are too many other opportunities for profitable investment all over the world, and more now and for many years to come than ever before.

If, as many propose, the return upon railroad capital is to be limited at best to a low fixed return, even by the most successful and best managed roads, with no hope of anything more for good management, inherent earning capacity and other considerations ordinarily influencing values, while all misfortunes are to be borne by the investors, the necessary capital will not be obtained.

The hope of profit should not be foreclosed. If it is the policy of the government to limit the return at best to six per cent or some other low fixed rate, then that return will have to be guaranteed to attract the investor. Only the prospect of profit justices risk in financial affairs.

Under rates prescribed by the government, or with its approval, and applying to all alike, why should profit be denied a stockholder of the wisely built, well managed railroad any more than to the owners of bank stock, or steel stock, or brewery stock, or any other stock?

But it is said that the latter are engaged in private business.

Very well. Who is more deserving of encouragement, liberal treatment and appreciation—he whose money provides the railroad facilities which the public convenience and interest require and conducts his business so well that he can make a profit out of it at rates which the government itself fixes; or the man in private business (in some lines, the more private the better for it) with no public interest involved, and only his own selfish interest to serve?

It is about time that we were introducing common sense into some of our theories about railroad capital.

No money except that devoted purely to benevolence is employed more in the public interest or is entitled to more encouragement or fairer treatment and consideration than that which is invested in the development and upbuilding of our railroad facilities.

It is "affected with a public interest" in more senses than that which subjects it to reasonable regulation by the Government, though too often these are overlooked.

It serves the public; it provides transportation facilities and conveniences for the public; and promotes the public interest in vital ways.

If by good management it can be made productive to its owner in competition with others, in the character of service and facilities supplied at rates fixed by the government, there is no reason in morals, and there should be none in law, why the owner should not be as much entitled to enjoy the profit as the owner of money invested in private, and often much less worthy, enterprises.

The Choice Before the Nation

I believe firmly that *the choice of this country with respect to its railroad transportation ultimately* is between

(1) Inadequate and impoverished railroad transportation facilities, or

(2) Government ownership of the railroads, or

(3) A guaranty by the government of a reasonable return upon railroad capital, or

(4) Rates that will be reasonable under all the circumstances determined by a government agency that will consider the needs of the traffic and the needs of the carrier, with the right to each carrier to keep whatever profit it can make out of such rates so established, by good management, good service, economy, wise investment, and success in competing for business.

Compulsory Federal Incorporation

But it is not merely a just rule of rate-making enjoined upon the commission by law, but relief from the disabilities imposed by conflicting and impracticable state regulation, and a comprehensive and unified system of national regulation that are necessary to re-establish the credit of the railroads and provide the facilities that the country needs; and it is plain, as a whole, recommended by the Committee of Railroad Executives, which is urged.

Among the most important of the needs of the situation is the compulsory federal incorporation of railroad carriers.

So long as Congress confined itself to restrictive legislation of railroads as *common carriers*, it was not material whether they were federal or state corporations, or indeed corporations at all.

The working and operation of the physical properties and their relations as carriers to the public were the only matters of concern, and their corporate functions were not substantially affected.

If only restrictive and oppressive legislation were intended now, federal incorporation would not be necessary.

But the time seems to have arrived for a comprehensive legislative plan for developing and sustaining necessary railroad transportation, or, in other words, for *constructive legislation.*

The very first feature of the problem is the credit of the railroads—the means by which this is to be established and maintained in order that the requisite capital may be secured.

This involves at once the most important corporate function; the power to raise money and issue stock and bonds.

The power to borrow money and the power to issue and sell stock and bonds are, of course, corporate powers.

It is elementary law that a corporation derives its corporate powers from the government that creates it and can exercise none not conferred—especially none prohibited—by that government.

May Congress authorize a state railroad corporation engaged in interstate commerce to borrow money and issue securities in excess of the amount or in a different manner from that authorized by the state that created it?

I believe that by a carefully worded statute it can. Then is it necessary to federalize all state railroad corporations in order to enable Congress to regulate their financial operations and the issue and sale of securities by them?

That in my opinion will depend very much on the action of the several states.

The corporations now are the creatures of the states incorporating them. The states gave them their lives and conferred all their powers, and the states may take away their

lives and abolish their powers so long as they are permitted to remain as mere creatures of the states.

Many states have reserved the power to repeal railroad and other charters granted under their laws. Suppose the state repeals the charter of the railroad company?

It would not even be necessary for the state to give a reason for its repeal. The corporation would be at an end. There would be no congressional act for incorporation to which the railroad could turn.

How would the government meet such a situation and carry out the national policy by utilizing the existing state corporations?

I assume that Congress would not undertake to compel the corporations to issue and sell stock or bonds.

The most it could do would be to give them the right to issue and sell such securities, a right which the state could by coercion prevent the corporation from exercising, just as in so many instances the states have coerced railroad companies into making interstate rates in accordance with the wishes of state commissions.

Congress would not, I assume, seek by law to compel federal corporations to issue securities, but being federal corporations they would be protected against coercion of the state authorities.

This is no mere imaginary danger. A bill was introduced (but I do not know whether it was enacted) in one of the state legislatures, providing for the forfeiture of the charter of any railroad corporation of that state that obeyed orders of the Interstate Commerce Commission in conflict with orders of the state railroad commission; and there are scores and even hundreds of instances where state commissions have coerced railroad companies into making interstate rates in accordance with the wishes of the state commissions.

Difficulties of Leases and Consolidations

What is true with respect to the issue of securities is equally applicable to the consolidation, lease, sale or other combination of railroads.

Then is it not necessary in a nation-wide transportation system, and is it not obviously in the interest of all concerned—the investor, the shipper and the citizen generally—that all railroad corporations throughout the United States should have the same corporate powers and restrictions with respect to their financial powers, and the same duties and obligations to the public, so that every investor will know precisely what every railroad corporation may and may not lawfully do in issuing and selling securities, and that every shipper and traveler may know the duty and obligation of every railroad company to him, whether in Maine or California, in Michigan or Texas.

No stockholder of a railroad engaged in interstate commerce ever had any right to withdraw such instrumentality of interstate commerce from business whenever the method of regulation did not suit him.

If Congress chooses to make the corporation owning a railroad a federal instead of a state corporation, it is merely exercising its right to determine the means and agencies for the better regulation of such commerce; and a stockholder has no more right to object when Congress chooses cars of certain specified designs, and equipped with certain appliances, instead of those selected by the owners of the railroad.

And I urge that in considering the power of Congress to require the federal incorporation of all railroad companies, the mistake should not be made of considering only the commerce clause.

The "war power" of Congress under the Constitution—the power to "declare war," to "provide for the common defense," to "raise and support armies," to "provide and maintain a navy," to "repel invasion," to "organize, arm and discipline the militia," etc., etc.—is ample without any other.

The limits of that power have never been explored, even during the recent world war.

It was in the exercise of that power that all the railroads of the country—twenty billions worth of property—were taken over without first making compensation and without question. *Northern Pacific R. Co.* vs. *North Dakota* (decided by Supreme Court, June 2, 1919). If Congress deems it advisable (it need not find it *necessary,* mind you), in times of peace to provide for the national defense by converting all state railroad corporations, with infinitely varied powers from and responsibilities to forty-eight different states, into national corporations, with uniform powers and responsibilities, subject directly to the national government, no court will hold that Congress was not exercising discretion vested in it by the above mentioned war powers of the Constitution even without any support from or reference to the commerce clause.

The power seems ample under any of these provisions; and the power to deal with the subject existing, the means of exercise and the agencies to be employed are, of course matters exclusively within the discretion of Congress.

Then, too, there is the constitutional power with reference to post roads, which may well be invoked.

The Reasonableness of Federal Action

What rights would be impaired or taken away by requiring the incorporation under an act of Congress conferring all powers essential to the ownership, use and enjoyment of the property now owned?

Only the right to be a state railroad corporation and to corporate powers held by such corporation, which might be greater or less than those conferred by Congress.

But would not the federal corporate powers be compensation for the state powers that ceased to exist?

However that may be, the conclusive answer to any complaint is that every state railroad corporation engaged in interstate commerce was created, and every shareholder acquired his stock, with the unavoidable knowledge that Congress had power under the Federal Constitution to regulate interstate and foreign commerce and all the instrumentalities thereof; that it had power to raise and equip armies and to provide for the national defense; that such powers were in no wise lost or impaired by failure or delay in the exercise of them; and that the time, the means, the agencies and the methods of the exercise of such powers rest in the unrestricted discretion of Congress.

This was the *effect* of the decision in the Anthracite Coal Cases (*United States* v. *Delaware & Hudson,* 213 U. S. 366).

By converting existing state corporations into federal corporations, Congress would not take away the property of the corporation or of the stockholders.

It would not affect the title of the property at all. The stock certificates would represent the same relative interest in the same property, and bonds and notes would represent the same debts.

It would no more change the title of the property or the rights of stockholders and creditors than does an act of the legislature that changes the name and amends the charter of a corporation created by it.

The United States is not a government *foreign* to these corporations and their stockholders, but they and all their properties are much more subject to it and to the will of Congress than they are to their states.

With respect to existing corporations, Congress should require them to reincorporate by filing with the designated department of the government articles of reincorporation, which should contain the statements and declarations Congress may prescribe; and thereupon they should become

federal corporations instead of state corporations, and possess the powers which Congress, by the act for reincorporation declares such corporations shall possess.

The obligations to creditors and all other private rights and relations should continue as before, and the stock and the certificates representing it should remain as before until transfers are made in the usual manner; and, of course, the certificates would, in form as well as in fact, represent stock of the reincorporated company.

Some one has discovered in this suggestion a scheme for for validating invalid stock.

Such would not, and certainly need not, be the effect, for it could be provided in the act that such reincorporation should not, as between the corporation and its stockholders and creditors, create any new rights or obligations or validate anything already invalid.

In short, on a given day to be specified in the Act of Congress, all railroad corporations of the United States would cease to be state corporations and would become federal corporations with the powers set forth in the Act of Congress; and would thereafter be bound, with respect to all corporate powers and action, by the terms of such act, rather than by the various state statutes and special charters.

Exclusive Federal Regulation of Securities

The necessity for the exclusive Federal regulation of the issue of railroad securities seems to be generally recognized, yet it is so vital to railroad credit, and to the success of any system of regulation which may be adopted, that it must not be overlooked.

Time is of vital importance in transactions involving the sale of corporate securities.

Bankers (and that includes the syndicates composed of numerous financial houses and institutions throughout the country whose co-operation the originally contracting banker invariably enlists with whom he shares his margin of profit) are almost indispensable in floating large issues; but bankers never buy such securities to keep—only to sell. If they bought to keep, their capacity to buy would soon be exhausted.

Their function is precisely that of the ordinary merchant, except that they count on making quicker sales, and therefore work on a smaller margin of profits than the ordinary merchant makes on his merchandise.

When bankers make an offer for an issue of bonds or stock they base their price upon current financial conditions and quotations, expecting to make a quick turnover.

If they are required to wait for the delivery of the securities they reduce the price to cover the risks of financial changes in the meantime, and the seller gets less for his securities.

If the period of waiting is long or indefinite and the transaction is a large one, bankers sometimes will not buy at all—particularly if the financial world has any menacing features.

But in any case, the longer the delay the lower the price, because of the greater risk.

If a railroad company is compelled to go to half a dozen state railroad commissions for permission to make an issue of stock or bonds, and to encounter delays running from weeks to months on account of numerous bearings before different commissions, and in meeting their conflicting policies and views, before it can deliver the securities, it will be impossible to have the issue underwritten, or if underwritten at all the cost will be excessive.

But worse still, the chances are that differences between the commissions will arise, or that the inexperience and perhaps the financial theories of some of the many commissioners may require changes that will upset the plan entirely.

Indeed, some states, in effect, deny railroad companies the right to borrow money for any kind of improvement at all.

As attorney, and afterward as president of the Southern Pacific I had to do and was quite familiar with the working of the Texas law regulating railroad stock and bonds, from the time of its enactment in 1893 until the termination of my connection with the Southern Pacific in 1913.

Without reference to branches and other subordinate lines, the Southern Pacific Sunset Route, made up of steamers from New York to New Orleans and Galveston, thence by rail to Los Angeles, San Francisco, and Portland, runs through the State of Texas for 936 miles from the Texas-Louisiana boundary to the Rio Grande River at El Paso, with a line diverging from this at Houston and extending to Galveston.

Yet under the stock and bond law of 1893, as administered by the Texas Railroad Commission, not a dollar of bonds or a share of stock has been issued against or on account of this line for the necessary betterments and additions of this great transcontinental line of railroad in Texas since the Texas statute was enacted in 1893 to this day.

The Gulf Line of the Santa Fe, extending from a connection with the main system in Oklahoma, thence through Texas to the Gulf, is in the same situation.

Not a bond or share of stock has been issued in over 20 years for the improvement of that great outlet for interstate and foreign commerce from the Northwest.

The money needed for the improvement of the Texas lines of the Southern Pacific and Santa Fe systems, when forthcoming at all, has been furnished by the parent systems by direct loan, without security, from their treasuries outside of the State and by foregoing dividends of the Texas companies from time to time to which they were fairly entitled.

Much of the lines mentioned—more than half of the Southern Pacific from the Louisiana boundary and the Gulf to the New Mexico boundary—is unproductive and would not pay operating expenses except for the through business.

No argument should be needed to show that the transcontinental lines of railroad extending from New Orleans on the Mississippi River and Galveston on the Gulf to the Pacific Ocean, and the lines from the grain fields of Oklahoma, Kansas, Missouri, Nebraska, Iowa, etc., to the Gulf —particularly those under the same stock ownership and operated as a single line—ought to be regulated, in their financial operations at least, by the Government that regulates interstate and foreign commerce.

Considering now the method or character of regulation to be prescribed by Congress to govern the issue and sale of railroad securities:

It is all important that it be made flexible and practically workable.

The issue of railroad securities does not call for the exercise of a judicial function, but it is a business matter; and whether the necessity exists and the conditions are favorable are not judicial questions, but are business questions.

Yet all the state commissions, in practice, deal with this purely business question as if it were a matter for judicial inquiry and determination, and employ the elaborate procedure and machinery appropriate only to judicial proceedings.

The result, of course, is delay—delay for pleadings, delay for process, delay for witnesses, for hearings and arguments; and delay sometimes for writing elaborate opinions which are to become precedents. This is intolerable under financial distress, and in the frequent and quick changes in financial conditions and markets. Moreover, it is wholly unnecessary.

What the People Really Seek Through Regulation

What the Government and the people wish to prevent is the issue of stock, bonds or other railroad securities for im-

proper or unnecessary purposes and without adequate consideration—"watered" or otherwise fraudulent securities.

This accomplished, the Government and the people are interested in encouraging and expediting the issue and sale of the railroad securities necessary to procure the money required to provide the transportation facilities which the people must have.

They are interested in having the money procured in the shortest time and with the least waste and loss through the working of cumbersome government machinery, and at the best rates obtainable by the corporation.

Hence the machinery provided should be as simple as possible to accomplish these objects, and especially should it be unencumbered by judicial forms and methods of procedure.

It is purely and only an executive function—determining whether the purposes are within the corporate powers and otherwise lawful, whether the terms of the issue are consistent with the public interest, and what if any special provisions should be made to assure the application of the money to the purposes authorized.

The circumstances of the cases vary greatly—with the financial strength and credit of the different companies and the extent and character as well as the purposes of the proposed issue, and in other respects.

What is needed is a governmental agent or agency with the ability and authority to take hold of each case and deal with it in a businesslike way and without regard to forms or methods of procedure.

Exclusive Federal Regulation of Rates

Argument in support of the power of Congress to regulate intrastate as well as interstate freight and passenger rates seems unnecessary.

It is notorious that many of the state commissions grossly discriminate in favor of their own citizens in the matter of both passenger and freight rates, and in favor of merchants, manufacturers and producers in their own states against citizens of other states.

Indeed it is not too much to say that the present interstate and foreign rates on traffic of immense volume and importance from very large sections of the country have been practically dictated by state commissions.

This policy and practice of coercion to a greater or less degree may be exercised by any, and probably is exercised by many, of the state commissions in the interest of the communities that elected them, as against the citizens and communities of other states.

But discrimination is not the only feature of the system. It is the evasion of the obligation of all the traffic to bear as equitably as possible a just share of the burden of transportation, which is a matter of national concern.

If the national commission holds that a three-cent fare is necessary to make passenger traffic bear a proper share of the railroad transportation expenses, no state should be allowed to escape its just portion by a two-cent rate.

When the national commission finds that a certain amount of revenue is necessary to provide and maintain the transportation facilities which the nation requires, no state commission should be allowed to relieve its shippers from their share of the burden.

And more important still, *when the national commission establishes or recognizes a rate adjustment affecting, as such adjustments always do, a large territory, many states, and varied interests, no state commission should have authority to disturb it.*

Important Functions of the State Commissions

I do not advocate the abolition of the state commissions. There are many important functions for them to perform.

There are not only public utilities of various kinds, such as street railways, interurban railways, electric light and power companies, water companies, etc., which they ordinarily regulate, but the ordinary police powers of the states with respect to the railroads, not involved in the matter of rates and through service, could be left to them; and they could perform a most important duty to the people of their states and to the national authorities by observing the working operation of the railroads and the effect of the rates in their respective states, and bringing before the federal authorities just causes of complaint for rectification.

And, of course, I am not suggesting that the Interstate Commerce Commission may itself regulate directly all the railroad rates of the United States.

A number of subordinate commissions in different districts or regions will be necessary in any event if we are to overcome insufferable delay, whether jurisdiction is limited to interstate or is extended to include intrastate rates.

But this appertains more particularly to the question of administrative machinery.

Organization is as essential in railroad transportation as engines and cars.

We have organizations by companies and by systems, but there must be for the government the organization necessary to govern and manage these companies and systems in their relations with each other and with the public, and so to co-ordinate them as to have them supply the nation with the transportation needed, as it is needed, and at reasonable rates. That is the problem of the Government.

We already have laws prescribing what is right and prohibiting what is wrong in most railroad activities.

These laws operate upon the railroad companies and their officers, severally and individually.

But they no more dispense with proper organizations acting for the government than the signing of a charter for a company dispenses with the necessity for an organization to manage and conduct its business.

I realize that this is a somewhat primary statement of principles, but I wish to be sure that the point is made clear.

Government Department of Transportation

It must be apparent that these duties relating to the quality and character of the service rendered by the railroads, to the application of safety appliances and the maintenance of the same, to the condition of engines and other equipment, and to the investigation, detection and prosecution of violations of the law, and regulations with respect to accident reports, etc., etc., could be very much more promptly and effectively handled in an executive department of the government than by a semi-judicial tribunal that can act only in conference.

But the greatest advantage would be the time it would give the commission for the performance of its more important duties of passing upon rates and determining questions which only such a body can properly determine, and also in relieving that commission of the petty prosecuting activities which tend to unfit its members for their more important duties.

A department of transportation should be created to take over and perform the executive and administrative functions devolving upon the Interstate Commerce Commission under existing laws, and any created by additional statutes.

I believe that the head of the department of transportation should be a member of the cabinet.

As I was the first railroad executive, so far as I know, to suggest that a cabinet member be put at the head of a department of transportation, and as I believe very strongly in the wisdom of it, I shall state briefly my reasons, which go further than merely relieveing the commission of its executive duties.

It soon becomes obvious to any one who has opportunity to observe that executive and administrative functions can-

not be efficiently exercised by boards, commissions or committees.

There was demonstration of this in Washington during the recent war. The larger the board or commission, the more cumbersome or difficult becomes the task; and the abler and stronger as executives the individuals are, the more likely that the board or commission will become a debating society, making but little progress with the work, unless, of course, they avoid conflicts by leaving the work to subordinates.

Recent experience has demonstrated the necessity for a national government officer to meet emergencies resulting from exceptional congestion in traffic or through blockades of transportation, by quickly mobilizing the transportation resources, and by the arbitrary diversion, if need be, of traffic from lines which cannot handle it to lines which can, and by other instant and heroic methods.

How can the Interstate Commerce Commission, or any similar body, exercise promptly and adequately this extraordinarily important and difficult executive power which requires immediate and varied action from day to day to be of any value?

They could make orders and appoint some subordinate, who, when appointed, could be directed only by other orders or general rules, since the commission cannot act except through quorums.

A power so vast should be committed to no commission employee, and to no officer of less rank than a cabinet member, who is a part of the Administration and is in direct touch with the President and can change his orders instantly to meet changing conditions.

I have already indicated in my discussion of the issue of railroad securities the importance of prompt and business-like government action with respect to that very important matter.

Then in the matter of service, a cabinet officer by calling in railroad executives, and through informal discussions, could bring about changes in train service, schedules, and other things desired by the public, which if taken up with the elaborate formality and procedure inevitable in cases of a commission or similar body, would not be accomplished for weeks, and possibly months.

In other words, a single executive representing the government in all these important matters of service could get instant touch with the railroad executives, and secure action with respect to these matters of such vital importance to the public very much quicker than would be possible by the slow moving procedure of any board or commission.

The secretary would not be hemmed about by any judicial conceptions, but could "talk across the table" to the railroad executives about what was needed and what action should be taken.

If his wishes were not complied with, he could bring the matter before the Interstate Commerce Commission by formal complaint; but in nine cases out of ten his demands for service and facilities, if at all reasonable, would be met.

But a stronger reason still why a cabinet member should be at the head of the transportation department is that the railroad business is unrepresented in the Government—is without any "friend at court."

It is, I understand, the largest single industry in the United States next to agriculture, and certainly there is none more vital to the very life of the nation, and yet in the President's cabinet nor anywhere in the vast machine constituting the government of the United States is there a department or bureau or agency or officer of any kind or description whose duty it is to look after its interest, to defend it, to speak for it, or to say a word for justice in its behalf.

The Interstate Commerce Commission was conceived in hostility to it.

The Interstate Commerce Act was designed to repress and regulate and punish it.

Running throughout the Interstate Commerce Act and all other statutes on the books of Congress relating to the railroads is an unmistakable spirit and purpose to curb and repress, unrelieved by a single helpful constructive encouraging provision which I can now recall.

Mind you, I am not saying that this restrictive and repressive legislation and the creation of the commission as a stern administrator of the law rather than a helpful agency was not necessary. Quite the contrary. Most of the things prohibited were wrong.

But I do say that *the policy of hostility and repression was carried too far, and the time has come for a change.*

I do not mean change by repealing any of the laws or abandoning what has been done, but a change by adding to the repressive and restrictive laws helpful and constructive laws and administrative agencies capable of more expeditious action.

Transportation Business Should No Longer Be Ignored by Government

The transportation interests of the country should no longer be ignored in the organization of the government's business and left to what I may term the penal authorities.

Along with—

The Secretary of Treasury, who looks after the banking and financial interests of the country;

The Secretary of War and the Secretary of the Navy, who look after national defense;

The Secretary of Agriculture, who looks with solicitude after agricultural interests;

The Secretary of Labor, who looks after the interests of the laborers;

The Secretary of Commerce, who looks after the commercial and industrial welfare of the nation;

The Secretary of Interior, who sees to the development of multitudes of internal projects of public interest; and

The Postmaster General, who provides the communication for the people,

—there should be—

A Secretary of Transportation, who should see that the nation has the transportation without which none of these others would be possible or of value, and who should have the same solicitude for the development and success of this essential business and industry that the others show for the interests they represent.

This paper is confined to consideration of permanent plans without reference to temporary measures for dealing with the transitory condition.

JUSTICE FOR THE RAILROADS.—Capital enough, ability enough and courage enough, says Judge Lovett, stand ready to rehabilitate American railroads, provided Congress can be persuaded to assert national authority over a problem that is essentially national. Radical reforms affecting incorporation, mergers, securities and rate-making are plainly indicated as necessary, but first of all the principle of nationality must be accepted. Forty-nine separate sovereignties blighted individual initiative and destroyed credit, so that financial disaster on an appalling scale was invited. To go back to the old plan of divided control would be inexcusable. The creation of a Department of Transportation would be a step in the right direction but it would be unavailing unless accompanied by the widest use of national power for the supervision, development and protection of one of the greatest of our industries. This is a legislative task that ought not to be beyond the capacity of a Congress instructed in peace and in war by the startling experiences of the last three years.—*New York World.*

Unification of the Puget Sound Terminals

Plans Conceived Under Railroad Administration and Instituted on the Pacific Coast Effect Savings

EARLY IN 1918 plans were formulated by operating officers of the Railroad Administration on the Pacific Coast for the unification of the terminals on Puget Sound at Everett, Wash., Tacoma and Seattle. These plans were later developed and about September 1, were put in operation at Everett and Seattle. At Tacoma the original plans were not carried out in full because of the withdrawal of several of the roads entering that terminal.

The results of this change in terminal operation are just becoming apparent. Because of the necessity for making the entire change at once, instead of gradually converting one unit at a time, the first 60 days of the operation of the unified terminals was anything but a success. However, as conditions have become more settled the advantage has become more marked and at the present time a vast improvement has been effected.

Consolidation at Everett and Tacoma

Everett, 35 miles north of Seattle, is the point at which the Great Northern reaches Puget Sound from the East. It is also the center of a large lumber manufacturing territory. The Northern Pacific has a line from Seattle through Everett paralleling the Great Northern in a general way to Vancouver, B. C., in conjunction with a Canadian Pacific connection from the International border. The Chicago, Milwaukee & St. Paul has a branch line terminating at Everett and connecting with its main line at Cedar Falls, about 40 miles east of Seattle. Everett, therefore, has three railroads, each of which had a completely operated and distinct terminal and all competing for the lumber business, and the small local traffic.

Because the Great Northern had the best facilities, such as terminal tracks, roundhouse and offices, the Chicago, Milwaukee & St. Paul and the Northern Pacific terminal forces were eliminated and all tracks were considered as one for operating purposes. The Great Northern agent was made joint agent for the three lines. The yard crews were placed under the general yardmaster and the yardmen and enginemen agreed to continue their existing schedules and separate seniority, and work with the unified terminal on the basis that after one Chicago, Milwaukee & St. Paul crew was employed, the remainder of the yard crews would be 75 per cent Great Northern and 25 per cent Northern Pacific. Each company agreed to pay its own men.

In addition to unifying the terminals, a large volume of eastbound business was detoured. That moving via the Northern Pacific was held at Everett and routed east over the Great Northern to Spokane instead of hauling it south about 70 miles to Auburn to go east from there. This was also true of eastbound business routed via the Chicago, Milwaukee & St. Paul, which road was handling between 150 to 200 eastbound loads per week by barge from Bellingham to Seattle. This practice was discontinued and the business routed east by rail from Bellingham via the Great Northern.

At Tacoma, the Great Northern withdrew, the Oregon & Washington and the Northern Pacific consolidated into a joint agency and the Chicago, Milwaukee & St. Paul continued as before, except that it closed its passenger station and coach yards and used the Union station. Considerable difficult freight switching was removed by permitting either the Chicago, Milwaukee & St. Paul or the unified organization to do all of it in certain sections.

A regular interchange of business continued between the Chicago, Milwaukee & St. Paul and the Northern Pacific. All cars arriving and departing on Oregon & Washington trains are interchanged with the Northern Pacific, thereby doing away with all car records for the Oregon & Washington. This plan was also adopted at Everett by interchanging all Northern Pacific and St. Paul business in and out with the Great Northern. An agreement with the yardmen similar to that at Everett was entered into at Tacoma.

Consolidation at Seattle

The terminal facilities at Seattle were consolidated and unified about September 1, 1918, in an effort to co-ordinate the work of six separate and complete railroad terminal organizations, namely, the King Street Terminal Company, handling the Northern Pacific and the Great Northern passenger trains and coach cleaning yards, the Northern Pacific freight yards, the Great Northern freight yards, the Chicago, Milwaukee & St. Paul freight and passenger yards, the Oregon & Washington Railroad & Navigation Company freight and passenger yards and the Pacific Coast Railroad freight and passenger yards and stations. Previous to this unification, the Chicago, Milwaukee & St. Paul used the Oregon & Washington passenger station as a terminal. Certain tracks, yards and terminal facilities were owned by each one of the six corporations enumerated above, each one of them reaching certain docks, warehouses and manufacturing industries exclusively. There were as a result, certain special agreements permitting one of these lines to use the property of another to reach certain locations and there were also joint or common use switching tracks which in some cases only one company could operate while in others two or three were privileged to use. When it is considered that the Seattle terminals in general extend north and south for a distance of 18 miles with the Northern Pacific, the Chicago, Milwaukee & St. Paul, the Oregon & Washington and the Pacific Coast lines entering at the south end and the Great Northern at the north end, the extent of the confusion created by this system of separate and exclusive ownership of certain lines and the complexity of the agreements and trackage rights between these corporations can readily be seen. Important industries and docks are located along this entire stretch, making it doubly important for each one of the six corporations to reach all of this territory. The operation of the old system caused a great deal of dissatisfaction and, because of the competition between these roads, it often was the case that four roads would have locomotive and crews endeavoring to serve the same dock at the same time.

Each of these organizations maintained two interchange or transfer movements with each other each 24 hours, which were conducted with the usual formality and red tape. Cars were rejected because of their being in bad order, improperly carded, or listed, received too early or too late or other lawful excuse which served to delay the other fellow's business. The old inefficient method of letter writing, tracing for cars not returned, excuses for failure to deliver to consignee promptly and a divided responsibility to the public, based upon the exact time a car or cars were actually interchanged for further handling was the result of this system. It was to eliminate this inefficiency and congestion that the unification plan was adopted and put into operation.

After approximately six months' work an organization was

perfected and methods were improvised for the operation of this part of the unified Puget Sound terminals. The organization which is at the present time handling this terminal work is composed of a terminal superintendent, a trainmaster, and three district general yardmasters. The terminal superintendent has complete charge of all freight switching matters for the four lines. Under his direction is an organization which handles all car and demurrage records and has supervision over switching orders. Maintenance and mechanical and accounting matters are handled separately for each line by their regular division officers. The terminal trainmaster serves in a capacity similar to a terminal general yardmaster, having the authority of an assistant superintendent. It is his duty to promote harmony between the three district general yardmasters, between the several railroads and the terminal organization and also between the employer's organizations and the terminal organization. Each of the three general yardmasters has full charge of a district which has been formed regardless of ownership or use, and these men are in turn provided with assistant yardmasters and a clerical organization with which to supervise all switching operations.

The entire Seattle terminal was made into one organization and divided into two parts—freight and passenger. The freight terminals in turn were subdivided into three districts without regard to original ownership. The coach cleaning and passenger car repairing formerly done in the Chicago, Milwaukee & St. Paul and the Oregon & Washington yards was diverted to the King Street Terminal Company, thereby releasing much trackage for freight operation and confining all passenger work of this kind into one section of the terminal. This step also eliminated the many interchange movements and the attendant red tape.

Under the old system there was considerable duplication of effort in the mechanical departments of the several companies which was eliminated by unification.

The Oregon & Washington engine terminals were formerly located in the extreme south end of this terminal district, the Great Northern at the extreme north end and the other three at different locations near the center. Each railroad housed and cared for its switch engines at its own plant. This plan has been entirely eliminated and, because of the fact that the ownership of yard engines and engine terminals has been disregarded, all repair tracks except one in each district have been closed, thereby consolidating the repair work and eliminating all delays. Still another advantage occurred from this consolidation, namely the distributing of switch engines with respect to size, wheel base, fuel and water capacity, etc.

Unified car and demurrage records are now kept by the organization under the superintendent of freight terminals; this office also acts as a clearance house for the five lines for all intra-terminal switching revenue orders. Full records of all trains arriving, departing or transferred from one district to another and a complete check of the district, are compiled by each district yard office and copies of these records are kept in the superintendent's office for book entry and proper filling. The complete interchange of all freight cars is also made between the railroads bringing them in or taking them out and the terminal. Junction cards are made and mailed to all car owners, showing all of their cars delivered to the lines taking them out of the terminal. This does away with all terminal interchange of cars, inspection and subsequent rejection on account of bad order at interchange points, together with the usual expense and records.

Relations with Brotherhoods

A special agreement with the Brotherhoods was worked out providing for the unified operation of the terminals upon a percentage basis which in turn was to govern seniority of positions. The brotherhoods on each railroad retain their own seniority lists and working schedules and further agree to have crews assigned within the unified terminals on the basis of the Northern Pacific, 45 per cent, the Great Northern, 24 per cent, the Chicago, Milwaukee & St. Paul, 16 per cent and the Oregon & Washington, 15 per cent. Under this arrangement the total engine hours worked by crews of each line for each month will bear the same percentage to the whole. With this arrangement the crews were assigned to best advantage and were enabled to do work anywhere upon the property of any railroad without violation of contracts or property lines.

Division of the Terminal

The south end of the Seattle terminal, formerly the receiving and outbound yard of the Oregon & Washington, includes at the present time a well-equipped roundhouse and shop and small car repair yard. In addition there are a storage yard for Chicago, Milwaukee & St. Paul cars and several commercial tracks operated by the Northern Pacific. This entire layout is under the jurisdiction of one general yardmaster and is the receiving yard for all Oregon & Washington, Chicago, Milwaukee & St. Paul and Northern Pacific freight trains and for Great Northern transfers which are properly classified and delivered to the several units into which each of the three divisions is divided.

The central district of this terminal is the largest of the three and formerly included the receiving and outbound yards of the Northern Pacific and the Chicago, Milwaukee & St. Paul as well as the industrial center of the city. Both the Northern Pacific and the Chicago, Milwaukee & St. Paul formerly had separate yards, roundhouses and repair tracks as well as a yard organization in this district. However, under the unified plan this whole layout is handled by one general yardmaster. The Chicago, Milwaukee & St. Paul yard repair tracks have been closed, allowing the use of these tracks for a classification yard for short pier loads. The entire layout is now the outbound yard for the Oregon & Washington, the Northern Pacific and the Chicago, Milwaukee & St. Paul lines as well as the classification yard for industrial engines working in this district.

The third district, the north end of the Seattle terminal, was formerly the receiving and outbound yard of the Great Northern and includes two of the largest docks in the terminal, one of which was operated jointly with the Northern Pacific. Both of these roads had separate organizations and a great deal of the work in this district was duplicated Under the new plan the entire layout was placed under one district yardmaster and it is now the receiving and outbound yard for the Great Northern as well as for detour business moving by way of the Great Northern for delivery to the Northern Pacific at Everett.

These changes have resulted in the increased use of cars, and in the elimination of terminal mileage by direct movement and immediate placement of the most convenient and suitable car. The present method provides direct movement from receiving yards to industries, piers or team tracks and, when compared with the old plan whereby a car first went to an interchange track, at least 36 hours has been saved on arriving loads and 24 hours on departing loads.

At certain periods, and under many conditions, Seatttle terminals always were, and always will be, congested, because the business of the city and port have outgrown the present facilities which were never designed to care for the present volume of business; however, the unification of terminals has increased the capacity of the facilities at least 100 per cent—and a 75 per cent greater increase would be obtainable if the entire terminal was converted into one corporation or association. Many serious difficulties, due to congested terminals, are now being eliminated.

Railroad Hearings Before House Committee

Additional Plans Submitted by N. L. Amster and E. J. Rich—Presentation of Transportation Conference Plan Completed

Two additional plans for dealing with the railroad problem after the return of the properties to private ownership, both of which were submitted to the Senate Committee at its hearings earlier in the year, were presented before the House committee on interstate and foreign commerce at its hearings this week, following the completion of the testimony of the witnesses representing the National Transportation Conference called by the Chamber of Commerce of the United States. The first of the additional plans was presented by Nathan L. Amster, president of the Citizens' National Railway League, who proposes the formation of a national railroad corporation to acquire the railroads and to be managed by a board of nine directors to be appointed by the President, representing business and farming interests, the security holders, the employees and the government. Mr. Amster was followed by E. J. Rich, representing a number of New England commercial organizations, including the Associated Industries of Massachusetts, who presented what is called "The New England Plan."

The presentation of the plan of the National Transportation Conference, which was described in last week's issue, was completed on Friday, July 25, and the hearing was adjourned until Tuesday, although the committee held a meeting to pass on bills on Monday.

Following the statements of H. A. Wheeler and W. W. Salmon, published in last week's issue, Emory R. Johnson, professor of transportation and commerce at the University of Pennsylvania, outlined on July 24 the proposed powers and duties of the federal transportation board provided for in the conference plan, and on July 25, W. N. Doak, vice-president of the Brotherhood of Railroad Trainmen, discussed the proposed method for dealing with labor questions. Paul M. Warburg also discussed "The Re-establishment of Railroad Credit."

Judging from the attitude expressed by members of the committee in their questions of the witnesses, it can hardly be said that the committee was favorably impressed by the conference plan. Chairman Esch was naturally more interested in the plan contemplated by his own bill, although he does not claim that it completely covers the situation and he expects additions or amendments, and both he and several other members of the committee appeared strongly opposed to the idea of federal incorporation, which the Chamber of Commerce witnesses admitted was practically an essential to the successful working out of their plan. Moreover, several members of the committee persisted in regarding the proposed rate-making rule of the conference plan as a guarantee by the government of a 6 per cent return, although the witnesses repeatedly explained that the plan does not provide for a guarantee and that it neither assures a road as much as 6 per cent nor reduces its return to 6 per cent. Representative Sims, who asked the most questions, but who not infrequently does not understand what the witness is saying and has some difficulty in getting the witnesses to comprehend what he is talking about when he asks a question, persisted in referring to the plan as one for a 6 per cent guarantee, and he finally said that if no one had anything better to offer "we had better get back to the old idea that rates must be just, reasonable and non-discriminatory." The Chamber of Commerce witnesses did not always satisfy the committee with their answers. Mr. Wheeler referred many questions to other witnesses. Judge Smith had to leave the city and promised to return for questioning. Mr. Warburg completed his statement just before adjournment and was not questioned and so most of the questions were reserved for Mr. Salmon and Professor Johnson.

Mr. Salmon's statement, of which some extracts were published last week, was devoted mainly to explaining by charts and tables how the application of the plan would work out as to different roads, showing what contributions the roads earning more than 6 per cent would make to the contingent funds and what the roads would receive from the funds if they failed to earn 6 per cent. Mr. Sims asked if the Interstate Commerce Commission would not be violating a law if it failed to make rates produce an average of 6 per cent. Mr. Salmon replied that it was only to fix rates "designed" to produce 6 per cent. He doubted if there would be any legal obligation on the commission, although he thought there would be a moral obligation, to make rates high enough in one year to make up a deficiency in the previous year, and he pointed out that the contingent fund was designed to act as a "shock absorber" in case for any reason the rates failed to produce the designed return. He also pointed out that even in a year when the returns of the roads in any district fell below 6 per cent some roads would continue to earn enough to contribute something to the contingent fund. For example, he said, the Queen & Crescent in the test period earned 9.13 on its property investment, whereas the average for the roads in the Southern district was 5.36 per cent. Therefore the Queen & Crescent would contribute to the contingent fund one half of its earnings in excess of 6 per cent.

Chairman Esch asked if the commission would be expected to make up by high rates in a succeeding year for a deficiency caused by a drought or a flood. Mr. Salmon replied that the commission would probably feel in such a case that no change in rates was necessary and that the contingent fund would take care of the situation temporarily. In reply to a question as to what would happen if the plan failed to produce the desired results, Mr. Salmon said he thought that would be a failure of government regulation, not a failure of the plan. Mr. Sims asked why there should be a guarantee of an arbitrary percentage of income. Mr. Salmon replied that it was not a guarantee, but that 6 per cent had been selected because the yield of the railroads during the test period, about 5.2 per cent, was demonstrably not enough to attract investors to the railroad field and the conference thought that nothing less than the jump from 5.2 to 6 per cent would accomplish the purpose. The conference, he said, holds no brief for the investor, but 6 per cent represents its idea as to what would be necessary to make railroad investment more attractive to the investor than it has been. Mr. Sims made the point that if railroad investment is made attractive it would have a depressing effect on other industry, by subtracting from the capital available for other industries. Mr. Salmon said that would not necessarily follow, that the idea was to seek to establish some parity between the credit of the railroads and other industries. He said it was not necessary to give an equal assurance of a return to other industries because their returns are not limited by regulation. He also pointed out that the assurance of a return could not be considered to amount to a guarantee because the most prosperous road under it may be reduced to the condition of a deficit through bad management and that the investor was not entirely protected from the necessity of taking chances. He also said

that the total increase in net return over that of the test period which would be necessary to make the plan a success could be provided at an average cost to each citizen of the United States of only 2½ cents a week.

Representative Denison asked if the requirement that a prosperous railroad pay a part of its net income into the contingent fund would not make it impossible for that road to make additions and betterments out of income. Mr. Salmon thought the share which a prosperous road would retain would provide for some such investments. Mr. Denison also wanted to know whether the Interstate Commerce Commission would be required to initiate rates. The witness said that the plan only went so far as to say that in its final determination of rates the commission should try to make them produce 6 per cent.

Re-Establishment of Railroad Credit

By Paul M. Warburg

Mr. Warburg said in part:

The National Transportation Conference was guided by the fundamental thought that transportation should pay its own "board"; i. e., that the yield of transportation rates should be sufficient to pay for the transportation cost, including a reasonable return on the value of the properties devoted to the public service. If by paying higher prices for all necessaries of life the consumer bore the cost of increased wages involved in the cost of production of these articles, there is no reason why, quite arbitrarily, in the case of freight charges the principle of cost should be abandoned. There appeared no reason why this cost of transportation, forming a fraction only of the total cost of things, should be furnished at a loss, to be made good by taxation levied indiscriminately from all instead of having the transportation paid for by those directly served.

The problem of raising through taxation the gigantic sums required by the country, for interest charges and other matters affecting the national welfare, is perplexing enough in itself, and I believe the conference made no mistake in assuming that the public interest would best be served by not unnecessarily increasing the burden of taxation by arbitrarily adding to it deficiencies caused by transportation to be furnished below cost.

In the opinion of the conference, it is the object of remedial legislation to establish conditions under which the carriers as groups are certain to receive a return sufficient to cover the cost of operation, including a reasonable adequate return on the fair value of their properties; while on the other hand, such legislation must safeguard the public's interests in assuring adequate service at charges which are not excessive. Transportation must be furnished at the lowest possible price, but under conditions generous enough to preserve a healthy spirit of competition and enterprise imperative for the further development of the country.

The conference understands that it is the purpose of the Interstate Commerce Commission in the near future to define what principles it will apply in establishing the value of a railroad as a whole. It is believed that such definition will provide that a consideration of the average earning power of a railroad, for a given period of years, should be given at least the same weight as the physical value, and that the commission's definition will take into account such other elements as may be proper in determining fair value, leaving room for adjustments in individual exceptional cases.

The report of the conference assumes that a definition on these lines will be given in the near future by the Interstate Commerce Commission, or that, failing that, a proper direction will be laid down in the law.

For the purpose of discussing the final stage of the plan the conference assumed that the value of the railroads will be satisfactorily determined under due consideration of these various factors, and that a "final valuation" will have been established.

It has been the consensus of opinion of members of the conference that if private capital is to enter freely upon the venture of further developing the railroads, and if railroad credit is to be re-established on a solid basis of genuine confidence, that 6 per cent on the final valuation plus a modest share in earnings in excess of this percentage would constitute the minimum required. The chances for profitable investments in other industries are so much more attractive that the offer of a lower return would be certain to defeat the very objects to be accomplished by remedial legislation.

In formulating this plan the conference was guided by the thought that in order to attract capital for the future development of our transportation system it was neither desirable nor necessary to erect a structure of speculative investments, but rather to lay so strong a foundation for railroad securities that they would prove attractive to the investor on account of their solidity rather than on account of their speculative possibilities.

The plan does not propose to give railroad security holders much more than they get today; the increase in return necessary to balance the very delicately poised scales, when measured in dollars, is comparatively insignificant. The benefits of the plan would result primarily from the better organic structure of the whole system and from the greater confidence that it would inspire.

Through the contemplative consolidations the inequalities of distribution of earnings and profits are removed and the rate-making problem is simplified, greater clarity and a definite assurance are provided as to what once and for all shall be the return to which as a matter of acknowledged right private capital shall be entitled; and, finally, the machinery of the contingent funds is designed to give such solid stability to railroad credit that private capital may be expected to be satisfied with the prospect of an assured though not over-generous return—but one that promises to be free from the vicissitudes and uncertainties of the past.

The realization of the power of practically unrestricted regulation vested in the government naturally engendered the thought that private capital could not possibly be expected to venture freely into the field of railroading unless it were assured that this power of regulation could not be wielded in a manner to reduce the return beyond a reasonable limit.

This consideration led to the demand, by some of the most prominent students of the question, for a guarantee of a minimum return to be granted by the very government that exercises the power of regulation and of determining the return. Serious fears are, however, entertained by others lest the granting of such a guarantee might lead to incompetence on the part of individual railroads, while on the other hand it is apprehended that the incurring of a direct liability on the part of the government ultimately might lead to direct government operation, a result abhorred by the vast majority of the people.

It appears to be the general desire of the country to see the government withdraw from active business as fast and as far as possible, and the conference plan proceeds on this hypothesis. It avoids direct guarantees given to any individual railroad. It recommends a rate-making structure producing no less than 6 per cent upon the aggregate final valuation of all the railroads of a traffic section. It assures the railroads against failure on the part of the rate-making body to produce the minimum 6 per cent yield to be prescribed by the statute; but it leaves the railroads free to compete within this assured statutory minimum return for a section. Conceivably one railroad might secure a return of 6½ per cent on its valuation, while the other might secure

5½ per cent. It is left to the energy, ability and spirit of enterprise of each railroad to secure its maximum share of the aggregate assured for all. The statute would protect the carriers as a group, not as individual corporations, and this, it is believed, is one of the strongest features of the plan.

We must contemplate the project, however, in its completed form, and this would show us in each section a small number of competing consolidated railroads; the weak sisters having been merged with some of the so-called strong companies. In these circumstances a 6 per cent rate structure for a traffic section is not likely to leave discrepancies between competing companies as marked as in the past. It would seem likely that most of the consolidated railroads would come reasonably near earning their full share of the minimum.

In the case of conservatively managed and strong railroads the final valuation no doubt will in some cases produce a value in excess of the present capitalization; in others the final valuation may prove to be much lower than the capitalization—indeed, it may wipe out the entire stock and possibly some of the bonds. The latter companies, it is to be assumed, will be merged with the stronger companies by an exchange of securities on a basis to be approved by the proposed Federal Transportation Board, and presumably on a basis approximating the relation established by the valuations, or they might first adjust their capital and obligations by a process of reorganization. It is imperative that the mergers result in establishing consolidated companies whose stock will sell substantially above par, because any future plan of rehabilitating railroad credit under private ownership and private operation will fail unless the plan establishes for the railroad stocks of the future values well above par and sufficiently attractive to enable the railroads to finance themselves through sales of their stocks on such scale as is necessary to preserve a proper proportion between their outstanding bonded indebtedness and capital stock. The strongest railroad would naturally furnish the best backbone for a new consolidated system.

P. M. Warburg

In hoping that the plan as proposed will furnish a foundation strong enough to sustain the future credit of the railroads, the Transportation Conference places great faith upon the effect to be produced by the two contingent funds.

The company's own contingent fund to be maintained by each railroad is devised for the purpose of protecting the carriers against adverse circumstances unexpectedly affecting an individual company.

The general contingent fund, on the other hand, which is to accumulate to an amount of $750,000,000, is designed to make good a deficiency arising in any year when the rates fixed by the Interstate Commerce Commission do not produce a minimum return of 6 per cent on the aggregate final valuation of the railroads composing a traffic section.

To illustrate, if the aggregate valuation of railroads of a section amounted to $7,000,000,000, and if the earnings available for distribution for interest and dividends during any one year amounted to only 5 per cent, or $350,000,000, instead of the statutory minimum of 6 per cent, or $420,000,000, the deficiency of $70,000,000 would be taken out of the general contingent fund and would be distributed amongst the railroads of the section on a pro-rata basis of their gross earnings—the underlying thought being that, if the rates had been fixed in accordance with the statutory rule, each railroad would have earned so much more on its gross business. A company having earned, including such contribution received from the general contingent fund, in excess of 6 per cent on its valuation, would be permitted to retain one-third of the excess, the other two-thirds going back into the general contingent fund. Or in case it had not yet completed its own contingent fund, one-half of the excess over 6 per cent would go into its own contingent fund and one-half into the general contingent fund, in the same manner as if these earnings had originally been made through rates aggregating the statutory minimum of $420,000,000.

The plan thus provides for two shock absorbers; one against adverse circumstances affecting individual roads, and the other against miscalculations on the part of the rate-fixing body, or against unexpected emergencies bringing about such reduction in tonnage or such extraordinary conditions of operation as would render impossible a prompt readjustment through increases in rates.

The weakness of the situation in the past was due to the fact that the Interstate Commerce Commission could neither know the true value of the railroad properties nor what constituted an adequate return, and thus was put in the predicament that if it granted adequate rates to weak roads it would be overfeeding the strong ones. It was not surprising that this lack of clarity with regard to the rate-making basis had a very unfavorable effect on the public mind. The shipper was ready to believe at all times that he was the victim of extortionate rates due to excessive capitalization and over-generous return to the railroads. The obscurity as to values and reasonable returns thereon stood in the way of the clear recognition of a just course, and, in the long run, created a hostile attitude toward the railroads which resulted disastrously to railroad credit.

Under the plan recommended the rate-making body would not need to fear that adequate rates would place the strong roads in a condition of excessive or unjustifiable affluence. When once the valuations are definitely determined there cannot be any reasonable objection to industrial enterprises earning a minimum of 6 per cent and a third of moderate earnings in excess of that limit. That is less than would be required to satisfy any other industrial venture. The rate-making body could thus act with greater independence, knowing that two-thirds of the excess would go into a general contingent fund, designed to protect the general situation. The Interstate Commerce Commission, moreover, would soon realize that the general contingent fund would prove an invaluable protection for the rate-making body itself, and that

it would be wisdom on their part to build it up as promptly as possible.

When once the contingent fund reaches the amount of $750,000,000 (which, on the basis of the tabulations made for the Transportation Conference, may be assumed to take place in less than 15 years) it is proposed that contributions to the fund bringing its total above that limit could be used either for providing additional transportation facilities for the benefit of the country (be they equipment or permanent improvements) or for amoritizing the cost of the railroads. The latter process could be carried out by a pro-rata purchase of obligations of the various railroads and by a corresponding reduction in their property investment accounts. To the extent that in this manner the property investment accounts would be written down, transportation charges would be correspondingly decreased. Liberal earnings would thus strengthen railroad credit and at the same time redound to the advantage of the whole country.

While the contingent funds when completed will thus render an invaluable service in safeguarding railroad credit, the plan would show a fatal weakness in that it would not provide against the emergency of the most critical years, being those immediately ahead of us. During that period the contingent funds would as yet be practically non-existent. For this reason the Conference, very reluctantly, has reached the conclusion that it is imperative to recommend to Congress the establishment of a railroad reserve fund of $500,000,000, to be placed in the hands of the transportation board. From this fund it is contemplated such sums are to be advanced to the general contingent fund as may be necessary to make up deficiencies in case rates fixed by the Interstate Commerce Commission fail to produce in any one year, during the first 10 years after the enactment of the proposed legislation, the statutory minimum yield of 6 per cent on the aggregate valuations of a traffic section and in case the funds in the general contingent fund are insufficient to make up the shortage. Such payments from the federal reserve fund would, however, be treated as advances only; they would be paid back with interest from railroad contributions as soon as the general contingent fund had accumulated and remained at an amount of $500,000,000. It is obvious that without such federal reserve fund railroad credit could not be re-established to a degree sufficient to permit a generous development of the railroads as required in the best interest of the country.

It is very important to bear in mind that this fund may be drawn upon only in case rates determined by the Interstate Commerce Commission should not yield the statutory minimum of 6 per cent return for a traffic section, and that it is therefore, entirely within the power of the commission, unless some unforeseen events occur, to protect the situation and to avoid the necessity of payments from this reserve fund into the general contingent fund. But even if such payments should be made, they would be certain to be repaid, because the plan provides that when the railroad consolidations are completed a minimum of 5 per cent of the annual net earnings of all the railroads (that is, on the contemplated basis of annual net earnings of approximately one billion dollars, $50,000,000 per year) shall be paid into the general contingent fund in any year when the carriers receive the statutory minimum of 6 per cent. There cannot, therefore, be any doubt as to advances being repaid in the end. For the period of transition, however, this federal reserve fund would form the keystone, without which the main strength and benefits of the plan would be lost.

An appropriation of $500,000,000, even in the form of an absolutely safe loan to be repaid to the United States with interest, is not likely, at first blush, to meet with a very cordial reception on the part of Congress. But it would appear an almost paltry commitment as against the amounts involved in present guarantees and advances. And if through the plan here proposed the present perplexities could permanently be solved, it would appear anything but an excessive demand. Indeed, it may be doubted whether the amount of $500,000,000 may really be sufficient.

Perhaps I should say a further word of explanation concerning the stipulation of compulsory contributions pro-rata to net earnings on the part of all railroads to the general contingent fund. This proviso is contemplated to go into effect only after the mergers approved by the transportation board are completed. The underlying thought is that as long as there are weak and strong roads the contributions into the fund may be expected to be forthcoming from the excess earnings of the strong roads. When once the mergers are completed and the weak roads are absorbed by the strong roads, there will be a greater equalization of earnings and, conceivably at least, if all consolidated railroads earn their 6 per cent (and the rate-making body fixes rates providing no more than the statutory minimum) there would not be any excess earnings from which contributions into the general contingent fund could be made.

It is thought that when that time comes it would not be any hardship for these large consolidated companies to pay into the general contingent fund their pro-rata share (to the extent that excess earnings have not provided it) so as to make the total contribution into the fund 5 per cent of the aggregate net earnings of a section, *i. e.*, at present approximately $50,000,000 per annum.

Under the conference plan the total increase which would go to the railroads by the adoption of a 6 per cent rate-making basis is figured to amount to about $137,000,000, and of this it has been calculated that about $51,000,000 would go into the contingent fund from excess earnings of the railroads as at present constituted, so that the total increase retained by the railroads would only amount to approximately $86,000,000 per annum, on the basis of the present standard return.

The transportation conference has not left unconsidered the puzzling question of whether or not in the long run a return of 6 per cent on the final valuation might prove to be too high or too low.

It has been suggested that it would be a mistake for Congress to determine a fixed basis of return and that it should be left flexible. Were the question left open, it is to be feared, however, that the uncertainty of the past might continue to prevail and credit might not be re-established. A definite assurance seems to be necessary so that the stockholder and the bondholder will know for a certainty what their position will be in the future. It has been suggested that the law might contain a provision whereby within given periods of, let us say, 10 or 15 years, upon the certification of the Federal Reserve Board as to the relative changes of values of securities and of money, a revision might be made by the transportation board of what should constitute an adequate return; the decisive element being that no adjustments should be made which would bring the average of then existing railroad stock so nearly down to par that financing through further issue of stocks would thereby become jeopardized.

While it is possible to insert a clause of this nature, and while much is to be said in its favor, it was the feeling of the conference that a provision of this character would be very difficult to formulate and might add to the complexity of the problem; that credit would be more solidly established by providing a definite basis of rate making, leaving it to the future, in case of need, to take care of itself. It was thought that any fear that the arrangement might turn out to be too favorable for the railroads might be disregarded, inasumch as after all it was within the power of the Interstate Commerce Commission ultimately to keep the return pretty close to 6 per cent on the actual value of the properties less the 5 per cent going into the general contingent fund, *i. e.*, a net return of 5.70 per cent. If, on the other hand, the return should prove too moderate to attract new capital, the Interstate Commerce Commission could meet the situation by

greater liberality in rate making, or Congress might step in and make the necessary adjustment.

It was also discussed whether any future saving in interest on the funded debt should redound to the advantage of the country at large or the owners of the railroads. In other words, if owing to the better credit of the railroads they should be able to place their new bonded indebtedness, or to refinance maturing obligations, on a lower interest basis than 6 per cent, should the benefit of such saving accrue to the stockholder?

While if such a course were desired the statutory rate could be so fixed as to yield 6 per cent on the aggregate final valuation of the railroad properties less their funded and floating debts, and the net yield available for the railroads in that case would have to provide only for the dividends and not for the interest charges, such change seemed unwise to the conference for the following reasons:

According to the statement of the Interstate Commerce Commission for the year 1916, the interest paid (leaving aside amortization or discount written off and charged to profit and loss account) was about $474,000,000 on about $11,000,000,000 of outstanding funded debt, that is at the rate of approximately 4.30 per cent, and on this present basis the amount available for dividends amounted to only $342,000,000 on outstanding stock of $8,250,000,000, or less than 4¼ per cent on the amount outstanding and approximately 6½ per cent on the dividend-paying stocks, which amount to about 60 per cent of all the outstanding stock, according to the statement of the Interstate Commerce Commission.

These results were secured in a year when the return on the total railroad property investment account was 5.90 per cent, the highest on record, which almost equals the proposed future statutory rate-making basis of 6 per cent, and is in excess of this return, if we take into account the contribution to the general contingent fund, which would reduce the 6 per cent return to 5.70 per cent net.

Under present conditions it is doubtful whether a substantial number of railroads could sell large amounts of bonds on an interest basis netting less than 6 per cent; many, indeed, have recently financed on a very much higher basis. It is to be assumed that, if ever, it will take many years before maturing railroad bonds could be renewed on a basis better than the present average charge of 4.30 per cent. In other words, as bonds mature and as more bonds are issued, the position of the stockholder is likely to depreciate rather than improve. Inasmuch, however, as the present condition of earnings and values of stocks and bonds is such as to have brought railroad development to a standstill, it is clear that it would be fatal to cut down the very limited opportunities that have been preserved for the stockholder under the present plan. It is felt that it is the minimum below which no attempt should be made to cut his chances. Indeed, the plan may already have gone too far in this respect. As has been stated before, if stocks of the consolidated railways do not sell above par railroad development will come to a stop. And hope for success in present circumstances is predicated upon the thought that in each section there will be found some companies the final valuations of which will exceed their capitalization, so that the percentage return on their outstanding stock may be in excess of the percentage return on the valuation. Against stocks and bonds of such companies the securities of the weak sisters would be exchanged on the basis of their respective valuations, and strength accumulated in the past will thus be used to benefit and protect the future.

The alternative would be a direct government guarantee of railroad securities, which, if extended over $18,000,000,000 of stocks and bonds, would tend most dangerously to depreciate our government credit. It is doubted whether under present circumstances a 5 per cent government bond offered on so large a scale would sell at better than par, particularly if it were subject to full taxation and if every year—for additions, betterments and improvements—an additional amount approximating $1,000,000,000 were issued.

The government could not today refund the outstanding obligations of the railroads without paying a substantially higher interest charge than the carriers pay today on the outstanding debt. If the government guaranteed a certain minimum return on the stock of the new federal corporations of, let us say, 4½ per cent, the rate-making body would have to provide an adequate margin above that in order to preserve the incentive of competition, and so as to safeguard the liability incurred by the government. In other words, if the government guaranteed 4½ per cent the Interstate Commerce Commission would have to try to establish rates providing 6 per cent in order to protect the government against all hazards. The saving to the country would, therefore, be unimportant, while the loss in the government's credit would make itself felt all along the line.

It is barely possible that if consolidations should not materialize on the basis of voluntary action on the part of the railroads involved, it may prove necessary to have the transportation board itself organize new holding companies, with power to acquire by condemnation proceedings the railroads to be merged into a consolidated concern, and that in order to make these mergers possible such new federal holding company would have to issue a stock endowed with a government guarantee. Let us hope, however, that such eventuality may be avoided.

The plan has the distinct advantage that within a reasonable number of years it will free the government from any financial liability and will take it out of actual business, while on the other hand plans contemplating individual railroad guarantees are considered by many as likely to lead the government into direct and permanent railroad operation.

Interval During which Consolidations Are Being Effected and Commission Is Completing Valuations

It is obvious that ample time must be given to devise and perfect the contemplated consolidations and that a *modus vivendi* must be found for the operation of the railroads during the interval. As the Federal Reserve Act provided for an organization committee which was charged with the duty to divide the country into no less than 8 and no more than 12 districts, so our plan provides for a transportation board that shall approve or determine the number of consolidated systems and their groupings.

It shall give the railroads an opportunity, and all possible assistance, to carry them into effect. If the mergers cannot be perfected by voluntary agreement, the board, after five years, shall have power to complete them by compulsory proceedings. The board shall also have power to sustain railroad credit pending this period of consolidation.

But how are rates to be fixed and profits to be divided during the interval when valuations are not yet completed and not available to serve as a basis for rate making and division of excess earnings? It is conceded that any basis during this period will have to be somewhat arbitrary and cannot be entirely satisfactory. But the report appears to have established a method as fair and equitable to all as possible in the circumstances. As a general basis for rate making it is proposed to use the aggregate property investment accounts of the railroads of each traffic section, as at present carried by the Interstate Commerce Commission. While it is admitted that these property accounts, taken individually, in some cases are too high and in others too low, it is generally assumed that considered as a unit they may be accepted as furnishing a fairly accurate basis to be used as a temporary yard-stick.

When dealing with individual roads, however, the often highly arbitrary investment account cannot be safely accepted as a basis for determining excess profits. The report,

therefore, recommends that for the purpose of ascertaining excess income the valuation of any individual railroad system, pending the completion of the final valuation, shall be that proportion of the aggregate property investment accounts of all the railroads of the traffic section in which it is located which its average annual railway operating income (computed for the period and in the manner prescribed by the federal control act of March 21, 1918) bears to the aggregate annual railway operating income of all the railroads of such traffic section, computed in the same manner.

It has been figured if the law as proposed went into effect, that on a basis of one-third to the railroads and two-thirds to the general fund (after the individual contingent fund had been filled) the result would be approximately as follows (in million dollars):

Section	Present standard return	Increase to 6 per cent on aggregate investment accounts	Increase	Retained by railroads after turning over two-thirds to gen. ctg. fund	Increase to railroads	Turned into general ctg. fund
Eastern	354	408	54	390	36	18
Southern	139	156	17	149	10	7
Western	402	468	66	442	40	26
	895	1,032	137	981	86	51

To these figures there would have to be added the return of 6 per cent on additional investments (since June, 1917) not compensated for by the present standard return, and there would have to be such adjustments as the transportation board would make.

In this manner a capitalization of earnings has been substituted for the highly arbitrary basis of individual property investment accounts. The only use of that account is made in this plan by providing that where the temporary earning valuation is higher than the existing property investment account, that account is to be used as the basis for determining excess income.

It is believed that the provisions of the plan will afford railroads during the ensuing years of the interval a sufficient strengthening of their credit to enable most of them to carry on their financial and physical operations until the mergers are completed.

Where immediate financial assistance by the government is required the report recommends that provision be made to enable the transportation board, directly or indirectly, through the War Finance Corporation, to extend temporary support to particular systems.

I cannot help feeling that in the public mind a mistaken emphasis generally is being placed both upon the effect of cost of transportation upon the cost of living, and also upon the part played by the cost of capital as a factor contributing to the cost of transportation.

If, quite arbitrarily, we assume that the cost of things produced per year in the United States amounted to something like $60,000,000,000 or $70,000,000,000, the total cost of transportation would amount to only 5 per cent of the cost of all things produced. An increase of 20 per cent in the cost of transportation would, therefore, represent an item of no more than approximately 1 per cent of the cost of things in general, even though in the case of certain articles transportation constitutes a much larger share of the cost of production. I cannot follow the theory propounded by some that the cost of living would be raised to an extent equaling four times the amount directly involved in the increased cost of transportation. If the price of coal rises due to increased wages both in mining and transporting, why should one increase in wages have a different effect than the other?

It would be well for us, however, to bear in mind that in a period during which the index prices for commodities show an increase of 200 per cent, the rates charged for the transportation of passengers, according to recent statements, increased only 40 per cent and of freight only 20 per cent, or, as it has been cogently expressed, "a ton of any given commodity will at present purchase more transportation than it could at any previous time."

Finally, when we remember that the annual increase in return contemplated in our plan equals about one-tenth of the increase in wages authorized by the railroads since the beginning of the war, we cannot escape the conclusion that the adequate return to be allowed to the investor plays only a comparatively unimportant part in the whole situation.

May I venture to remind you, moreover that it would be a misfortune if remedial legislation were passed which did not go to the root of the evil—legislation of a palliative character, or that was but temporary patchwork, and would leave unsolved a question certain to grow increasingly difficult.

Functions of the Federal Transportation Board

By Emory R. Johnson

The functions of the proposed transportation board were outlined by Professor Johnson in part as follows:

The regulation of railroads by the federal government will be more comprehensive and detailed in the future than it has been in the past. When private operation is resumed, the government's relation to the railroads will be much more than corrective in aim, it will be co-operative. Regulation must become increasingly constructive—positive rather than negative in purpose and method.

The people are looking forward to an even better railroad service than they have enjoyed in the past. They believe it will be possible for all railroads to render a service as excellent as that which has been performed by the strongest and most efficient systems. To make this possible, however, the number of railroad systems must be reduced by the grouping and consolidation of existing roads in accordance with plans approved by public authority. Competition is not to be abandoned, but it is no longer to be a struggle of weak roads to maintain themselves alongside their strong and jealous neighbors; it is to become the service rivalry of a limited number of vigorous systems of approximately equal strength.

The strong railroad systems formed by the grouping of existing railroads ought not to be owned and operated by corporations subject to the authority of the several states. These powerful corporations must in the public interest be brought under the jurisdiction of the United States. It is believed by the transportation conference that this seemingly difficult task can readily be accomplished by the enactment and enforcement of a federal railroad incorporation act similar in principle to the national bank act by means of which state banks are converted into federal institutions.

The capital expenditures and the security issues of the consolidated railroad companies of the future are certain to be regulated by the United States government. The agency that performs this task will render the country a great service. In passing upon capital expenditures of the railroads, public authority will sit in judgment upon the wisdom or unwisdom of proposed railroad improvements or extensions and will in effect determine the lines of development of the American railway system as a whole. Through the exercise of this authority it will be possible for the government to bring about gradually the unification and the economic development of railroad terminal facilities and services, to prevent the unnecessary construction of new lines, to require the physical connection of railroads and, if Congress so wills, the connection and joint use of railroads and waterways.

Through its regulation of rates and fares the government has already come to determine the revenues of the railroads. In the future, in larger measure than in the past, the expenses of the railroads will depend upon the requirements made by the regulatory authorities of the government. It is obvious that Congress and the administrative agencies it creates must assume responsibility for the adoption and en-

forcement of measures that will not only assure the financial stability of the railroads, but will also enable the companies to acquire and maintain such credit as will enable them to secure from the investing public the funds required for the adequate development of the country's railroad transportation system. Unless the private railroads under government regulation can thus secure capital from private investors, government ownership must necessarily follow.

Broadly speaking, there are three tasks of major importance that must be accomplished to bring about the permanent solution of the railroad problem and to insure the success of government regulation of railroads. The existing railway systems, many in number, and of varying degrees of weakness and strength, must be brought together into an appropriate number of vigorous competing systems; the corporations which control these large systems must owe their allegiance to the federal government and observe its requirements as to expenditures, capitalization and corporate practices; and laws must be enacted and enforced that will assure to the railroads adequate revenue, financial strength and harmonious relations with their employees and with the public. These tasks can not be accomplished unless Congress provides appropriate and effective machinery for giving effect to legislative policy. Railroad regulation is an executive problem. Its success depends upon the creation of an administrative agency with responsibilities and powers commensurate with the magnitude of the work to be done and vested with that freedom of initiative and action that will cause it to organize and to function as an effective executive body.

The plan developed by the National Transportation Conference calls for the establishment of an administrative agency of large powers and heavy responsibilities. The conference does not favor placing those powers and responsibilities in the hands of a cabinet officer. The members of the President's cabinet hold office for a comparatively few years. They are inevitably selected in large part because of the prominent place they occupy in the counsels and activities of the political party in power. They are political appointees and their administration of the railroads would almost certainly be political. The adequate development and the technical efficiency of the railroads and other agencies of transportation are of such vital consequence to the people of the United States that it would be a public misfortune to allow political methods and party politics to control or even largely to influence the regulation of transportation agencies.

The conference has, moreover, after very careful consideration of the subject, reached the conclusion that it would be unwise to require the Interstate Commerce Commission to exercise the administrative functions that must be performed to insure the success of railroad regulations.

The conference recommends that a Federal Transportation Board be established. It should be an executive board, of at least five members, and should be charged with the responsibility both of administering the act which Congress shall adopt for the regulation of railroads and of bringing about the co-ordinated development of a national system of rail, water and highway transportation. The proposed board should not be entrusted with the regulation of rates—that should be left with the Interstate Commerce Commission; nor should the proposed board be concerned with the construction of waterways and highways, which work should be done by appropriate agencies especially created by Congress. The following specific duties should be performed by the Federal Transportation Board:

1. The Board should determine and announce the grouping or consolidation of railroads deemed to be in the public interest. An opportunity and incentive should be given existing railroad companies to effect the desired consolidations upon their own initiative; but if the desired mergers are not thus accomplished by the railroads within a reasonable time, the transportation board should have the power to carry out the plans authorized by Congress for merging all railroads engaged in interstate commerce into a limited number of strong systems so located that each important traffic district of the United States shall be served by more than one system.

2. The board should have the authority to require, if compulsion is found to be necessary, the railroad companies, as a condition precedent to the formation of consolidated railroad systems, to become federal corporations, either by the organization of new companies under federal charters or by changing from state to federal corporations in the manner suggested by the transportation conference.

3. The transportation board should be given authority to pass upon the public necessity for the expenditure of capital (in excess of a minimum amount stipulated by statute) by all carriers by rail engaged in interstate commerce.

4. The board should administer the general railroad contingent fund or funds which must be built up and maintained as a means of strengthening and stabilizing railroad credit. Instead of the fixed guarantee by the government, the conference favors a statutory rule of rate making that will yield the railroads, as a whole, a fair return upon the value of their property devoted to the public service; and, in order that railroad credit may really be put upon a sound basis without imposing unreasonably high rates upon the public, the conference recommends that railroads be required to turn over the larger part of their excess profits into contingent funds which shall act as financial shock absorbers.

5. The transportation board should act as a referee in cases of disagreement resulting in a deadlock of any of the boards which it is proposed shall be entrusted with the adjustment of wages, hours of employment and other conditions of the service of railroad employees. It is the hope of the conference that the disputes between the railroad companies and their employees, which have in the past on more than one occasion threatened to paralyze the industries of the country, may be avoided in the future by continuing the method of adjusting wages, hours of labor and conditions of service that was adopted in 1917, and has been continued and developed by the Railroad Administration.

6. The conference recommends that each of the corporations owning and operating the proposed consolidated railroad systems shall organize with directorates of 12 members, "one of whom shall be a representative of the employees of the system, and nominated for that position by such employees, and three of whom shall be selected by the Federal Transportation Board to represent the principal interests involved in the territory served by such system." The directors thus selected are to make regular and special reports to the transportation board in accordance with the rules laid down by that board.

7. The transportation board should be authorized and required to inquire into the practices of railroad management and to propose measures for preventing abuses therein. Because of the incompleteness of past regulation of railroads, the financial and other practices of those irresponsible and unscrupulous men who unfortunately are to be found in limited number in practically every line of business, have brought ruin upon some American railroad systems and have injured the security of all railroad companies in the mind of the investing public. It should be the aim of the transportation board to promote the legal and moral responsibility of railroad directorates and railroad executive officers with a view to protecting the funds that have been invested by the public and to make railroad securities safe and attractive investments for the accumulating wealth of the nation.

8. The plan provides that "It shall be the general duty of the board to promote the development of a national system of rail, water and highway transportation." The United States, as a result of the initiative of its business men, has an ex-

cellent system of railroads. Highway development, although long neglected, is now proceeding rapidly and motor transportation is being organized on a large scale. The country is supplied with numerous waterways capable of large traffic uses when systematically developed and properly co-ordinated with the railroads. What is now needed is a transportation board vested with the power, and charged with the duty, of bringing the railroads, the waterways and the highways together into a national transportation system. The railroads and waterways must be connected at river, lake and ocean terminals, through routes must be established, through rates provided, and opportunities afforded shippers to despatch their goods on through bills of lading by such a combination of rail, water and highway carriers as will be most efficient and economical. This integration of the different parts of the national transportation system can be brought about only by creating some single agency with authority over the use of railroads, waterways and highways.

In creating the Federal Transportation Board it will be desirable to provide against conflict of jurisdiction between that board, the Interstate Commerce Commission and the Shipping Board. It would not be desirable to create a board that will encroach upon the work now performed by the Interstate Commerce Commission or that will interfere with the activities of the Shipping Board. What is needed is a board that will supplement and co-ordinate the activities of the Interstate Commerce Commission, the Shipping Board and certain other agencies of the government. The mind of the Interstate Commerce Commission is now, and should continue to be, upon the regulation of railroad rates and the determination of the value of railroad property. The Shipping Board is temporarily devoting itself mainly to the construction of vessels, but when war conditions end it will seek to apply to the business of ocean transportation the general principles of regulation that have been applied to railroads with such modifications as are made necessary by the differences between ocean and rail transportation.

The necessity for a Federal Transportation Board may be clearly indicated by a reference to the present regulation of terminal facilities and services. The Interstate Commerce Commission has certain authority over railroad terminals and the Shipping Board has limited powers over persons engaged in the performance of terminal services at ocean ports but neither body has adequate power at the terminals where water and rail carriers come together. There is no authority that can unify terminal operations, that can bring about the physical connection and the traffic articulation of rail and water carriers.

There is no authority having the responsibility of formulating plans for the systematic development of transportation facilities by rail and by water. We shall always have a disconnected and uneconomical system of transportation in the United States until we create a board whose mind shall be upon the whole transportation problem.

The board entrusted with the duties that have been briefly enumerated should be composed of men of the highest character and attainments. Their responsibilities will equal, if not exceed, those of the Federal Reserve Board, whose creation at a critical period in the history of the United States has proved to be of incalculable benefit. The proposed Transportation Board will have an opportunity to perform an even greater service. Its duty will be to guide and facilitate the development of a truly national system of transportation.

Chairman Esch asked the witness if he realized that there was a deep-seated prejudice against the creation of additional governmental boards. Professor Johnson said he realized it, but thought that in this case it was justified because the main work of the commission is semi-judicial in character and it could hardly function as an efficient executive body without interfering to some extent with the best results in its rate-making functions.

Bi-Partisan Labor Boards

By W. N. Doak

W. N. Doak, vice-president of the Brotherhood of Railroad Trainmen and member of the Railroad Administration's Board of Adjustment No. 1, told the committee that he was in favor of the Plumb plan of government ownership of the railroads and therefore was not committed to the conference plan as a whole, but he had been asked to discuss the section of the plan proposing a method for adjusting labor controversies which had been adopted by the conference largely on his suggestion. The conference favors the adjustment of wages, hours of labor and other conditions of service of railroad employees by boards consisting of equal numbers of representatives of employees and officers of the railroads, with appeal in case of disagreement to the federal transportation board as referee. Mr. Doak explained the origin of the plan of bi-partisan labor boards which was adopted by the Railroad Administration. On the same day that the Supreme Court upheld the Adamson law in 1917 the railroad managers and the brotherhoods reached an agreement and in connection with its application to 1600 different schedules it was decided to appoint a Commission of Eight, consisting of four representatives of the managers and four of the brotherhoods, whose duty it would be to apply the principles of the agreement and the law to the different schedules and settle all controversies. This commission was in existence for about a year and had before it between 30,000 and 40,000 disputes, but it was able to reach unanimous decisions except in a very few cases. At the time that the idea of compulsory arbitration was being seriously considered the brotherhoods advocated the bi-partisan plan instead and after the organization of the Railroad Administration it was decided to create a new board to take the place of the Commission of Eight, but organized along the same lines. Railway Board of Adjustment No. 1 was created by an agreement entered into between the regional directors and the executives of the brotherhoods approved by the director general in General Order No. 13, and was organized with four representatives of the managers on one side and four representatives of the brotherhoods on the other. From its organization in April, 1918, up to July 24, 1919, it had handled about 1100 disputes involving nearly every form of imaginable disagreement as to discipline and schedules without a dissenting opinion and in practically all cases with a unanimous decision of the board. Later Board of Adjustment No. 2 was created to deal similarly with the shopmen, and Board of Adjustment No. 3 to deal with other classes of employees. In General Order No. 27 the director general also provided for the creation of a wage board composed of three representatives of the employers and three of the employees to investigate wage questions and make recommendations for the decision of the director general, but the boards of adjustment were given the power of final decision except in the case of a deadlock, when the director general has to act as a referee. In cases involving an interpretation of wage orders they also make recommendations to the director general, but it has never been necessary to call upon him to act as referee. He said that the members of the board continue their connections with their organizations and are paid by them, while the office expenses, etc., are paid by the Railroad Administration, and this connection with their organizations, he thought, made it possible for them to get information and to keep in touch with the situation in a way that would be impossible for a purely governmental board. The plan had been entirely successful, Mr. Doak said, and in his opinion a similar plan could be worked out

with equal success under either government control, private ownership or government ownership. It has been tried out so far under both private ownership and under government control. He declared that the four representatives of the railroads have met the representatives of the brotherhoods in a most broad and liberal manner and that it was surprising how easy it was to reach conclusions after having heard the arguments. Asked who would be the referee, Mr. Doak said that the conference plan proposed that the federal transportation board would act, whereas under the Plumb plan the board of directors would act, and he assumed that under any plan there will be some kind of a board or tribunal which could act as referee because past experience shows it would have practically nothing to do. He thought practically all railroads and labor organizations would come in in such an agreement because the two boards could make it uncomfortable for any to stay out. He strongly urged that Congress should not attempt to provide for anything further than voluntary arrangements of this kind. He did not believe a purely governmental board would work or that the practical men such as now constitute the boards of adjustment would serve on a governmental board. "We are all American citizens," he said, "and you can lead us to most anything, but you cannot drive any of us," and he thought a simple declaration by Congress providing for the creation of such boards and leaving the details to be worked out by the employees and the employers would get the best results. He would not interfere with the present Board of Mediation and Conciliation, which he said has adjusted more disputes than were ever settled by legislation and which would be very useful in many cases, and he would also retain the provisions of the Newlands arbitration law.

Members of the committee were apparently very favorably impressed with Mr. Doak's suggestions, and Chairman Esch asked him to draft a section for the bill to carry out his ideas and to provide who should be the referee. Mr. Esch said that his own bill has made no provision for settling labor disputes, but he recognized that the matter was an important one and said the committee was very receptive to suggestions along that line because it is anxious to have some satisfactory plan suggested. Mr. Doak said he thought it did not make much difference what tribunal is stated as the referee, but when Mr. Esch suggested the Secretary of Labor he was inclined to think that was not desirable because the railroad men have never been under the Department of Labor or had much to do with it. In reply to a suggestion that the President might appoint a referee, Mr. Doak said that whoever is appointed should be permanent rather than appointed for each occasion because he would gain experience. Mr. Esch asked whether the success of the bi-partisan plan under the Railroad Administration had been due in any degree to the fact that the representatives of the railroads realized that they were under federal control and the roads were guaranteed a return. Mr. Doak replied that he thought the railroad managers would be equally broad-minded even without the government guarantee. He said that 65 per cent of the cases his board has passed on had originated prior to government control and in a very large number of cases employees had been reinstated and been awarded back pay which would have to be paid by the corporations and he had never seen any difference in the attitude of the managers toward paying out corporation money or paying out government money.

Representative Sims said that under the conference plan neither side would have any interest in holding down wages because it would be the duty of the commission to make rates high enough to pay them in any event. To this Mr. Doak replied that when the organizations had gone to the Railroad Administration for increases in wages it had encountered the same railroad men who had always opposed them and that they were able to present as strong arguments for their side as before, but that when practical men representing the two sides got together they were able to reach an agreement. If the judgment of six or eight practical men from both sides cannot be taken, he said, he feared that a satisfactory decision could not be obtained from the Interstate Commerce Commission or any body "that knows nothing about wages."

Mr. Doak urged strongly that the power of appointment of members of the board should not be given to the President or made in any way dependent upon Congress, because it should be removed absolutely from the field of politics. If Congress had anything to do with it, he said, every time a man got an adverse decision he would insist on his Congressman demanding a Congressional investigation.

Most of the discussion related to the kind of disputes arising out of interpretations of schedules and discipline that are passed upon by the boards of adjustment rather than to the question of passing on large increases in wages amounting to hundreds of millions of dollars. Mr. Doak was not asked whether the wage questions which are passed on by the Board of Wages and Working Conditions only in the form of recommendations to the director general, who must decide whether he can spend the money, are handled with complete success, nor did he refer to the question of time and a half for overtime in train service which was referred by the director general to Board No. 1, which rendered conflicting reports, putting the decision back up to the director general.

Representative Stiness pointed out that wage schedules provide differentials between classes of employees, but asked how they provide for discrimination between a good man and a bad man. "The only way is to tie a can to the bad man," said Mr. Doak, "and that is done quite frequently." Mr. Stiness also pointed out that stabilizing wages does not seem to prevent the men from asking for another increase within a short time. Mr. Doak said that was because wages never had been made high enough and that under the former plan they remained unadjusted for years until the grievances had accumulated sufficiently to cause a crisis, whereas a wage board that would be constantly sitting and adjusting wage questions from time to time instead of waiting until they accumulate into a big controversy, would produce more satisfactory results.

"The fact is," he said, "we have had too much publicity. The people got unduly alarmed in 1916 because they were afraid they would wake up some morning and not find their milk. They might not have had any milk on the morning of September 4, 1916, but they would have had it by noon because the question as to who was bluffing would have been determined inside of four hours."

Mr. Doak insisted that the increase in freight rates made necessary by the increase in wages was in no way responsible for the increased cost of living. He said he knew many people who were just existing even on what are now called high wages and he did not see how any family could live on less than $150 a month. He said he sympathized greatly with the director general in his difficult problem of handling both wages and rates. Mr. Stiness referred to a statement circulated by the American Federation of Labor that the law of supply and demand could be repealed by legislation and asked if Mr. Doak agreed with that idea. Mr. Doak said that he would require at least half a day to answer the question, but that he sometimes thought it would be better to let the law of supply and demand alone. He said during the war it seemed as if something ought to be done and Congress reduced the price of wheat and of flour, but he never saw any cheap bread resulting from it. He declared that wages have never been anything like as high as they ought to have been and that in the case of railroad men their working life is so short that they ought to be able to accumulate enough

to provide for the years when they can no longer work. Mr. Doak argued strongly against the idea of compulsory arbitration. It might be possible to prohibit an organized strike, he said, but it would be impossible to prevent men from quitting work individually.

The Amster Plan

When the hearing was resumed on Tuesday, Nathan L. Amster, president of the Citizens' National Railway League, outlined and strongly argued for his plan for having the equity of the railroad stockholders acquired at a valuation fixed by a valuation commission, taking into consideration original cost, replacement cost and earning power, and taken over and operated by a corporation whose board of directors should be elected by the various interests, giving the security holders only one-third of the membership. He proposed that the bonds should not be disturbed, unless they represented more than the value of the property, and that the new corporation should issue stock in exchange for the stock of the railroad companies. The Interstate Commerce Commission would be required to make rates sufficient to pay 6 per cent on the stock, or 4½ or 5 per cent if it should be decided to have the government guarantee it, and any excess over 6 per cent should be divided under a plan which would provide for profit sharing with labor or a reduction of capitalization and rates. Mr. Amster declared that the railroads are the most democratically owned industry in the country, saying that more than one-third of the population has its savings invested directly or indirectly in railroads, that it is the only industry that has every individual and every other industry as its client, and that it is second only to agriculture in the percentage of its product which is represented by labor. He declared that 80 per cent of the railroad service is represented by labor. Mr. Amster also said that any deficit resulting from railroad operations is merely a subsidy paid by the people as a whole to the industries that do not pay their fair share of freight rates. He said his plan would give to railroad security owners a square deal which they have not had for years and that they will not put any more money into the railroad until they get it. He described his plan as a middle course between government ownership and "taking off the lid," to leave the investor to take his chances of loss or of large gains. This plan, he said, is no longer possible.

The New England Plan

E. J. Rich testified on Wednesday, saying in part:

No railroad plan can meet the necessities of the public which does not provide for the establishment of the credit of substantially all important railroads. In the past credit has been established only through surplus earnings. The old plan has failed because of the unwillingness of the Interstate Commerce Commission to establish a basis of rates which will give adequate earnings to the weaker lines. This attitude of the commisison has a large measure of justification because a basis of rates which would give adequate earnings to the weaker lines would give unnecessarily high profits to the stronger lines. So long as there is competition, and consequently strong lines and weak lines, the credit of the weak lines must be established in some other way than through earnings and rates.

The main features of the plan are as follows:

1. Any railroad finding itself unable to issue its capital stock at par may apply to the government for the guaranty of its loans necessary to raise money for the physical improvement of the property. The government, through some agency—perhaps the Interstate Commerce Commission—shall then appoint two public directors, who shall have equal votes with other directors, except on the question of the necessity for improvements to be financed by these loans, and in reference to those their decision will be final.

2. Prior to the great war investigation showed that a railroad in order to put out its stock at par must show earnings of substantially 9 per cent applicable to the stock. It is proposed that when a railroad earns more than 9 per cent it shall divide the surplus above this amount with the government.

For the years 1915, 1916 and 1917, the average annual aggregate deficits of those railroads having deficits—that is, insufficient income to pay operating expenses and fixed charges—amounted to $22,000,000. The annual average share of the surplus which the government would receive under this plan amounted to $52,000,000.

3. Congress should give a mandate to the Interstate Commerce Commission that the margin of safety of the government share of the surplus over the deficits which it would be obliged to meet should not fall below a stipulated sum, say $25,000,000; and if it were thought advisable a maximum sum could be given, say $50,000,000. Of course the mandate should include the words, "as near as may be." This margin of safety should be the average margin of safety over a period, say, of three years. Under this mandate no possible loss could fall upon the government.

4. The railroad seeking a government guaranty should establish a sinking fund for the retirement of the obligations at maturity. A payment into this fund of one-half of one per cent per annum would retire a 50-year bond. Therefore, no loss would fall on the government on account of failure to meet obligations at maturity.

The following are the advantages of this plan:

1. Every railroad could raise the necessary capital for improvements, and thus every community would receive proper transportation service.

2. This result is obtained at the least possible cost to the shippers, for there is no necessity to raise rates to the point necessary for the establishment of credit of all railroads through earnings.

3. The strong roads would continue to finance their own requirements, and the weak roads would be entirely free from the unwholesome domination of banking interests.

4. Competition is preserved, and with it private initiative.

5. One of the most important advantages of the plan at the present moment is that it can be put into immediate effect. If other plans are thought as the ultimate solution, such, for instance, as the consolidation of weak lines with the strong lines, or the fixing of rates so as to give a return upon the valuation of railroads as found by the Interstate Commerce Commission, the railroads are relieved from the menace of bankruptcy and become at once an effective agency of transportation. Too much stress can not be laid upon this point for the railroads are faced with disaster unless some adequate plan is put into effect at once.

6. Fictitious capitalization is not recognized in rate making. No serious charge of over capitalization has been made against the strong lines; it is the weak lines which have been subject to this criticism. No attempt is made to establish rates so as to give the weak lines credit—credit is given by the government guaranty.

The subcommittee of the Senate committee on interstate commerce, appointed to draft a tentative railroad bill, has held numerous meetings and has had before it Director General Hines, C. A. Prouty, director of the Railroad Administration Division of Accounting, and Paul M. Warburg. These men have conferred with the committee regarding various phases of the proposed legislation but not in a formal way as at a hearing and no record has been taken. John E. Oldham, of Boston, Mass., and S. Davies Warfield have conferred with the Senate sub-committee on the railroad bill.

The House is to recess on August 2 until September 9, but the railroad hearing before the committee is to continue.

Some Chapters in Canadian Government Ownership*

Temiskaming & Northern Ontario Has Never Earned Its Fixed Charges—Disfranchisement of Railway Employees

By Harold G. Villard

III

UNLIKE THE OTHER British North American colonies which first joined the dominion, Ontario has only very recently become possessed of a government owned and operated railway. With the object of having the agricultural lands lying west of Lake Temiskaming opened up for settlement, the Ontario legislature some twenty years ago chartered several private railway companies to build through this then undeveloped territory. As these corporations failed to commence construction, and as it was feared that the trade of the district would drift to Montreal in the absence of a connection with the railway system of Onario, the Liberal provincial government announced in 1901 that it would cause a survey to be made in order to ascertain the cost of building a railroad into the region in question. While the line was to be constructed with the funds of the province, which was to retain control over transportation rates, the road, it was intimated, might be leased on completion to a large railway system like the Grand Trunk.[1]

A year later when the surveys were further advanced, a bill was passed under government auspices authorizing the construction in the public interest of what has since been known as the Temiskaming & Northern Ontario Railway.[2] A board consisting of three commissioners was appointed to build the new avenue of transportation and to construct telegraph and telephone lines in connection therewith. For each mile of railway built, 20,000 acres of public lands were to be set aside and the proceeds derived from their sale used to retire any bonds issued for the construction of the road.

The first board of commissioners decided to have the railway constructed by the contract system rather than directly by its own officers. This method of construction has been followed in the main ever since. As to the kind of road to be built, "the decision of the commission, which was concurred in by the government, was that a railway should be constructed which would be creditable to the province and which would conform to the standard of a trunk line, having regard at the same time to proper economy in every direction."[3] In other words, the first section of the road between North Bay and New Liskeard was located as a colonizations road where an adherence to uniform and definite grades was not required. The cost of this first section of 112 miles complete, with a suitable equipment of rolling stock, was estimated by the commission at $29,755 per mile.[4]

Even before this first section was completed, however, the Ontario administration decided to extend the provincial railway some 140 miles further to the town of Cochrane so as to form a connection with the newly begun National Transcontinental railway planned to run through the Northern wilds of Ontario. It was determined that this extension should be built up to the standard adopted for the National Transcontinental and with ruling gradients of 0.5 per cent. north bound and 0.4 per cent. south bound. Hence, the first portion of Ontario's provincial railway is of inferior construction as compared with the second, and will require an expenditure of $2,263,000, as estimated in 1912, to make its gradients correspond with those prevailing on the second section from New Liskeard to Cochrane.

Just about the time the first section reached completion, a change of government took place. After having been in power for a third of a century, the Liberals were replaced by a Conservative ministry inclined to favor government management and control of public utilities. Although the services of all the then employees on the railway were retained, the Liberal railway commissioners felt constrained to resign and were promptly replaced by three Conservative appointees.

New Government Charges "Mismanagement"

Shortly after the new government assumed office, it announced that "the whole Temiskaming Railway has been mismanaged" by its predecessors—and that, owing to the construction of unnecessary trestle work and other unserviceable expenditures "the railway has cost far more than it should have cost." In place of the first section being completed for $30,000 a mile as originally anticipated, its cost had attained in 1907 $46,200 per mile. The causes for this greatly increased expenditure were explained by the provincial treasurer as follows:

> "The road was very poorly laid out, and the engineering was bad, and during the past three years there has been a large amount expended on the first division in order to put it into a proper state for operating. In places the rock cuts were as narrow as three to four feet from the rails. They should be at least five or six feet from the rails in order that the sway of the train may not result in striking a rock. A large expenditure has been made in clearing these rock cuts and making them safe. Further than that, the road was not properly laid out. It goes west on a grade of 1½ per cent, and east on a grade of 1¼ per cent, and the result of this is that it is impossible to take more than nineteen or twenty (freight) cars on one train."[5]

Besides making good the deficiencies in the construction of the first section, the new provincial government proceeded energetically with the construction of the remaining portion and at the close of 1908 had the entire main line in operation. On October 31, 1916, the Temiskaming & Northern Ontario railway system, including branches, comprised 344 miles and represented a capital expenditure on the part of the Province of $21,183,687.50, or at the rate of $61,412 per mile[6] This cannot be regarded as an especially low capitalization.

Road Never Has Earned Fixed Charges

While not an inexpensive line to build, the Temiskaming railway has a relatively large freight and passenger traffic. This is due to its serving the highly prosperous Cobalt mining district. Yet despite this favoring circumstance and the fact that its net earnings have been swelled almost one-fifth by the proceeds of town lot sales and by royalties on rich silver ores found along its right of way, the road has never as yet met its fixed charges. When it was completed, however, the contrary was anticipated. "The government railway seems likely to become a permanent source of revenue to the province. We shall be able to obtain annually from the net earnings of the railway a sum quite sufficient to pay

*Earlier articles in this series were published in the *Railway Age* of July 18, 1919, page 119, and July 25, page 158.

the interest on the cost of the road so that it shall not be a charge on the province or otherwise."[7]

Instead of this desired state of affairs being attained, the net earnings of the road—even after including receipts from ore royalties and town lot sales—have not sufficed since its opening to pay a return of two-and-a-half per cent. on the capital invested in this government enterprise.[8] As against $510,000 derived from net earnings, the Province during the fiscal year 1916-1917 was obliged to pay out $825,000 for interest charges on the sums borrowed for the construction of the Temiskaming railway.[9]

This unsatisfactory showing is almost entirely ascribable to the fact that the provincial railway is not run on commercial lines. On May 20, 1912, and at a time when only two-thirds of the fixed charges of $625,000 per annum were being met, "all freight rates on this railway were revised and a general reduction made."[10] Concerning these new rates, the Temiskaming Commission a year later unbosomed itself as follows:

"Pulpwood, lumber and other forest products, coal, coke, stone, sand, etc., constitute this year almost 70 per cent of the entire tonnage handled. On all of this traffic the earnings are very much less than the actual operating cost of hauling the freight, and on some of it, particularly on pulpwood, the earnings are less than half the actual operating cost * * * Whereas other railways in Eastern Canada apply what is known as the standard mileage tariff to local traffic, the Temiskaming Northern Ontario Ontario Railway has adopted what is known as Schedule A, being a basis approximately 25 per cent less than standard mileage."[11]

Had this reduction in freight rates not taken place, the earnings of the Government railway since 1912—which have averaged $1,750,000 per year—might have been sufficiently increased to have met nearly all of the bond interest charged against it instead of less than two-fifths as has been actually the case. Instead of running the road on a business basis, however, and charging what a given traffic is worth, lower rates for freight have been introduced than prevail on other privately owned lines in Ontario and the provincial treasury is forced to make good the resultant difference. In other words, those living along the Temiskaming railway are favored with cheap transportation rates for their goods at the expense of the general taxpayers.

According to the officials of the Ontario government, politics play no part in the conduct of the Temiskaming railway. If the opposition party is to be believed, however, the provincial railway is merely an adjunct of the Conservative party machine. It is claimed that the patronage system with all its evils is in vogue and that only government followers are eligible for appointment to positions or are awarded contracts for supplies. Color is lent to this assertion by the fact that the government at a 1917 session of Parliament refused to permit the passage of a resolution calling "for the purchase of all supplies for the public service on a business basis regardless of the political or peronal affiliations of the vendors," and providing further "for the abolition of the patronage system and the creation of a Civil Service Commission to make appointments and promotions in the civil service by merit."[12]

Use of Road for Political Purposes

That the Ontario government is not above using the railway to advance its own political fortunes was brought out at the time when the building of the branch to Elk Lake was decided upon. Surveys for this extension of 29 miles were first made in 1909, but led to no result either then or in the following year. When, however, a parliamentary election was to be held in the Temiskaming district in December, 1911, the government caused a new reconnaissance to be made in the month of November[13] and the location of the line to be definitely determined. Just a few days previous to the election, the prime minister of Ontario sent a telegram to a supporter reading "it is true that the government has decided to build a branch line to Elk Lake." Asserting that this communication had been timed so as to decide the election in favor of the government, the opposition scored the then premier for having used the announcement of the construction of this extension as a bribe to the electorate In the words of the opposition leader:

"The people of Elk Lake had repeatedly requested the government and the commission to give them that extension Then when the contest was going sore with the government candidate in Temiskaming, a week before election came the announcement that this Elk Lake branch would be built. The Conservative agents took telegrams to this effect and showed them to the people, saying: 'Unless you elect a supporter of the government the line will not be built or will be greatly delayed.' "[14]

While stating all such strictures to be unjustified, the Ontario authorities acknowledge that there has been "some criticism of the Temiskaming & Northern Ontario management to the effect that items were being charged to capital that were legitimately chargeable to maintenance."[15] In the early history of the road, too, no proper allowance appears to have been made for depreciation of equipment. When in the fiscal year 1911-12, the operating expenses swallowed up nearly 15 per cent. more of the gross earnings than in the year previous; the commission reported that this higher expense ratio was due to a considerable extent to the fact that "since the first of the current fiscal year, there have been written off monthly charges for depreciation of the different classes of equipment and credited to appropriate depreciation accounts to provide for replacement."[16]

It is a difficult matter to determine whether these various imputations on the conduct of the Temiskaming railway are justified or not. For unlike what occurs in the dominion House of Commons, very little discussion of the government's railway methods takes place in Ontario's Provincial Parliament. Most of the information available regarding the railway is to be found in the more or less inspired statements of department heads and in optimistic official publications like the reports of the railway commission. Certain it is, however, that the construction of the Temiskaming railway was marked at the outset by grave and costly errors. Furthermore, although possessing a relatively dense traffic, it has not proven profitable. Principally on account of the practice of charging decidedly lower rates than those demanded by private lines, the road has so far failed to meet its fixed charges and has entailed additional burdens on the taxpayers. Even if it be conceded therefore that the Temiskaming system has been more efficiently conducted than other Canadian government railways, its record cannot be said in all fairness to be such as to justify much increased public confidence in the public ownership and operation of railroad facilities.

Political Influence on Dominion Government Railways

From the very advent of Confederation appointments to positions on the Dominion Government Railways have been made along party lines. This practice of naming only faithful followers of the party in power for office began under the first federal administration, which was made up of Conservatives. Indeed, no sooner had the new central government started than its official heads sought to influence the employees in the various branches of the public service to vote for government candidates. Thus, when the first provincial election after confederation took place in Nova Scotia in the fall of 1867, the Minister of Customs admitted in the House of Commons that he had requested the men belonging to his department to vote in opposition to the Lib-

eral provincial government then in office. As voting at elections was carried on at that time under the open-ballot system, which made it easy to ascertain how each individual voted, the federal employees found it difficult to resist the pressure brought to bear on them to support the government's side. If they failed to cast their ballots as directed, they ran the risk of dismissal. "Any man in the public service suspected of being a Liberal was made to feel that he was under a ban. If officials supported the Dominion Government they were protected, otherwise opportunity was sought to drive them out. They reduced the salary with the hope that the officer would resign, and when the government could do nothing else, they dismissed officials."[1]

As in the case of other servants of the government, railway employees were not allowed to vote as they pleased but were to use a phrase of the time "driven to the polls like sheep." "An election had been held in Colchester County with the power of the dominion government arrayed against the local government; and the public officials from the railway commissioner to the humblest officer in their employ were brought to the polls to vote—in many cases against their will."[2]

With the approval of their superiors, railway officials even became active political workers for the Conservative or administration party. "At every election since 1867, the dominion government had brought their influence to bear to break down the local government. In Hunts county, he found that the person who spoke loudest against the local government was a dominion official, the head of the railway department at Windsor, who was neglecting his duty and going about the country electioneering."[3]

Nova Scotia Disfranchises Railway Employees

Resenting this interference of dominion officials in provincial elections, the Liberal ministry had a bill passed in 1871 to secure the independence of the House of Assembly, as the lower chamber of the Nova Scotian parliament was called.[4] It provided, among other things, that no person employed within fifteen days before the day of election on the government railways could vote at a provincial election. Thus, what the Liberal politicians termed the pernicious activity of the federal authorities in local elections was rendered harmless so far as the casting of votes by dominion officials was concerned.

Nevertheless, even when these were not allowed to vote, "many of them worked at the polls in opposition to the local Liberal government year after year."[5]

Despite repeated efforts to bring about its repeal, this disenfranchising law remained on the statute book for a period of thirty years. When this discrimination against the employees of the federal government was finally removed in 1901, the Liberals were in power both at Ottawa and in Nova Scotia. As tauntingly stated by members of the Conservative opposition, they were perfectly willing to allow government employees to exercise the local franchise now that they were in a position to influence dominion officials to support the candidates of their own party.

This dragooning of government railway employees at local elections to support candidates favored by the federal administration also took place in Prince Edward Island. In the words of a local statesman:

"It may be fair for us to assume that from one-third to one-half of the railway men belong to the Liberal party and the other one-half to two-thirds to the Conservative party. Under these circumstances, what do we find at elections? We find that every man goes up and polls his vote against the Liberal party * * * In this country, where we have a system of open voting, the man who goes up and polls his vote for the Liberal party is marked out as a man upon whom, one day or another, the wrath and indignation of the dominion government will fall. Of course, it does not always happen that the man is immediately thrown out of office. That is not the way it is done. * * * The man is shuffled out of office. Some occasion arises, perhaps it may be the plea of economy, it may be the uniting of two offices into one. But something else happens. A man is charged with having openly advocated his views against the policy pursued by the present (federal) government. If they can find any instance where he has done that openly, he is discharged from the position."[6]

Government Railway the Largest Employer

As the Island possesses no manufactures of any importance and is peopled by farmers and tradesmen, the dominion government railway has always been the largest employer of labor in the province. Whenever the two leading parties were almost evenly matched—such as occurred in the local election previous to 1893 when the Liberals and Conservatives polled 9160 and 8944 votes respectively—the outcome of an electoral contest might easily depend on the way in which the railway men voted. Feeling that these employees would not be allowed to cast an untrammeled ballot and that they should not be permitted to control possibly the destinies of the Island, the Liberal provincial administration caused a law to be enacted in 1893 on the eve of a general election prohibiting dominion officials from voting at local elections. This act remained in force only for four years, however.

In 1897, when the Liberal ministry was again seeking a vote of confidence at the hands of the Island electorate, the Conservative government at Ottawa had been replaced by a Liberal administration. As only followers of the Liberal party were now eligible for appointment to positions on the government railways, the possession by dominion railway officials of the right to vote was no longer deemed "a menace to the free institutions" of the Island. The disenfranchisement law was therefore promptly repealed by the Liberal legislators, who had only a short time previously deemed it essential that all federal government employees should be precluded from voting.

Now happily a thing of the past, the disenfranchisement by the provinces of dominion railway officials is not likely to occur again. The adoption of the secret ballot in elections has made impossible a repetition of the spectacle reported in the early days of confederation at Halifax of the retainers of the federal government being marched in a body to the polls to cast their votes solidly against the provincial administration. No longer can it be said that the railway servants of the central government endangered their positions if they merely voted as their conscience dictated and in so doing cast their vote contrary to the direction of their superiors.

Yet the fact must not be lost sight of, however, that what really caused the passage of these laws restricting the right of suffrage was not so much the desire of the local politicians to gain a passing party advantage, but rather the attempt of the dominion authorities to predominate in provincial affairs by making what the Canadians termed "a political engine" of the federal railway service. Had they confined the activities of their agents to influencing the outcome of dominion elections alone, it is safe to say that the enactment of this disenfranchising legislation would never have been thought of.

Four million dollars instead of two, will be the cost of the proposed twelve-mile freight cut-off of the Philadelphia & Reading, between Sinking Spring, Pa., and Blandon, according to a revision of the estimates, recently made, to take into account present-day prices for labor and material. The engineers say that the total for bridges alone is something like $1,500,000. The bridges include one over the Schuylkill river about three miles north of Reading. No date has been fixed for the beginning of work.

Orders of the Regional Directors

RECRUITING ACTIVITIES IN STATIONS.—The Northwestern and the Eastern regional directors observing that the Railroad Administration is entirely in sympathy with the efforts of the War Department to handle recruiting work in passenger stations, advises federal managers to apportion space for this work wholly in accordance with the limiting circumstances at each station; uniform rule cannot be made.

Employees Riding on Passes.—The Central Western Regional Director advises federal managers of a complaint, received at Washington, that employees riding on passes monopolize space in sleeping cars; also that employees are making trips which are unnecessary.

I. C. C. Regulations for Protection of Lading.—The Northwestern regional director, July 18, promulgates instructions from the Division of Operation, concerning Paragraph 1894-A I. C. C. regulations for the protection of freight from fire. Goods liable to be ignited by sparks must not be placed next to cars placarded "explosives."

Surplus Capacities of Army Arsenals.—The Northwestern Regional Purchasing Committee, Bulletin 154, quotes a letter from the Ordnance Department, Washington, dated July 1, with reference to the possible utilization of surplus capacities at army arsenals for the manufacture of railroad materials. It is desirable to give the Arsenal Order Branch of the Ordnance Department an opportunity to quote prices on materials required by the railroads which they can possibly furnish.

Postponement of I. C. C. Hearing.—The Northwestern regional director in a letter to the northwestern railroads, dated July 12, gives orders similar to those issued by the regional director of the Eastern region in Circular 1500-130 (*Railway Age,* June 11, page 74).

Charges for Application of Grip Nut Locks.—Circular 226 of the Southwestern regional director quotes a letter from Frank McManamy, assistant director, of the Division of Operation, relative to an interpretation made by Section 3, Mechanical, of the American Railroad Association that grip unit nuts, which take the place of a commercial nut and a nut lock, but which, under the rule as at present interpreted must be billed either as a common nut at $.035 per lb. or as a nut lock at $.03, are patented manufactured articles and may be charged as such at the net store department cost in accordance with Rule 105.

Freight Car Distribution—Automobile Cars.—Freight Car Distribution Notice 13, canceling Freight Car Distribution Notice 6 and Supplements 1 to 8 inclusive, outlines instructions for expediting the return of automobile cars to eastern loading territory.

Grain Embargo—Primary Market.—Circular 83 of the Northwestern regional director states that, effective at a date to be determined later, permit regulations will be established for controlling grain shipments from country stations to primary markets and shipments between primary markets. The details of the plan to be used are also outlined.

War Risk Insurance Posters.—Supplement 7 to Circular 112 of the Southwestern regional director states that the Treasury Department has been given permission to display posters in railroad stations bearing the caption "Hold on to Uncle Sam's Insurance." These posters will be sent by the Treasury Department direct to the stations at which their display is desired.

Per Diem—Non-Federal Controlled Roads.—Supplement 6 to Circular 78 of the Northwestern regional director states that the question has been frequently raised as to whether "Short Line" railroads not under federal control that do not execute the standard contract with the Railroad Administration will be entitled to the per diem free time allowance of two days granted to such roads as do sign the standard contract. The director general has ruled that a non-signatory line shall be given the same advantage of free time as one which has signed the contract, provided all claims against the government are waived by appropriate document, this free time allowance to be effective retroactively from April 1, 1918.

Postponement of I. C. C. Hearings.—Supplement 1 to Circular 209 of the Southwestern regional director similar to Circular 1500-130 of the Eastern regional director (*Railway Age,* July 11, page 74).

Double and Triple Loading of Minimum Carloads.—The Southwestern regional director, by Circular 229, advises that complaints are still being received from shippers alleging neglect on the part of the carriers' agents to observe instructions; and shipments are going astray, with consequent delays and claims for loss and damage. The order states that the subject should be given attention by all concerned to remove what appears to be a prevailing impression on the part of shippers that carriers are not extending complete co-operation in this matter.

Freight Cars Damaged.—Supplement 1 to Circular 39 of the Southwestern regional director states that 12,183 cars were damaged in yards and trains on Federal controlled railroads during the week ending May 34, 1919, the cost of repairs for which is estimated at $310,764. While this is a substantial reduction compared with one year ago, and is also below the average for the entire year, still further improvements should be made, by closer supervision.

Leaky Western Pacific Cars.—Order 219 of the Southwestern regional director calls attention to claims for loss of grain by leakage from new Western Pacific cars, series 16,801 to 18,300. These cars should be repaired by seeing that there are no short floor boards, that the floors are well fitted around the posts and braces, and that the beveled grain strips are well fitted between the posts and braces and securely fastened to the floor. The side sheathing boards should be well secured by nails to the side-sill nailing timber.

Marking Cotton.—Supplement 2 to Order 182, effective August 1, canceling Paragraph 8 of Supplement 1 of Order 182 of the Southwestern regional director, in regard to square bale cotton tendered at compresses, calls for better marking. If the character and quality of the bagging is insufficient to properly carry the mark, a suitable patch must be used. This must be placed under the bands on one or both broad sides. It must be of closely woven fabric of smooth bright surface not less than 28 in. long and 22 in. wide; and on both sides of the bale there shall be stenciled in letters, not less than four inches in depth, with bright durable ink that will not run or fade, the initials or recognized trade mark of the shipper and the class mark used by the shipper.

Safety Devices on Locomotives.—Southwestern regional director in Order 221 calls attention to improved safety devices for application to locomotives on lines under Federal control.

Routing of Materials for Use of Federal Controlled Railroads.—By Order 223 of the Southwestern regional director shipments of newly purchased materials are ordered routed over the purchaser's line so as to save all charges possible over other roads, unless this plan will entail a long or circuitous haul.

Safety Appliances on Freight Cars.—Order 222 of the Southwestern regional director calls to the attention of Federal managers that at the present time there are approximately 80,000 freight cars in service which are not equipped with United States standard safety appliances as provided by the orders of the Interstate Commerce Commission; all such cars should be equipped at the first opportunity.

Express Employees' Passes.—The Southwestern regional director, by Order No. 220, announces revised regulations for issuing transportation to employees of express companies.

Results from Concrete Subgrade Construction

Descriptions of Several Designs and Information Concerning Service Under Steam Road Traffic

CONCRETE HAS COME into such wide use in almost all forms of construction that it is not surprising that it has been employed in the building of foundations for steam railway tracks. The developments of this nature were the subject of a paper presented before the annual meeting of the American Concrete Institute at Atlantic City, N. J., on June 28, by A. C. Irwin of the Portland Cement Association, Chicago. After discussing the shortcomings of

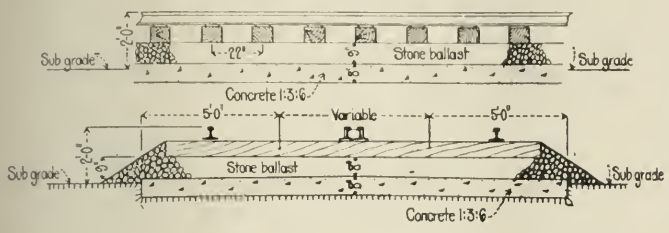

Fig. 1—Slab Construction on the Long Island

the present forms of track construction, Mr. Irwin described a number of designs of concrete subgrade construction which are now in service under steam railway tracks. The following is an abstract of that part of his paper.

Examples of concrete slabs carrying ballast in which ordinary track ties are embedded are shown in Fig. 1. This construction was placed under 49 crossings, switches and slips on sand embankments averaging 20 ft. high on the Long Island Railroad at Jamaica, N. Y., during the winter of 1912-13. Portions of the slabs were placed without al-

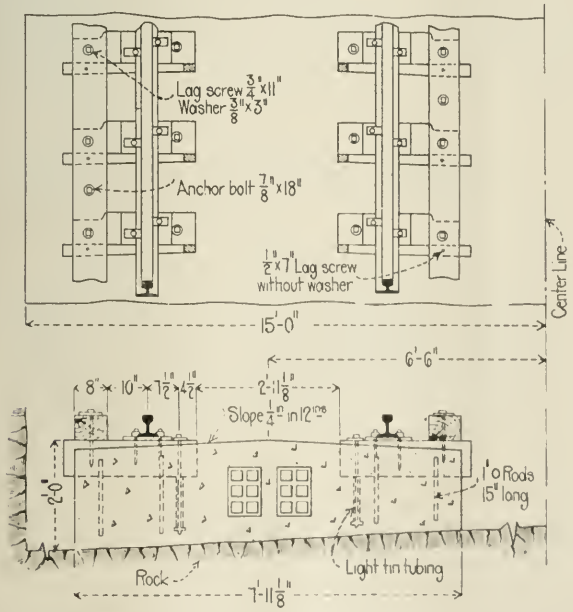

Fig. 2—Delaware, Lackawanna & Western Construction in Bergen Hill Tunnel

lowing time for the embankment to settle. The traffic over these slabs has been extremely heavy from the day they were put in, running as high as 1,300 train movements per day. After 3½ years the general manager of this road reported that there had been practically no maintenance on these tracks. He stated further that the great advantage of the slab is that the bearing surface on the natural ground is increased about three times that with the usual form of construction without taking into consideration its continuity and that an examination of these experimental slabs showed that there were no cracks, at least in the vicinity of the points of examination. It will be noted from the drawing that these slabs are not reinforced and that they are only eight inches thick. It should also be noted that they have been subjected to the pounding that occurs at crossings and frogs. There can, therefore, be no question of the practicability of concrete under main line tracks, but where so used it would seem appropriate to construct curbs at the ends of the slabs to hold the ballast from spreading, and to reinforce the slabs.

It has become very common practice to use reinforced concrete slabs to form the decks of deck girder railroad bridges. These slabs are usually about 1 ft. thick and 5 ft. long and span the distance between girders. The ballast is retained by curbs at the ends of the slabs. The testimony of railroad officers is that when the ties are once embedded they stay in place and maintenance is very greatly reduced.

In the new Bergen Hill tunnel of the Delaware, Lackawanna & Western, completed in 1909, the tracks are carried on reinforced concrete slabs, details of which are shown on Fig. 2. This construction was designed by Lincoln Bush,

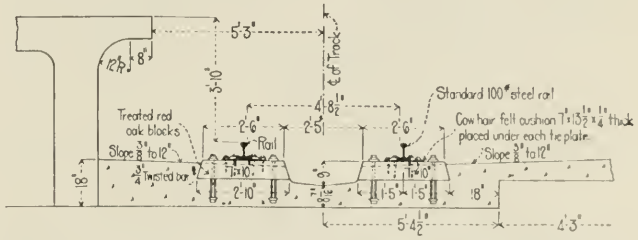

Fig. 3—Design Installed in Pennsylvania Station, New York

then chief engineer of the D. L. & W. The tie blocks are notched at the outer end to form a shoulder and are in place when the concrete is poured. A wedge is driven in between the concrete and the opposite side of the block, preventing the block from being disengaged from the shoulder under traffic. The blocks are replaced by removing the wedge, pushing the blocks lengthwise of the track so as to disengage the shoulder, and slipping them from under the rail. This work can be done by one man.

Under date of October 3, 1916, Mr. Bush said as follows in regard to this construction:

"It was completed and turned over for service in February, 1909. The roadbed in the new tunnel has stood up exceedingly well and none of the creosoted tie blocks have been renewed so far as I have learned on recent inquiry.

"My idea in getting out this design was that if railroad track could be made perfectly rigid and unyielding there would be no pounding or unusual stress in the rail. The roadbed in the new tunnel referred to has been in service under the heaviest kind of traffic since February, 1909, and has demonstrated fully that, if track is made perfectly rigid, it will stand up against the heaviest kind of traffic.

"I am convinced that, with a perfectly rigid surface, there will be no pounding and serious damage in railroad track unless some defect exists, such as flat wheels. Such conditions, however, are corrected when they do arise with the railroad rolling stock. I have felt for some time that, with

the heavy rolling stock, the best ballasted track had practically reached the limit of loading and if the heavy rail is used the support of same on tie ballasted track is not like the abutment of a bridge as ties yield, causing deflections in the rails, and it will be found that even with a heavier rail the stress may be greater in the rail than with a light and less stiff rail section which lends itself more readily to deflection."

Figure 3 shows the concrete track construction in use in the Pennsylvania station in New York City. A single-track length of 14,600 ft. of this type was laid adjacent to platforms. In general the concrete was laid on the rock of the subgrade, but where the subgrade consisted of loose rock backfilling, the concrete slab was reinforced. A length of 720 ft. of similar construction is in use in two of the East River tunnels (Nos. 1 and 2) immediately east of the Long Island shafts. These sections of track are subjected to high speed traffic.

In 1911 500 ft. of concrete track support was installed on the Campbell Avenue line of the Chicago Junction Railway where it crosses the Illinois and Michigan canal in Chicago. Details of this construction are shown by Fig. 4. This has been patented by Louis H. Evans of Chicago. This location was selected with a view to subjecting it to very heavy and continuous traffic, a majority of the stock trains going to the Chicago Stock Yards passing over this track. These trains are usually drawn by heavy locomotives at higher than usual freight train speed. A thorough examination of

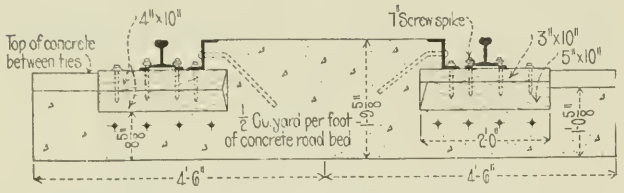

Fig. 4—Concrete Track Support on Chicago Junction Railway

the track indicates that, although transverse cracks appear in the portion of the concrete above the base of rail, these cracks do not extend down into the supporting slab. In fact, the construction seems to have suffered practically not at all from the heavy traffic which it has carried. G. W. Hegel, chief engineer of the Chicago Junction, states that there has been no maintenance on this stretch of track except to renew a few of the tie blocks. The tie blocks are spaced 34 in. centers, which spacing has been found to be practicable with this unyielding track foundation.

On the Point Defiance line of the Northern Pacific in the State of Washington, 2,000 ft. of track was constructed with a concrete slab foundation about 5 years ago. Several types were used, which consist in general of reinforced concrete slabs provided with recesses or troughs for the reception of wood blocks or stringers to carry the rails. Details of Type No. 1 are shown in Fig. 5. The short tie blocks rest on two longitudinal 3 in. by 6 in. pieces in the bottom of a trough at each side of the slab. The space between tie blocks is filled with ballast. Drainage of the troughs is provided at intervals. There is a total of 594 ft. of Type 1 construction. The slabs are cast in lengths of 16 ft. 5½ in.

Type No. 2 Fig. 6 is 6 in. wider than Type No. 1 or No. 3 and is distinguished by a curb practically equal to the height of the rail along each side. There is 594 ft. of single track of this type in service. In this type recesses are cast into the slab into which the tie blocks are placed and wedged into position. The rails are fastened in the usual way with tie plates and screw spikes. In the bottoms of the tie block recesses three inches of sand is placed to afford a cushion. On top of this sand cushion the creosoted tie block is placed and wedged at the inner end of the block. L-shaped malleable iron shims are used at the other end of the tie blocks with one leg of the "L" resting on top of and fastened to the tie block. This allows the track to be lined and gaged. These slabs are cast in widths of 32 ft. 11 in.

Type No. 3 is shown in detail in Fig. 7. The distinguishing features of this type are that the concrete is carried up 3½ in. near the inside of each rail and sloped to the center of the track for drainage, and that the rail rests directly on a continuous longitudinal stringer of 6 in. by 10 in. creosoted fir. These stringers are fastened at intervals by long lag screws driven into wood anchor blocks embedded in

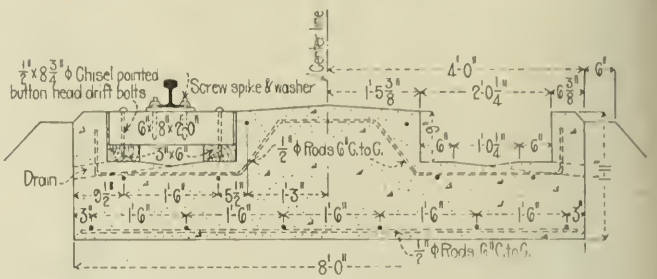

Fig. 5—Type No. 1, Installed on the Northern Pacific

the slab. The slabs have a depth of 18 in. at the center and were molded in lengths of 16 ft. 5½ in. There is a total of 810 ft. of single track of Type 3.

While neither the first cost of the concrete track foundation on the Northern Pacific nor the annual maintenance cost is available, the railroad officers say that the maintenance has been far below that of track of the ordinary type of construction on the same line. The greater part of this maintenance concerns the wooden blocks to which the rails are fastened, especially with Type No. 2.

Fig. 8 shows a suggested design for concrete track support prepared by A. D. Whipple and the writer. The form work required for this slab is of the simplest sort. The design of the slab is based on Cooper's E-60 loading with 100 per cent impact. This design does not require any radical departure from the usual type of rail fastenings; that is, a

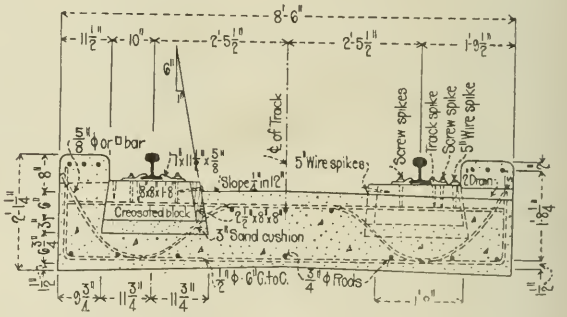

Fig. 6—Type No. 2, Installed on the Northern Pacific

rail clip is used similar to those now standard. There is, however, a great difference between this rail fastening and the usual cut or screw-spike used with wooden ties. In this concrete design a U-shaped casting is embedded in the concrete and the upstanding legs of the U are tapped to receive the threaded end of holding-down bolts which pass through the rail clips, tie plate and tie block. A positive fastening which has great strength against lifting the rail is thus secured. The use of a block of wood under the rail in this design is at once a concession to the prevalent idea that some elastic medium must always intervene between a track rail and a solid foundation and a means for easy adjustment of the rail both vertically and horizontally to provide for

whatever inequalities may exist in the top of the slab either at the time of placing or subsequent thereto. The latter is the only sufficient reason for using this tie block, and where the slab is placed on a well-compacted subgrade the rail may be anchored directly to the concrete, with possibly the intervention of a longitudinal steel plate between the rail and the concrete surface, thus affording the rail a continuous support. In the latter case drainage would be taken care of by finishing the slab to a slight pitch between the rails and furnishing openings beneath the rails at intervals.

Economic Considerations

In the final analysis, the use of concrete track construction will be governed by economic factors. Will it pay? Will the economies and advantages derived from it afford an adequate return on the cost of installing it?

Lincoln Bush, in an article published in the *Railway Age Gazette* of April 23, 1919, shows comparative tables of the cost of ballast and tie double track construction and the concrete slab. The cost of the latter from actual figures and the estimated cost of ballast and ties was carefully prepared from data known from experience to be correct. Annual maintenance and renewal costs used were similarly reliable and the result shows an earning on the extra cost of concrete slab construction of over 40 per cent per year, due to savings in maintenance and renewals.

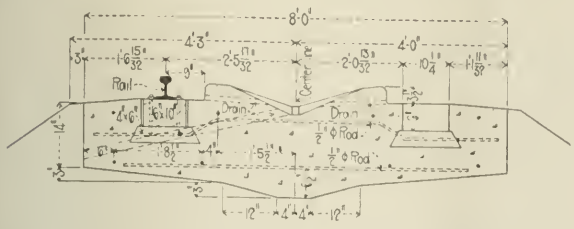

Fig. 7—Type No. 3, Installed on the Northern Pacific

A recent letter from Mr. Bush says:

"Bergen Hill tunnel track has now been in service under very heavy traffic over 10 years and has fully demonstrated all I believed it would do and is in good condition."

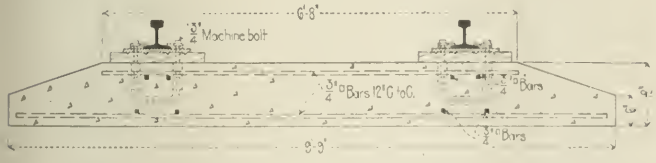

Fig. 8—Proposed Design of Concrete Subgrade Construction

L. V. Morris, chief engineer of the Long Island Railroad, said in regard to an adaptation of the design shown on Fig. 1 to main line service:

"In constructing a new line I cannot conceive that the cost would be over $2 per running foot, single track, for a slab 10 ft. wide and 8 in. thick. This would be in the neighborhood of $10,000 per mile and is a very small part of the total cost of a modern roadbed which I have in mind running anywhere from $100,000 to $200,000 per mile, single track. It seems to me that this expense is justified, particularly as it supports practically the only working part of the roadbed. This working part, namely, the track, is the most expensive to maintain and upon its condition depends largely the wear and tear of the rolling equipment."

THE FIREMEN'S BROTHERHOOD, in convention at Denver, adopted a reolution advocating the creation, in co-operation with the other three train-service brotherhoods, of a national labor party.

Commerce Members Endorse Committee Recommendations

RESULTS OF THE REFERENDUM vote on recommendations for remedial railroad legislation, drafted by the Railroad Committee of the Chamber of Commerce of the United States, indicate an overwhelming desire on the part of more than 1,100 commercial and industrial organizations, scattered throughout the 48 states, to see the railroads of the country released from federal control and returned to corporate operation as soon as Congress can enact the necessary legislation. As to some of the recommendations which involve more specific details the opinions expressed were less unanimous, but all of the recommendations were approved by a large vote.

The recommendations voted upon were drafted by the committee after it had made a most careful study of the transportation situation and are similar, in many respects, to the provisions incorporated in the plan advocated before Congress by the National Transportation Conference. They are 10 in number and were submitted to referendum for separate votes, with the following results:

1. 1,439 votes in favor. 12 opposed.

The Committee recommends adherence to the policy of corporate ownership and operation, with comprehensive regulation.

2. 1,439 in favor. 12 opposed.

The committee recommends return of roads to corporate operation as soon as remedial legislation can be enacted.

3. 1,329 in favor. 109 opposed.

The committee recommends adherence to the period of federal control as now fixed unless and until impossibility of remedial legislation in this period clearly appears.

4. 1,293½ in favor. 123½ opposed.

The committee recommends permission for consolidation in the public interest, with prior approval by government authority, in a limited number of strong competing systems.

5. 1,215 in favor. 184 opposed.

The committee recommends a requirement that railroad companies engaging in interstate commerce become federal corporations, with rights of taxation and police regulations reserved for states.

6. 1,321½ in favor. 85½ opposed.

The committee recommends exclusive federal regulation of capital expenditures and security issues of railroads engaged in interstate commerce, with provision for notice and hearing for state authorities.

7. 1,314 in favor. 114 opposed.

The committee recommends federal regulation in interstate rates affecting interstate commerce.

8. 1,206½ in favor. 208½ opposed.

The committee recommends a statutory rule providing that rates in each traffic section shall yield an adequate return to a fair value of the property as determined by public authority.

9. 850 in favor. 540 opposed.

The committee recommends payment into fund of a share of the excess earned by any railroad system under application of the above statutory rule over an equitable minimum return upon fair value of property, this fund to be used as Congress directs for strengthening general railroad credit and increasing general railroad efficiency.

10. 1,183 in favor. 242 opposed.

The committee recommends a federal transportation board to promote development of a national system of rail, water and highway transportation and articulation of all transportation facilities.

In initiating its movement to bring about a change in existing transportation regulations, the chamber called into con-

ference at Washington, more than two score prominent men associated with important interests affected by transportation needs. These included the commercial, industrial, agricultural, financial, labor, governmental, economic and social leaders, all of whom were invited without respect to affiliation with the National Chamber in order that each "important interest should have a voice in determining what should be done with the railroads."

After five meetings, each lasting two days, and more than 22 general sessions, the conference voted unanimously to urge the adoption by Congress of remedial railroad legislation drawn in fairness to the Nation, its business, commerce and other important interests and also in equity to the railroads. The conference plan was published last week.

The Committee on Railroads, after an exhaustive study of these problems, advanced its recommendations through the chamber's referendum system and by registering the vote of more than 1,100 member organizations, it has ascertained the opinion of the Nation's business on the 10 most vital proposals.

Wartime Conditions on Southern Pacific Lines in Mexico

An insight into the conditions which have existed during the last few years in those portions of Mexico which have been overrun by revolutionary forces and bandits, is afforded by information acquired recently in an inspection of the Tonichi branch of the Southern Pacific Railroad of Mexico, in the State of Sonora. Conditions are still so unsettled in this country that the trip over this line was made under the protection of an escort of 300 troops, including 50 cavalry and 250 infantry. The inspection was made in June of this year by J. D. Mathews, engineer maintenance of way of the Southern Pacific of Mexico and W. E. Schley, division engineer of the Sonora division.

This branch extends from Corral on the main line 58 miles south of Guaymas, northeast along the Yaqui river 34 miles to Tonichi. It was built between 1906 and 1909 and operation was discontinued in 1913 because of revolutionary disturbances. The inspection made last month was to determine the present condition of the line and the nature and extent of the repairs necessary to restore it to operation.

The area traversed by this line has been over-run during the last few years by roving bands of Yaqui Indians, who have committed many depredations. The present condition of Buena Vista, one of the towns midway on this branch, is typical of the devastation which has been wrought in this part of the country. Until a few years ago this was a thriving village surrounded by a considerable area of cultivated land which produced all of the food required by the inhabitants and a considerable surplus for exportation to adjacent mining camps and nearby cities. The inhabitants were Mexicans, peaceful and industrious. Today, Buena Vista is a wreck, the skeletons of its buildings still standing but with their adobe walls shorn of their protecting roofs and crumbling before the wind and rain. In the ruined residences are wrecks of stoves, cooking utensils and furniture, all destroyed and burned while the people have long since fled.

It was the danger from these roving bands of Yaqui Indians that made necessary the provision of the escort in making this inspection. This escort consisted of 300 native soldiers, including 50 cavalry and 250 infantry, in charge of Mexican officers. In proceeding over the line the escort was formed with 25 of the cavalry in advance, marching about 15 min. or about one half kilometer ahead of the infantry. The latter was followed by the railway officers with their pack animals, while the remaining 25 cavalry brought up in the rear. The entire column extended considerably over a kilometer along the road when in motion. On arriving at the camping places at mid-day or at night, the advance cavalry posted themselves on the higher points on the hills commanding a view of the camp and the surrounding territory and remained in that position until recalled after a sentry line had been established around the camp proper.

The condition of this line is instructive as indicating what may be expected on many other lines which have been laid waste during the revolutionary troubles in Mexico. The major portion of this branch was laid with Japanese oak ties during construction, although some Oregon pine ties were also installed at the time the line was built and in early renewals thereafter. The inspection showed that the Japanese oak ties had completely rotted, although a considerable proportion of the pine ties are still in condition for further service.

Because of the advance state of decay of the oak ties, the grass and incendiary fires, which have been numerous, have completely consumed these ties, leaving the rails lying on the ground, usually undamaged, although they have been kinked where brush or other fuel has added to the flames. The Oregon pine ties have not burned as readily and it was not uncommon to find considerable stretches of track which had been burned over with the rails still resting on the pine ties, while the oak ties between them had been completely consumed, the difference in action being probably due to more advanced state of decay of the oak ties.

An interesting exception to this tendency of the Japanese oak ties to decay was found within the tunnels where the ties appeared as if they had just been laid, many of them still presenting the appearance of newness. These tunnels are dry and this is probably brought about by the absence of the alternate wetting and drying.

Bridge timbers were generally found to be in better condition, few of the decks of the unburned trestles being in such a state of decay that they could not be operated over at once and all of them with minor repairs. The piling, however, was found to require considerable reinforcing, both because of the inroads of decay and because many of the piles had not been driven deeply, in the original construction and had since been uncovered, the scouring of the arroyos having left piling hanging suspended from the caps by the drift bolts.

The only buildings left standing on the line were an ore platform, two water tanks and two depots. Relatively little of the telegraph lines has been destroyed, although the larger part of the poles still standing are worm-eaten and rotten at the ground line and have been greatly weakened.

In general the tunnels are in good condition, the principal repairs necessary being the removal of small slides from the portals. About 50 per cent of the roadway signs will require renewal. The heavy growth of brush on the roadway and about bridges and telegraph poles constitutes a serious problem for it must be removed promptly if danger of further fires is to be avoided.

The trip was not without its exciting experiences. On the return which was made across country from Tonichi to La Colorado by automobile and again under military escort, it was necessary to stop to repair a tire blow out at the point in a canyon where an American and his Mexican helper had been ambushed and killed while driving a motor truck over this same route within a month, while a well-to-do Mexican and two companions were ambushed and killed a few days previous in traveling by the same automobile in which the inspection party was traveling, the steering column of the machine still carrying marks of that encounter in the form of a segment cut out of the semi circle by a brigand's bullet. In another instance, the party came upon the camping place of a party of Indians which had been abandoned only a short time before and at which the fires were still burning.

Doings of the United States Railroad Administration

The 1919 Cycle of Demands for Further Increased Wages Is Reaching a Critical Stage

WASHINGTON, D. C.

AT A MEETING of the committee on mechanical standards on August 5 consideration will be given to the question of maintenance of equipment during federal control in its relation to the expenditures for that purpose during the test period and the obligation of the Railroad Administration under its contract to return the railroads in substantially as good repair and as complete equipment as when taken over. Consideration will also be given to possible methods to prevent tampering with the angle cock in the air brake system and to the proposed standard designs for cabooses.

Freight Traffic for Six Months Shows 14.5 Per-Cent Decrease

The volume of freight traffic movement in June continued to show a marked falling off as compared with last year, according to the monthly report of the Operating Statistics Section. The net ton-miles of freight handled amounted to 31,953,366,000, a decrease of 15.2 per cent. For six months of the calendar year the net ton miles amounted to 178,083,192,000, a decrease of 14.5 per cent. In the Eastern region for June the reduction in net ton miles was 20.9 per cent.

The net ton miles per mile of road per day for June, 1919, were 4,615, as compared with 5,423 for June, 1918. Train miles were reduced 17.2 per cent. Freight car miles were reduced 13.4 per cent. The net ton miles per train mile continue to show a slight increase, from 698 to 715, or 2.4 per cent, but the net ton miles per loaded car mile show a decrease from 28.6 to 27.5, or 3.8 per cent. The net ton miles per car day decreased from 506 to 429, or 15.2 per cent. The percentage of loaded to total car miles was 67.9, as compared with 66.8 in June, 1918. The average number of freight cars on line daily is reported at 2,480,673, a decrease of 0.1 per cent, of which 8.1 per cent are reported as unserviceable, as compared with 6 per cent last year. The car miles per car day show a reduction from 26.5 to 23, or 3.2 per cent.

For the six months' period ending June 30, net ton miles fell off 14.5 per cent, train miles 16.6 per cent and total car miles 10.6 per cent. The net ton miles per train mile averaged 669, an increase of 2.6 per cent. The net ton miles per loaded car mile averaged 27.8, a decrease of 2.5 per cent, and the car miles per car day averaged 21.5, a decrease of 10 per cent. The net ton miles per car day averaged 403, a decrease of 13.9 per cent.

Standard Freight Cars Being Put in Service

Because of the favorable progress being made in working out the plan for financing the standard equipment ordered by the Railroad Administration through a national equipment corporation, and because of the growing demand for cars, the Railroad Administration has arranged to put into service at once all of the standard freight cars that have been built and that have been kept in storage on railroad tracks near the plants of the builders because of the failure of many of the railroads to accept the allocation of the cars as made by the Railroad Administration. This will put into service several thousand cars, including a large proportion of coal cars, as fast as the cars can be stencilled with the initials of the roads to which they have been allocated. The cars that have been built but not accepted have been paid for by the Railroad Administration as they have been completed, with a deduction representing the cost of stencilling and marking, and the storage has been at the expense of the Railroad Administration. It is understood that the cars are being placed in service without opposition on the part of the railroad companies, many of whom formerly protested against the allocations, largely on the ground of their inability to finance them, because the Association of Railway Executives has received assurances from roads representing 70 per cent of the equipment that they will participate in the new equipment trust plan.

Reports of scattering local car shortages are coming from various parts of the country, but while there is understood to be a very large number of surplus cars in the country as a whole the Railroad Administration is unwilling to give out the figures. On June 1 there was a surplus of about 300,000 cars, and it is believed this was considerably reduced by July 1 and still more reduced during July, but the number of freight cars reported as unserviceable for the month of June was nearly 200,000, or 8.1 per cent, although a large number were so reported merely because they were not grain tight and would require little work to put them in shape. Orders were issued late in June to increase the car repair forces that had been reduced earlier in the year in an effort to put the equipment in condition for the summer and fall traffic. About 4,000 locomotives are being held in white lead as a reserve.

Shopmen Press Wage Demands

The 1919 cycle of demands on the Railroad Administration for increased wages is reaching a critical stage. Committees representing the various shop craft unions federated under the organization of the Railway Employees' Department of the American Federation of Labor, that presented demands to the director general in January for a wage increase from 68 to 85 cents an hour for the principal classes of craftsmen, as well as increases for helpers and differentials for various classes of special work, has been in Washington all week conferring with the Railroad Administration officials and threatening strikes unless a favorable decision is forthcoming soon. The unions are also demanding the issuance of an order prescribing uniform rules and working conditions. Both propositions have been under investigation for several months by the Board of Wages and Working Conditions, which has submitted its recommendations on both to Director General Hines. The shopmen have been displaying a great deal of impatience because of the delay in passing on their demands and several local strikes have already been called but the men were persuaded to return to work. It is understood that the conferences regarding the rules and working conditions relate only to details, but that the Railroad Administration in view of the state of its finances is not disposed to do much if anything in the way of increasing wages.

Cost of Freight Train and Locomotive Service Decreasing

The total cost of freight train service, including locomotive service, continues to show a steady decrease each month as compared with preceding months, although increases as compared with last year, according to the monthly report compiled by the Operating Statistics Section. For the month of May it was 103.9 cents per 1,000 gross ton miles as compared with 112.7 in April, 119.5 in March and 126.5 in February. The cost of freight locomotive service

per locomotive mile in May was 110.3 cents, as compared with 97.8 cents in May, 1918, 115.2 cents in April, 1919, 119.2 cents in March and 120.7 cents in February. The cost of freight train service per train mile was 156.8 cents, as compared with 141 cents in May, 1918, and 162.2 cents in April, 1919, 167.5 cents in March, and 169.3 cents in February. The increase in the cost of locomotive service per locomotive mile in May this year over May last year was 12.8 per cent and the increase in the cost of train service per train mile was 11.2 per cent. All items of cost continue to show increases as compared with last year. The figures are reported by roads and by regions. The combined averages for all regions and the comparative figures for last year and for April, March and February, this year are as follows:

	May, 1919	May, 1918
Cost of locomotive service per locomotive mile	110.3	97.8
Locomotive repairs	37.9	31.3
Enginehouse expenses	9.0	6.6
Train enginemen	19.1	18.1
Locomotive fuel	40.7	38.9
Other locomotive supplies	3.5	2.8
Cost of train service per train mile	156.8	141.0
Locomotive repairs } Enginehouse expenses }	53.4	43.7
Locomotive fuel	46.3	44.9
Other locomotive supplies	3.9	3.3
Train enginemen	21.8	20.9
Trainmen	25.1	23.7
Train supplies and expenses	6.4	4.6

	May, 1919	April, 1919	March, 1919	Feb'y, 1919
Cost of train service per 1,000 gross ton miles	103.9	112.7	119.5	126.5
Locomotive repairs } Enginehouse expenses }	35.4	38.6	40.8	43.1
Locomotive fuel	30.6	34.3	37.5	40.3
Other locomotive supplies	2.6	2.9	3.1	3.4
Enginemen and trainmen	31.1	32.4	33.5	34.8
Train supplies and expenses	4.2	4.4	4.6	4.8

Contracts Executed

The Railroad Administration has executed compensation contracts with the Minneapolis, St. Paul & Sault Ste. Marie for $10,547,428, the Chesapeake Steamship Company for $102,548, and the Chicago, Terre Haute & Southeastern for $922,784, also co-operative short line contracts with the Beaver, Meade & Englewood, Garyville Northern, Palatine, Lake Zurich & Wauconda, Chicago, Harvard & Lake Geneva, and the Bristol.

Troop Movement Makes Necessary Use of Box Cars for Express

Director General Hines has authorized the following:

For a considerable period when our troops were being transported from interior points to the seaboard for movement overseas, it was deemed by the military authorities as necessary that military equipment be moved in express cars, which curtailed to a great extent the availability of express car equipment to handle the large amount of business which the express company was then being called upon to transport and this curtailment of equipment resulted in the use by the American Railway Express Company of a large number of box cars which were in no wise equipped for the proper handling of express traffic.

Now that the troops are returning the government is again requiring the use of a large number of express cars for transportation of equipment of troops to their final destination and this is again resulting in the American Railway Express Company having to use box car equipment to handle some of its business.

While the Railroad Administration and the American Railway Express Company are doing everything possible to maintain the best service under existing conditions, this withdrawal of express company equipment for military purposes is resulting in inconvenience in some parts of the country, and this condition will continue to a greater or less extent while there is need for express cars for military purposes.

Capital Expenditures Order Modified

The director-general has issued an amendment to General Order No. 12 as follows:

General Order No. 12 and supplement No. 1 thereto are hereby amended to provide that no work involving a charge to capital account in excess of $1,000 (instead of $10,000) shall be contracted for or commenced unless it be specifically authorized by the Division of Capital Expenditures; or

(a) Unless the corporation agrees to furnish the cash at the outset without calling upon the Railroad Administration in any way for the funds; or

(b) Unless the expenditure is in accordance with a definite program approved by Director, Division of Capital Expenditures, by which is meant such general authority as is covered by his letter of April 5 (Capital charges merely incidental to maintenance authorized by Director, Division of Operation) and letter of July 8 (Capital charges covering application of safety appliances designated by Director, Division of Operation.)

In cases of emergency, authority may be obtained by telegraph.

Director General Hines Confers with President

Director General Hines held his first conference with President Wilson, since the latter's return from Paris, at the White House on Wednesday. It is understood that he discussed the entire railroad situation, but no announcement was made as to any conclusions reached.

Six Months Deficit About $288,000,000

Preliminary figures showing the earnings and expenses of 183 Class I roads, operating 222,000 miles, show an improvement as compared with previous months of this year, but still show a deficit as compared with the standard return. For these roads the net operating income was about $51,000,000, which is an increase of 183 per cent as compared with June, 1918, when there was a large deficit because of the inclusion of five months' back wage increase. The average net operating income for June in the test period, however, was $82,595,000. For the first five months of this year the net operating income was $105,000,000, so that for half of the year the roads have earned approximately $156,000,000 as against $400,000,000 during six months of the test period and as against $444,000,000, which is the amount of the guaranty accrued for six months for the Class I roads. This leaves a deficit of $288,000,000. In making the comparisons with last year it is necessary to bear in mind that five months' back pay was included in the expenses for last June and that the increased rates were in effect only part of that month. The total operating revenues of the 183 roads for June was $413,000,000, an increase of 7.79 per cent as compared with June, 1918; operating expenses were $315,000,000, a decrease of 18.5 per cent; taxes were $14,000,000, a decrease of 14.7 per cent, and the net operating income, $50,990,000, represents an increase of 183 per cent.

The Pennsylvania Railroad Relief Fund is available for men absent in France. William Keller, of Altoona, a member of Company G, 110th Infantry, was employed by the road and was a member of the relief fund. He recently made application for relief benefits during the time he was in the hospital in France while in the military service and is now advised that the claim will be paid by the Fund as soon as a disability certificate is received from the government. According to this ruling all members of United States fighting forces who were members of railroad relief funds and who were temporarily disabled in the service will be entitled to such compensation as the relief fund pays members when incapacitated.

Engineers' Brotherhood Appeals to the President

WASHINGTON, D. C.

THE ADVISORY BOARD composed of the officers of the Brotherhood of Locomotive Engineers has reached the conclusion that repeated increases in wages followed by an immediate reduction in the value of the dollars in which the wages are paid because of the decreased purchasing power do not afford the solution of the cost of living problem. At a conference with President Wilson and members of his Cabinet at Washington on Wednesday they urged that the government take adequate measures "to reduce the cost of the necessaries of life to a figure that the present wages and income of the people will meet" as the only alternative to another increase in wages which they declared to be necessary under present conditions but which they felt would afford but temporary relief unless something is done to attack the problem on the side of prices.

The following statement made to the President by Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, to which the President replied that he would give the matter serious consideration and see what could be done, was given out at the White House:

"At a meeting of this board, held in Cleveland, the matter of an increase in compensation commensurate with the condition we find because of the constantly increasing cost of living commodities was thoroughly and studiously considered. We know that a widespread spirit of unrest exists among all classes, especially among wage earners whose wages will no longer provide adequate food, shelter and raiment for themselves and families.

"We believe this situation is brought about mainly by conscienceless profiteering by the great interests who have secured control of all the necessaries of life.

"At this time we find ourselves obliged to again request an increase in wages to meet the mounting cost of living; but we feel that, should this request be granted, the relief would be but temporary should prices continue to soar.

"We believe the true remedy for the situation, and one that will result in lifting the burden under which the whole people are struggling, is for the government to take some adequate measures to reduce the cost of the necessaries of life to a figure that the present wages and income of the people will meet. Should this not be considered feasible, we will be forced to urge that those whom we represent be granted an increase in wages to meet the deterioration of the purchasing price of the dollar, be that what it may, which can be easily determined by competent authority.

"This action may be unique and it may be properly termed a pioneer movement in the history of labor organizations in seeking an audience with the Chief Executive of our Country and, in a manner, suggesting to him the convening of the members of his Cabinet, or that portion that may be quickly assembled. However, the result sought seems to us to justify the means, and should our efforts in this direction completely fail, then we will be forced to request for those whom we represent the granting of an increase in wages to enable them to live according to the American standard.

"We invite your attention to the fact that approximately 77 per cent of the locomotive engineers are American born citizens, and it may be safely stated that the remaining per cent are naturalized citizens, and they have, of course, a great interest in not only their own welfare but in the welfare of all the people, and they are not unmindful of your past efforts in behalf of the people, and they believe that they should exert every effort not only for themselves but for the country in general, as well as the administration Yet we find ourselves today earning less money than we did prior to the war. This can be demonstrated by simply taking, as an illustration, a daily wage of $5 prior to the war, which at that time was worth 500 cents, and today it is worth approximately, judging from competent authority, only $2.15.

"So, while it may be stated that we have had a substantial increase in compensation, when considering the dollar only as a medium of exchange our income has been substantially decreased when compared with pre-war prices.

"The Brotherhood of Locomotive Engineers appreciates the fact that all wages are being increased, and that constant demands are flowing to the employer and we must, of necessity, be mindful of the interests of our craft; but we do not believe that increasing the compensation, accompanied by a greater increase in the cost of commodities of life, will produce lasting benefits to our craft or to the American citizen in general.

"The unanimous opinion of the Advisory Board, our duty to the locomotive engineers and to our country as American citizens, impelled us to seek an audience with you and your Cabinet for the purpose of laying this situation before you, and we trust that you can find a way to immediately inaugurate executive action to remedy it.

"We trust that you may find it consistent to give us, in the near future, something definite as to what we may expect that will aid in guiding us as to our future actions, hoping that you appreciate the spirit that has prompted this action on our part."

The officers of the brotherhood presented similar views to Director General Hines before going to see the President. As Mr. Hines has been devoting a large share of his attention recently both to wage demands and to the cost of living of the Railroad Administration employees it is believed he received their representations with sympathy. It is said that the firemen's and the conductors' organizations agree with the views of the engineers but the Brotherhood of Railroad Trainmen does not. The latter organization still has hopes of higher wages and is now before the Board of Wages and Working Conditions asking for further increases.

Some definite action on the part of the government to counteract the tendency of the "vicious circle" of ever-increasing prices and wages is likely to be forced on the administration by the repeated demands of the employees of its various branches and the industries which furnish its supplies. During the war period the government not only raised wages itself to meet the increasing cost of living but its example and encouragement led to other increases, and the higher wages, together with "profiteering," has kept the cost of living ever on the jump. The Railroad Administration raised wages and then raised rates to meet them, but the rate increase fell short of the amount needed and now large classes of the employees are asking for still further advances which cannot be met except by still higher rates unless the deficit to be met by taxation is to be still further increased.

In each case the employees are able to point to some other branch of government activity in which higher wages are paid, and some officials at Washington have come to the conclusion that it is about time to call a halt somewhere. Director General Hines does not want to increase rates because of the influence it would have directly or indirectly on further increases in prices. The ideas expressed by the brotherhood have already become impressed on some of the President's advisers, and it is believed that some action by the Department of Justice in an effort to get at some of the causes for high prices may be forthcoming.

Cross-country flying by government aviators, as reported by the Director of Air Service, for the week ending July 5, exceeded 50,000 miles.

Railroads Handle Crowd During Chicago Car Strike

Tie-Up of Local Transportation Puts a Large Burden on the Steam Lines Entering the City

The steam roads entering Chicago were again forced to handle the bulk of the city's local transportation on Tuesday of this week when a strike of 15,000 employees of the street railway and elevated lines tied up the regular traffic channels. However, experience with a like situation for three days in June, 1915, enabled the roads to meet the increased burden placed upon them by the failure of the trolley and "L" service. The number of persons carried by the roads daily is variously estimated, but no accurate figures are available. The estimated daily traffic in 1915 was 625,000 and it is not believed that this number was exceeded this week, as a very much larger number of street vehicles, mainly motor trucks, were pressed into temporary passenger service. Owing to perfected arrangements the traffic was handled with much less congestion than in the earlier emergency. One factor that helped out the situation at the start was the failure of the public to avail themselves of the steam road facilities as rapidly as they were provided. As a consequence, the traffic did not reach its maximum until Tuesday evening or Wednesday morning, which enabled the roads to complete their arrangements in advance of the maximum load. As it was, little overcrowding was noted, while some of the roads actually provided more equipment than was necessary.

By far the largest part of the crowd was carried by the Illinois Central and the Chicago & North Western. These roads normally carry the bulk of the suburban service since their lines traverse the more highly developed residence sections of the city from which the largest part of the downtown workers are drawn. The Illinois Central, which normally handles 40,000 suburban passengers daily, carried about 200,000 each day during the strike, running 504 trains in place of a normal number of 285, while the Chicago & North Western, with an average daily suburban business of 60,000, also handled about 200,000. The Chicago, Rock Island & Pacific, a portion of whose lines also traverse a high class residence territory, and which normally handles about 25,000 people, assumed an increase of about 60 per cent during the emergency period. The Chicago, Milwaukee & St. Paul, on the other hand, which also has lines through extended portions of the residence district, conducts but a very limited suburban business. However, this road also made considerable addition to its regular service, particularly on the Evanston line, on which passenger operation had been entirely abandoned several years ago. During the morning and evening rush hour, a 10-min. service was instituted on this line as far north as Buena station, about six miles from the business center of the city, but owing to the lack of trackage space in the Union Station the downtown terminal for this service was placed at Kinzie street, within easy walking distance of the "loop."

The Chicago & Western Indiana, which normally handles only 3,000 suburban passengers, carried about 22,000 daily during the strike, with the use of about 37 trains in place of the normal number of 7. The Chicago, Burlington & Quincy, which maintains a considerable suburban service on its line as far west as Aurora, traverses a district within the city that does not afford much patronage for downtown travel. As a consequence there is only one intermediate station, Western avenue, within the city limits. During the strike the bulk of the additional traffic handled by this line was from three or four stations just outside the city limits, the residents of which usually rely largely on street car service.

In general the arrangements for additional service were provided according to plans best suited to the facilities of the several roads. The main problems involved concerned the matters of additional trains, loading and unloading, and selling and collecting tickets. In most cases the extra train service was provided by abandoning the regular suburban schedules and substituting a shuttle service under which trains ran between terminals as fast as traffic conditions permitted. This was done on the Illinois Central, the North Western and the Rock Island. The Burlington was able to handle all the traffic with one or two extra trains and the use of additional equipment on the regular trains.

In handling the passengers at terminals little difficulty was encountered in disposing of the crowds arriving at the terminals during the rush hour in the morning. The real task was the distribution of the passengers to the trains during the evening rush. This was well handled by the Chicago & North Western through the assignment of several tracks to each route, with large signs over the train gates designating the destination of the trains. Thus three tracks were assigned to trains making all station stops from Clybourn Junction to Rogers Park, two tracks for trains making all stops between Evanston and Waukegan, etc. The crowds assembled on the concourse in front of the gates for the respective trains and were passed on to the platforms as fast as the trains were ready. At the Illinois Central terminal at Randolph street, which has island platforms, passengers were passed through the station in a continuous stream and the alternate arrival and departure of trains on the two tracks adjoining each platform disposed of the crowds expeditiously.

The use of long trains with capacity crowds made it impracticable for the trainmen to collect cash fares, consequently the passengers were required to buy trip or commutation tickets before entering trains and to avoid interference with the regular through business of the ticket offices liberal use was made of temporary ticket booths for the sale of suburban tickets. At the North Western terminal eleven of these booths were erected on Madison street and Canal street outside the building. The Burlington and the Rock Island also had temporary ticket offices at the terminals, while the North Western also provided one or more of these booths at each of the outlying stations. This road largely avoided the collection of fares on incoming trains by fencing off the station platforms at the local stations and collecting or punching tickets as the passengers passed on to the platforms.

Electrification in Italy.—Recent electrification of a railway stretch in our Northwest attracted much attention but it will look small beside the Italian project—the electrification of 4,000 miles by use of Trentino waterfalls. In two of Italy's greatest manufacturing cities, Milan and Turin, there is already extensive use of water power. The available horsepower was in 1914 less than Austria-Hungary's, but territorial acquisitions have changed the balance, and Italy should now be able to develop more hydroelectric energy than any other European nation save Norway and Sweden. Even before the war she utilized more water than any other country except France and Norway. Italy was then importing nearly $40,000,000 worth of coal a year from Britain, and her chief complaint has ever since been that she could not get enough. To dig coal in England and laboriously transport it to the Po Valley while river energy there runs unused to sea typifies a kind of waste of which the world will hereafter be more impatient.—*New York Evening Post.*

General News Department

The shops of the New York, New Haven & Hartford at Valley Falls, R. I., were destroyed by fire on the night of July 26; estimated loss $130,000. The fire was started by lightning.

The Tax on ice cream, "soft drinks" and similar articles is not applicable when such things are sold on dining cars; the deputy commissioner of internal revenue holds that a dining car is not a place of business similar to a soda fountain or an ice cream parlor.

The Pennsylvania System federation of employees, composed of six crafts employed in the shops of the railroad, held their first annual convention at Columbus, Ohio, on July 14. The federation represents more than 40,000 men employed in various shops of the Pennsylvania System.

The Track Supply Association announces that 47 firms have already arranged for space at the exhibit which will be presented in connection with the convention of the Roadmasters & Maintenance of Way Association in Chicago, on September 16, 17 and 18. This is the largest number which has ever been recorded so far in advance of the convention.

Members of the Committee on Electricity of the American Railway Engineering Association made a ten-day trip of inspection over the electrified lines of the Chicago, Milwaukee & St. Paul and the Butte, Anaconda & Pacific in Montana in July. The party studied the operation of freight and passenger trains electrically, visited repair shops of the Chicago, Milwaukee & St. Paul at Deer Lodge, Mont., where electrical locomotives are maintained and went through power plants of the Montana Power Company at Great Falls, Mont., and other points.

The train despatchers and other railroad officers who last year undertook to clear up the debt ($1,810) of the defunct Train Despatchers' Association of America have succeeded—or have come near enough to success so that John F. Mackie, the former secretary, who was the single creditor, has given a receipt in full. T. P. Finan, of Needles, Cal., the secretary, informs us that in response to his appeal the sum of $1,652 has been received. This left Mr. Mackie still $158 short, but because of his pride in the memories of the association and his desire to see it die a respectable death, he waived the remainder of his claim. More than three-fourths of the money received was in the shape of checks for one dollar each.

The United States Railroad Administration through its counsel has advised the Attorney General of North Dakota that it will comply immediately with the eight-hour law of that state as applied to women and minors, will put in effect lower freight rates and will comply with the full-crew law as the result of three mandamus actions instituted by the Attorney General against the Director General of Railroads. The eight-hour regulation has been the law since July 1. The railroad Administration, which employs between 2,000 and 3,000 women and girls in its shops and express, freight and passenger offices, had failed to comply with these laws. The writ of mandamus has been dismissed.

The use of steel crossties, instead of wood, so as to conserve our timber, is urged in a resolution which is now before Congress. The House Committee on Interstate and Foreign Commerce held a hearing on it last week. It was introduced by Representative Dyer of Missouri, and calls for an investigation by the Interstate Commerce Commission on the advisability of using steel. E. H. Clapp of the Forestry Service of the Department of Agriculture, testified that the country's timber consumption was now at the rate of three times the production; something must be done to restore a balance between production and consumption. H. T. Douglas, chief engineer of the Chicago & Alton, gave testimony regarding the tire requirements of the railroads and a letter from W. G. Bierd, federal manager of the Chicago & Alton, was presented, in which Mr. Bierd declared that steel ties have progressed beyond the experimental stage.

Prompt diversion of non-perishable freight to another road is one of the measures which has been adopted by the United States Railroad Administration in Kentucky and Tennessee to deal with a strike of enginemen. A congestion of freight on the Cincinnati, New Orleans & Texas Pacific due to this cause, was relieved by the issuance of an order to the effect that shipments from Cincinnati for Danville, Ky., and beyond, should be moved over the Louisville & Nashville, and delivered back to the Southern (C. N. O. & T. P.) at Knoxville. Shipments for Birmingham, Ala., and beyond were ordered to be sent through by the Louisville & Nashville. Northbound freight was diverted in the same manner. The strike was against being required to run large new engines of the Santa Fe type through the numerous tunnels between Danville, Ky., and Oakdale, Tenn. With these engines the clearance at the sides and top is so small that the flow of fresh air is seriously checked; so much so that in hot weather the enginemen have reported temperatures in cabs of 140 deg. F. Fans to ventilate the cabs, by air drawn from below the pilot, are being fitted to the engines.

Seventeen Lives Saved

H. M. Mayo, Superintendent of Safety of the Southern Pacific and other lines in Texas, in his latest bulletin to employees (No. 23) says that the safety record of his lines, always reasonably good, since December has been splendid. In the first half of 1918 35 persons were killed and 1,056 injured; in the same period of this year 16 were killed and 753 injured, a saving of 17 lives and the prevention or avoidance of injury to 303 persons. This, says Mr. Mayo, is due to a greater sympathy with the safety work on the part of employees. "It is due to a better conception of your responsibilities to each other, and to a better realization of what you owe your families, yourselves, and the company. You are acquiring the habit of thinking before acting. To save 17 lives in six months is fine. You did it. But how much greater an accomplishment it would be to save all. Let us neglect no detail of condition or practice that may help to success. It is a grand work."

Blockade by a Pint of Water

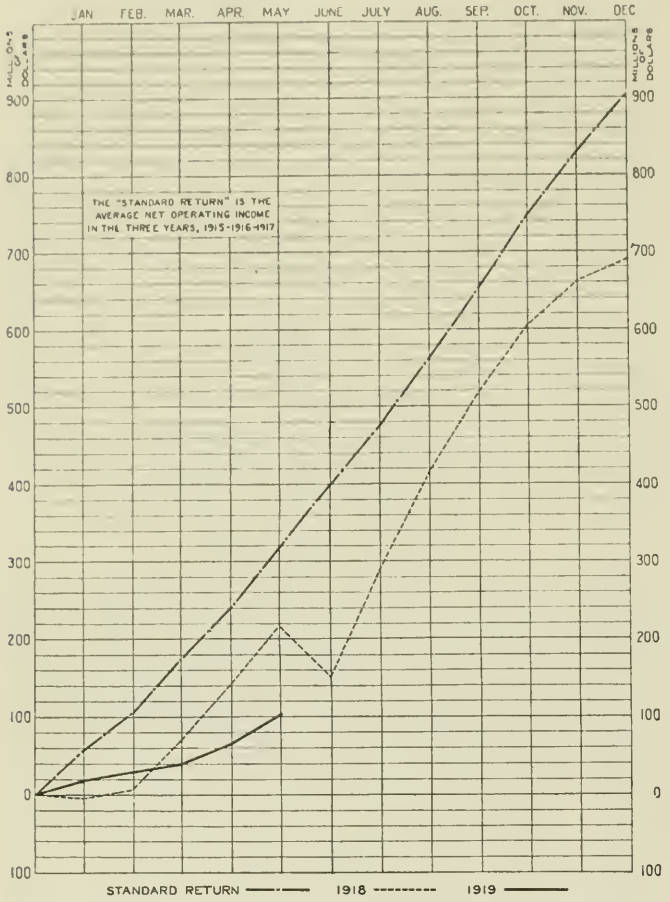
This is the heading in the New York Sun of an account of the stoppage of all trains to and from the Pennsylvania terminal, New York City, for about 30 minutes, on July 23, because of the failure of electric power. The mosquito, which once on a time stopped innumerable trains by getting caught between the points of a relay controlling a block signal, is outdone. The Sun says:

Rainwater, after eight days of gentle persistence, succeeded at 4:27 o'clock yesterday afternoon in seeping into fuse boxes in the so-called Sunnyside yards of the Pennsylvania railroad in Long Island City. Probably there wasn't more than a pint of the stuff that did the business, but no pint of booze ever accomplished so much mischief so quickly. For at 4:27 o'clock, trains scooting across Long Island plains suddenly grew tired and stopped. Trains scooting across the New Jersey meadows did the same. Also trains which had been roaring through black tubes beneath two rivers—the East and the North—stopped roaring and died, with lights out. Just for good measure, trolley cars in Queens,

Nassau and Suffolk counties also stopped. The trains advertised with important sounding names were just as impotent as the dinky 5:15's. Not until 6:15 was the mischief repaired and by that time even the vast waiting room of the Pennsylvania Terminal was hardly large enough for the throngs. As for the unlovely little brown and red stations in Brooklyn, they sent waiting crowds of suburbanites out into the drizzle of the cheerless Brooklyn streets.

Net Operating Income

The chart made by the Bureau of Railway Economics shows the net operating income of the Class 1 Roads in 1919, compared with the average in the test period (1915-1916-1917) on which government rental is based. The table gives the figures on which the chart is based.



Net Operating Income, Cumulated by Months, 1918 and 1919, Compared with Standard Return, Class 1, Railways of United States

Month	Average net operating income (standard return) in 3-year test period: By months	Average net operating income (standard return) in 3-year test period: Cumulative	Net operating income earned in 1919: By months	Net operating income earned in 1919: Cumulative	Deficit in 1919: By months	Deficit in 1919: Cumulative

Railway Men Wanted for Service in Russia

The office of the director general of military railways is desirous of securing the services of a few good roundhouse foremen, car foremen, and railway store material men who have had experience in railway storekeeping, for railroad work in Russia. A statement by President Wilson regarding the work being done by American railroads in Russia is given in another page of this issue. Applications should be addressed to "Office Director General Military Railways, 2709 Munitions building, Washington, D. C., Attention Lieutenant R. G. Cole," and should give applicant's experience in detail. The machinist and car foremen will be paid $2,000 a year and all expenses, including uniform, etc., and will rank as second lieutenants in the Russian Railway Service Corps. The store material men will be ranked as either first or second lieutenants, receiving $2,500 or $2,000.

The Dunkirk Wreck and the Deadly Angle Cock

In a letter to the editor under the above title, which appeared on page 92 of the July 18 issue of the *Railway Age*, the following statement was made near the end of the closing paragraph:

"Had the angle cock been as far back as the water station pans the A. S. A. brake would have stopped the train without any collision whatever." The meaning of this sentence was obscured through the inadvertent omission of a word. The sentence should have read as follows: "Had the angle cock been turned as far back as the water station pans, etc."

Half a Million Billionths, Plus

United States District Judge Hollister, at Cincinnati, has entered a decree in the foreclosure suit of the Bankers' Trust Company of New York et al. vs. The Cincinnati, Hamilton & Dayton Railway Company et al., confirming the sale of four parcels of securities to Herbert Shaffer as representative of the purchasers of the Cincinnati, Hamilton & Dayton Railway Company. These securities represented all the property of the C. H. & D. not sold with the real estate, rolling stock, etc., more than a year ago. Receivers are directed to turn this property over to Shaffer upon the payment of the purchase price, $45,085. After certain deductions, the receivers are ordered to pay the balance to holders of claims allowed by court. The face amount of these claims is $79,201,177, and under the order of Court the dividend is calculated at $0.0005005155 on each $1 (otherwise 50 cents on $1,000).

Labor Day to Be Devoted to Propaganda Against Return of Railroads

Labor day activities and oratory this year are to be devoted to the single purpose of promoting the campaign of the railroad labor organizations to prevent the return of the railroads to their owners, according to plans being worked out by the Plumb Plan League and the American Federation of Labor. The plan is to have speeches in favor of the Plumb plan in every community in the country and that all the usual activities of the day, such as speeches, meetings and parades, shall be used to call attention to the campaign of the labor organizations to have government control of the railroads continued until the present wave of opposition to government ownership shall have had an opportunity to subside and the prospects for the carrying out of the Plumb plan or some other plan which will give labor a large degree of control over the railroads appear more propitious than at present. It is also reported that a movement is on foot to call the day "Nationalization Day" rather than "Labor Day," on the theory that the word "nationalization" in some measure relates to the proposed plan of having the government buy the railroads and turn them over to the control of the employees.

It is understood that the leaders of the Plumb plan organization are not so optimistic as to expect the adoption of their plan in the near future, but that their primary object is to prevent the restoration of private management until circumstances shall be more favorable to their ultimate purposes. Considerable pressure is being brought to bear on members of Congress to influence them to oppose the return of the roads, which the President has stated will take place at the end of the year, and those who recall the abject surrender of Congress to the demands of the brotherhoods at the time of the passage of the Adamson "eight-

hour" law are inclined to listen with some interest to a rumor that the labor organizations are planning a call for a nation-wide strike if necessary by way of protest against any move for the return of the railroads, because there is still no more machinery for dealing with such a situation than there was at the time Congress passed the Adamson law because it thought it the only way to prevent a strike.

Federation of Labor Demands Agreement

Representatives of the Railroad Department of the American Federation of Labor are in Washington threatening to order a general strike on August 1 unless the Railrad Administration will enter into a comprehensive agreement on wages and working conditions. A committee of 100 shopmen, representing the six different crafts, conferred in Washington on Wednesday with Director General Hines. Mr. Hines advised them that the Railroad Administration would enter into an agreement and he expects to give them a decision on the wage question without delay; and as to working conditions he has given no decision, but the strike seems to be temporarily averted. Following the interview with Mr. Hines, E. M. Buell, assistant president, wired the chairmen throughout the country that there must be no stoppage of work until the conclusion of the negotiations.

Association of Railway Executives' Meeting

The standing and law committees of the Association of Railway Executives met at the New Haven board room, Grand Central Terminal, New York, Friday morning, July 25, and in the afternoon the member-roads of the association met. After the meetings, Thomas DeWitt Cuyler, chairman of the association, said:

"The railroads have had under consideration today a number of important matters, including the question of the maintenance of the properties while in the possession of the government, remedial legislation to accompany the return of the railroads to private operation, and the formation of a proposed national equipment corporation.

"The question of maintenance during federal control is now being investigated and considered by both the Railroad Administration and by the railroad companies. Sufficient data has not yet been secured to lead to any conclusion, but it is hoped and expected that with all the facts in hand an amicable understanding can be reached between the government and the railroads as to the extent to which they have been properly maintained while in the government's possession.

"Within a short time the railroads expect to submit to the House Committee on Interstate Commerce substantially the same recommendations for remedial legislation as were submitted by them to the Senate Committee in January of this year. In order to show precisely the form which these recommendations would take, they have been reduced to the phraseology of a bill. The only change of importance will be the substitution of a board of transportation for the secretary of transportation with a seat in the President's cabinet as originally proposed.

"For some time we have had under consideration with the government the formation of a national equipment corporation to take up and finance in a single operation a large part of the equipment contracted for by the government, and allocated by it to the various railroad companies. Some time ago we submitted to the roads belonging to this association the report of a committee of bankers on a proposed national equipment corporation. Our member-roads having equipment valued at approximately $250,000,000, have signified their willingness to finance this through this proposed national equipment corporation. The participation already assured represents over 70 per cent of the value of the equipment allocated to roads belonging to this association. The matter has been referred back to the special committee on allocation and financing of equipment, which has been empowered to negotiate the details and arrangements necessary for the formation of the proposed national equipment corporation. The facts of the situation have been communicated to the government, which is understood to be ready to negotiate the matter to a conclusion.

"The railroad companies have made every effort to cooperate with the government in this matter, and many of the strongest railroad systems which could make thoroughly satisfactory other arrangements, have nevertheless elected to join in this general movement in the belief that relationship with the government will be simplified and that the general railroad situation will be benefited by such co-operative action."

Meetings and Conventions

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

Air Brake Association.—F. M. Nellis, 165 Broadway, New York City. Next convention, May 5-7, 1920, Chicago.

American Association of Demurrage Officers.—F. A. Pontious, Supervisor of Demurrage and Storage, C. & N. W. Ry., Chicago.

American Association of Dining Car Superintendents.—E. H. Thayer, St. Louis-San Francisco R. R., St. Louis, Mo.

American Association of Freight Agents.—R. O. Wells, Illinois Central, Chicago.

American Association of General Baggage Agents.—E. R. Reynolds, C. G. W. R. R., Chicago. Next meeting, November 11-13, 1919, New Orleans, La.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

American Association of Railroad Superintendents.—J. Rothschild, Union Station, St. Louis, Mo.

American Electric Railway Association.—E. B. Burritt, 8 W. 40th St., New York. Next convention, October 6-10, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—C. F. J. Dell, 50 E. 42nd St., New York.

American Railroad Master Tinners', Coppersmiths' and Pipe Fitters' Association.—Otto E. Schlinck, 165 W. 5th St., Peru, Ind.

American Railroad Association.—J. E. Fairbanks, 75 Church St., New York:

Section I, Operating (including former activities of Association of Railway Telegraph Superintendents).

Section II, Engineering (including former activities of American Railway Engineering Association and Railway Signal Association).—E. H. Fritch, 431 South Dearborn St., Chicago.
Signal Division.—H. S. Balliet, 75 Church St., New York.

Section III, Mechanical (including former activities of Master Car Builders' and Master Mechanics' Association).—V. R. Hawthorne, 431 South Dearborn St., Chicago.

Section IV, Traffic (including former activities of Freight Claim Association).

Section V, Transportation (including former activities of Association of Transportation and Car Accounting Officers).

Section VI, Purchases and Stores (including former activities of Railway Storekeepers' Association).

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W. Ry., 319 N. Waller Ave., Austin Station, Chicago. Next convention, October 21-23, 1919, Cleveland, O.

American Railway Engineering Association.—(See American Railroad Association, Section II, Engineering).

American Railway Master Mechanics' Association.—(See American Railroad Association, Section III, Mechanical).

American Railway Perishable Freight Association.—E. F. McPike, 135 E. 11th Place, Chicago. Regular meetings, 2d Wednesday in March and September.

American Railway Tool Foremen's Association.—R. D. Fletcher, 6202 Greenwood Ave., Chicago. Next convention, August 27-29, Hotel Sherman, Chicago.

American Society for Testing Materials.—C. L. Warwick, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Charles W. Hunt, Engineering Societies Building, 33 W. 39th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 33 W. 39th St., New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Short Line Railroad Association.—T. F. Whittelsey, 708 Union Trust Bldg., Washington, D. C.

American Train Despatchers' Association.—D. L. Darling, Northern Pacific Ry., Spokane, Wash.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md.

Association of Railway Claim Agents.—Willis H. Failing, C. R. R. of N. J., Jersey City, N. J. Next meeting, May, 1920, Atlantic City, N. J.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Next meeting, October, 1919. Chicago.

Association of Railway Telegraph Superintendents.—(See American Railway Association, Section I, Operating).

Association of Transportation and Car Accounting Officers.—(See American Railroad Association, Section V, Transportation).

Bridge and Building Supply Men's Association.—M. J. Trees, Chicago, Bridge & Iron Company, Chicago. Next annual convention, October 21-23, 1919, Cleveland, O.

Canadian Railway Club.—James Powell, 46 Aberdeen Ave., St. Lambert (near Montreal), Que.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, New Morrison Hotel, Chicago.

Car Foremen's Association of St. Louis.—Thomas B. Koeneke, Federal Reserve Bank Bldg., St. Louis, Mo. Regular meetings, first Tuesday in each month, American Hotel Annex, St. Louis, Mo.

Central Railway Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 2d Thursday in November, and 2d Friday in January, March, May and September, Hotel Statler, Buffalo, N. Y.

Chief Interchange Car Inspectors' and Car Foremen's Association.—W. R. McMunn, New York Central, New York.

Chief Interchange Car Inspectors' and Car Foremen's Supply Men's Association.—D. B. Wright, Lehon Company, 45th and Oakley Sts., Chicago.

Eastern Railroad Association.—D. G. Stuart, Washington, D. C.

Freight Claim Association (See American Railroad Association, Section IV, Traffic).

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Sta., Chicago. Regular meetings, Wednesday preceding 3rd Friday in month, Room 856, Insurance Exchange Bldg., Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, B. & O., Lima, Ohio. Next convention, August 19-21, Hotel Sherman, Chicago.

International Railway Fuel Association.—J. G. Crawford, 702 E. 51st St., Chicago. Next annual meeting, May, 1920, Hotel Sherman, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 1061 W. Wabash Ave., Winona, Minn. Next convention, September 2-5, Hotel Sherman, Chicago.

Maintenance of Way and Master Painters' Association.—F. W. Hager, 1323 Hurley Ave., Ft. Worth, Tex. Next annual convention, October 21-23, 1919, American Annex Hotel, St. Louis, Mo.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 9, 1919, Hotel La Salle, Chicago.

Master Car Builders' Association.—(See American Railroad Association, Section III, Mechanical).

National Association of Railway and Utilities' Commissioners.—James B. Walker, 49 Lafayette St., New York. Next annual convention, October 14, 1919, Indianapolis, Ind.

National Foreign Trade Council.—O. K. Davis, 1 Hanover Square, New York. Next convention, May 12-15, 1920, San Francisco.

National Railway Appliances Association.—C. W. Kelly, Kelly-Derby Co., Peoples Gas Bldg., Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, excepting months of June, July, August and September.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—George A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Regular meetings, 3d Tuesday in each month, Tenjost Hall, Buffalo, N. Y.

Pacific Railway Club.—W. S. Wollner, 64 Pine St., San Francisco, Cal.

Railway Accounting Officers' Association.—E. R. Woodson, 1116 Woodward Bldg., Washington, D. C.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Next annual meeting, December, 1919, Buffalo, N. Y.

Railway Club of Pittsburgh.—J. D. Conway, 515 Grandview Ave., Pittsburgh, Pa. Regular meetings, 4th Thursday in month except June, July and August. Colonial Annex Hotel, Pittsburgh, Pa.

Railway Development Association.—D. C. Welty, Missouri Pacific R. R., St. Louis, Mo.

Railway Electric Supply Manufacturers' Association.—J. Scribner, General Electric Co., Chicago. Annual meeting with Association of Railway Electrical Engineers.

Railway Equipment Manufacturers' Association.—D. L. Eubank, Galena Signal Oil Company, Richmond, Va. Next annual meeting, September, 1919, Hotel Sherman, Chicago.

Railway Fire Protection Association.—G. L. Ball, St. Louis-San Francisco Ry., St. Louis, Mo. Next annual meeting, October 21-23, 1919, La Salle Hotel, Chicago.

Railway Real Estate Association.—James P. Nelson, President, C. & O., Richmond, Va.

Railway Signal Association.—(See American Railroad Association, Engineering Section, Signal Division).

Railway Storekeepers' Association.—(See American Railroad Association, Section VI, Purchases and Stores).

Railway Supply Manufacturers' Association.—J. D. Conway, 1841 Oliver Bldg., Pittsburgh, Pa.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, Waterbury Battery Co., 30 Church St., New York.

Roadmasters' and Maintenance of Way Association.—P. J. McAndrews, C. & N. W. Ry., Sterling, Ill. Next annual convention, September 16-18, 1919, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

Signal Appliance Association.—F. W. Edmunds, West Nyack, Rockland County, New York.

Society of Railway Financial Officers.—L. W. Cox, 1217 Commercial Trust Bldg., Philadelphia, Pa. Next annual meeting, October 16-17, New York City.

Southern and Southwestern Railway Club.—A. J. Merrill, P. O. Box 1205, Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September and November. Piedmont Hotel Atlanta.

Southern Association of Car Service Officers.—E. W. Sandwich, Western Ry. of Ala., Atlanta, Ga.

Supply Association of American Railway Tool Foremen's Association.—C. N. Thulin, Duff Manufacturing Company, 935 Peoples Gas Bldg., Chicago. Next convention, August 27-29, Hotel Sherman, Chicago.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Next annual convention, September 16-18, 1919, Auditorium Hotel, Chicago.

Train Despatchers' Association of America.—J. P. Finan, A. T. & S. F. Ry., Needles, Cal.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. R. R., Cleveland, O. Next annual meeting, September 16-19, 1919, Hotel Sherman, Chicago.

Western Association of Short Line Railroads.—Clarence M. Oddie, Mills Bldg., San Francisco.

Western Railway Club.—J. M. Byrne, Chief Clerk to Mechanical Assistant, Central Western Region, 547 Jackson Blvd., Chicago. Regular meetings, 3d Monday in month, except June, July and August.

Western Society of Engineers.—Edgar S. Nethercut, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except July and August.

Traffic News

Edwin Kluever, assistant general freight agent of the New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, has been elected president of the Cleveland Traffic Club.

Representative Black has introduced in Congress a bill directing the President to grant reduced rates over railroads under federal control one and one-third fare for the round trip to passengers attending conventions, meetings or congresses of religious, charitable and other organizations or associations.

The Canadian National Railways, in the five months January-May, transported from the seaboard 116,328 home-coming troops, in 318 trains, an average of 366 men per train or about 33 in each car. Each of these train movements included also the movement of an empty train in the opposite direction, and the total train mileage was 539,212, the average length of the trip of each loaded train being 848 miles.

Seven cents, instead of five cents, is now the fare for a large portion of the street car rides in Brooklyn, N. Y., where hitherto the rate has been five cents. This increase is brought about by abolition of the practice of giving free transfers at 959 points where these have been given to passengers changing from one car to another. Now, passengers must ask for such transfer when beginning their journey, and must pay for it two cents. At 49 places the issuance of free transfers, allowing the passenger to ride over two lines for a single five-cent fare, will be continued. It is estimated that the additional two-cent collections will increase the annual revenue of the Brooklyn Rapid Transit Company by $1,200,000.

The Canadian Pacific Ocean Services, Ltd., at the outbreak of the war had in commission in the Atlantic and Pacific services 38 steamships with an aggregate gross tonnage of 341,399 tons. Since August, 1914, the construction of four steamships, having a gross tonnage of 67,000 tons, has been completed and 12 steamships of 76,000 gross tons have been purchased within the same period. During the war 15 steamships were lost by enemy action or through accidents at sea and eight have been sold to the British government and one to an Indian prince who later presented it to the British government for use as a hospital ship. A ship 625 ft. long, having a gross tonnage of 22,000 tons, is now being built at the Clyde yards of the Fairfield Shipbuilding & Engineering Company, while work will soon be started on the building of three passenger ships of intermediate class for the Atlantic service. At the end of the last fiscal year the company had in ocean service 28 steamships of a gross tonnage of 264,430 tons, and 6 steamships under order or purchased but not delivered having a gross tonnage of 88,600.

Tobacco Association Co-operates in Heavier Car-Loading Campaign

The Tobacco Association of the United States at its recent annual meeting adopted resolutions that the members of the tobacco trade as far and as soon as possible adopt as a standard the 48-inch by 46-inch hogshead, which was recommended by the Railroad Administration on the ground that a large saving in car space and a much heavier loading of tobacco can be made in a hogshead of that size, which admits of loading in the car side by side and then double decking. The resolutions call attention to the advantages of standardization: Recooperage is decreased to a minimum insuring arrival at destination in better order; the cylindrical hogshead, which shape does not stand shipping, can be done away with. Several of the largest export firms have adopted this size hogshead and others have expressed their intention to do so. The railroads are requested to see that full size cars are furnished and that agents understand the necessity of full and careful loading.

Commission and Court News

Interstate Commerce Commission

The Commission has submitted a report on its investigation, conducted at the request of Director General Hines, into the controversy between coal operators as to the relationship of rates on bituminous coal by rail-lake-and-rail from Ohio and West Virginia to the northwest to rates by rail all the way from Illinois and Indiana mines, which relationship was changed by the increases resulting from Mr. McAdoo's General Order No. 28 last year. The commission finds that there has been no recognized relationship between these rates and that therefore, there is none to be restored.

State Commissions

The New York State Public Service Commission, Second District, announces that freight and passenger tariffs issued by the United States Railroad Administration, and now in force, will be accepted as legal tariffs by the commission when the railroads are returned to their owners. This does not mean formal approval of the rates in such tariff; they will be subject to protest, complaint and investigation, the same as is the case, under the law, with rates established by the carriers.

The New York State Public Service Commission, Second District, acting on a complaint from the Brotherhood of Railroad Trainmen, holds that under the full-crew law of New York every passenger train of five cars or more must have a baggageman—whether there be or be not any baggage to be handled. The commission says that the law is very clear on this point, and calls attention to the general practice of requiring that the baggageman shall act when necessary, in place of a brakeman in the protection of the train from collision.

Court News

Federal Employers' Liability

The Circuit Court of Appeals, Second Circuit, holds that an employee in a local switching crew at a station in New Jersey, injured while setting a brake on an open coal car being switched between sidings, the car having come from Pennsylvania consigned to a company in New Jersey, was not engaged in interstate commerce so as to bring his case within the federal act.—D., L. & W. v. Peck, 255 Fed. 261.

Hours of Service Act

The Circuit Court of Appeals, Fifth Circuit, holds that where a railroad detained train crews in service more than 16 hours, it cannot excuse the violation of the law because an accident occurred at a point some distance from division points, where it could have sent relief crews, since section 3 of the act, relieving railroads in case of casualty, does not relieve from the duty to exercise diligence to comply with the act.—G., C. & S. F. v. U. S., 255 Fed. 753.

Doing Business in District

The federal district court in Massachusetts holds that a railroad company which operates no line of road within a federal district, but merely maintains an office therein for the solicitation of passenger and freight business, paying the rent and salaries of the employees, is not doing business nor is "present in the district," in such sense as to be subject to suit in the federal court therein.—Davis v. Baltimore & Ohio, 256 Fed. 407. Decided February 11, 1919. Graustein v. Rutland, 256 Fed. 409. Decided March 4, 1919.

Foreign Railway News

American Rail for Danish State Railways

Sophus Berendsen, Inc., have announced the placing of an order for 2,000 tons of rail with the United States Steel Products Company. The rail is to be supplied to the Danish government, and if the quality of the rail proves satisfactory, it is expected that the government will accept shipments of 2,000 tons per month, not including curve rails, frogs and switches.

The rail is a special section, formerly supplied by manufacturers in England and Germany. It is said that the purchasers experienced some difficulty in getting an American concern to roll a rail of special section, but that the United States Steel Products Company went to considerable trouble to meet every requirement of the purchaser.

Siberian Railroad Management Petitions Authorities for Loan

The management of the Atchinsk-Minusinsk Railway has petitioned the authorities for a loan to be used to survey a railway from Menisseisk to Tomsk and thence to Tara, a distance of 800 miles. This line would be the central section of the proposed North Siberian main line extending from Krasnufinsk eastward and paralleling the existing main line.

It is stated that there are 1,000 loaded freight cars between Manchuria and Irkutsk waiting to be forwarded. The railway situation is said to account for wide difference of prices at Manchuria and at points farther westward. For example, an arshine (28 inches) of Chinese cloth costs 8 rubles at Manchuria, 12 rubles at Tchita, and 23 rubles at Irkutsk, although the freight per arshine is calculated at 2.10 rubles from Manchuria to Irkutsk.

Arrangements were made to ship 140 cars of freight west of Blagovyeshtchensk by the Amur Railway in February and that 68 cars were to be loaded with fish. Owing to the cutting of the Amur Railway line by insurgents, this program could not be carried out fully.

From April 1 on, all freight rates are to be increased, according to newspaper reports, so that they will be 10 times as high as those prevailing up to July 10, 1917.

"Railway Nationalization in Japan"

The *Railway Age* is in receipt of a copy of "Railway Nationalization in Japan," a 200-page book with pages 8 in. by 12 in. in size and in English, issued by the Imperial Government Railways of Japan. The book is a general review of ten-years' progress of the Japanese Railways under unified state management from 1907-8 to 1916-17, including the report for the fiscal year 1916-17. It is profusely illustrated and in addition to giving the detailed figures of finances and operation gives also a history and description of the Japanese lines, details concerning the stations, cars and locomotives, etc., information concerning the through traffic arrangements to China, Manchuria, Russia, etc., as well as data concerning the wages and treatment of employees, etc. As the title indicates, emphasis is placed principally on the difference between the lines under private control in 1906 and the government owned lines of today as shown by the increased weight of engines, larger capacity cars, etc. The book is especially interesting to American readers, however, because of the descriptions and diagrams given of the equipment in use and other valuable information relating to the physical and traffic characteristics of the Japanese system.

The figures concerning the operation of the Imperial Government Railways show that on March 31, 1918, the government lines had a mileage of 5,206 as compared with 5,094 in the year preceding. In the fiscal year ended March 31, 1918, the "working revenue" was $91,763,000 as compared with $70,628,000 in 1917. Operating expenses totaled $42,185,000, leaving a profit of $49,578,000, as compared with $40,046,000

in the preceding year, the operating ratio being 46 per cent in 1917-18, as against 43 per cent in 1916-17. The balance after the deduction of inspection and survey charges, additional works expenses, subsidies to light railways and interest charges, amounted to $21,790,000 in 1917-18, as compared with $17,497,000 in 1916-17. The figures show that in 1917-18 the passengers carried totaled 245,234,480, as compared with 197,043,320 in 1916-17, and that the passenger revenue was $37,080,000 as against $29,373,000 in the year preceding. The freight ton miles totaled 5,033,344,000, bringing in a revenue of $43,862,000, a considerable increase over the ton miles of 4,179,135,000, yielding a revenue of $34,666,000 in 1916-17. The average receipts per passenger mile remained the same over the two years, namely .67 cents, but the revenue per freight ton mile in 1917-18 was .87 cents as against .83 cents in 1916-17. The average trainload showed an increase over the two years from 128 to 142.6.

On March 31, 1918, the Japanese Government Railways owned 2,827 locomotives, 6,903 passenger cars and 46,600 freight cars.

The Russian Railway Service Corps

In a message to the Senate regarding the reasons for sending United States soldiers to Siberia, President Wilson has given an explanation of the operations of the Russian Railway Service Corps. He says in part:

"In February, 1919, as a conclusion of negotiations begun early in the summer of 1918, the United States accepted a plan proposed by Japan for the supervision of the Siberian railways by an international committee, under which committee, Mr. John F. Stevens would assume the operation of the Russian Railway Service Corps. In this connection it is to be recalled that Mr. John F. Stevens, in response to a request of the provisional government of Russia, went to Russia in the spring of 1917. A few months later he was made official adviser to the minister of ways and communication at Petrograd under the provisional government. At the request of the provisional government, and with the support of Mr. John F. Stevens, there was organized the so-called Russian Railway Service Corps, composed of American engineers. As originally organized, the personnel of this corps constituted 14 skeleton division units as known in this country, the idea being that these skeleton units would serve as practical advisers and assistants on 14 different sections of the Siberian Railway and assist the Russians by their knowledge of long-haul problems as known in this country, and which are the rule and not the exception in Siberia.

"Owing to the Bolshevik uprising and the general chaotic conditions, neither Mr. Stevens nor the Russian Railway Service Corps was able to begin work in Siberia until March, 1918. They have been able to operate effectively only since the railway plan was adopted in February, 1919.

"The most recent report from Mr. Stevens shows that on parts of the Chinese-Eastern and Trans-Baikal Railway he is now running six trains a day each way, while only a little while ago they were only able to run that many trains a week.

"In accepting the railway plan it was provided that some protection should be given by the allied forces. Mr. Stevens stated frankly that he would not undertake the arduous task before him unless he could rely upon support from American troops in an emergency. Accordingly, as provided in the railway plan and with the approval of the interallied committee, the military commanders in Siberia have established troops where it is necessary to maintain order at different parts of the line. The American forces under General Graves are understood to be protecting parts of the line near Vladivostok, and also on the section around Verchne Udinsk. There is also understood to be a small body of American troops at Harbin. The exact location from time to time of American troops is, however, subject to change by the direction of General Graves.

"The instructions to General Graves direct him not to interfere in Russian affairs, but to support Mr. Stevens wherever necessary. The Siberian Railway is not only the main artery for transportation in Siberia, but is the only open access to European Russia today. The population of Siberia, whose resources have been almost exhausted by the long years of war and the chaotic conditions which have existed there, can be protected from a further period of chaos and anarchy only by the restoration and maintenance of traffic on the Siberian Railway.

"Partisan bands under leaders having no settled connection with any organized government, and bands under leaders whose allegiance to any settled authority is apparently temporary and transitory, are constantly menacing the operation of the railway and the safety of its permanent structures.

"The situation of the people of Siberia meantime is that they have no shoes or warm clothing; they are pleading for agricultural machinery and for many of the simpler articles of commerce upon which their own domestic economy depends and which are necessary to fruitful and productive industry among them. Having contributed their quota to the Russian armies which fought the Central Empires for three and one-half years, they now look to the Allies and the United States for economic assistance.

"The population of western Siberia and the forces of Admiral Kolchak are entirely dependent upon these railways.

"The Russian authorities in this country have succeeded in shipping large quantities of Russian supplies to Siberia, and the Secretary of War is now contracting with the great cooperative societies which operate throughout European and Asiatic Russia to ship further supplies to meet the needs of the civilian population. The Kolchak government is also endeavoring to arrange for the purchase of medical and other Red Cross supplies from the War Department, and the American Red Cross is itself attempting the forms of relief for which it is organized. All elements of the population in Siberia look to the United States for assistance. This assistance can not be given to the population of Siberia, and ultimately to Russia, if the purpose entertained for two years to restore railway traffic is abandoned. The presence of American troops is a vital element in this effort. The services of Mr. Stevens depend upon it, and, a point of serious moment, the plan proposed by Japan expressly provides that Mr. Stevens and all foreign railway experts shall be withdrawn when the troops are withdrawn.

"From these observations it will be seen that the purpose of the continuance of American troops in Siberia is that we, with the concurrence of the great allied powers, may keep open a necessary artery of trade and extend to the vast population of Siberia the economic aid essential to it in peace time, but indispensable under the conditions which have followed the prolonged and exhausting participation by Russia in the war against the Central Powers. This participation was obviously of incalculable value to the allied cause, and in a very particular way is a commendation to the exhausted people who suffered from it to such assistance as we can render to bring about their industrial and economic rehabilitation."

Railways of Northern China

In the claim of China for the abrogation of the treaties and notes concluded with Japan on May 25, 1915, which claim was printed in the Congressional Record of July 25, 1919, there occur the following paragraphs dealing with the railway situation:

"The meaning of this Japanese succession to German rights in Shantung is best illustrated in the railway situation arising out of Japan's exercise of two of the 'other railway rights' that were vested in Germany.

"Although Japan's claim now before the peace conference, in so far as it relates to China, is confined to the 'railways and other rights possessed by Germany in respect of Shantung Province,' she has pressed (in a set of secret agreement and notes concluded on September 24, 1918) on China the acceptance of the view that her first demand in Group I—which is substantially repeated in her conference claim—covers the German rights to finance, construct, and supply the materials for two lines of railway running into the two other Provinces of Kiangsu and Chihli, though starting in Shantung.

"If the peace conference concede this Japanese claim, the following formidable situation will be created: Through the

trans-Shantung Railway, with its western or inland terminus at the provincial capital of Chinanfu where it flanks the northern section of the Tientsin-Pukow Railway—built by the Germans—Japan will at once dominate the whole of Shantung as well as the northern half of this important trunk line. Then, by financing, constructing, and supplying the materials for the first of the aforesaid 'two lines of railway'—i. e., a line from the city of Kaomi, on the trans-Shantung Railway, to a point strategically dominating the southern or British constructed section of the same Tientsin-Pukow Railway—Japan will practically master the great railroad linking Tientsin (the port of Peking) and north China with the Yangtze Valley and south China.

"Next, by financing, etc., the second of the 'two lines of railway'—i. e., a line practically extending the trans-Shantung Railway from Chinanfu, where it will bisect the Tientsin-Pukow trunk line, to a point westward on the Peking-Hankow Railway—Japan will flank the other of the two trunk lines connecting Peking and north China with central and southern China. (It is important to note that the administration of a Japanese constructed railway in China goes far beyond that of any other foreign constructed railway in China, including even those constructed by Germany in Shantung. It means that the railway is practically manned by Japanese, to the exclusion even of Chinese; that the railway is policed by Japanese gendarmerie and is guarded by Japanese troops along its entire length. That is the danger.)"

Railway Material for South Africa

Purchases of railway supplies from the United States are again bothering the British House of Commons. The Times, London, in a recent issue reports the following:

In reply to Mr. Houston (West Toxteth, C. U.), who asked the president of the Board of Trade whether, in view of the friendly relations existing between the South African and British governments, he could state why the former had placed important orders for railway material in America instead of in this country, seeing the necessity of finding work for the people of Great Britain and for maintaining her export trade.

Colonel Amery, Under-Secretary for the Colonies (Birmingham, Sparkbrook, C. U.), said: Some of the orders were placed by the South African authorities in the United States before the armistice at a time when it was impossible to supply railway material from this country. As regards 70 locomotives, which have been ordered since the armistice, I am informed that the British offers in respect both of price and of date of delivery were so unfavorable that the South African authorities felt themselves obliged to go further afield. Forty of the locomotives, however, were, I am glad to say, ordered in Canada. I would remind the honorable member that the policy on which the governments of the Empire have agreed is that of preference, in contracts, to the produce and manufactures of the Empire, and not merely to those of the United Kingdom. Contractors in this country cannot expect preference from other governments in the Empire, except as against foreign countries.

[The orders in question are the 30 Mountain type locomotives ordered from the Baldwin Locomotive Works and 40 of the same type ordered from the American Locomotive Company (Montreal Locomotive Works) as reported in the *Railway Age* of February 7.—Editor.]

Mr. Kellaway, Parliamentary Secretary, Ministry of Munitions (Bedford, C. L.), replying to Mr. Houston, said that arrangements had been made to sell to the South African government a quantity of 75-lb. flat-bottomed rails, payment to be made from a grant of $2,500,000 by the British government in respect of services rendered by the South African government in connection with the transport of troops and material during the war. The rails to be supplied were not required by the British railway companies, there being sufficient material of this class to meet home requirements in addition to those of South Africa. No rolling stock was to be sent to South Africa and special arrangements were being made to bring over as rapidly as possible to this country all the surplus railway material in France suitable for the re-equipment of British railways.

Financial and Construction

Railway Financial News

Canadian Northern.—Wm. A. Read & Co., New York, have bought from the company and resold to the public $10,000,000 two-and-a-half-year six per cent collateral trust Canadian Northern notes. These notes are secured by the deposit of $14,286,000 Canadian Northern guaranteed general mortgage four per cent bonds due 1934. These pledged bonds are guaranteed, principal and interest, by the Canadian government.

Cleveland, Cincinnati, Chicago & St. Louis.—This company has sold to a syndicate of bankers, headed by J. P. Morgan & Co., the First National Bank, the National City Company and the Guaranty Trust Company, all of New York, $15,000,000 ten-year six per cent refunding and improvement mortgage bonds, July 1, 1919 to July 1, 1929. The bankers are offering these bonds to the public at 98, yielding over 6¼ per cent interest on the investment. These bonds are part of a total authorized issue of $20,000,000 series "A" bonds issued under the refunding and improvement mortgage, which mortgage also secures the company's 4 per cent 20-year European loan of 1910 and its 20-year 4½ per cent debentures of 1911.

Erie.—The New York & Erie second mortgage 5 per cent bonds, of which $2,149,000 are outstanding, maturing on September 1, are being paid or extended at the option of the holder by J. P. Morgan & Co., New York, and Drexel & Co., Philadelphia. The extended notes bear 5 per cent interest and are due September 1, 1939, and the holder of each thousand-dollar bond, which is extended, receives $27.50 in cash. In other words, the new bonds are offered to holders of the old bonds at a price to yield 5.20 per cent interest.

Railway Construction

Grand Trunk Western Lines.—This road is enlarging its freight handling facilities at Belsay, near Flint, Mich., where the construction of switching yards with a capacity of 500 to 600 cars has already been started. The layout will also provide for a large roundhouse which will be built in the future.

Missouri Pacific.—The L. J. Smith Construction Company, Kansas City, Mo., has been awarded a contract for filling five bridges on the White River branch of the Missouri Pacific near Hollister, Mo. This company has sublet the placing of 1,000 cubic yards of reinforced concrete on the same job to the J. W. McMurray Contracting Company, Kansas City.

Savannah & Atlanta.—A contract has been given to H. O. Young, Savannah, Ga., to build a freight warehouse for the Savannah & Atlanta in Savannah. It will be a one-story building of wood frame sheathed with galvanized iron, 40 ft. wide and 320 ft. long. The work is to be started at once and will cost about $10,000.

St. John & Quebec Railway.—This company has completed the work since January 1 on the section from Gagetown, N. B., to Westfield, 37.92 miles, and the entire line of 158.83 miles is expected to be in operation early in August.

Winchester & Western: This company has completed track laying on 28 miles of its new line, between Winchester, Va., and Wardensville, W. Va., 40 miles, on which work was started in 1916. Track laying is now under way between Shiloh and Capon Springs, on about 6 miles. The line will have maximum grades of 3 per cent, and maximum curvature of 12 deg. The Intermountain Construction Company, Winchester, Va., has the contract to build the line. The railway company expects to develop a traffic in lumber, iron ore, livestock, fruit and forest products. W. B. Cornwell, Winchester, Va., is president, and William Morgan, chief engineer.

Equipment and Supplies

Locomotive Deliveries, Week Ending July 19

The following new locomotives were shipped to railroads under federal control during the week ended July 19:

Works	Road.	No.	Type
American	C. & N. W.	4	USRA 6W. Sw.
	C. St. P. M. & O.	8	USRA 6W. Sw.
	Virginian	3	USRA Mallet
		15	
Baldwin	A. T. & S. F.	7	Santa Fe
	C. C. & O.	1	Mallet
	C. R. I. & P.	6	USRA Mikado

Freight Cars

The Texas & Pacific is in the market for 110 tank cars.

The Chesapeake & Ohio, Richmond, Va., is inquiring for 12 12-yd. air dump cars.

The Arthur J. Dunkle Company, New York, is inquiring for fifteen kerosene or gasoline driven cars.

O. B. Cintas, Havana, Cuba, has ordered 25 cane cars from the American Car & Foundry Company, Chicago.

The Island Refining Company has ordered 1,400 tank cars from the General American Tank Car Corporation, Chicago.

The General Chemical Company, New York, has ordered five steel flat cars from the American Car & Foundry Company, Chicago.

The Havana Central of Cuba is in the market for 500 30-ton box cars, 500 25-ton flat cars, and 50 15-ton narrow gage cane cars.

The Sun Company, Philadelphia, Pa., has ordered 100 50-ton 10,000 gal. tank cars from the American Car & Foundry Company, Chicago.

The North American Car Company, Chicago, has ordered fifty 40-ton 8,000 gal. tank cars from the American Car & Foundry Company, Chicago.

Willits & Patterson, San Francisco, Cal., Victor Labadie, traffic manager, are in the market for 25 standard 8,000 gal. tank cars equipped with steam coils for handling vegetable oils imported from the Orient.

Passenger Cars

The Havana Central of Cuba is in the market for 8 first-class passenger coaches and 12 third-class passenger coaches.

Six rigid air ships of improved type, representing successive stages of development, are under construction for the British Navy at a cost of about $11,000,000.

An Early Train Ferry.—There has recently come into the possession of one of our staff, says the Railway Gazette, London, a copy of a limited autograph edition of the "Reminiscences of General Herman Haupt," who was chief of the Bureau of the United States Military Railroads in the Civil War. Therein is a reference to a subject which has been much in evidence recently in connection with the train ferries from Richborough and Southampton. It is difficult, without local knowledge and a large scale map, to reconstruct the situation that gave rise to the events about to be related, so it must suffice to say that in the autumn of 1862 the Confederate forces, under Lee, were on the south side of the Potomac river and in command of certain railway communications from Washington southwards, and thus severing the army of the Potomac at Washington from that on the Rappahannock. What Haupt did to remedy this was to lash two canal barges together by long timbers bolted transversely and to lay thereon eight tracks, each track being of sufficient length to hold one car. The loaded cars were put on the ferry at the advanced base of the Federal army on the Orange & Alexandria Railroad, towed down the Potomac to Acquia Creek, a distance of 60 miles; there again put on the rails and conveyed to Fredericksburg on the Rappahannock river and the Richmond, Fredericksburg & Potomac Railroad. This, we should say, was the first military train ferry.

Supply Trade News

The **Camden Forge Company,** Camden, N. J., has opened a district sales office at 2 Rector street, New York, with **Samuel W. Hilt** as manager.

The Page Steel & Wire Company, New York, has opened a branch office at 29 South La Salle street, Chicago, and another in the Book building, Detroit.

H. A. Wolcott has been appointed district manager of the **Ohio Locomotive Crane Company,** Bucyrus, Ohio, for the Chicago territory, with office in the Lytton building, Chicago.

George C. Isbester, district sales manager of the Rail Joint Company, with headquqarters at Chicago, has resigned to become district sales manager of welded and weldless products for the American Chain Company, Inc., with headquarters at Chicago, effective August 1. Mr. Isbester was connected with the mechanical department of the Great Northern Railway at St. Paul, Minn., from 1897 to 1899, leaving the Great Northern at this time to go to the Sargent Steel Company, with headquarters at Chicago. He remained with this company until about 1902, when he went with the Q & C Company, with headquarters at Chicago, afterwards becoming vice-president of that company. In 1912 he left the Q & C Company to go with the Rail Joint Company as district sales manager, which position he held until his change as noted above. Mr. Isbester has been a director of the National Railway Appliances Association for several years until his resignation recently. During the war Mr. Isbester served in the United States Naval Reserve Forces as Lieutenant Commander, having been on active duty from April, 1917, until he was placed on the inactive list during May, 1919. He was recalled to active duty on July 28, 1919, to be sworn in as Commander in the supply corps. He was selected for promotion from lieutenant commander to commander by the Board of Selection, and after receiving his promotion he was again detached from active duty. Commander Isbester has also served with the Illinois Naval Militia for ten years.

G. C. Isbester

D. C. Schultz, Sr., who has had a wide experience in the design and sale of Morgan & Northern cranes, has been appointed sales manager of the **Pittsburgh Crane & Equipment Co.,** with headquarters at Sharpsburg, Pa.

Frank O. Leitzell, assistant to the general manager of the **H. K. Porter Company,** Pittsburgh, Pa., has been appointed an engineer-salesman in the sheet and tin mill specialties department of the Blaw-Knox Co., Pittsburgh, Pa.

The Ulster Iron Works, Dover, N. J., has completed a new puddling mill at Dover, with a main building 390 ft. by 77 ft. and an adjoining wing 90 ft. by 60 ft. The entire output of the mill is distributed by Joseph T. Ryerson & Son, Chicago.

J. Leonard Replogle, president of the **American Vanadium Company,** New York, also president of the **Wharton & Northern Railroad** and chairman of the board of directors of the **Wharton Steel Company,** who, during the period of the war was director of steel supplies for the War Industries Board, has had conferred upon him by the French Government the decoration of Chevalier of the Legion of Honor, in recognition of services rendered by him in the Allied cause during the war.

The National Railway Appliance Company, New York, has completed arrangements for the sale in the Eastern and Southern states of a line of car heaters, including the Jewel hot blast forced ventilation stoves and Cutler-Hammer electric heaters.

John J. Greer, president of the J. J. Greer Company, Kansas City, Mo., which operates commissaries and boarding camps on the Chicago, Burlington & Quincy and the Chicago, Rock Island & Pacific and also news service and hotels on the latter road, died suddenly at the Pfister Hotel, Milwaukee, Wis., on July 19. He was about 60 years old.

Theodore L. Dodd & Company, 80 East Jackson boulevard, Chicago, have been appointed western sales representatives for the Worth Steel Company of Claymont, Delaware, manufacturers of high grade steel for railroad uses in connection with fire boxes and boilers. This company has a 160-in. mill with 4 100-ton open hearth furnaces. It was formed by former members of the Worth Brothers Company, of Coatesville, Pa., which concern was sold to the Midvale Steel Company several years ago.

Kenneth R. Hare, whose appointment as district manager for the **Transportation Engineering Corporation,** New York, with headquarters at Chicago, was briefly noted in our issue of July 25, was graduated from the University of Wisconsin in 1911 with the degree of electrical engineer, Mr. Hare having previously spent his vacations on railroad location and construction in Northern Minnesota, as concrete inspector and later in connection with transit and level work, estimates, etc. He also did considerable work in connection with the electrical construction, installation of dynamo electric machinery, transformers and switchboards for the Duluth Edison Company, and the General Electric Company. After graduation he took the test and shop course at the Schenectady works of the General Electric Company, following this, in 1912, with construction and meter work for the Great Northern Power Company, Duluth, Minn. Later, in the same year, he was appointed chief electrician for the Northern Pacific Railway, in charge of all electrical work from St. Paul to the Pacific Coast. In 1915 he was appointed associate editor, and later became managing editor of the Railway Electrical Engineer, published by the Simmons-Boardman Publishing Company, New York. He left this position in 1917 to enter military service as first lieutenant in the Ordnance Department. In 1918 he was appointed, on behalf of the government, assistant superintendent of the munition plant of the American Can Company, Kenilworth, N. J., in direct charge of the high explosive plant, remaining in that position until the work of the plant was about finished. He now becomes district manager of the Transportation Engineering Corporation, which is the authorized representative of the Edison Storage Battery Company in the sale of storage batteries to railroads, and of the Automatic Transportation Company in the sale of industrial trucks and tractors to railroads. Mr. Hare is in charge of the territory in the Middle West, including Chicago, St. Louis and other important railroad centers.

K. R. Hare

American Car & Foundry Company

The war activities of the American Car & Foundry Company afford an interesting commentary on the adaptability and efficiency of the organization. This company alone built all of the specially designed railroad guns mounted for the seven- and eight-inch guns and twelve-inch mortars used by the American army. Furthermore, nearly all of the six-inch gas and ten-inch high explosive shells used by the Americans were manufactured by the American Car & Foundry Company. With the cessation of hostilities there came, of course, a large number of cancellations of war orders and the company which had $290,000,000 of business on its books at the beginning of the year had $100,000,000 business on its books at the end of the fiscal year (April 30) 1919. The management of the American Car & Foundry Company has made special efforts to develop the manufacture and sale of miscellaneous supplies. The profit from this business has proved satisfactory and it would seem that the experience with war business would further aid in the development of this department.

Despite very heavy taxes estimated at $24,000,000, the income account of the company shows a large margin over dividend requirements. Net earnings after deducting expenses and taxes amount to $17,273,000. From this is charged out $5,501,000 for renewals, replacements, new patterns, etc., leaving $11,772,000 net earnings, comparing with $11,283,000 net earnings in the previous fiscal year. Dividend requirements (7 per cent on the preferred and 8 per cent on the common) call for but $3,000,000 added to the reserve for general overhauling, $2,400,000 added to the reserve for dividends on the common stock and $1,872,000 added to surplus. The company had on April 30, 1919, net working capital exclusive of reserves, $23,799,000.

In studying the accompanying balance sheet for the company for June 30, 1919, it should be borne in mind that the American Car & Foundry Company was awarded an order for 31,000 out of the total 100,000 freight cars purchased by the Railroad Administration. These cars are in the process of construction and materials for completion of the order are included in the materials on hand, as itemised in the balance sheet shown below. The company received orders for 10,000 cars for Italy and 3,250 cars for India during the fiscal year.

ASSETS.

Property and Plant Account		$67,525,272
Cost to April 30, 1918	$66,782,532	
Add: For expenditure for additions to plants during year	742,740	
Current Assets		110,266,605
Materials on hand, inventoried at cost or less, and not in excess of present market prices	$46,276,398	
Accounts and notes receivable	14,024,529	
U. S. Certificates of indebtedness and Liberty Bonds	32,052,000	
Stocks and bonds of other companies at cost or less	1,070,091	
Cash in banks and on hand	16,843,587	
		$177,791,877

LIABILITIES

Preferred Capital Stock		$30,000,000
Common Capital Stock		30,000,000
Current Liabilities		73,152,326
Accounts payable, and bills payable not due, and pay rolls (paid May 10, 1919)	$34,357,156	
United States Railroad Administration, advances for materials	13,195,170	
Provision for federal income and war profits taxes	24,475,000	
Dividend No. 81, on preferred capital stock (payable July 1, 1919)	525,000	
Dividend No. 67, on common capital stock (payable July 1, 1919)	600,000	
Reserve Accounts		13,315,030
For insurance	$1,500,000	
For general overhauling, improvements and maintenance	4,101,967	
For dividends on common capital stock, to be paid when and as declared by Board of Directors	7,200,000	
For improving working conditions of employees	513,063	
Surplus Account		31,324,521
		$177,791,877

Railway Officers

Railroad Administration

Federal and General Managers

J. B. Carothers, assistant to the federal manager of the Baltimore & Ohio, Western Lines, with headquarters at Cincinnati, O., has had his jurisdiction extended over the departments of fuel and locomotive operation.

Operating

H. R. Frierson, trainmaster on the Central of Georgia, with office at Macon, Ga., has been transferred to Savannah, to succeed C. E. Scarborough, who has been assigned as trick despatcher at Columbus; and F. D. Barnes, road foreman of engines, has been appointed trainmaster of the Macon division, with headquarters at Macon, vice Mr. Frierson.

T. W. Crowley, superintendent of the Adirondack division of the New York Central, with office at Utica, N. Y., has been transferred to the St. Lawrence division, with headquarters at Watertown, vice J. W. Evans, deceased, and C. H. Calkins, assistant superintendent at Buffalo, has been promoted to superintendent of the Adirondack division to succeed Mr. Crowley.

F. J. Gavin, general superintendent of the Western district of the Great Northern, with office at Seattle, Wash., has been appointed general superintendent of the Lake district with headquarters at Superior, Wis., vice G. S. Stewart, deceased, and J. H. O'Neill, terminal manager of the Puget Sound district, United States Railroad Administration, has resumed his position as general superintendent of the Western district of the Great Northern, with headquarters at Seattle, vice Mr. Gavin.

E. W. Lollis, division superintendent on the Chicago, Milwaukee & St. Paul, with headquarters at Des Moines, Iowa, has been transferred to the Illinois division, with headquarters at Savanna, Ill., succeeding L. T. Johnston, who has been transferred to the Green Bay division, with headquarters at Green Bay, Wis., to succeed C. H. Buford, who has been transferred to the Sioux City division, with headquarters at Sioux City, Iowa, in place of M. L. Larsen, who has been assigned to other duties.

Traffic

The authority of R. A. Ebe, live stock agent of the Eastern Lines of the Baltimore & Ohio, with office at Baltimore, Md., has been extended to cover both B. & O. Eastern and Western lines and allied lines.

Charles D. Quinn, chief clerk in the general freight office of the Louisville & Nashville, has been appointed assistant general freight agent, with headquarters at Louisville, Ky., succeeding G. C. Devol, resigned.

Engineering and Rolling Stock

J. W. Kern, who has just returned from military service abroad, has been appointed roadmaster on the Illinois Central, with headquarters at Water Valley, Miss., succeeding C. A. Maynor, who has been transferred to Memphis, Tenn., to take the place of J. L. Downs, who has been transferred to Champaign, Ill., to succeed F. B. Oren, who has resigned to enter private business.

Obituary

W. M. Blount, assistant to president of the American Short Line Railroad Association, died on July 27, at Union Springs, Ala.

Good Taste in Passenger Stations

The posters of the War and Treasury departments which, in large numbers, are now seen everywhere in railroad stations, afford a good index of the efficiency of the station master. They give loud testimony to his taste and neatness—or the lack of these qualities. There are numerous villages, here and there, in which the railroad station is the most prominent—or the only—public building in which neat "housekeeping" is exemplified. We have seen such stations. There are also a good many stations of the opposite kind—a fact which, perhaps, it is not necessary to recall to our readers. These posters—large and small, colored and plain, of pleasing design and some not so pleasing—are issued quite frequently, and the care which the regional directors have been taking to prescribe exact and detailed rules for putting them up in waiting rooms (and cars) suggests that they call for serious attention. Ragged edges and big spots of dirt, when added to carelessness in posting or in selecting places for posting, spoil much of the good effect which it is desired to produce. The station master who neglects these details is to be classed as inefficient. This may sound like a rather severe indictment, but will not the testimony of all first-class trainmasters confirm it? In short, the agent who manifests taste and neatness is the same one who stands at the head in plain business efficiency, is he not? The idea of taste has been too intimately connected with the idea of "frills" and other elements usually associated only with Pullman and dining cars; but there is danger of becoming too contented in that notion. There is much truth in the old saying that "the beautiful is as useful as the useful, and sometimes more so."

Union Agreements Become "Scraps of Paper"

The recent strikes on the railways, especially the widespread strikes of shop employees, have demolished the last argument in favor of government operation that had been left standing. This was the argument that government operation would prevent strikes. There were no serious strikes on the railways under government operation as long as the government promptly advanced wages every time a class of employees ask it. Strikes began as soon as wage demands were not complied with, just as they did under private operation. One of the notable features of these shop craft strikes is that they are "illegal." Probably they do not violate any governmental statute, but they violate the laws of the unions whose members have struck. These employees through the officers of their unions have made certain agreements with the government. These agreements were still in existence since neither the government nor the officers of the unions had given notice of their abrogation. Most of the strikes have been avoided by a self-constituted organization formed by the unions in Chicago. The officers of the unions have ordered all the men to return to work until a strike vote can be taken, but the number of men out continues to increase. The government has encouraged railway employees to organize in order that it might have responsible unions to deal with. If, however, the men will not be led by their "leader" and strike in violation of their agreement with the government, their agreements become mere "scraps of paper," and if union agreements are to become merely "scraps of paper," what is the use of making them?

Car Lighting Generator Belts

The belts used under passenger cars for driving car lighting generators are a constant expense, an occasional cause of lighting failures, and are frequently an aggravation to the operating man who is not entirely in sympathy with the trials and tribulations of the car lighting man. These operating men know, however, that the electric systems are the best for general car lighting service and that the belts are the only kind of generator drive which heretofore has met all requirements. Attention is now called to two gear and shaft generator drives which have appeared in the field. In years past experiments were made with generators mounted directly on the axle and with flexible shaft drives, but nothing was developed which met with all the requirements. The makers of the new gear and shaft drives have profited by the experience of automobile manufacturers as they have adopted designs similar to those which have stood up under hard service in automobiles and have produced equipment which bids fair to be a strong competitor of the belt.

History Repeats Itself, With Variations

Three years ago this month some highly interesting and important conferences took place at the White House in Washington. The four brotherhoods of railway train service employees had demanded the basic eight-hour day time and a half for overtime. The Conference Committee of Managers, representing the railways, had refused to grant the demands, but had offered to submit all the points in controversy to arbitration. The representatives of the employees had declined to submit anything to arbitration and threatened to call a strike unless all their demands were granted. President Wilson asked the representatives of both the railways and the brotherhoods to meet him. He told the Conference Committee of Managers that it must withdraw its demand for arbitration and grant the employees the basic eight-hour day. The Conference Committee refused to do so. President Wilson then sent for the railroad presidents and told them the same thing he had told the Conference Committee of Managers. The railroad presidents stood firm for arbitration. The result was that the heads of the brotherhoods ordered a strike, and President Wilson recommended and Congress passed a law requiring the railways to grant the basic eight-hour day. Some important changes have occurred in the official personnel of the railroads since then. Instead of their operation being in charge now of a number of presidents, it is in charge of just one President. There was an important conference between this one President and the officers of the railway shop crafts' organizations this week. It also was held at the White House. The shop

crafts, after having been given a big increase in wages last year, are demanding another big increase. The President now in charge of the operation of all the railroads asked the officers of the shop crafts to submit their claims to investigation by a government commission. They turned him down cold, as they did the managers of the railroads three years ago, and have ordered a strike vote.

The president *now* in charge of the operation of all the railroads was president of the United States three years ago, and he is still president of the United States now. Three years ago he upheld railroad employees in refusing to submit their demands to arbitration. And now a group of railway employees which has made demands upon President Wilson as the operating head of the railroads of the United States under the law, declines to accept what would practically be arbitration of the demands that they have made upon him.

There were persons who criticised President Wilson three years ago for the way he dealt with the eight-hour basic day controversy upon the ground that his course was arbitrary and would encourage railway employees to persist in refusing to arbitrate controversies with the railway managements and to rely in future, as they did then, upon the use of force to get what they wanted. Now railway employees give to President Wilson the same answer which they gave to the railway managers three years ago, namely, that they will not submit their claims to a commission as suggested by him, but that he must grant them what they demand or they will strike. In fact, a good many thousands of them already have struck.

We wonder if President Wilson does not think better of the reasonableness and fairness of railway officers and worse of the reasonableness and fairness of some railway labor organizations now than he did three years ago?

We wonder if he does not think better of arbitration and worse of arbitrary methods as a means of settling railway labor disputes now than he did three years ago? Departures from sound principles in dealing with important matters always establish dangerous precedents.

Meantime, how much is left of the argument that serious strikes on railways will not occur under government operation?

The Wage Demands And the Plumb Plan

We do not quite understand from the various statements being made by the railroad labor leaders whether they propose to drop their demands for a billion dollar wage increase if they can have their Plumb plan adopted or whether the idea they would have the public receive is that if they are given control of the railroads the employees would work so much harder and more efficiently than they ever did for private management, or than they have been doing for the past year and-a-half for the government, but they could afford to pay themselves the increased wages and still show a surplus for a wage dividend.

If the former is the case, their argument that the higher wages are needed to meet the increased cost of living falls to the ground. If, on the other hand, they expect to pay themselves the increased wages their payroll would be equal to if not greater than the present total earnings of the railways. Certainly we have not heard any of them say anything about reducing the payroll by dismissing a large number of employees because the others would be able to do all the work, and there is not enough margin between the payroll and the total earnings to allow for any economies that would bulk very large as compared with the recent rates of wage increases.

There is no longer any room for discussion of the possibility of increasing wages at the expense of capital. The 1918 cycle of wage increases took more than capital ever got out of the railways in their most prosperous year. Practically all that capital is now getting for its guaranty is coming out of the treasury because in the first six months of this year the roads have earned only $157,000,000 toward paying the cost of $18,000,000,000 of capital. The literature circulated by the Plumb plan press bureau promises large reductions in freight and passenger rates. W. G. Lee and L. E. Sheppard, in testifying before the wage board, declared that large increases in rates are necessary.

Their public statements and what they say when they are not talking to the public do not hang together.

The brotherhoods and other railroad labor unions would receive more sympathy from those who have an opportunity to read the text of their repeated demands for higher wages, as distinguished from the public that gets merely newspaper statements based usually on the minimum rates they ask, if they did not invariably couple their pleas for relief for the lower paid men who undoubtedly have great difficulty in making both ends meet, with such unreasonable and outrageous rules for the benefit of the more prosperous members of the organizations as are contained in the demand which was recently presented to the Railroad Administration by the Brotherhood of Railroad Trainmen. Mr. Lee refers to his demand in the newspapers as for a minimum of $150 a month, which does not sound especially unreasonable. But that is merely his minimum for flagmen and brakemen in passenger service. The proposed minima for baggagemen, assistant conductors and conductors in passenger service are $160 and $169 for two classes of baggagemen, $179 for assistant conductors and $200 for conductors. In freight service the proposed rates are stated as so much per mile or per day, for 100 miles or less, or eight hours or less, and range from $5.88 per day for flagmen and brakemen to $8.64 for conductors. It may be added that the Order of Railway Conductors is not satisfied with the demands made by Mr. Lee's organization for the conductors who are members of it, but ask higher rates.

But even the rates named are no index to the earnings of the men, because probably 50 per cent of them are paid mileage rates, plus various arbitrary allowances and overtime, and by making more than 150 miles a day in passenger service or 100 miles in freight service, earn much more than the basic day's pay, frequently in a period of less than eight hours. But this is not all. While Mr. Lee says he is demanding rates which will preserve the pre-war standard of living, he is asking not only enough to offset the depreciated purchasing power of the dollar but also to enable the employees to preserve their pre-war standards by doing less work. They have already been given the eight-hour basic day, which increases the rates per hour by 20 per cent, and large increases in the rates besides. Now, they want time and one-half not only for overtime but also for Sundays and holidays, and also a guaranty of the minimum rates named, for a 26-day month, exclusive of any earnings from overtime and extra service. The extra payment for Sunday and holiday work is not only demanded for men who may have 10 or 12 lay-off days in a month, but for all men, in spite of the fact that there are not 12 26-day months in a year exclusive of Sundays and holidays. Out of a 365-day year there are 52 Sundays. The holidays for which time and one-half is asked number seven. This leaves only 306 days, but the Brotherhood of Railroad Trainmen demands a guarantee of 312 days' pay, with any overtime or extra work additional.

Another feature of the B. R. T. demand is a rule that

'mountain" rates, 10 per cent higher than the ordinary rates, shall be paid in freight service for the entire trip over any line where the gradient on any part of the trip whatever is 1.8 per cent or over. Mountain rates were originally established many years ago to meet the frontier conditions existing in the sparsely settled western country, and to compensate for the danger or difficulty of operating trains with hand brakes on mountain grades. Now the frontier conditions have largely disappeared and trains are equipped with power-brakes, yet it is proposed to extend the "mountain" rates to all parts of the country; and this is because a large percentage of railroad divisions include short stretches of track the grade of which is 1.8 per cent or over.

Moreover, the maintenance of the elaborate system of differentials between the rates of pay of the various classes of employees requires that any increase to the men who really need more money shall be granted in even greater proportion to the higher paid men who might be able to stand high prices for a time until an opportunity has been afforded to puncture some of the inflation which represents one of the costs of war.

It is interesting to note also that Mr. Lee is not satisfied with trying to meet the increase in the cost of living up to date, but told the wage board that he was "predicting into 1920."

Get Ready for a Strike to Force Government Ownership

THE AGITATION which has been started by the railway labor organizations, and especially by the employees in the shops and in train service, regarding wages and the cost of living, presents two entirely different phases. This is true because the leaders of these organizations are coupling their agitation regarding the cost of living with their propaganda for the Plumb Plan of government ownership and employees' management of railroads.

It is easy to sympathize with the complaint of the employees that the benefit of the billion dollar a year advance in wages which has been given them under government operation has been nullified by the increase in the cost of living. But even if it be true that the increase in the cost of living has been as great, or even greater, in proportion as the advance in railway wages, it does not follow that further advances in railway wages should be made. Any further advance in wages, like the advances which already have been made, would have to be paid by the public, either in the form of higher taxes, if the railroads are to continue to charge only the present rates, or in higher freight and passenger rates if rates are to be advanced enough to cover all expenses and fixed charges. The real question, then, is whether the railway employees are better entitled to further advances in wages than the public is to immunity from the increase in taxes or in freight and passenger rates which a further advance in railway wages would make necessary. This question might be intelligently and fairly investigated and determined by some government commission such as that which Director General Hines has recommended to President Wilson, and the President in turn has recommended to Congress, shall be created.

The leaders of the labor organizations have made clear, however, that they would not be satisfied by any such disposition of the question of wages and living costs. They have a scheme of their own for dealing with the cost of living. This is the adoption of the so-called "Plumb Plan" for government ownership of the railroads and their management by a board one-third of whose members would be appointed by the President, one-third by the officers, and one-third by the employees. Railway salaries and wages, under this plan, would be fixed by the board of directors, and as two-thirds of the directors would be chosen by the persons whose salaries and wages were to be fixed, undoubtedly they would be fixed high enough—at the expense of the general public—to more than offset all increases in the cost of living of railway employees.

But the claim that the Plumb Plan would stop increases in the general cost of living and even cause reductions in it is of all claims that could be made for it the most preposterous. This claim is based upon the ground that the cost of railroad transportation would be reduced under the Plumb Plan in two ways. First, it is said, the government could issue bonds bearing 4 per cent interest to buy the roads, while the companies must pay substantially higher rates of return. But everybody knows that the government had finally to pay 4¾ per cent interest to raise money to carry on the war; that war bonds are now selling in the market at rates that yield practically 5 per cent, and therefore it is an insult to the intelligence of the American public to claim that the government could raise at 4 per cent the many billions that would be required to buy the railroads. Second, it is claimed that if the railroads were turned over to the management of a board one-third of whose members were appointed by the President of the United States, and two-thirds by the officers and employees, vast economies would be effected. The question naturally arises, how would they be effected? The Plumb Plan advocates reply, by unified operation and better co-operation between the officers and employees. But we have unified operation already; and at least 99 per cent of the railroad operating officials of the United States are of the opinion that the Plumb Plan would destroy the last vestige of efficiency in the operation of the railroads. Now, whatever would destroy efficiency in the operation of the railroads would necessarily tend to increase the cost of living.

If the railway labor organizations were disposed to rely entirely upon propaganda for the promotion of the Plumb Plan, their advocacy of it would afford no ground for concern. Any person with even an elementary knowledge of economics and railway operation can demonstrate that the Plumb Plan is unsound in almost every particular and that its adoption would result disastrously to the public and in the long run to railway employees themselves. But unfortunately it is daily becoming more evident that the railway labor organizations do not intend to rely entirely, or even mainly, on propoganda to secure the adoption of their plan.

There have been sinister rumors for several weeks that the leaders of the large railway brotherhoods were quietly preparing to first prevent the return of the railroads to private operation and then to force government ownership and employees' management upon the American public. Recent developments, and statements made by the railway labor leaders, show that credence must be given to these reports, which a few weeks ago sounded incredible. The shop crafts and the Brotherhood of Railway Trainmen already have given notice that they will strike unless demands which they have presented to the Railroad Administration are favorably acted upon, and several serious strikes of shop employees already have occurred.

These and numerous other developments show that the labor leaders are taking steps to bring about a general condition of demoralization in the railroad labor field as the time approaches, according to the announcement of President Wilson, for the return of the railroads to private operation. Among the most ominous and conclusive signs are statements which are being made by the labor leaders. W. G. Lee, president of the Brotherhood of Railway Trainmen, said before the Board of Railroad Wages and Working Con-

ditions in Washington last week: "The war is over, but peace is not before us, or I am a poor prophet. We are nearer war today, I believe, than when the Kaiser threw down the gauntlet." L. E. Sheppard, acting head of the Order of Railway Conductors, also said: "They tell us that the railroads are going back in January, but mark this prediction: While I am not a prophet, or a son of a prophet, they will not go back January 1." Warren S. Stone, Grand Chief of the Brotherhood of Locomotive Engineers, in a newspaper interview published on August 4 was asked the question: "How far will you go in the fight?" He replied —"emphatically," as the reporter noted: "We will go far enough to win, and we are going to win." He was asked: "What if the roads are turned back to their owners?" He replied: "If they should be, they wouldn't stay there long, and it is not absolutely sure that they will be turned back by next January."

Three years ago the country was given an example of what Mr. Stone and his associates mean when they say, "We will go far enough to win." Declining to submit their basic eight-hour day demand to arbitration in any form, the "Big Four" brotherhoods frightened Congress into passing the Adamson Law by issuing an order for a tie-up of all the railroads of the United States and refusing to withdraw it until Congress passed the legislation that they wanted. The man who doubts that the nation is going, within the next few months, to be brought face to face with another similar crisis is blind.

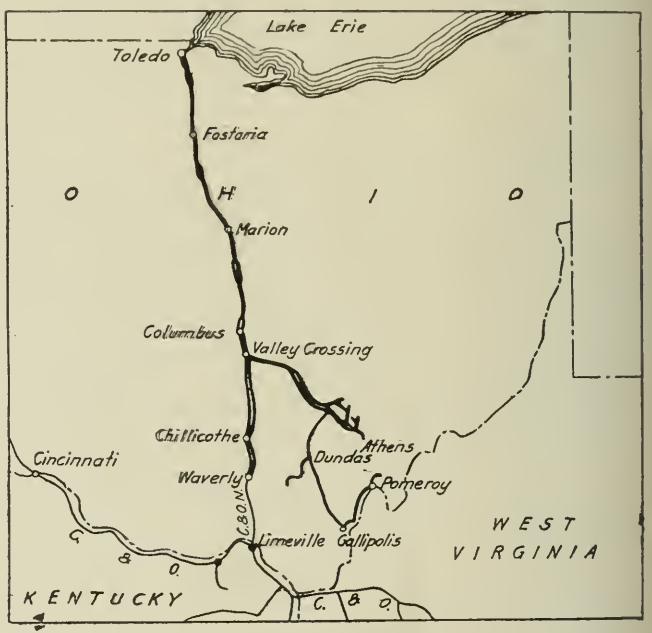
There can be no question, in view of what all classes of persons say and of the attitude of the press, that at least 80 per cent of the people of the United States are opposed to government ownership and in favor of returning the roads to the operation of the companies. The railroad labor leaders are plainly trying to create a labor situation which will convince the public and Congress that a return to private operation on January 1, as announced by the President, is impracticable; and it is beyond serious question that they are prepared to take the same steps to force Congress to adopt the Plumb Plan that they took to force Congress to pass the Adamson Act. In other words, they are fully prepared to call a general railroad strike for the purpose of forcing government ownership and employees' management of the railroads upon the American people whether the people want it or not. This may seem an extreme view. But a little over three years ago anybody who had said that the Brotherhoods would go the length of calling a general railroad strike to force Congress to pass an eight-hour basic day law would have been accused of libeling them; yet they did it; and if they cannot get their plan for employees' management of the railroads adopted in any other way, they will try to force it through by means of a strike.

In view of past developments, it would be the greatest folly for the American public not to meet squarely the question which the attitude of the Brotherhoods has raised. That question is, do the 110,000,000 people of the United States, of whom at least 80 per cent are opposed to government ownership and favor a return of the railways to operation by the companies, intend to let the labor leaders force the public, by threatening or actually calling strikes, to continue government operation beyond January 1; force the public to buy the railroads and assume complete responsibility for their financial results; and then force the public to turn them over to the employees to manage as they see fit? If the public doesn't intend to submit to this, it must begin very soon to manifest its purpose to the President and the Congress of the United States and to demand that they adopt effective measures for the public's protection. There can be no reasonable doubt whatever as to how far the railway brotherhoods will go to get what they want. How far will the public go to protect itself?

Hocking Valley

IT WAS GENERALLY considered by the railroad men directly interested in traffic conditions in the Hocking Valley territory that there were distinct advantages to all concerned in having the Hocking Valley and the Toledo & Ohio Central, which parallels it, operated under conditions of restrained competition. For many years these roads were controlled jointly by the Chesapeake & Ohio, Pennsylvania, New York Central, Baltimore & Ohio and Erie. The state of Ohio, however, fought vigorously to break up the so-called monopoly, and in 1910 the control of the Hocking Valley passed to the Chesapeake & Ohio and the control of the Toledo & Ohio Central to the New York Central interests. Under government control, of course, the Hocking Valley has been operated as a part of the government unified system, but there is nothing in the figures in its report to indicate that it derived any operating advantages from this.

In 1918, under government operation, total operating revenues of the Hocking Valley amounted to $13,156,000, an increase of $2,459,000 or 23 per cent over 1918. The entire increase in revenue was due to increased freight



Hocking Valley

and passenger rates. The business handled by the road was less in 1918 than in 1917. The ton mileage of revenue freight carried in 1918 was 1,893,000,000, which was 73,000,000 ton miles or 3.7 per cent less than carried in 1917. The number of passengers carried one mile was 42,551,000 or 7,450,000 passenger miles or 14.9 per cent less than in 1917. The average revenue per ton mile of coal was 5.38 mills in 1918 or 32.8 per cent higher than in 1917, and the average revenue per ton mile of freight other than coal was 9.12 mills or 39.9 per cent higher than in 1917. The average revenue per passenger per mile was 2.441 cents in 1918 or 26.9 per cent higher than in 1917.

The increases in expenses on the Hocking Valley in 1918 over 1917 represent purely and simply increased costs of handling the same or less business. Total operating expenses amounted to $10,449,000, an increase of $3,040,000 or 41 per cent over 1917. It should be pointed out that the largest increases came in maintenance, being 58 per cent in maintenance of way and 57 per cent in maintenance of equipment. Transportation expenses, however, amounted to

$4,913,000 or a little over 32 per cent more than 1917 transportation expenses.

Both train and car loading fell off somewhat in 1918 as compared with the very high average obtained in 1917. The revenue train load in 1918 averaged 1,267 tons or 5 per cent less than in 1917, and the average loading per loaded car was 43.7 tons or a fraction of 1 per cent less than in 1917. There was a decrease in the proportion of empties northbound but the number of these northbound empties is so small, anyway, that a reduction of 8.7 per cent meant only an average of two-tenths of one car less northbound in 1918 than in 1917. The average number of loaded cars southbound per train was 10.8 in 1918 and 13.2 in 1917, a decrease of 18 per cent. The average number of empty cars southbound was 40.9, an increase of a fraction of 1 per cent.

It would seem that whatever operating advantages might have been shown by operation of the Hocking Valley jointly with competing roads were offset by other conditions in 1918.

The rental which the government pays the Hocking Valley Railway Company is $2,637,000. The operation of the property by the government failed to earn this amount by only a few thousand dollars.

This rental is sufficient to pay interest, war taxes, etc., and leaves $1,360,000 available for dividends. The 4 per cent dividends which were paid called for $440,000, leaving over $900,000 to be put into the property.

As a matter of fact, the government paid, during 1918, no part of the rental due, but attempted to compel the company to accept 500 50-ton coal cars which, in the opinion of the board of directors, were of a type unsuited for the proper and efficient operation of the railroad. The cost of these 500 cars was $1,348,000. The board of directors, however, will probably accept them as the lesser of two evils, thus clearing the way to getting payment of part at least of the rental due.

The Hocking Valley has deservedly had good credit, although probably the anti-monopoly suits of the state of Ohio have made that credit somewhat lower than the earning power of the property would justify. Even under federal operation and the war conditions of 1918 the property earned a substantial margin above the dividend rate actually paid by the company.

The company had outstanding $5,000,000 six per cent notes which fell due November 1, 1918. The director general refused to accept the plan for refinancing these notes proposed by the bankers and which was acceptable to the Hocking Valley directors. After an extension of the notes a plan was agreed upon whereby the Hocking Valley made a general mortgage to secure $50,000,000 bonds, of which $9,600,000 notes bearing 6 per cent interest were issued and deposited as security for $7,500,000 five-year, six per cent notes, due March 1, 1924, sold to the public.

The following table shows the principal figures for operation of the property by the government in 1918 as compared with the operation of the property by the owners in 1917. This is not the corporation income account.

	1918.	1917.
Mileage operated	350	350
Freight revenue	$11,343,613	$8,974,873
Passenger revenue	1,038,843	961,700
Total operating revenues	13,155,861	10,696,434
Maintenance of way and structures	1,490,446	945,590
Maintenance of equipment	3,718,010	2,365,944
Traffic expenses	83,422	120,675
Transportation expenses	4,912,857	3,716,384
General expenses	248,697	261,469
Total operating expenses	10,448,792	7,409,123
Taxes	634,842	612,800
Operating income	2,072,112	2,667,792
Other income (balance)	519,913	646,933

Letters to the Editor

Automatic Train Stop Economy

Chicago.

To the Editor:

The *Railway Age* of June 20 offers an interesting discussion by the New York Commission on the collision problem. In my opinion Mr. Frank Rhea of New York City has definitely advanced the cause of automatic train control by suggesting the combination of the best features of all inventions into one standard system.

The automatic train control system designed by the late Benton C. Rowell of Chicago solves the problem more completely than any other system. However, there are many commendable features in other systems and ultimately, when the advocates of automatic train control are recognized, as they should have been years ago, and when such systems come into common use, the combination of the best ideas and the coalition of manufacturers must follow. Otherwise this particular line of manufacture will prove an exception to the rule that similar industries have a tendency toward consolidation.

And if ultimately the makers are going to combine their interests and ideas, would they not progress faster by such a consolidation at the present time? Why not all pull together for the best and most practical solution of the problem?

The old saying that competition is the life of trade is undoubtedly true; but where the life or limb of the traveling public is a factor such competition can do a great deal of harm. The cheapening of the grades of materials and workmanship in order to meet competition can cause untold damage, and that to human beings. The problem of train control is one not only for the inventor but for the humanitarian as well. A man's conscience must be his dictator in this work.

C. W. Morgan.

The I. C. C. or a New Federal Body?

To the Editor:

It is much to be regretted that many of the splendid letters and articles that have recently appeared in the columns of the *Railway Age* relative to government control and government ownership and the situation generally with respect to Interstate Commerce Commission affairs and methods of dealing with the transportation companies are not read and thoroughly understood by the entire public that they, as well as those directly interested, including shippers, manufacturing and industrial concerns of every class and those connected with them, may be fully and correctly informed of the manner in which the railroads, which have accomplished more in the expansion and development of this great nation than perhaps any other business, are having their energy and life crushed out as the result of political propaganda.

It is the opinion of the writer, based on long experience and study of the question, that the Interstate Commerce Commission with its present powers and prerogatives, if allowed to continue, will result in complete demolition of the whole system that has taken years of energy and capital in the midst of difficulties and discouraging conditions to put even on a paying basis. Let's ask this question of ourselves: If left to the government itself, would we have as many miles of railroad as we have today? Would there be the vast army of railroad employees there is; would the manufacturer and farmer have prospered as he has? When it comes to a question of who has been the most benefited, there is no doubt

but that in the majority of cases the forces responsible for all this development have really benefited the least. It appears to me that it is like killing the goose that laid the golden egg.

Suggestions that the Interstate Commerce Commission be superseded by a newly created federal body sounds good if, in the selection of such, it is to be composed entirely of representatives who are practical railroad men in matters of operation and traffic and with power, say to the extent of acting in the capacity of arbitrators, or merely a referee in fact in the adjustment or settlement of controversies or differences arising as between railroads or railroads and the public, each case of dispute to be investigated and considered in accordance with conditions and circumstances as may exist in any particular location.

With the creation of this new body, let follow the abolishment of all State Commissions, with the exception that there be one representative for each state who will be present at any hearing and act in conjunction with the federal representative who may be assigned to investigate and consider any particular case merely in order that a state official may be in immediate touch with the situation that concerns his own state.

Can any one except a politician offer any satisfactory or good reason why there should be a dual commission in each state?

If it is really necessary that the railroads must have a guardian, then let it be one, and one who is competent in experience and judgment to render a decision that is as fair to the railroads as it is to the public, and eliminate entirely any ideas that tend to build up a powerful political machine.

E. B. Seymour.

The Weak and Strong Road Problem

Iowa City, Iowa.

To the Editor:

The letter from Charles S. Fay and the address of E. P. Ripley, published in your issue of June 27, lead me to speak briefly on the subject of the reorganization of the railroads.

Mr. Fay's difficulty is that no plan provides for adjustment of rates as between the strong and weak lines which will not allow the strong too great compensation and the weak too little.

It seems to me that several plans make proper provision for this particular matter. Almost any plan that provides for the consolidation of weak and strong lines into systems, if carried out on a proper basis of value, would accomplish this purpose, possibly even better than the plan proposed by your subscriber, which aims to do the same thing.

Public attention has not been called to this plan and I beg to present the feature covering Mr. Fay's difficulty. By this plan the body fixing rates is to make rates such that the aggregate earnings of all railroad properties of the country shall be equal as nearly as may be to the following sums:

1. The aggregate of all costs of operation including wages and material and supplies for operation and maintenance, and including also proper allowance for depreciation for those items not properly maintained by the replacement method from year to year, and including also the cost of administration of the holding company. (A federal holding company to take over the stock of separate companies is provided in this plan. Separate properties, however, would be operated as independent concerns.)

2. All interest on the funded and other debt of the separate properties.

3. The stated interest on the preferred stock of the holding company. (This will be about 4 per cent. on the total value of the stock of the properties of the country, determined by taking the market value at a selected proper time for normal properties and an agreed value for abnormal properties.)

4. A surplus emergency allowance of 5 per cent. of the sum of items 1, 2 and 3 to be collected only until the surplus funds shall equal 10 per cent. of the par value of the preferred participating stock of the holding company and thereafter to be collected at a rate only sufficient to maintain the surplus emergency fund at approximately 10 per cent. of the preferred participating stock par value.

5. A profit of not less than 10 per cent and not more than 20 per cent. of items 1, 2, and 3, calculated to be about 15 per cent. in the beginning and to increase toward the higher limit as the sum of 1, 2, and 3 per unit of service is decreased and to decrease as the sum of items 1, 2 and 3 is increased and in such proportion to be worked out as will penalize extravagance and reward economy.

From the earnings obtained the holding company is to distribute cash, equivalent to the net earnings in the following manner:

Semi-annually to pay the interest on the separate property bonds and other obligations.

Semi-annually to pay the stated interest on the holding company preferred stock. (In effect the stock of all separate properties.)

Semi-annually to charge the surplus funds quarterly to pay the profits.

Now comes the point of Mr. Fay's objection. The profits shall be distributed to the several properties in proportion to their *net earnings.*

It is expected that the foregoing will develop efficiency by making each separate property put forth its efforts to secure the largest traffic, that is, to render the largest service, and to handle it at the least cost.

Every road deemed essential to the commercial interests of the country will receive its operating expenses and interest on its obligations and a minimum rate of return on the value of its stock. The profit that it may earn above this will depend upon the traffic it secures and the efficiency with which this traffic is handled, which it seems to me is a just arrangement. Those properties that have been well located and are well handled are entitled to a larger rate of return than those properties which have been unwisely located and inefficiently handled.

With respect to Mr. Ripley's difficulty, the plan referred to creates a board made up of representatives of the people, appointed by the President, railroad owners and railroad operators. This board is to fix the rates in accordance with the requirements of the statute indicated above and is to determine the general policy of the transportation business of the country, assuming the executive and administrative duties of the Interstate Commerce Commission and leaving that commission to be a sort of court of appeals when the board cannot agree within itself or when objection to its policies or determinations is made by any one of the three parties interested, namely: the people, the operatives and the owners. This board also assumes the control of transportation on interstate roads now exercised by state commissioners, except the police power exercised by these commissioners.

The plan provides further for handling of the labor question, but that is another matter and this letter is not to present that complete plan, but to touch upon the two points made by Mr. Fay and Mr. Ripley.

No assertion is made that the provisions of this plan will bring about the results expected. It is merely believed by the subscriber that they will, and for that reason they have been offered as a contribution to the general discussion.

Dean the State University of Iowa.

Labor Leaders Fight to Prevent Return of Roads

Present General Demands for New Wage Increases or Reduction in Cost of Living with Plumb Plan as Alternative

WASHINGTON, D. C.

ORGANIZED RAILROAD LABOR came out in the open this week with its campaign to prevent the return of the railroads to their owners.

The alternatives of a nation-wide strike or strikes of railroad employees, a new cycle of wage increases duplicating the large increases of the war period, a reduction in the cost of living or the retirement of capital from the management of the railroads by the odoption of the Plumb plan of government ownership for the benefit of the employees, were put up to the government by the leaders of the railroad labor unions united in the Plumb Plan League, with strong indications that the adoption of the Plumb plan or something like it or at least the prevention of the return of the roads was the real object sought.

Speedy legislation providing for the creation of a tribunal to investigate and determine all questions concerning the wages of railroad employees, and also making its decisions mandatory upon the Interstate Commerce Commission to provide any increases in rates necessary to cover any recommended increases in wages was the remedy for the situation urged upon Congress on August 1 by President Wilson, on the representations of Director General Hines that such a course is required by the almost universal demand of the employees for further increases in wages to meet the high cost of living. The President and Mr. Hines, apparently conceding the need for higher wages, also turned their attention to efforts to reduce the prices of necessities.

President Wilson

"I hope that it will be possible to consider and recommend legislation which will provide a body of the proper constitution, authorized to investigate and determine all questions concerning the wages of railway employees, and which will also make the decisions of that body mandatory upon the rate-making body and provide, when necessary, increased rates to cover any recommended increases in wages, and, therefore, in the cost of operating the railroads."

The legislative solution proposed was received rather coldly by Congress, whose committees awaited the submission to them of the draft of a bill to carry out Mr. Hines' proposal. Many Congressmen, remembering their surrender to the brotherhoods in passing the Adamson law three years ago rather objected to being stampeded this time, while many were opposed to having any other tribunal fix the basis for rates established by the Interstate Commerce Commission.

The House committee, meeting on Monday, took no action on the President's recommendations, but voted to report the Cummins bill already passed by the Senate, which would make it impossible for the director general to put rates into effect without the chance of suspension by the commission. The Senate committee, meeting on Tuesday, appointed a subcommittee to report whether the full committee should first conduct an inquiry as to whether the cost of living has so increased since the wages were raised as to render them now inadequate. There were also some other indications during the first part of the week that Congress might "pass the buck" back to the President.

Director General Hines, without funds to pay increased wages, with a deficit of $295,000,000 for the first six months of this year, confronted with a strong probability that Congress would pass the Cummins bill to curtail his ability to increase rates, and also sympathizing to some extent with the claim that present wages of many of the employees are inadequate, has declared the inability of the Railroad Administration to deal with the situation without special legislation.

The labor leaders, on the other hand, insist that he can meet their demands by raising rates to whatever point is necessary. They have made it clear that the plan proposed by Mr. Hines and the President does not meet with their approval and have threatened not to wait for action by Congress along the lines suggested.

The only alternative they seem willing to discuss is the Plumb plan which was introduced in the House as a bill by Representative Sims on Saturday (by request) and given a hearing before the House committee on Wednesday.

While Director General Hines was seeking to transfer from the Railroad Administration to the national government as a whole the responsibility for deciding on wage and rate increases that has perplexed him for some time, he in turn was appointed a member of a committee of three, including also R. C. Leffingwell, assistant secretary of the treasury, and W. B. Colver, chairman of the Federal Trade Commission to report on a program for dealing with the cost of living problem. The report was submitted to the Cabinet on Tuesday, but its recommendations were not made public.

These developments were precipitated by a new demand from the Brotherhood of Railroad Trainmen on July 1 for another large wage advance, accompanied by a resolution threatening the possibility of a strike if the increase is not allowed by October 1; notice that the other brotherhoods and other organizations were contemplating similar action, and by the announcement of the six shop craft unions that they would wait no longer for the general increase in wages demanded in January, which has since been under consideration by the Board of Wages and Working Conditions.

After a conference with the President at the White House on Monday, B. M. Jewell, chairman of the shopmen's committee, told newspaper men that "if Congress adopts the plan proposed by Director General Hines and President Wilson we will tie the railways up so tight that they will never run again." He added that this was also the position of the other organizations.

The entire situation was discussed with the President, and he was informed that his program was not acceptable. In a statement to the President, the committee said in part:

"We have not been consulted as to this entirely new departure, and it is only fair to say to you that the suggested plan does not at this time meet with our approval, nor are we willing to say that we are prepared to indorse any such procedure as the basis upon which wage rates shall be finally determined. From our point of view to do so would, in a great measure, deny to the men we represent the right of collective bargaining as we understand it.

"The letters of transmittal accompanying the recommendations, submitted by the Board of Railroad Wages and Working Conditions to the director general, copies of which have been furnished us by the director general, do not materially differ as to the necessities of meeting to a reasonable degree the increase of wages to the men we represent. The differ-

ence being only to the extent that the three labor members of the board recommend a specific increase, specified in the amount to be paid per hour. The three members representing the railroads qualified their recommendations to the extent of saying that unless costs of living could be reduced, thereby increasing the purchasing value of a dollar earned, it would be necessary to meet the situation by granting increases in wages.

"We particularly call your attention to the position now occupied by the railroad employees whom we represent. The only increase they have received since the railroads were placed under federal control is that provided for under Supplement No. 4, effective January 1, 1919.

"Practically all other employees of the railroads have received substantial increases under General Order 27, effective as of January 1, 1918, and other adjustments creating substantial increases were granted by the issuance of Supplements 7 and 8, effective September 1, 1918, and subsequent supplemental orders issued up to as late as April 14, 1919, effective to January 1, 1919.

"Members of these same organizations engaged in other industries have received substantial increases, establishing a differential in rates of pay, ranging from 10 to 30 cents per hour in excess of that now paid to the men in the railroad service, reserving, in a large degree, the pre-war conditions, as the railroad employees at that time received, as a general proposition, equal compensation paid men in other industries.

"As a result of this changed condition and the disappointment resulting from the long delay in disposing of the question which was submitted last January, we are now confronted with a situation which is nearing a point that can be no longer controlled.

"Information received within the last 48 hours is to the effect that not less than 20,000 of our railroad members have suspended work, as a protest against this long-deferred decision.

"In view of this condition, there is but one course open for us to pursue. That to submit to the entire membership the proposition as it has been presented to us by the director general, with a request that by their vote they shall decide what further action they may deem necessary to secure the much needed relief.

"We are in accord with the thought that an increase in wages of itself will not altogether solve the problem, but it is well to bear in mind that the classes of employees herein referred to, and for whom we speak, feel, and we believe justly so, that they are entitled to an increase in wages which will restore them to the same relative position as compared to their fellow-members employed in outside industries. We are not aware that this condition applies with equal force to other classes of railroad employees.

"May we urge upon you the necessity of meeting the present situation by putting into effect our original request submitted to the director general on January 7, 1919?"

President Wilson told the committee frankly, Mr. Jewell said, that while every agency of the government was working on plans to bring relief from the high cost of living, the country could not expect a reduction to pre-war standards for a good many years to come.

Mr. Hines' recommendation, which was also placed in the form of a letter to the President, was transmitted by the President to the chairman of the House and Senate committees on interstate commerce on August 1 with a letter urging action along the lines suggested, and the President also wrote to the speaker of the House, asking it to postpone its recess, which had been set to begin on August 2.

Director General Hines' Recommendation

Mr. Hines' letter to the President is as follows:

Several months ago the railroad shop employees asked for an increase in wages. The matter was considered by the Railroad Administration's Board of Wages and Working Conditions, which is composed of three representatives of labor and three representatives of the railroad managements. This board was unable to agree, and therefore took no action as a board, but on July 16 I received two reports from members of the board, one from the three labor members recommending a general increase in wages (for example, increasing the wages of machinists from 68 cents per hour to 80 cents per hour and proportionately increasing the wages of other classes of shop employees), and another report from the three management members recommending against any general increase in wages, although recommending certain readjustments of the wages of some classes of the employees.

The position of the labor members of the board is that the wages of railroad shopment are substantially below the wages paid similar classes of employees in the navy yards, arsenals and shipyards, and in many industrial enterprises in the principal cities of the country, and that substantial increases in the wages in the shipyards and outside industrial enterprises have taken place since the wages of the shop employees were established in the summer of 1918, and the cost of living has been, and is, steadily rising. The position of the management members on the board is that the wages of shop employees are not properly comparable with the wages of non-railroad employees cited by the employees and their representatives, and that these latter industries have differentiating conditions which account for the high wages paid by them, and that a further wage increase at this time would simply begin a new cycle in the cost of living which would not benefit the employees. They urge instead, the adoption of methods of reducing the cost of living.

On July 28 a conference was begun in accordance with an arrangement made on July 8 between the representatives of the Railroad Administration and representatives of the shop employees. At this conference the representatives of the employees made it plain to my associates that their members expected, and believed that they were entitled to, a substantial increase in wages retroactive to January 1, 1919, and that the state of unrest was so great that it was of the highest importance that a definite answer be given on the

L. E. Sheppard

President, Order of Railway Conductors

"I hope he (director general) will see his way clear to cut the Gordian knot and throw the responsibility back on the government where it belongs.

"God knows the people of this country are against government control. Almost everybody is against it. But mark this prediction. They will not go back January 1."

Elisha Lee

Chairman of Regional Directors' Committee opposing trainmen's demands

"It is a very serious question in my mind, whether during this period of reconstruction we can all go back to pre-war conditions."

wage matter without delay. These representatives expressed the same views to me yesterday.

On July 17 the Shop Crafts Convention, meeting at Atlanta, Ga., and representing employees from 16 railroads in the Southeast, strongly urged the necessity for substantial increases in wages by August 1, retroactive to January 1.

The earnest insistence that immediate action be taken to equalize wages with the rapid increase in the cost of living is not confined to the shop employees.

The Triennial Convention of the Brotherhood of Railroad Trainmen, representing about 160,000 railroad employees, meeting at Columbus, Ohio, adopted on May 31 a resolution strongly urging substantial additional increases in wages to meet the cost of living.

The Triennial Convention of the Brotherhood of Locomotive Firemen, meeting at Denver from June 9 to July 15 and representing about 116,000 employees, likewise adopted resolutions insisting upon the necessity for substantial increases in wages to meet the increased cost of living.

The Thirteenth Annual Convention of Railway Signalmen of America in session at Kansas City on July 15 strongly urged a further increase in wages and similar action was taken at Boston on July 27 by 150 delegates to the convention of the United Brotherhood of Maintenance of Way Employees and Railroad Shop Employees of the railroad systems of New England and New York. The International Convention of the Brotherhood of Railway Clerks, which was held in Cincinnati from May 12 to 24, endorsed proposals to the Railroad Administration which also urged an increase and readjustment of the wages of the employees represented by that organization.

The representatives of the Railroad Administration have had assurances from representatives of practically all classes of employees that the continuance in the increase in the cost of living would necessarily involve very substantial increases in wages, and that any increases in wages given to any one class of railroad employees would necessitate corresponding increases to all other classes of railroad employees.

The situation thus presented involves the following considerations:

We have received the most positive assurances that any general increases to shop employees will result in demands for corresponding increases to every other class of railroad employees. The situation, therefore, cannot be viewed except as a whole for the entire two million railroad employees. Viewing it as a whole, every increase of one cent per hour means an increase of $50,000,000 per year in operating expenses for straight time with a substantial addition for necessary overtime. An increase of 12 cents per hour as asked for by the shop employees would, if applied to all employees, mean (including necessary overtime) an increase of probably $800,000,000 per year in operating expenses.

The government is already incurring a deficit at the rate of several hundred million dollars per year in operating the railroads, because the increase in transportation rates has been proportionately less than the increases in wages already granted and the increases in prices which have taken place. Therefore, there is no fund whatever out of which additional wages can be paid, so that additional wages cannot be paid unless new revenues are produced through an increase in transportation rates, and any immediate payment of additional wages would necessitate for several months an appropriation by Congress out of the Treasury because substantial increases in rates could not be made immediately effective.

While you may find it expedient to use the temporary rate-making power, which was conferred upon you as a war emergency during federal control, to prevent the continuance of the deficit now being incurred which grows out of increases in wages and prices due to the war, you would not, in my opinion, be justified in regarding that rate-making power as a sufficient warrant for making still additional increases in rates for the purpose of paying still additional increases in wages to be established under existing peace conditions, and to be controlling as the wage basis in the future.

The question presented for an additional increase in wages, whether the total amount be $800,000,000 or any proportion of that sum, is a peace-time question between the entire American public on the one hand and the two million railroad employees and the members of their families on the other hand. It is a question which I do not believe the Executive ought to undertake to decide unless specific authority is conferred upon him for the express purpose of deciding it.

The fact that these demands are made and are so urgently pressed emphasizes the great necessity of having for their decision legislation which will provide adequate machinery representing both the public and the employees. Obviously any such machinery should include a method whereby revenues will be provided to the extent required to pay the increased wages awarded.

While the general powers implied in the federal control act were sufficient to admit of taking as war measures the necessary steps to deal with the wage problems that arose during the war they are not sufficient to satisfy the requirements arising in connection with any present proposals for general wage increases. Under the existing machinery the ultimate public interest is exclusively represented by the Railroad Administration in the making of wages but by the Interstate Commerce Commission in the final decision upon rates. Moreover, the Railroad Administration while thus charged with the final decision as to what wages are proper as between the American public and railroad labor is also charged with the responsibilities incident to the day to day operation of the railroads. On the one hand, a decision by the Railroad Administration against an increase in wages will be regarded by the employees as a decision dictated more by the immediate difficulties of railroad management than by the broad interests of the public as a whole. On the other hand, a decision by the Railroad Administration in favor of an increase in wages will not necessarily be binding on the Interstate Commerce Commission, which is now the final representative of the public as to transportation rates. To deal with these problems under peace time conditions there ought to be a final and authoritative presentation of the public whose decision when in favor of a wage increase would carry with it the obligation on the part of the final rate-making power to prescribe rates which would furnish the necessary funds with which to pay the increased wages. It is obvious that no wage increases could be put into effect at the moment except on the theory that for several

Warren S. Stone

Grand Chief, Brotherhood of Locomotive Engineers

"We do not believe that increasing the compensation, accompanied by a greater increase in the cost of commodities of life, will produce lasting benefits to our craft or to the American citizen in general. We believe the true remedy for the situation, and one that will result in lifting the burden under which the whole people are struggling, is for the government to take some adequate measures to reduce the cost of the necessaries of life to a figure that the present wages and income of the people will meet."

months they would be paid by an appropriation of Congress because even under the existing machinery rate increases could not actually be put into effect for a substantial period. Undoubtedly any rate increases of a general character ought at the present time to be considered by the Interstate Commerce Commission before they shall be put into effect.

The conclusion to which I have come has been forced upon me by the recent developments above referred to.

When I announced last March the increases in wages for the employees in train and engine service I stated that they completed the war cycle of wage increases.

When it developed in May and June that the continued pressure of the increase in the cost of living was causing railroad employees generally to urge that they be given substantial protection through further important increases in wages if the cost of living was not reduced, I realized that the question was assuming such wide and deep significance to the American public as well as to railroad employees that the question ought not to be dealt with in the same way in which the railroad wages had been increased in connection with the war emergency. I therefore advised the Board of Railroad Wages and Working Conditions on July 3 that they could not regard themselves as vested with jurisdiction to formulate and recommend further general wage increases to be made by me, but that in all cases thereafter arising they should report the facts to me that I might decide in the light of the facts upon a fair and just procedure.

The receipt of the observations of the members of the board with reference to the shop employees, the hearings now in progress before the board with reference to the Brotherhood of Railroad Trainmen, the conferences I have had in the last three days with the representatives of the shop employees and the conferences which my associates and I have been having recently with the representatives of practically all classes of railroad labor with reference to the menace in the continued increase in the cost of living, force me to the definite conclusion that the problem is too great and has too much permanent significance to the American public as well as to railroad labor to admit of its being decided through the exercise of the war emergency powers of the federal control act and which are subject to the limitations and embarrassments above pointed out. I feel that the developments have now reached the point where the situation has taken a sufficiently concrete form to serve as the basis for a positive recommendation.

I therefore respectfully recommend that Congress be asked promptly to adopt legislation providing a properly constituted body on which the public and labor will be adequately represented and which will be empowered to pass on these and all railroad wage problems, but not on rules and working conditions (because the latter cannot be satisfactorily separated from the current handling of railroad operations and therefore should continue to be dealt with by the Railroad Administration). Such legislation should also provide that if wage increases shall be decided upon it shall be mandatory upon the rate-making body to provide where necessary increased rates to take care of the resulting increases in the cost of operating the railroads.

I do not think that we can properly deal with this great problem without a full recognition of the fact that the cost of living is rapidly rising, and that every month that passes promises to impair still further the purchasing power of the existing wages of railroad employees unless the rise in the cost of living can be successfully restrained (as I earnestly hope in the general public interest it can speedily be). I therefore further recommend that Congress be asked to provide in any such legislation that any increases in railroad wages which may be made by the tribunal constituted for that purpose shall be made effective as of August 1, 1919, to such an extent as that tribunal may regard reasonable and proper in order to give railroad employees from that date the benefit which the tribunal may think they were then entitled to. In this way the delay necessarily incident to the creation of such tribunal and its action will not be prejudicial to the fair interests of the railroad employees.

W. G. Lee

President, Brotherhood of Railroad Trainmen

"We are going to have time and one-half for overtime, we are going to have decent living wages and we are going to get it in our own way if we must.

"The railroads properly refer to their inadequate rates, but it is up to the Railroad Administration to determine what is needed to pay the going costs of railroad operation and to fix the rates to meet it. There is no business in this country that is asked by the public to operate at a loss except the railroads. Unless these employees are given a wage that will permit them to live under pre-war conditions there is going to be something worse happen on these railroads, so far as the public is concerned, than an increase in freight and passenger rates.

"I will admit that we are going the wrong way. I admit to you that it is time to call a halt, but as long as present methods continue I believe in everybody getting his share as nearly as he can until the final upheaval comes.

"We are dealing with this situation wrongly in trying to settle these things as we are, and not getting after the people who are to blame."

President Wilson Urges Legislation

The President in his letters to Senator Cummins and Representative Esch said:

I take the liberty of enclosing a copy of a letter which I have just received from Mr. Walker D. Hines, the director general of railroads, and which I am sure you will agree with me in thinking contains matter for very serious thought and for action also.

May I not say that I concur in the suggestions which Mr. Hines makes in the two concluding paragraphs of his letter. I hope that it will be possible for your committee to consider and recommend legislation which will provide a body of the proper constitution, authorized to investigate and determine all questions concerning the wages of railway employees, and which will also make the decisions of that body mandatory upon the rate-making body and provide, when necessary, increased rates to cover any recommended increases in wages and, therefore, in the cost of operating the railroads. In view also of the indisputable facts with regard to the increased cost of living, I concur in Mr. Hines' suggestion that the legislation undertaken should authorize the body thus set up to make its findings with regard to wage increases retroactive to the first of August, 1919, at any rate to the extent that that tribunal may regard reasonable and proper, in order to give real realief to the employees concerned.

I need not, I am sure, urge upon you the importance of this matter, which seems vital from more than one point of view, and I hope that you will think this form of action the proper and necessary one.

In the letter to Speaker Gillett, President Wilson said that Mr. Hines had informed him that the situation with reference to the railroads is growing so critical every hour that

ıe hoped it would be possible to postpone the recess until some definite action is taken. He also said that officials of the government have been in consultation with reference o the problems growing out of the high cost of living, upon which he expected recommendations to be made within a fortnight. Somewhat grumblingly, because a large number of the Representatives had already bought their tickets for ıome, the House rescinded its adjournment to September 9, although an unsuccessful effort was made to adopt a pro-gram of three-day recesses.

As soon as the President had announced his approval of he plan, Mr. Hines went to the Capitol and conferred with Senator Cummins and Representative Esch, offering his as-istance in the drafting of a bill.

Some of the Congressional leaders were disposed to try to ıake political capital out of the fact that the President ıad "passed the buck" to Congress. Representative Mon-lell, the Republican floor leader, said he still believed that careful and wise consideration of the railway problem, in-luding the very problems suggested by the President, would ıave been advanced by the ecess, because the committees would have continued con-ideration of great questions, ncluding the railway prob-em, during the recess. Speaker Gillett, in replying o the President's request for postponement also said ıat "as to railroad legisla-ion, I supposed by an act of Congress you had now full uthority, and one of the easons of our recess was ıat the committee of the House might, uninterrupted y the business of the House, repare the legislation which ill be necessary when your uthority ceases." However, Representative Blanton was ıe only one to vote against ıe postponement, which he id on the ground that it was nother "hold-up" on the art of the labor organiza-ons. Mr. Blanton de-ounced the brotherhoods nd declared that the grant-ıg of the proposed wage in-reases might solve the high cost of living problem for ailway employees, but it would leave the other people of the ountry worse off than before.

Walker D. Hines

Director General of Railroads

"The question presented for an additional increase in wages, whether the total amount be $800,000,000 or any proportion of that sum, is a peace-time question between the entire American public on the one hand and the two million railroad employees and the members of their families on the other hand. It is a question which I do not believe the Executive ought to undertake to decide unless specific authority is conferred upon him for the express purpose of deciding it.

"Contentions that existing wages are lower than they ought to be in view of the present cost of living raise an exceedingly grave question for the government. That question is whether, when railroad operations are now being conducted at a very heavy deficit, the government ought to enter upon a course which will bring about large additional increases in wages, and will inevitably bring about also very heavy increases in rates, and without question set in motion a new and dangerous cycle of increases in the cost of living."

"Big Four" Brotherhoods Prepare Demands

On the same day that Mr. Hines conferred with the resident, Warren S. Stone, grand chief of the Brotherhood f Locomotive Engineers, and the other members of the dvisory board of the brotherhood, called on the President nd presented the statement published in last week's issue nnouncing an alternative demand for either a reduction in ıe cost of living or a wage increase. The brotherhood has ınce served formal notice of its intention to present a new age proposition and L. E. Sheppard, president, and other fficers of the Order of Railway Conductors, which had oted not to ask for a wage increase at this time, but had sked the wage board for consideration in connection with ny increase that might be allowed on the request of the rotherhood of Railroad Trainmen, also called on the Presi-ent on August 2 and announced the intention of asking or a 35 per cent increase.

The Brotherhood of Locomotive Firemen and Enginemen has called a meeting for August 12 at Cleveland to frame its demands. President W. G. Lee of the trainmen has referred to his demands as providing for a 45 per cent increase. The demand of the Brotherhood of Railway Clerks which has since been filed is for 20 cents an hour increase and a 44-hour week.

Urge Action to Check Cost of Living

While insisting that their demands must be granted, officers of the transportation brotherhoods have expressed a realization that repeated increases in wages do not solve the problem because they are immediately followed by increasing rises in the prices of commodities, and have strongly urged a campaign to prevent further increases in living costs. They have bitterly criticised Congress for not doing something but have directed most of their invective toward alleged profiteering. W. G. Lee and L. E. Sheppard have also been outspoken in their demand that freight rates be advanced to a level sufficient to pay higher wages.

The wage demands before the Railroad Administration upon which hearings have been held had reached a total of approximately $400,000,000 a year. This includes $210,000,000 for the 450,000 shop employees, $100,000,000 for the 140,000 trainmen, $40,000,000 for the 40,000 conductors on the basis of the demands presented by the trainmen; and $50,000,000 for time and one-half for overtime in road train service, on which Railway Board of Adjustment No. 1 has submitted a divided report to the director general.

The re-opening of the wage question by the "Big Four" brotherhoods so soon after the $60,000,000 award made in April came as a surprise. The brotherhoods received more than $60,000,000 in 1917 through the Adamson law; last year they gained a further increase of $140,000,000 under Director General McAdoo, and this was followed by the $60,000,000 supplementary award this spring—a total of $260,000,000, or an average increase of about $800 per man, bringing their average up from $1,250 and $2,050 a year.

The new demands also have definitely destroyed the theory so sedulously advanced by the labor leaders that wage and labor controversies can be satisfactorily settled by bi-partisan boards composed of equal numbers of representatives of the management and of labor. This plan for dealing with labor questions, with provision for a referee in case of disagreement, was adopted by the National Transportation Conference called by the United States Chamber of Commerce and was advocated before the House committee as recently as July 24 by W. N. Doak, vice-president of the Brotherhood of Railroad Trainmen, who said that it made little difference who the referee was because the boards could agree in most cases. The bi-partisan plan has worked very successfully in the handling of the multitude of disputes as to schedule interpretations and discipline which have been passed on by the Railroad Administration boards of adjustment but questions of wages have been handled by the bi-partisan

Board of Railroad Wages and Working Conditions, which has merely made recommendations to the director general who had the responsibility of final decision. This board has not always been unanimous and in the case of the shopmen's demands the representatives of the management and of the employees divided evenly. Moreover, when the Brotherhood of Railroad Trainmen started the new cycle of demands for the brotherhoods the director general on July 3 removed even the jurisdiction of the board to make recommendations except as to matters of equalization and directed the board to report to him a summary of the facts.

Cabinet Tackles Cost of Living Problem

Director General Hines has been giving serious consideration for some time to the cost of living problem and its causes, in its relation both to wages and to rates, and is understood to have strongly urged upon the President and members of his cabinet the fundamental importance of taking such steps as may be possible to deal with the situation. His reluctance to increase freight rates to offset his steadily mounting deficit, although such a course had come to be regarded as inevitable even by many shippers who did not like the idea, has been due to his unwillingness to furnish even the excuse for further increases in prices if it could be avoided.

On the day after Mr. Hines saw the President a conference of eight high government officials was called by Attorney General Palmer to discuss the matter, which was attended by Secretaries Glass of the Treasury, Houston of the Department of Agriculture, Redfield of the Department of Commerce, Wilson of the Department of Labor, Director General Hines, Chairman W. B. Colver and Victor Murdock of the Federal Trade Commission, and R. C. Leffingwell, assistant Secretary of the Treasury. After a general discussion lasting nearly three hours the conference adjourned to meet on Tuesday, when Julius H. Barnes, director of the United States Grain Corporation, was also included, and Messrs. Hines, Colver and Leffingwell were appointed a special committee to report at the next meeting. The new developments also stirred up a good deal of oratory in Congress and in a couple of Congressional committees that are holding the usual kind of Congressional investigations of the cost of living. The Senate passed a resolution requesting its banking committee to report whether legislation to reduce the amount of currency in circulation was advisable, and several bills were introduced. A plan for selling surplus army food supplies at cost is also being worked out.

The purpose of the labor organizations to prevent the return of the roads to their owners is indicated in a statement issued on Saturday by the heads of the four brotherhoods and of the Railway Employees' Department of the American Federation of Labor regarding the bill introduced in Congress on Saturday by Representative Sims to carry out the provisions of the Plumb plan. In this it was declared that "the railroad employees are in no mood to brook the return of the lines to their former control," also President Sheppard of the Order of Railway Conductors, in his statement before the Board of Wages and Working Conditions, told the board to "mark his prediction that the railroads will not go back on January 1."

Although in speaking before the wage board W. G. Lee and L. E. Sheppard had both expressed great impatience because Mr. Hines was not willing to order large increases in freight and passenger rates in order to pay the higher wages asked, they both signed the statement issued by the Plumb plan press bureau asserting that the Plumb plan would reduce both rates and the cost of living. They failed to explain in any detail how they expected to pay themselves another billion dollar increase in wages on top of the increases in last year, which have produced deficits for eight months, and still reduce rates while paying a wage dividend out of the surplus. Warren S. Stone, asked how far the organizations proposed to go, said, "We are going far enough to win the fight, and we are going to win." Such statements are not carelessly made public.

Shop Crafts Take Official Strike Vote

The labor organizations apparently did not take kindly to Mr. Hines' proposal for an independent tribunal to pass upon wage questions. The shop organizations particularly were aroused by the suggestion that any increases be made effective as of August 1 because they had demanded that their increase be made retroactive to January 1, 1919. B. M. Jewell, acting president of the Railway Employees' Department of the American Federation of Labor, announced on August 2 that it had been decided to call for a strike vote, returnable by August 24, of the approximately 500,000 shop employees involved. Acting on behalf of the six shop crafts a committee of 100, of which Mr. Jewell as chairman presented to the director general on January 7 a request for a minimum of 85 cents an hour for mechanics, an increase of 17 cents; a minimum of 60 cents for helpers, an increase of 15 cents; an increase of 10 cents per hour for apprentices and various differentials for special classes of work. On February 8 the question was referred to the Board of Wages and Working Conditions, during March and April hearings were held by the board, and on July 16 the board made its divided report to the director general. During this period the board was also giving consideration to a demand by the shop crafts for a national agreement covering rules and working conditions, to be effective on all roads under federal control regardless of whether they had previously had contracts with the unions. These were considered by committees representing the employees and the regional directors, which submitted a report to the board and the board made its recommendation to the director general on July 16. During June and July several local shop strikes were called by way of protest against the delay in passing on these two matters, but they were settled. Beginning on July 28 the committee of 100 began a series of conferences with the director general demanding a decision by August 1. The unions on the southeastern roads had definitely decided to strike on that date unless their demands were granted. On July 30 Mr. Hines advised the committee he would be glad to enter into the agreement covering rules and working conditions, and promised to give a decision on the wage question later. Mr. Jewell then wired the various local organizations that they had gained one point sought and instructing them that there must be no stoppages of work pending the conclusion of the negotiations. This was not sufficient to hold the men in check, however, and the shop men walked out in various parts of the country on August 1, the number increasing on the following days. The dissatisfaction was increased on Friday, when in lieu of a decision on the wage question Mr. Hines read to the committee his letter to the President proposing a special wage tribunal. Meanwhile the negotiations as to the rules and working conditions have been temporarily set aside.

"We shall continue to endeavor to settle the demands by negotiation with the Railroad Administration pending receipt of the strike vote," said Mr. Jewell. "That will, when taken, simply center the power for calling a strike in the hands of the committee. The first effect will probably be the ending of the present strike, which has taken out a considerable number of men over various sections of the country who have been impatient of the long delay. Their walkouts have been unauthorized, but we expect they will return when they see that the organizations intend action in a united fashion."

Approximately 30,000 shopmen in Chicago and 100,000 men in the Chicago district were reported to have left their

work at 10 a. m. on August 1 and approximately 35,000 men on 16 railways in the Southeast took similar action. This strike came at a particularly unfortunate time because the Railroad Administration has been bending every effort to put its equipment in condition to meet the demands of the heavy grain traffic. Shopmen in Boston, Philadelphia, Denver were also reported to have gone out, and the strike spread somewhat on the following day. By Monday leaders of the shopmen in Chicago declared that 50,000 men were out throughout the country. The shop employees of the Southern Railway at Alexandria, Va., a strategic location for making an impression on Congress, were among the first to walk out, and they were followed on Saturday by the employees at Potomac yard, and on Monday by those at the Washington terminal.

On Monday B. M. Jewell and other members of the shopmen's committee called on the President at the White House.

Director General Hines held a conference on Monday with the labor officers who were in the city, including the Brotherhood officers and J. J. Forrester of the clerks, to explain his attitude to them first hand.

Opposition to Wage Tribunal in Congress

Many members of Congress have expressed disapproval of the plan for the creation of a special wage tribunal, very brave in their declarations not to be stampeded by organized labor as long as they thought that by inaction they could leave the responsibility for dealing with the situation with the President or Director General Hines. There was a lively discussion of the proposal in the Senate on Tuesday, when Senator Cummins declared that the President and the Railroad Administration already have full power under the federal control act. He insisted that no legislation was necessary, but that the President's recommendations would receive careful consideration. He said the President can fix both wages and rates, that the Cummins bill was not yet a law and that even if it were the director general could still initiate rates. Mr. Hines, however, has taken the position that while he could initiate rates he would have no knowledge as to whether they would stick and that even under the present law the commission could reduce his rates after a review, and he does not like the idea of raising wages and then wondering whether the money to pay them is to come from rates or an appropriation, with uncertain factors attending both methods.

Chairman Esch of the House Committee also indicated a belief that the President already has ample powers, and he opposed the idea of a new commission whose findings would leave the Interstate Commerce Commission no discretion as to an increase in rates. Mr. Esch in discussing the Plumb plan bill said he thought the people are opposed to government ownership and that if labor tries to force its plan by threatening strikes such action will react against them.

Senator Cummins also declared that nationalization of the railroads would be a step toward socialism that could only be followed by its application to other industries, but, he said, he did not anticipate that the step would be taken.

Senator McKellar urged that the efforts of Congress be devoted to working out a permanent solution of the railroad problem.

Senator Pomerene said that if he were director general he thought he would "have the courage to say either that there ought or ought not to be an increase of wages," or resign.

Senator Kellogg took the position that the President is recommending only temporary emergency legislation and expressed the opinion that the President already has sufficient authority. But he said he would give the matter earnest consideration and would not say that he would not finally favor the action proposed by the President.

Senator Thomas denounced the action of the labor organizations in a long speech, in which he said: "I do not want to be extreme, and yet I cannot in my mind characterize a threat like this from government employees as short of treason."

Senator King referred to the criticism already caused by the increases in rates and wages last year and asked if it would not be far better, if such an important step is to be taken, that Congress should legislate and direct whether there shall be an increase in wages, and if so, advise the means by which an increase shall be made.

Executive officers of all fourteen railroad labor organizations have been in Washington conferring with Director General Hines, and on Tuesday left with him some kind of a proposition, the nature of which was not disclosed. They also made it clear that they were united in opposition to the plan for a wage tribunal.

President Wilson cancelled all other engagements to devote his attention to the cost of living problem, which was the subject of the cabinet meeting on Tuesday, and received many reports bearing on it from various government departments. It was announced he would address Congress on the subject on Friday.

In a statement presented to Director General Hines by fourteen railroad organizations his proposal for a wage commission was opposed, and he was urged to recommend the passage by Congress of an appropriation bill to enable him to increase wages pending a careful study as to what increases in rates would be necessary. They declared that employees were at least entitled to compensation that would re-establish the pre-war purchasing power of their wages, that board of wages and working conditions already affords necessary machinery to handle the wage questions and they asked that its functions be restored, but that its recommendations be submitted to the organizations before being issued. A plan for a Congressional investigation was disapproved because it would mean delay. "Prompt action in this regard is both essential and desirable. This will only give temporary relief and must be accompanied or immediately followed by a determined united effort to not only prevent a further increase in cost of living but to secure a reduction therein." They also declared that any permanent solution of the railroad problem must necessarily remove the element of returns on capital as the sole purpose of operation.

The Senate committee on Wednesday decided to take no action on the President's recommendation, and authorized Chairman Cummings to write a letter to the President saying he already has full authority and that a special board is neither necessary nor desirable.

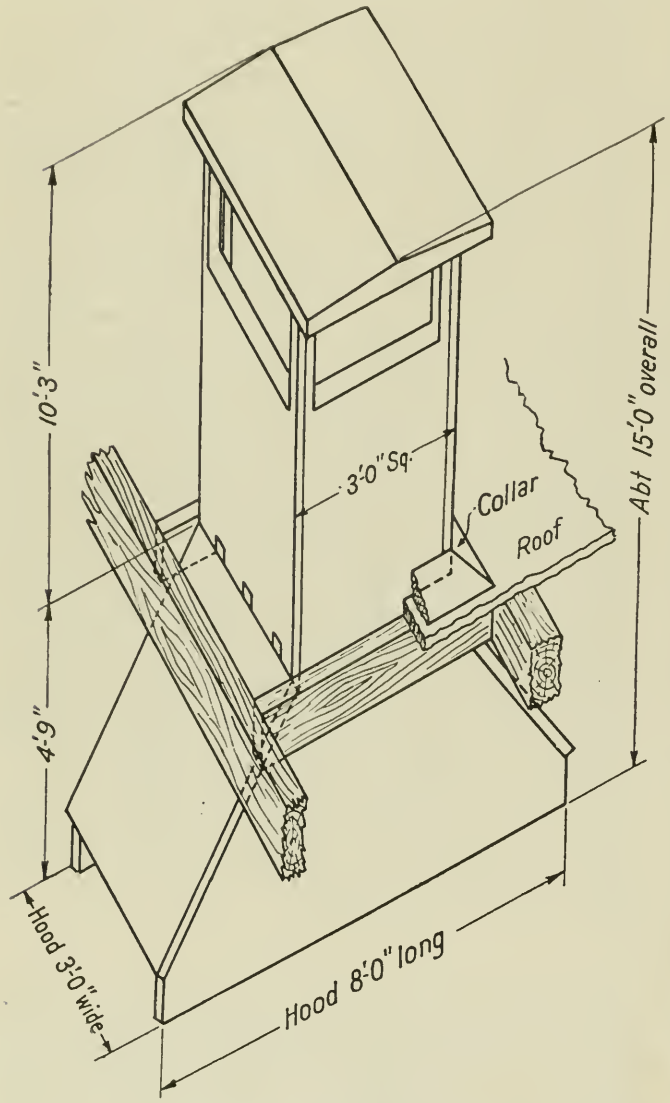
A Timber Smoke Jack

ONE OF THE RECENT developments in engine house equipment has been the development of a smoke jack manufactured of kiln-dried California redwood, thoroughly treated and fireproofed before being fabricated. It has the advantages of being light in weight and easy to handle and is furnished knocked down ready for assembly by unskilled labor. No nails or fastenings are exposed to the smoke or locomotive gases and it is claimed for the jack that it is free from sweat, rust and other objectionable features. The jack is built of mill construction, the details of which are clearly



Details of the Mill Type Jack

shown in the drawing. It is supported in place by a simple collar resting on the roof and requires no guy wires or other supports. In operation, the jack presents a large ventilating area and it may be equipped with an automatic damper if desired. It presents smooth surfaces inside and out, which, with the absence of supports, are reflected in the low cost of maintenance. The jack is manufactured under the trade name of Mill Type Smoke Jack by the Smoke Jack Company of East Boston, Mass.

Croesus was once a poor man, but he saved. He would have jumped at a chance to buy War Savings Stamps.

The Striking Shopmen

THE NUMBERS OF SHOPMEN on strike on the principal roads in the Central Western region as reported on Wednesday, August 6, were as follows (numbers reported by labor leaders are much larger than these):

Chicago, Burlington & Quincy	500
Chicago, Rock Island & Pacific	7,250
Chicago & Eastern Illinois	2,800
Indiana Harbor Belt	425
Atchison, Topeka & Santa Fe	1,100
Chicago Junction	280
Kansas City Terminals	800

The total in the Central Western region is approximately 18,000. The Northwestern region reports the total number of shopmen out as 38,000. The strike appears to be rapidly spreading westward. Press reports on Wednesday indicated that the shopmen of the Union Pacific, Denver & Rio Grande and Southern Pacific walked out on that day.

On the Wabash, as a consequence of the strike, freight service was practically suspended. The Chesapeake & Ohio announced at Huntington, W. Va., on Wednesday evening, that on all its lines west of Clifton Forge, Va., both passenger and freight traffic would be discontinued at once.

The St. Louis-San Francisco and the Missouri Pacific placed embargoes on all freight.

Eastern railroads up to the time of going to press have reported little disturbance, though there were a number of local walkouts in New England, apparently not large.

In Macon, Ga., according to "The Telegraph" of that city, about 1,600 shopmen struck on Saturday, August 2, the larger number being employees of the Central of Georgia. At Florence, S. C., about 400 men struck, at the shops of the Atlantic Coast Line. Considerable numbers struck at the shops of the Chesapeake & Ohio at Silver Grove, Ky., and Covington, Ky.; on the Louisville & Nashville at Covington and Decoursey, and on the Cleveland, Cincinnati, Chicago & St. Louis at Riverside yards.

Reports from Duluth, Minn., indicated that all shop employees on all roads in Duluth and Superior were out. All shop employees on the Duluth, Missabe & Northern left their work and all on the Duluth & Iron Range, except a few at Two Harbors. The electrical workers on the Duluth, Missabe & Northern coal dock went out Tuesday morning, tying up operations of the dock. Dock workers struck at Escanaba and Ashland. Duluth reported no interruption to freight or passenger train service; the necessary work on locomotives was being done by emergency help.

The Reconstruction Program for French Railways*

Plan for New Construction and Standardization of Railway Material; Cost of Improvements to Inland Waterways and Seaports

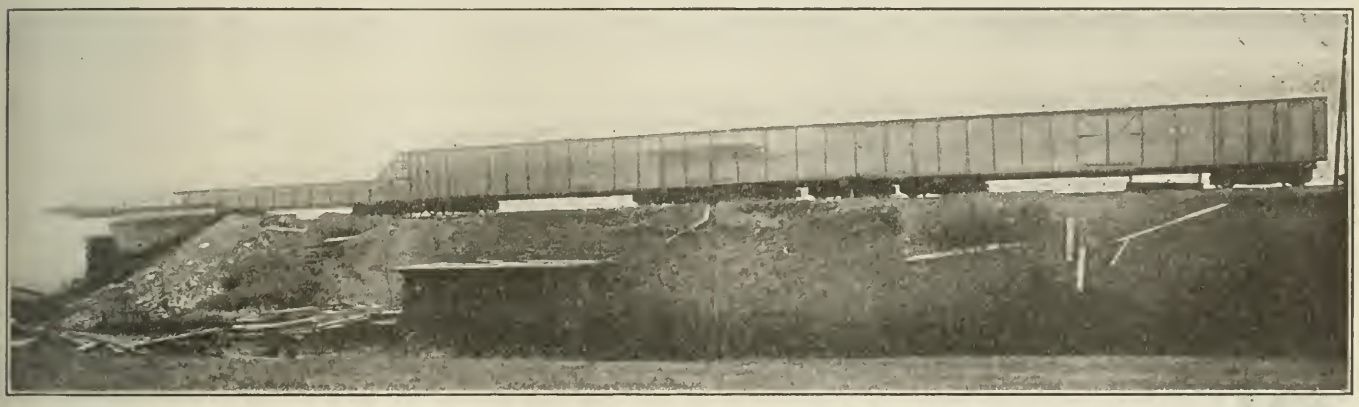
By Robert E. Thayer,
European Editor of the *Railway Age*

Part II

THE PROBABLE COST of work for the reconstruction of the lines of communication of the liberated regions mentioned in the first part of this article may be summed up as follows:

Principal Railroads (way and buildings)	$250,000,000
Railroads of Local Interest	83,000,000
Navigable Waters	43,000,000
Maritime Ports	16,000,000
Highways	64,000,000
Total	$456,000,000

This figure is not final, but only gives an approximate estimate of the probable cost of each class of work. It does not include the material, supplies and machinery of the principal railroads, as well as all the damages which have no direct connection with work still to be carried out.



This Shows the Members of the Bridge Rivetted in Place and Ready to Extend Out Over the Span

Plans for New Construction

As pointed out at the beginning of this article, the French Minister of Public Works in addition to the general reconstruction of the devastated lines, is seeking to not only carry on the new construction contemplated before the war but to still further improve the railways to meet the new conditions arising on account of the war. He has asked that the following program be carried out in order to handle the problems in a practical way:

1. The work interrupted by the war should be completed as rapidly as possible, as well as that already properly authorized, using to advantage everything that has been constructed or imported during the war for the needs of the French and Allied armies. For this purpose, on March 2, 1919, a commission was named to study all questions regarding the handing over to the French Government of installations in connection with railroads, navigation and ports, as well as equipment belonging to the British and American armies.

2. A new financial system is to be adopted, controlled by a law, preventing the overburdening of the present generation and permitting the making of a program for each big problem, thus reducing as much as possible the charges on the treasury and regulating the execution of the work so as to prevent its being dependent on the variations of the budget from year to year. The Minister proposed that this law should require:

(a) That a special report should be submitted for each big piece of work, which should be studied by a committee composed of technicians, manufacturers, financiers, etc., and then be examined by the Supreme Council of the Ministry of Public Works.

(b) That the authorizations necessary be then requested from the Chamber of Deputies, account being taken of the amount of the financial participation of the communities, corporations and other parties interested in the project.

Realizing the importance of completing the new working contemplated as soon as possible and at a reasonable cost the Minister of Public Works gave strict instructions that the engineers should not seek to construct elaborate structures (ouvrage d'art).

He stated that all unnecessary features should be avoided, and that wherever possible the stock material on the ground should be used. He also mentioned, that although the size of the installations—particularly in the ports—should take into account the future needs, certain ones should be constructed rapidly and cheaply now, using the best methods employed during the hostilities, in order to meet present requirements.

Standardization of Materials

The Ministry of Public Works is doing its best to standardize the types of material and equipment used on railroads. Instructions were issued February 24, 1918, by the Ministry requesting that a study be begun of the general improvements to be made after the war in the operating of railroads, and calling attention to the unfortunate situation—from both a technical and a financial point of view—resulting from the diversity of types of material and equipment in use on the

*Part one of this article was published in the *Railway Age* of August 1, page 191.

six main railroads. Special committees were formed for this purpose, made up of government officials, and representatives of the railroads and private manufacturers. During the meetings held in December, 1918, the Supreme Council of the Ministry of Public Works adopted the following rules for the future:

As regards the "Vignole" or "T" rail; in the future the railroads are to order the following specified weights only:

92 lb. rail for standard gage tracks with heavy traffic.
72 lb. rail for tracks with average or small traffic.
52 lb. rail for meter gage tracks of general interest.

The length of each rail is to be normally 18 meters (58 ft. 6 in.) or in any case a multiple of 6 meters.

As far as the different types of rolling stock are concerned, the Supreme Council of the Ministry of Public Works, and the Minister himself, have declared that this rolling stock should be standardized on the French railroads in the following way:

(a) The elementary parts should be made uniform, such as truck frames, springs, wheels, tires, axles, couplers, buffers, draft gear, journal boxes, brake rigging, etc., for use in constructing complete cars and locomotives.

(b) Finished locomotives, and passenger and freight cars should be limited to as few types as possible, differentiating only where necessary on account of the various operating requirements and not on account of the fact that they are going to be used by different railroads.

New Construction Work on the Principal Railroads

Included in the new work to be done is the replacing of tracks removed during the war for military needs from the State, Paris-Orleans, Midi, and Paris-Lyons & Mediterranean. The sum total of the track thus removed amounted to 930 miles divided as follows:

	Miles
Single track lines	217.5
Double track lines reduced to single track lines	637.5
Siding tracks	75.

Since the armistice, measures have been taken for the reconstruction of these lines and many of them have already been re-opened. By March 1, 1919, 130 miles of track had been put back. For the reconstruction of four lines on the Paris-Orleans arrangements were made by the French Government in May, 1919, to purchase 62 miles of 80 lb. rail from available American stock.

The increase in traffic is going to require the railroads to make improvements as regards stations, engine terminals, double tracking of lines, sidings, and in general all railroad installations. The amount of all additional work inter-

Midi	7,836,000
Total	$151,740,400

acter, the armies constructed, in the regions of the Nord and the Est, 1,030 miles of new lines, made up of 1,002 miles of standard gage track and 28.6 miles of meter gage track. The only one of these lines entirely constructed by the American army is the one from Aubréville to Aprémont, 10 miles long, although two others were done under American supervision—one from Souilly to Courreuvre (10.5 miles) and the

The B. S. Type of Bridge in Place

It will be necessary to revise these projects, for some will certainly have to be enlarged on account of the increase in the traffic because of the war, and others reduced owing to the fact that work will be kept which was done by the French and Allied Military Services during the hostilities. It is certain that the cost will in any case be very heavy. Mention should also be made of the fact that Minister Claveille requested the Est and Paris, Lyons & Mediterranean on February 14 and 18, to particularly consider the new improvements to be made to meet the additional traffic resulting from the return of Alsace and Lorraine to France.

Besides the stations and work of a purely military char-

other from Loxeville to Pierrefitte (11.8 miles). Steps have been taken with the railroads and geographical departments interested for having all or part of these lines incorporated in the lines of the principal railroads or in those of local interest.

The following totals show the number of miles and the approximate cost of the lines which the Administration in-

This Shows the Marcille Type of Bridge Ready to Be Swung Across the Span. It Will Be Noted That This is Somewhat Similar to the B. S. Type of Bridge

tends to construct as actively as possible as soon as it has the necessary resources:

	Total length. Miles	Probable Cost
Nord	41.5	$10,400,000
Paris-Orleans	326.	28,600,000
Paris, Lyons & Mediterranean	200.5	86,440,000
Midi	390.	34,440,000
Other lines	138.	25,200,000
Total	1,096	$185,080,000

* On account of the uncertainty of prices, the estimates given here are not very precise. In general they are calculated by increasing pre-war prices 60 per cent.

As a result of the war certain modifications have come about in international relations which will require the study of new railroad lines. In this respect, the Supreme Council of the Ministry of Public Works has given its approval, in principle, to the execution of the following work:

Improvement in the present lines to facilitate communications by railroad between Switzerland and the French seaports.

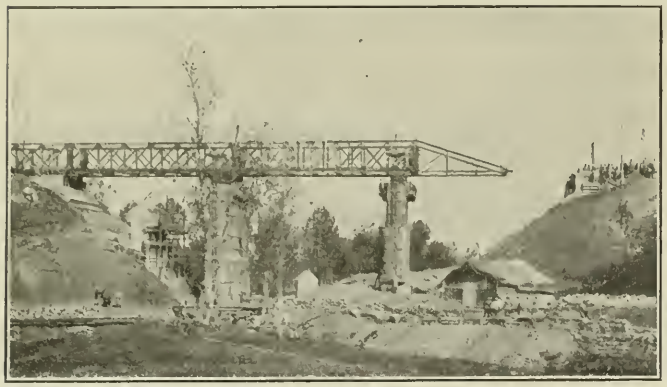
New communications across the Vosges Mountains by connecting the line from Remiremont to Bussang with the line from Krûth to Mulhouse by the construction of a line from St. Maurice to Uesserling; and by the construction of a line from St. Die to Saales.

It has also been judged indispensable to construct a new line between Rouen and Hâvre in order to develop the Maritime installations of the lower Seine and the Ports of Rouen and Hâvre.

New Construction on Railroads of Local Interest

The Ministry of Public Works is making the same efforts with the railroads of local interest as with the principal railroads regarding the standardizing of track material and rolling stock.

The 308 miles of track removed during the war from railroads of local interest for the military requirements will gradually be put back as soon as the material is obtained.



The Henry Type of Bridge in Process of Construction

It is hoped that this will be finished before the end of the year. The following figures show the new work to be done on these lines:

	Length of lines. Miles	Probable Cost
Work interrupted by the war	541.7	$25,645,400
Work declared of public utility or belonging to projects already approved	1,382.8	153,113,400
Totals	1,924.5	$178,758,800

Inland Waterways, Seaports and Highways

Although inland navigation, sea ports and highways do not belong to our immediate province, perhaps a few figures will be of interest to show the probable future cost of work to be done.

Inland Waterways—In connection with inland navigation, 450 bridges (300 of steel) will have to be reconstructed, 115 canal locks were destroyed or seriously damaged, and 62 miles of canal bed will have to be cleared out and put into shape. The total cost of the work to be done for the restoration of the inland waterways will probably reach $43,200,000. In general it will take from six weeks to six months to complete the work; but in the case of the canal from the Oise River to the Aisne River, eighteen months to two years will be required to rebuild the great viaduct carrying the canal. In addition to the reconstruction work to be done on the canals, the following figures show the vast program which is to be carried out:

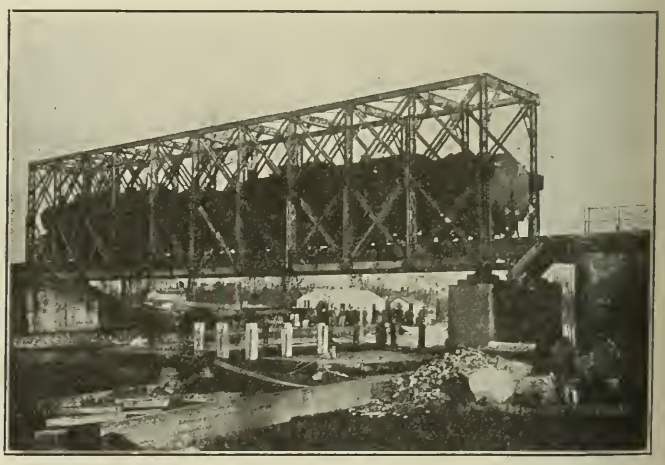
Work interrupted by the war	$39,976,800
Work approved but not begun	30,647,600
Total	$70,624,400

In the work approved but not begun, a figure of $22 000,000 is included for changes to be made to the Seine River, where it crosses Paris, in order to improve navigation and prevent floods.

Sea Ports.—The ports which suffered most damage during

Method of Supporting the Henry Bridge During Construction

the war are those of Dunkirk, Calais and Boulogne. The damages to the docks, locks, storage yards, etc., as a result of bombardments were not very heavy, amounting to about $201,800. The damages done to buildings belonging to the port service and the Chamber of Commerce, and to port machinery, etc., are far greater, being $911,000. If these figures are added to the cost of removal of wreckage and of clearing out these ports, the approximate cost will be $1,600,000. These figures do not include an outlay of $14,000,000, made to construct temporary berths in the ports for receiving the supplementary coal imported on account of the destruction of the French mines. In addition to this reconstruction work, the following program is to be carried out:



The Henry Bridge in Place, Supporting Two Heavy Locomotives

Work interrupted by the war	$17,072,000
Work approved but not begun	89,439,800
Work underway not interrupted	16,000,000
Total	$122,511,800

Highways.—During the war the highways of 19 geographical departments of France were badly destroyed. The following figures will give an idea of the damage done:

National Highways		
Length of roads to be repaired	5,592	miles
Material required	2,900,000	metric tons
Number of bridges destroyed	550	
Approximate cost	$30,000,000	
Other Roads		
Length of road to be repaired	59,650	miles
Material required	7,500,000	metric tons
Number of bridges destroyed	1,500	
Approximate cost	$52,000,000	

On account of the wonderful work done in keeping up the highways during the hostilities, they can still be used nearly everywhere, but much of the construction work is only temporary and must be replaced. At the time of the declaration of war, a program for improving the national highways was being carried out, involving an expense of $5,881,600. This is going to be continued. Some of this work has already been begun, and the American army has helped to a great extent in certain regions, furnishing the labor, material and means of transportation.

This Shows How the Permanent Bridge Has Been Constructed Under the Temporary Henry Type Bridge Without Interference with Traffic

Summary

The following figures show approximately the cost of the program outlined above:

Reconstruction of lines in the War Zone	$456,000,000
New work on principal railroad lines being operated	151,600,000
New lines	185,000,000
Work on railway lines of local interest	178,600,000
Navigable waters	70,600,000
Maritime ports	122,000,000
Highways	40,000,000
Total	$1,203,800,000

This cost will be divided between the State, the geographical departments interested, the railway companies, and the communities.

The facts given in this article will go to show the vast destruction wrought by the enemy to the lines of communication in France, and principally to the railroads. The effort to be made in the future for reconstructing and improving them will be immense, but the establishment of adequate means of communication will permit France to rise up out of her ruins more than any one thing. In this work America can be of great assistance, but she should always remember that she is there to help and she should not expect to compete in a way which would be detrimental to the rebuilding of French industries.

The House committee on interstate and foreign commerce has favorably reported the resolution which was introduced by Representative Dyer requesting the Interstate Commerce Commission to investigate the future supply of tie timber and the possibility of using steel ties.

Plumb Plan Introduced as Bill in Congress

The bill embodying the "Plumb plan" of organized labor for government ownership and what it pleases to call "democracy in the operation of the railroads," was introduced in the House on August 2 by Representative T. W. Sims, former chairman of the House Committee on Interstate and Foreign Commerce. The bill provides for the following:

1. Purchase by the government on valuation as determined finally by the courts.
2. Operation by a directorate of 15, 5 to be chosen by the President to represent the public, 5 to be elected by the operating officials and 5 by the classified employees.
3. Equal division of surplus, after paying fixed charges and operating costs, between the public and the employees.
4. Automatic reduction of rates if, as, or when the employees' share of surplus is more than five per cent of gross operating revenue.
5. Regional operation as a unified system.
6. Building of extensions at expense of the communities benefited, in proportion to the benefit.

Congressman Sims introduced the bill in the form it was drafted, which in detail, he said, is not to be considered as being textually labor's final draft, but is subject to change and for which suggestions are invited.

"The heads of the four railway brotherhoods and ten affiliated railway organizations of the American Federation of Labor, numbering 2,200,000 men," he said, "have asked me to present this bill. The executive council of the American Federation of Labor was instructed on this matter at its last convention at Atlantic City on June 17, last, to co-operate with the organizations representing the railroad employees.'

"The proposed law would leave the valuation of the railroads to the courts, providing review on appeal from the findings of a properly constituted appraisement board. By the decisions of this body or of the courts, it would pay back every honest dollar put into the railroads, issuing therefor government bonds at 4 per cent. It would work at every stage by peaceful, constitutional methods.

"It would establish harmony between the public interest, the interest of the wage earners and capital. It would protect the public against exploitation for the benefit of either capital or labor, and it would assure the public of reductions in rates exactly equivalent to any increase in earning power which the employees might create for themselves by the efficiency of their organization or the skill of their management. This would be the first step in solving the problem of the high cost of living, as the cost of transportation enters into the price of every commodity which is paid by the consumer. Protection against increased rates—assurance of reduced rates—would inspire industry with confidence; would increase the purchasing power of the dollar; and would break the vicious cycle which now exists whereby every increase in wages is reflected in an increase in the cost of production. The plan itself, without committing myself to the details by which it is to be carried into effect, to my mind offers a solution of the railroad problem much more perfect than any other that has been presented."

Warren S. Stone, president of the Plumb Plan League, has announced that Edward Keating, former Representative from Colorado, has been appointed business manager of the league, and that he, with the representatives of the brotherhoods and other organizations in Washington, will devote their efforts to looking after the progress of the bill in Congress. Mr. Stone predicted that within 90 days Congress will have heard from 1,000,000 of the people on the plan. "If the roads are returned to their private owners,"

he said, "the majority of them will be in the hands of receivers within 60 days."

"Labor's railroad bill has the purpose of reducing the cost of living by operating the most important industry in the country for service rather than for profit," says a statement on the Sims bill issued by the heads of the four brotherhoods and the chief of the railway division of the American Federation of Labor.

"Labor faces a persistently serious situation due to the cost of living, and the impossibility of wages keeping pace with the depreciation of money," the statement continues. "No fundamental changes are being advanced to save workers from continual defeat in the economic struggle of life. The railroad employees are in no mood to brook the return of the lines to their former control, since all the plans suggested for this settlement of the problem leave labor essentially where it has stood, and where it is determined not to stand. We realize that in the strife for wage increases we cannot win any permanent victory. It is not money but value which counts. The vicious circle is infinite; increased wages are over-capitalized for inflated profits and the cost of goods mounts faster than the wage level. A few grow wealthy, and the multitude is impoverished.

"Any basic change must begin with the railroads. We believe the interests of labor and the public to be identical in the railroad question. The properties have been operated for the profit of the few, not for the service of the many. Not only have we suffered from inadequate wages, but the public has paid an extortionate tax for transportation, a tax based on inflated values and collected from every person buying the necessaries of life.

"Our proposal is to operate the railroads democratically, applying the principles to industry for which in international affairs the nation has participated in a world war.

"It has been argued that labor is merely asking the public to let the workers become the railroad profiteers in place of Wall Street. This argument cannot survive a scrutiny of our proposal. We do ask for a share of the surplus, at the end of each year, after operating costs are met and fixed charges are paid. But we also provide an automatic reduction in rates when this surplus comes to a given level. To restore the surplus, the employees of the railroads must increase the efficiency of their management, and they must invite new business. We should not profit from the railroads as financiers have done; we should participate in the increased earnings from our increased production. We could not earn dividends unless industry as a whole were stimulated by improved transportation service. In our bill, the rights of the public are protected. The rate-fixing power, which is the final check upon railroad management, remains with the Interstate Commerce Commission. If the new corporation should attempt to pay itself excessive returns, and produce a deficit, the lease is forfeitable.

"We assure the public immediate savings. The cost of capital would be reduced from the present 6 to 7 per cent paid to Wall Street, to 4 per cent paid upon government securities. The savings assured under a unified system are enormous. The savings through efficiency, rendered possible only by democratic operation, are even greater. For the increased production resulting from harmonious relations between employees and their managers are incalculable. We believe our plan will reduce transportation charges in surprising measure, and that it is the first and the most important step in any constructive effort to lower the cost of living."

The brotherhood executives and Mr. Jewell issued another statement on Monday, saying in part:

"The innuendoes in telegraphed despatches from Washington, appearing also in the speech of Representative Blanton of Texas, that the railroad unions are 'holding up Congress and the government,' may as well cease.

"This appeal is made to the American people direct. It invokes the judgment and common sense of public sentiment of all the public which earns a wage or a stipend. We recognize that the only way in which we can exist under the present system is to demand further increases in wages, but we agree that this affords but temporary relief. It does not offer a remedy.

"Labor's bill, on the other hand, provides a remedy. That this role originates with labor is merely because labor happens to have firm organizations through which it may become articulate. It is not to benefit labor as labor alone; it is to benefit the consuming public, of which labor at present is the audible part. In labor's bill providing that the public take over the railroads and establish a tri-partite control between the public, the railway operating management, and the employees, the labor organizations of America have established this new policy which envisages their condition, not only as producers, but also as consumers.

"It marks the step by which organized labor passes from demands for wage increases to demands that the system of profits in industry be overhauled. Hitherto during successive wage negotiations and arbitration awards we have called for provisional attention only of questions arising out of differences as to wages, hours and conditions of labor. That principle of genuine co-operation and partnership based upon a real community of interest and participation in control, of which President Wilson has spoken to Congress, has been ignored both by labor and by the private owners of the railroads.

"What wage increases have been received during the past few years resulted only in immediately being followed by more than proportionate increases in the cost of living. Each rise in wages has turned out to mean only temporary relief for the affected workers. When the increases have gone around the circle, labor as producer loses the advantage of the new wages through the additional cost it pays as consumer. Moreover, through compounded profits taken on the wage increases each cycle becomes an upward spiral of costs, which the consuming public vainly reaches to control.

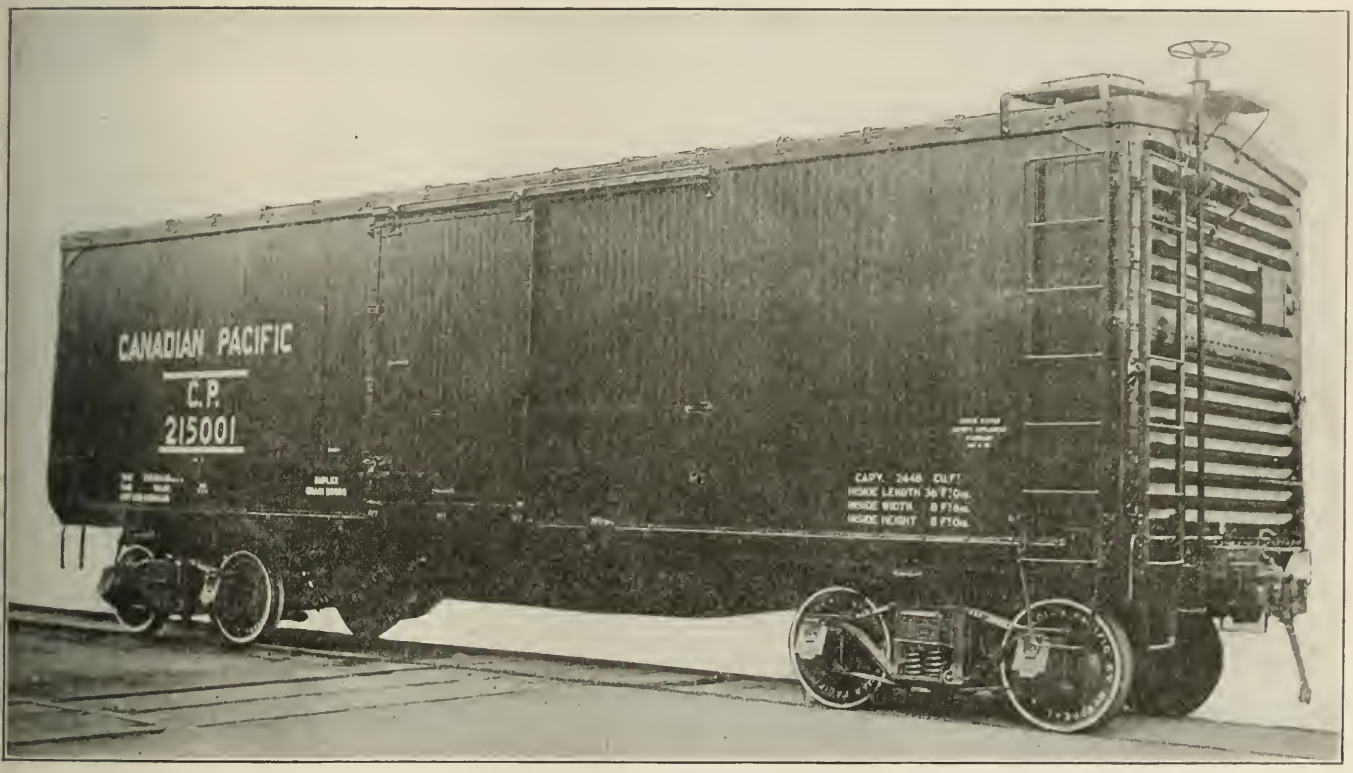
"As the major part of the consuming public, labor is entitled to representation on the directorate of the public railroads; as a producer of capital it is entitled to representation on the directorate of the railroads. To capital, which is the fruit of yesterday's labor, we now propose to discharge every just obligation. We demand that the owners of capital, who represent only financial interest as distinguished from operating brains and energy, be relieved from management, receiving government bonds with a fixed interest return for every honest dollar that they have invested in the railway industry. We ask that the railroads of the United States be vested in the public—that those actually engaged in conducting that industry, not from Wall Street, but from the railroad offices and yards and out on the railroad lines, shall take charge of this service for the public."

The eight-hour day for seamen has already been established by law in France. The Norwegian Legislature is discussing the question. The ship owners and men agreed on the eight-hour day several months ago, and the Shipping Board was forced to follow suit. Seamen on ships from the Pacific coast come into New York regularly, working eight-hour days, while men on other routes work twelve hours. When the eight-hour day is granted here it will only be a short time until England will do the same. On the Pacific coast, where the eight-hour day is in effect, it costs 25 per cent less per ton mile to move cargo, because the seamen are of a better type, more highly skilled, and work together better.—A. Furuseth, president, International Seamen's Union (New York).

Double Sheathed Box Cars for The Canadian Pacific

Length Inside, 36 Ft.; Weight, 39,500 Lbs.; Steel Underframe, Wood Superstructure and Metal Roof

The Canadian Pacific has built an order of box cars of the steel underframe, double sheathed type, the design of which in a general way is similar to the 40-ton double sheathed box cars designed by the United States Railroad Administration. The Railroad Administration cars, however, have an inside length of 40 feet 6 inches, and a height of 9 feet, with an actual weight of about 46,000 pounds. Owing to the very high average box car load in 36 ft. by 8 ft. cars on the Canadian Pacific, the building of cars of these dimensions on trucks on 5 in. by 9 in. journals, with the additional weight which would thus be required, did not seem to be justified. The Canadian Pacific cars, therefore, have an inside length of 36 feet and a height of 8 feet, the width in both cases being 8 feet 6 inches. An average care weight of 39,500 pounds has thus been obtained, which represents a saving of over three ton-miles for each car-mile in the movement of loaded or empty equipment, as compared with the Railroad Administration standard car of similar type. The cars have been designed for a limit load of 92,000 pounds.



Canadian Pacific Steel Underframe Double Sheathed Box Cars

Underframe

Like the Railroad Administration cars the Canadian Pacific box cars have steel underframes built up on center sills of the fishbelly type. The center sills are built up of plates and angles, the web plates having a thickness of ¼ inch, with a maximum width at the center of 25 inches. Each plate is flanged at the bottom with two 3½ inches by 3½ inches by 5/16- inch angles and at the top with a single 3½-inch by 3½-inch by ⅜-inch angle riveted on the outside of the plate. The top of the sills is completed with a ⅜-inch cover plate 26½ inches wide, which extends continuously from end to end of the car. Bottom cover plates are also applied at each end, extending from the rear draft gear stop through the bolster construction to a point about halfway down the slope of the deepening section of the sills. These bottom cover plates are replaced for the remainder of the length of the car by the inside flange angles, the ends of which overlap the ends of the plates far enough to provide against weakening the section at the point of transfer.

The side sills are 6-inches by 4-inches by ⅜-inch angles, with the horizontal flange at the top and extending outward. The end members of the underframe are 5-inches by 3-inches by 5/16-inch angles placed horizontally, resting on the center sill cover plate and the top flanges of the side sill.

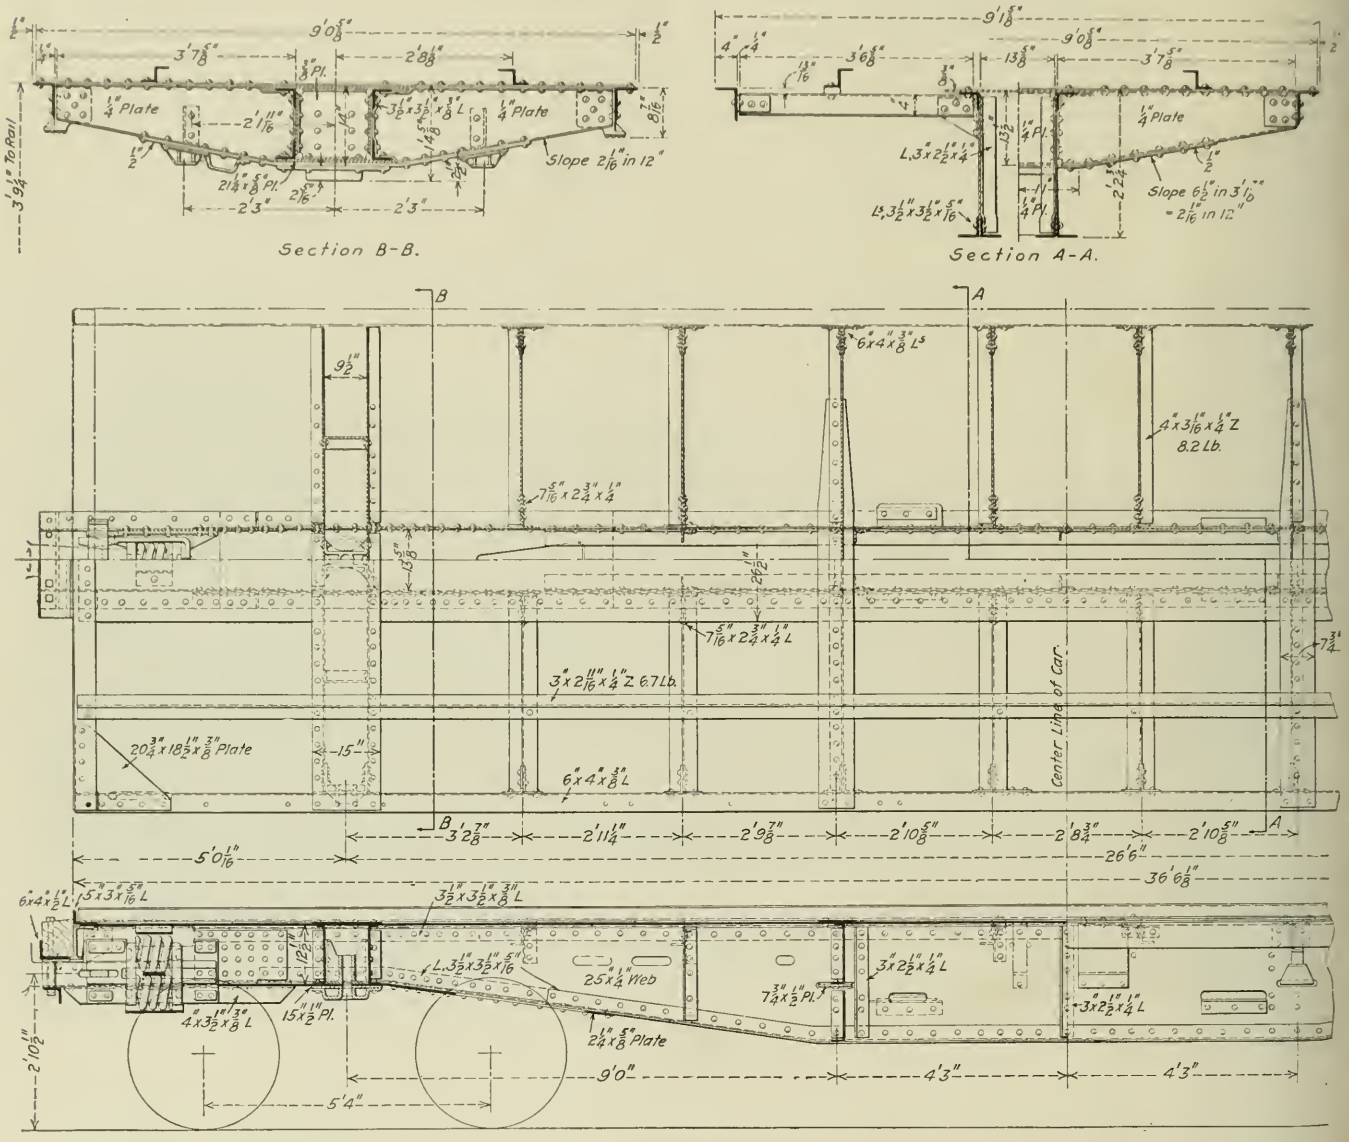
The bolster is of the double diaphragm type. The pressed steel diaphragms are of ¼-inch material spaced 9½ inches apart, tapering with a slope of 2 1/16 in 12 from a maximum depth at the center of 13½ inches. A continuous top cover plate 15 inches wide is riveted at the ends to the side sills and at the center through the center sill cover plate to the top flanges of the sills. Filler diaphragms of ¼-inch material are placed between the center sills and to these is riveted the center plate support casting. A bottom cover plate extends across the under side of the center sills, terminating just beyond the side bearings. The ends of the bolster diaphragms are secured to the vertical flange of the side sills by means of a filler casting to which all three members are riveted. Intermediate crossties of single diaphragm section are located at points 4 feet 3 inches from the trans-

verse center line of the car. The diaphragms of these members are of ¼-inch plate with a depth at the center of 13½ inches, which decreases toward the sides of the car with a slope of 2 1/16 in 12. The flanges of these diaphragms are reinforced with a ½-inch top cover plate 7¾ inches wide, extending across the car above the center sill cover plate, and a short, tapering ½-inch bottom cover plate.

The intermediate floor beams are 4-inch Z-bars, attached at the center and side sills with angle connections and carrying the intermediate longitudinal floor supports of 3-inch, 6.7-pound Z-bars, the web of which is placed 2 feet 8⅛ inches from either side of the longitudinal center line of the car.

used for the posts and braces with the exception of the intermediate posts. The wood posts and braces are of 3-inch by 4½-inch section.

The intermediate posts are 3-inch steel I-beams, these being used for the purpose of providing ample stiffening against bulging when the car is loaded high with grain. The C. P. R. cars also differ from the Railroad Administration cars in that diagonal brace rods are used at each panel section to provide against endwise racking of the car super-



The Steel Underframe of the Canadian Pacific Box Cars

The Car Body

The design of the car body differs from the Railroad Administration cars in that the body frame members are not secured directly to the steel underframe. Above the side and end sills are placed 3⅜-inch wood stringers, to which the post and brace pockets are attached with bolts extending through the steel members. The floor is thus raised above the underframe structure, allowing the use of the intermediate Z-bar supports previously referred to.

The side frame members are 3 inches thick, wood being structure. The side plates are of 7-inch by 3½-inch section, while the end plate is formed integral with the corrugated steel end of the car.

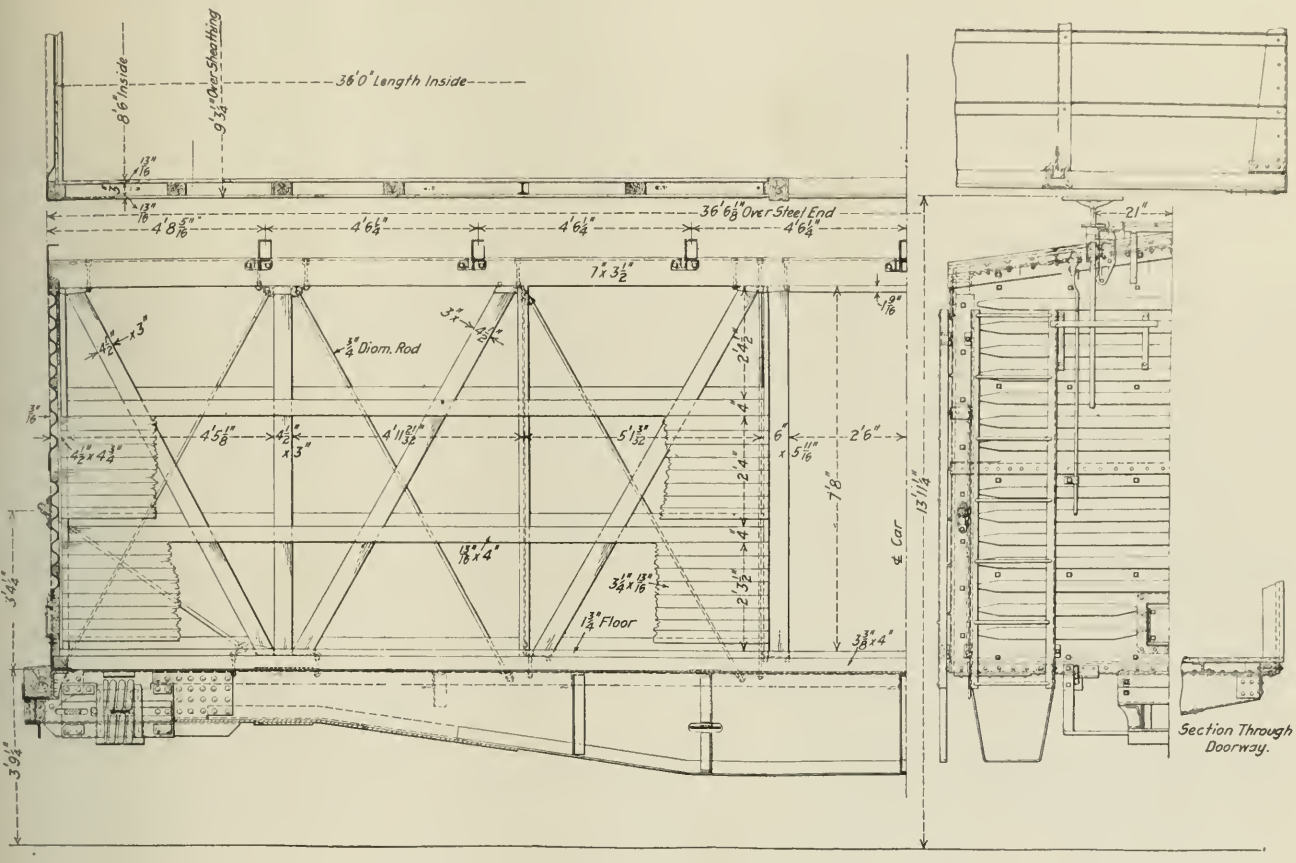
The outside sheathing is standard 13/16-inch tongued and grooved material nailed in the usual way, and in addition to nailing, it is further secured at the side sill by a steel angle bolted at frequent intervals. There are two girths on each side of the car, and the inside lining is carried up to the second girth, 5 feet 3½ inches above the floor. The ends are lined full height with tongued and grooved lumber 13/16 inch thick, which is placed vertically and nailed to strips secured in the bottoms of the steel end corrugations by means of bolts, the outer ends of which are riveted to the steel end sheet.

The side-door openings are 5 feet wide. The doors are of wood, bound with metal on all of the edges. The band at the back edge of the door is arranged to engage with the strip on the back door post, forming an effective weather and spark strip and further securing the door from bulging outward. The front stops are of wood, braced with malleable brackets. The locking arrangement is of the combined lock and stop type equipped with a door starting lever. Two handles are provided on each door, one on the bottom for track level operation and the other near the center girth for platform operation.

Two types of roof are applied to these cars, one an outside metal roof and the other an inside metal roof. The carlines for both roofs are of 4-inch angles, which are attached to the side plates by means of malleable brackets. These brackets are secured to the plate by two horizontal bolts, with the nuts on the inside of the car and the head secured from turning by a flanged double washer plate back of the fascia board.

Trucks

The cars are fitted with trucks of the arch bar type with a wheel base of 5 feet 4 inches, and 5-inch by 9-inch journals. The bolsters are the Simplex type, with long column guides to provide the maximum area between the bolster and the cast steel truck columns. The trucks are fitted with roller type side bearings.



End and Sectional Views Showing the Body Construction

Hauling Freight on Electric Railways

An electric locomotive pulling an oil train on the Sand Springs Railway in Oklahoma

Turn Around Service on The Western Maryland

On February 10, 1919, the Western Maryland inaugurated an innovation on its Hagerstown division which has been a decided factor in reducing the cost of operation.

The innovation was the adoption of "Turn-Around" service between Hagerstown and Cumberland, a round trip distance of 160 miles. The westbound opposing grade is 6 per cent and the eastbound opposing grade is 3 per cent. Cumberland to Williamsport 7.3 miles, with seven mile helper grade (1.1 per cent) Williamsport to Hagerstown.

In former years power was called at Hagerstown and run to Cumberland and there tied up for rest before resuming the eastward trip. There was no incentive for crews to make a good run westbound as they knew they would be tied up for rest on their arrival at Cumberland. In some cases crews made terminal overtime before being called for the eastward journey.

With the advent of turn-around service, the incentive of "breakfast and supper at home" was put before the men with a result that they entered into the plan determined to help make it a success. Of course, the same rate of pay was maintained for the new service as they had obtained from the old: viz.: Minimum of 100 miles, or eight hours for the run in each direction. In order to successfully make the run, experiments proved that it would be necessary to relieve the men on westbound trips for one hour and thirty minutes after putting engine on ash track at Cumberland, in order to clean the fires, coal and water the engine, and allow men time for breakfast or lunch.

The Hagerstown division includes the line between Hagerstown and Cumberland, but the Cumberland terminal is included in the Elkins division, and it is therefore necessary that the two divisions work very closely together in order to avoid delay in despatching eastbound loaded trains from Cumberland on the return movement to the home terminal at Hagerstown. Another interesting feature was the fact that at no time was the tonnage or the number of cars reduced to enable good runs. All trains moved 100 cars when available with approximately 2,500 tons on the westward trip; these consisted of empties as a rule. On the eastward runs trains were given 100 loads and handled successfully trains of 7,200 tons. The average tonnage eastward, however, was between 6,600 and 6,700 tons.

These trains were all handled by Mallet locomotives and on the eastward trip were helped by the same type of locomotive from Williamsport into Hagerstown, a distance of seven miles.

The following figures show conclusively the reduction of hours on duty for the four months of 1919 as compared with the same months of 1918:

		Average time on duty			Average cars and tons handled: West		East.	
Month.	Year	West	East	Both ways	Cars	Tons	Cars	Tons
Turn-Around Service, 1919								
Feb.	1919	8′ 52″	9′ 58″	18′ 50″	91	2,695	100	6,823
March ..	1919	7′ 33″	8′ 23″	15′ 56″	94	2,592	99	6,739
April ...	1919	7′ 18″	7′ 40″	14′ 58″	88	2,557	100	6,687
May	1919	7′ 09″	7′ 41″	14′ 50″	92	2,487	99	6,781
Single Trains Operated 1918								
Feb.	1918	14′ 30″	14′ 35″	29′ 05″	78	2,182	92	6,435

4 mos...	1919	7′ 39″	8′ 21″	16′ 00″	91	2,572	99	6,755*
4 mos...	1918	13′ 16″	12′ 18″	25′ 34″	86	2,384	93	6,395†

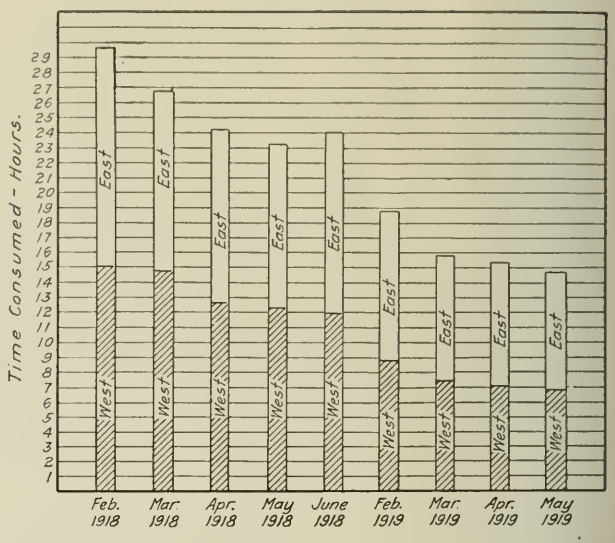
* Equals 10 miles per hour.
† Equals 6¼ miles per hour.

A number of trips were made under 12 hours and the best one was made by Conductor Wm. M. Manning and Engineer W. W. Waite with engine 921 on April 17. The time consumed was 5 hours and 45 minutes west and 5 hours and 30 minutes east making the round trip of 160 miles in 11 hours and 15 minutes with 101 loads—6,182 tons east. On March 26, Conductor T. Wilhide and Engineer G. E. Alsip with engine 918 made the round trip in 11 hours and 35 minutes with 100 empties 2,000 tons west, and 100 loads 6,780 tons east.

The trains were carefully inspected before leaving each terminal, particularly in regard to high and low couplers, truck frames and to guard against hot boxes. The conductor in charge of train reported promptly any car that became defective between terminals, stating cause of trouble and giving car inspector's number. This information was handled by the chief despatcher by telephone, and the proper officer gave the matter immediate attention.

Daily detail reports of each complete "turn-around" were made and sent to all officers interested, so that a careful study could be made of the delays and proper remedy applied to improve the operation.

Close co-operation existed between officers and men in engine and train service, and many suggestions were made by the employees which resulted in elimination of delays and improvement of the service. The average daily performance for April and May 1919 is unusual in handling tonnage trains. It will be noted that about 100 loads were moved east and 90 empties moved west on each train, and that the average time actually in service for handling approximately 190 cars on the west and eastbound legs of the turn-around and running 160 miles with a helper grade on the east end was less than 15 hours, including all delayed trains and relief crews used.



Performance of Tonnage Trains Between Hagerstown and Cumberland

The most reliable measuring stick today in efficiently handling tonnage freight trains is the number of gross ton miles moved per crew hour, and it will be noted that for April and May 1918 there was an average of 31,000 gross ton miles handled per crew hour compared with an average for April and May 1919 of 49,700, or an increase of 60 per cent in gross ton miles moved per crew hour, by the turn-around plan compared with the handling of traffic by single trains.

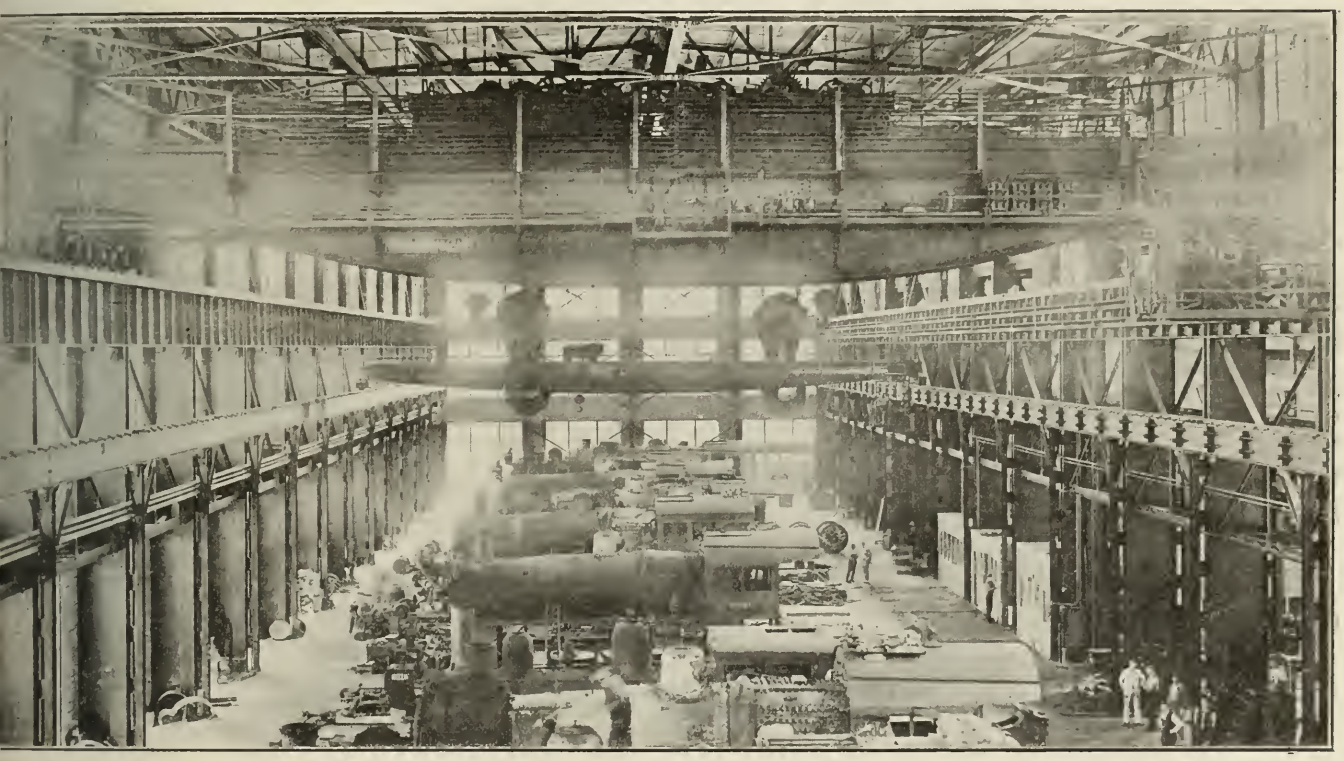
The Railway Fire Protection Association will hold its annual meeting at Chicago on October 21, 22 and 23. The executive committee of the association is now preparing the program for the meeting.

The Design of Modern Locomotive Repair Shops*

A Study of the Considerations Entering Into an Efficient Layout for the Maintenance of Engines

By Gaustave E. Lemmrich
Layout Engineer, the Austin Co., Cleveland, Ohio

A MODERN LOCOMOTIVE REPAIR SHOP should be a plant of well balance proportions, with conveniently arranged sub-departments, equipped with up-to-date ools and appliances, and capable of repairing the maximum umber of locomotives per year. On the other hand, the nancial condition of the railroads as a whole has largely revented the application of these ideas to recent locomotive epair shop construction. The need for additional shop



The Erecting Bay of a Modern Locomotive Shop

apacity is now pressing, and with financial relief in sight, ndoubtedly many improvements in this direction will be ndertaken.

In view of the cost of the U. S. standard locomotives rang- ng from about $36,000 for the light switching engines to ractically $100,000 for the heavy Mallets, it is evident that very day a locomotive is held out of service because of a ack of proper repair facilities creates a heavy charge. There re still in operation quite a number of antiquated locomo- ive repair shops which should gradually be replaced by odern facilities.

The Functions of Locomotive Shops

The functions of a locomotive shop may vary from com- paratively small repairing and some overhauling in an im- portant engine terminal to complete overhauling in a gen- ral locomotive repair shop, or to a locomotive manufacturing lant. Locomotive shops may be classified as follows:

1. A backshop at a very important engine terminal or at the sole terminal of a short or belt line, where general repair work, on a small scale, has to be included in its functions.
2. A locomotive repair shop for overhauling locomotives only.
3. A locomotive repair shop as a part of the general repair shop of a district on a large railroad or as the main shop of a small railroad.
4. A locomotive repair shop in connection with some new locomotive building.
5. A locomotive shop for new locomotive construction or a locomotive manufacturing plant.

The scope of the work to be performed is more or less different in each of these five classifications and the layout will need correspondingly different treatment to produce maximum efficiency in each case. However, the principles governing the design of shops of the third and fourth classes enumerated above are closely similar to those of the second class, with the exception of the layout, which, of course, is more complicated and demands careful study for a practical solution, while the number of locomotive manufacturing plants built by the railroads is so few as to be practically negligible. For this reason the discussion which follows will be confined to shops of the first two classes

The Back Shop

Generally speaking, a back shop is the result of greatly enlarging the machine shop of an engine terminal. The

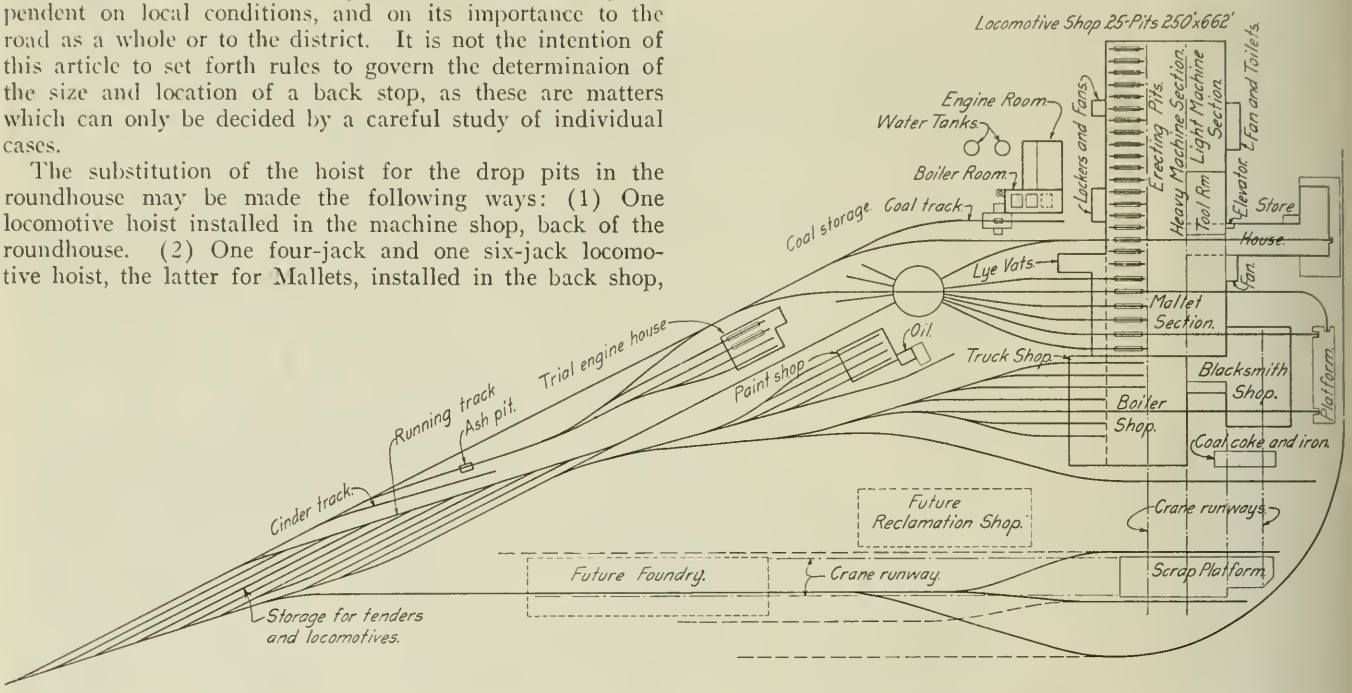
modern, heavy, costly power requires efficient attention and maximum employment. To accomplish this, modern tools, appliances and housing are required, together with an organization to make this investment effective. But to warrant all these costly improvements and above all the organization, it has to be proved and demonstrated fully that the location is in fact the right one. Undoubtedly, one of the most important factors affecting location is the expense due to overtime resulting from the Adamson law. A thorough investigation of this question will frequently show that great economy will result from an entire relocation of terminals and a revision of engine runs. One thing, however, is quite sure —the heavy power has put the drop pits out of date, and that means the installation of a locomotive hoist or a heavy crane in a back shop.

A back shop should be seriously considered for any important engine terminal with a preponderance of passenger traffic, or with some passenger runs of about 200 miles and for terminals at important junction points. The scope of repairing to be done at such a place, however, is largely dependent on local conditions, and on its importance to the road as a whole or to the district. It is not the intention of this article to set forth rules to govern the determinaion of the size and location of a back stop, as these are matters which can only be decided by a careful study of individual cases.

The substitution of the hoist for the drop pits in the roundhouse may be made the following ways: (1) One locomotive hoist installed in the machine shop, back of the roundhouse. (2) One four-jack and one six-jack locomotive hoist, the latter for Mallets, installed in the back shop, close to the roundhouse, or, better, it should be connected to the roundhouse by a passage way. In addition to the back shop the repair department of the terminal should embrace a complete working unit in buildings and equipment. Its magnitude, of course, will depend on the importance of the terminal, its location relative to other repair facilities, and, in fact, on many more or less deciding factors.

Generally, the machine shop is enlarged to embrace erecting, heavy and light machinery sections. The erecting bay section in small layouts is sometimes of the longitudinal type with one or two tracks, but the transverse type is more generally adopted. The shop's dimensions should be fixed according to its demand. In the transverse shop the pits may be spaced 22 ft. or 24 ft. apart, and the erecting aisle width may be 80 ft. or even 90 ft. wide. The height from the floor to the under side of the roof trusses may vary from 36 ft. to 58 ft., depending on the size of the cranes and importance of the terminal.

The size of the machine shop should correspond to its



Proposed Layout for Locomotive Repair Shop Facilities

with additional shop area and tools, which will result in an increased cost above that for the drop pits of about $40,000, or infixed charges, at 11 per cent of $4,400 per year. (3) One six-jack locomotive hoist for Mallets, one 100-ton crane serving four pits, a few heavy tools, and a full equipment of light tools installed in some additional shop area near the four pits. This will cost about $90,000 above that for the drop pits, or in fixed charges, at 11 per cent, or about $10,000 per year. Assuming an engine terminal with an average of 100 engines per day for about 300 days per year, or an average of 30,000 engine days per year, the second scheme will result in an additional fixed charge of 15 cents per engine per day, while scheme No. 3 will result in an additional fixed charge of 33 cents per engine per day. The selection of the scheme or more elaborate improvements should be considered as entirely dependent on existing local and other prevailing conditions.

Sometimes the back shop is operated in connection with a transfer table, but the need for this should be investigated in each case. In many instances a transfer table will prove a very desirable and satisfactory accessory, even though the shop is of the lift-over type. The shop should be erected

sphere in the terminal and its place in the railroad as a whole. Its present and future possibilities and the character of power to be repaired have an important bearing on the size of the machine shop. The possibilities of doing some boiler repairing should also be considered. Quite often this may be done at one end of the erecting shop. If separate buildings are required for the blacksmith shop, storehouse and office, their location and size should be studied in each individual case on broad lines as outlined before. The power house, however, should be a separate building, incorporating such features as were outlined in the article on engine terminals, published in the *Railway Age* of March 14, page 587.

The Locomotive Repair Shop

The locomotive repair shop referred to in the second classification above is intended for repairing locomotives only. In analyzing the scope of work done in a general repair shop, on locomotives, coaches and freight cars, it will frequently be found that a separate locomotive repair shop is more economical. In a general repair shop, the work in the three departments is so different in character that it requires sepa-

rate organizations, except perhaps where coach and car repairs may be combined so that separate buildings and possibly a different location may be more satisfactory from an operating standpoint.

In case separate shops are desirable they can be located at points most suited to each special case. The selection of a location is usually a question for each road to decide, and it should be based on operating requirements material and labor markets, suitable available sites, the amount of grading, its drainage possibilities and the cost of providing a sufficient water supply. On larger systems the tendency seems to be to divide the spheres of the shops into districts. The size of the shop depends on the number of engines tributary to it and the average number of engines to be repaired per year. A modern locomotive repair shop should be so laid out that it would have an average output of two locomotives per pit per month.

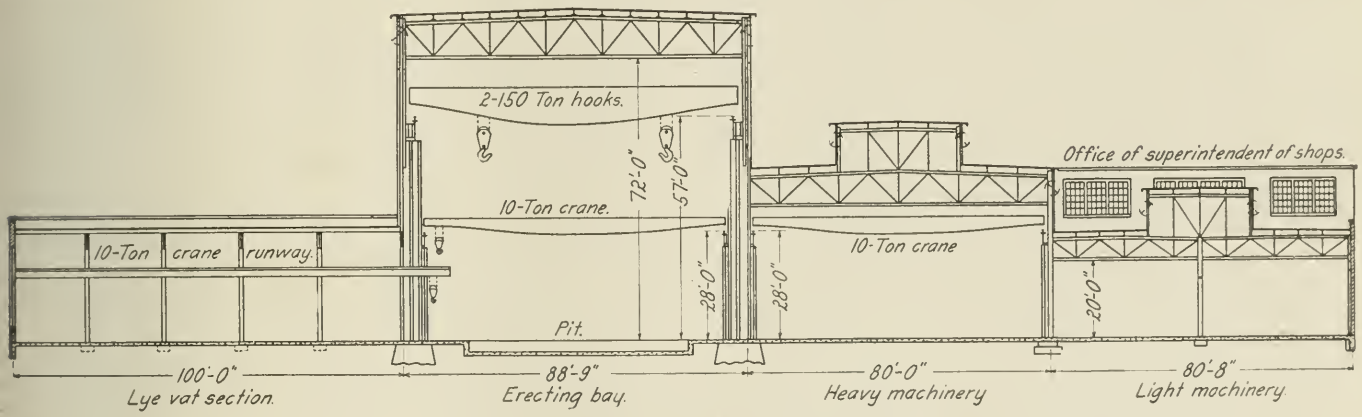
There is still some controversy regarding the relative merits of the longitudinal and transverse types of repair shops. In the first years of the modern locomotive shops, it was a mooted question as to which of these two types was best suited for a contemplated plant. In these years of infancy the longitudinal shop with its middle communicating track demonstrated its good points, and its flexibility, in capacity, but as soon as the crowding of locomotive repairs began, trouble arose. Cost statements, output, etc., of those days are of little value today, as the conditions and requirements have entirely changed.

It may be of historical interest to refer to statements by R. H. Soule in a series of articles in the *American Engineer*, 1903, which gave different longitudinal shops considerably larger outputs than a certain number of transverse shops. The comparisons were not based on exactly equal terms, and it looks as though a great share of the early favor for the longitudinal shop was largely due to its relatively greater machine shop area per engine as compared at that time with the transverse shop. This was at that stage in locomotive shop operation when the middle track was totally or partially kept open. The transverse shop had a width of the erecting bay proper of about 65 ft. and this quite often necessitated encroaching on the already limited area of machnie shop space. Moreover, sometimes the decision for a layout was influenced more by the preference of motive power officers on questions of organization, shape of available property, track arrangements, etc., than by the real advantage of the type of shop. Lately some railroads that were inclined to favor a longitudinal arrangement have prepared or built shops of the transverse type.

One of the most important features of the transverse shop is that the machine aisle, through its traveling cranes, is readily accessible to any locomotive on any pit. The smaller shops of this type can be operated with or without a transfer table, but in the larger shops the lift-over type is more generally applied. Where very large shops are desired, double erecting bays, one on each side of a central machine shop, have been installed. Plants of this design are special and require individual treatment. Each case should be treated on its own merits. A very close study in all its details of the operation of a modern locomotive shop, its organization and the location of assembling and dissembling pits, lye vats, tools, tool room, storage of wheels, etc., is of the utmost importance.

The width of the erecting aisle should not be less than 80 ft., and 90 ft. is preferable; this width now being adopted by some important lines in their latest shop layouts. The distance between columns has now been increased to 24 ft. and 25 ft. To utilize the end pits for the heavy crane service a distance of 30 ft. to 35 ft. is required, and this width would be quite useful at the stripping and assembling pits. The height from the floor to the under side of the truss should not be less than 58 ft. while a 71-ft. vertical clearance will permit simultaneous operation of both cranes, the heavy one carrying a locomotive. In a long shop this latter arrangement is of more importance than the extra cost involved.

For the heavy Mallets a width of 90 ft. may be somewhat scanty, but this can be overcome by locating a Mallet section with a lean-to at the front. It is a question whether this lean-to should not be extended for the whole length of the shop. A so-called covered bay may be well worth special study in some individual cases.



Cross Section Through Main Shop Building

Lean-tos, besides that required for the Mallets, are also suggested for the stripping and assembling sections and they should extend over one adjoining pit each side. The lye vats can be placed in the latter sections, and a crane extending into the erection bay should be installed in it. By this arrangement material to be cleaned in bulk can be transferred directly from the stripping pits into the lye vats.

In the erecting bay proper the capacity of the heavy crane has now been increased to carry two 125-ton hooks, and the next step will probably be to a crane with two 150-ton hooks. The type of general service crane used is commonly of 10 tons capacity.

The size of the machine shop is a controlling factor in the output of the entire plant. An area of 4,000 sq. ft. per pit of the erecting shop seems generally to be considered the correct relation under normal conditions, to produce a satisfactory working unit, and obtain maximum output. This area was suggested by G. W. Wildin in 1905, and is now adopted in some of the larger shops. However, there are many other points which might influence this question, such as the extent to which repair parts are manufactured for other smaller shops. As mentioned before, the question of

the size of the machine shop is of such magnitude that it demands careful study in each particular case.

The capacity of the cranes in the heavy machine shop section is generaly 10 tons. In many cases a layout will produce more satisfactory results if these crane runways are extended to the outside of the shop. The heating plant for the locomotive shops should be of the hot air type operated by a fan. A division in units may prove to be economical in first cost and operation.

By locating the boiler shop in a building adjoining the erecting shop, partitioned off but arranged with electrically-operated doors, the heavy crane runways in the erecting aisle may be extended into the main aisle of the boiler shop. This will permit the heavy crane to transfer boilers into this shop, and at the same time the noise incident to the boiler shop is confined. The machine shop crane may also be extended into an aisle of the boiler shop, and should be extended through this building to the boiler plate storage and to the scrap platform. This will greatly facilitate the handling of material, scrap, etc. In the first stages of operation it may also save a few cranes.

The truck shop can be located in the bay in front of the boiler shop proper. It should be provided with a crane of such capacity as will be in line with a possible future greatly increased length and load capacity of locomotive tenders. An 80-ft. width for the truck shop appears to be about right.

The blacksmith shop should be well lighted and ventilated and equipped with modern tools and appliances. The installation of an overhead traveling crane is perfectly feasible and desirable. The crane runways should extend outside of the shop to the iron storage sheds and to the scrap platform, thus increasing the sphere of its usefulness. The size of this department depends on the size and requirements of the rest of the plant, and each case will require special consideration.

The scrap platform should be located convenient to the blacksmith shop, and for the delivery of scrap from other shop departments. Its size, bins and other accessoreis depend on local conditions, and should have facilities for handling scrap.

The storehouse should be located convenient to the machine shop. In the tentative layout it is placed back of the tool room and directly connected to the machine shop. It should be of reinforced concrete construction with concrete retaining walls, concrete floors for the house, platforms, etc. It can be of two or three stories, according to local requirements, utilizing the upper floor for the offices. In the tentative layout the offices are located in the upper story, beside the machine shop. The private office of the superintendent of the shop can be in an upper story over the light machinery bay, which location will furnish a perfect view of the entire shop. The storehouse should be equipped with elevators, vaults, etc.

If the location of the plant is somewhat isolated, a restaurant for the employees on the top floor of the storehouse might be well worth serious consideration. Provisions for a lecture hall, apprentice room and a technical library will also be along modern lines. There are numerous repair parts which are usually stored outside. Suitable shelters for these should be provided wherever desirable, and they should be readily accessible for receiving and delivering materials.

The points regarding the design of a power house suggested in the article by the writer on the design of roundhouses in the *Railway Age* of March 14, page 587, apply here also, except that the power house should be designed on lines proportionate to its greatly increased importance. The track hopper should be housed, permitting the unloading of coal under all weather conditions. Coal storage should be provided for about two months supply. The coaling installation can be extended to include a coal pocket and sand storage facilities for engines requiring trial trips. Near the power house one or two water tanks of such capacity as the local requirements may demand can be provided, thus furnishing further facilities at this point for outgoing engines on trial trips.

In case the locomotive shop is not located at or near an engine terminal, these facilities should be provided for engines requiring trial trips after they have been repaired. In the accompanying sketch for a tentative layout of a locomotive plant, such an engine terminal is indicated. The engine house is rectangular, about 80 ft. by 110 ft. in plan, although this size can be changed as local conditions require. A small ash pit is also indicated on the plan which may be of the water type, but of such design as to correspond to its purpose. This pit may be operated by a locomotive crane, which, in a plant of this character, is a most useful appliance.

Sometimes it is found desirable to have a small paint shop in a separate building. The plant also requires an oil house of such proportions as local conditions require. It should be a fireproof structure, similar to the one outlined in the article on engine terminals referred to previously. The oil house might be combined with the oil room of the paint shop, if it could be so located as to make this arrangement feasible. This plan would also save an organization.

Unless the locomotive plant is situated at an engine terminal or near an existing wye, there should be at least a 100-ft. turntable. Studies and plans should also be prepared for a drainage and sewerage system, and also for water supply and fire protection, including a house for the fire department.

A good operating track layout is of great importance to an efficient locomotive repair plant. In the tentative layout, storage tracks for locomotives, tenders, materials, etc., are indicated.

It is very desirable to have an easy approach for automobiles, trucks and pedestrians to the storehouse and office. Driveways laid out for fire protection, without having to cross a net work of tracks, are also important. At some points, because of conditions, overhead bridges may be necessary for proper fire protection. The tentative layout represents practically an ideal condition in this respect.

The whole plant should be fenced and the main entrances for tracks, automobiles, employees, visitors, etc., should be controlled if possible at one point where a gateman's house should be provided. It is needless to say that the plant should be equipped with telephones, and wherever required, with telegraph service. The vacant grounds not used for storage should be treated in some pleasing way, suitable for recreation. Some inexpensive landscape gardening may be worth considering.

The layout should be so arranged that reasonable extensions are feasible, in line with good operating practice, and so they can be made without any serious alterations. Sufficient property should be secured at the start to make future extensions possible.

Features of the Accompanying Layout

The tentative layout of a locomotive shop accompanying this article is planned for handling the repair of 600 locomotives per year. The shop is based on 25 pits which should handle two engines per pit per month.

The main features of this layout are a plant of liberal proportions embracing all departments under one roof in order to reduce the travel and the handling of material between departments to a minimum. The departments are separated by partition walls, but arranged for continuous crane runways and crane service, which also extends to the outside material store yards and scrap platforms. This plant was laid out in one unit on the continuous mill plan to produce the maximum output.

The incoming engines drop their tenders on the storage tracks provided for that purpose, and then proceed over the turntable to the dissembling pits. The lye vats are located beside these, but in a lean-to, which can be closed by elec-

trically-operated doors to prevent the spread of bad odors to the erecting way. The machine shop is of such dimensions as to permit a liberal allowance of space for tools and at the same time provide reasonable storage room.

Approximate Estimate of Cost of a Locomotive Shop for Repairing 600 Locomotives Per Year

	Cost	Percentage of total cost
Grading, drainage and track	$120,000	4.6
Locomotive shop—		
Erecting bay $375,000		
Machine shop bays 235,000		
	610,000	23.4
Boiler shop	240,000	9.2
Blacksmith	75,000	2.9
Storehouse—		
65 ft. by 220 ft. } 2 stories	105,000	4.0
60 ft. by 80 ft. }		
Powerhouse, including thawout house, track hopper, coal and ash-handling piping, stack, etc	85 000	3.3
Paint shop, oil houses and engine terminal	60,000	2.3
Scrap platform, material sheds and outside crane runways	30,000	1.2
Water supply, fire protection	30,000	1.2
Misc. fencing, driveways, concrete walks, etc	20,000	0.8
Cranes	155,000	6.0
Total	$1,530,000	
Shop tools and equipment	$630,000	24.2
Power house	180,000	6.9
Cost of property, interest during construction, eng., etc.	260,000	10.0
Total	$1,070,000	
Grand total	$2,600,000	100.0

This estimate, which indicates the respective percentages of the main items, shows that an increase in the size of any particular building or facility would change the percentages only slightly, and at the same time might lead to improvements more fitting to local conditions which would result in increased output.

Comparative Proportions of Lemmerich Layout With That of Walter Berg*

	Lemmerich layout		Berg	Relative size of four departments in percentage of erecting bay		Four departments	
	Total sq. ft.	Sq. ft. per pit	Sq. ft. per pit	Lemmerich	Berg	Lemmerich	Berg
Erecting bay (90 ft. by 662.5 ft.)	59,625	2,385	1,750	100	100	23	25
Machine shop (160 ft. by 662 ft. 5 in.)	106,000	4,240	2,450	178	140	42	35
Boiler shop (250 ft. by 230 ft.)	57,500	2,300	1,575	96	90	22.5	22.5
Blacksmith	32,000	1,280	1,225	54	70	12.5	17.5
Total four depts.		10,205	7,000	428	400	100	100

Note.—Mr. Berg's blacksmith shop is designed for a general repair shop with car departments.

*Mr. Berg's figures are taken from his book, American Railway Shop Systems.

Scenes from Foreign Ports—On the Docks at Tampico, Mexico

Doings of the Railroad Administration

THE RAILROAD ADMINISTRATION has executed a compensation contract with the Delaware, Lackawanna & Western, providing for an annual rental of $15,749,476; also co-operative short line contracts with the Weatherford, Mineral Wells & Northwestern and the Denison & Pacific Suburban.

Six Months Deficit $296,000,000

Director General Hines has authorized the following regarding the June earnings:

"Detailed statistics will shortly become available of the operating results for the month of June of practically all the Class One railroads and large terminal companies in Federal operation. These results will indicate that the net operating income for the month of June, 1919, was about $51,800,000. After allowing for one-twelfth of the annual rental due the railroad companies whose railroads are covered by these statistics, the net loss to the government on account of these properties was for the month of June about $23,000,000.

"The corresponding net loss for these same properties by months of the present calendar year has been as follows:

Month	Net loss to the Government after allowing for one-twelfth of the annual rental
January	$57,782,557
February	65,430,850
March	64,881,856
April	48,757,057
May	36,249,334
June	23,000,000
Total	$296,101,654

"The falling off in freight business as compared with the years 1918 and 1917 continues to be an important factor. This is indicated by the following comparison of net ton miles per mile of road per day:

	Net ton miles per mile of road per day Revenue and non-revenue		
	1919	1918	1917
January	4,275	3,878	4,770
February	4,002	4,591	4,511
March	4,059	5,273	5,192
April	4,134	5,471	5,257
May	4,524	5,226	5,617
June	4,615	5,423	5,694
6 months ended June 30	4,266	4,975	5,081

"The month of June, 1919, shows a slight improvement over May, 1919, both with reference to the actual business handled and the relation to the corresponding month of 1917.

"The unfavorable showing also continues to be due in part to the fact that the increase in rates has been on a much lower percentage than the increases in wages and prices of materials."

Orders of Regional Directors

COOLING OF HOGS.—The Southwestern regional director, in order 225, gives instructions for drenching hogs in cars, especially during the present heavy movement.

Examination of Drinking Water.—Circular 232 of the Southwestern regional director promulgates a complaint of the Surgeon General that the Bureau of Public Health Service and also many of the state departments of health, making examinations of water supplies used by railroads for drinking and culinary purposes, are having difficulty in securing the co-operation of railroad officers; containers are not promptly returned.

Forty-ton Wooden Coal Cars.—The Southwestern regional director, in order 224, calling attention to light capacity coal cars now out of the service, says that wooden cars of 80,000 lb. or less capacity can be used for transporting company material.

Safety Chains on End Doors.—Order 227 of the Southwestern regional director promulgates a note from

the Safety Section of the Railroad Administration recommending that chains or some other suitable device be applied on automobile cars with end doors to prevent these doors from opening further outward than the line of the side of the car; and gives instructions to have cars in this region so equipped as rapidly as possible.

Oriental Oil.—Order 226, canceling order 212 of the Southwestern regional director, quotes rules for the handling of shipments of Oriental oil and the containers therefor. These quoted rules amplify instructions issued in order 212. Shipments of nut and bean oils have been made in barrels and other wooden containers which were not of sufficient strength to prevent leakage; all shipments should comply with Section 2, Rule 8, of the Western and Official Classifications.

Removal of Placards Regarding Troop Movements.—The Central Western Regional Director in a letter to Central Western railroads, dated August 1, quotes a letter from Edward Chambers, director of the Division of Traffic, giving authority to take down the placards regarding the heavy movement of returning soldiers during June and July.

Controlling the Traffic at Its Source*

By Walter D. Hines
Director General of Railroads.

THERE IS ONE specific feature of railroad operation which I think is particularly important to this part of the country, and I want to say a few words about it, and that is what the Railroad Administration has done and is trying to do in order to control the movement of traffic, so as to avoid as far as possible the serious congestion of traffic, such as has occurred in recent years. For several years past, before the federal operation of railroads began, in my capacity as an officer of the Santa Fe, I had occasion to make frequent trips through the west, and I took a number of those trips in the fall of the year, and for two or three years I was very much impressed with the fact that the railroads in the west were tremendously hampered in carrying on their business, and in giving adequate service to their part of the country, due to the fact that the railroads in the east were so congested that they could not accept shipments which were ready for delivery in the west and the railroads in the west could not get back the cars to supply their customers, because these cars were tied up under load in the east. I saw in the fall of 1916 train loads of cars that stood on the side-tracks in Missouri, and even in Kansas, because the eastern railroads could not accept this traffic at Chicago. The eastern railroads could not accept these trains of traffic at Chicago, because the consignees in every part of the east were unable to accept the traffic which had been loaded and shipped to the east and was being held for them and there was a tremendous congestion and a very serious paralysis of railroad transportation.

Last year the government took advantage of the opportunity of having a unified control of railroads and undertook to meet that situation by controlling the loading and movement of the traffic, and I believe the results accomplished were very gratifying to the country as a whole, although, no doubt, in some individual cases the shipper may have felt that he was being deprived of the right to ship his traffic when he wished to do so. Under the old system it was really haphazard as to when the traffic would be started in railroad channels, and as to what would happen to it after it started. When the shipper had a load which he wanted shipped it was put into a car and the car was turned into the stream of traffic regardless of the question whether or not that carload of traffic could be unloaded at the point of destination and the car released and sent back to the other road. It was very much the same situation that would exist if you had a stream and had it full of logs, on the point of getting jammed, and every man up the stream would put additional logs into the stream, at his own option, without regard to the general situation. Such a situation as a log jam would be the inevitable result and the movement of the logs would be slowed down until that log jam could be broken. We have undertaken to control that situation under the federal railroad administration by controlling the traffic at its source, by making a rule that the traffic shall not be loaded at the point of shipment until there is an assurance that it can be unloaded at destination. The result of that has kept the railroads free from this jamming of traffic and we have moved a great deal more traffic than could possibly be moved without that restriction. Therefore, the arrangement is eminently in the public interest, and I wanted to mention that fact, because I believe this summer and fall we are going to have an enormous movement of grain, and if that grain were to be loaded just at the option of the shipper—the individual shipper—without regard to the policy of taking care of it at destination, we would soon have an unparalleled condition of railroad congestion in this country which would slow down the movement of traffic to such an extent as would amount almost to a public disaster.

Our plan is to control that and to prevent the loading of traffic until we are sure it can be delivered at destination, and I am sure we will find this year, just as we did last year, that an observance of that policy is going to result in moving a vastly larger amount of traffic than otherwise could be moved and give to the individual shipper far better service than he could otherwise have, and while at times some individual shipper may feel it is an arbitrary disregard of his personal rights, we are going to be able to accommodate them much better and give far better service to the public, a greater quantity of traffic will be moved and the public interest greatly promoted.

*From an address before the Omaha Chamber of Commerce, Omaha, Neb., on June 10, 1919.

"Railroad Democracy"

A WEEKLY MAGAZINE entitled "Railroad Democracy," published by the Plumb Plan League in the interest of its campaign to have the government buy the railroads and turn them over to the employees to operate, made its appearance on July 22. It is published at the headquarters of the league in Washington and contains eight pages devoted to arguments for the adoption of the plan. The leading article is by Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers and president of the Plumb Plan League, entitled "The Labor Campaign Is On." In it he says, "Labor is starting the greatest enterprise in its history and it has called upon every man of its rank and file to rally in support of its railroad program." He calls on every worker to act as a missionary in getting public support for the plan and says that the plan will get this support because its interests are identical with the publics, although "it may, and doubtless will, take time and effort to make the country realize the fact." Then follows a series of questions and answers regarding the Plumb plan, some brief editorial paragraphs asserting that the railroads want a guaranty, two headed editorials and an article on "Co-operation vs. Competition," by B. M. Jewell, acting president of the Railway Employees' Department of the American Federation of Labor. In a "filler" item it is asserted that Congressman Rose of the 19th district in Pennsylvania has received more than 2,000 letters from his constituents in one city asking his support for the Plumb plan.

Hearing on Wage Demands of the Trainmen

W. G. Lee Admits "We Are Going the Wrong Way," but Insists on His Members "Getting Their Share"

WASHINGTON, D. C.

HEARINGS BEFORE THE Board of Railroad Wages and Working Conditions on the demand of the Brotherhood of Railroad Trainmen for another general increase in wages, which was followed before the hearing closed by a demand from the Switchmen's Union and a statement from the Order of Railroad Conductors that if the trainmen's demands were granted the conductors should have a corresponding increase, were concluded on July 31. In this case the board is not authorized to recommend increases but merely to make a report to the director general summarizing the facts.

The demand of the trainmen was submitted on July 1 and was followed by a resolution adopted by the brotherhood committee threatening a strike if the demands were not met by October 1. It provides for a minimum wage of $150 per month of 26 days for brakemen, flagmen and baggagemen, and of $200 for conductors, and increases in mileage rates ranging up to 48 per cent. It is estimated that the new schedule, if granted, would amount to an increase of about $100,000,000 a year for trainmen and about $40,000,000 a year for conductors. In its letter to the board the committee representing the brotherhood said:

"The second triennial convention of the Brotherhood of Railroad Trainmen, in session May 14 to June 4, 1919, inclusive, unanimously decided that the wage rates outlined and ordered effective in Supplement No. 16 to General Order No. 27 were entirely insufficient to meet the just claims of the men, and the convention provided for the creation of a special committee to meet and prepare rates and certain uniform conditions commensurate with the service requirements incident to the employment of the men represented by our brotherhood. The convention, composed of more than nine hundred delegates, declared that not less than $150 per month of 26 days should be conceded as a minimum living wage for any employee in the classes we represent.

"The special committee, composed of 16 general chairmen, 5 from the East, 5 from the West, 5 from the South, and the chairman of the Chicago Switching Association, with the grand lodge officers, met at Cleveland on June 23, and below will be found an outline of a proposed revision to Supplement No. 16 which, in the opinion of the special committee, should be conceded by the United States Railroad Administration to govern the employment of train and yardmen and to maintain proper standards of living.

"The Brotherhood of Railroad Trainmen disapproves the rates established for trainmen, yardmen and switchtenders by Supplement No. 16 to General Order No. 27, for the reason that under present economic conditions they are not commensurate for the service performed, nor sufficient to maintain proper standards of living, and that the rates and rules herein proposed are essentially necessary, if proper standards are to be maintained and thrifty and wholesome conditions are to exist among these classes and their families.

"The responsibilities, hazards, cost of uniforms, standard watches, living expenses (while away from home), physical examinations, age limit, rules, exposure to the climatic elements and the fact that their industrial life is shortened by some of these requirements, all tend to entitle these classes to more liberal wages and working conditions than have been covered in Supplement No. 16.

"We contend that in addition to being entitled to receive wages that properly compensate for services performed, to enable men to maintain American standards of living, they are entitled to receive sufficient compensation to enable them to set aside sufficient surplus each year to protect them when, on account of old age, or requirements of the railroads, they are no longer able to follow their employment."

The proposed rates for passenger service range from 3.85 cents to 4.55 cents per mile, $5.77 to $6.88 per day and $150 to $179 per month for flagmen, brakemen, baggagemen and assistant conductors, and the minimum rates for conductors are 5.13 cents per mile, $7.70 per day and $200 per month. One hundred and fifty miles or less is to constitute a day's work. Time and one-half is asked for overtime, including Sundays and holidays.

The rates in passenger service are based on the assumption that brakemen and flagmen should receive not less than 75 per cent of the conductor's rate and the baggagemen not less than 80 per cent, and in freight service on the assumption that the brakemen and flagmen should receive not less than 80 per cent of the conductor's rate.

In through freight service the rates proposed are 5.88 cents a mile, or $5.88 a day for flagmen and brakemen, and 7.35 cents or $7.35 a day for conductors for "valley" service, and 6.47 cents per mile for flagmen and brakemen, and 8.08 cents for conductors, for "mountain" service, which is defined as service on lines where the gradient on any part of the trip is 1.8 per cent or over.

In local or way freight service the proposed valley rates are 6.28 cents for brakemen and flagmen, and 7.85 cents for conductors, and the mountain rates are 6.91 cents for brakemen and flagmen, and 8.64 cents for conductors. One hundred miles or less, eight hours or less, is to constitute a day's work in all road service except passenger service and where, under mileage schedules, a more favorable condition exists. Numerous other rules and rates are also contained in the demand.

In presenting the demands W. G. Lee, president of the Brotherhood of Railroad Trainmen, began in the usual style of threatening protest that wages are too low to meet the cost of living and demanding the increase as the only alternative to a strike. Before the hearing was concluded, however, he changed his tone somewhat and adopted the attitude taken by W. S. Stone of the Brotherhood of Locomotive Engineers in his statement to the President that continued increases in wages do not afford relief, and he declared that instead of shouting across the table at each other all interests would accomplish more if they would get together to reduce the cost of living. But, he said, as long as present methods continue, he believed in "everybody getting his share as nearly as he can until the final upheaval comes."

A large part of the hearing was devoted to a technical discussion of the proposed rules, which the railroad managers objected to as arbitrary and as designed to give larger increases to the higher paid men than to the lower paid men whose needs were made the basis of the brotherhood argument. W. G. Lee was given a preliminary hearing before the board on July 3 and presented his demands which he had previously discussed with W. T. Tyler, director of operation, and W. S. Carter, director of labor. He dwelt especially on the increased living expenses of the men when away from home, saying that the men in road service in many instances spend one-fourth of their salary in this way. Mr. Lee told the board that his committee had voted that in the event they were not given a prompt hearing and a satisfactory adjustment he was authorized to "use the protective features of the

brotherhood." As the trainmen and conductors have usually presented joint demands he had wired A. B. Garretson of the Order of Railway Conductors on June 24, asking whether the conductors contemplated asking for any increase over the wages allowed in the director general's recent Supplement No. 16 to General Order 27, and Mr. Garretson had replied that they had not decided. Thereupon the B. R. T., which includes some 24,000 conductors, had gone ahead with its own plans.

Chairman A. O. Wharton of the board read from a letter from Director General Hines pointing out that the requests now arising for the consideration of new wage rates fall into two classes, which necessitate different treatment.

Such cases, Mr. Hines said, as the various contentions that rates heretofore granted have not made a proper equalization between different classes of employees, are naturally proper for the board to consider and make recommendations, but contentions that existing wages are lower than they ought to be in view of the present cost of living "raise an exceedingly grave question for the government." "That question," he said, "is whether, when railroad operations are now being conducted at a very heavy deficit, the government ought to enter upon a course which will bring about large additional increases in wages, and will inevitably bring about also very heavy increases in rates, and without question set in motion a new and dangerous cycle of increases in the cost of living, and which undoubtedly will involve in addition the development of great additional hostility toward the whole scheme of government operation of the railroads. This problem is so grave and difficult that I am not in a position, in advance of opportunity to consider it further, to delegate to the Board of Railroad Wages and Working Conditions the authority to make recommendations as to additional increases in wages predicated upon the claim that conditions have newly arisen which were not in existence at the time the board made its recommendations heretofore acted upon."

The hearing was resumed on July 21 after notices had been sent to the Order of Railway Conductors and the Switchmen's Union. At this meeting Chairman Wharton read another letter from Mr. Hines, dated July 19, which definitely disposed of the theory that wage questions should be handled by a bi-partisan board. Mr. Hines authorized the hearing on the demands of the brotherhood, but made it clear that the board had distinct functions as to two separate branches of the application. As to questions of equalization, Mr. Hines said, the functions of the board as established by General Order No. 27 were broad enough to admit of its entertaining the application for the purpose of determining whether Supplement No. 16 should be corrected to make proper equalization, but General Order No. 27 does not confer upon the board any jurisdiction to consider the broad subject of the proposition that existing wages are lower than they ought to be in view of the present cost of living. Without further light on that question, he said, he was not in a position to delegate to the board a new jurisdiction to deal with this great problem for any special class of railroad employees. "Nevertheless, the responsibility rests upon me to consider the facts at all times on all matters affecting the railroad employees to the end that I may take such action as may be just and reasonable. To aid me in discharging this general responsibility I shall be glad to have you hear anything that the Brotherhood of Railroad Trainmen may wish to present on this second branch of the subject and to make a report to me carefully summarizing the facts brought out. Upon the basis of that report I will rest under the responsibility of taking just and reasonable action to protect the fair interests of the employees concerned."

Mr. Lee began his general argument by saying that the government had promised that pre-war living conditions for employees would be maintained. "So far as we are concerned," he declared, "this has not been done." In four years, he said, the increases in wages for his members in passenger service had been as follows: Conductors $45 a month or 33.3 per cent; baggagemen, $42.30 or 51.2 per cent; brakemen, $43.50 or 56.5 per cent; in through freight service, conductors, 1.4 cents per mile, 35 per cent; brakemen, 1.41 cents or 52.8 per cent; flagmen, 1.4 cents or 52.8 per cent; in local freight service, conductors, 1.42 cents or 31.5 per cent; brakemen, 1.48 cents or 49.3 per cent; flagmen, 1.48 cents or 49.3 per cent; yard service, day foremen, $1.53 per day or 40.2 per cent; night foremen, $1.33 a day or 33.2 per cent; night helpers, $1.30 or 35.1 per cent. As against these increases, he said, the cost of living had increased 82 to 100 per cent.

"It is inconsistent for the Railroad Administration," Mr. Lee declared, "not to at least maintain the faith of the people in the expression of the government itself that the pre-war standards of living must be maintained and do what it properly should to maintain them by allowing wages at least that will permit men to do so. They are entitled to earn enough in six eight-hour days to permit them to live in comfort for seven 24-hour days, and this is the basis of our demand. We are asking for a wage that need not be pieced out with overtime."

After saying that the brotherhoods had surrendered their demand for time and one-half for overtime in 1916 in order to protect the public against a strike which he said would have been successful, Mr. Lee continued: "When the railroads were taken over by the government an agreement was entered into by the Administration, the railroads and the men that made a strike on the government operated roads impossible. They took their chances on being treated fairly by the Railroad Administration. They were so conspicuously good that their willingness to surrender their economic rights for the period of the war did not get even passing recognition from the public and not much more than that from the Railroad Administration. Now the war is over. We have kept faith with the government and the people and we have reaped the reward that comes to one who pulls his teeth and tries to remain a meat-eater.

"In the winning of the war the railroad transportation men must have had some part, and, having helped to win the war, we do not propose to pay the entire cost of it. We are going to have time and one-half for overtime; we are going to have decent living wages and we are going to get it in our own way, if we must, unless the Railroad Administration shows as much disposition to be fair to us as it has been to others.

"The railroads properly refer to their inadequate rates, but it is up to the Railroad Administration to determine what is needed to pay the going costs of railroad operation and to fix the rates to meet it. We have little patience with the Railroad Administration when it declares it will wait until later on when it can determine how much the rate increase ought to be, for the purpose of protecting the public against an increase in the cost of living.

"The packers, coal mine owners, shoe makers, clothing factories, builders, in fact, every business, put up no such weak plea of continued loss in earnings. They saw their chance to get the money and they took it, in most instances with the support of the government and without apology to the Railroad Administration or any of the rest of us. The spirit of the Railroad Administration in holding off the cost of living for everybody else at the expense of the railroad employees carries no appeal to us. The Railroad Administration is not paying its way. There is no argument on that. But it is up to the director general to quit begging the question. The deficit is due to insufficient revenue, from natural causes, or to administration failure. There is no business in this country that is asked by the public to operate at a loss except the railroads, which generally is their own fault. We don't agree with the director general's plan

of waiting to see what will turn up. It makes it too long between meals. It is up to the Railroad Administration to put the rates where they can pay wages and the going cost of operation."

When A. O. Wharton, chairman of the board, remarked that the trainmen were asking for rates of pay which would represent increases of from 112 to 121 per cent in four years as compared with an increase in living cost of about 85 per cent, Mr. Lee replied:

"We were predicting from everything surrounding us that the increase would extend into 1920, and if that is true the 112 per cent is not appalling. The Department of Labor says there was a 2 per cent increase in March, 1919, over February, 1919."

Mr. Wharton said the Department of Labor statistics also show a reduction in several of the months since the armistice was signed.

"How long will such wages remain equitable if the cost of living keeps going up?" asked J. J. Dermody, one of the labor representatives on the board.

"I can assure your board in advance that if the railroads stay under government control and the increased cost of living continues to go up you have not seen the last of me," replied Mr. Lee, "but we have predicted forward into 1920."

"I have no patience with the director general or the administration who say 'We are going to wait and see if something will not come along to take care of this terrible deficit, and continue to do business at a loss. We do not meet that in any store we patronize. There is something radically wrong in our policy that will permit the people controlling the commodities of life that a very large majority of people depend on to increase out of all proportion. Just so long as that continues you will add to the world's unrest."

Mr. Lee was followed by other officers of the organization, Val Fitzpatrick, L. L. McDowell, P. C. Bradley, J. L. Rowe, H. R. Sauer, James A. Farquharson, A. F. Whitney and James Murdock, who testified and were cross-examined regarding the detail schedule rules. One of the questions asked inspired Mr. Lee to take up the general proposition again when he declared that it would be better to go after the cost of living than to try to keep up with it by wage increases. Mr. Lee said:

"If these organizations and the different departments of the government would use the same effort and energy to assist in some manner to crush profiteering and to stop this constant increase in the cost of living, the cycle after cycle that is bound to come on, you would come nearer, I believe, to harmonizing the working people of this country than we are by shouting across the table at each other as we have been doing. All of us are to blame because we are exerting every effort to try to get more money for ourselves and better conditions and every day we must realize that the profiteers are taking double from the working men what is given to them. The trouble with the people on the (Capitol) Hill, with us, and with every corporation and with everybody is that we are exerting ourselves to get the dollar, while the working man is merely existing, and while the profiteer is piling up millions, and if a 25 per cent increase in freight and passenger rates is granted, it simply means 50 or 75 per cent increase on the commodities that the railroads are paid for hauling and that the consumer must buy.

"I will admit to you, gentlemen, that we are going the wrong way. I admit to you that it is time to call a halt, and I admit to you that until we get together to stop this there will be hell in this country, and it is nearer to-day than I ever knew it in my years of experience. You can talk about stopping this and satisfying the working people all you please; you can talk about high rates all you care to, but just let somebody drop a match today in this country of ours and it will be a sorry day for all of us. I am not blaming the administration a particle for declining as far as they can to give additional increases. I think I know what it means. But unless my vision is most terribly obscured, then there is something coming to us pretty soon in this country that we had better take notice of. We are dealing with this situation wrongly in trying to settle these things as we are and not getting after the people who are to blame.

"Surely some method can be devised that will call a halt and stop this, and if we were back on a pre-war basis we would be far better off. The war is over, but peace is not before us, or I am a poor prophet. We are nearer war to-day, I believe, than when the kaiser threw down the gauntlet.

"Our lawmakers are to blame in my opinion for this because the masses of the people would be behind them if they would attempt to correct it. Surely, there is power to correct it, but instead of that they are playing politics, as some of these labor organizations, I am sorry to say, are playing politics, and it is the same all down the line, but unless we get together as honest people should and say 'a fair day's pay for a fair day's work,' then we are going to meet a sorry condition."

"Then, you believe that the true fundamental principle is to increase the purchasing power of the dollar?" said W. E. Morse, one of the representatives of the railroad managers on the board.

"Absolutely so," replied Mr. Lee.

"Do you believe in doing that at the expense of any one certain class of employees?" asked Chairman Wharton.

"No," replied Mr. Lee. "But as long as present methods continue I believe in everybody getting his share as nearly as he can until the final upheaval comes."

"How can the increased cost of living be stopped or present prices reduced?" asked Mr. Dermody.

"I am not authorized either by my organization or by the public to say how it can be stopped," Mr. Lee said. "We are paying millions of dollars to the men on the Hill who are supposed to have all the brains in the world, and they are not wasting any time in doing it." Another increase to the working man means that those selling commodities will not only immediately take it away from him, but more. I am not a red card man, but I am coming close to it if this thing keeps up.

"Surely, if we can make laws that we cannot have a glass of beer in this country, we ought to be able to make a law that a man cannot make millions over night off the working man."

Mr. Dermody asked, "In your opinion, is the increased cost of living based on wage increases, or will the increased cost of living continue whether wages are increased or not?"

"My experience," replied Mr. Lee, is that the increased cost of living is not based on wage increases, but is boosted on the slightest intimation of a wage increase."

"I think the record will show," said Chairman Wharton, "that since 1914 approximately 75 per cent of the increased cost of living was prior to the announcement of the 25 per cent increase in freight rates, and after the rate increase there was a slight jump further in the cost of living, but after business had adjusted itself to the new conditions the increased cost of living has been steadily mounting and in greater proportion than it did during the period that the adjustment of the freight rate increase was in effect."

Mr. Lee continued: "The government or the director general should, regardless of any criticism, place the railroads while under government control on a paying basis, and if the 25 per cent rate increase will not take care of it, and we know it will not, we know that on some of the railroads prior to the war 25 per cent would hardly have put them on a living basis, the director general should come out boldly and say that if the railroad business is going to be operated on a living basis, with a fair return to the investor and good service to the public, and with living wages to the employee, then the increase in freight and passenger rates

may perhaps be, not 25 per cent, but 50 or 75 per cent before we get through. If we did that we would not have equalled many of the principal industries of the country. We believe the increased cost of living should stop. If it does not we will hardly get this proposed increase applied before we are back here again. Unless these employees are given a wage that will permit them to live under pre-war conditions there is going to be something worse happen on these railroads, so far as the public is concerned, than an increase in freight and passenger rates.

"This is the first time in my 25 years' connection as an officer of this brotherhood that I have ever gone before any tribunal and raised the question of living cost in connection with a request for an increase, because I thought that, like a boomerang, it would come back and hit us some time. But now it is the all-absorbing question.

"We are going to get a pre-war living condition in our own way if we must, but we would rather get it in a business-like and gentlemanly way, and we would rather that the director general should see the necessity for it and tell the public so."

F. F. Gaines, one of the railroad members of the board, said: "Taking all of the classes Mr. Lee represents, this request averages 16½ cents per hour. Sixteen and one-half cents for all railroad employees—and, we might as well acknowledge the fact that if one class is given an increase it has got to go around the circle—and for each cent an hour increase it is $50,000,000 a year, and a 16½-cent an hour increase would bring it up to $825,000,000 a year increase. Their present deficit, it has been figured, would require a 10 per cent increase in rates to cover. The other $825,000,000 would require 33 per cent additional, or right now, if this were granted, it would mean at least 43 per cent increase in rates to cover the deficit, and that does not take into consideration any punitive overtime for Sundays and holidays, and that does not cover the increased cost of coal, rails or anything else, only wages."

Mr. Morse asked what would be the attitude of the employees when living prices descend.

"That would be a question I would submit to the membership and answer by their vote," replied Mr. Lee. "Knowing human nature as I do, I have an idea what they would tell me they wanted."

A. F. Whitney, vice-president of the Brotherhood of Railroad Trainmen, said that it would be impossible to estimate the cost of the wage demand, because he claimed the effect of the punitive overtime rate would be to reduce overtime and Sunday and holiday work. "But," he said, "I imagine you would see committees of the Brotherhood of Railroad Trainmen asking for a reduction of pay about as soon as you would see the General Managers' Association going to the Interstate Commerce Commission for a reduction in rates."

Mr. Whitney asserted that the percentage of overtime had been materially reduced since the Adamson law went into effect, but it appeared later that he was speaking principally of yard service. Mr. Morse said that before the Adamson law the percentage of overtime to the gross payroll in road service was 10 to 12 per cent, whereas he had information that now it is 20 to 30 per cent.

"Since the roads were taken over by the government," Mr. Whitney said, "there has not been a very close check on overtime. There seems to have been a lack of supervision." Mr. Lee added that if there had been any laxity of discipline it was under the same officials as before.

"But in order to discipline the average train service employee you would have to have more evidence than is usually necessary to convict a man for life sentence to the penitentiary in civil law before the courts," retorted Mr. Morse.

"Generally speaking, I think what we would term good employees, whether it be federal manager or brakeman, have tried to give good service," said Mr. Lee, "but perhaps they may have been discouraged by too many higher-ups. I imagine that under government control an operating officer or federal manager today has his troubles as compared with private control. I imagine he is bound around with red tape more than he ever dreamed of being under private control."

L. E. Sheppard, president of the Order of Railway Conductors, entered a protest against the Brotherhood of Railroad Trainmen or any other organization except the Order of Railway Conductors, appearing before the board in an effort to legislate wages for conductors, saying his organization has an agreement with 95 per cent of the railroads. The grand lodge of the Order of Railway Conductors at its recent session, he said, refrained from taking any action on a wage increase on the advice of the officers. If additional rates and rules are given which appear to the conductors as reasonable and fair, he said, it is possible there will be no action on the part of the organization. He protested, however, against the ratio between the pay of the brakemen and that of the conductors proposed by the Brotherhood of Railroad Trainmen as being too high. The B. R. T. proposed that the brakemen's scale should be 75 per cent of that of the conductors, and proposed rates for the conductors, of whom about 24,000 are included in the membership of the B. R. T., based on that ratio. Mr. Sheppard said that the ratio should be 66 2/3 per cent and that whatever rate was awarded to brakemen, the conductors should receive a corresponding differential, and he submitted a scale of rates for conductors which he said would leave the ratio where it was fixed in the director general's latest wage order. Mr. Sheppard said that the conductors had received an increase of approximately 50 per cent, counting the reduction from a ten-hour to an eight-hour day as 20 per cent, and that as the increased cost of living was 85 per cent they still had 35 per cent coming to them. He asked to be excused from commenting on the proposed rules of the Brotherhood of Railroad Trainmen, but said that in order to get the extra 35 per cent the conductors should have $9 a day in passenger service, $8.10 in through freight service and $8.88 in local freight service. He trusted that the board would give the director general such recommendations or information that would lead him to see his way clear to do something for these men.

"I hope he will see his way clear," Mr. Sheppard said, "to cut the Gordian knot and throw the responsibility back on the government where it belongs. Let these men on the Hill, who are batting at toy balloons and fanning the air and who are running around like a cat chasing its tail and doing nothing else, let them get busy. If the government can fix wages, hours and the price of steel rails, it can fix the price of things which men must have to maintain life. God knows the people of this country are against government control. Almost everybody is against it. They tell us the railroads are going back in January, but mark this prediction: While I am not a prophet or a son of a prophet, they will not go back January 1. The party in power dares not put them back under these chaotic conditions. It may be the gentleman in the White House will give them back, but from my observation of and experience with that gentleman, he is too wise to do it.

"What have they done on the Hill? They have recessed for the summer with the whole world aflame. Like Nero, they are fiddling while Rome burns. There are too many fiddlers up on the Hill instead of statesmen."

Mr. Sheppard was not so vociferous as Mr. Lee for an advance in freight rates. "My position," he said, "is that the old idea that every time an increase in wages is given the freight rates should be put up is merely subterfuge. Freight rates ought to be based on equity and justice without regard to labor, but I firmly believe freight rates ought to go up considerably more."

Mr. Sheppard also suggested reducing the tonnage of freight trains as one way of reducing overtime. He said if the railroads were not so largely regulated by the necessity of showing a good tonnage many of the things the brotherhoods asked could be adjusted.

"It has been repeatedly stated in this hearing," said C. E. Lindsay, a member of the board, "that the only thing the men had to dispose of was their time, and they have evinced very little interest in accomplishing the results that are to be obtained by the railroads. What I think ought to be brought about would be some means by which they would become interested, from selfish and personal standpoints in accomplishing the results that must be obtained by the railroads, and that is in the moving of ton miles and passenger miles."

"Adopt the Plumb plan, and we will have it," replied Mr. Sheppard.

S. E. Heberling, president of the Switchmen's Union, presented a demand for the following rates east of the Rocky Mountains:

Night foremen, $8 a day; night helpers, $7.50; day foremen, $7.50; day helpers, $7. He also asked for a higher scale for the mountain district and time and one-half for overtime, Sundays and holidays.

Elisha Lee, federal manager of the Pennsylvania, as chairman of a special committee representing the regional directors, presented a statement in opposition to the demands. He said the B. R. T. proposition represents a revision of Supplement 16 only in part, as it contains requests not heretofore submitted. He also said the railroads have no knowledge of changed conditions to justify a closer relation between the wages of the brakemen, flagmen and baggagemen and those of the conductors. He took up in detail the various provisions of the demand. Regarding overtime, he said: "The principle of overtime for road service employees on the basis of time and one-half is wrong and inequitable, and cannot be fairly applied where the regulation of business and the traffic requirements of business are beyond the control of the employer. It should be remembered that road service provides a dual basis of pay, miles and hours, and cannot be considered in the same category or comparable with other classes of service or labor. In road service it is quite evident that in many cases neither the management nor the men can prevent overtime." Regarding the demand for a higher rate for Sundays and holidays, he quoted from a statement by the director general in a wage order: "In the nature of things it is unjustifiable to impose such punishment in respect of work which cannot be avoided."

A rule for overtime for Sundays and holidays, Mr. Lee said, could have no other effect than simply to increase the compensation of the men, and he pointed out that while they demand a guarantee of 26 days a month, they could not work 26 days a month without working on Sunday or a holiday some of the time. He also pointed out that many of them now have 10 to 12 layover days a month, and he gave several examples to show that such a rule would merely result in large increases in pay to some of the men now receiving high wages. For example, on the Erie between Jersey City and Salamanca, a run of 413 miles, he said the brakemen work two Sundays and 18 week days a month, and would be increased under the proposed rule from $219.72 to $333.91. On a Baltimore & Ohio train between Baltimore and Frederick, Md., Mr. Lee said, the crew leaves Baltimore at 5.05 P. M., and gets back at 8.55 A. M. The elapsed time is 15 hours and 50 minutes, but the actual time on duty is 8 hours and 25 minutes. The conductor now earns $312.45 a month, and under the proposed rule would get $500 a month.

Mr. Lee also pointed out that mountain rates were established to meet frontier conditions in the west, and in recognition of the difficult braking conditions in the old days of hand brakes. Now the trains are equipped with power brakes, and living conditions in the west are as good as in other places, so there is no reason for the higher rates and certainly not for their extension to other parts of the country, but the proposed rule would require mountain rates to be paid on every trip which contained any grade, no matter how short, over 1.8 per cent. This would apply the higher rates, he said, to a very large percentage of the divisions on nearly all roads in the United States.

As to the general question of an increase in wages, Mr. Lee said that Supplement 16 represented an equalization with other classes of employees, and if any one class is given more it will undoubtedly be necessary to bring the other classes of employees up in proportion. "We understand," he said, "that the foundation of this request is predicated on the statement of one member of the War Labor Board (in which we understand the balance of the War Labor Board does not concur) that the minimum wage should be $150 per month. This statement has been public information for many months, and so far as we have heard there has been nothing presented either to substantiate that statement or to indicate it is other than the opinion of one man. Hundreds of thousands of railroad employees have wages considerably under $150, many of whom have more onerous working conditions than many of the men here represented, whose units per day are not an index to their actual earnings per month. The mileage factor fixes the pay of more than 50 per cent and results in earning approximating if not in excess of $150. You are already informed as to the financial situation of the Railroad Administration, so it does not seem necessary to comment thereon. It is a very serious question in my mind whether during this period of reconstruction we can all go back to pre-war conditions."

At the conclusion of the hearing Mr. Wharton put into the record a statement of the Bureau of Labor Statistics estimating the increased cost of living in April, 1919, as compared with the average for 1913, which showed an increase in wholesale prices of 111 per cent, on which basis the present comparative purchasing power of the dollar would be 47.4 cents.

Chicago Suburban Lines Demonstrate Efficiency

Strike of Street and Elevated Railway Employees Results in Taxing Terminal Organization and Equipment

THE STRIKE OF CHICAGO'S street and elevated railway employees, which began on Tuesday morning, July 29, and lasted until Saturday, August 2, presented an opportunity to the steam railroads entering Chicago and to operating officers in the Chicago district to show the efficiency with which they could handle an enormous overload of traffic; and the way in which the business was handled cannot be praised too highly.

Early Tuesday morning the 15,000 employees of the street railway and elevated lines, after negotiations with their employers, were stampeded by a radical element into initiating a strike. Although negotiations had been under way for some time the action on the part of the men was wholly unexpected by the public, and threw upon the steam lines entering Chicago's business district the task of providing transportation for the hundreds of thousands of workers who ordinarily depend upon the street railway and elevated lines for transportation daily to and from their work.

When the controversy over the question of wages first arose between the street and elevated railway line's employees and officers of the line, the steam railroads operating suburban service into Chicago immediately began making preparations for any eventuality which might arise. Preparations were made particularly by the Chicago & North Western and the Illinois Central, the two roads upon which the burden would be heaviest because of the fact that they traverse heavily populated residential districts and handle a large suburban business at all times. When it is considered that until Monday night the negotiations between the two factions were to all appearances progressing satisfactorily and a strike did not seem imminent, the preparedness demonstrated by the railways is all the more commendable. The cisis came on Monday night when a meeting of the car men was stampeded by a radical element and the car men were forced into the declaration of a strike beginning the following morning. The next morning not a street car or an elevated train was running in Chicago.

Officials of the various steam roads upon which the burden would be thrown were immediately notified and early in the morning the final arrangements were made for the handling of the increased traffic. The actual results accomplished by each of these roads may best be told in the tentative records compiled at the end of the four-day period.

The Chicago & North Western during this four-day period operated 1,555 trains carrying approximately 704,480 passengers as compared with a daily average under ordinary circumstances of 100 trains carrying 40,000 people, or 400 trains carrying 160,000 people during an average four-day period. In other words, this road operated 300 extra trains per day, carrying approximately 140,000 passengers in addition to its regular traffic. Stated another way, this road operated 1,200 extra trains in four days, carrying approximately 600,000 extra passengers.

The mere increase in the number of trains operated and in the number of passengers carried does not adequately tell the story. With this increase in trains and in passengers carried there were no accidents reported on the Chicago & North Western lines in the district served by the suburban trains. Extra ticket booths to the number of 15 were erected at the Chicago & North Western terminal in order to accommodate the crowd, and all of the passengers were required to purchase tickets before entering trains. Several tracks were assigned to each route from the downtown terminal and large signs were placed over the train gates entering these tracks. The crowds after purchasing their tickets were assembled on the station concourse in front of the gates for the different routes and were allowed to enter the platform as soon as the trains were placed in position.

In addition, extra ticket booths were established at practically all of the suburban stations where heavy traffic was

Crowds Waiting for Trains at North Western Terminal

likely to originate, and practically the only difficulty encountered in handling the crowds on the North Western was in the handling of these additional trains. This difficulty was overcome by eliminating the regular suburban schedules and substituting therefor a shuttle service. In consequence, the large number of suburban trains ran between, into and out of the terminals as the traffic permitted and at no time was it necessary to hold trains after they were loaded to capacity. On July 30, the second day of the strike, the North Western operated 402 trains carrying 175,993 passengers.

Special Ticket Booths Outside the Chicago & North Western Station

On the third day of the strike, July 31, the North Western operated 388 trains carrying 176,130 passengers. On August 1, the fourth and last day, 393 trains were operated carrying 184,830 passengers.

Much of the credit for the expeditious and satisfactory handling of the crowds on the North Western is due to S. G. Strickland, federal manager, who personally assumed im-

...diate direction of the suburban service during the four-...y period.

The Illinois Central, which with the Chicago & North ...estern normally carries the bulk of the suburban traffic, ...ried during this four-day period approximately 800,000 ...sengers as compared with the normal travel during that ...iod of approximately 200,000. As in the case of the ...rth Western, plans were perfected by the Illinois Central for handling the increased travel on short notice when the strike of the car men became imminent. In fact, Illinois Central officials were watching the situation so closely that trains began operating within 15 min. of the time the strike was called, and by 5 a. m. on the first morning of the strike a 10-min. service was being conducted into Randolph street, the suburban terminal of the road. During the peak load in the morning and evening rush hours trains were run into and out of the Randolph street station every minute. At the Van Buren and Randolph street stations inbound passengers were discharged during the morning rush hours at the rate of approximately 500 each minute and the same number of outgoing passengers were handled at these stations during the evening rush hours. Considering the increased traffic handled on such short notice, the service was particularly free of congestion and accorded a free movement of passengers at all times, there being no delays, no accidents and no personal injuries recorded. The extra employees which were delegated to handle this increased traffic were given dining and sleeping car facilities throughout the entire period of

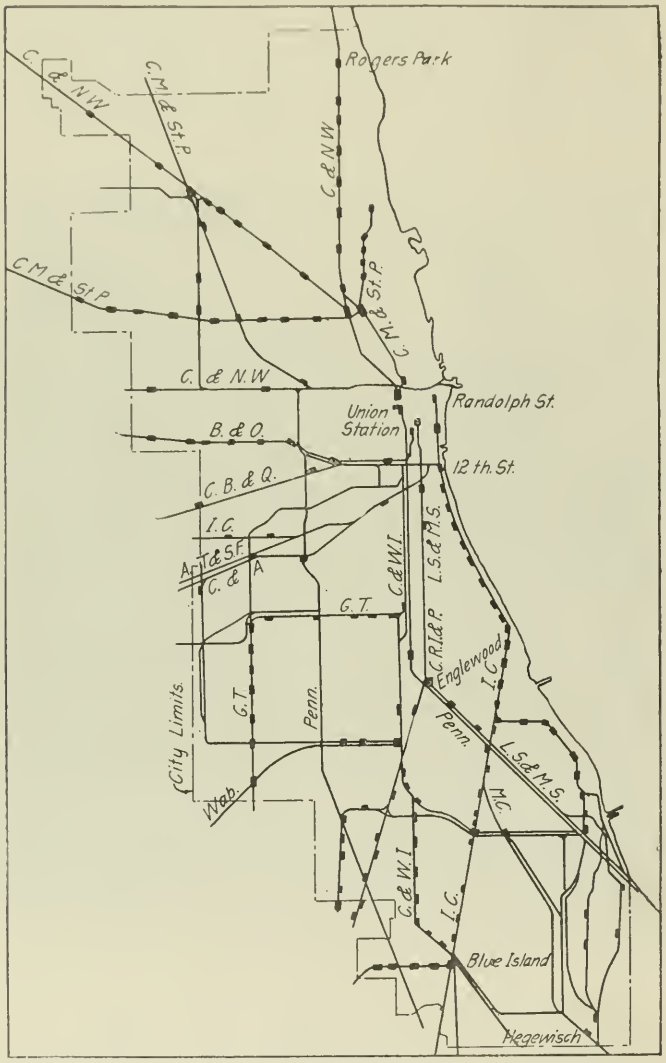
Reserved Seats on the Tender of an Illinois Central Engine

service, and because of this fact no extra employees were used to handle the increased traffic.

The Chicago, Rock Island and Pacific under ordinary conditions has a heavy suburban traffic, running 75 trains a day and carrying from 17,000 to 18,000 passengers. During this four-day period there were put in service approximately ten extra trains a day, which, with the regular trains, handled between 30,000 and 35,000 passengers, or an increase of 12,000 to 13,000 over the regular traffic. In other words, the Rock Island during the strike period carried 120,000 to 140,000 passengers on 340 trains as compared with an average traffic of 68,000 to 72,000 passengers carried on 300 trains. Additional ticket booths were installed at the La Salle street station, and preparations were made to handle the traffic expeditiously.

The Chicago, Milwaukee & St. Paul under ordinary conditions does a limited suburban business, although its lines traverse heavily populated districts which are ordinarily

served by the street and elevated railways. Its regular schedule consists of six suburban trains which carry on an average 5,000 passengers per day. During the four days of the strike the number of trains daily was increased by 12, making a total of 18. These trains handled approximately 30,000 additional passengers during each day of the four days, making a record for the four-day period of 72 trains handling 140,000 passengers. Service on the Evanston line of this road, which has been abandoned for several years, was resumed, and during the morning and evening rush hours service was rendered as far north as Buena Park, a distance of approximately 6 miles. In addition service was resumed on this company's line to Dunning, serving portions



Distribution of Suburban Stations on Steam Roads in Chicago

of the city normally served only by the street and elevated lines.

The Chicago & Western Indiana, which normally runs 7 suburban trains a day which carry a total of approximately 3,000 passengers, increased its trains by 30 each day during the strike, making a total of 37 trains per day which carried daily a total of approximately 23,000 passengers per day.

Conditions on the Chicago, Burlington & Quincy approximately duplicate conditions on the other lines handling a suburban traffic from Chicago, but its lines do not traverse a section of the city that affords much suburban business. The number of trains on this line were increased from the normal number of 70 by the addition of 5 trains, beside an increase in the number of cars per train, and the number of passengers handled was increased from the average daily number of 14,000 by the addition of approximately 7,000 a day.

One of the difficulties encountered in the operation of this additional suburban service was in the collecting of tickets and fares. This difficulty was overcome by requiring passengers to buy trip or commutation tickets before entering the trains and taking up these tickets as the passengers entered the train platform. At the suburban stations on many of the roads the station platforms were fenced off and the tickets purchased were collected or punched as the passengers passed through to the station platform.

The experience these railroads obtained during a similar situation in June, 1915, enabled them to avoid many of the difficulties encountered at that time. The congestion was further relieved by the fact that a greater number of street vehicles were pressed into service than in 1915 and because the public did not commence to use the steam roads to the fullest extent until the second day of the strike.

Hydrogen Gas for Cutting and Welding

WHILE ACETYLENE in combination with oxygen is widely used for welding and cutting, there are certain disadvantages in the process due to the explosive character of the acetylene. In order to eliminate the disadvantages incident to the use of acetylene, the Carbo-Hydrogen Company of America, Pittsburgh, Pa., has developed a gas known as carbo-hydrogen with the view to furnishing an efficient and safe medium for use in cutting and certain types of welding.

Carbo-hydrogen is a product of the destructive distillation of suitable hydro-carbons and is a general analysis of 85 per cent hydrogen, the balance being light hydro-carbons. It is a fixed gas, permanent under all weather conditions, and does not solidify or leave any residue in the tank. Being a combustible gas and not an explosive, it is easy to use and safer than acetylene. No air or free oxygen is mixed with the gas in the process of manufacture.

Gases having a high B. t. u. value are necessarily slow in combustion and require a longer time to deliver a given amount of heat and a larger expenditure of oxygen than gases having a higher rate of combustion. For this reason, a smaller portion of oxygen is needed for a given amount of work where carbo-hydrogen is used. The gas maintains a very high rate of combustion and ignition consequently generates an intense heat.

In cutting ferrous metals gases having a high carbon content change the character of the metal at the cut hardening it so that machining or canting is exceedingly difficult. It is claimed that metal cut by the carbo-hydrogen process on the other hand retains soft surfaces that can readily be worked, while the absence of slag increases the speed of cutting and produces a smoother surface.

The use of carbo-hydrogen for heavy welding on steel parts is not advocated by the manufacturers, although the process is said to be superior to the oxy-acetylene flame for welding softer metals.

Among the advantages of carbo-hydrogen may be mentioned the absence of dangerous and poisonous gases in the products of combustion which often prove injurious to operators being composed largely of pure hydrogen, carbo-hydrogen burned almost entirely to water, while the combustion of acetylene and oxygen produces at least 50 per cent carbon monoxide. Carbo-hydrogen compressed to 1,800 lb. per sq. in. is supplied in drawn steel cylinders. The working pressure varies from 5 to 19 lbs. per sq. in.

Plumb Plan Given Hearing Before House Committee

Congressmen Not in Receptive Mood and Resent Threatening Attitude. Stone, Morrison and Plumb Testify

WASHINGTON, D. C.

THE PLUMB PLAN for having the government take the railroads from the "bourgeois," paying them the number of dollars representing their original investment, but in the depreciated dollars of today, and turning their operation over to a corporation not for the benefit of the "proletariat," but only of that section of the proletariat employed on the railroads, was given a hearing before the House committee on interstate commerce on Wednesday and Thursday, during which it encountered some rude jolts at the hands of the committee members.

Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, and president of the Plumb Plan League, and Frank E. Morrison, secretary of the American Federation of Labor, opened the presentation, and they were to be followed by Glenn E. Plumb, the author of the plan, and A. B. Garretson, until recently president of the Order of Railway Conductors. Mr. Stone and Mr. Morrison made very brief statements, but they did not leave the witness stand until they had been questioned at length by nearly every member of the committee, most of whom made it very plain that they were neither in sympathy with the ideas represented by the plan nor with the threatening manner in which it has been presented to the public.

Both Mr. Morrison and Mr. Stone said that the cost of living constituted the real problem; that increased wages would afford only temporary relief, and that the Plumb plan would afford no immediate relief along that line, but they had no concrete suggestions to offer for a reduction of the cost of living, and Mr. Morrison insisted that an increase in wages would be necessary in any event while the cost of living was being reduced, although he admitted its effect would probably be to increase the cost of living. Mr. Stone denied that the labor organizations propose to strike for the purpose of securing the adoption of the Plumb plan, but said there might be some strikes to "secure relief from the high cost of living."

Mr. Plumb Speaks on Living Costs

Before discussing the principles underlying the Sims bill Mr. Plumb spoke on behalf of labor as holders of Liberty bonds. "Twenty-two million citizens out of patriotism contributed," he said, "20 billion dollars to aid in the prosecution of the war. On this contribution, they are assured a return of only 3½ to 4½ per cent. If they now see the Government guaranteeing 6 per cent returns on $20,000,000,000 of railroad securities, of which at least half is fictitious, if the Interstate Commerce Commission's figures on five small roads are to be taken as characteristic of the entire industry, representing no service to the public, thereby depreciating their securities, for which they paid par value, by 50 per cent, can you expect them to maintain that patriotic belief in their country?

"Would you not believe that such action merely transferred from the market value of war bonds to the market value of railroad securities, six or seven billion dollars?

"The representatives of railway securities, the railway security holders, and the United States Chamber of Commerce appearing before you have asserted that they speak for half of the citizens of the United States as being interested in the value in maintaining the credit of railway securities. By what basis they reach this conclusion I cannot tell. But if 50 million people are indirectly affected by the market value of 20 billion of railway securities held by 200,000 individuals, how many people are affected by the market value of 20 billions of Government bonds held by 22 million individual subscribers? And to what extent are the holders of life insurance policies and depositors in savings banks interested in seeing that the assets of those institutions are not damaged by shrinkage in the market of Government bonds which they hold?

"If the value of a labor investment be calculated by the return which it receives, in the same manner in which a capital investment is determined, then that labor investment measured financially approximates a value of 50 billion dollars. In addition to that at least three million citizens appear here as capitalists owning a large proportion of the national debt and seek to have their interests as such owners likewise considered and justly protected.

"This vast army of producers are not divided. They present no conflicting plans, no diverse theories for the solution of this problem, but appear before you a united force profoundly convinced of the economic soundness of the principles upon which their plan is built, imbued with the crusaders' spirit to support the principles upon which their faith is founded.

"The progress of recent events has brought us face to face with a crisis of tremendous importance. The constantly rising cost of commodities to the consumer has far outstripped the purchasing power of the consumer's wage. This difference between earning power and spending power of the great mass of the workers has compelled a corresponding lowering of the standard of existence. This is an onfluence entirely hostile to the interests of humanity, and to be resisted by all the powers of mankind. Human nature cannot do otherwise than oppose the universal lowering of the standard of living. To avoid the deprivations which loss of purchasing power necessarily inflicts, the first natural reaction is the demand for increased purchasing power through demanded raises in wages, yet, this demand is acknowledged to be futile, because such increase in cost of production is immediately more than reflected in the increased cost of commodities.

"In answer to this first reaction, demand for increased wages, we now find a hundred thousand railway employees refusing longer to render their services for these constantly diminishing returns. This manifestation of revolt is but symptomatic of the entire industrial situation. It is not unrest that confronts us, it is revolt because of industrial conditions no longer to be borne.

"We already number in the supporters of labor's plan approximately six million adult producers—about one-sixth of the productive man-power of the United States, perhaps the same proportion of the political power of the nation, and a financial power which few comprehend. Those employed on the railways alone represented in this movement, receive as their annual compensation for the investment of their life and labor upwards of 2½ billion dollars a year,—two and a half times the amount of compensation paid for the use of the money invested in railways.

"It is claimed by those who represent the financial interests before this committee that they have investments of approximately 20 billion dollars in this industry. Unless they receive a return of a billion dollars a year, how shall this investment of money be compared with that investment of life and labor that receives a return of 2½ billion dollars a year? By what standard can they be compared which gives

to the investment of life a value less than that allotted to the investment of dollars? By what reason can the interest of things exceed in value the interest of human beings? He who speaks of the interests of property as consisting of rights which the property possesses disassociated from the human right of ownership, reasons falsely.

"All citizens are consumers. Most citizens are producers. Those who consume and do not produce are either beggars or capitalists. Many who produce are also capitalists. I have already shown that 1,700,000 of the wage-earners on the railroads, producers, are capitalists in that they hold Government securities. Many of those who hold investments in the railroads, also, serve the industry in some capacity. So that these three interests are commingled in the great body of citizens. Likewise, all producers are consumers; and again all consumers are producers, except those who live by charity or those who live on interest alone. All of organized labor are consumers, and it is the failure of producers in industry to recognize their interest as consumers that has made the efforts of organized labor ineffectual in securing for its membership a greater share of the profits of the industries in which they are employed.

"The owners of the capital alone have benefited. Wages have been increased, but all commodities which the wage-earners must purchase have been more than correspondingly increased in price by the profit demanded by the owner of capital upon the increased cost of production. Under such a system earning power can never overtake spending necessity. But the necessity of purchase always outstrips the power of buying exactly by the profit demanded on the increased purchasing power, and to the extent of the profit compounded by each intermediate handling and transportation of the commodity. This constantly growing difference between necessity for buying and ability to pay must be compensated by a lowering of the level of existence. In no other way can the sheet be balanced, and mankind not only here but the world over refuses to accept that balance sheet.

"Organized labor now realizes that further advances in wages at the expense of a cost of living exceeding that of values are wholly futile. Equally, organized labor realizes that to correct this vicious system the interests of both producers and consumers must be protected; that the great increase in the productive power of human effort should be reflected equally in increased earning power of those who produce and the decreased cost of the commodity, so reduced.

"In order to affect the price of all commodities by advances in wages to those who produce, then, it would be necessary to complete the entire cycle of industrial production. An advance to the shoemakers is reflected only in the advanced price of shoes. It does not affect any other commodity.

"But with transportation the situation is quite otherwise. The cost in transportation is reflected in the price of all commodities, whether transported or not. The consumer pays the freight on everything that he consumes, although it may be produced next door, and may never have passed over any line of transportation. Heretofore railroad rates have not been advanced universally. A commodity rate is advanced here, a classification rate advanced there, and only those commodities affected by such local advances reflect the increased cost in their price. But with the coming of the war a 15 per cent advance was allowed by the Interstate Commerce Commission, covering all rates and all commodities, and reflected the next day in the purchase price of everything by which we live. Later the director general again advanced these rates 25 per cent. This advance was again immediately reflected in the price of commodities, and the cost of living. The wages earned by those who produce constitutes the great bulk of the purchasing fund of this nation. When the price of all commodities is advanced due to an increased cost of transportation and the wage fund is not correspondingly increased, the difference is exactly reflected by a restriction in the amount of commodities consumed. This soon reacts on the producing agencies. They provide a restricted output to correspond with the restricted demand. This, again, restricts the wage or purchasing fund, and the cycle of restriction endlessly repeats itself, until we find production stifled, industry in stagnation, unemployment and inevitable political and social revolution.

"Reverse this vicious system. Reduce rates. The costs of all commodities are then reduced accordingly. The purchasing power of the wage fund is then correspondingly expanded. A greater volume of commodities is consumed. The demand on industry is increased. There follows a wider field of employment, which, in turn, increases the wage or purchasing fund of the community. This must inevitably follow, unless the savings of the cost of transportation, instead of being reflected in the price of commodities, are appropriated to swell the volume of profits of those who control capital. Insure the savings effected by a reduction in rates to the consumer, and you will have turned the tide that now threatens to overwhelm us."

Testimony of Warren S. Stone

Declaring that "American democracy is controlled by an autocracy in industry and that America must become the home of industrial freedom," Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers and president of the Plum Plan League, argued that there could be no solution of the industrial problem and no lowering of the cost of living as long as consumers had to pay extortionate profits on their own earnings in purchasing the necessaries of life. Labor's belief in the Sims bill, he said, was profound. "In this plan," he concluded, "we raise the banner of democracy in control of industry, we advance to a new crusade with the faith of the Pilgrims, with the convictions of the framers of the Constitution and with the hope of America for economic independence." His statement was in part as follows:

"At the request of these organizations the Sims bill is now before you. I speak as the voice of these two million men, delegated by them to announce to this committee and to the people of this country that they are supporting this measure with all the strength and all the unity of purpose that can move so large a body of citizens. Joined with us is the American Federation of Labor, adding three million and a half men to that body of railway employees who instituted this movement.

"In the industrial development of this country great organizations of capital first appeared as employers. Individual workers, following the example set by capital, organized as employees. Their purpose was to secure better working conditions and a larger measure of return for their labors. The full force of capitalistic organizations has been set against labor to hold and to keep all the profits of industry. The strength of the labor unions has been exerted to wrest from capital some share of the profits for the wage-earners.

"This has been a perpetual struggle by the workers to maintain a tolerable standard of existence; on the part of capital to amass greater profits. At times both sides could ignore the needs of the public. But now the very growth of the labor organizations has brought into their ranks a great mass of the consumers. The large number of the wage-earners now constitute a large percentage of the people.

"For whatever the worker receives in wages he must spend for the necessaries of life. In addition, he is always compelled to pay to the employer an excessive profit on his own wages. The cost of his living is determined by the sum he earns plus the profit he is charged on his own labor. And as a group, labor is forever prevented from bettering its lot because of the profits exacted by the employer. The hope

of a finer life is never realized. So long as consumers are forced to pay extortionate profits on their own earnings to a third interest there can be no solution of the industrial problem.

"We find that this third interest absolutely controls and dominates the management of industry. It fixes wages and controls working conditions. It fixes the prices of commodities without regard to the needs of society, or the necessities of producers and consumers. We have a democratic form of government but an autocratic control of industry.

"We exist under government, but by industry we live. Under such a system the majority of a democracy can through their government enjoy only such rights and privileges as an autocracy in industry permits them to receive. This country was peopled by a race who sought within its boundaries religious freedom. It was established by their descendants through revolution as a land of political freedom. We now demand that it become the home of industrial freedom. This can only be accomplished by extending to industry the same right of individual freedom recognized by the founders of our government in establishing this democracy. The need of mankind for the products of industry must be accepted as the basic interest in all industry. The right of the worker who supplies that need demands like acceptance. This can only be achieved by permitting producers and consumers to share in control of the management of their means of existence. The machinery for attaining this result we believe is embodied in the plan outlined in the Sims bill."

Mr. Stone Questioned

Members of the committee apparently had prepared themselves for the labor leaders, and Mr. Stone promptly bumped into a hornet's nest of hostile questions. Chairman Esch began by reading from the statement signed by the brotherhood leaders that labor is in no mood to brook the return of the railroads, and asked what was the purpose and intention of that declaration.

"We are bitterly opposed to the railroads being returned to the old plan of private ownership and the struggle of labor," replied Mr. Stone.

"This committee has heard numerous plans for dealing with the railroads, and we have given you the same chance as everybody else to present your plan," said Mr. Esch, "but should the committee not endorse the Plumb plan what will be the attitude of your organization?"

"We will try to create enough public sentiment so that the majority of the House and Senate would endorse it; through every means at our command; through the press; through our members, and in every legitimate way."

"Would you seek to develop your plan through a strike?"

"No. I can speak only for the B. of L. E. We have made no threat of a strike. We have not even asked for an increase. We prefer a reduction in the cost of living."

"I don't think any of these organizations are going to strike simply to get the Plumb plan," said Mr. Stone, "but I think some of them may strike if they don't get some relief, and they do object to the plan proposed by the President. I don't believe they will wait that long because they cannot live under present conditions."

"If the President does something to reduce the cost of living, will the strike be withdrawn?" asked Mr. Esch.

"I am not advised as to what the other organizations will do," answered Mr. Stone, "but if you reduce the cost of living you will solve the problem of industrial unrest."

"Have you any concrete suggestions for reducing the cost of living?"

"No. We want to see what the President and the government will do. If they fail, and I hope they don't fail, I am satisfied the labor organizations can do something."

"Have you any suggestions to make as to what Congress can do?" said Mr. Esch.

"I think we could offer you many, but they are not in concrete form at this time. We might advocate a firing squad for some kinds of people."

"You say you will not brook delay; yet you have no concrete suggestions to make. Shouldn't Congress have some time to deal with the problem?"

"Congress should have seen this was coming months ago. The working man knew it, but it looked as if Congress was going to go away and take a summer vacation."

Mr. Esch pointed out that even if Congress had taken a vacation the committees were to remain in session in an effort to work out some of the problems.

"We realize that an increase in wages is only temporary relief," Mr. Stone said, "but if it takes a bushel basket of dollars for a man to live 30 days then his wage for 30 days must be a bushel basket of dollars. A dollar now is worth only 43 cents."

"Isn't that the result of the war influence?" said Mr. Esch.

"Pardon me, I cannot agree to that. It is due to the system of profiteering that has been developed since the war. Prices are higher today than they were during the war period and there is no excuse for it. Yet up to date no one has done anything to remedy the situation."

Mr. Stone, as an example, stated that carloads of food are thrown on a dump in Cleveland every day in order to keep prices up, and when it was suggested that this was a problem for the municipality he said similar conditions exist all over the country and that the government ought to do something about it. He said Congress was able to do a good many things during the war period and that it ought to be able to control prices.

Representative Winslow then took up the questioning, asking first whether the Plumb Plan League had been authorized by a referendum or any definite expression of the members themselves. Mr. Stone said it had been organized by the officers with full authority to speak and with a knowledge of what the members wanted. Mr. Winslow wanted to know if any of the two million railroad men Mr. Stone had mentioned as supporters of the plan were included in the three and one-half million members of the American Federation of Labor he had mentioned in the same way. Mr. Stone turned to Mr. Morrison, who said he was unable to give the exact figure. Mr. Winslow said he would like to know whether the real number was five and one-half million or whether this represented duplication.

Referring to statements that labor always got the worst of it while capital is always protected, Mr. Winslow asked if every business did not have periods of depression when there were no profits and no dividends and which might properly be offset by larger profits in a good year. Mr. Stone replied that labor always suffers when capital does not make its money and that such conditions might be due to mismanagement and overcapitalization. "It is a question anyway," he said, "whether capital is entitled to any return or not."

"What do you think Congress should have done to reduce the cost of living?" asked Mr. Winslow.

"Well, Congress could have seen this coming months ago, but it was so busy playing politics that it had no time to pay attention to the common people."

"Is that your answer?"

"It should have done something about the cost of living, not merely talk about it."

"What should Congress have done and when should it have done it? Let us suppose we are boneheads and have not seen it; what do you say we should have done?"

"You should have done something to stop profiteering and as soon as you met in session."

"That marks the time," said Mr. Winslow, "but I ask

you frankly as man to man, with no halo around either of us, what should we have done?"

"After we have had a reasonable time to see what the government does, I think we can formulate a plan. I have no concrete remedy to propose this morning."

"But suppose Congress is of the same mind after having perhaps given the subject more investigation than you have given it?"

"They could get some suggestions from their constituents."

"Yes, but no remedy. Then, so far as you are concerned as a witness, we do not get any help?"

"I have some ideas, but I am talking about government ownership of the railroads now."

Representative Sanders asked Mr. Stone's opinion regarding government ownership of coal mines. The witness was not prepared to discuss that question.

"There is a propaganda being carefully circulated," he said, "that this is only a move to have the government take over everything, but we are only dealing with the railroads. I think there should be some regulation of the price of coal, at least. Whether the government at some time should take over all natural resources is a question for the future."

Representative Rayburn asked if Mr. Stone believed in a general price-fixing scheme.

"Unless we get some other solution," replied Mr. Stone.

Mr. Rayburn then read the statement attributed to B. M. Jewell, chairman of the shop employees' committee, threatening to tie the railroads up so tight they would never run again. Mr. Stone said he had no authority to speak for Mr. Jewell and questioned whether he had made such a statement because it was sheer nonsense. "We know the railroads are going to run some way," he said, "if the government has to do it."

Representative Denison asked if the adoption of the Plumb plan would not have great influence on its spread to other industries. Mr. Stone said that if under it they were able to show a better operation of the railroads it would undoubtedly have such an influence. He would not think it wise to begin now on a policy of socializing industry, but he thought the time had come for the government to take over the railroads. "Any other plan," he insisted, "would simply mean financial panic and chaos and result in receiverships of a number of railroads inside of 30 days because they could not meet interest charges." Mr. Denison asked if Congress could not possibly prevent a panic in some other way.

"Yes, by subsidizing them," Mr. Stone said. "That is the plan proposed by capital interests. The proposed guaranty means a subsidy and there is no reason why the railroads should be given a guaranty any more than labor. The Railroad Administration agrees that we should have a 25 per cent increase, but that it has no money to pay it."

Mr. Denison asked why, if the time has come for the government to take over the railroads, the same thing does not apply to other public utilities that are in a similar condition. Mr. Stone said he was not so familiar with other industries.

"Do you desire an increase in wages under your plan?" asked Representative Montague.

"Under our plan," replied Mr. Stone, "there can be no increase in wages until we have shown a profit."

"But suppose you do not show a profit?"

"We are going to," insisted Mr. Stone. "There is no argument about that. We know that we can."

"At prevailing rates?"

"We think so; yes."

"Do you believe rates are going up, or down?"

"I think we can show a reduction," replied Mr. Stone.

"How long will it take; how many years?"

"I wouldn't undertake to say," replied the witness, "but you must remember there can be no increase unless the Interstate Commerce Commission says so."

Testimony of Frank Morrison

Frank Morrison, secretary of the American Federation of Labor, said, in part:

"In all discussions of this question it would be well to bear in mind that quasi-public corporations are created for service and not for profit. A long line of decisions, from the Supreme Court of the United States down have invariably held that the fundamental purpose of these corporations is to serve the public and that they are only entitled to a fair remuneration.

"Hardly any one will deny that under private management the railroads have been financial footballs, and that they have been directed by interests whose wreckage of numerous railroad systems is common knowledge. This wreckage has been accompanied by a debauching of legislatures and other political activity that tested democratic institutions.

"The times call for new arrangements in the management of properties that are only made possible by the public's consent. The passage of the Sims bill will re-establish the theory that railroads should be operated for public service rather than for private profit.

"Aside from the application of democracy in these properties, and their handling by practical railroad men, the Sims bill will squeeze all fictitious value out of these properties This will affect living costs and reduce charges the public must now meet, for then it will no longer be necessary to compel the railroads to earn dividends on millions of dollars of watered stock."

Regarding the question raised by Representative Winslow as to the number of supporters of the Plumb plan, Mr. Morrison said that the membership of the federation was 3,700,000 paid members and over 4,000,000 if those not paid be taken into consideration and that including the brotherhoods the total would be brought up to 4,700,000. It also claims to represent all other organized labor and therefore that all the wage workers of the country have endorsed the plan. He said that of the 14 railroad labor organizations in the Plumb Plan League, 10 are members of the federation, two, the conductors and engineers, have made applications for membership and the Brotherhood of Railroad Trainmen has authorized negotiations with the officers of the federation to become a member.

Chairman Esch asked what method could be used to develop the public sentiment of the country as to the plan. Mr. Morrison said that any method that could be used to convince the public that the plan was necessary should be followed, that duress was not a part of the plan, but that it proposed to educate the public and to support the men, regardless of party, who would favor labor's plan. Mr. Esch asked if, assuming the Plumb plan is not adopted by Congress at this session, an effort will be made to submit the proposition to the people by a national referendum. Mr. Morrison did not give a direct answer to this and showed a marked aversion to giving a direct answer to many of the questions that followed. He said that members of Congress were supposed to represent public opinion and could easily find out the sentiment of the people in their districts.

Representative Rayburn led the witness through a number of questions in which Mr. Rayburn took the position that wages in the last analysis would be settled by the board of directors, on which the employees, including the officers, would be two to one as against the representatives of the public. Mr. Morrison would not agree that the officers would vote with the representatives of the employees.

Mr. Winslow tried to get the witness' opinion of a suggestion that all wages be reduced 25 per cent for the purpose of reducing the cost of production and thereby decreasing the cost of living. Mr. Morrison preferred to discuss this question in terms of government employees rather than in terms of the workers engaged in a productive capacity. Mr.

Winslow then put to the witness the following two questions which he had prepared and on which he asked a careful answer:

"Has labor, including railroad labor, at any time, in any country, ever been so well fed, so well clothed, so well housed, so well entertained, and so well furnished in its homes, as is labor in the United States today?

"Has labor ever been so well off in respect to bank deposits and other evidence of savings and prosperity as now?"

Mr. Morrison went into a long discussion which did not answer the questions, saying that when four million went into the army it reduced the problem of unemployment and kept the people pretty well employed for long hours and for extra compensation. That, he said, however, was a war condition, changed since the armistice, and now there is a great deal of unemployment and unrest.

"Do you prefer not to answer my question?" asked Mr. Winslow.

"Well, taking into consideration the fact that railroad men have received only 37 per cent increase in wages, while the cost of living went up 82 per cent, it is not possible that they should be in as good condition as they were."

After considerable argument Mr. Winslow repeated the questions. As to the second, Mr. Morrison replied that he had no accurate information, but that taking into consideration the great efforts made to promote thrift during the war, the railroad employees, being loyal citizens, naturally deprived themselves of a great many things and there was no question in his mind that labor has saved more.

In reply to Representative Webster, he admitted that if wages were increased the probable result would be a further increase in prices, but when Mr. Webster suggested that for this reason the idea of increasing wages as a remedy should be set aside while Congress devoted its attention to some better method, the witness demurred, saying that the railroad men are entitled to a large increase now and will need it during the time required by the effort to reduce the cost of living.

"But we are after a cure, not a palliation," said Mr. Webster, "and since both you and Mr. Stone admit that an increase in wages will result in an increase in the cost of living, must we not, in our search for a cure, lay aside that remedy? You want us to engage simultaneously in the task of increasing the cost of living and reducing it."

"I don't believe wages are the cause for the cost of living," replied Mr. Morrison. He admitted that it would take a long time to put the Plumb plan into effect, but declared that in the meantime the workers should be protected by being put on a basis as good as they enjoyed in 1914."

"But both you and Mr. Stone concede that the Plumb plan is not a panacea for the high cost of living. Would it not be the part of good sense for Congress to lay the Plumb plan on the shelf for the time and devote itself to immediate consideration of some immediate remedy, particularly since the Plumb plan is revolutionary and experimental?"

"But I understand the proposition before your committee is this bill," said Mr. Morrison. "The high cost of living affects every one and there will be other hearings on that. We are here today to advocate this bill."

Mr. Webster tried repeatedly to get the witness to say whether the united effort on the part of the government to reduce the cost of living would not be preferable to a wage increase at this time. Mr. Morrison thought that the railroad men should not suffer the increased cost while a solution is being worked out.

"But you propose to increase the cost to the public generally while we are working on it," said Mr. Webster.

Mr. Morrison insisted that the Plumb plan would assist in the solution of the difficulty and that the Railroad Administration had not given its employees the wages they have been entitled to.

In concluding the questioning, Mr. Webster said that he was perfectly willing to sit night and day in order to give a fair and intelligent consideration to any plan proposed, but that he would not be dominated or coerced by any threat, however vaguely conveyed, as to what organized labor will do to him if he does not vote as they wish.

"I am sorry," said Mr. Morrison, "if any one has got the idea that we are threatening, but there is an unrest in this country because men are not receiving what they should have and great bodies of them have already gone on strike in spite of the efforts of their officers. There comes a time when the burden is too great, and when that time comes you may expect revolution, to the extent at least of strikes."

Other Witnesses

R. C. Fulbright, representing a number of Texas shippers' associations, testified before the committee on July 31 and August 1, making a strong argument for the establishment of six regional commissions under the Interstate Commerce Commission, to relieve the Interstate Commerce Commission of a burden of detail and to supplement the local regulation of the state commissions. He pointed out that the Esch-Pomerene bill makes no provision for regional commissions, although, he said, the demand for them is very general. The work of railway regulation has become so vast, he said, and complicated, that the commission needs the assistance of other bodies and power to delegate some of its work to them. Regional commissions would expedite the handling of cases, bring regulation closer to the people, insure greater efficiency in the routine of regulation, and promote better cooperation and understanding between both shippers and carriers and between the state and the interstate commissions. The commission now cannot pass upon a formal complaint in much less than a year, and the Esch-Pomerene bill proposes to give it several classes of additional functions. The commission, Mr. Fulbright said, is the hardest-working group of public officials he had ever had anything to do with, but it is physically impossible for them to give real consideration to all the cases that come to them for decision.

John Martin, representing the Railway Investor's League, proposed the abolition of the Interstate Commerce Commission on the ground that it has outlived its usefulness, and the creation of a federal transportation board. He urged the consolidation of the railroads into 15 or 20 systems and a Government guaranty of 4½ per cent.

W. A. Wimbish, of Atlanta, Ga., special counsel for the Southern Traffic League, testified before the committee on Tuesday and counseled it not to be stampeded by the demands of the labor organizations, but to "sit tight," and proceed with its hearing just as it otherwise would do.

"If you are considering Government ownership or this new radical proposition," he said, "if you propose to lie down supinely and let any interest in this country, capital or labor, dictate what Congress shall do, I have little to say to you, but I don't think you are going to be stampeded, because you would be condemned by your constituents, and I can't think that this proposition represents even the thought of intelligent working men."

Mr. Wimbish then gave his views on the railroad problem generally, supporting the Esch-Pomerene bill, which he said came nearer meeting what is required than any plan that has been presented. He declared that the return of the roads would not mean bankruptcy to the Southern roads, which he was particularly interested in, nor to the transcontinental lines. He thought the commission in fixing rates ought to take into consideration the cost of labor and the cost of capital, but that it ought not be bound by either. The railroads had got along very well financially before Government control, and no radical changes in the system of regulation were necessary. Therefore he opposed most of the plans that have been advanced.

General News Department

The Senate has confirmed the appointment of John Barton Payne, now general counsel of the Railroad Administration, as a member of the Shipping Board.

The Bill appropriating $17,000,000 additional to complete the construction of the Alaska railroad has been made the subject of a favorable report by the House committee on territories; and members of the territories and appropriations committees have gone to Alaska to inspect the road.

E. E. Betts, superintendent of transportation of the Chicago & North Western, with headquarters at Chicago, and vice-president of the General Superintendents' Association of Chicago, has been elected president of that Association, and W. C. Staffa, superintendent of the car service on the Chicago & Alton, Chicago, has been elected vice-president.

Near Verona, Italy, on August 2, fourteen persons were killed when the airplane in which they were flying fell to the ground from a height of more than 3,000 ft. The airplane was a Caproni, which had started from Venice for Milan. Press despatches report the fall as due to an explosion caused by the careless use of a cigar or cigarette by one of the passengers.

Rubber tires to the number 2,300 figure in the latest reported freight car robbery. Near Alliance, Ohio, one night last week, thieves, armed with shotguns, held up a freight train crew while they unloaded the tires and carried them off in motor trucks. Press despatches say that there were six men in the gang.

Edward H. Shaughnessy, formerly trainmaster of the Galena division of the Chicago & North Western, with headquarters at Chicago, and lately a lieutenant in the Thirteenth (Railway) Engineers, has been commissioned a lieutenant-colonel, in charge of transportation for the American expeditionary force. He has been awarded the distinguished service medal "for meritorious performance of the highest type in the prosecution of his duties."

Isaiah Hale, safety superintendent of the Atchison, Topeka & Santa Fe, in a recent bulletin devoted to the interest of the safety-first movement says that 40 per cent of the injury reports which passed over his desk during a ten-day period consisted of mashed toes. "No favorites are played," says Mr. Hale, "it is the major toe as often as the little buck private toe down at the foot. The cases range from the man who drops a coupler on his toe, to the man who steps on his own feet. The law of gravity is universal: if an object is unsupported it falls and keeps on falling until it strikes the earth—or your own or some other fellow's toe. Toe injuries threaten to make our personal injury record look bad; there is nothing fanciful about them, they are a stern reality." And the sensation monger who glories in large totals of "killed and injured" can make as much out of a mashed toe as out of a broken neck.

Frauds in the sale of unclaimed freight are charged in indictments against two expert brokers who were arraigned in the United States District Court, in New York City, August 1, and held in bail of $25,000 each for trial in October. Two clerks in the freight claim office of the Central of New Jersey have been indicted on charges of having accepted bribes to approve fraudulent dealings with these sales agents. Between June, 1917, and March, 1919, it is alleged that about $100,000 was stolen by rendering to the railroad company false reports, showing sums much smaller than those for which the goods actually were sold. The irregularities were discovered by an investigator of the Interstate Commerce Commission, who examined the books of the claim department of the railroad. Similar but smaller frauds have been committed against the Central Vermont and the Long Island railroads.

The railroads of Detroit, Mich., ought to pool their freight and passenger service to prevent duplication of effort; at least, so says the City Council, which body has decided to appeal to the Interstate Commerce Commission, the United States Railroad Administration, the Public Utilities Commission of Michigan, and the Michigan representatives in Congress, to bring about such unification. The Toledo and the Bay City divisions of the Michigan Central form a direct straight line across the city from the southwest to the northeast. Between the west city limits and Milwaukee junction, this line has been paralleled by the Grand Trunk and the Wabash with freight spurs. The old main line of the New York Central (the Lake Shore) is now being used for freight only from West Detroit. These parallel lines already have expended $2,250,000 for grade separation. The councilmen declare that one railroad would serve the industries as well as four. The City Council also has plans for the establishment of "rapid transit" for the benefit of workers in the factories along the Bay City, and Toledo divisions of the Michigan Central. A group of large manufacturers are preparing a petition to present to the Michigan Central for the installation of gas-driven passenger cars. Henry Russell, vice-president and general counsel of the railroad, tells the councilmen, however, that the company's tracks are now being used already to their full capacity for regular passenger and freight service, and further, the workmen would have long distances to walk as the railroad lines do not touch the residential districts. The industrial growth of Detroit is so rapid that the railroads have got to devise some way of increasing their facilities to handle freight instead of overloading them with this local passenger service.

Signal Division—A. R. A.

H. S. Balliet, secretary, 75 Church street, New York city, has issued the call for the annual meeting of the American Railroad Association, Signal Division, to be held at Congress Hotel and Annex, Chicago, on Wednesday, Thursday and Friday, September 17, 18 and 19. The notice of the meeting, containing reports of committees, will be issued on September 2. Orders for rooms at the hotel should be sent by members direct, at an early date. Rooms for one person, with detached bath, $2.50 to $3 a day; for two persons, $3 to $5 a day. Room with bath, $3.50 to $6 a day; or, for two persons, from $5 to $10.

Pullman Porters and the Chicago Riots

A serious problem confronted Chicago's railroads and the Pullman Company at Chicago in the handling of their colored employees during the race riots in that city from July 27 to August 2. The problem was successfully solved, however, by the adoption of a plan whereby the colored employees on the passenger lines upon arriving in Chicago were immediately assigned to outgoing trains, thereby eliminating their layovers in Chicago to a large extent. When this was impossible, the men were given permission to remain in the cars in which they arrived, until such time as they could be assigned to outgoing trains. In this manner the majority of the thousands of colored men on railroads entering Chicago were able to avoid any serious clashes.

A surprisingly small number of the 1,200 Pullman porters, cooks and other employees failed to report for regular work during the period of the rioting. Adequate guards were provided at the railroad yards to protect the men and where it was necessary for them to return to their homes they were provided with police protection.

Chicago & Alton

In the July 18 issue of the *Railway Age*, on page 125, the passenger earnings of the Chicago & Alton are shown as $5,407,589 for the month of May. This should be $540,759.

One Perfect Railroad—Almost

The above is the title of an interesting pamphlet issued by George Bradshaw, supervisor of safety of the Pere Marquette and other roads under the jurisdiction of federal manager Frank H. Alfred. The road in question is described as being less than 500 miles long and it has more than one main track. It is one of the few roads that have been able to pay a regular 10 per cent dividend and in addition extra dividends running as high as 40 per cent. The road's cars and engines, if coupled together, would make a train considerably greater than the total main line mileage of the road and the yard and siding mileage of this road is approximately three times its main line roadway. The main line is stone ballasted and equipped with automatic block signals and its shops are provided with the latest machines; in fact, the road, physically, is as near perfect as possible. However, of the 12,000 employees on this near-perfect road, 27 were killed last year; and not one of these met death accidentally or by reason of an unsafe physical condition. In other words, every one of the 27 men was killed on account of the failure on the part of himself or some other employee to use reasonable care in performing his duty. Hence, the title "One Perfect Railroad—Almost."

Proposal to Include Coast and Geodetic Surveys Under National Department of Public Works

One advantage to accrue from the organization of a National Department of Public Works in accordance with the bills recently introduced in both houses of Congress would be the correlation of the work of the Coast and Geodetic Survey with other activities of an allied nature now being conducted by other departments of the government. The principal work of the Survey is the charting and sounding of the coast waters of this country. This is strictly an engineering work, done by and under the supervision of engineers. The next activity of the Survey is the providing of horizontal and vertical control points throughout the interior of the country. This is of the highest importance as it provides skeleton framework on which all other surveys should be based. It is important to note, however, that a large number of other government agencies are also engaged in map making. These include the Corps of Engineers, the Geological survey, the Land office, the Bureau of Indian Affairs, the Forest service, the Boundary commission, the Bureau of Roads and Rural Engineering, the Bureau of soils, the Reclamation service and the Hydrographic survey of the navy. This results in a large amount of confusion that could be eliminated by the co-ordination of all of this work under a Department of Public Works. This is particularly pertinent with respect to the Coast and Geodetic Survey since it necessarily forms the foundation for all survey work. It would result in a comprehensive mapping and leveling plan of inestimable value to the railroads and land owners and others who have occasion to make use of the maps and records of any of the existing survey bureaus. There is no work of the survey that does not fit well with the work planned for the Department of Public Works. It is essentially engineering work and should consequently belong in the national department designed to correlate all engineering activities of the government.

Northwestern fruit growers, at a hearing recently conducted by Examiner Marshall of the Interstate Commerce Commission, at Portland, Ore., on the proposed Perishable Protective Tariff No. 1, declared that the rate increases proposed in this tariff would endanger the industry in that district; and they thought that the adoption of some of the rules in the tariff would practically eliminate the carriers' liability on fruit shipments. The fruitmen are backed up by the Public Service Commissions of Oregon and Washington.

Traffic News

In accordance with notice previously given, the permit system for the shipment of grain was put into effect on August 1. In lieu of the individual permit system that was in effect last year (and which will be continued this year on a portion of the traffic), a so-called blanket permit system is now in operation, experimentally.

Because of the fact that locomotives operating over the National lines of Mexico between Laredo, Tex., and Pochica, Mexico, must be moved to San Antonio, Tex., for repairs, the International & Great Northern has petitioned the Dallas District Freight Traffic Committee for a reduction in rates on this movement from $0.26½ per 100 lb. to $0.09½ per 100 lb., the same basis as that which applies on intrastate movements in this territory.

The House committee on interstate and foreign commerce has voted 6 to 5 to report favorably the Cummins bill, already passed by the Senate, to restore the former jurisdiction of the Interstate Commerce Commission and the state commissions over rates. This would leave the director general subject to the same restrictions as were formerly imposed upon the railways, including the suspension power, except that the House committee adopted an amendment proposed by the Interstate Commerce Commission to remove the requirement of approval of the Interstate Commerce Commission before a tariff containing an increased rate may be filed. The committee also adopted an amendment to provide that no change or increase shall be made in interstate rates without having first secured the approval of the state authorities.

Traffic conditions throughout the country for the week ended July 28, 1919, were somewhat improved over the previous week in several regions, but as a general thing the movement was behind that for the same period in 1918. In the Northwestern region freight loaded for the week totaled 164,819 cars, a decrease of 2 per cent. In the Pocahontas region, compared with July 28, 1918, tidewater coal dumped decreased 54 per cent, coal and coke 12 per cent and other freight 12 per cent. In the Southern region, although the situation shows steady improvement for the last week in July, 1919, car loadings decreased 6,700 under the same period for 1918. In the Central Western region there has been an increase in the total traffic handled, both as compared with the same period last year and with previous weeks of the current year.

Senate Inquires About Coal Cars

The Senate on August 4 adopted a resolution introduced by Senator Pomerene calling on the director general of railroads to inform the Senate regarding the number of coal cars now in use in the transportation of coal, the number of empty coal cars which are suitable and available, whether the coal cars belonging to the railroads under federal control are now or have been during the past six months sufficient to meet the demand, the number constructed and purchased which have not been sold or transferred to the railroad companies and the reasons therefor, the methods adopted to supply producers of coal with necessary cars and any action by Congress which may be required in order to meet demands. Senator Pomerene had a number of letters from coal men complaining of car shortages and apparently did not know that the Railroad Administration had already taken steps to put into service the U. S. R. A. cars which had been accepted by the railroad companies, as announced in *The Railway Age* last week. The Columbia Trust Company of New York has been appointed by the Railroad Administration to be trustee to hold title to a large number of these new cars, pending the adjustment of questions respecting their allocation which are now being studied in connection with the plans for a general equipment trust.

Commission and Court News

Interstate Commerce Commission

At the request of the director general, the Interstate Commerce Commission has ordered an investigation as to the rates and regulations applying on grain and grain products from points in Idaho, Montana, North Dakota, South Dakota, Minnesota, Wisconsin, Iowa and Nebraska. The Railroad Administration in General Order No. 28 increased the rates and numerous complaints have been made regarding the disturbance of the parity formerly existing as between markets and interior milling points and as between country shipping points and markets.

Bill of Lading Order Postponed

Because of the injunction obtained by the Alaska Steamship Company and other carriers to restrain the enforcement of the Interstate Commerce Commission's order of April 14 prescribing forms of bills of lading, the commission has postponed the effective date of its order until further order of the commission.

State Commissions

The New York State Public Service Commission, First District, which has been asked by the city authorities of New York City, to revoke its approval of the increase in fares on surface street cars in Manhattan and the Bronx (a charge of two cents for transfers from one line to another where heretofore the transfer has been free) will not decide the question for two weeks yet; but the proceedings do not operate as a stay, and the transfer charge is now in effect. The counsel for the city alleges that each of the 99 points where the two-cent charge is imposed has been designated in the franchises of the company as a free transfer point. The Public Service Commissioner says that he has allowed the tariff, making the charge two cents, instead of approving three cents, as requested by the receiver in charge of the car lines, because he feels sure that there will be an increase in traffic sufficient to enable the company to maintain its facilities.

Court News

Federal Safety Appliance Act

The Circuit Court of Appeals, Eighth Circuit, holds that the movement by a switch engine of 40 or more cars coupled together over a Duluth terminal track, used only to connect different terminal yards, over which no through or local trains pass, and on which trains are moved slowly, without orders, time cards, or block signals, is a switching operation, and not within the air brake provision of section 1 of the federal Safety Appliance Act.—U. S. v. Northern Pacific, 255 Fed. 655.

The Circuit Court of Appeals, Fifth Circuit, holds that the movement by a switch engine of 30 to 50 cars, coupled together, some containing interstate shipments, for several miles, crossing main line tracks of several railroads and streets at grade, and running for parts of the distance over main line tracks, although in a network of tracks commonly called the city yards, was not a switching operation, but the running of a train, and the failure to connect up the air brakes was a violation of section 2 of the federal Safety Appliance Act.—U. S. v. G. H. & H., 255 Fed. 755.

Failure to comply with the federal Safety Appliance Act requiring hand brakes is held by the Circuit Court of Appeals, Second Circuit, to render a railroad company liable for injuries to a switchman resulting from such violation, although the punishment fixed by the statute is a penalty recoverable at the suit of the United States.—D., L. & W. v. Peck, 255 Fed. 261.

Foreign Railway News

Increased Use of Electricity in Norway

The continued rapid extension of the hydroelectrical development of Norway seems assured. In addition to the extensive plans which have been formulated and are being carried into effect relating to development of water power in nearly all sections of the country, there has been begun an active campaign for bringing before consumers the value and economy of electric power. Even now, in some sections of Norway electricity is used for running sawmills and heating homes in districts where timber is the principal produce marketed.—*U. S. Commerce Report No.* 172.

To Return Mexican Railways to Private Owners

A press despatch from Mexico City, dated July 31, is authority for the statement that the Mexican Railway and the Pan American Railway, which systems traverse the territory between the capital and the Gulf of Mexico and the Isthmus, have been turned back to separate management. Information from reliable sources is to the effect that the Government probably will return the systems to the private owners within a month.

The management of these systems had been merged with that of the national lines since Colonel Paulino Fontes, former manager of these lines, took over the management of the National Railways.

The Mexican Railway, which controls the important line from Vera Cruz to Mexico City, is a British-owned property. It was handed over to the Carranza Government on April 3, 1917. The stock of the Pan American Railway is owned by the National Railways of Mexico.

Traffic on Siberian Railways Disturbed

Press despatches from Vladivostok report that on July 18 the Inter-Allied Railway Commission sent a formal protest to the Omsk Government of Admiral Kolchak against violations of the Inter-Allied agreement regarding the operation of railways. The communication demands that the Russians live up to the agreement which they signed, and are a party to, if the Government expects Allied aid. The removal of General Semenoff from the zone where he can interfere with railroad operations also is asked.

The violations have chiefly been through the military station commandants, who sell tickets, allot cars and attempt general supervision of traffic, a duty assigned to the technical board of the American Railway Commission to Russia, under the chairmanship of John F. Stevens.

The chief disturber is alleged to be General Semenoff, who appears to be the dominating figure in the trans-Baikal sector.

The United States has furnished $4,000,000 and China $500,000 for the railroad reorganization, while the other allies have promised funds.

Conditions Affecting Trade With Siberia

Numerous inquiries have been received in Washington regarding the conditions and regulations surrounding trade with Siberia. In order to clear up certain misapprehensions regarding trade with this region the following notes have been compiled by the Foreign Trade Advisers' Office of the Department of State.

The so-called Allied Purchasing Committee, of which Capt. George E. Spengler is chairman, is a subcommittee of the Interallied Technical Board of the Committee for Supervision of the Chinese Eastern and Transsiberian Railways. This committee will make purchases of supplies and materials for the Siberian railways by direction of John F. Stevens, president of the Technical Board of the Interallied Committee. All orders for material to be purchased in the United States for use in connection with the railways will

be placed by the committee through the Director General of Military Railways, War Department. This committee has nothing to do with purchases of other than railway material and supplies. The Director General of Military Railways is in close touch with all American manufacturers and is in a position to expedite orders for badly needed supplies.

Reduced Cost of Living to Help German Railway Men

Press despatches from Berlin reported the Government has appropriated one and a half billion marks to be spent in three months for the purpose of reducing the cost of food. The despatches say that the cutting down of the cost of living is the direct result of the railroad strike. The railroad men asked for higher wages and accepted cheaper food as a compromise. The reduction means a weekly saving of about 27 marks, $6.75, to every worker in Germany, according to an announcement of Railroad Minister Oesar, made in the Prussian Diet.

Granting the demands of the striking railroad men would have cost four billion marks, $1,000,000,000, German railroads formerly the best paying investment of the Prussian state, are losing money at a rate of from three to four billion marks a year. Wage demands, if granted, would have increased the total deficit. It would also be impossible to raise the passenger

Minister Oesar, reporting the food agreement to the diet, said it would be impossible to raise an additional seven or eight billion marks by taxation, to make good the railroad deficit for the year to almost eight billion marks, $2,000,000,000. and freight rates again, because higher freight rates would merely increase the cost of living further.

Plight of the Russian Railways

The Russian railway system threatens to collapse, owing to the fact that no repairs have been effected since the revolution, says an article in the Reconstruction Supplement of the Review of the Foreign Press issued by the British War Office. The station buildings are for the most part deserted, the warehouses falling in, and the central switches and signalling apparatus no longer work, owing to the lack of spares with which to replace the wornout parts.

No modern electric or automatic signalling and loading apparatus exists on the Russian railways. The railway workshops were obliged to hand over important parts of their machinery to the munition workshops. This absence of necessary machinery and instruments is especially felt in the locomotive shops. The number of railway engines out of repair amounted in March, 1916, to 17.3 per cent; March, 1917, 23 per cent; March, 1918, 35.3 per cent; March, 1919, 52.4 per cent. The number of freight cars out of repair amounted in March, 1916, to 3.4 per cent; March, 1917, to 5.4 per cent; March, 1918, to 9.1 per cent; March, 1919, to 18.8 per cent.

The railway bridges and railway lines are also in a state of decay and have in some cases been badly damaged as a result of civil war. Little is heard in the press of the numerous accidents that take place in consequence of trains running off the lines. The work of repair is often hindered by the passive resistance of railway workers antagonistic to the Soviet regime. For lack of raw material, the number of engines built in 1918 was considerably reduced. In 1917, 520 locomotives were able to be built in Russian foundries, but only 191 in 1918, 152 of which were intended for goods traffic, and only 39 for passenger trains. Since the taking of the Urals by Kolchak's army, the production of pig-iron for rails has entirely ceased as far as the requirements of Soviet Russia are concerned and few new lines can be built.

In January, 1916, there were still 72,743, and in January, 1917, 70,118 freight cars, running daily; in January, 1918, this number had decreased to 16,644, and in January, 1919, it had sunk to 13,193 cars. The working capacity of the engines has fallen off in a similar degree. In 1918 they were capable of travelling only about 35 miles per day. Naturally the financial results of the railways are unsatisfactory. Up to 1916 the balance-sheet still showed a profit. In 1917, however, there was a deficit of R. 1.9 milliards, and in 1918 the deficit rose to R. 8 milliards. The measures taken by the Soviet Government are too late to prevent the ruin of the Russian railway system.

Equipment and Supplies

Locomotive Deliveries Week Ended July 26

The following new locomotives were shipped during the week ended July 26:

Works	Road	Number	Type
American	Virginian	2	USRA Mallet
	Total	2	
Baldwin	P. L. W.	2	Mallet
	S. P.	1	Sante Fe
	C. & S.	2	USRA S. F.
	C. R. I. & P.	3	USRA Mikado
	P. & R.	1	Mallet
	B. & O.	1	USRA Pacific
	A. T. & S. F.	4	Santa Fe
	A. T. & S. F.	1	Pacific
	P. L. W.	3	USRA S. F.
	Total	18	
	Grand Total	20	

Locomotives

The Pesant Company (Cuba) has ordered one Mogul locomotive from the American Locomotive Company. This locomotive will have 17 by 24 in. cylinders and a total weight in working order of 110,000 lb.

The Cerro De Pasco Railway (Peru) has ordered two Consolidation locomotives from the American Locomotive Company. These locomotives will have 21 by 28 in. cylinders, and a total weight in working order of 164,000 lb.

The American Trading Company (Cuba) has ordered one Consolidation locomotive from the American Locomotive Company. This locomotive will have 18 by 24 in. cylinders and a total weight in working order of 125,000 lb.

The Taiwan Railways (Formosa) have ordered three Consolidation locomotives from the American Locomotive Company. These locomotives will have 20 by 24 in. cylinders, and a total weight in working order of 134,000 lb.

The Imperial Karafuta Government (Japan) has ordered four Prairie locomotives from the American Locomotive Company. These locoomotives will have 14 by 22 in. cylinders and a total weight in working order of 90,000 lb.

The Tata Iron & Steel Company (India) has ordered eight six-wheel switching locomotives from the American Locomotive Company. These locomotives will have 18 by 24 in. cylinders and a total weight in working order of 110,000 lb.

The Government of Poland has given the Baldwin Locomotive Works an order for 150 Consolidation locomotives of a design similar to that of the locomotives which are supplied for the American military railroads in France. It is understood that the Baldwin Locomotive Works has arranged to finance the $7,000,000 represented by the purchase over a period of ten years and has accepted an issue of ten-year equipment notes from the Polish Government.

The United Railways of Havana have ordered 11 Consolidation, four six-wheel switching, and two Prairie type locomotives from the American Locomotive Company. Of the Consolidation locomotives, ten will have 20 by 26 in. cylinders and a total weight in working order of 160,000 lb., and one will have 16 by 20 in. cylinders and a total weight of 97,000 lb. The six-wheel switching locomotives will have 19 by 24 in. cylinders and a total weight of 130,000 lb., and the Prairie type locomotives will have 17 by 24 in. cylinders and a total weight in working order of 114,000 lb.

Freight Cars

The H. C. Frick Coke Company, Pittsburgh, Pa., is in the market for 1,200 mine cars.

The Kannoten Refining Company, Kansas City, Kan., is inquiring for 20 50-ton, 10,000-gal. tank cars.

The Lubrite Refining Company, St. Louis, Mo., has ordered 20 50-ton, 10,000-gal. tank cars from the American Car & Foundry Company.

The Kendall Refining Company, Bradford, Pa., has ordered two 40-ton, 8,000-gal. tank cars from the American Car & Foundry Company.

The Texas Oil Company has ordered 500 tank cars from the Pennsylvania Tank Car Company, Sharon, Pa., and the General American Tank Car Corporation, Chicago.

The Pennsylvania Equipment Company, 1420 Chestnut street, Philadelphia, Pa., is in the market for one second-hand flat car of about 60 tons' capacity and for 30 logging cars, with spring drawheads and of 40,000, 50,000 or 60,000 lb. capacity.

Passenger Cars

George H. Carey, New York, is inquiring for 10 electric railway cars for export to Spain.

The Peerless International Corp., New York, is inquiring for gasoline driven passenger cars for export to Cuba.

Signaling

The Lehigh Valley has ordered from the General Railway Signal Company an interlocking machine, style A, 32 levers, for Constable Junction, N. J., with ten electric locks; also a 32-lever machine for Pine Junction, N. J.

Trade Publications

Blaw Cableways.—The Blaw-Knox Company, Pittsburgh, Pa., has issued a 16-page booklet illustrating and describing the various appurtenances used in cableway construction, including carriages, falls, stops, spring bumpers, etc. The illustrations show the character of the devices and also the nature of the possible installations.

Supply Trade News

Earle W. Vinnedge has received his discharge from the military service and has been appointed sales engineer for the **Worthington Pump & Machinery Corp.**, New York, with headquarters at Cincinnati, Ohio.

The **Spencer Otis Company**, 747 Railway Exchange Bldg., Chicago, has been succeeded by the **DeRemer-Blatchford Company** effective Aug. 1, 1919. The change is purely one of name and the same headquarters will be retained by the DeRemer-Blatchford Company.

E. T. Sawyer has been appointed a representative of the railway sales department of the **U. S. Light & Heat Corporation**, Niagara Falls, N. Y. Mr. Sawyer will specialize on car lighting equipment and electric car welders and will have his headquarters at 30 East Forty-second street, New York City.

J. A. Massie, sales manager for the **Hoyt Electrical Instrument Works**, Penacook, N. H., has retired from active service with the company. He will continue to be identified with the organization through his interest in the Burton-Rogers Company which has been made the sales department of the Hoyt Electrical Instrument Works. M. T. Rogers will take over Mr. Nassie's duties.

F. B. Hartman has been appointed representative of the **Hunt-Spiller Manufacturing Corporation**, Boston, Mass. He is to cover the southeastern district succeeding **J. M. Monroe**, who has resigned to become vice-president of the Charles H. Long Company. Previous to 1906 Mr. Hartman was in the service of the Union Pacific and later was with the Southern Railway, part of the time as general equipment inspector.

The Hazard Manufacturing Company, Wilkes-Barre, Pa., on July 1, opened a new sales office and warehouse at 1415 Wazee street, Denver, Colo., in charge of **Ernest P. Kipp**, district manager. The Denver office will cover the Intermountain district including in its territory Colorado, Wyoming, Montana, Idaho, Utah, New Mexico, and the western portions of Nebraska and South Dakota. Mr. Kipp served as a captain in the U. S. Engineers, and has received his honorable discharge.

Rolard S. Lebarre, assistant manager of sales for the Cleveland, Ohio, district of the Carnegie Steel Company, Pittsburgh, Pa., has resigned to become general sales manager of the alloy steel department of the **Interstate Iron & Steel Company**, Chicago. He began his business career 20 years ago with the United States Steel Corporation and in 1902 entered the sales department of the Illinois Steel Company. During the past 14 years he has been assistant district manager of sales for the Carnegie Steel Company, at Cleveland.

James H. Reed, senior member of the law firm of **Reed, Smith, Shawl & Beal**, Pittsburgh, Pa., and president of the Bessemer & Lake Erie Railroad, owned and operated by the Carnegie Steel Company, Pittsburgh, has resigned from all industrial boards on account of the present status of the interlocking directory act, which prohibits a director on a railroad from being a director of any industrial company that furnishes material to that railroad. For this reason, Judge Reed has resigned as a director of the Pressed Steel Car Company, Pittsburgh, and **J. H. Beal** has been elected in his place.

Thomas O. Morgan, until recently head of the service department of the New York office of the **American Steam Conveyor Corporation**, Chicago, has been promoted to sales engineer in charge of Long Island and Connecticut territory, and **H. S. Valentine** has been appointed sales engineer

in charge of Philadelphia territory with office in the North American building, Philadelphia, Pa. Mr. Valentine is a mechanical engineer and previously served with the Link Belt Company, Philadelphia, for five and one-half years, with the Brown Hoisting Machine Company and Yale & Towne Manufacturing Company for six years, and with the Badenhausen Company, New York, manufacturers of water tube boilers, for one year.

George H. Richie, sales engineer in New England and Eastern Canada for the **Sullivan Machinery Company,** Chicago, has been promoted to New England sales manager, to succeed **George Elmer Wolcott,** deceased. **R. S. Weiner** has been appointed district manager with headquarters at El Paso, Tex., in place of **Don M. Sutor,** who has been transferred to the St. Louis, Mo., office as sales manager for Missouri, Arkansas, Eastern Texas, Oklahoma, Kansas (except the oil territory), Western Kentucky and Western Tennessee. **Phillips S. Jarvis** has resigned as sales manager for the territory controlled from the St. Louis office and **Marion C. Mitchell** has been appointed sales manager for the territory in Indiana and Illinois previously controlled from the St. Louis office, with temporary headquarters at St. Louis. **Daniel H. Hunter** has been appointed sales manager for Louisiana, Texas (except the southwestern section), and the oil fields of Oklahoma and Kansas with headquarters at Dallas, Tex.

The **Norton Grinding Company** and the **Norton Company,** both of Worcester, Mass., have been consolidated under the latter name. **George I. Alden,** who has been president of the Norton Company for some years, is chairman of the board of directors of the reorganized company, **Charles L. Allen** is president and general manager, **Aldus C. Higgins,** treasurer and general counsel and **George N. Jeppson,** secretary and works manager. Two new vice-presidents have been appointed. **W. LaCoste Neilson,** vice-president and foreign manager, and **Carl F. Dietz,** vice-president and general sales manager. A factory for the manufacture of abrasive products has been established in Japan and the company has secured control of the Hiroshima Grinding Wheel Company, at Hiroshima, near Kobe, Japan, which was established some years ago by the company's agents. Sales agencies have been established with native houses in several foreign countries, including England, France, Italy, Belgium, Denmark, Holland and connections will be formed in Norway and Sweden. A new store at Detroit, Mich, has also been opened under the management of C. W. Jinnette.

Scenes from Foreign Ports—Merchandise Being Landed by Lighter at Mollendo, Peru

Railway Construction

Baltimore & Ohio.—A contract has been given to the Vang Construction Company, Cumberland, Md., for the masonry work required in the reconstruction of the Baltimore & Ohio Allegheny river bridge, at Thirty-third street, Pittsburgh, Pa.

Canadian Roads.—John W. Stewart & Co., railway contractors, Vancouver, B. C., have been awarded a contract for the construction of a railway from Acme, Alberta, to Drumheller, a distance of 37 miles. Work was started on July 1.

Chicago & Alton.—This road is now actively engaged in grading operations and track laying for its Harrison street freight terminal, Chicago. Bids will be asked for in about two weeks for the construction of two large freight houses.

The officers of the Chicago & Alton have submitted a proposition to the secretary of the Nutwood Drainage and Levee District, of Illinois, for the construction of a six-mile extension from Titus, Ill., south into the Nutwood district, with a branch line of one mile to the east bank of the Illinois river, opposite the town of Harding. The proposal requires that the property owners furnish the ties, the right-of-way and the work of grading, and the company is to furnish the steel, the ballast and the labor for track work. It is estimated the cost to the land owners in the district will be about $75,000.

Chicago Union Station Company.—A contract has been given to the Mellon, Stewart & Nelson Company, Chicago, for the grading and construction of six approach tracks to the Union Station, and two joint freight tracks for the Chicago & Alton freight terminal and the Pittsburg, Port Wayne & Chicago freight connections in the territory between Twelfth and VanBuren streets. The work includes underground construction of cables for interlocking plant and necessary sewerage. The contract amounts to approximately $200,000, not including material, which is furnished by the Station Company.

Colorado Roads.—Mining interests of Paradox Valley, Colo., are ready to invest large sums in the construction of an electric railway from their mines to some point on one of the larger lines in the state, according to James M. McBride, general manager of the Cashin mines in the Paradox Valley. Data is now being gathered with which to interest railroad builders.

Pennsylvania.—This road has resumed work on the construction of a belt line around Detroit, Mich., after an interruption of more than a year. Prior to the suspension of this work in 1918 the Pennsylvania had purchased right-of-way for a six-mile extension around the city of Detroit from a connection with the Pere Marquette, north of Michigan avenue to Highland Park. Along this right-of-way sites for industries had been bought on the statement of the road that it proposed to proceed with the construction of this line at an early date. When the work was suspended, the owners of these industrial sites made no complaint, but this year they have asked that the road fulfill its promise of providing track connections and it is on account of this that the track laying has been authorized and is now in progress. Three hundred acres of land have been acquired west of the River Rouge near Oakwood, Mich., where the freight yards will be located. As now designed they will have an immediate capacity of 3,850 freight cars and an ultimate capacity of 12,000 cars. It is expected that as soon as the railroads are returned to corporate control, the work on the entire projected extension from Toledo, Ohio, to Detroit will be resumed.

Port Huron & Detroit.—Surveys are now being made for a single track from Marine City, Mich., to Detroit, a distance of 40 miles.

ANNUAL REPORT

The Hocking Valley Railway Company—Twentieth Annual Report

Columbus, Ohio, July 1, 1919.

To the Stockholders:

The Twentieth Annual Report of the Board of Directors, for the fiscal year ended December 31, 1918, is herewith submitted.

The average mileage operated during the year was 349.7 miles, an increase compared with the previous year of .1 miles. The mileage at the end of the year was 350.2 miles.

RESULTS FOR THE YEAR.

Standard Return was	$2,637,167.48
(Decrease $677,557.44 or 20.44%, compared with corresponding income items of 1917.)	
General Expenses (Corporate) were	68,507.57
	$2,568,659.91
War Taxes were	14,200.00
(Decrease $205,747.50 or 93.54%.)	
Remainder was	$2,554,459.91
(Decrease $540,318.01 or 17.46%.)	
Miscellaneous Income was	282,486.41
(Increase $180,538.66 or 177.21%.)	
	$2,836,946.32
Rentals and Other Payments were	205,202.48
(Increase $149,629.45 or 369.25%.)	
Income for the year available for interest was	$2,631,743.84
(Decrease $509,363.80 or 16.22%.)	
Interest (48.33% of amount available) was	1,271,914.50
(Increase $64,719.33 or 5.36%.)	
Net Income for the year amounted to	$1,359,829.34
(Decrease $574,083.13 or 29.69%.)	
Dividends paid during the year:	
Two dividends of 2% each, aggregating	439,980.00
Balance, devoted to improvement of physical and other assets	$919,849.34

RETURN ON PROPERTY.

The following table shows the amount of return to your Company, from transportation operations only, upon its investment in road and equipment at the termination of each year of the five-year period ended December 31, 1918; the road having been operated in 1918 by the United States Railroad Administration, the Standard Return has been used for that year in lieu of the operating and other items corresponding therewith:

Year ended December 31:	Property Investment.	Total Operating Income. (including hire of equipment and other items).	Per Cent. of Return.
1918	$48,057,539.03	$2,598,474.64	5.41
1917	46,237,480.24	3,060,174.97	6.62
1916	45,198,144.03	3,052,123.37	6.75
1915	44,802,665.64	2,041,149.36	4.56
1914	45,475,978.73	1,673,012.19	3.68
Average	$45,954,361.53	$2,484,986.91	5.41

FINANCIAL.

The changes in funded debt shown by balance sheet of December 31, 1918, as compared with December 31, 1917, consisted in the payment of $205,000.00 on equipment trusts.

An analysis of the property accounts will be found on pages 18 and 19, by reference to which it will be seen that additions and betterments were made during the year to the net amount of $1,819,858.79, of which $1,783,596.02 was added to cost of road, and $36,262.77 was added to cost of equipment.

During the past ten years your Company's net addition to property accounts has been as follows:

Equipment	$4,217,845.07
Additions and Betterments	5,559,945.26
	$9,777,790.33

Your Company had outstanding $5,000,000 of short-term six per cent. notes which matured on November 1, 1918. A plan submitted by bankers looking to the financing of this maturity was acceptable to your Directors, but the necessary sanction of the Director General of Railroads to such plan was withheld. Consequently, upon the maturity of the notes, your Company found it necessary to request the note-holders to extend the maturity of their notes for three months. In effecting this extension the Director General co-operated. At the suggestion of representatives of the Railroad Administration, your Company then undertook the creation of a General Mortgage, under which bonds could be issued if found desirable, either for sale or for pledge to secure short-term obligations, for the purpose of providing both for the extended notes and for other capital expenditures. The stockholders at a Special Meeting held on January 25, 1919, authorized the creation of such a mortgage to secure not exceeding $50,000,000 of General Mortgage Bonds. The total amount of bonds outstanding is further limited to an amount which, including prior lien bonds, shall not exceed three times the outstanding stock. On February 1st, 1919, when the extended notes matured, no plan acceptable to the Director General had been agreed upon, and a further extension until March 1, 1919, was arranged. Before the date last mentioned, your Company reached an understanding with the Director General and with bankers, whereby it was able to provide for the payment of the extended notes and for its other immediate capital requirements, through the issue and sale of $7,500,000 of Five-Year 6% Gold Notes, due March 1, 1924, secured by pledge of $9,600,000 of the new 6% General Mortgage Bonds.

Your Company purchased during the year $200,000 United States Government 4¼% Bonds of the Fourth Liberty Loan.

GENERAL REMARKS.

The equipment in service December 31, 1918, consisted of:

Locomotives owned	133	No change	
Locomotives leased under equipment trusts	8	No change	
Total	141	No change	
Passenger train cars owned	72	Increase	1
Freight train and miscellaneous cars owned	13,081	Increase	393
Freight train cars leased under equipment trusts	1,999	Decrease	500
Freight train cars under special trust	47	No change	
Total freight train and miscellaneous cars	15,127	Decrease	107

The changes during the year in accrued depreciation of equipment account were as follows:

Balance to credit of account December 31, 1917		$2,412,337.17
Amount credited during year ended December 31, 1918, by charges to U. S. Railroad Administration	$315,012.83	
Charges to account for:		
Accrued depreciation on equipment retired during year—114 freight and work cars	$13,960.93	
Accrued depreciation on cars changed in class during year	4,238.54	
	18,199.47	
		296,813.36
Balance to credit of account December 31, 1918		$2,709,150.53

Of the 27 miles of second track, north of Columbus, reported under construction last year, 3.36 miles LeMoyne to Cummings and 7.24 miles Delaware to Meredith (total 10.6 miles) have been completed, except ballasting, and placed in service; 2.35 miles Crawford to Carey were completed, except ballasting, and placed in service for siding purposes pending completion of Carey coaling station; and the grading and masonry for the remaining portions have been completed. Owing to the development of Parsons Yard the second track (.94 miles) between that point and Valley Crossing was converted into a passing track. The grading and bridging have been completed for 12.6 miles of extensions of passing tracks. A telephone dispatching and message circuit from Columbus to Toledo has been constructed. At Walbridge 9 stalls are being added to the engine house, which will be ready for use by the opening of the lake coal season, a 500-ton capacity concrete coaling station is under construction and the capacity of the yard has been increased by the construction of five 100-car departing tracks and the extension of four hump tracks to hold 100 cars each. At Carey the construction of a 500-ton capacity concrete coaling station has been commenced. At Marion a 5-stall engine house and 100-foot turntable are being constructed. At Parsons Yard South Columbus the five 100-car tracks under construction last year have been completed, the grading for 10 additional tracks (5 each in empty yard and loaded yard) has been completed, the advance lead for southbound trains has been extended three-quarters of a mile, an addition of 12 stalls to the engine house is under construction, and a 500-ton capacity concrete coaling station is practically completed. At South Columbus the separation of grades at Smoky Row Road ordered by the County Commissioners, and commenced last year, has been completed. At Logan the work of lengthening five stalls of the engine house is practically complete. At Nelsonville a 10-stall engine house, 100-foot turntable, machine shop, sand house, and oil house are under construction and will be in use early in 1919. On the River Division piers have been constructed to support two girder bridges, which are being renewed between Hawks and Minerton, and the steel work will be erected so that heavier power can be operated on this division by the middle of next summer.

OPERATION BY UNITED STATES RAILROAD ADMINISTRATION.

In the Annual Report for the year 1917, you were advised that the President of the United States, by Proclamation dated December 26, 1917, took possession and assumed control of the railroad systems of the country, appointing a Director General of Railroads, through whom the operation of such transportation systems was to be conducted. Under the Proclamation and under the Act of Congress of March 21, 1918 (generally known as the Federal Control Act), the railroad of your Company has, since December 28, 1917, been operated by the United States Government through William G. McAdoo, Director General of Railroads, and Walter D. Hines, his successor. The operating and traffic statistics contained in this report relate to the operation of your property by the Director General of Railroads.

Increases in wages of employees, made by the Director General of Railroads during the year, increased the year's cost of operation approximately $1,762,000. These increases are in addition to the increases of $625,000 mentioned in last year's report.

The revenue coal and coke tonnage was 11,799,891 tons, an increase of 10.5%; other revenue freight tonnage was 3,444,959 tons, a decrease of 17.8%. Total revenue tonnage was 15,244,850 tons, an increase of 2.5%. Freight revenue was $11,343,613.42, an increase of 26.4%. Freight train mileage was 1,494,261 miles, an increase of 1.3%. Revenue ton miles were 1,892,824,838, a decrease of 3.7%. Ton mile revenue was 5.99 mills, an increase of 31.4%. Revenue per freight train mile was $7,591, an increase of 24.7%. Revenue tonnage per train mile was 1,267 tons, a decrease of 5%; including Company's freight, the tonnage per train mile was 1,302 tons, a decrease of 4.8%. Tonnage per locomotive, including Company's freight, was 1,061 tons, a decrease of 5.5%. Revenue tonnage per loaded car was 43.7 tons, a decrease of .2%. Tons of revenue freight carried one mile per mile of road were 5,412,710, a decrease of 3.8%.

There were 1,293,257 passengers carried, a decrease of 23.9%. The number of passengers carried one mile was 42,551,254, a decrease of 14.9%. Passenger revenue was $1,038,843.40, an increase of 8%. Revenue per passenger per mile was 2.441 cents, an increase of 26.9%. The number of passengers carried one mile per mile of road was 121,679, a decrease of 14.9%. Passenger train mileage was 548,159, a decrease of 22.5%. Passenger revenue per train mile was $2.014, an increase of 48.1%; including mail and express it was $2.188, an increase of 38%. Passenger service train revenue per train mile was $2.260, an increase of 36.7%.

There were 5,726 tons of new 100-lb. rails, equal to 36.44 track miles, and 65 tons of new 90-lb. rails, equal to .46 track miles, used in the renewal of existing main tracks.

The average amount expended for repairs per locomotive was $7,579.90, an increase of 102.2%; per passenger train car $1,251.12, an increase of 49.5%; per freight train car $136.93, an increase of 54.9%.

THE FEDERAL CONTROL ACT.

The Federal Control Act authorized the President of the United States to enter into agreements with the companies owning railroads taken over for their maintenance and upkeep during the period of Federal Control, and for the determination of the rights and obligations of the companies and the Government arising out of Federal Control, including the compensation to be received or guaranteed. The Act authorized the payment, under such agreements of an annual compensation equivalent, generally speaking, to the average net railway operating income for the three-year period ending June 30, 1917, as ascertained and certified by the Interstate Commerce Commission. The President was also given power, in any case where the average of the three-year period appeared plainly inequitable as a measure of Just Compensation, to enter into an agreement for such compensation as in his judgment would be just in the particular case.

COMPENSATION CONTRACT.

The average Annual Net Railway Operating Income of your Company for the three-year period ending June 30, 1917, as tentatively certified by the Interstate Commerce Commission, being $2,637,167.48, the Directors of your Company believed it to be to the interest of the Company to enter into the agreement contemplated by the Federal Control Act, and, accord-

ingly, at the Special Meeting of Stockholders held on January 25, 1919, requested authority to proceed with the negotiation of an agreement on such basis. Such authorization was duly conferred, and the officers of your Company pursuant thereto, have made application to the Director General of Railroads for such an agreement. It is expected that the formal agreement will be executed in the near future.

CORPORATE ORGANIZATION.

During the early part of the period of Federal Control, the Director General permitted the railways to be operated under his supervision by officials of the corporations for the account of the Federal Government. Later a complete separation of the personnel and of the accounting records was ordered, and separate books were opened for Federal transactions and separate operating and accounting officials were appointed. The staff of the Director General for the operation of the railroad of your Company was selected from former officials of your Company and, as the officials so selected were by order of the Director General, required to sever all connection with the corporation, the creation of a distinct corporate organization to carry on the affairs and protect the interests of your company during Federal control became necessary. The expense of maintaining this organization has been, by order of the Director General, excluded as an operating expense chargeable to Federal Railroad operating income, which, in effect, amounted to a deduction of the cost of maintaining the corporate organization from the Standard Return provided by the Federal Control Act.

ALLOCATED EQUIPMENT.

During the year the officers of your Company were notified that the United States Railroad Administration had allocated to it five hundred fifty-five ton coal cars, the cost of which your Company was expected to assume. Your Board of Directors protested against being required to accept such equipment, as, in their opinion, the equipment allocated was unnecessary and was of a type unsuited for the proper and efficient operation of the railroad of your Company, and the prices paid for it by the Administration were unreasonably high. Notwithstanding these objections, the Director General has insisted that your Company accept this allocation under penalty of having the entire cost, approximately $1,348,500.00, charged against the annual compensation due from the Railroad Administration, which cost, if so charged, might render it impracticable for your Company to maintain its present dividend rate. Your Directors are disposed to accept the allocation, provided the Director General will assist in financing its cost which it is believed he will be willing to do.

THE FUTURE.

The President of the United States has announced that Federal Control will terminate on December 31, 1919. The practical certainty that operating costs cannot be substantially reduced below their present high level and the probability that determined efforts will be made by shippers to prevent further increase of rates and even to effect reductions, will render it very difficult, after Federal Control has ended, to maintain between revenues and expenses the margin necessary to ensure an adequate return to your Company and provide the basis of credit necessary for the improvement and development of its property. This prospect, which faces every railroad in the country, makes it of the highest importance that some plan be devised and enacted into law, which, while protecting the proper interests of the public, shall yet also ensure the financial stability of our transportation system.

Your Directors have given and will continue to give their earnest consideration to the various plans that have been proposed for dealing with this problem. Its solution will require the exercise by National and State Legislatures and by public officials generally, of broad statesmanship and wise forethought. Railroad stockholders and creditors can render invaluable assistance in the formulation and discussion of any plan that may be adopted, and will, it is hoped, co-operate actively to the end that a solution may be reached which, while protecting the public, will make railroad securities attractive to investors and thus ensure the continuance of the wise principles of private ownership and individual initiative in the management and control of our transportation systems.

On July 30, 1918, your Company sustained a serious loss in the death of Mr. Clarence Brown, who had been a Director of your Company for a number of years.

Announcement is also made with regret of the death, on June 6, 1919, of Mr. Carl Remington, Assistant Secretary and formerly Secretary of your Company.

On February 1, 1919, Mr. James Steuart MacKie was, at his own request, relieved of his duties as Treasurer of the Company, and Mr. Arthur Trevvett succeeded him in that office.

Appreciative acknowledgment is hereby made to officers and employees for their efficient services during the year.

By order of the Board of Directors.

FRANK TRUMBULL, Chairman and President.

GENERAL BALANCE SHEET, DECEMBER 31, 1918 (CORPORATE).

ASSETS.

Property Investment.			
Cost of Road	$31,672,612.79

This Company and The Toledo & Ohio Central Railway Company severally endorsed, in 1901, upon 5% First Mortgage Bonds of the Kanawha & Hocking Coal & Coke Company due 1951 ($2,842,000 outstanding) and, in 1902, upon 5% First Mortgage Bonds of the Continental Coal Company due 1952 ($1,569,000 outstanding less credit on foreclosure of $506.75 per $1,000 bond) purported guaranties thereof. In *quo warranto* litigation in Ohio, to which the bondholders were not parties, the purported guaranties of this Company upon the bonds last mentioned have been declared *ultra vires* and the performance of the contracts pursuant to which both guaranties were made has been enjoined by the Federal Court in that State. The enforceability of these alleged guaranties is now in litigation.

Railway Officers

Railroad Administration

Operating

J. W. Lynch, assistant superintendent of the Denver & Rio Grande, with headquarters at Gunnison, Colo., has been appointed trainmaster of the Salt Lake division, with headquarters at Thistle, Utah.

C. J. Connett, chief dispatcher on the Chicago, Burlington & Quincy, with headquarters at Casper, Wyo., has been promoted to trainmaster with headquarters at Lincoln, Neb., succeeding **F. G. Gurley** who has been transferred.

O. P. Whitlock, assistant trainmaster on the Cincinnati division of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Springfield, Ohio, has been promoted to trainmaster of the Cairo division with headquarters at Harrisburg, Ill.

W. M. Stillman, who recently received his discharge from the army, has resumed his duties as assistant superintendent of the Stockton division of the Southern Pacific, with headquarters at Stockton, Cal., in place of **E. D. Leavitt,** who has been transferred.

J. P. Phelan, assistant superintendent on the Rocky Mountain division of the Chicago, Milwaukee & St. Paul lines west of Mobridge, with office at Three Forks, Mont., has been promoted to superintendent of the Rocky Mountain and Missoula divisions, with headquarters at Deer Lodge, Mont., vice **J. J. Murphy,** assigned to other duties. **H. L. Wiltrout,** trainmaster at Tacoma, Wash., has been promoted to assistant superintendent of the Rocky Mountain division, with headquarters at Three Forks, vice Mr. Phelan, and **W. H. Wingate,** trainmaster at St. Maries, Idaho, has been transferred to the Coast division, with headquarters at Tacoma, Wash., vice Mr. Wiltrout.

Financial, Legal and Accounting

J. A. Quinn has been appointed assistant auditor of the **Oregon Short Line Railroad,** with office at Salt Lake City, Utah, to succeed H. A. Toland, resigned to accept a position with the corporation.

Traffic

Lewis T. Kavanaugh, assistant traffic manager of the Mississippi-Warrior Waterways with headquarters at St. Louis, Mo., has been promoted to manager with the same headquarters, to succeed **A. W. Mackie,** who has resigned to become general manager of the Lientz Furnace Corporation, Kansas City, Mo. **S. I. Flournoy,** assistant to the manager, has also resigned to enter other work.

G. C. Devol, assistant general freight agent of the Louisville & Nashville, with headquarters at Louisville, Ky., has resigned to enter the service of the Irving National Bank of New York. Mr. Devol was born on January 3, 1883, at New Albany, Ind., and was educated in the grade and high schools. He began railway work in October, 1898, in the freight claim department of the Louisville & Nashville. From 1901 to 1908 he served as clerk in the general freight office and then was appointed assistant chief clerk to the third vice-president and freight traffic manager. In February, 1912, he was appointed chief clerk to the general freight agent, and in March, 1917, was promoted to assistant general freight agent.

Engineering and Rolling Stock

J. R. Smith, chief electrician of the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at St. Paul, Minn., has been appointed signal supervisor, with headquarters at Minneapolis, Minn., succeeding **E. B. Dodd,** who has been assigned to other duties. **S. D. Dimond** succeeds Mr. Smith as chief electrician.

Corporate

Executive, Financial, Legal and Accounting

Colonel Frederick W. Green, assistant to the president of the St. Louis Southwestern Railway Company and the St. Louis Southwestern Railway Company of Texas, has been appointed vice-president of these companies, with headquarters at St. Louis, Mo., and his former position has been abolished.

Operating

A. D. McCarthy has been appointed assistant superintendent of the Montreal (Que.) terminals of the Grand Trunk, vice **F. J. Miller,** resigned.

R. A. Sewell, assistant superintendent of the Canadian Pacific, with headquarters at Montreal, Que., has been appointed superintendent of car service on the Eastern lines, succeeding **O. M. Lavoie,** promoted.

E. J. Naylor, auditor and car accountant of the Batesville Southwestern, with headquarters at Memphis, Tenn., has been promoted to general superintendent with headquarters at Batesville, Miss., succeeding **Henry Pingle,** who has resigned.

H. J. Humphrey, superintendent on the Quebec district of the Canadian Pacific, with headquarters at Montreal, Que., has been transferred to the Trenton division with headquarters at Toronto, Ont., in place of **R. W. Scott,** who has been transferred to the Toronto terminals division, with headquarters at West Toronto, Ont., succeeding T. Collins, who has been transferred.

Traffic

Guy Tombs, assistant freight traffic manager on the **Canadian National Railways,** with office at Montreal, Que., has resigned to enter the service of the Canadian Export Paper Company.

Obituary

Charles E. Vroman, formerly assistant general solicitor for the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, died on August 30, at his summer home on an island north of Mackinac, Mich. He was 74 years old.

Edward S. Keeley, former vice-president of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, died on August 1, at his home in Summit, N. J., following an operation for appendicitis. He was born on November 11, 1858, at Peru, Ill., and entered railway service in 1874 as a clerk in the freight department of the Rock Island & Peoria at Rock Island, Ill. For two years he was employed in the traffic department of the St. Louis & Southeastern, which is now a part of the Louisville & Nashville, with headquarters at St. Louis, Mo. In 1883, he entered the service of the Chicago, Milwaukee & St. Paul as a clerk for the division freight agent, in which position he remained until 1887, when he was promoted to division freight agent with headquarters at Milwaukee, Wis. In 1891 he was appointed assistant general freight agent and in 1900, he was promoted to general freight agent, which position he held until January 1, 1907. He then became freight traffic manager which position he held up to his election as vice-president on April 21, 1909. In December, 1917, Mr. Keeley resigned as vice-president to become manager and assistant treasurer of the United States Sugar Equalization Board, Inc., with headquarters at New York.

One rain drop won't make a crop and one Thrift Stamp won't make a fortune, but both usually bring others of their kind with them.

Railway Wages and the Cost of Living

There is a manifest disposition in some high official quarters to concede the justice of the contention of railway employees that their wages have not been, but should be, advanced in proportion to the increase in the cost of living. But is this contention well-founded? The increase in the cost of living has affected everybody—rich and poor, large and small, capitalists, salaried people and wage workers. How many of the people of the United States have received increases in their incomes since 1915 which have equalled the increases in the cost of living? We don't know, but we venture to estimate that not one-fourth of the people of all classes have. If not one-half, and probably not one-fourth, of the people have received increases in their incomes as large in proportion as the increase in the cost of living, what right have railway employees to demand that the advances in their wages shall be made equal to the advance in the cost of living? If their wages are further advanced, the entire people of the United States will have to foot the bill, either in taxes, or in passenger and freight rates. The effect of this will necessarily be to increase the cost of living of all other classes of people. The question which really should be considered is not whether the cost of living has increased more or less than the wages of railway employees. If the cost of living is to be made the starting point of the investigation, then what ought to be ascertained is whether the wages of railway employees have increased more or less in proportion to the increase in the cost of living than have the incomes of the other people, and especially the other working people of the country. To raise the wages of any class of people enough to offset the increase in the cost of living, when the incomes of most of the other people have not increased in proportion to the cost of living, is to make a privileged class of those whose wages are raised at the expense of the rest of the people; and this the government has no right to do.

Must We Use Substitute Ties

The Dyer resolution, recently reported favorably by the House Committee on Interstate Commerce, calls attention to the waning supply of timber and directs the Interstate Commerce Commission to investigate the advisability of using steel ties. There is no denying the fact that as a nation we are rapidly exhausting our birthright of wonderful forests. According to officers of the forest service, the consumption is now three times the production. However, the scarcity will unquestionably result in such advances in prices that there will be a natural decrease in consumption in all lines where substitutes for lumber may be applied. While the relation of lumber consumption to lumber production is a matter of real concern, the scarcity of ties experienced during the war period cannot be interpreted in terms of ultimate depletion. On the contrary, the shortage of ties in 1918 was the result of the temporary cessation in production, brought about by war conditions and other circumstances previously discussed in these columns. This condition has now largely been overcome, as witnessed by the production of about 10,000,000 ties per month. If we must take cognizance of our rapidly disappearing forests, it would seem to be a matter of national concern as affecting all forests and all users of lumber. Why should the railroads be singled out to bear the brunt of a campaign for forest conservation? With any undertaking involving the use of private capital, the question resolves itself into one of cost. As long as the cost of a wooden tie, distributed over the years of its natural life, is less than the cost of some substitute considered in a like manner, the railroads cannot well be deterred from using the wooden tie in the absence of some general restriction on the use of lumber for all purposes. However, just as soon as a substitute is devised which will enable the roads to maintain their tracks at a lesser expense than with the wooden cross tie, no legislation will be necessary to promote its general introduction. In the mean time, there will be every incentive for co-operation on the part of the railroads in the development of the substitute, as there are probably more opportunties for immediate conservation of lumber through improved practice in its use. Too many wooden cross ties are still being used without preservation treatment or protection from mechanical destruction. When all the railroads have adopted the measures for conserving ties, which on some roads have resulted in a reduction of 50 per cent of their annual renewals, a very pronounced reduction in the consumption of our forests will have been accomplished.

The Slow Growth of Public Sentiment

The people of our American cities will require a generation—thirty or forty years—in which to come to an adequate realization of the simple and axiomatic truth that to get good service from their street railways they will be obliged to allow the owners of the properties a reasonable income. These are the words of Dean Mortimer E. Cooley of the engineering schools of the University of Michigan, speaking in Washington, before the commission which was appointed by President Wilson to make a general investigation of the country-wide crisis in street railway finances. Doctor Cooley, evidently, is a philosopher who believes in taking things as he finds them—while most of us go on discussing grave problems, involving the most fundamental issues; as though we expected such discussion to produce results immediately. To what extent does Dr. Cooley's time-estimate fit the general railroad situation? The Interstate Commerce Commission and Congressmen have had a pretty clear view of the thickening storm in the railroad world now for several years; what signs do we see that they have learned wisdom in that time? The few leaders who see straight have still before them the task of arousing their hundreds of colleagues to an appreciation of the broad view which will be essential to the adoption of a workable policy. There is one element of satisfaction at least; the general railroad problem is the biggest one of all; it cannot long be ignored or evaded. Even delay and inaction are clearly recognized by everybody as equivalent to a decision. The street railway problem, like the "Short Line" problem—enormous as these are intrinsically—still must be classed as secondary. Every

one of us, however, must sympathize warmly with the "traction" men pleading their cause at Washington, for we are all riding daily on street cars at rates less than cost; and we cannot help seeing that the day of settlement must surely come.

New York Central Lines' Financing

CAPITAL AS WELL AS LABOR must be secured by railroads at a reasonable price. Even the roads which, under present abnormal conditions, are able to show substantial net earnings must be provided with new capital when they are returned to the owning companies.

The New York Central Lines are illustrations of this fact. Quite recently the Cleveland, Cincinnati, Chicago & St. Louis sold to a syndicate of bankers, headed by J. P. Morgan & Co., and including the National City Company and the Guaranty Trust Company, both of New York, an issue of $15,000,000 ten-year, six per cent refunding and improvement mortgage bonds. The bankers offered these bonds to the public at 98, at which price they yield a little over 6¼ per cent. At almost the same time a banking syndicate which also included the Guaranty Trust Company and the National City Company, offered to the public $30,000,000 government of Switzerland 5½ per cent ten-year bonds at 96¼. At this price the bonds yielded a little over six per cent on the investment. The offering price of these two issues of bonds would indicate that railroad capital can be procured at a comparatively reasonable price. The $30,000,000 of foreign government bonds, however, were sold immediately upon the announcement of their offering. The $15,000,000 of railroad bonds are understood to have had a fairly satisfactory market. The New York Central Lines will have to go into the market for many times the $15,000,000 which the Big Four is raising at present. In 1918 the New York Central, itself, earned approximately the rental which the government had guaranteed to the company. The Cleveland, Cincinnati, Chicago & St. Louis and the Michigan Central earned a large surplus as over the guaranteed rentals. In regard to earning capacity, therefore, the New York Central Lines may be said to be in an exceptionally strong position as compared with most other American railroads under the present rate structure, wage scale and materials' costs, although this statement is based on the assumption that a return to private operation would not materially injure the New York Central Lines as compared with its competitors.

On December 31, 1917, the New York Central itself had loans and bills payable which amounted to over $17,000,000 with $15,000,000 notes maturing September 15, 1919, and a total funded debt, including these notes but not the floating debt, of $712,000,000, as against $250,000,000 stock outstanding. The Big Four had $3,763,000 loans and bills payable, $19,663,000 "miscellaneous obligations," $6,017,000 non-negotiable debt to affiliated companies, and a total funded debt, including the miscellaneous obligations and debt to affiliated companies, but exclusive of the floating debt, of $105,000,000, as against $57,000,000 outstanding stock. In other words, at the beginning of government control the New York Central Lines were badly in need of new capital and the proportion of debt to stock was higher than would generally be considered desirable. The Big Four note sale shows that a comparatively small amount of new railroad capital can be raised by a company which had demonstrated earning power under present conditions, but the measure of success of the sale would indicate that the term "reasonable," as applied to the interest rate on new capital has taken on a very different meaning than it had five years ago, and it does not indicate that it is safe to assume that the large capital requirements of the railroads can be met through the sale of securities bearing interest at between six and seven per cent in competition with the sale of securities in this country by foreign governments and by our own industrial companies on a huge scale.

An Efficiency Engineer On Electrification

ELSEWHERE IN THIS ISSUE there is an article giving an efficiency engineer's views on the electrification of railways. In this article the engineer makes some noteworthy comments on the subject of railroad economics, but also makes several statements which may well be questioned. Examples are cited in the following paragraphs in which the engineer's statements appear in quotation marks and the editor's comments follow:

"In our country electrification means an immense scrapping of existing equipment." This would, of course, be true if it were possible to electrify all of the roads in the United States over night, but all of the present electrically operated sections of steam railroads represent very small parts of the total mileage operated and electrifying most of these relatively small sections represents years of work. Long before it would be possible to electrify all of the steam roads, all existing steam equipment would be obsolete or worn out. Electrification, as applied to steam roads, is a matter of evolution, not revolution.

"Electric service has been successful in all respects except one—financial. The old horse-car lines made money; the electric lines are on the edge of bankruptcy." It would appear in this that the author has lost sight of the fact that the development of street railway equipment was so rapid that it was necessary in some cities to scrap horse-car and cable equipment for electric equipment, with the result that the electric lines are forced to pay their own carrying expenses along with the interest on the horse-car lines and cable lines which have ceased to exist. In addition, as expressed by Thomas A. Edison, the iron-clad contracts between the roads and cities made in the pioneering days, under normal conditions, have no protective clauses against the great change in operating costs brought on by the world war.

"Present railroad equipment works notoriously very few hours a day. Main tracks are occupied by moving trains about one per cent of the time; locomotives average less than three hours' working service a day, and cars are moving scarcely two hours a day." In using this argument, the engineer has, figuratively, set up a straw man and knocked it down. Electric operation is not advocated for sections of track which are occupied by moving trains only one per cent of the time.

"Electrification does not help the terminal situation; it aggravates it, since it tempts into the centers of cities terminals that, under steam conditions would have remained in cheaper suburbs." It is logical to suppose from this that the engineer would advocate bringing passengers and freight into the cities on already overcrowded streets from outlying railroad stations.

"As an economic or financial proposition, electrical operation is out of the question." One firm of consulting engineers, during the past two years decided that electrification was not advisable in more than half of the cases considered, but as a large number of capable operating men have concluded that electrification was the only solution of specific difficult problems, it would appear that the efficiency engineer's statements should be considered with reservations. Probably nothing has retarded the adoption of electric operation so much as the extravagant claims which manufacturers of electrical equipment have made in the past. It is quite possible to go as much to extremes in the other direction. If

the subject of electrification is to be discussed in general, it is wrong to assume that electrification of all of the railroads in the United States is the subject of discussion. Electric operation has been adopted in few cases except where local conditions made it appear particularly necessary, and it is highly improbable that more than a small percentage of all the roads in the United States will be electrified for many years to come.

New Books

Storing. By H. B. Twyford, 200 pages, illustrated, 6 in. by 9 in., bound in cloth. Published by D. Van Nostrand Company, 25 Park Place, New York.

The necessity for storing stocks of materials of various kinds arises from the practical impossibility of obtaining a constant and uniform flow of materials from the raw state to the finished product at the point of consumption, and with the growing complexity of the modern industrial operations storage problems have also grown in complexity as well as in importance. In its broadest sense, the problem of modern storage not only involves questions of efficient methods of protecting and handling material, but many questions of a commercial nature must also receive consideration.

In this volume the author has attempted to consider the whole range of questions involved in the storage problem, both economic and technical. The former are dealt with in a general way only, defining the fundamentals, and pointing out some of the more common mistakes of an economic nature.

The technical problems are dealt with at greater length. Two chapters are devoted to the question of location, equipment and appliances for the storeroom, while the greater part of the work deals with storehouse operations, including discussions of clerical work, the storehouse organization and methods of accounting for and disposing of material received and delivered from the storeroom. Although, beyond the rather general discussion of the economic phases of storing, it has been the intention of the author to confine the discussion to the problems of the storekeeper rather than to include the related problems of purchasing, a brief discussion of the value of stores inventories has been included, as these materially affect proper cost accounting in connection with the work for which the material is delivered.

The book contains a large number of illustrations showing storehouse equipment and methods of handling material, as well as various forms required in properly listing and accounting for stores stock.

Official Proceedings of Sixth National Foreign Trade Convention, size 6 in. by 9 in., 650 pages, bound in cloth. Issued by the Secretary National Foreign Trade Council, 1 Hanover Square, New York.

The Official Proceedings of the Sixth National Foreign Trade Convention are now ready for distribution in book form.

Contained in the proceedings are all the speeches made at the convention, the discussions of important foreign trade problems, the reports made to the convention, and the list of delegates and firms. This volume, together with the reports of previous conventions, finds wide application as a textbook of foreign trade. The information contained in it furnishes a summary of the foreign trade thought of the country, and will be found highly suggestive to all practical foreign traders.

Letters to the Editor

The Noise Nuisance on Railroads

Chicago.

To the Editor:

The recent articles in your paper describing the introduction of telephone signals on the Pennsylvania Railroad to call in the flagmen causes the writer to wonder if we do profit by experience.

Whistles and other noises (some unnecessary) have cost the American railroads untold millions of dollars in law suits, often resulting in relocation of terminals, elevation of tracks, electrification, etc., to abate the noise nuisance.

What thought or attention has been given to a noiseless locomotive. The chief offenders are noisy exhausts. Why not muffle them? A noisy shrill whistle made of cast iron without musical tone, a harsh metallic clanging din called a bell and noisy open pop valves! For years efforts were made to secure a tuneful bell and whistle and to produce a muffled safety valve, and considerable success was attained, as indicated by the large number in service.

This progress was cast to the winds a few years ago by the introduction of so-called high lift or increased efficiency safety valves, that open with the roar of a 13-in. gun. Likewise the composition metal tuneful bell and chime whistle have had to give place to cast iron and pressed steel.

Evidently our daddies made a mistake in giving too much consideration to the sensitive ear and slumbering public, for the muffled safety valve has now gone into the discard and evidently was not considered a necessity on the United States Railroad Administration standard locomotives.

Do we forget or are we progressing?

A Subscriber.

Preventing Collisions Due to Angle Cocks

Chicago.

To the Editor:

I have read your editorial relative to the closed angle cock in connection with the recent serious accident near Dunkirk, N. Y., and it brings to my mind the many devices and designs that have been brought out during the last thirty years to avoid just such accidents as this.

I was air brake expert for a large railroad during eight years ending in 1900, and was so concerned over the many similar, though less disastrous, failures that I personally investigated all such inventions as gave promise of simplicity and effectiveness, and since that time have had only less active interest in the subject.

The Louisville & Nashville fully 25 years ago entirely abolished the angle cock on the locomotive, both to prevent its being closed at the wrong time, and also to keep the dirt and cinders out of the engine hose where they are blown back into the train line brake pipe. It adopted an air-tight dummy coupler and was still using this a few years ago and presume it is today. However, to the best of my knowledge, no other road or roads of considerable size followed its plan, as it occasions a slight loss of air and time in connecting and disconnecting the locomotive and train. The old American feeling of optimism, that "lightning doesn't strike twice in the same place," seems to prevent effective changes of this character unless and until such accident comes to your own road, and even then they are not lasting.

A number of years back, the railroad with which I have

been connected for nearly thirty years, abandoned the so-called "angle cock" on the rear of all passenger locomotives and substituted in its place a "straight-way" cock located about a foot or more under the back tender beam, so as to be reached only by a man on the ground and especially so located that a man riding "blind-baggage" could not accidentally push it closed with his foot. We also for a time drilled a 1/4 in. hole in the side of all these rear tender cocks, which would vent the air from the hose-side of the cock rapidly enough to apply the brakes.

These ideas are simple, are not patented, and cause no delay or loss of air when the two adjacent cocks are closed nearly simultaneously and would, I believe, be well worth consideration as a "safety-first" proposition on all the railroads.

The Motion Picture Machine As an Engineering Instrument

Chicago, Ill.

To the Editor:

There is every reason why the moving picture machine should become a scientific instrument for the use of the civil engineering profession. Its ramifications are untold and apparently unlimited. It is surprising that some of the scientific instrument makers have not seen its possibilities and produced a machine that would meet the requirements of this field.

If an instrument were built with leveling attachments for the horizontal plane and a telescope with cross-hairs, it would seem to be what would be needed. By means of the leveling device, pictures obtained would conform to diagrams and detailed drawings. The telescope with its cross-hairs would enable the operator to focus the machine carefully on the point and in the desired plane.

Such a machine would be particularly adaptable to railway engineering. With it the problem of the rail under load, that has been bothering investigators for some time, might be solved. The instrument could be set up so that the horizontal cross-hair is parallel with the top of the rail, when free from load and at a distance of ten feet from the rail so that the instrument would be prevented from receiving the vibrations from passing trains. A record of the cars and their weight would be shown in the pictures. A cross-hair immediately in front of the films and corresponding to the cross-hair in the telescope would show the actual point of the top of the rail before being loaded. As the train passed (speed to be predetermined and the reel turned to meet such a speed) the depression of the rail would be shown upon the films.

It might be possible that some calculations would be necessary but this could be determined by experiments.

Individual films of reels, so taken, could be selected from which graphs could be made. In this manner it seems possible that accurate knowledge of the action of the rail under load at varying speeds of trains could be obtained. It would also seem possible that movements of all the rails and parts of crossings could so be obtained. These films or sets of pictures, taken in conjunction with tests of the rail under transverse and alternating stresses and with a knowledge of the elastic limit and ultimate load of the steel of the rails undergoing investigation, would apparently give the investigators a rather comprehensive knowledge of the rail under load.

Investigators of rails under load have stated that the means so far employed have not been satisfactory for many reasons. It would seem, to the writer, that the instrument or machine suggested, would be available for bridges, culverts, locomotive driving wheel counter balances and many other problems that are now perplexing railway engineers.

The Respectable Commission

Boston, Mass.

To the Editor:

The excellent editorial in the *Railway Age* of July 18 on the qualifications of the members of the Interstate Commerce Commission leaves off just about where it ought to begin. It is true that the majority of the commissioners are wedded for life to "the people"—that is, the majority of the voters; and as the majority of the voters do not yet know their own desires we must expect that the commission as a whole will remain flabby. Mr. Esch, for the same reason, has presented a flabby bill.

But with all its faults the Interstate Commerce Commission is the only body of men that anybody seems to be able to think of as competent to regulate our freight rates. The "average man" sets his hope on these commissioners because they are outwardly respectable, like a policeman, or a hotel clerk, or a Tammany alderman; while their disqualifications are not clearly defined—at least not to him. Railroad presidents recommend the commission as a rate-making power because they feel sure that Congress would certainly refuse to approve any action looking to the institution of a more intelligent or courageous body. So, therefore, it appears that we are destined—or doomed— to live with the Interstate Commerce Commission for better or for worse till death do us part.

What next? A number of competent writers have proposed that Congress direct the commissioners to regulate freight rates so as to permit the railroads to earn six per cent on their stock. This is good in principle; but how will the thing be done? They will spend so much time in trying to decide how low they can make the freight rates while still complying with the law that the railroads will die of apoplexy, or anaemia; delirium, or tuberculosis. To make the rates just right is impossible. It would be an endless problem on a single road, let alone the rest of our enormous railroad system. The commissioners would fear to make rates too high because of the sure displeasure of the shippers and the politicians. They would fear to make them too low, for it is by this time evident, even in Washington, that the railroad treasuries face bankruptcy; and even the politician knows something of the evils of insolvency. The only practicable plan is to make the rates *too high,* and provide for turning the surpluses over to the government. It is a difficult thing to make a law today, to provide for taxing a railroad equitably on its income which is to be earned one, two or three years hence; but it must be done, if we are to accomplish our threefold purpose of providing stable freight rates, reasonable railroad dividends and contented—or even half-way contented—voters. Let the railroads earn seven per cent. Possibly next year they will need 7½ or 8 per cent. The federal government and the states will debate many months before deciding how to apportion among themselves the income taxes to be taken from the carriers; but they will have to settle the question in some way or other.
